EPA welcomes the opportunity to hear more of PEW's detailed perspectives on this very important topic. Although it is valid to assert that there seems to be a strong reliance to garner the majority of nutrient loads from agriculture, EPA will clearly be cognizant that all sectors that have an economic stake in the Chesapeake Bay as well as contributing pollution will shoulder a fair and equitable distribution of the restoration program. As you are aware municipal treatment plants have made much progress in reducing nutrients and they will continue to carry a significant financial investment to achieve required load reductions. Reductions from the urban sector has been a more recent concern to state agencies as well as EPA. Agriculture has in fact made a fair amount of progress yet need to also push harder to implement not only traditional BMPs but also look to the private sector to support advance manure technologies which has been proposed in Pennsylvania.

The draft TMDL also states on page 8-16 that "CAFO permitted facilities are assumed to have a control that all animals subject to CAFO permit conditions must receive feed management" and that EPA "assumes that all animals except dairies (e.g., poultry and swine) on AFOs that are not subject to CAFO permit conditions are assumed to receive feed management."

Including feed management as a mandate is another example of an overly broad application of a BMP that may not be the appropriate tool in all circumstances. Site-specific conditions, such as variation in supplemental phosphorus sources, may make reductions in feed phosphorus impractical. In this case, mandating the goal is more appropriate than mandating a specific BMP. The goal in this case is reduction in the phosphorus land application rate where phosphorus is not needed. Any number of alternatives may be used to meet this goal. Virginia acknowledges that the TMDL states "jurisdictions may meet the WLA assumptions by...applying a different set of practices that would result in equivalent nutrient and sediment reductions;" however, the associated nutrient reduction of an alternative, equally effective BMP may not be as easily calculated by the model and therefore limits necessary flexibility for operations to determine the most effective suite of BMPs and for those BMPs to be accounted for in the model.

Recommendation: Remove the sentence on Page 8-16 that begins "EPA also assumes"

Response

EPA acknowledges that jurisdictions may meet the WLA assumptions by applying a different set of practices that would result in equivalent nutrient and sediment reductions. EPA is committed to work with all jurisdictions to ensure that any "new" BMP that has not been previously reported for use in the model undergoes the Chesapeake Bay Program's BMP-approval protocol to ensure that it is properly defined and assigned an effectiveness estimate so that jurisdictions can get the appropriate credit for implementation of alternative practices. C. Point Source (CAFO)-related Issues

As recognized by the Draft TMDL's proposed allocations (see Table 1 above), the increased CAFO-related reductions in Nt and Pt loadings which will be required if the Draft NY WIP is implemented would be "de minimis", because New York's existing CAFO permitting program has already minimized CAFO-related nutrient related additions to Waters of the United States/Waters of [New York] State.

Despite the tremendous work that has been done by New York CAFOs and the regulation of them by NYSDEC which goes beyond EPA's CAFO requirements, EPA in its comments on the Draft New York WIP has indicated both that there is not a "reasonable assurance" that the nutrient reductions called for in the draft WIP will be achieved and secondly that significantly more agricultural-related reductions will be needed. For example, the Draft TMDL includes the following additional CAFO-related "federal Backstops":

- AFOs of any size should be regulated as CAFOs;
- AFOs of any size will have to develop a Comprehensive Nutrient Management Plan (CNMP);

- Large CAFOs will be required to use Precision Feed Management;
- CAFOs of any size will be required to have a manure storage and will be prohibited from spreading manure during the winter;
- All manure applied to crop fields will need to be injected;
- All farms will be required to have ammonia emission controls on their facilities.

Thus, the main additional nutrient-related reductions that can be projected if the federal CAFO-related Backstops are imposed would be by forcing many, if not all, small AFOs to become CAFOs. Assumedly, this would be formalized through a modification of New York's CAFO SPDES Permits so that AFOs within the New York Bay Watershed, modifying the definition of a CAFO by significantly lowering the minimum numbers of animals, perhaps to as low as one must obtain Permit coverage and comply with all Permit mandates. This would likely be done by NYSDEC.

Among the costs this would impose on each newly defined CAFO is approximately \$8,000 a year in Certified Nutrient Planners fees to prepare CNMPs and supporting documents. In addition, significant monies would also have to be invested in structural BMPs and the non-structural BMPs described in New York's draft WIP.

As recognized in New York's proposed WIP, New York's large and medium CAFOs are already leading the nation in reducing CAFO-related nutrient and sediment runoff from enters waters of the United States. Some examples include:

- New York's CAFO SPDES Permit and its mandated best management practices (BMPs) is being implemented on New York farms. It is the Coalition's understanding that CAFO-related inspections by both EPA and NYSDEC representatives have found a high level of compliance. Further, that most non-compliance issues are related to administrative (mainly record keeping) requirements rather than with those Permit requirements which are intended to eliminate nutrient and sediment discharges.
- Participation of large CAFOs in the permitting process is believed to be 100 percent.
- The vast majority of medium and large CAFOs have developed a Comprehensive Nutrient Management Plan (CNMP), and many have implemented dozens of structural and managerial practices changes.
- In many instances, the New York Natural Resources Conservation Service (NY-NRCS) standards which CAFO owners and operators must comply with to remain compliant with the CAFO SPDES Permits are stricter than the comparable standards in many of the other Bay States.
- The New York CAFO program, as specified in New York's CAFO SPDES General Permits, is clear, actively implemented and enforced. It has State-wide applicability, is practical and is based on sound science.
- When the original CAFO SPDES Permit was issued, New York did not have a working P index in place. The New York Phosphorus Working Group was formed to address this issue. Members included Cornell faculty and staff from the Departments of Crop and Soil Sciences and Biological and Environmental Engineering, staff from the New York City Watershed Agricultural Program, as well as staff from the New York State Soil and Water Conservation Committee and NRCS. The Group worked diligently over a two-year period to mesh field practices with current science to formulate weighting factors that combine to determine the P Index runoff risk score for a particular field. Subsequently, private crop consultants and field staff from soil and water conservation districts and NRCS helped to field test the P Index. The

P Index is now an integral part of CAFO-required landspreading practices. It has become a practical management tool that was designed so that higher scores can generally be reduced by selecting lower risk practices for implementation. At the end of the day, if a score cannot be managed below a certain threshold, no phosphorus can be applied to that field from either fertilizer or manure sources. The Index has been supported by dozens of field training sessions, publication of a P Index User's Manual, and a downloadable P Index spreadsheet calculator.

- While New York had had a Nitrogen Index in since the early 1990s, it was updated when the second New York CAFO Permit became effective. The updated N Index is based upon soil hydrologic group and a seasonally weighted rainfall factor. NY-NRCS provided updated rainfall data that were interpolated to the township level, and this serves as the basis for the revised New York N Index. The addition of town-ship-based data was especially important because the earlier N Index was expressed on a county-average basis, and there are some counties in New York State with substantial rainfall differences from township to township. Also, appropriate N leaching risk reduction practices were updated to require that fall manure applications be made on fields with a live sod or cover crop in high leaching risk soils and locations.
- New York, through the work of Cornell University and its County Soil & Water Conservation Districts, has become the regional leader in Precision Feed Management. This is both incorporated into the draft New York WIP and is an identified Federal Backstop.

If these additional mandates are placed on New York CAFOs and the smaller AFOs, USC estimates that the requirements will add about 800 regulated farms to a program that has been successful but is financially strained. This, in turn, may lead to reducing the number of cows and heifers within the New York portion of the Bay Watershed by 50%.

Response

Thank you for your comments. Good progress has been made on reducing sediment, nutrient, and pesticide losses from farm fields through conservation practice implementation in the Chesapeake Bay region, but a significant amount of conservation treatment remains to be done to reduce nonpoint agricultural sources of pollution. The greatest concern in regards to nutrient and sediment loads from CAFOs and AFOs is from the lack of implementation of nutrient management on the cropland under their control as well as the lack of assurance and verification that nutrient management planning tools are actually being implemented by CAFOs and AFOs on their cropland. According to a recent NRCS study, cultivated cropland represents only about 10 percent of the land base in the Chesapeake Bay watershed. With the current level of conservation treatment, cultivated cropland delivers a disproportionate amount of sediment and nutrients to rivers and streams and ultimately to the Bay. Of the total loads delivered to rivers and streams from all sources, cultivated cropland is the source for 25 percent of the sediment, 27.5 percent of the phosphorus, and 32 percent of the nitrogen. There is significant room for improvement in reducing the amount of nutrients and sediments from agricultural lands. All CAFOs are required to implement nutrient management planning under their SPDES permits in NY. Currently, EPA has the authority to designate small AFOs as CAFOs, and EPA will be exploring the use of that authority in the Chesapeake Bay watershed.

2) Outfall 001 and Combined Sewer System

The WLAs proposed by DDOE in its Draft WIP (Table 4)[FN 1] for Outfall 001 and the CSOs remaining after completion of the LTCP are those developed by employing the LTCP model. These WLAs have been calculated from LTCP collection system model predictions as the arithmetic average for the wet weather (storm) events for the Bay TMDL model hydrologic period (the years 1991 through 2000) using rainfall recorded at Reagan National Airport.

However, Section 6 of the draft TMDL Report establishes a critical 3-year period within the hydrologic period as the benchmark for determining attainment of water quality standards (WQS). In order to comply with the critical period requirement, WLAs for Outfall 001 and CSOs remaining after completion of the LTCP would have to be based on the average of the years 1993 through 1995. WLAs calculated from LTCP model predictions as the arithmetic average for the wet weather (storm) events for the Bay model critical period (years 1993 through 1995) using rainfall recorded at Reagan National Airport are summarized as follows:

[Figure. Please see pg 5 of original document 0254.1]

If the critical period applies, the WLAs included in the Draft WIP for Outfall 002 and the remaining CSOs (See footnote 1 to these comments) will have to be revised to include the allocations in the table above rather than the WLAs in Table 4 to the Draft WIP.

Because discharges from Outfall 001 and the CSOs remaining after completion of the LTCP will vary due to rainfall conditions, the Permit includes performance, monitoring, and continuing post-LTCP construction evaluation of these discharges. Therefore, DC Water has asked DDOE to include in its final WIP a statement that compliance with these WLAs for discharges from Outfall 001 and the CSOs remaining after completion of the LTCP shall be based on the arithmetic average of LTCP model predictions for the wet weather (storm events) for the years 1991 through 2000, or the Critical Period years (whichever period is applied by EPA), using rainfall recorded at Reagan National Airport. Such a statement in the final WIP is necessary to provide clear guidance to permit writers and to avoid any suggestion that the WLAs for these discharges can be complied with under all rainfall conditions. DC Water requests that EPA include this same statement in the final TMDL as well.

[FN 1] These WLAs are 134,073 lbs/yr TN, 4,304 lbs/yr TP, and 438,634 lbs/yr TSS for Outfall 001; and 3,809 lbs/yr TN, 810 lbs/yr TP, and 105,350 lbs/yr TSS for the CSO Outfalls remaining after LTCP implementation.

Response

This issue has been discussed between EPA, WASA and VAMWA over a lengthy period of time. The municipalities want to use the 10 year average as their captured CSO WLA. EPA agreed with this approach provided the municipalities monitor their discharges and if they fail to meet the WLA and do not obtain credits, they will be in violation of permit limits. For the Blue Plains permit, EPA used the highest load during the 10 year period, not the average; and essentially retired the load for Outfall 001. WASA is required to monitor Outfall 001 and if the underlying assumption is incorrect, the limit will be revisited. Accordingly, EPA does not agree that the commenter's proposed language should appear either in the DC WIP or the Bay TMDL.

Organization: City of Alexandria, Virginia

Exhibit A to these comments contains a description of the Communities' combined sewer systems (CSSs) and CSO control programs. [Comment Letter contains additional information in the form of an attachment. Please refer to Exhibit A of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]. The following overview describes the key program elements and system features that are relevant to establishing appropriate WLAs for these systems.

II. OVERVIEW OF RELEVANT PROGRAM ELEMENTS AND SYSTEM FEATURES

A. Program Elements

All of the Communities adopted the demonstration approach authorized in EPA's CSO Control Policy [FN1] in their long-

term control plans (LTCPs). Each Community is implementing a different Virginia Department of Environmental Quality-approved CSO control program based on local factors and circumstances, as provided under the CSO Policy. Alexandria's approved LTCP employs a capture and treat approach to CSO control, and continues implementing the Nine Minimum Controls (including maximizing flow to the Alexandria Sanitation Authority's advanced water reclamation plant) as a requirement of its permit. Lynchburg's LTCP provides for total separation of its combined system; however, the City is presently updating its LTCP and may decide to convey and treat combined flow in the remaining downtown area rather than separating that part of its system. Richmond's LTCP calls for conveyance, storage, and treatment of combined flows as well as limited sewer separation.

B. Status of Program Implementation

The Communities are at different stages in the implementation of their LTCPs, which, collectively, involve capital investments totaling approximately \$1 billion in today's dollars and millions of dollars in annual operation and maintenance costs. The City of Alexandria has progressed to the post-construction monitoring phase, and employs a target-of-opportunity approach for re-development projects to separate combined sewers under its non-regulatory Area Reduction Plan. Lynchburg has separated approximately 50 percent of its combined system as required by its VPDES permit and State consent special order at a cost of approximately \$168 million. Richmond has completed two phases of its three-phased LTCP at a cost of approximately \$267 million as required by its VPDES permit and State order. Both the Lynchburg and Richmond orders establish schedules for construction of the controls in their LTCPs. Neither city is expected to complete construction until after 2025 given the magnitude of the estimated remaining costs in today's dollars (\$326 million for Lynchburg, and \$500 million for Richmond) and highest rates in the state as a percent of median household income (MHI). Alexandria, Richmond and Lynchburg are required by their VPDES permits to continue implementing the Nine Minimum Controls, including maximizing combined flows to their WWTPs.

C. System Features

The Communities' discharge combined sewer flow from both individual CSO outfalls and from the WWTPs serving their CSSs. Discharges from CSO outfalls occur during rainfall events that produce combined flows exceeding the wet weather design capacities of the conveyance, storage and treatment facilities. In order to meet the applicable water quality-based requirements, the Communities have either significantly reduced or are in the process of significantly reducing the volume, duration and number of discharges from their CSO outfalls by conveying, storing and treating the combined flows and/or by separating parts of their CSSs. Combined flows that do not exceed the design capacities of the conveyance, storage, and treatment facilities are conveyed to and treated at the WWTPs serving the Communities. Currently, combined flows conveyed to the WWTPs receive complete treatment. Consistent with the CSO Policy, however, future controls may include partial treatment of combined sewer flows to meet bacteria WLAs.

The illustration in Figure 1 reflects system features that are common to all of the Communities in the context of the input to the Bay Watershed Model.[Please see page 3 of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]

(1) Dry Weather Flow (DWF): DWF is the sanitary portion of the flow discharged from the WWTP. Annual changes in this flow are primarily associated with the population growth of the community in the same way as the flows for a community served by a separate sewer system. Pollutant concentrations are controlled by the design and operation of the WWTP facilities.

(2) Combined Sewer Captured (CS-C): CS-C is the sanitary and storm water portion of the flow captured, stored, treated and discharged from the WWTP. The CS-C portion of the WWTP flow is highly dependent on the amount of rainfall received during a given year. The amount captured, stored and treated at the WWTP is also a function of how the rain falls (i.e. less is captured from an intense summer storm as compared to a slow all-day rainfall). In general, as improvements to the CSS are implemented that capture more CSO flows (and if these flows are treated at the WWTP), the annual average flow at the WWTP will increase. The Discharge Monitoring Report (DMR) flows (comprised of DWF and CS-C) reported by the WWTPs will vary based on the rainfall pattern received in a given year. For some storms, WWTPs will be able to provide full treatment and therefore pollutant concentrations will be the same as the DWF. For other storms, pollutant concentrations will be higher than the DWF even though treatment is being provided at the WWTP.

(3) Combined Sewer Overflow (CS-O): CS-O is the portion of the flow that is not captured by the intercepting system and is released at the permitted CSO outfalls. The amount of CS-O released from the outfalls is a function of the total rainfall and how the rain falls as described for CS-C above. In addition, the pollutant concentration in the CS-O will vary with each storm. The CS-O is reduced by separation or by capture and treatment.

The City of Richmond's CSS offers a good example of the way that above described system features operate in response to wet weather events. The City has been operating its 50 million gallon combined sewer storage facility for about 30 years. After storm events, the stored CS-C flow is sent to the WWTP over a two-day period. Thus, the DMR data includes both DWF and CS-C flow as shown in Figure 2.

Figure 2 - Current Richmond WWTP Annual Average Flow [Please see page 5 of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]

Figure 2 is the actual annual average flow, in million gallons per day (mgd), for the Richmond WWTP for the period 1991 through 2006. As can be seen in this figure, the flow discharged from the WWTP is significantly influenced by the rainfall pattern from year to year. For example, the average WWTP flow for the period between 1991 and 2000 is about 50.7 mgd. During 1994, annual average flow was about 58 mgd, and in 2004 the annual average flow was about 63 mgd. The difference in flows is associated with the amount of CS-C treated at the WWTP.

The DWF changes for Richmond are associated with the growth in Goochland County, which started sending DWF to Richmond in 2006. The Richmond WWTP has a permitted DWF capacity of 45 mgd. This is to ensure that treatment of additional sanitary flow is provided to accommodate additional customers. Figure 3 shows that if the WWTP had been operating at its full permitted DWF capacity, the total flow from the WWTP would have increased, even though the amount of CS-C treated at the WWTP would have remained the same.

Figure 3 - Future Richmond WWTP Annual Average Flow [Please see page 5 of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]

D. System Nutrient and Sediment Loads

Approximately 95 to 99 percent of the wet weather CSS flow that either is discharged through CSO outfalls or conveyed to the WWTP (or other treatment facility) for treatment is storm water. Therefore, wet weather CSS flows generally are large in volume, but the concentrations of TN and TP in these flows are small when compared to the nutrient

concentrations in separate sanitary sewer system flows. The Communities' CSO control programs reduce the discharge of TN and TP in both the sanitary and storm water components of their combined flows by maximizing conveyance and complete treatment of combined flows within the design capacities of their plants as part of the Nine Minimum Controls required by EPA's CSO Control Policy.

The Communities have already achieved almost all of the nutrient load reductions and much of the sediment load reductions associated with their CSO control programs by virtue of having maximized combined flows through complete treatment. Furthermore, independent of their CSO control obligations, the Communities are currently on target to achieve nutrient reductions at their WWTPs by the end of 2010 as called for by the Virginia tributary strategies. [FN2, FN3] While Richmond's LTCP (and possibly Lynchburg's LTCP) calls for the installation of additional capacity at the WWTPs to treat larger combined flow volumes in the future, this capacity is associated with disinfection facilities. This additional capacity will transfer some of the nutrient and sediment load now discharged from CSO outfalls to the WWTP, but will not change the total nutrient and sediment load from the CSS.

III. VIRGINIA'S DRAFT WATERSHED IMPLEMENTATION PLAN REFLECTS THE CORRECT APPROACH FOR ESTABLISHING WLAs FOR COMBINED SEWER SYSTEMS

The WLAs proposed for the Communities' CSSs in Virginia's September 2010 draft Phase I Watershed Implementation Plan (WIP) reflect the Virginia Department of Environmental Quality's (VDEQ's) and the Virginia State Water Control Board's longstanding familiarity with the Communities' systems and control programs. These agencies have reviewed and approved the Communities' LTCPs, issued and reissued VPDES permits for the CSSs for over 20 years, and issued consent orders establishing schedules for the implementation of Richmond's and Lynchburg's LTCPs. The WIP also reflects the considerable information that the Communities have shared with VDEQ over the last year related to the CSS nutrient and TSS loads. Virginia's approach to establishing WLA for the Communities embodied in the WIP is summarized in Table 1.

Table 1 - Virginia WIP's Approach for Establishing CSS WLAs [Please see page 7 of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]

WLAs for the dry weather flow treated at the Communities' WWTPs ("DWF" in Figure 1 above) are correctly included in the WLAs assigned in the WIP to the significant dischargers, which are based on the Tributary Strategy concentrations. The Richmond and Lynchburg Tributary Strategy concentrations for the dry weather TN, TP, and TSS are 8.0, 0.5, and 30 mg/L, respectively. The ASA Tributary Strategy concentrations for the dry weather TN, TP, and TSS are 3.0, 0.18, and 6 mg/L, respectively. The WWTP permit must contain a performance standard in the form of a concentration limitation for wet weather flows above the permit dry weather design flow capacity, which will encourage operators to empty CSO storage facilities as fast as possible (maximize wet weather treatment). This will prepare the storage facilities to capture more volume from the next storm and have the net effect of increasing the annual volume treated, which will maximize the overall pollution removal. This is consistent with EPA's CSO Control Policy requirements to maximize the flow treated at the WWTP. The Table 1 footnotes must be included in the TMDL report to provide the proper guidance to the NPDES permit writers and document the assumptions used to establish the WLAs.

The CSS WLAs proposed by Virginia in its WIP correctly assign WLAs to the two sources of nutrient and TSS loads from the Communities' combined sewer systems as summarized in Table 1. Table 1 includes (1) flows that are captured and conveyed to the WWTPs for treatment ("CS-C" in Figure 1 above), and (2) flows that exceed the conveyance and

treatment capacity of the CSS and WWTP and are discharged from CSO outfalls ("CS-O" in Figure 1 above). The WIP correctly shows the WLAs for the City of Alexandria's CSO outfalls (UCS-O") and captured combined sewer flow ("CS-C") treated at the ASA's WWTP as separate allocations because the CSO outfalls and the WWTP are permitted separately. The WLAs for Richmond's and Lynchburg's captured combined sewer flow and CSO outfalls are correctly aggregated (shown as "Aggregate CSS" in the Tables) in Virginia's WIP. Aggregating the CSS WLA's affords Richmond and Lynchburg the flexibility to maximize CSS flows to their WWTPs (as required by their permits and EPA's CSO Control Policy) without risk of exceeding the WLAs in the WIP.

The WIP correctly describes the basis for Virginia's proposed CSS WLAs, including event mean concentration data for the CSO outfalls, model-predicted 1991-2000 CSO discharge volumes, and WWTP flow and concentration data used to derive the WLAs. See WIP at pages 32-35. EPA should adopt the approach reflected in Virginia's WIP, which bases the WWTP WLAs on the DWF and CS-C average of the '91-'00 flows and footnote to the allocations to provide guidance to the permit writer to use a performance standard (concentration, not loads) for flows above the DWF design capacity. Virginia's approach would avoid consuming allocations needed by other sectors, promote maximizing flow through the WWTP consistent with the CSO Control Policy, and will better reflect the loading in the water quality model associated with the actual '91- '00 hydrology. Further, the WIP provides permitting guidance that is fully consistent with the CSO Control Policy, NPDES permit regulations, and EPA guidance pertaining to wet weather permitting as reflected in the following overview.

The CSO Control Policy requires CSO communities to develop and implement LTCPs that provide for compliance with the applicable water quality-based requirements of the Clean Water Act. CSO communities may base the LTCPs either on the "presumptive" approach where the LTCP is presumed to provide for compliance with the applicable requirements if it meets one of several specified discharge criteria, or the "demonstration" approach where the community must demonstrate through data, modeling and/or other acceptable methods that its LTCP will provide for compliance with applicable requirements. See CSO Policy at II.C.4. As explained above, all of the Communities have selected the demonstration approach. Permitting authorities are instructed to include LTCP-derived performance standards and requirements based on average design conditions in NPDES permits issued to those CSO communities that have developed LTCPs using the demonstration approach. See CSO Policy at IV.B.2.c.

Water quality-based effluent limits are numeric performance standards for selected CSO controls, such as concentration limitations for wet weather at the WWTP or flow or volume capacity of the facilities identified in the LTCP. See CSO Policy at IV.B.2.c. Rainfall durations, frequencies and intensities vary from storm to storm and across the CSO watersheds. Additionally, the periods between rainfall events vary and cause loads to build-up and wash off at different rates, which makes it infeasible to determine numerical mass effluent limitations for wet weather flows (WWFs) associated with the CSS. The controls in the LTCP, including WWF treatment controls at the WWTP, represent Best Management Practices (BMPs) that may be designed to meet the CSO related WLAs from the TMDL. See 40 C.F.R. § 122.44(k) and 40 C.F.R. § 122A4(d)(I)(vii)(B). The WLAs proposed in the WIP were developed based on the LTCP performance standards, which should achieve the WLAs using the same modeling that EPA and/or the Communities used to derive the WLA for wet weather flows associated with operating the CSS. [FN4] See 40 C.F.R. § 122.44(d)(I)(vii)(B). The LTCP performance standards are the water quality-based effluent limitations for WWFs associated with facilities in the approved LTCP.

Virginia's approach applies equally to each of the 64 CSO communities in the Chesapeake Bay watershed and should be adopted across the watershed.

IV. THE DRAFT TMDL ERRONEOUSLY FAILS TO INCLUDE THE WLAs PROPOSED BY VIRGINIA IN ITS WIP

While the Draft TMDL incorporates the TN and TP WLAs proposed in the WIP for the CSO outfalls, it erroneously fails to include any WLAs for captured CSS flows treated at the WWTPs. Further, the Draft TMDL reduces the TSS WLAs for the CSO outfalls by 16 to 31 percent, with no explanation of the basis for the TSS WLAs or how they were calculated. These unexplained departures from the WIP are fundamentally inconsistent with the above-described technical, legal, and policy rationales. The Communities urge EPA to incorporate the CSS WLAs and related text in the WIP in the final TMDL.

A. EPA's proposed approach for establishing the CS-C portion of the WLAs

Based on recent meetings and communications among representative of EPA, VDEQ, and the Communities, we understand that EPA does plan to include WLAs for captured combined sewer flow in the final TMDL. However, as reflected in an October 27, 2010 email from EPA (Exhibit B), EPA intends to establish these WLAs based on a WWTP fixed design flow capacity rather wet weather-driven CSS flows actually treated by the WWTPs. [Comment Letter contains additional information in the form of an attachment. Please refer to Exhibit B of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]. We believe this approach is arbitrary and fails to reflect the way that a CSS actually works as described above. For these reasons, EPA's approach is not the correct way to establish the WLAs. However, if EPA continues to insist that the WLAs for captured CSS flow treated at the WWTPs be established using fixed annual average flows, the final TMDL should include the WLAs identified in Table 2 as follows:

Table 2 - EPA's Proposed Approach for Establishing the CS-C Portion of the WLAs [Please see page 10 of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)]

The WWTP WLAs in Table 2 are based on the Tributary Strategy concentrations and annual average flows needed to reliably operate the WWTP during years with high rainfall. ASA's TN concentration would be based on 3 mg/L for flows at and below 54 mgd and 4 mg/L for flows above 54 mgd. WWTPs served by CSSs are susceptible to the effects of snow melts and potentially toxic spills on roadways that may enter the CSS through storm water curb inlets. For example, in 1996, the Richmond WWTP was upset by high salinity runoff water associated with a snow melt event. It took over a month to recover BOD treatment after this event, but nitrification took much longer. If these types of events take place in December or January, it will be difficult to meet the WLAs even on the annual average basis. Additionally, colder wastewater temperatures are common in years with heavy snowfall such as in February 2010 when the Richmond WWTP average monthly temperature was 10.7°C. While the ASA WWTP treats a lower percentage of CSS flow compared to Richmond and Lynchburg, it too may experience nitrification inhibition during extended winter wet weather accompanied by snow melt. WWTPs that serve CSSs should have WLAs that reflect the site-specific treatment challenges that occur during the winter periods.

[FN1] 59 Fed. Reg. 18,688 (April 19, 1994). The Policy has been incorporated by reference into the Clean Water Act (CWA). See CWA § 402(q), 33 USC. § 1342(q).

[FN2] Commonwealth of Virginia, Office of the Governor. Chesapeake Bay Nutrient and Sediment Reduction Tributary Strategy for the James River, Lynnhaven and Poquoson Coastal Basins. March 2005.

[FN3] Commonwealth of Virginia, Office of the Governor. Chesapeake Bay Nutrient and Sediment Reduction Tributary Strategy for the Shenandoah and Potomac River Basins. March 2005.

[FN4] 40 C.F.R. § 122.44(d)(1)(vii)(B) requires the permitting authority to ensure that effluent limits developed to protect a narrative or numeric water quality standard are consistent with the assumptions and requirements of any available WLA for the discharge prepared by the State.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. EPA understands commenters concern relating to assigning loads to combined sewer systems. EPA and VA DEQ have worked to resolve these matters as can be seen in the final TMDL. EPA will continue to work on proper implementation procedures through the NPDES permitting process.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Comment ID 0463.1.001.011

Author Name: Sharma Lalit

Organization: City of Alexandria, Virginia

The CSS operates as a system; therefore it is inappropriate to disaggregate the CSS loads to smaller segments that discharge into the same TMDL segment.

Response

The WLA allocations for the CSS for Alexandria, Richmond, and Lynchburg have been established using different methodologies as each of the systems are in different stages of implementation of the CSO Long Term Control Plan (LTCP). There are two WLAs established for Alexandria's CSS. One WLA has been developed for the WWTP and will be incorporated into the VPDES Watershed General Permit. Another WLA has been established to address loads resulting from overflows from the collection system. This WLA will be addressed by the VPDES WWTP Individual Permit. For Lynchburg and Richmond, these WLAs are for loads discharged by the cities' CSS and reflect estimated annual average loads discharged from both their permitted CSO outfalls

and CSS flows discharged by their treatment plants. The aggregated CSS WLAs will accommodate the transfer of nutrient and sediment loads from the cities' CSO outfalls to their treatment plants as additional CSS conveyance, storage, and treatment capacity is constructed in the future. Further, it is anticipated that a portion of these aggregated WLAs will need to be transferred to the MS4s at some point in the future to reflect combined sewer separation projects completed after establishment of the TMDLs. Specific WLAs for the WWTP and the CSO will be determined from the aggregate WLA at the time of permit issuance and will be based upon state of LTCP implementation.

Author Name: Steidel Robert

Organization: City of Richmond, Virginia

We own and operate a combined sanitary and separate storm sewer system within the Chesapeake Bay watershed. The City of Richmond knows that the Draft TMDL is fundamentally and materially flawed as a technical matter, especially with regards to the wasteload allocations assigned to cities with combined sewer systems. These issues are thoroughly documented in the Comments on the Draft Chesapeake Bay TMDL by the Alexandria Sanitation Authority, and the Cities of Alexandria, Lynchburg, and Richmond, Docket Number EPA-R03-0W-2010-0736, November 8 2010 attached to this letter. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0522.2 and 0419.1] We request that EPA fully consider and address all of these comments, which we support and hereby incorporate by reference as if fully set forth herein.

Response

Commenter has incorporated by reference comments that are addressed by EPA elsewhere in the response to comment document. Therefore, no additional comment is required here.

Comment ID 0681.1.001.006

Author Name: Baxter Russ

Organization: VA Department of Environmental Quality

Richmond/Lynchburg - CSO Communities - EPA plans to base WLAs on "full" design capacity of Richmond POTW (75 MGD) and a separate CSO WLA; this differs from VA approach of using dry weather flow capacity of POTW (45 MGD) and separate WLA for CS - overflows and CS - captured. EPA's backstop only provides WLAs for Richmond based on a POTW flow of 45 MGD and the VA CSO proposed WLAs [if delivery factors are set to 1.0]. With the approach proposed in the TMDL, during dry years the backstop WLAs are too high, effectively taking allocation away from other sources, and in wet years it is not clear whether the implementation approach EPA contemplates with their backstop allocation will adversely impact local water quality since it may result in less CSO treated by the treatment plant. The current Virginia implementation approach for CSOs used over the past 25 years is superior to the approach proposed by EPA and protects local water quality.

Recommendation for Richmond/Lynchburg: Base the TMDL allocations for Richmond and Lynchburg on the current Virginia implementation approach.

Response

Based on additional information from VA, EPA agrees that the "full" design capacity of 75 mgd for Richmond is inappropriate for use in assigning the WLA to the WWTP and has accepted VA's approach of using 45 mgd plus an additional wet weather flow to calculate the WLA. The WLA is for loads discharged by the city's CSS and reflect estimated annual average loads discharged from both the permitted CSO outfalls and CSS flows discharged by the treatment plant. The aggregated CSS WLA will accommodate the transfer of nutrient and sediment loads from the city's CSO outfalls to the treatment plant as additional CSS conveyance, storage, and treatment capacity is constructed in the future. Further, it is anticipated that a portion of the aggregated WLA will need to be transferred to the MS4s at some point in the future to reflect combined sewer separation projects completed after establishment of the TMDLs. Specific WLAs for the WWTP and the CSO will be determined from the aggregate WLA at the time of permit issuance and will be based upon state of LTCP implementation.

22.6 - NPDES DISCHARGE

Comment ID 0334.1.001.008

Author Name: Troutman John

Organization: Buchart Horn, Inc.

EPA has had the opportunity to comment on draft NPDES permits showing annual loads, offsets, trading program, and retirement of on lot systems. Why has EPA failed to comment during the draft period and final permits have been issued and now offer that offsets and on lot system retirement are not valid. EPA needs to explain their position.

Response

As part of its NPDES program oversight responsibilities, EPA requires PA DEP to submit all draft permits for Chesapeake Bay significant dischargers. EPA has and continues to review and comment on these draft permits. Part of that review includes considering PADEP's basis for the treatment of retired on lot systems as offsets for providing additional WWTP loading. PADEP has provided better documentation that offsets will result in a reduction in existing loads from other sources (e.g., nonpoint sources) and included that information in its WIP.

Comment ID 0509.1.001.001

Author Name: Hankins Joseph

Organization: The Conservation Fund

Section 9- Table 9.4 -pages 35 and 36: This table indicates individual annual WLAs for significant permitted dischargers to meet the proposed amended Chesapeake Bay WQS. In the table on page 9-35 an entry is listed for The Conservation Fund Freshwater Institute with NPDES ID WV0116149, providing TOTN of 5,537 pounds per year and TOTP of 62 pounds per year. The Conservation Fund respectfully disagrees with the figures proposed in Table 9.4 for the referenced permit held by us and we believe that there was an error in calculation of the WLAs based on either the assumed facts of the current permit or the intent as outlined in the Section 9 narrative.

The Conservation Fund was first issued a WV NPDES permit in March of 2005. This permit was updated and renewed in April 2010. Consistent with the WV Tributary Strategy this permit was assigned capped annual mass loadings of TN and TP based on design flows and a minimum technology standard of 5 mg/l TN and 0.5 mg/l TP. In the current permit, each of two outfalls (001 and 002) is permitted until 2013 to discharge 7600 pounds of TN and 760 pounds of TP per outlet (x 2 outlets x 0.5 mgd per outlet) for a total of 15,200 pounds of TN and 1,520 pounds of TP for the discharge permit in total.

As represented by USEPA in the TMDL and in comments back to West Virginia on the first WIP submission, the high backstopping provisions proposed to account for West Virginia's WIP deficiencies would cause these allocations to reduce to mass loading caps based on 3 mg/l TN and 0.1 mg/l TP. Based on the narrative intent and the more stringent high backstopping standard WLA totals for this permit should be closer to TOTN 9,120 pounds per year and TOTP 304 pounds per year.

We believe the WLAs indicated in Table 9.4 for WV0116149 are too low and are not consistent with either the calculation process as stated or the intent in the TMDL narrative.

The WLAs indicated in Table 9.4 would result in required effluent concentrations less than 2 mg/l TN and less than 0.02 mg/l TP at 1 mgd design flows. These concentrations are less than the existing background levels of nutrients in the spring source water for our facility.

Table 9-4. Individual WLAs (Annual) for the 483 significant permitted dischargers to meet TMDLs to address the proposed amended Chesapeake Bay WQS

[Please see pages 3 and 4 of the original letter for the table.]

Response

Comment ID 0610.1.001.002

Author Name: Randall Clifford

Organization: Occoquan Watershed Monitoring Program (OWMP)

The draft TMDL backstop provision assigns an annual UOSA WRF nitrogen load allocation of 657,841 pounds, which is a 50% reduction from the currently permitted 1,315,682 pounds. The latter figure itself represents an annual load limitation that was developed only recently for the UOSA facility (2005), and was based on an 8 mg/L total nitrogen (TN) limit at a discharge flow of 54 million gallons per day (mgd). At the time that load limit was being considered, the OWMS voiced strong concerns about the likely detrimental effects on water quality in the Occoquan Reservoir (Attachment A) if such stringent nitrogen limits were imposed on the UOSA facility. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0610.1] As will be explained herein, the concern was that nitrates discharged by the UOSA WRF serve to maintain current water quality conditions in the Occoquan Reservoir, and that reductions of those loads could be expected to have negative impacts on water quality.

Since 2005, the observed data in the reservoir have only served to strengthen the conclusion that the imposition of that technology-based limit was ill-advised, and that the further reductions proposed in the draft TMDL are likely to have the unintended consequence of contributing to water quality degradation in the Occoquan Reservoir. Indeed, there is an increased risk that application of the backstop nitrogen removal provision to the UOSA WRF will contribute to the accelerated release of decades of stored nitrogen and phosphorus from the sediments of the reservoir, and the possibility that those releases will reach the Potomac Estuary.

We do not make these assertions lightly, because it is clear that dramatic overall reductions in nitrogen delivery to the Chesapeake Bay are required to implement the TMDL, and that high performance removals from most wastewater treatment facilities are indicated. However, the body of evidence developed from intensive study in the Occoquan Watershed for many years clearly shows that watershed nitrogen management must be viewed from an overall system perspective, and not simply as an end-of-pipe limit imposed at the water reclamation facility. In short, nitrogen loads discharged from the UOSA WRF should not be assumed to be transported conservatively through the reservoir and into the Potomac Estuary. Instead, the UOSA WRF, the Occoquan Watershed and the Reservoir should be viewed as a single nitrogen management system with the release at the Occoquan High Dam as the point for evaluating of nitrogen limits (as is currently stated in the Occoquan Policy).

Response

Backstop allocation scenarios were designed to have a specific control level on all facilities in the absence of consideration of actual site specific technologies. Thus, backstop allocations in the draft TMDL represented an overall level of control, rather than site specific application. Backstop allocations may not have appear reasonable for facilities in the absence of information relating to specific levels of control or local water quality issues. Backstop allocations were only intended to be used by EPA in the TMDL in the event that other reduction scenarios failed to meet required water quality standards in the Chesapeake Bay. As a result of improvements to the State WIP, the final TMDL will not require these backstop allocations. See Section 9 and Appendix Q of this TMDL.

Comment ID 0681.1.001.007

Author Name: Baxter Russ

Organization: VA Department of Environmental Quality

The nitrogen allocation in the WIP for Upper Occoquan Sewage Authority (UOSA) was set at current loads to protect the Occoquan reservoir, the drinking water source for over 1 million people. Nitrate-nitrogen discharged from the UOSA facility is needed to prevent the reservoir from going anaerobic, thereby releasing phosphorus and ammonia-nitrogen from sediments, and fueling algae blooms.

The EPA backstop set the UOSA allocation at 657,841 lbs/yr, exactly one-half of their existing Watershed General Permit allocation that is needed to protect the reservoir. Due to natural processes in the reservoir, the UOSA delivered backstop WLA is 24% of discharged, or 156,880 lbs/yr entering the tidal Potomac River.

In the submitted WIP, of the 39 wastewater treatment plants in the Shenandoah-Potomac basin, 25 received a WLA based on TN = 4 mg/l, 13 based on TN = 3 mg/l, and UOSA based on TN = 8 mg/l.

For the 13 facilities that have a WLA based on TN = 3 mg/l, their total allocations amount to 635,000 lbs/yr below a 4 mg/l based allocation. This more than exceeds the additional delivered load [156,880 lbs/yr] that is needed to set the UOSA WLA so it remains protective of the Occoquan reservoir.

Recommendation: Set the UOSA WLA at their current allocation of 1,315,683 lbs/yr (315,764 lbs/yr delivered).

Response

Please see response to comment 0610.1.001.002.

22.7 - MUNICIPAL DISCHARGE

Comment ID 0039-cp.001.002

Author Name: Austin John

Organization:

The plan and the current Inland Bays PCS share many of the same failings. Specifically, the PCS needs to restrict wastewater to advanced treatment facilities that can achieve significantly more N & P removal, that 5.0 mg/L TN and 3.9 mg/L TP. My analysis indicates <2.0 mg/L TN & <0.03 mg/L TP are needed. At the levels of the current PCS, TMDLs can never be attained. Growth, allowed septic systems, and even new facilities with 5.0 mg/L TN & 0.5 mg/L TP simply prohibit TMDL attainment, because the loads are too great.

Response

Commenter writes that the TMDL established loads for TN and TP are not sufficient to restore the waters of Delaware. Commenter states that wastewater should be directed to and treated by advanced wastewater treatment facilities which can achieve lower reductions of nutrients. While this may be desirable, it is not possible for all locations, particularly those located in rural areas

which are not served by POTWs. Future growth is generally addressed by zoning requirements and is beyond the scope of this TMDL.

Comment ID 0179.1.001.001

Author Name: Curatolo James

Organization: Upper Susquehanna Coalition

Why is it that the TMDL is not based on equal treatment of all sectors? The EPA is forcing all Sewage Treatment Plants to go to "limit of technology". Why was this same concept not used for the other major source, namely agriculture, where every states agriculture should be reduced to either the limit of technology but at least each states agriculture should be reduced to get same delivered load, not a percent.

Response

The NPDES program has, since its inception focused on wastewater treatment plants as a source of contaminants to our surface waters because of the large numbers of such plants serving our communities. In recent years improvements have been made to wastewater treatment technologies, especially in the area of nutrient reduction. Because municipal systems are a major contributor of nutrients to surface water it is not unreasonable to expect municipalities to upgrade their plants to employ the newly available technology. In the case of agriculture, EPA and the states have developed new nutrient management regulations and programs from agricultural operations and they are now part of the NPDES permitting program.

Comment ID 0213.1.001.001

Author Name: Daley Edwin

Organization: Hopewell Regional Wastewater Treatment Facility (HRWTF), Virginia

The concept of an industrial/domestic POTW was fully supported and endorsed by USEPA in the 1970's as an effective means of providing centralized treatment to the Hopewell region, and as such the City was the recipient of EPA and State construction grants in the amount of \$40 million. The proposed TMDL allocation for HRWTF would negate this long term successful investment by forcing our industrial base to either close down or install immensely expensive onsite treatment that would place them in a very disadvantaged position in a competitive business climate.

Response

Please refer to comment 0501.1.001.005

Comment ID 0223.1.001.002

Author Name: Hazenstab Robert

Organization: Duncansville Municipal Authority

1. The EPA admits that the current limit of technology is 3.0 mg/l for TN and 0.1 mg/l for TP. Since that is the case, why is Duncansville being asked to do what current technology cannot achieve?
2. Why isn't Duncansville's cap load limits based on current technology limits?
3. Why is Duncansville being asked to achieve these lower limits when we just completed a very expensive plant upgrade to achieve annual cap loads for the Chesapeake Bay's protection?

Response

Please see Section 8 of the final TMDL for an analysis of the Watershed Implementation Plans.

Comment ID 0230.1.001.013

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

EPA's "Backstops" Jeopardize Virginia's Highly-Effective Point Source Regulations, Related \$2 Billion Investment, and Nationally-Recognized Nutrient Exchange Program

Virginia's approach to POTW wasteload allocations and nutrient reductions is stringent, but also reasonable and appropriate, in its current form. Importantly, this approach is actually working. HRSD supports the embodiment of the Virginia approach to POTW wasteload allocations from Virginia law and regulations into the Draft WIP, and urges EPA to accept this element of Virginia's WIP.

The POTW wasteload allocations under the Draft WIP are derived primarily from Virginia's Water Quality Management Planning ("WQMP") Regulation (9VAC25-720) and Chesapeake Bay Watershed General Permit Regulation (9VAC25-820). These allocations are recognized in the Virginia Nutrient Credit Exchange Program statute enacted in 2005 and codified at Virginia Code § 62.1-44.19:12 et seq. This approach has been touted on numerous occasions as a strong national model for addressing the nation's nutrient challenges.

Virginia's regulatory approach has a lengthy and relevant history of establishing nutrient wasteload allocations that must be taken into account when establishing those same types of wasteloads in the TMDL. Virginia attained a major milestone when its State Water Control Board's ("SWCB" or "Board") adoption of stringent point source regulations referenced above in 2005 and 2007. Those regulations established a comprehensive program for the regulation of POTWs.

Extensive State and stakeholder efforts went into Virginia's development of wasteload allocations. The allocations were

even supported by aggressive advocacy groups in Virginia, including the Chesapeake Bay Foundation and the James River Association in 2005. Based on the SWCB's final adoption of the point source wasteload allocations, localities and authorities across Virginia have made major infrastructure design and financial decisions, and have constructed or are in the process of constructing major capital upgrades to implement the wasteload allocations.

To help support this construction program, the General Assembly has appropriated over \$600 million in cost-share funding for treatment upgrades with the larger balance of the funding being raised directly by VAMWA member localities and authorities. In sum, an estimated total specific set of capital projects to implement Virginia's recently established wasteload allocations.

In addition, pursuant to the above-referenced statute and regulations, the Virginia Nutrient Credit Exchange Association, Inc. (the "Nutrient Exchange") was formed to facilitate a highly structured and highly regulated point-point trading program under the supervision of the Virginia Department of Environmental Quality ("VADEQ"). The Nutrient Exchange and its participants, working under the terms a complex, multiparty contract and the related VADEQ-approved Exchange Compliance Plan, have developed a comprehensive upgrade and compliance program that reflects the most extensive, proactive treatment upgrade program in Virginia since the secondary treatment regulations.

As a result of these many efforts by the Commonwealth, VAMWA members and others, Virginia expects to meet its regulatory point source allocations by December 31, 2010. In fact, this commendable progress is largely due to decisions made in Virginia to establish a Watershed General Permit with an early effective date of January 1, 2007 for all regulated facilities and a 4- year compliance schedule. This effectively ensured Virginia's significant point source compliance the Chesapeake 2000 deadline. VAMWA and HRSD is proud to have proposed this schedule and the general permit mechanism and respectfully urges EPA to credit VAMWA for this concept and this progress by respecting the wasteload allocations set forth in the WIP.

Significantly, as recently as January 2009, EPA officially supported Virginia's regulatory approach to point source wasteload allocations and related upgrades. In fact, EPA confirmed in writing that Virginia's wasteload allocations were properly designed to meet Bay water quality standards. Now, less than two years later, EPA inexplicably proposes to ignore Virginia's approach and jeopardize Virginia's \$2 billion capital upgrade program and the integrated point-point trading program. In this regard, the Draft TMDL is completely unreasonable.

Ironically, EPA itself has agreed in writing that the "regulatory stability" that VAMWA and HRSD seeks should be a fundamental component of the Bay TMDL. In addition, EPA's Office of Inspector General has also agreed that allocations for significant dischargers should remain unchanged. Yet, despite this tremendously proactive effort in Virginia and EPA's own prior statements, EPA's Draft TMDL reverses course.

EPA has concluded that Virginia's WIP fails to comply with EPA's July 1, 2010 and August 13, 2010 nutrient and sediment allocations and is deficient because it does not establish sufficient "reasonable assurance" of nonpoint source implementation. EPA has established what it is calling a "backstop allocation" in response. The EPA backstops would set wastewater discharge concentrations at 4 milligrams per liter ("mg/l") for total nitrogen ("TN") and 0.3 mg/l for total phosphorus ("TP").

For HRSD facilities on the York and James River basins the above concentrations are significantly lower than those used to derive Virginia's wasteload allocations. Those allocations were established by the SWCB at the level

appropriate to protect local water quality consistent with the EPA Chesapeake Bay Program's documented findings that these basins have minimal or no impact on the mainstem Bay and should be established on the basis of local water quality. The concentrations for the Upper Occoquan Service Authority ("UOSA") facility are also inconsistent with local water quality needs for the drinking water reservoir to which it discharges in the Potomac River basin. The EPA backstops unreasonably and unlawfully put Virginia's current regulatory program and the related investments that have been made at risk.

This is completely unjustifiable based upon EPA's earlier remarks, and is unwarranted based upon the minimal impact wastewater has on Bay water quality as compared to other sectors. In addition, as explained below, EPA's rejection of Virginia's Draft WIP is legally objectionable. The CWA does not give EPA the authority to review and/or approve WIPs or to direct their specific terms. EPA's decision to overwrite Virginia's Draft TMDL is unlawful.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. The backstop allocations were designed to have a specific control level on all facilities without consideration of site specific information. Backstops do not address specific facilities, rather they are intended to implement a general level of control.

Comment ID 0231.1.001.001

Author Name: Boepple Charles

Organization: Upper Occoquan Sewage Authority (dba Upper Occoquan Service Authority)

The Upper Occoquan Service Authority (UOSA) appreciates the opportunity to provide comments on the Draft Chesapeake Bay Total Maximum Daily Load (TMDL) document dated September 24, 2010. UOSA is an advanced water reclamation plant located in Centreville, Virginia and it serves the western portions of Fairfax and Prince William Counties, and the Cities of Manassas and Manassas Park.

In the draft TMDL the UOSA total nitrogen waste load allocation (WLA) was reduced from 1,315,682 pounds/year (in short, 1.316 million pounds/year) to 657,841 pounds/year. This reduction appears on Page 9-36 of the draft TMDL, and it is consistent with the backstop allocations and measures EPA imposed on the Commonwealth of Virginia, as discussed in Chapter 8 of the TMDL draft document. The comments and exhibits submitted herein provide unequivocal information that shows that reducing the UOSA TN WLA in any future Bay TMDL would be detrimental to Northern Virginia's water supply and would also result in increased loads of phosphorus and nitrogen delivered to the Potomac River and the Chesapeake Bay. Such detrimental effects are contrary to the purpose and restoration goals of the Bay TMDL.

Response

EPA acknowledges the comment.

Comment ID 0231.1.001.005

Author Name: Boepple Charles

Organization: Upper Occoquan Sewage Authority (dba Upper Occoquan Service Authority)

Dr. Grizzard, OWML's Director, and Dr. Randall, an Emeritus professor at the Virginia Polytechnic Institute and State University (Virginia Tech) and Chairman of the OWMS, will submit comments to the EPA docket opposing the reduction of the UOSA TN WLA. Mr. Charles M. Murray, Fairfax Water's General Manager, in his letter dated October 20, 2010 also expressed concerns regarding the reduction of the UOSA TN WLA in the draft Bay TMDL. Fairfax Water is the purveyor who owns and uses the Occoquan Reservoir to supply drinking water to most of Northern Virginia. In his letter Mr. Murray agrees that research and monitoring shows a strong relationship between reduced nitrate levels in the Occoquan Reservoir and increases in ammonia and phosphorus in the water column, which expose Fairfax Water to increasing water quality challenges. A copy of his letter is provided as Exhibit 3.

Response

EPA acknowledges the comment.

Comment ID 0231.1.001.016

We urge EPA to restore the UaSA's TN WLA to 1.316 million pounds/year.

Response

EPA acknowledges the comment.

Comment ID 0254.1.001.005

Author Name: Hawkins George

Organization: District of Columbia Water and Sewer Authority

As the U.S. Environmental Protection Agency (EPA) knows, EPA reissued the NPDES permit for DC Water's Blue Plains Advance Wastewater Treatment Plant (Blue Plains) on August 31, 2010 (Permit). The Permit contains effluent limitations and performance conditions governing, among other things, the discharge of total nitrogen (TN) in conformance with TN allocations assigned to Blue Plains and District of Columbia's combined sewer system (CSS) in the District of Columbia's 2004 Chesapeake Bay Tributary Strategy. The TN limitations and conditions in the Permit reflect agreements between DC Water and EPA following many months of negotiation. Therefore, since the Bay TMDL will serve to supersede and replace the TN allocations that are the basis for the TN limitations and conditions in the Permit, we believe it is appropriate to start our comments with an overview of the TN-related limitations and conditions in the Permit.

The Permit includes effluent limitations and performance conditions as follows:

- Outfall 002 (Complete Treatment) - Effluent limitations and performance conditions
- Outfall 001 (Anticipated CSO Related Bypass) - Performance conditions
- Combined Sewer System (CSS) - Performance conditions.

(1) Complete Treatment (Outfall 002) Design Capacity

The TN effluent limitations for Outfall 002 are based on a design capacity of 370 million gallons per day (mgd). This design capacity is derived from the annual average flow allocations assigned to Blue Plains user jurisdictions in the Intermunicipal Agreement (IMA) of 1985. The IMA is the governing document regarding the use of the Blue Plains and addresses issues such as capacity allocations, capital cost and operating and maintenance cost allocations. Signatories to the IMA are the District of Columbia; Fairfax County, VA; Montgomery County, MD; Prince George's County, MD; and the Washington Suburban Sanitary Commission (WSSC). Capacity allocations in the IMA are as follows:

[Table. Please see pg 3 of original document 0254.1]

The 370 mgd IMA allocation does not, however, comprise the total design capacity required for Outfall 002 because the Permit also requires Complete Treatment for captured CSS flow as established in the LTCP for the CSS and DC Water's Total Nitrogen Removal/Wet Weather Plan (TN/WW Plan). The average year flow allocation for captured combined sewer flow derived from the LTCP and TN/WW Plan required to receive Complete Treatment is 17 mgd. Therefore, the design capacity required for Outfall 002 is the sum of the 370 mgd IMA flow allocation plus 17 mgd captured combined sewer flow or 387 mgd.

Additionally, Blue Plains is required by the Permit to provide Complete Treatment for captured CSS flows in wet years. Based on studies of past experience for Complete Treatment, discharges from Outfall 002, in a wet year, will average 435 mgd.

In view of the foregoing, the WLAs for Outfall 002 in the Bay TMDL should be based on a design flow of 387 mgd and must be sufficient to be within the range of performance for the treatment technology now under design during a wet-year annual average flow of 435 mgd.

The design flow for Blue Plains, Outfall 002 that incorporates the IMA flow allocations, treatment of captured combined sewer flow and a wet weather year annual average flow of 435 mgd is summarized as follows:

[Table. Please see page 4 of original document 0254.1]

(1) WLA at design flow to be sufficient to be within the range of performance for the treatment technology during a wet year annual average flow of 435 mgd.

(2) The above design flow for Blue Plains, Outfall 002 is consistent with EPA requirements for Phase I WIPs covering CSO communities as reflected in EPA's October 27, 2010 email, which is attached as Exhibit No.1.

Response

Commenter is expressing a preference for a performance based approach for the CSS based on wet weather hydrology rather than design flow as discussed and finalized in the Blue Plains NPDES permit. The proposed approach is not consistent with permit assumptions and the EPA agreement with DC Water. The final TMDL and the Blue Plains WLA will be in accordance with the permit limits as agreed between the parties.

Comment ID 0254.1.001.007

Author Name: Hawkins George

Organization: District of Columbia Water and Sewer Authority

(3) WLA Comparisons

Based on the above, we have prepared the table in Exhibit No.2 to compare the WLAs included in the Draft WIP (and, where appropriate, the draft TMDL) and the WLAs that must be included in the final TMDL to provide DC Water with the allocations needed to comply with the Permit now and in the future. The WLAs in Exhibit No.2 are based on the following:

- A design flow of 387 mgd for Outfall 002 (Complete Treatment)
- Effluent concentrations at design flow of 4.00 mg/L TN, 0.18 mg/L TP and 7.00 mg/L Total-Sed.
- Sufficient allocations for Outfall 002 at design flow to be within the range of performance for the treatment technology now under design, during a wet year annual average flow of 435 mgd.
- WLAs for Outfall 001 and CSOs remaining after completion of the LTCP to achieve Bay WQS during the critical period within the hydrologic years 1991 through 2000.

The comparisons in Exhibit No.2 show the following:

- The District distributions to Blue Plains for TN require an increase to satisfy permit requirements for a TN effluent concentration of 4.0 mg/L.
- The District distributions to Blue Plains for TN, TP and Total-Sed will require increases for Outfall 001 if WLAs are needed to satisfy the Bay Model Critical Period. Increases to distributions for CSOs remaining after completion of the LTCP will also be required if WLAs are needed to satisfy the Bay Model Critical Period.
- The District distribution to Blue Plains for Total-Sed may be reduced if the permit requirement of 7.00 mg/L is used to calculate the distribution.
- The Maryland TN allocation to Blue Plains requires an increase for the Maryland design flow of 169.7 mgd or the flow will have to be restricted to a rate equivalent to the TN allocation of 1,993,000 lbs/year at 4.00 mg/L or 163.7 mgd.
- The Virginia Total-Sed allocation to Blue Plains requires an increase for the Virginia design flow of 47.8 mgd or the flow will have to be restricted to a rate equivalent to the Total-Sed allocation of 726,823 lbs/year at 7.00 mg/L or 34.1 mgd.

Response

The limits and conditions in the Blue Plains permit are and have been predicated on the established design flow of 370 mgd. This was the flow rate that was considered for the 2010 permit and earlier issuances. The concept of a design flow for a specific outfall (002) was not considered during discussions for the issued permit; and EPA believes that it is inappropriate to modify what was used as a basis of agreement for the permit issuance in subsequent discussions relating to the issuance of the WIP and Bay TMDL. Furthermore, the allocations provided to Blue Plains is based on the state WIPs and is the loading necessary to achieve applicable WQS.

Organization: District of Columbia Water and Sewer Authority

EXHIBIT 1

Colleagues - Thank you for this morning's call on calculating combined sewer system WWTP loads in Virginia's Phase I WIP, the Watershed Model, and the Chesapeake Bay TMDL. As we discussed, EPA expects in the Phase I WIPs that all WWTPs submit allocations based on design flow rather than dry weather flow, average wet weather flow treated through the facility, or peak flow. Using the Richmond plant as an example, this would equate to a flow of 75 mgd. EPA will calculate the Chesapeake Bay TMDL WLA based on the flow multiplied by the concentration. This approach ensures consistency among all WWTPs and CSO communities in the watershed.

If VA is interested in pursuing alternative approaches for the Phase II WIPs such as average wet weather flow, the jurisdiction should work through the Chesapeake Bay Program Wastewater Workgroup, coordinated by Ning Zhou. Ning agreed to place this issue on the next Workgroup agenda if VA is interested in proposing alternative approaches.

Author Name: Gumm Gary

Organization: Washington Suburban Sanitary Commission (WSSC)

WSSC staff also participated in a detailed conference call on 10/14/10 chaired by Reginald Parrish of EPA to discuss the load allocations specifically associated with Blue Plains and the Seneca WWTP. The purpose of that call was to convey the position of the Blue Plains Regional Committee on the correct nutrient load allocations that need to be incorporated in the Final Bay TMDL. Separate agreements on the allocation of capacity among the users of Blue Plains are beyond the purview of EPA and governed by the Intermunicipal Agreement (IMA).

WSSC commends EPA for acceptance of the Maryland wastewater load allocation strategy for significant Municipal WWTPs Strategy which is based on implementation of Enhanced Nutrient Removal standards that treat wastewater to 4 mg/L TN and 0.3 mg/L TP stated in section 8.3.2 pp. 8-12 and 8-13 of the Draft Bay TMDL and that no further EPA backstop is necessary with respect to significant WWTPs.

The specific corrections necessary in the Table contained in Section 9 are as follows:

Page 32

Marlboro Meadows: WSSC is in the process of constructing a pumping station and pipeline that will, upon completion, transfer the flow from the community of Marlboro Meadows to the WSSC Western Branch WWTP. MOE has agreed to transfer the TN, TP and sediment load assigned to Marlboro Meadows and the 0.6 MGD of capacity to the Western Branch WWTP.

There needs to be a footnote to the Table 9 that specifies that the 7,309 TN, 548 TP and 54,820 total sediment allocations for Marlboro Meadows will transfer to Western Branch along with the associated 0.6 MGD of capacity upon completion of the ongoing pump-over project. The discharge from the Marlboro Meadows facility will be eliminated at that time and the current Marlboro Meadows NPDES permit will terminate at that time.

Parkway: The load allocations assigned to the Parkway WWTP are correct.

Western Branch: The load allocations for the Western Branch WWTP will be increased by the addition of the TN, TP and sediment allocations currently assigned to

Marlboro Meadows and the capacity of Western Branch will increase by 0.6 MGD. This can also be handled by a cross reference to the footnote for Marlboro Meadows: The final load allocations at Western Branch upon transfer of the flow from Marlboro Meadows will then be 372,776 TN, 27,958 TP and 2,795,824 total sediment load. The new capacity

at Western Branch will be 30.6 MGD.

Page 33

Damascus: The load allocations assigned to the Damascus WWTP are correct.

Mattawoman: The three separate load allocations assigned to the Mattawoman WWTP apparently represent local load equivalents assigned to the multiple jurisdictions that send flow to the wastewater plant. None of the three separate allocations correspond to the commitment by the Mattawoman WWTP to reserve 3 MGD of treatment capacity for the portion of the flow that originates in Prince George's County, Maryland. Appendix B, page 18, of the Maryland WIP simply assigns the entire 20 MGD allocation to the Mattawoman WWTP.

Page 34

Seneca Creek: The load allocations shown for Seneca are incorrect since they are based on a capacity of 20 MGD and the approved design capacity is 26 MGD. The Seneca NPDES permit recently issued and effective on 10/1/2010 reflects the authorized 6 MGD increase in capacity for a total Seneca capacity of 26 MGD. The associated nutrient load allocations authorized are 316,738 TN and 21,563 TP at a design capacity of 26 MGD.

Page 36

Blue Plains: The two separate load allocations shown for the Maryland portion of the flow are artificial jurisdictional load designations that have no practical meaning as the Maryland portion of the flow to Blue Plains is assigned to WSSC and not proportioned among Montgomery and Prince George's Counties. The total load allocation is also in error. The correct nitrogen load for allocation for the Maryland portion of the flow at Blue Plains is 1,993,000 TN. The TN load allocation shown in the Blue Plains permit and in the Blue Plains Regional Committee letter of April 7, 2010 (attached) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0255.1] clearly confirms that the agreed to TN annual load allocation for Blue Plains is 1,993,000 lbs. In addition, WSSC supports the proposed footnote to the Draft Bay TMDL and the Maryland WIP regarding assignment or transfer of future nutrient load allocations at Blue Plains noted at the bottom of page 6 of the letter from the Blue Plains Regional Committee.

The WSSC Potomac Water Treatment Plant (WTP) also has an NPDES permit that may need to be added to the list of NPDES point source dischargers in Table 9 of the Bay TMDL and to Appendix B of the Maryland WIP. Although the Potomac WTP does not have nutrient limits, the NPDES permit does impose limits on the discharge of suspended solids under certain conditions and the Draft Bay TMDL is assigning annual sediment loads to NPDES dischargers. There may not be a need to assign a sediment load allocation for the purposes of running the Bay model since there is a net removal of sediment from the Potomac watershed by the Potomac WTP process. In a typical year the operation of the Potomac WTP results in a net reduction of approximately 2,350 dry tons of sediment per year, or 4,700,000 dry pounds of solids per year at the current raw water production rate of 123 MGD. The net reduction in sediment load to the Potomac should be recognized for the purposes of modeling the sediment load in the Potomac watershed.

Response

The MD WIP narrative document does not specify a transfer of flow from Marlboro Meadows to the Western Branch. However, the Final Phase I MDE input deck submitted to EPA does account for this transfer. The TMDL was developed based on the input deck and the corresponding load transfer. EPA is developing guidance to address future transfers within and between basins which will provide further clarification on the issues to be considered.

With regard to the Mattawoman, consistent with the MDE input deck and EPA policy, the final TMDL will assign the loads associated with the total flow of 20 mgd. The loads in the WLA will represent the total load for Mattawoman and will not be partitioned by county. If MDE and WSSC need loads further partitioned, the agencies should coordinate their needs with EPA CBPO modellers.

With regard to Seneca Creek, the Final Phase I MD input deck does reflect the appropriate approved design flow of 26 mgd. This reflects the 6 mgd transfer from Blue Plains to Seneca. The final TMDL was based on that Final input deck.

With regard to Blue Plains, the final MD input deck reflects the appropriate TN load of 1,993,000 lbs. and the TMDL WLA reflects that information.

With regard to the WSSC Potomac Water Treatment Plant, the CBP model simulates withdrawals associated with water treatment plants. Therefore, any credit associated with a water withdrawal has already been taken into account. The final TMDL would not provide any additional credits.

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

MAMWA previously submitted comments (on December 18, 2009) in response to EPA's September 19, 2009 Notice and Initial Request for Public Input regarding the development of a Chesapeake Bay TMDL. [FN2] In addition to laying out a number of Guiding Principles MAMWA felt strongly must be considered by EPA as it developed the TMDL,

MAMWA also commented extensively on the need for regulatory stability for POTWs (i.e., retaining the existing approach to POTW nutrient upgrades) and made a number of recommendations regarding the development of the TMDL.

Generally speaking, EPA's Draft TMDL and Maryland's Draft WIP appropriately are consistent with and meet MAMWA's request for regulatory stability relative to the Tributary Strategies. [FN3] MAMWA supports this aspect of both the Draft TMDL and Draft WIP. However, MAMWA has noted a few issues in both documents that warrant further comment and revisions prior to the issuance of a final TMDL and WIP.

[FN2] MAMWA's December 18, 2009 Comments are incorporated by reference to these comments. Additionally, MAMWA incorporates by reference all EPA files or documents, no matter the form, and all materials from EPA Chesapeake Bay committees or subcommittees pertaining to Bay clean-up efforts.

[FN3] Draft TMDL ES-8; 8-13; Draft WIP at ES-14; 5-19.

Response

EPA has welcomed the involvement of individuals, groups, organizations and others in the development of the Chesapeake Bay TMDL. Through the public comment process, public meetings, webinars and other extensive outreach opportunities, EPA has sought feedback and perspective on the TMDL from all Bay stakeholders. There will be additional opportunities for public input as the process continues in 2011 and beyond. See Section 11 of the Bay TMDL for a more detailed description of the Public Participation. More information on the Virginia Bay TMDL efforts, including its Stakeholder Advisory Group, can be found at <http://www.deq.state.va.us/tmdl/chesapeakebay.html>.

Comment ID 0272.2.001.003

Author Name: Pippel Julie

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

The State has determined that it will continue Enhanced Nutrient Removal ("ENR") upgrades at 67 of the State's largest POTWs. [FN4] According to the Draft WIP, "[a]t the current rate of implementation, 24 plants will be operational by June 30, 2011, accounting for an estimated 780,000 lbs/year reduction in nitrogen. To date, 14 plants have been completed; 17 plants are in construction; 22 plants are in design, and 14 plants are in planning." [FN5]

Maryland's Chesapeake Bay Tributary Strategy Statewide Implementation Plan (Jan. 24, 2008) ("Tributary Strategy Implementation Plan") addresses major WWTPs as follows:

Significant wastewater treatment plants are those with design* capacity of 500,000 gallons per day or greater. Annual nutrient load caps are based on an annual average concentration of 4.0 mg/l total nitrogen and 0.3 mg/l total phosphorus and the approved design capacity of the plant. The combined flow of these facilities comprises more than 95% of the total sewage flow generated in Maryland. [FN6]

This approach is incorporated into the Draft TMDL and Draft WIP, and MAMWA supports this aspect of both drafts. As MAMWA explained in its December 2009 Comments, there are compelling reasons to continue and adopt this particular approach in Maryland and not consider attempting to reduce POTW wasteload allocations further.

First, the POTW wasteload allocations are set at or very near limit-of-technology levels. For example, most plants will have reduced from approximately 20 to 30 mg/L total nitrogen to less than 4 mg/L, and from approximately 6 to 10 mg/L total phosphorus to less than 0.3 mg/L. [FN7] This also represents a dramatic reduction from 1985 levels - more than any other sector contributing nutrients to the Bay - and this will continue as ENR projects continue to be constructed in accordance with the Point Source Strategy.

Second, an estimated total investment of \$1.5 billion has very recently been made, or is in the process of being made, to design and construct specific ENR capital projects to implement the proposed POTW WLAs. This is above and beyond earlier upgrades to BNR levels. Any deviation at this late date would be terribly disruptive and wasteful of current efforts and investment.

Third, because the proposed POTW WLAs are so stringent, there is limited capacity available to concentrate smart growth in existing urban areas. What limited amount that does exist must be preserved to enable smart growth [FN8] and economic development in the State. [FN9]

Fourth, under the proposed POTW WLAs, POTWs have very little ability to design and construct a facility capable of producing a regulatory compliance "cushion" to help ensure compliance despite operational variability.

Fifth, also on the subject of compliance, several upgraded POTWs in the State are already struggling to comply with ENR treatment levels. None have experience operating in compliance with such limits at a fully loaded facility. Time is required to determine how successful these newly upgraded facilities will be in meeting ENR treatment levels under various conditions.

Sixth, any marginal reductions in POTW WLAs would not be cost-effective (due to markedly higher costs and the obviously diminishing benefits compared to the current program to reach ENR levels). Further, those scant reduction benefits would certainly be accompanied by adverse environmental impacts due to increased chemical production, transportation and use; increased energy production and use; and increased greenhouse gas emissions.

Lastly, although the State has been working to establish a nutrient trading program, offsets are not widely available. Nonpoint source offset trading is in its infancy Bay-wide. Even if it were viable - and MAMWA sees no clear evidence that offsetting is a viable strategy for acquiring additional nutrient allocations - it would certainly be extremely expensive. In the absence of a reliable trading program with reasonable costs, it is imperative that EPA and the State maintain sufficient POTW WLAs to serve future growth.

[FN4] Draft WIP at ES-14; 5-19.

[FN5] Draft WIP at 5-19.

[FN6] Tributary Strategy Implementation Plan at 7. Design capacity is defined to mean: "(1) A discharge permit was

issued based on the plant capacity, or the Maryland Department of the Environment (MDE) issued a letter to the jurisdiction with design effluent limits based on the new capacity as of April 30, 2003; (2) Planned capacity was either consistent with the MDE-approved County Water and Sewer Plan as of April 30, 2003, or shown in the locally-adopted Water and Sewer Plan Update or Amendment to the County Water and Sewer Plan, which were under review by MDE as of April 30, 2003 and subsequently approved by MDE."

[FN7] Additionally, according to EPA's model runs, wastewater represented a relatively small percentage of the average annual nitrogen and phosphorus load to the Chesapeake Bay. Under the critical 3-year condition for the TMDL (1993-1995), wastewater would represent an even lower proportion of the nutrient load with existing controls.

[FN8] POTWs play a critical role in enabling economic development and smart growth. POTWs are far superior in nitrogen removal to even the most efficient on-site disposal system option. Nutrient removing on-site systems are estimated to deliver approximately 20 mg/L in total nitrogen as compared to 3 mg/L for POTWs at ENR levels. The math is compelling. Allowing for development on POTW systems in already developed areas is far preferable for the health of the Bay to developing in greenfields, using septic systems.

[FN9] Adequate POTW allocations based upon adequate levels of sewer capacity is a critical part of future economic growth.

Organization: U.S. House of Representatives

As the EPA admits, a very serious miscalculation was made several years ago by projecting that a substantial reduction of nutrients (nitrogen and phosphorous) into the tributaries which feed the bay could be met by imposing strict point source limitations, i.e. municipal sewage plants.

Unfortunately, this turned out not to be true. Instead, the evidence is overwhelming that by far the greatest source of these "nutrients" is from non-point sources, particularly agriculture, but including individual lawn fertilizing, etc. Nonetheless, the EPA is pushing ahead to require that all sewage treatment plants must meet strict new nutrient removal standards by 2013.

Response

EPA does not agree that it has admitted to a serious miscalculation relating to the ability of the point sources to limit nitrogen and phosphorous to the Bay. On the contrary, the NPDES program, especially as it relates to reducing nutrients, has been very successful, however, it has not been enough. For example, new wastewater treatment plants have come on line, or older plants have been expanded due to increasing populations. Newer and improved technologies have been developed with the ability to improve nitrogen removal. However, loads from WWTPs are only part of the problem; additional loads from other sources such as agricultural operations, stormwater runoff and air deposition also need to be addressed and EPA and the states have responded by developing new agriculture, stormwater and pesticide programs. The Bay TMDL is intended to be used in the NPDES permitting context to assure the implementation of new technologies and to bring clarity to existing programs so that permittees understand the limits that they need to achieve.

Author Name: Bulova Sharon

Organization: County of Fairfax, Virginia

The purpose of this letter is to provide joint comments on the Commonwealth of Virginia's Draft Chesapeake Bay TMDL Phase I Watershed Implementation Plan (WIP) and the EPA's Draft Chesapeake Bay Total Maximum Daily Load (TMDL) on behalf of the Fairfax County Board of Supervisors. Located in Northern Virginia just outside of Washington D.C., Fairfax County is the most populous local jurisdiction in the Chesapeake Bay watershed. The county has a long history of progressive environmental management, and we appreciate the opportunity to provide comments on both the Draft Phase I WIP and Draft TMDL which together will drive increased efforts to restore the Chesapeake Bay through 2025 and beyond.

Both draft documents outline sector-specific implementation measures for the different source categories that impact the bay. The ultimate responsibility for controlling several of these source sectors, most notably wastewater and urban stormwater, falls to local governments, and the cost to comply with the controls proposed will be borne by the same local tax and rate payers.

Significant progress has already been made in controlling wastewater discharges in Northern Virginia . Of the five wastewater treatment plants (WWTPs) that treat sewage from Fairfax County homes and businesses, four are in the process of upgrading to the limits of technology at an estimated cost to Fairfax County rate payers of about \$350 million. The only exception is the Upper Occoquan Service Authority (UOSA), which currently is permitted to discharge at 8 mg/L total nitrogen . This exception was made in order to protect water quality in the Occoquan Reservoir, which is

a major source of drinking water in Northern Virginia. Extensive monitoring and analysis have proven that discharging this higher level of nitrogen is necessary to maintain water quality. We urge the Commonwealth and EPA to modify the Draft WIP and TMDL to ensure that UOSA is allowed to continue to discharge nitrogen at the level necessary to protect the Occoquan Reservoir.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Reviewing Table 9-4, for Pennsylvania only, lists Berwick Municipal Authority, Danville Municipal Authority, Mt. Carmel Municipal Sewage Authority, Dillsburg Borough Authority, Hanover Borough, Lower Allen Township Authority, Shippensburg Borough Authority, Moshannon Valley Joint Sanitary Authority, Little Washington WW Co, KBM Regional Authority, and Gregg Township twice. Why are these facilities listed twice and how does that impact the total loadings requested?

Response

The duplicate facilities are a result of these POTWs having service areas in more than one county. The loads were divided evenly among the counties for each facility. It does not impact the total loadings. For example, Danville Municipal Authority has a service area that is partially in Montour County and partially in Northumberland County; therefore, the loads for the authority were split between the two counties. Because it was not known how much of each facility is located in each service area, 50% was assumed for each county.

Design Flow = 3.62 MGD

Annual TN Load based on 6 mg/l = 66,150 lbs/yr

50% of TN Load = 33,075 lbs/yr

Author Name: Iwanowicz Peter

Organization: New York State Department of Environmental Conservation

It is Harder for NY to Reduce Nitrogen at its Wastewater Treatment Plants

New York's climate affects the ability of its WWTPs located in the Southern Tier to meet the limit of technology effluent limits imposed by EPA backstops as set forth in the Draft TMDL Section 8-17. New York's climate is significantly colder than the climate in other parts of the Chesapeake Bay watershed because of its northern proximity and general higher elevation. This also contributes to colder temperatures in the winter and an overall shorter growing season. Winter temperatures of the wastewater, in NY's portion of the Bay watershed, averages to a seasonal low of nine degrees centigrade (48 Deg. F.). These low winter temperatures cause several problems at the WWTPs and directly affects the plants' ability to remove nutrients. The key relationships of temperature to nitrification rates are through Specific Growth Rate and the Half Velocity Constant. Denitrification rates are related to temperature via the Percent of Denitrification Growth Rate at 20 Degrees Centigrade. (Metcalf & Eddy, Wastewater Engineering 2d edition, 1979). Based upon this relationship, the Specific Growth Rate is essentially halved for each five degrees below 68 degrees F and is basically at or near zero at 50 degrees F or lower.

Basically articulated, this means that the lower the temperature, the slower the nitrogen removal process will function. A study showed that at the Upper Occoquan, Virginia wastewater treatment plant, temperatures of at or below 10 degrees C, the nitrite increased to nearly 10 mg/l/nitrite decreased to 3 mg/l, and Ammonium peaked at 10 mg/l. As can be seen from this data, nitrification failed due to the cold temperatures. Nitrogen removal is severely inhibited during periods of very low temperatures, and removal could even be inhibited during warmer weather, as it takes time for the proper culture of microorganisms to grow back after die off during the winter. WWTPs located in NY's Chesapeake Bay watershed may only be able to achieve the lowest effluent limits for nitrogen six months out of the year.

Another issue that affects the ability of the NY's WWTPs to meet effluent limits for nitrogen as low as three milligrams per liter (also known as the limit of technology or "LOT") is refractory nitrogen. Refractory nitrogen is the nitrogen remaining after treatment that is unable to be treated by the microorganisms in biological treatment systems. There can be up to one to three milligrams per liter of refractory nitrogen in wastewater effluent after advanced Biological Nutrient Removal treatment. Therefore, when effluent limits are at LOT, expressed as three milligrams per liter total nitrogen (see Draft TMDL at 8-17), the amount of refractory nitrogen can be equal to the effluent limit. Compliance under this situation would be virtually impossible. Also, as the lower limit is approached, more effort is required to remove more nitrogen.

2. The Cost of Achieving LOT for Nitrogen in NY is Astronomical

Based on the 20 year cost estimates for nitrogen removal to LOT by Stearns & Wheler for the CBP in 2005, it was estimated that the largest plants in NY's portion of the CBW would cost approximately \$290 million in 2010 dollars. The S & W report did take into account local factors, such as temperature and labor rate, therefore, did predict higher costs than the earlier cost studies performed by the CBP. However, even the S & W reports are felt to underestimate what the actual costs would be.

Response

EPA agrees with commenter that extreme low temperatures can have an adverse impact on nitrogen removal organisms. Areas such as New York which experience cold winters will need to provide operational flexibility to achieve effective operation. System design should incorporate adequate flexibility to allow plant operators to respond to adverse operating conditions. For example, many plants operate with a longer sludge age at low temperatures.

A portion of a plant's influent dissolved organic nitrogen can be resistant to biological treatment. Actual values will depend on plant influent and process characteristics. It would be inaccurate to assume that refractory nitrogen will prevent all plants from meeting low nitrogen discharge limits.

Actual costs for BNR upgrades will depend on a number of factors including such things as: influent characteristics, effluent target concentrations and the type of treatment processes already in play.

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

2. POTWs typically deliver complex treatment plant upgrades that take about 5 to 6 years from start of planning to initiation of operation.

3. Pennsylvania developed its Chesapeake Bay Tributary Strategy ("CBTS") in 2004 through 2006, and many POTWs have already received annual cap loads and compliance schedules in their NPDES permits and have started construction. EPA's backstop cap loads are based on effluent concentrations that are 50 percent of the Department's CBTS limits for total nitrogen and 12.5 percent for total phosphorus:

a. What should a POTW in a planning phase plan for at the current time? Should it plan for the CBTS limits or the

backstop limits or both?

b. What should a POTW under construction plan for at the current time? Should it now plan for additional treatment?

Response

EPA's allocation applicable to WWTPs and industrial sources has changed significantly based in part on receipt of a Final Phase I WIP from the State, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter. EPA agrees that treatment plant upgrades are complex and require many years from planning to initiation. Facilities covered by NPDES permits need to meet the requirements of their permits. At the time that permits are modified or reissued, new conditions may be included to meet additional requirements. If POTWs are building to the limit of technology, it is not likely that the permitting authority will require more stringent requirements at the present time, however, once construction is complete, if the POTW's effluent does not meet water quality standards, additional requirements may be necessary. If the POTW is planning construction and the POTW has reason to believe that the new construction is not likely to meet water quality standards, the POTW should begin to plan for additional improvements to meet water quality standards.

IX. Sediment Limits Should Not Apply to POTW's

A. The draft TMDL assigns sediment limits to POTW's.

1. How are sediment loads contributed by point sources measured and reported? Is this the TSS discharge, the volatile TSS, as measured in the POTW effluent plus stormwater runoff?

2. Are a POTW's SSO and CSO contributions included in the calculation?

X. District of Columbia Blue Plains POTW Treated Differently from Pennsylvania's POTW's

A. The Blue Plains POTW NPDES permit was effective September 30, 2010.

1. Why is the Blue Plains POTW allowed to discharge from just one of its outfalls concentrations of total nitrogen and total phosphorus greater than EPA's assumed limit of technology? The NPDES permit provides for limits of 3.88 mg/l total nitrogen and 0.18 mg/l total phosphorus.

2. Why do the limits contained in the Blue Plains POTW NPDES permit allow cap loads of 4,377,580 pounds per year total nitrogen which is equal to the load granted to all 183 significant POTW's in Pennsylvania (before the

consideration of the average Pennsylvania delivery ratio of 0.75. and Blue Plains delivery ratio of 1.0)?

3. Why is there no cap load for total phosphorus in the Blue Plains permit?

4. Why is the concentration limit for total phosphorus 0.18 mg/l instead of the EPA assumed limit of technology of 0.1 mg/l?

5. Why are the proposed backstop limits for Pennsylvania POTW's lower than the limits imposed on Blue Plains in light of Blue Plains much higher delivery ratios and the Pennsylvania POTW's in the Potomac basin being upstream of the Blue Plains discharge?

6. Why is the "calculated cap load" (based on design flow times monthly maximum concentration) for total phosphorus 202,737 pounds per year when the total nitrogen cap for all Pennsylvania point sources is 200,000 pounds per year?

7. Same question, but asked in light of the difference in delivery ratios for Blue Plains and all of Pennsylvania.

8. Are the Blue Plains planned total nitrogen reductions beginning in January 1, 2015 considered in the current model and in the resultant allocation of loadings to states and segments within state?

Response

IX. Sediment Limits should not apply to POTWs

A.1. Wastewater sediment loads are calculated from TSS and BOD loads. Stormwater sediment loads are modeled.

A.2. CSOs are included; SSOs are not because such discharges are illegal under the CWA and therefore have a zero WLA for SSAs.

Comments related to X. District of Columbia Blue Plains POTW treated differently from PA POTWs. WASA, the permittee for the Blue Plains permit is engaged in the design phase of comprehensive plant and LTCP improvements to meet its prescribed Bay allocations. The TN limit in the permit is a limit of technology requirement. The TP limit is carried over from a previous permit and will be reviewed and modified as necessary during the next permit modification or reissuance cycle, whichever comes first. The cap load for the Blue Plains permit for TN is limit of technology based on a flow of 370 mgd. This is the largest advanced treatment facility in existence.

The TP limit is based upon a variety of factors, including flow and is a tradeoff to achieve additional TN reduction as phosphorus is added to the process to enhance denitrification. As noted earlier, this limit was carried over from an earlier permit and will be reviewed in light of the new TMDL load at the time the permit is modified or reissued, whichever is earlier.

As noted elsewhere in this response to comments, the backstop scenarios were designed to achieve a specific level of control over all facilities, in the absence of having considered site specific information. Backstops do not address specific facilities, nor do they take into account process improvements already planned or in place for specific facilities. Accordingly, backstops may not appear reasonable for some facilities.

Yes, the planned Blue Plains TN reductions considered in the current model and loadings.

Communities in the James River watershed have spent years working with EPA to improve their wastewater and stormwater infrastructure. Cities like Lynchburg have made significant capital improvements to their systems as a result of this effort, and the Draft TMDL fails to acknowledge or consider those efforts in setting load allocations for wastewater or stormwater facilities on the James River. Rather, the Draft TMDL simply imposes a one-size-fits- all mandatory reduction for nitrogen, phosphorus and sediment on all wastewater treatment plants. In so doing, EPA has failed to consider all relevant factors with respect to those wasteload allocations. To the extent EPA believes it may not consider anything other than achieving compliance with the water quality standards in determining wasteload allocations, such an interpretation of Section 303(d) is inconsistent with the Clean Water Act, as previously discussed. [FN52]

[FN52] See *Sea-Land Servo v. DOT*, 137 F.3d 640, 646 (D.C. Cir. 1998) ("An agency action, however permissible as an exercise of discretion, cannot be sustained when it is not based on the agency's own judgment but on an erroneous view of the law.").

Response

Commenter provides information suggesting that improvements made to WWTPs in VA were not considered in the allocations to the James River watershed. EPA disagrees. While EPA recognizes that improvements have been made in many of the Bay watersheds in the past, however, additional nutrient reductions are necessary to achieve applicable water quality standards. EPA is establishing this TMDL in accordance with Section 303(d) of the CWA with the proper exercise of discretion. See also Section 1.4 of the TMDL for further discussion of legal authority.

Upper Occoquan Service Authority Concerns

The Upper Occoquan Service Authority (UOSA) facility is an advanced water reclamation plant located in Centreville, Virginia serving the western portions of Fairfax and Prince William Counties, and the Cities of Manassas and Manassas Park. Discharge from the facility flows through the Bull Run tributary and serves as a major raw water source augmentation to the Occoquan Reservoir, a drinking water reservoir which currently serves approximately one million

northern Virginia residents. UOSA has operated its water reclamation facility for over 30 years meeting very stringent permit limitations imposed by the Virginia Department of Environmental Quality. Since 1978 the UOSA plant has consistently complied with a total phosphorus permit limit of 0.1 mg/L, which is considered the limit of technology for phosphorus removal.

In the draft TMDL the UOSA total nitrogen (TN) waste load allocation was reduced from 1,315,682 pounds/year to 657,841 pounds/year. This reduction appears on Page 9-36 of the draft TMDL, and is consistent with the moderate "backstop" allocations and measures EPA imposed on the Commonwealth of Virginia, as discussed in Chapter 8 of the TMDL draft document. The Northern Virginia Regional Commission staff is very much concerned that reducing the existing UOSA TN WLA in any future Bay TMDL would be detrimental to Northern Virginia's water supply and would also result in increased loads of phosphorus and nitrogen delivered to the Potomac River and the Chesapeake Bay. Such detrimental effects are contrary to the purpose and restoration goals of the Bay TMDL.

Research performed by the Occoquan Watershed Monitoring Laboratory (OWML), an independent research entity operated by the Virginia Tech Department of Civil Engineering, has demonstrated that due to some unique characteristics of the Occoquan Reservoir, the nitrate contained in the UOSA discharge provides an oxidizing environment in the lower layers of the reservoir during times of thermal stratification. As long as nitrate persists in the bottom layer of the reservoir, the redox reactions prevent the release of sediment bound phosphorus, reduce the release of ammonia from reservoir sediments and maintain the green algae and diatoms species dominance and preventing the proliferation of less desirable blue-green algae.

If UOSA's allocation were reduced to 657,841 pounds/year, UOSA would be placed in a position of having to conduct a year-round maximum denitrification effort which would result in Reservoir nitrate deficiencies and a significant release of phosphorus, ammonia and manganese from the reservoir sediments. The backstop measure of reducing UOSA's TN WLA from 1.316 million pounds/year to 657,841 pounds per year could result in the degradation of the Occoquan Reservoir's water quality similar to the pre-UOSA 1960s conditions along with an associated increase in nutrient loads to the Potomac River and the Chesapeake Bay.

The Northern Virginia Regional Commission staff urges the Commonwealth and EPA to modify the Draft WIP and TMDL to ensure that UOSA is allowed to continue to discharge nitrogen at the level necessary to protect the Occoquan Reservoir.

Response

EPA's allocation applicable to WWTPs and industrial sources including the commenter has changed significantly based in part on receipt of a Final Phase I WIP from the State, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter. The allocation commenter discusses is the backstop allocation. Backstop allocation scenarios were designed to have a specific control level on all facilities in the absence of consideration of actual site specific technologies. Thus, backstop allocations represent an overall level of control, rather than site specific application. Backstop allocations may not appear reasonable for facilities in the absence of information relating to specific levels of control. Backstop allocations are only intended to be used by EPA in this TMDL in the event that other reduction scenarios fail to meet required water quality standards.

We own and operate a municipal wastewater treatment plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We are already doing our part for the James River and Bay restoration. The City wastewater treatment facilities are being upgraded to comply with the Richmond WWTP total nitrogen (TN) and total phosphorus (TP) DWF waste load allocations of 1,094,402 and 68,525 pounds per year. The improvements are described as follows:

Contract 1 - Total Phosphorus Control (a fully functioning element on this date): Chemical storage and new feed pumps will be installed to dose ferric chloride in the primary and secondary sedimentation tanks.

Contract 1 - Methanol Feed & Storage: The existing filters will be upgraded to denitrification a filter, which includes methanol storage tanks, chemical metering pumps and controls.

Contract 1 - Filter Upgrades (a fully functioning element on this date): The existing filters will be upgraded to reliably remove particulate phosphorus and nitrogen to meet the new permit limitations of the general permit.

Contract 2 - UV Disinfection: The existing chlorination disinfection facilities will be replaced with UV disinfection to mitigate the adverse impact of any nitrites that may break through the process and cause unstable of disinfection and potential bacteria violations.

Contract 2 - Main Plant Incoming 13.2 kV Switchgear: The existing incoming switchgear and portions electrical distribution system will be replaced, based on a condition assessment. Based on present, concerns for electrical safety, the new switchgear will be installed within a building instead of an outdoor walk-in enclosure.

Contract 3 - Scum Control Upgrades: The existing primary sedimentation tanks will be upgraded with new troughs and electrically actuated gates, which will control scum build-up in the activated sludge process. Scum will be conveyed to a new scum concentrator building.

Contract 4 - Aeration Upgrades: Improvements to the aeration tanks include new internal mixed liquor recycle pumps, and baffles and upgrade of gates and diffuser system. Contract 4 - RAS Capacity Upgrades: The RAS pumping capacity will be increased to about 60 mgd, which will reduce the solids carryover to the effluent filters during WWF.

Contract 4 - Bioaugmentation Upgrades: The existing sludge holding tanks will be upgraded to accommodate the bioaugmentation process to allow the WWTP staff to restart the activated sludge system faster and shorten the period to recover the nitrification process.

Contract 5 - Final Sedimentation Tanks: Two sedimentation tanks will be added to improve the solid capture efficiency

of the final sedimentation tanks and reduce the solids loading to the effluent filters.

Contract 5 - Fermentation: One existing digester will be converted to a fermentation reactor to produce volatile fatty acids (VFA) from primary sludge. The VFAs returned to the anoxic zone are more effective electron donors, improve the efficiency of the denitrification in the aeration tanks and reduces the operating costs associated with the addition of methanol. The upgrades include odor control, transfer pumps, and electrical/instrumentation.

Response

EPA appreciates the comment and commitment of the WWTP to advanced treatment. This comment is informational and no further response is required.

Organization: Borough of Bellefonte, Bellefonte, Pennsylvania

The Draft TMDL does not take into consideration WWTPs that have already spent millions of dollars toward meeting the October 1st, 2010 nitrogen and phosphorus limits. It is utterly ridiculous to make the customers of these treatment plants pay again to meet new limits when WWTPs only account of approx. 11% of the problem. We have an \$30,000/month debt payment that we must pass on to our customers. Many of them will not be able to make their new sewer rate payment. We can not go back to them and ask for more. Municipalities and Authorities have done their share. Look to the polluters to effectively and wisely address the problem. It is an outrage that people at the top levels in government can possibly come up with a plan that misses the target by such a incredible margin. If it should come to pass, we will explore all options including handing over the keys.

Response

EPA's allocation applicable to WWTPs and industrial sources has changed significantly based in part on receipt of a Final Phase I WIP from the State, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter. In general, EPA and the states hear your concern and understand that industrial dischargers want set, certain limits that are attainable at a reasonable cost. EPA and the states share that concern however, but also recognize that past programs, controls and investments have not achieved the level of water quality necessary to meet the designated uses of our rivers, creeks, estuaries and the Bay. Accordingly, it is necessary to periodically evaluate how well we are doing and determine what additional steps are necessary to achieve water quality. The TMDL identifies a plan sufficient to restore the Bay and surface water bodies. It is possible that additional controls will be necessary in the future if implementation is not sufficient or the TMDL is revised to reflect new information. The goal is achieving water quality that meets each state's designated use for their water bodies.

We have significant concerns with EPA's Draft TMDL and object to EPA's proposed "backstop" actions against the Commonwealth of Virginia and our facility. EPA proposes to cut our facility's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Response

EPA's allocation applicable to WWTPs and industrial sources including the commenter has changed significantly based in part on receipt of a Final Phase I WIP from the State, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter. The allocation commenter discusses is the backstop allocation. In general, backstop allocation scenarios were designed to have a specific control level on all facilities in the absence of consideration of actual site specific technologies. Thus, backstop allocations represent an overall level of control, rather than site specific application. Backstop allocations may not appear reasonable for facilities in the absence of information relating to specific levels of control. Backstop allocations are only intended to be used by EPA in this TMDL in the event that other reduction scenarios fail to meet required water quality standards.

14. In evaluating the loading reductions required to restore the Chesapeake Bay, did EPA fully evaluate the impact of recent changes to the Blue Plains Wastewater Treatment Plant, which will be discharging 3.8 million pounds of nitrogen less per year under its new permit?

Response

Yes, EPA did fully evaluate the impact of recent changes to the Blue Plains WWTP. Because the NPDES program has not been delegated to the District, EPA writes and issues all NPDES permits for the District.

Comment ID 0689.1.001.023

Organization: Capital Region Council of Governments TMDL Work Group

34. Please describe how EPA determined the limits of technology for nitrogen and phosphorus (3 mg/l and 0.1 mg/l, respectively) to be used in conjunction with the backstop allocation approach. What information or data was used in the decision-making process setting these standards? EPA's decision to impose limits of technology is also contrary to the Clean Water Act because EPA cannot show that Pennsylvania water quality standards are inconsistent with the Clean Water Act.

Response

EPA's allocation applicable to WWTPs and industrial sources has changed significantly based in part on receipt of a Final Phase I WIP from the State, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter. In response to the specific comments, the commenter is mistakenly interchanging the usefulness and purpose of backstop and limits of technology. Limits of technology speak to the effectiveness of commercially available technologies which can be applied at facilities. Backstop allocations are designed to achieve a specific control level on all facilities without considering the site specific conditions at each facility. Accordingly, limits of technology make a lot of sense for specific facilities where such controls are required. Backstop allocations may not appear reasonable for specific facilities. The information used to set the limits for Blue Plains is set forth in detail in the Fact Sheet which is available at www.epa.gov/reg3wapd/npdes/index.htm.

When issuing permits, the NPDES permitting authority must consider two approaches to pollution control under the CWA, whichever is more stringent, technology based limits and water quality based limits. Limits for both are calculated and the more stringent of the two is incorporated into the permit. Accordingly, neither technology-based limits nor water quality based limits are inconsistent with the Clean Water Act.

Allocations for POTWs

Wasteload allocations (WLAs) for POTWs must be stable to avoid repeated, extremely expensive upgrades to wastewater treatment plants that present an unreasonable burden to ratepayers. Under the current tributary strategies for reducing nutrient loads to the Bay, POTWs have already made significant investments to upgrade treatment facilities to meet these load reduction requirements. As stated in EPA's Section 202a report, The Next Generation of Tools and Actions to Restore Water Quality in the Chesapeake Bay, issued in response to Executive Order 13508, "Over 90 percent of nutrient reductions needed to reach the wastewater treatment facilities' basinwide loading caps are expected to be achieved by 2010." The report also acknowledges that "it would be very expensive to further reduce loadings from municipal and industrial wastewater dischargers below the established facility-specific cap loads in the tributary strategies."

EPA has not only proposed to reduce WLAs for POTWs in the initial TMDL, but also could "require additional reductions of loadings from point sources [by] revising the final December 2010 Chesapeake Bay TMDL to reallocate additional load reductions from nonpoint to point sources of nutrient and sediment pollution, such as wastewater treatment plants,"

to ensure that "jurisdictions develop and implement appropriate WIPs, attain appropriate 2-year milestones of progress, and provide timely and complete information to an effective accountability system for monitoring pollutant reductions." (p. 7-11) This continued threat of additional nutrient controls does not provide the regulatory stability that the Bay community needs. It is wasteful and inappropriate to expect frequent modification or reconstruction of major facilities, absent a major new health or ecological risk that needs to be urgently addressed. A major modification at a POTW should bring 10 or 20 years of stability prior to different or incompatible upgrade requirements being imposed.

These additional point source reductions will have very little environmental benefit while presenting tremendous financial burdens on POTWs and their communities to add additional nutrient controls to facilities that were recently upgraded. Furthermore, as nutrient control approaches the limits of technology, the consumption of energy and chemicals increases dramatically and concerns emerge regarding offsetting environmental impacts overall such as greenhouse gas emissions. Severe limits on POTWs will also encourage increased reliance on on-site disposal systems, such as septic systems, that are far less efficient than centralized treatment, and drive population growth and development away from existing urban areas with advanced centralized treatment, leading to more environmental problems.

Response

EPA's allocations applicable to WWTPs and industrial sources have changed significantly based in part on receipt of a Final Phase I WIPs from the States, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLAs. In general, EPA and the states hear your concern and understand that industrial dischargers want set, certain limits that are attainable at a reasonable cost. EPA and the states share that concern however, but also recognize that past programs, controls and investments have not achieved the level of water quality necessary to meet the designated uses of our rivers, creeks, estuaries and the Bay. Accordingly, it is necessary to periodically evaluate how well we are doing and determine what additional steps are necessary to achieve water quality. The TMDL identifies a plan sufficient to restore the Bay and surface water bodies. It is possible that additional controls will be necessary in the future if implementation is not sufficient or the TMDL is revised to reflect new information. Level of Treatment Municipal Wastewater Treatment Plants

Due to our extended cold winters, 3mg/L is not the Limit of Technology (LOT) for biological nitrogen removal (BNR) in New York. Studies indicate that nitrification and denitrification rates increase as temperatures increase (until a maximum temperature is reached). In general, nitrification rates double for every 8 to 10oC rise in temperature [FN30]. Within New York, however, the situation is reversed. During our long, cold winters both ambient air and wastewater temperatures drop significantly decreasing and, at times, stopping nitrification and denitrification. The effect of temperature on biological phosphorus removal is not completely understood.[FN31]

The Coalition's understands that NYSDEC has done a BAT evaluation for aerobic biological treatment systems in New York and concluded that 5 mg/L is BAT, and in essence, the LOT for nitrogen removal. Similarly, it has concluded that biological treatment in and of itself does not constitute BAT/LOT. Instead, it has determined that chemical oxidation (without subsequent filtration) is BAT and LOT for phosphorus removal. We defer to NYSDEC to further justify these levels.

Since making this determination, NYSDEC has modified most of the 28 Bay Significant SPDES Permits to insert Action Levels which capped both the concentration and mass loadings of Nt and Pt discharged by these WWTPs. For those New York WWTPs which have some excess capacity, the concentration Action Levels essentially place a moratorium on accepting significant new discharges which have any potentially significant levels of Nt or Pt. In addition, these modified SPDES permits require an engineering evaluation of both how much additional nutrients can be removed by:

- optimizing the operation of the current WWTPs with a goal of reaching 12 mg/L Nt and 2.0 mg/L or less of Pt; and
- reaching the defined BAT levels of 5.0 and 0.5 mg/L respectively for Nt and Pt.

While only 8 of these reports have been submitted to NYSDEC to date, we understand that these reports served as the basis of NYSDEC's estimated that it will cost an additional \$140 Million dollar upgrade these plants to reach the mix of optimized and BAT upgraded WWTPs which NYSDEC built into its draft WIP.

Because even the current SPDES permits place restrictions on the use of the current excess capacity at these plants, a situation which will be extended to most, if not all, of these 28 Bay Significant WWTPs after the TMDL goes final, especially if any of the federal Backstops are included, "offsets" will be needed by any WWTPs who wish to be able to use their full design capacities [FN32] or to expand that capacity. Therefore, trading between both permitted Point Sources and Point/Non-Point Sources must be allowed without triggering the need for a TMDL modification, because trading may be the most efficient method of achieving the needed offset.

B. Level of Treatment for Nutrient Removal For High Strength WWTPs

There are two Bay Significant WWTPs serving industrial plants within the New York portion of the Bay watershed. These are not specifically addressed in the draft New York WIP. For the reasons discussed below, both the final New York WIP and the final TMDL must recognize that BAT/LOT is significantly different for WWTPs treating high organic strength wastewater and that the determination of what constitutes BAT/LOT must be done on a case-by-case basis. Both plants are food processors and are important sources of employment for local residents. They are also vital to our local dairy farmers having a local purchaser of much of their dairy products, so they can avoid having to pay significantly higher costs which would be necessary to transport their products to competitors located outside of the Bay watershed. One of these plants, the Kraft Global plant in Cambell, New York is a member of the Southern Tier TMDL Coalition and provided these comments. The Coalition is also very concerned about the effect the draft TMDL would have on the farmers in that area within the northern part of the Bay Watershed, who provide the majority of its raw material milk from local farmers. If they are forced out of production by the TMDL, the viability of these two industrial food processing facilities may be compromised. Obtaining milk from other regions will be at increased cost due to transportation and potentially diminished supply if dairy farms are forced out of business.

1. Background

C. Level of Treatment for Nutrient Removal For High Strength WWTPs

There are two Bay Significant WWTPs serving industrial plants within the New York portion of the Bay watershed. Both plants are food processors and are important sources of employment for local residents. They are also vital to our local dairy farmers having a local purchaser of much of their dairy products, so they can avoid having to pay significantly higher costs which would be necessary to transport their products to competitors located outside of the Bay watershed. One of these plants, the Kraft Foods Global (Kraft) plant in Campbell, New York (with close to 400 employees) is a member of the Southern Tier TMDL Coalition. This plant and the Coalition are very concerned about the effect the draft TMDL would have on the farmers in the area within the northern part of the Bay Watershed, who provide the majority of the raw material milk. If farmers are forced out of production by the TMDL, the viability of these two industrial food processing facilities may be compromised. Obtaining milk from other regions will be at increased cost due to transportation and potentially diminished supply if dairy farms are forced out of business.

A. Level of Treatment for Nutrient Removal For High Strength WWTPs

There are two Bay Significant WWTPs serving industrial facilities within the New York portion of the Bay watershed. Both facilities are food processors and are important sources of employment for local residents. They are also vital to our local dairy farmers as they are nearby purchasers of much of their dairy products, so the farmers can avoid having to pay significantly higher transportation costs to transport to locations outside the area. One of these, the Kraft Foods Global, Inc. (Kraft Foods) facility in Campbell, New York, employs close to 400 nearby residents and provides a significant economic benefit to the surrounding communities. The local dairy farmers provide the majority of the raw material milk used at the Kraft Foods facility. Kraft Foods is a member of the Southern Tier TMDL Coalition. [FN33]

This facility and the Coalition are very concerned about the effects the draft TMDL would have not only on the Kraft Foods Campbell facility but also on the farmers in the area within the northern part of the Bay Watershed. If farmers are forced out of production by the TMDL, the viability of the Kraft Foods facility may be compromised because of increased transportation costs. As explained below, the facility would not be able to achieve the proposed limits using its current, advanced system. If there even is a system available to achieve the proposed results, capital costs to implement such a solution most likely would be significant. It is not unreasonable to consider that such costs could reach a prohibitive amount for the facility to continue operating at its current levels, especially if the local supply of dairy is sufficiently diminished.

1. Background

The Kraft Foods facility produces cheese and related products from milk produced at local dairy farms. From an organic loading perspective, it produces a wastewater that is higher in strength (that is, it has more nutrients) than what a typical municipal WWPT treats. In addition, the volume and the amount of nutrients are highly variable. The retention time is short, which provides a shorter window of opportunity for full processing/digestion of the nutrients.

Additional variability to the wastewater treatment process was added when the treatment plant was upgraded in 2008 to convert waste byproducts, such as whey, into energy. The effective operation of this waste-to-energy WWPT process not only reduces the need for natural gas, but also reduces the need to apply the whey on land, which is an alternate approved use of this byproduct material. The facility works hard in its efforts to meet its permit limits given the complexity of its advanced system.

The permit and discharge monitoring reports do not tell the whole story about the system. The volumes indicated in the permit do not reflect the total volume sent to the WWPT because the permit does not address the waste byproduct that is being processed at the WWPT since 2008. Therefore, any inputs and outputs from the conversion of whey and other byproducts to energy are not shown on the discharge monitoring reports.

2. Discussion of Permits

The facility has worked to reduce its nutrient discharge. The current permit does not have any permit limits, but does contain action levels based on a twelve-month rolling average and a request for an engineering report on what would be involved to achieve potential daily targets.[FN34] In the prior permit (before the 2008 upgrade), the permit did not have any total nitrogen (TN) limit; the current permit action level for Nt is 10 mg/L and the potential daily target is 12 mg/L. For total phosphorus (PT), the prior permit limit was 5 mg/L; the current permit action level is 3.5 mg/L and the potential daily target is 2 mg/L.

Currently the WWPT's twelve-month rolling averages are within the action levels range for mg/L. This gets more challenging to maintain as waste load volumes increase and/or outside temperatures become extreme. The upgraded WWPT facility's ability to meet the potential targets (of 12 mg/LNt and 2 mg/L PT) consistently under seasonal peak loads has not been established.

a. Nitrogen:

For the Kraft Foods WWPT's process to properly operate as a waste-to-energy process that treats the wastewater, nitrogen must be added. This addition is estimated based on incoming flow, which can be a challenge given daily production process variations. Currently, the facility typically removes over 96% of Nt entering the WWPT. Since the upgrade in 2008, the facility's best full-month discharge [FN35] of Nt was 1.2 mg/L. For that month, loading volumes into the WWPT were relatively low and temperatures favorable. Even at this best level, the facility would exceed the proposed daily pound limits of the TMDL by 1.4 times.

The proposed Appendix Q total nitrogen levels would not be achievable with the current system at the Kraft Foods facility. A significant capital upgrade to include additional biological nutrient removal would be required.

b. Phosphorus:

Similarly, this recently upgraded facility cannot achieve the proposed Appendix Q allocation level for PT. Milk has a total phosphorus level around 91 mg/L [FN36]. The proposed backstop level for PT is 0.1 mg/L. This would require treatment to reduce the phosphorus levels by nearly 900 times what milk naturally is. Moreover, the proposed PT limit is approximately 35 times more stringent than the action level in the current permit. Currently, the facility typically removes over 93% of PT entering the WWPT.

Wastewater generated by this facility and sent to the WWPT for treatment has phosphorus from a variety of sources. The principal source, of course, is the milk itself. The phosphorus in the milk gets into the wastewater from water used to rinse the cheese or clean the equipment. The facility needs to add phosphates to the incoming water to prevent the precipitation of manganese, which would otherwise affect the product and likely contribute to pipe corrosion. Thus the

wastewater and byproducts that go to the WWPT have a high phosphorus loading. In addition, Kraft Foods' well water PT level is already at the backstop limit of 0.1 mg/L. This further compounds the facility's difficulty in achieving the proposed limit in treated wastewater.

Moreover, the facility's best full-month discharge [FN37] of PT is 0.73 mg/L. Thus under current ideal operations, the facility would not be able to meet the proposed PT limit of 0.1 mg/L

Even if the facility were able to meet the BAT of 0.1 mg/L for PT, it still would not meet all of the proposed requirements relating to phosphorus. For example, the Appendix Q draft would limit PT to 36 lbs/year. The facility's permit is based upon wastewater from cheese making only (not the full flow from converting waste to energy); thus even 0.1 mg/L PT when multiplied by the actual flow will surpass the 36 lbs/year limit (in just two days). These proposed limits are unattainable using the facility's current processes, and it is unknown whether they are technically attainable at all.

Under the proposed TMDL limit of 0.1 mg/L, an additional area of the facility's processes would need to be treated before discharge. Currently, well water used in non-contact cooling (about 300,000 gallons per day) is permitted to be discharged without any further treatment. A tighter phosphorus limit would require either another chemical solution (which has not been identified) or another treatment option, such as ultra filtration, to all incoming water.

[FN30] Biological Nutrient Removal (BNR) Operation in Wastewater Treatment Plants Water Environment Federation (WEF) and American Society of Civil Engineers (ASCE)/Environmental and Water Resources Institute (EWRI). 2006. McGraw Hill, New York.

[FN31] Id.

[FN32] If concentration limits close to the NYSDEC determined BAT (i.e 5 mg/L Nt and 0.5 mg/L Pt) are included in the next round of modified SPDES permits.

[FN33] While Kraft Foods is a member of the Coalition, it does not endorse any statements about the desirability of the NYDEC WIP and instead endorses and signs onto statements concerning USEPA's Chesapeake Bay TMDL.

[FN34] At the time the report for these potential targets was due, Kraft Foods did not have enough data from steady state processing in the upgraded WWTP facility to establish projected operating and/or capital upgrade costs to achieve these potential targets.

[FN35] This is calculated based on a calendar month, not the twelve-month rolling average.

[FN37] This is calculated based on a calendar month, not the twelve-month rolling average.

Response

EPA agrees with commenter that extremely low temperatures can have an adverse impact on nitrogen removal organisms. Areas that experience cold winters will need to provide additional operational flexibility for effective operation of their facilities. System design should incorporate adequate flexibility to allow plant operators to respond to adverse operating conditions. A rule of thumb is that a temperature change from 20oC to 10oC will decrease the nitrification rate to approximately 30 percent, requiring about three times the mass of biomass in the reactor to produce an equivalent effluent ammonia concentration. Consequently, a system designed for winter nitrification can generally meet year-round ammonia nitrogen limits with proper design or modification. Alternative systems or process enhancements should also be considered.

With regard to costs for upgrades, this will depend upon a number of factors which include influent characteristics, effluent target concentrations and the type of treatment system already in place.

It should also be noted that such treatment upgrades would not be expected to be implemented immediately. New limits will be incorporated into permits at the time they are modified or reissued. In addition, schedules for compliance can be written into permits to provide time to plan and build technological improvements.

22.8 - STORMWATER

Comment ID 0225.1.001.003

Author Name: Locke Latana

Organization: Fredericksburg Area Association of Realtors (FAAR)

Of particular concern to our industry are the urban and suburban stormwater retrofits that would be required of existing properties, including state and local highways.

Response

EPA points out that the TMDL does not require any specific management measures, only that the relevant WLAs be achieved.

Implementers may choose a variety of combinations of programs and practices.

EPA does believe that retrofits are necessary to achieve the relevant allocations. Most robust stormwater programs should include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Comment ID 0228.1.001.005

Author Name: Rolband Michael

Organization: Wetland Studies and Solutions, Inc.

The proposed Draft WIP input deck applies E3 (Everything by Everyone Everywhere) levels of stormwater management retrofit to all urban lands [FN4]. This makes EPA's backstop proposal of requiring 50% of urban MS4 lands and 25% of unregulated lands to meet "aggressive performance standards through retrofit/redevelopment" seem reasonable when compared to the draft WIP, although it is still not practicable, as discussed below.

Over the next 15 years, redevelopment will have an insignificant impact on urban runoff reductions; urban retrofits (independent of redevelopment) will be necessary for more substantial reductions in urban pollutant loads. The Phase 5.3 Chesapeake Bay Community Watershed Model (Bay Model) [FN5] indicates a total of 266,438 acres of impervious surface in Virginia's portion of the Bay watershed (150,340 high density acres and 116,098 low density acres) existed in 2009. Even if half of all development projected in the Bay Model is redevelopment and reduces loads by 50% (an unlikely level of redevelopment and a very aggressive load reduction assumption with regulations currently at 10% and proposed to be 20%), total loads would only be reduced by 8% [FN6] by 2025, nowhere near Virginia's proposal to reduce TN and TP by 45% and 59% respectively compared to 2009 loads [FN7].

Thus, the vast majority of the proposed Urban sector pollutant reduction can only occur if existing impervious surfaces are retrofitted. Exhibit 2 (Cost Effectiveness of Pollutant Removal Options for the Urban Sector Population) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] provides calculations and data sources for the following order-of-magnitude estimates for urban pollutant reductions and costs associated with the EPA backstop and the draft WIP shown in Table 2, below.

Table 2: Order-of-Magnitude Cost Estimate for Urban Retrofit Proposals.

[Please see page 4 of the original letter (Docket ID 0228.1.001.005).] [FN8] [FN9]

Notwithstanding the extraordinary cost, retrofitting 266,000 acres of imperviousness under the current draft WIP (or even 104,000 acres under the EPA backstop) is simply not practicable. Additionally, the next version of the Bay Model is expected to double the impervious area [FN10], which will also double the retrofit requirement. It is difficult to imagine trying to design, construct, and maintain enough rain gardens (with a maximum drainage area of one acre) to treat these surfaces (including every VDOT highway and subdivision street) compared with upgrading 126 significant WWTPs. Clearly, upgrading WWTPs is considerably more practicable from a management perspective.

[FN 4] Based on EPA Comments on Virginia's Draft WIP, 10/4/2010. (Page 6.)

[FN 5] Version released 7/21/ 2010.

[FN 6] The Bay Model 2009 Progress Model Year indicates 13,965 acres of bare construction. The model documentation (US EPA, 2008. Chesapeake Bay Phase 5 Community Watershed Model, Chapter 4 (Page 4-18). U.S. Environmental Protection Agency, Chesapeake Bay Program Office, Annapolis, MD.) states an assumption that 40% will become impervious surfaces (40% x 13,965 acres = 5,586 acres); 5,586 acres/year x 15 years x 50% Redevelopment x 50% Removal Rate / 266,438 acres x 100% = 7.86% Removal from Redevelopment.

[FN 7] EPA Comments on Virginia's Draft WIP, 10/4/2010 (Page 6.)

[FN 9] Total Area = 50% of high density impervious and 25% of low density impervious

[FN8] Urban Retrofit - 50/50 cost allocation between TN/TP

[FN 10] Based on an a memo dated 5/25/2010 received from Peter Claggett (USGS) to Mike Rolband (WSSI), pervious and impervious surfaces are likely to change by a factor of 2 to 3.

Response

EPA believes that retrofits are necessary component of a reduction program to achieve the relevant allocations. Most robust stormwater programs should include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Comment ID 0300.1.001.016

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

VDOT is also concerned with the initiative in the stormwater WLA that would require 50 percent of urban lands not currently included in an MS4 permit to meet redevelopment and retrofit requirements. As discussed previously, stormwater retrofits in urbanized areas are probably the most costly action per pound of nutrient removal. The draft TMDL is unclear as to whether this would be required only if those urban areas become included under the MS4 regulated areas through NPDES regulatory revisions or if it would be required upon adoption of the TMDL. Finally, if additional reductions in nutrient loading are necessary outside current MS4 geographic limits, then VDOT requests that alternative mechanisms (such as a nutrient exchange program) be allowed.

Response

EPA does believe that some amount of urban retrofitting is necessary in order to achieve the necessary pollutant reductions, and that a robust MS4 program will include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Please see response to Comment 0067.001.009

Comment ID 0379.1.001.008

Author Name: Shields Wyatt

Organization: City of Falls Church, Virginia

Finally, in developing the Chesapeake Bay TMDL, we must all remember that the current conditions in our urbanized watersheds developed over many decades and that most of the land is privately owned. Plans and programs developed under the current initiatives need to take into account what can be achieved by localities, given their unique policy and budgetary constraints over the short and long-term. If the costs of these stormwater management efforts are made to be too high, or if the stormwater management standards effectively become unattainable, these beneficial redevelopment efforts will be hindered.

Response

EPA believes that robust MS4 programs are necessary to achieve the relevant allocations. There are a variety of solutions implementing stormwater controls, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Comment ID 0389.1.001.020

Author Name: Iwanowicz Peter

Organization: New York State Department of Environmental Conservation

The Cost of Retrofits Outweighs the Benefits

The Chesapeake Bay Watershed Model predicts that, after implementation of New York's Watershed Implementation Plan, urban runoff will contribute approximately 5.7% of New York's delivered Nitrogen load to the Bay. For this model, 120,285 acres are categorized as contributing urban runoff, 835,421 acres are categorized as agriculture, 3,020,810 are categorized as forest, and 35,357 non-tidal water deposition. To meet the loadings assigned to New York for Nitrogen in the TMDL, EPA has proposed that one half of the regulated (under MS4 permits) urban runoff acres be required to be retrofitted to address runoff, and that one quarter of presently unregulated urban runoff also be retrofitted to treat runoff. The total area to be retrofitted would be approximately is between 30,000 acres and 60,000 acres.

EPA's Urban Stormwater Retrofits Manual (Appendix E, Page 2) provides a range of costs for Urban Stormwater Retrofits of \$58,000 to \$150,000 per impervious acre. If the urban runoff acres in the New York's portion of the Chesapeake Bay Watershed to be regulated is one quarter of the total acreage and those acres are 25 % impervious on average (a conservative assumption), then the cost for retrofitting those areas is between \$430 million and \$1.3 billion. If the total acreage to be retrofitted is closer to 50% of the urban runoff acres, and a less conservative (and more likely) assumption of 50% imperviousness were used the cost would be could double to closer to \$2.2 billion.

Very roughly, the cost for retrofitting such large land areas would be between \$0.4 and \$2.23 billion. This proposed urban runoff retrofitting would only address a portion of the 5.7 percent of New York's Nitrogen load associated with urban runoff. Even a qualitative assessment suggests that the benefits of these retrofits are not justified by the costs. EPA's retrofit proposal is excessive.

2. EPA's Proposal Would Require Almost a Zero Discharge of Runoff

To require anything more than an un-measurable effect on loads to the Bay, an urban retrofit program would have to reduce runoff on retrofitted projects to zero or near zero. Such an aggressive program would mean that implementation costs for municipalities and other MS4s would be at the high end of the estimate, closer to \$2 billion than \$0.4 billion dollars. This EPA proposed backstop would go beyond any statutory or regulatory retrofit requirement that New York has imposed in any other watershed, including the New York City Watershed, which is being for the purpose of protecting human health. In other watersheds where New York has imposed retrofit requirements, the basis for the requirement was an assumption that the most likely retrofits would be in already publicly owned transportation corridors (ditch retrofits to water quality swales) and rooftop disconnection. Such practices would tend to be far less costly; taking advantage of 'low hanging fruit' opportunities

New York has required some retrofits in watersheds where the portion of the loading associated with urban stormwater exceeds 10 % of the necessary load reductions. However, even where urban stormwater is a significant portion of the pollutant loading, New York does not consider it feasible or effective to rely on retrofits as the predominant means of meeting load reductions.

Response

EPA does believe that some amount of urban retrofitting is necessary in order to achieve the necessary pollutant reductions, and that a robust MS4 program will include a retrofit element. However, where state programs propose solutions that can meet the overall wasteload allocations EPA will not automatically impose backstop retrofit requirements on MS4s. Fortunately, since the final state WIPs were much improved from the drafts, EPA chose to reduce or remove the EPA backstop allocations, from the TMDL. The backstop framework is one logical algorithm to achieve the allocations, but not the only one. EPA continues to encourage states to develop the frameworks that will work best for their jurisdictions' sets of unique circumstances.

There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Pennsylvania's stormwater regulations require that post-development stormwater volume, quality, and flow rate match pre-development levels, however, this provision is expressed as a narrative standard.[29] experts familiar with development practice under the Commonwealth's Stormwater Management Act and regulations, the lack of specificity in the standard has led to widespread inconsistencies and frequent abuse. This is, unfortunately, one of the overall frustrations of EPA's stormwater program, as noted by the NRC panel and the Agency itself in its recent MS4 Permit Improvement Manual. 30 NRDC echoes EPA's concern over the lack of objectivity and clarity in the narrative approach adopted by Pennsylvania. We fully agree with EPA's assessment that Pennsylvania "must apply a strong performance standard that is likely to be most effective if based on a volume or flow metric, and formulated as a retention (not detention) standard with the objective of stable hydrologic condition." [31]

Virginia assures EPA and the Bay community that impacts from future development will be effectively eliminated through the application of the new stormwater regulations that it expects to implement after issuance of the TMDL.[FN 32] Ostensibly, these regulations will require that post-construction loadings of nutrients and sediment not exceed levels expected from a generic, undeveloped site.[FN 33] At this stage, it is unclear from Virginia's WIP how (or even whether) these proposed new regulations will actually achieve this goal. EPA must only consider Virginia's WIP as "reasonable assurance" upon demonstration that any revised regulations will meet the same standards of objectivity, measureability, and effectiveness set by other states in the region and recent EPA guidance or technical statements.

Maryland is alone among these three states in adopting regulations that hold stormwater discharges from new development and redevelopment to a clear, hydrologically based standard that requires full consideration and implementation of low impact development management practices. Though concerns remain about the strength of the standards, the State's commitment and ability to enforce compliance with these regulations, and their embrace by the regulated community, Maryland's revised stormwater regulations must be considered by the rest of the Bay community. We encourage EPA to remain closely engaged with MDE staff in order to evaluate the effectiveness of these regulations, and to ensure that they provide measureable benefits in line with the expectations detailed in Maryland's WIP.

Organization: County of Spotsylvania, Virginia

Lastly, it is interesting to note that, in the past, both state and local agencies have made requests to EPA that permits and inspections for the Virginia Stormwater Management Permit (VSMP) be regulated by the localities. EPA has historically flatly refused these requests. However, today the story has changed and the draft TMDLs are mandating a shift in the program responsibilities to localities. Unfortunately, EPA's deadlines fail to provide localities with the time necessary to adequately train staff and educate the public.

Response

The TMDL sets allocations for nitrogen, phosphorus and sediment throughout the Bay Watershed. It does not say anything about who should do stormwater inspections.

The federal stormwater regulations provide for oversight of programs, including inspections, at all levels: federal, state and local.

Comment ID 0746.1.001.030

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

In New York State, the stormwater sector represents a small percentage of the overall nutrient loading leaving the state and reaching the Bay. As per the New York State Tributary Strategy for Chesapeake Bay Restoration (2006), approximately 5 percent of New York's nutrient load is attributed to urban sources. Furthermore, it is anticipated that this percentage will become further reduced, given the recent New York State legislation placing restrictions on nutrients in home fertilizers.

1. There Is No Need For NY to Adopt the Region 3 Urban Stormwater Permitting Guidance.

The NY portion of the Bay watershed is totally different from most of EPA Region 3. Our portion of the watershed is 76% forested and 21% agriculture. The New York portion of the Bay watershed is not a largely paved urban watershed. We haven't had, and don't expect, the significant population growth and urban/suburban growth that the mid-Atlantic portion of the Bay watershed is experiencing.

Response

The referenced document, Urban Stormwater Approach for the Mid-Atlantic Region and the Chesapeake Bay Watershed (EPA, 2010), was developed to apply to all stormwater programs, regardless of percentage of overall load of selected pollutants. In order to meet the objectives of the Clean Water Act for all receiving waters robust stormwater programs are necessary everywhere.

EPA believes that robust stormwater management is necessary to achieve the relevant allocations, including retrofits of existing impervious surfaces. There are a variety of cost-effective solutions for retrofitting sites, in particular for surfaces like parking lots.

22.9 - GENERAL/MISCELLANEOUS**Comment ID 0038.1.001.014**

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

The use of TMDLs are a great help in this situation because they can be used to primarily focus on the problems of agriculture runoff and wastewater. Under the Clean Water Act, I believe the EPA should rewrite the previously written TMDL to propose stricter standards of point sources. I also think that the EPA should have less pollution discharge permits. The more of these permits the EPA allows, the less effective the CWA and TMDLs will be.

Response

The commenter states that TMDLs can be useful in dealing with environmental problems associated with agriculture, wastewater and urban runoff (stormwater). EPA agrees with the commenter's statement to the extent that this TMDL is intended to reduce the amounts of total nitrogen (TN) and total phosphorus (TP) from these and other wastestreams. The end result of this TMDL is, as the commenter suggests, stricter standards for these two pollutants to be placed on point sources. Agricultural, municipal wastewater and urban runoff (stormwater) are all regulated under the National Pollutant Discharge Elimination System (NPDES) permit program and the purpose of the TMDL is to place more restrictive limits on TN and TP discharges from permitted sources. EPA does not agree that fewer NPDES permits would equate to the discharge of fewer pollutants to the waters of the United States; nor does it agree that the issuance of more permits lessens the effectiveness of the CWA or TMDLs. Under the CWA, EPA and the regulating states are required to issue permits to all facilities which discharge pollutants from any point source into the waters of the United States.

Organization: Algae Producers of America

I would like to share with you progress which the company I represent, Algae Producers of America (APA) and its partner organizations, has achieved in realizing the level of nutrients reduction which are required. Before sharing the results of our efforts, it is important to share a little bit about APA.

APA is an Ohio based company located in the greater Cleveland area. Our goal is to provide algal based solutions to current and emerging market needs. To accomplish this, we have established an Open Innovation Technology Platform consisting of member organizations from universities, industry and commercial users. Of our partner organizations, approximately 39% are actively involved in some form of bio-remediation effort. Additionally, APA is the lead commercial partner for a recent State of Ohio Third Frontier Grant awarded to Ohio University (OTF 10-510, titled Center for Algal Engineering Research and Commercialization). The purpose of this Third Frontier Grant is to establish a Center of Excellence for the development and commercialization of algae-based technologies, with an emphasis on use of waste nutrients. In addition to Ohio University and APA, this effort involves 10 additional partners, including several major Fortune 500 international companies.

We recently submitted comments to the Ohio EPA in response to a request for assistance from industry on available technologies which might be usable to the State of Ohio in addressing several excessive nutrient-related issues which the state faced this past summer. It occurred to me that these same technologies may be usable to you in your efforts. The following comments are offered for consideration and review for inclusion as part of the overall comprehensive strategy you have undertaken

Response

Thank you.

Comment ID 0216.1.001.003

Author Name: Johnson Rick

Organization: Algae Producers of America

The potential use of algae-based technologies to reduce nutrient loads is a recognized technology. The US Department of Energy Aquatic Species Program identified this technology as a viable use of the nutrients inherently present in wastewater treatment facilities. While there are several companies who claim to be able to reduce nutrient loads through the use of algae-based systems, very little is known about their effectiveness. We have demonstrated the ability to significantly reduce nutrient loads at multiple sites. The data summarized below is a compilation of results obtained from four separate sites located across multiple northern and northwestern states and includes both wastewater treatment facilities (up to 8M GPD capacity) and industrial facilities:

[Figure 1. Please see original document 0216.1]

In addition to the above data, the following third party analysis data was recently obtained from one of our recent demonstration sites (a 3.5M GPD wastewater treatment facility) on multiple effluent streams:

[Figure 2. Please see original document 0216.1]

The above results clearly demonstrate the ability to exceed current capabilities of Enhanced Nutrient Reduction (ENR) technology. Our technology offers several distinct advantages:

- o Our solution is based on the incorporation of a "bolt-on" closed system. This system uses treatment modules that can be sized to the individual need. This allows for a much smaller footprint than conventional "open pond" designs. For example, a two acre site based on our solution could treat up to 10M GPD.
- o Being a bolt-on design, no significant change to an existing infrastructure is necessary. Our solution will accept incoming effluent from either a primary or secondary treatment stage and the resulting post-treated effluent can either be directly discharged or be further processed for chlorination if desired.
- o The above two items are significant in that individual treatment modules can be developed for application at multiple point sources. Further, the results above have been demonstrated in year-round conditions and are not restricted to

warmer month operation.

Response

EPA does not endorse particular technologies or brands. Rather, as a regulatory agency, EPA writes permits which specify limits to be met by the permittee. It is the permittee's responsibility to purchase and install the most advantageous technology for his facility to meet the limits specified by his permit.

Comment ID 0234.1.001.001

Author Name: Dickey Dean

Organization: Prince William County Service Authority (PWCSA), Virginia

PWCSA has just requested a Certificate to Operate (CTO) the upgrade and expansion of the H.L. Mooney WRF to 24 MGD. The capital cost of the upgrade and expansion was approximately \$120 million. The rate payers of Prince William County will bear the entire costs of the additional Operations and Maintenance (O&M) costs of running the upgraded facility. The upgrade was primarily driven by the requirements of the Chesapeake Bay Program as codified in the Virginia Nutrient General Permit (VAN010018). The waste load allocation (WLA) assigned to our facility requires a limit of technology (LOT) concentration for Total Nitrogen of 3mg/l at our expanded design flow of 24 MGD. H.L. Mooney WRF has met the extremely stringent phosphorous requirements of the Virginia Potomac Embayment Standards (PES) for decades. The PES requires monthly TP limit of 0.18mg/l and a weekly maximum of 0.27mg/l with corresponding mass loads. The Virginia Nutrient General Permit Total Phosphorus WLA was based on the sub-LOT concentration of 0.18mg/l at a design flow of 24 MGD.

A major municipal upgrade and expansion of this nature is expected to serve the community's needs for the 20-year expected life. Clearly, regulatory stability is required to maintain public support for public expenditures of this magnitude. PWCSA believed, and told our rate-payers that the upgrade and expansion of the H.L. Mooney WRF did our part, and more, to meet the goals of the Chesapeake Bay program as defined in the Virginia Potomac Tributary Strategy and later codified in the Virginia Nutrient General Permit. We strongly object to any attempt by EPA to reduce the WLA currently reserved for the H.L. Mooney WRF via any mechanism during the TMDL process.

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

LGAC is most directly concerned with the impact of the Bay TMDL on wastewater treatment plants and, where it applies, on MS4 permits.

Response

The complete comment is as follows: LGAC is most directly concerned with the impact of the Bay TMDL on wastewater treatment plants and, where it applies, on MS4 permits. More stringent regulations and expensive retrofits for stormwater facilities to meet TMDL requirements will have an enormous impact on the ability of local governments to pay for them. In Pennsylvania, for example, the state is reported to be facing a five billion dollar deficit which has already caused environmental programs and staff to be drastically reduced.

Please refer to the response to comment 0691.1.001.006

Comment ID 0342.1.001.003

Author Name: Levine Thomas

Organization: Moshannon Valley Joint Sewer Authority

The Authority believes that all point sources are carrying a disproportionate share of the Chesapeake Bay "pollution diet" and recommends that Environmental Protection Agency look to the following non-point sources for nutrient pollution reduction:

- Over fertilization of lawns and landscaping
- Over fertilization of country clubs and parks
- Manure generated from fish and migratory birds
- Actual results from agricultural best management practices (BMP's)
- On-lot sewage disposal systems
- Forest/forestry Dairy agricultural feeding operations
- Abandon strip mine operations

Response

Thank you for your comment. EPA is aware of the contribution of non-point source pollution and has accounted for this in its modeling and in the TMDL. While EPA notes commenter's observation that that point sources may carry a disproportionate share of the "pollution diet" it should also be noted that since at least 1980 EPA and the Bay states have engaged in voluntary efforts to understand and limit non-point source contributions to the Bay. These efforts continue in tandem with the regulatory approach implicit in the TMDL and NPDES programs.

Comment ID 0530.1.001.007

Author Name: Gulibon Grant

Organization: Pennsylvania Builders Association

Conclusion

Pennsylvania builders clearly are on the front line of defense when it comes to protecting the Bay. While challenges still remain, most builders are operating on the edge of technology in terms of what they can feasibly achieve, and thus there are limited improvements that can be garnered from the industry. Despite these demonstrable gains, improvements, and impediments, many still blame the development community for the majority of the problems in the Bay and other watersheds, although even EPA's estimates show that new construction is not a leading source of pollution problems, "Urban pollutants" do not come solely from new construction, and new construction should not be required to address 100% of that that contribution. It is the responsibility of all who live, work, and play in urban areas to help reduce their collective contributions. EPA has already addressed the "during construction" phase and requires extensive controls and best management practices to ensure that sediment does not flow off construction sites.

Response

EPA does not agree that opportunity is yet very limited for improvement by America's builders. While it is certainly true that environmental awareness by builders has improved, and that many builders strive to limit ground disturbance, stormwater runoff and implement BMPs, there still remains ample opportunity for improvement. Builders are not held responsible for the reduction of 100% "urban pollutants", rather builders are asked to do their share to limit the amount of "urban pollution" from their job sites. EPA and the states look forward to working with builders to find ways to limit environmental damage resulting from construction.

Comment ID 0553.1.001.006

Author Name: Uzupis John

Organization: Synagro Technologies, Inc.

States are expected to have difficulty enforcing the TMDL mandate. This expectation is causing concern among point sources already regulated by EPA and state environmental organizations.

- Wastewater treatment plant authorities worry that states, finding the task of writing TMDLs for runoff onerous, will instead force sharper reductions from point sources, which have discharge permits that are easier to enforce.
- Since some estimates place atmospheric deposition at an approximately 50% contribution to Chesapeake Bay pollution, many believe a water TMDL cannot achieve water quality goals, since atmospheric pollutants often originate in other states or countries. Therefore, as described above, many point source contributors, such as wastewater treatment facilities fear ever-tightening restrictions on output as states attempt to meet TMDL goals any way possible.

Response

EPA understands the commenter's concern. While it is true that implementation of the TMDLs will, in some cases, require more stringent levels of control on permitted facilities, EPA and the states recognize that this is not the end of the story. EPA and the states are fully cognizant that atmospheric deposition is a major cause of pollution in the Bay and are working to address those issues through the Clean Air Act authorities. The Bay TMDL includes an allocation for air deposition that reflects substantial reductions in air deposition over the next decade. In addition, EPA and the states are working to curb pollutants entering Bay waters through stormwater, agriculture and non-point sources.

Organization: Agricultural Retailers Association et al.

The Draft TMDL also threatens to impose allocations on small entities that raise one or more animals, but are not large enough to require a permit under the Clean Water Act. According to the U.S. Department of Agriculture, in 2002 there were a total of 111,692 livestock operations of all sizes in Virginia, West Virginia, Maryland, Delaware, Pennsylvania, and New York. In 2001, EPA estimated the total number of animal feeding operations with 300 animal units or more in these states to be 4,360. While these are statewide numbers, and the number of operations in the Chesapeake Bay watershed will be smaller, these numbers indicate that a very large number of small livestock operations could be affected by the Draft TMDL. At this point, the potentially affected small farms are not individually listed in the Draft TMDL, but the threat to subject them to federal regulation is there.

Response

Thank you for your sharing your concern over small animal feeding operations. EPA's field experience as we have visited a number of small AFOS is mixed. We have observed some reasonable BMPs that have been implemented and also have documented a number of manure management concerns. We continue to work with conservation districts and state agencies to discuss how best to address many of the shortcomings from AFOS.

In the final TMDL EPA has reduced or removed the backstop allocations that EPA had imposed in the Draft TMDL. An important consideration in tracking implementation of this TMDL is to assure that the control actions identified in the State WIPs are actually implemented. If implementation stalls, EPA is prepared to seek alternate avenues for control. One particular area for the CAFO program is to designate small animal operations as this type of regulatory activity is clearly in the Clean Water Act. AT this point in time no decision has been made to launch ahead to designate operations but as you mention in your correspondence there are a large number of small operations that could be brought in the regulatory program.

DO NOT PUT THE BURDEN ONTO FARMING! They have been suppling our FOOD ! Why are you trying to make it even harder to feed us all! More restrictions will put more farmers out of business! That will increase our dependance on other countries to help this country ! Let us drill ! Do not restrict the farming industry ! Make the other states come up to the level New York State is already !

Response

Thank you for your comments. Natural gas extraction from the Marcellus Shale formation is the number one emerging threat to the restoration of the Chesapeake Bay. The technique of hydraulic fracturing (fracking) used to extract the natural gas from the shale over one mile below the surface has damaged streams, water supplies and forests in Pennsylvania. The drilling and fracking process presents three water-related problems. The first is withdrawals. Gas companies need about 5 million gallons to frack each well. They pull the water from streams, and because nearly three-quarters of the Marcellus is in the Susquehanna River basin, much of that water has and will come from those feeding the Bay's largest tributary. The companies have occasionally pulled water from small headwater creeks that are slow to refill, which can change temperatures and oxygen levels and endanger fish. The second is the fracking wastewater, called flowback, which is usually stored in a plastic-lined impoundment before it can be trucked to a treatment plant. Critics worry that the wastes could spill during transit or operations and run into waterways or seep into groundwater. Because fracking waste can have five times as much salt in it as ocean water, groups such as Trout Unlimited worry that accidents like that will forever change the ecology of fresh, coldwater streams. The third problem is groundwater contamination from methane accidentally released through the drilling. Methane contamination has been reported in other states where drilling has occurred, and critics worry it could become a bigger problem in Pennsylvania. In regards to forests, the concern is loss and fragmentation. According to a recent report by the U.S. Department of Agriculture's Forest Service and the Conservation Fund, the Bay watershed loses 100 acres of forests a day, and is likely to lose nearly 10 million acres by 2030. That's of great concern for the Chesapeake Bay watershed, because forests have long been considered the best land use to protect the Bay. They absorb nitrogen, slow erosion, provide crucial fish and bird habitat and promote biodiversity. The rush for gas has the potential to accelerate those losses and break up increasingly rare, large, unbroken blocks of forest, since each drill site requires at least five acres for a well pad, and miles of roads and pipelines that fragment the forest.

When everyone is held accountable for their production and operations, then you will start to see a greater reduction of nutrient and sediment loading to the Bay.

Response

The TMDL is based on extensive evaluation of loading data from all sectors - wastewater, storm water runoff, forests, atmospheric deposition, and agriculture – and restoration of the Bay will necessitate reductions in loadings from each of these sectors. In the TMDL EPA has apportioned wasteload allocations and load allocations to achieve the reductions in all sectors that will be necessary to attain water quality standards in the Bay.

Agricultural operations in the Bay watershed have made significant progress in implementing management practices to reduce nitrogen, phosphorus, and sediment loadings in many areas of the Bay watershed. Many operations have implemented innovative approaches to reducing nutrient runoff from cropland and animal agriculture areas. Nevertheless, the record for this action includes detailed data showing that agriculture is the largest single source of nutrients and sediment to the Bay. EPA has documented that significant opportunities still exist to implement improved nutrient management practices for both cropland agriculture and animal agriculture, including more widespread adoption of innovative or “next-generation” practices. Within the animal agriculture sector, concentrated animal feeding operations (CAFOs) can achieve load reductions by incorporating more advanced nutrient reduction measures into their nutrient management plans. Non-CAFO animal feeding operations, which are currently subject to less regulatory control, can be designated or defined as CAFOs where necessary to achieve nutrient reductions for impaired water bodies.

The TMDL, and the activities being taken pursuant to the Executive Order and the settlement agreement, reflect the need to reduce loadings to the Bay from all sources – not just agriculture – through a variety of regulatory and non-regulatory practices that are equitable, reflect different sectors’ contributions to impairment and opportunities for further progress, and the best possible science.

EPA's Backstops Eliminate Planned Agricultural Load Reductions Despite Those Controls Being Among the Most Cost-Effective Measures for Improvement

The bulk of responsibility for nutrient reduction in the Draft TMDL has been unfairly shifted to the wastewater sector, particularly on the James River. The level of effort associated with EPA's proposed "backstop allocation" for the James River basin approximates the status quo for agriculture, while imposing near limit-of-technology controls on wastewater point sources. This disparate approach disregards the rules previously established in the TMDL development process that were designed to achieve fairness and equity in responsibility among sectors and makes no economic sense.

Response

The Chesapeake Bay Program partnership and the agricultural community, have made significant past progress towards addressing the loss of nutrients and sediments to the tidal Chesapeake Bay. The agriculture and point source sectors, including municipal waste water treatment plants, have achieved the majority of the pollution reductions to date. Another important point source sector where much more progress needs to occur is pollution from urban areas. As you may know agriculture represents the largest managed land use within the Chesapeake Bay watershed, as well as the largest single source of nutrients and sediment entering the Bay. Consequently, the Bay states are seeking additional nutrient and sediment reductions from the agricultural sector to assist with achieving the water quality requirements of the Chesapeake Bay TMDL to be released by December 31, 2010 through their supporting Watershed Implementation Plans (WIPs). A portion of this continued reliance by the Bay states to achieve future nutrient and sediment reductions is based on continued support from municipal treatment plants, equitable pollution reductions from urban areas as well as from the agricultural community.

Organization: Environmental Working Group

Environmental Working Group is a research and advocacy nonprofit with considerable expertise in U.S. agriculture. Our goal is to bring the best data and science to bear to inform the development of policy to address agriculture's environmental challenges.

The reduction of agricultural pollution necessary to restore the health of Chesapeake Bay is a critical environmental challenge receiving considerable Environmental Protection Agency attention. As the agency evaluates state Watershed Implementation Plans (WIPs), EWG urges the EPA to focus on thresholds for land application of phosphorus as an appropriate indicator of "sufficient reasonable assurance" of reductions in agricultural non-point source pollution.

Response

Please see response to comment 0228.1.001.002.

Comment ID 0327.1.001.005

Author Name: Stewart Steve

Organization: Baltimore County

- **Shoreline Erosion:** While mentioned in the TMDL document, there is no loading ascribed to this source. Given the immediate proximity of shorelines to shallow water habitat and the detrimental effect of sediment on water clarity and the ability to support SAVs, greater effort needs to be made to quantify the amount sediment, phosphorus, and nitrogen from this source.

Response

Estimates of the sediment and nutrient loads associated with tidal shoreline erosion are included in the inputs of the Water Quality and Sediment Transport Model of the tidal Bay. Generally, the sediment loads from shoreline erosion are equivalent to sediment loads from the watershed. Estimates of the fastland or shore recession rate, the elevation of the fastland, and the subtidal erosion rate were used to develop these shoreline erosion estimates.

Tidal shoreline erosion is actually a combination of the erosion of fastland (or shoreline) and nearshore erosion. Nearshore erosion is subtidal and usually unseen. Subtidal erosion can be accelerated when shoreline protection activities such as stone revetment are used. That practice typically cuts off fastland erosion, but the reflected wave energy continues subtidal erosion until the wave energy no longer scours the bottom to the depth of a meter or more.

Organization: National Association of State Departments of Agriculture (NASDA)

State agriculture departments are at the forefront of efforts in the region to address water quality in the Chesapeake Bay. Our members in the Chesapeake region -and nationwide-are committed to addressing water quality, and other environmental challenges, in an effective and responsible manner. In the Chesapeake Bay watershed, agriculture and forestry producers are among those who have made possible the significant reductions in nutrient and sediment loadings to the Chesapeake Bay that has occurred over the past 25 years. Even EPA's data show that since 1985 the agriculture community has reduced phosphorus loadings by over 21 percent, nitrogen loadings by over 27 percent, and sediment loadings by over 24 percent from 1985.[FN1] However, EPA's models do not account for many agricultural

and forestry practices that are currently being employed in the Chesapeake Bay Watershed to protect water quality. Thus, the Draft TMDL fails to acknowledge the success that has been achieved in the Bay by the efforts of the agricultural community and others. It is imperative that the watershed jurisdictions be afforded wide latitude in issuing TMDLs for nutrients and sediment that accurately reflect the tremendous progress that has been made and that build on that success, rather than having federal mandates imposed upon them. It is vital that EPA consider the benefits derived from agriculture and the risk of driving agriculture out of the watershed through this process.

[FN1] See EPA Presentation at the September 29, 2010 public meeting on the Draft TMDL in the District of Columbia, at 23-25 (available at http://www.epa.gov/reg3wapd/pdf/pdf_chesbay/dcpblicmeetingrakmods.pdf).

Response

The Chesapeake Bay Program partnership and the agricultural community have made significant past progress towards addressing the loss of nutrients and sediments to the tidal Chesapeake Bay. The agriculture and point source sectors, including municipal waste water treatment plants, have achieved the majority of the pollution reductions to date. Agriculture continues to represent the largest managed land use within the Chesapeake Bay watershed, as well as the largest single source of nutrients and sediment entering the Bay. Consequently, the Bay states are seeking additional nutrient and sediment reductions from the agricultural sector to assist with achieving the water quality requirements of the Chesapeake Bay TMDL to be released by December 31, 2010 through their supporting Watershed Implementation Plans (WIPs). A portion of this continued reliance by the Bay states to achieve future nutrient and sediment reductions is based on improving the tracking and reporting of both cost shared and non-cost shared agricultural practices. The verification and crediting of these practices by EPA may result in more conservative nutrient and sediment reductions as a result of a comparison to approved practice implementation and maintenance standards, and associated effectiveness value estimates.

Organization: National Association of State Departments of Agriculture (NASDA)

EPA acknowledges that the "Chesapeake Bay TMDL is the largest, most complex TMDL in the country, covering a 64,000-square-mile area in seven jurisdictions." Draft TMDL, at 2-7. EPA is proposing two separate sets of load allocations and waste load allocations for three pollutants in 92 water body segments. Thus, the Draft TMDL is, in fact, 552 TMDLs.

Response

The Chesapeake Bay TMDL released on December 31, 2010 is a composite of 92 TMDL load allocations based on the 92 tidal segments of the Chesapeake Bay proper. Within each of the TMDL load allocations is a distinction between point sources and non-point sources; e.g. load allocations (LA) and waste load allocations (WLA). This distinction between sources within a TMDL is

typical of the TMDL process and is not specific to the Chesapeake Bay TMDL. Unlike the draft TMDL, which proposed allocations based on “hybrid backstop allocations,” “full backstop allocations”, and allocations based on current water quality standards, the final TMDL will include one set of wasteload and load allocations for each of the 92 tidal segments of the Chesapeake Bay and its tributaries. Furthermore, the final TMDL is based only on the applicable WQS.

Additionally, we object to the draft backstop allocations for agriculture operations. In particular, there are several concerns related to the management of animal feeding operations (AFO) as concentrated animal feed operations (CAFO) and imposing CAFO permitting requirements on all AFO's.

EPA's authority to designate AFOs as CAFOs is governed by 40 C.F.R. 122.23(c). However, that authority is limited. First, the AFO must actually discharge pollutants.[FN2] Second, either the state or the EPA Regional Administrator must first make a determination that the particular AFO "is a significant contributor of pollutants to waters of the United States." Third, if a state is authorized to carry out the CWA permitting program (which includes every watershed jurisdiction except for the District of Columbia) then the Regional Administrator may designate an AFO as a CAFO only if "the Regional Administrator has determined that one or more pollutants in the AFO's discharge contributes to an impairment of a downstream or adjacent State or Indian Country water that is impaired for that pollutant." 40 C.F.R. 122.23(c)(1). EPA will not be able to rely on its Watershed Model to make these determinations, because the model cannot predict water quality impacts at the individual facility level. Thus, EPA will have to develop site-specific data before it can make such a determination.

Notably absent from the regulation is the authority to designate an AFO as a CAFO because EPA does not agree with a state's WIP. Accordingly, EPA's claim (in both its backstop allocation and in its evaluation of state WIPs) to be able to broadly use residual designation authority against AFOs is invalid.

[FN2] See *Waterkeeper Alliance et al. v. EPA*, 399 F.3d 486, 504 (2d Cir. 2005); *Service Oil, Inc v. EPA*, 590 F.3d 545 (8th Cir. 2009).

Response

Thank you for providing comments about EPA's designation authority for animal feeding operations. The provision to designate an animal feeding operation has been a provision in the Clean Water Act for quite some time although this action has rarely been exercised by EPA. However, under appropriate circumstances, EPA may consider using its authority to designate an AFO as a CAFO. In these cases, EPA will utilize the protocol set forth in 40 CFR Section 122.23(c). EPA developed backstop allocations for this sector based assumptions about tighter controls on federally permitted point sources of pollution.

Comment ID 0517.1.001.005

Organization: Piedmont Environmental Council

PEC believes that EPA has too readily dismissed the potential for voluntary, incentive based programs to achieve some of the goals for the reduction of non-point source pollution, particularly in the agricultural sector. The rhetorical device of claiming that the historic reliance on voluntary programs in the agricultural sector to reduce non-point source contributions of sediment has failed ignores the fact that pollution from agricultural sources has declined, whereas pollution from urban and suburban non-point sources has increased dramatically

Cattle, other livestock, and the equine industry, along with the hay and grain that sustains them, are the dominant agricultural uses. In the past decade, growing interest in local food supply and agricultural tourism has reinvigorated produce production. Vineyards and wine production have also expanded dramatically. Each of these uses has the potential to either supplement or conflict with efforts to protect water quality. But for the most part, the trends are favorable. Within the PEC service area, more than 160,000 acres of prime farm soils and important farms have been placed into conservation easement. Most of those easements include specific provision for protection of riparian areas, including vegetated buffers of 35 to 100 feet along perennial streams and rivers.

Similarly, the interest in protecting scenic and historic values that are the basis for recreation and heritage tourism in the Piedmont region has facilitated the conservation of additional lands, including critical riparian, wetlands, and forested areas. Fully 325,000 acres of land in the PEC service area have been placed in conservation easement, most of which include limits on structures and roads, require forest management plans and include requirements for vegetated buffers of 35 to 100 feet along perennial streams and rivers.

PEC believes that their remains potential to expand participation in voluntary programs. Consistent administration, expanded collaboration with local and non-profit agencies to increase landowner education and technical assistance, and expanded funding of a variety of federal, state, and local programs all will help achieve the ambitious goals set out by the Chesapeake Bay TMDL.

Response

The Chesapeake Bay Program partnership and the agricultural community, have made significant past progress towards addressing the loss of nutrients and sediments to the tidal Chesapeake Bay. The agriculture and point source sectors, including municipal waste water treatment plants, have achieved the majority of the pollution reductions to date. Another important point source sector where much more progress needs to occur is pollution from urban areas. As you may know agriculture represents the largest managed land use within the Chesapeake Bay watershed, as well as the largest single source of nutrients and sediment entering the Bay.

Consequently, the Bay states are seeking additional nutrient and sediment reductions from the agricultural sector to assist with achieving the water quality requirements of the Chesapeake Bay TMDL to be released by December 31, 2010 through their supporting Watershed Implementation Plans (WIPs). A portion of this continued reliance by the Bay states to achieve future nutrient and sediment reductions is based on developing more stringent nutrient management plans and innovative technical practices, new policies and regulations that reduce nutrient runoff and improving the tracking and reporting of both cost-shared and

non-cost shared agricultural practices to more clearly document implementation of conservation practices by the agricultural community.

EPA's continued insistence on the development of more alternative use facilities and technologies fails to recognize effective BMPs such as the organic fertilizer plant in Sussex County, DE. This facility produces organic fertilizer from poultry litter generated within the Chesapeake Bay watershed. Perdue offers the service of removing poultry litter from grow out houses and processing this litter to produce an organic fertilizer. This service is offered, free of charge, to any poultry farmer that operates within the Delmarva Peninsula. Since 2001, Perdue AgriRecycle has handled approximately 694,000 tons of raw litter. 325,506 tons of finished product has been marketed and shipped out of the plant with roughly 50 percent being shipped outside of the Chesapeake Bay watershed. EPA's efforts could be better spent on helping with transportation costs of the finished Perdue AgriRecycle products than constantly calling for the development of high priced, complex, on-the-farm or centralized alternative use facilities. Money provided for government grants to research new technologies and the grants/loans available to farmers to install and operate such systems would be more efficiently used by providing transportation assistance to the finished products from the Perdue AgriRecycle plant.

Response

EPA is fully aware of many of the advances that the poultry industry has helped support as part of the nutrient management planning process throughout the Chesapeake Bay watershed. We often have had meetings and discussions with the Delmarva Poultry Industry and the Virginia Poultry Industry and have appreciated the opportunity to share developing technologies and other on farm practices.

Nutrient management plans as you know represents all of the important technical components that address improvements to water quality. Some of the newer technical practices that have been supported by USDA's Natural Resources Conservation Service can also address air quality concerns in minimizing the transfer of nitrogen from poultry houses.

Over the past several months the Chesapeake Bay program has been presented with a number of new practices and have been asked to accept them to be included in the Bay model crediting nutrient reductions. Some have been accepted on an interim basis while others were rejected based on not have water quality documentation and related nutrient efficiency data. EPA has suggested to State agricultural agencies and other agriculture organizations to plan to undertake the appropriate levels of research on management practices that either are being implemented or are planned to be implemented as EPA would look forward to working with these agencies and organizations to achieve a greater number of practices that ultimately be part of the Chesapeake Bay model.

EPA looks forward to continuing to having discussions with the poultry industry and appreciates the support you have provided.

Comment ID 0607.1.001.008

Author Name: Bauhan Hobey

Organization: Virginia Poultry Federation (VPF)

Recognizing Successful State Programs

Rather than exceed the limits of its regulatory authority, EPA should recognize the efficacy of state programs. For example, the Virginia Poultry Waste Management Act and regulations are equally and in some cases more efficacious for water quality protection than federal CAFO permits. Requiring more farmers to be covered under federal CAFO permits only burdens farmers with more paperwork and does nothing for water quality.

Conclusion

Virginia has identified some priority agricultural BMPs and directed cost-share and other incentives toward their adoption. Rather than new regulatory mandates, the most good can be achieved through consistent and reliable cost-share funding and technical assistance through local conservation agencies. We ask EPA to reconsider its perilous course and allow states to chart a path forward that balances the universally shared desire to improve the condition of the Bay while preserving state prerogatives and avoiding detriment to agriculture and Virginia's economy generally.

Response

EPA is fully aware of many of the advances that the poultry industry has helped support as part of the nutrient management planning process throughout the Chesapeake Bay watershed. We often have had meetings and discussions with the Delmarva Poultry Industry and the Virginia Poultry Industry and have appreciated the opportunity to share developing technologies and other on farm practices.

Nutrient management plans as you know represents all of the important technical components that address improvements to water quality. Some of the newer technical practices that have been supported by USDA's Natural Resources Conservation Service can also address air quality concerns in minimizing the transfer of nitrogen from poultry houses.

Over the past several months the Chesapeake Bay program has been presented with a number of new practices and have been asked to accept them to be included in the Bay model crediting nutrient reductions. EPA looks forward to continuing to having discussions with the poultry industry and appreciates the support you have provided. After several decades of efforts to restore the Bay, it still remains significantly impaired. So more of the same is not acceptable and innovative and aggressive new efforts are necessary to demonstrate that the source sectors such as the poultry industry will take the

necessary steps to restore the Bay.

Comment ID 0614.1.001.012

Author Name: Street William

Organization: James River Association (JRA)

Agriculture - While the allocation for agriculture in the Draft WIP is appropriate and the projected implementation levels for input deck BMP's are reasonable, the plan lacks sufficient detail for the programs and policies that will be proposed in order to achieve them. The Draft WIP acknowledges that additional incentives and requirements/other mechanisms will be needed to meet the projected implementation levels but does not offer any specifics of what they will be. A number of policies and even proposed legislation were circulated and discussed with members of the Stakeholder Advisory Group, of which JRA was a member. However, none of the program delivery mechanisms was described sufficiently in the Draft WIP. In order to provide reasonable assurance that the projected implementation levels will be achieved, the final WIP must provide greater detail for the delivery mechanisms.

Members of Virginia's agricultural community have suggested an approach that would provide flexibility to farmers through the use of a conservation plan. Such an approach has the benefits of allowing farmers to select the practices the best fit their operation, thereby gaining greater buy-in from the farmer and the agricultural community as a whole. However, in order for this approach to be successful and provide reasonable assurance, it must include the following elements:

- A specific methodology for the conservation plan that ensures a comprehensive assessment of the farm operation
- A performance standard for the conservation plan that can be tied to needed nutrient and sediment pollution reductions. (This will also facilitate nutrient trading by establishing a baseline beyond which pollution reductions could become nutrient credits.)
- Clear accounting of BMP's implemented both prior to the plan and on an on-going basis
- Verification of practice implementation and function over time
- Accountability for lack of implementation.

Response

EPA has articulated its expectations for what level of detail should be included in the Watershed Implementation Plans through several memoranda to the states. Specifically, in the November 9, 2009 memorandum to the states, EPA called for specific details on how key strategies will be achieved in the WIPs including how funding and technical resources will be garnered to support the activity, how producers will be motivated/incentivized to reach the implementation levels, and timeframes for when implementation levels and reduction targets will be achieved. This level of detail is necessary to build EPA's reasonable assurance that agricultural reduction targets will be met. Organization: VA Department of Environmental Quality

The EPA backstop allocation for the James River does not call for any reduction in nitrogen loads within the agriculture sector from 2009 progress. For the other VA basins, the backstop calls for decreased allocations from 2009, ranging from 18 to 39% among the basins.

Recommendation: Set allocations that establish reductions for the agricultural sector.

The attached [Comment Letter contains additional information in the form of an attachment. See original comment letter 0712.1] photo illustrates why you need to make BMPs for nonpoint sources enforceable. I took the attached photo this morning. This farmer farms several hundred acres yet he didn't want to fence off a narrow strip of land along an ephemeral stream. This is 2010 and there are still farmers that don't keep their cows out of the creek. The ephemeral stream in the picture feeds into Tom's Creek which is exceeding its water quality standards for nutrients and sediments. There are countless examples of farmers not implementing BMPs in my county. All visible from the road. Enforcement officials wouldn't even have to get out of their car to find these polluters! Voluntary programs are not working.

I am a farmer and I support enforceable BMPs for nonpoint sources.

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

Assumptions Made in the Draft TMDL With Respect to Agricultural Loadings and What Constitutes Achievable Further Nutrient Reductions Are Arbitrary and Capricious and Must Be Changed.

A. The Draft TMDL's Overall Agricultural-related Allocation Will Drive Many Small and Medium Size Farms Out of Business

In the judgment of some of New York's leading agricultural experts convened by the USC, the only possible way to meet the draft TMDL's identified allotment would be if 50% of the farms within the watershed ceased operation [FN39] and the current inventory of farm raised animals (mainly cows) was reduced by 50%.

In general, the Coalition defers to the more detailed analyses of the agricultural-related issues it understands are being made by both the NYSDEC and the USC. However, it believes that some of these issues need to be highlighted here as they underscore why our Coalition, whose members represents most of the New York identified N/P/Sediment sources has come together to demand additional changes to the Draft TMDL before it is finalized.

[FN39] USC Factsheet "Chesapeake Bay Program TMDL Allocations in NY".

Response

EPA has received numerous comments that the nutrient allocations to NY are arbitrary and capricious. While the comments and reasons why the commenter believes the allocation to NY was unfair, this response provides EPA reasoning why the allocation to NY is appropriate.

EPA led a dialogue with all watershed jurisdictions, including NY, for over 2 years on the approach that should be used to allocate loadings to all states. While numerous methods were considered, EPA could not arrive at a consensus methodology for all states. The methodology used did enjoy the most agreement of any methodology considered among the jurisdictions.

The methodology used was, in part, based on the loadings expected under current land use and design flows from WWTP facilities. Current land use and design flow of WWTPs is a common approach used in developing TMDLs, including New York. Of the thousands of TMDLs developed in the Bay watershed, EPA is aware of only a few TMDLs that were based on past land use. The reason for this approach is straightforward. That is, in establishing a TMDL, one allocates to various sources contributing to the problem. When developing an allocation approach it stands to reason that the approach should consider the existence of those sources. So to suggest an approach that 'pretends' that the population and land use is different than the existing levels is inappropriate in EPA's opinion. Consistency with other TMDL practices is one of the reasons why the Bay partner states supported the method for allocating loads to the states that include using existing land use and design flows for WWTPs.

At an October 29, 2009 meeting among all states Principals' Staff Committee members, including New York, the proposed method

was accepted by all states except New York. New York abstained from an opinion during that meeting. Subsequent to that meeting New York and West Virginia expressed their disagreement with the method, citing various reasons.

Having no other method by which to allocate loads among the various jurisdictions, EPA used the method, with two significant exceptions, that gained widespread agreement among the states for the target loadings for nitrogen and phosphorus when these loads were provided to the states in a letter of July 1, 2010. Those exceptions were that EPA provided additional loading to both West Virginia and New York above that loading which those states would have received using the allocation methodology. More specifically, EPA ‘bumped’ the West Virginia allocation by 200,000 pounds per year of phosphorus and the New York allocation by 750,000 pounds per year of Nitrogen. This increase was intended to address the concerns raised but not limited to:

--New York delivers cleaner water to the bay than other states.

--New York is losing in population and farming operations over the years while other states are increasing population

--New York’s load is attenuated when being ‘processed’ through the Susquehanna River on its way to the bay and therefore any reductions in load have less beneficial impact on the Bay.

Some of the comments cited statistics on the low loadings allocated to New York. While these statistics are helpful the more relevant statistics are the amount of reductions expected of New York.

In that regard a few statistics may be helpful:

--On a pound for pound basis, New York nutrient loads have a moderate impact on reducing dissolved oxygen in the bay, falling about in the middle of the various states and basins within the watershed.

--While New York has a moderate impact on the Bay, because of the ‘bump’ in nitrogen allocation, the New York nitrogen allocation represents the lowest percent of controllable load of any jurisdiction in the watershed. Controllable load was considered by the Bay partners to be the best metric of load by which to make allocations decisions to the states.

--The ‘bump’ in nitrogen allocation for New York represents a 25% drop in the loading reduction needed in New York.

--The allocation for New York represents the second lowest pounds per acre reduction of all states (and the district) in the Bay watershed for both phosphorus and nitrogen.

--As of 2009, New York lags far behind all other states (and the district) in the bay watershed in upgrading their wastewater treatment plants to control nitrogen and phosphorous.

--The 2009 loading of nitrogen delivered to the Bay from New York is greater than the delivered loading from West Virginia, Delaware, and the District of Columbia and greater than the delivered load of any two of those jurisdictions combined.

--The 2009 loading of phosphorous delivered to the Bay from New York is similar to the delivered loading from West Virginia, and greater than the combined phosphorous loading from Delaware and the District of Columbia.

So the point remains that to restore the Chesapeake Bay, all jurisdictions and all sectors will need to achieve reductions of nitrogen and phosphorous. EPA used its discretion, based on extensive input from the Bay partners, to develop a rational science-based methodology to divide that allowable loading among the bay jurisdictions. To address the concerns raised by the headwater states of New York and West Virginia, EPA provided additional loadings to those states.

On the matter of EPA backstop allocations in the draft TMDL, please see response to comment # 0067.1.001.009.

Non-Point Source Agriculture Has, and Will Continue To, Reduced Its Nutrient Loads In Excess of the other Bay States

In addition to the Point Source-related nutrient reductions discussed above, much work has also been done in New York to reduce nutrient and sediment-related runoff from agriculture NPS within the Bay Watershed. Under the umbrella of the USC's Agricultural Team, which includes partners from NY-NRCS, DEC, Ag and Markets, major universities and all 16 New York County Soil and Water Conservation Districts (which are Coalition members) within the Bay Watershed [FN40] promote several programs that are intended to reduce agricultural related nutrients and sediments from entering the surface waters. These programs include:

- The New York Agricultural Environmental Management Program (AEM);
- Voluntary, incentive-based program in existence since 1996
- Progressive planning process to implement BMPs on farms consistent with the resources of each individual farm:
 - The 5-Tiered AEM process includes an inventory and assessment of environmental risk, conservation planning, implementation of BMPs according to NRCS standards, and evaluation of implemented BMPs to ensure on-going effectiveness.
- Watershed-based but locally lead and implemented
- Reflects local financial and technical needs
- Technical assistance is provided by local Soil and Water Conservation Districts, NRCS, Cornell Cooperative Extension, Certified Planners, and Professional Engineers
- Funding for implementation of AEM generated plans through the Agricultural Nonpoint Source Abatement & Control Grant Program (AGNP) and USDA Farm Bill Programs which nationally provides millions of dollars annually in competitive grants to assist farmers in preventing water pollution from agricultural activities
- Support of "wall to wall" buffers through "Graze-NY" which provides farms with technical assistance to adopt prescribed grazing management systems that contribute to the financial, environmental and social well-being of local watersheds.
- Commitment to proper Herd Nutrient Management through rigorous conservation planner certification process, which is supported by
 - Performance-based Conservation Planner Certifications
 - Regular training for SWCDs (including their Board of Directors) and NY-NRCS employees,

o Training to, and helping, farmers apply environmentally and agronomically-sound guidelines developed by Cornell University (New York's Land Grant College).

- Cornell University promotes resource efficient (nutrients, soil, water, fuel, etc.) farm management along with robust outreach, extension and applied research efforts.

[FN40] In addition, of their Pennsylvania counterparts Solid Water Conservation Districts are also members of USC.

Comment ID 0211.1.001.009

Author Name: McCarthy R.

Organization: Town of Erwin, New York

the EPA has failed to incorporate a sufficient system of checks and balances to ensure a significant reduction of airborne nutrients deposition originating from areas outside of the Chesapeake Bay watershed,

Response

Over the last 30 years reduction in NO_x deposition in the Chesapeake watershed have declined by more than 30%. Further reductions in atmospheric deposition are expected from ongoing implementation of management practices to achieve the current air quality standards, as well as additional reductions that may be required by the new ozone standard to be set by July 2011.

The air reductions assumed in the Chesapeake TMDL include emission reductions due to regulations implemented through the Clean Air Act authority to meet National Ambient Air Quality standards for criteria pollutants in 2020. These are:

On-Road mobile sources: For On-Road Light Duty Mobile Sources this includes Tier 2 vehicle emissions standards and the Gasoline Sulfur Program which affects SUV's pickups, and vans which are now subject to same national emission standards as cars.

On-Road Heavy Duty Diesel Rule – Tier 4: New emission standards on diesel engines starting with the 2010 model year for NO_x, plus some diesel engine retrofits.

Clean Air Non-Road Diesel Rule: Off-road diesel engine vehicle rule, commercial marine diesels, and locomotive diesels (phased in by 2014) require controls on new engines.

Off-road large spark ignition engine rules affect recreational vehicles (marine and land based).

EGUs: CAIR second phase in place (in coordination with earlier NO_x SIP call); Regional Haze Rule and guidelines for Best Available retrofit Technology (BART) for reducing regional haze; Clean Air Mercury Rule (CAMR) all in place.

Non-EGUs: Solid Waste Rules (Hospital/Medical Waste Incinerator Regulations).

EPA's Failure to More Aggressively Target Air Deposition Is Unreasonable

CBPO has estimated that atmospheric sources account for about one third of the nitrogen that reaches the Bay, and the majority of this load originates from outside the Chesapeake Bay watershed (EPA, 2010). CBPO has developed airshed model scenarios representing various levels of atmospheric load reduction. Given the magnitude of the load derived from atmospheric sources, it is critical that these sources bear a proportional operational and financial responsibility for load reduction, and other sectors not be negatively impacted due to lack of atmospheric load reductions. This may require the CBPO to model and pursue regulatory strategies that are beyond existing or proposed regulations, including atmospheric controls specifically targeted toward water quality protection.

EPA's Draft TMDL document states that "in determining the amount of air controls to be used as a basis for the air allocation, EPA relied on current laws and regulations under the Clean Air Act." While EPA is calling on states to go well beyond existing programs and regulations for other sectors, it is not applying the same standard to the air allocations for which it is responsible. The resulting allocation is only about 12% lower than 1985 levels, and does not reflect key opportunities of the 2020 maximum feasible scenario, additional ammonia reductions from agricultural practices, or new air regulations specifically focused on nutrient reduction. EPA is being complacent in aggressively chasing down additional reductions from this key source sector. EPA has lackadaisically accepted what other programs are planning for air pollution reductions as good enough. In addition, EPA's decision to require Virginians to clean up nutrients that are deposited on our land from states outside the Watershed begs for a better approach to source reductions.

Response

Over the last 30 years reduction in NO_x deposition in the Chesapeake watershed have declined by more than 30%. Further reductions in atmospheric deposition are expected from ongoing implementation of management practices to achieve the current air quality standards, as well as additional reductions that may be required by the new ozone standard to be set by July 2011.

The air reductions assumed in the Chesapeake TMDL include emission reductions due to regulations implemented through the Clean Air Act authority to meet National Ambient Air Quality standards for criteria pollutants in 2020. These are:

On-Road mobile sources: For On-Road Light Duty Mobile Sources this includes Tier 2 vehicle emissions standards and the Gasoline Sulfur Program which affects SUV's pickups, and vans which are now subject to same national emission standards as cars.

On-Road Heavy Duty Diesel Rule – Tier 4: New emission standards on diesel engines starting with the 2010 model year for NO_x, plus some diesel engine retrofits.

Clean Air Non-Road Diesel Rule: Off-road diesel engine vehicle rule, commercial marine diesels, and locomotive diesels (phased

in by 2014) require controls on new engines.

Off-road large spark ignition engine rules affect recreational vehicles (marine and land based).

EGUs: CAIR second phase in place (in coordination with earlier NO_x SIP call); Regional Haze Rule and guidelines for Best Available retrofit Technology (BART) for reducing regional haze; Clean Air Mercury Rule (CAMR) all in place.

Non-EGUs: Solid Waste Rules (Hospital/Medical Waste Incinerator Regulations).

Of the atmospheric NO_x emitted from Virginia, only about 7% is deposited back into Virginia's portion of the Chesapeake. The rest of Virginia's emissions are deposited mostly in downwind States including other States of the Chesapeake watershed. Overall, only about 50% of the NO_x emitted in the Chesapeake watershed returns to the watershed. In atmospheric deposition we are all upwind emitters of load, and downwind receivers of atmospheric deposition. That's why controls of atmospheric deposition loads need to be from national programs, just as they are in the Chesapeake TMDL accounting of atmospheric deposition loads.

Comment ID 0265.1.001.015

Author Name: Clark, Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

Also, EPA has failed to aggressively target air deposition in the TMDL for greater load reductions. Atmospheric sources are estimated to account for about one-third of the nitrogen loading to the Bay, yet the TMDL simply accepts existing and planned air regulatory programs as an appropriate level of effort to reduce nitrogen loads from air deposition, much of which originates from outside of the Bay watershed. An aggressive, targeted approach to this large source sector would free-up allocations for the urban source sector, making it more likely that this sector's allocations could be attained at some point in the future.

Response

The Chesapeake TMDL establishes allocations for atmospheric nitrogen loads, which includes NO_x emissions from all power plants, industry, mobile sources and others. NO_x is a precursor to ozone and a contributor to PM_{2.5} particulates and are controlled by the Clean Air Act (CAA) but also are involved with nitrogen deposition in the Chesapeake watershed and ultimately, the delivery to the Chesapeake of nitrogen loads. Because the CAA ozone and PM_{2.5} standards are fixed air quality standards that must be met, and since the standards are out of attainment in many parts of the watershed, the SIP plans created by the States to control NO_x emissions are a significant control for Chesapeake nitrogen loads.

Over the last 30 years reduction in NO_x deposition in the Chesapeake watershed have declined by more than 30% due to Federal and State programs of air quality management. Further reductions in atmospheric deposition are expected from ongoing implementation of management practices to achieve the current air quality standards, as well as additional reductions that may be required by the new ozone standard to be set by July 2011.

The air reductions assumed in the Chesapeake TMDL include emission reductions due to regulations implemented through the Clean Air Act authority to meet National Ambient Air Quality standards for criteria pollutants in 2020. These are:

On-Road mobile sources: For On-Road Light Duty Mobile Sources this includes Tier 2 vehicle emissions standards and the Gasoline Sulfur Program which affects SUV's pickups, and vans which are now subject to same national emission standards as cars.

On-Road Heavy Duty Diesel Rule – Tier 4: New emission standards on diesel engines starting with the 2010 model year for NOx, plus some diesel engine retrofits.

Clean Air Non-Road Diesel Rule: Off-road diesel engine vehicle rule, commercial marine diesels, and locomotive diesels (phased in by 2014) require controls on new engines.

Off-road large spark ignition engine rules affect recreational vehicles (marine and land based).

EGUs: CAIR second phase in place (in coordination with earlier NOx SIP call); Regional Haze Rule and guidelines for Best Available retrofit Technology (BART) for reducing regional haze; Clean Air Mercury Rule (CAMR) all in place.

- Atmospheric nitrogen from other states : It is estimated that approximately 20-25 percent of the total nitrogen delivered to the Bay from New York originates from airborne pollution from outside of the state.

The allocations assigned to New York State in the Draft TMDL fail to incorporate these fairness principles . In addition to being inequitable, the proposed allocations are likely unachievable. Attempting to meet these goals would require significant and costly implementation measures that could jeopardize the economic well-being of communities within the watershed. We thus request that the proposed allocations be replaced with reasonable allocations that are both equitable and achievable.

Response

Of the atmospheric NO_x emitted from New York, only about 1% is deposited back into New York's portion of the Chesapeake. The TMDL states that 25-28% of total nitrogen loading is derived from areas outside the Chesapeake Bay Watershed. Are phosphorus and sediment deposited by means of atmospheric deposition as well? If so, what are the loads deposited for these pollutants?

Response

Response – The estimated atmospheric deposition loads of nitrogen and phosphorus can be found in Section 5 of the Phase 5.3 Watershed Model documentation:

ftp://ftp.chesapeakebay.net/Modeling/P5Documentation/SECTION_5.pdf

Atmospheric deposition loads of phosphorus are low in the Phase 5.3 and are only the aeolian sources of phosphorus deposited to water surfaces. Atmospheric deposition loads of sediment also occur, but are inconsequentially small and are not included in the CBP simulation as documented in Section 5 above.

We have been following the development of the Draft TMDL on our own and as members of the Utility Water Act Group (UWAG) [See comment EPA-R03-OW-2010-0736-0548] and the Edison Electric Institute (EEI) [See comment EPA-R03-OW-2010-0481]. UWAG will be submitting detailed comments on the Draft TMDL which Constellation strongly endorses and urges EPA to consider. Both EEI and UWAG are members of the Federal Water Quality Coalition (FWQC). The FWQC will also be submitting comments and we urge EPA to take those comments into consideration as well.

EPA correctly modeled nitrogen inputs from atmospheric deposition as non-point sources and established load reductions to be achieved based on Clean Air Act regulations by EPA and the states through 2020 (letter from Shawn M. Garvin to Shari T. Wilson, dated July 1, 2010). This methodology is appropriate because EPA has no authority under the Clean Water Act to regulate air emissions. Constellation encourages EPA to maintain this approach for air deposition sources in Phase II and Phase III of the TMDL.

Response

Thank you for your comment of support for the Chesapeake Bay Program's "correctly modeled nitrogen inputs from atmospheric deposition as non-point sources and established load reductions to be achieved based on Clean Air Act regulations by EPA and the states through 2020".

Comment 2. Air Deposition to Water.

The draft Bay TMDL includes reductions associated with deposition due to the installation of deNO_x technologies throughout the watershed. However, a portion of the reductions in air deposition will return to the Bay from these deNO_x technologies in the form of increases in ammonia nitrogen associated with stormwater runoff and in landfill leachate from fly ash handling and disposal.

As a result, WLAs or reserve WLAs are necessary because these deNOx technologies use of ammonia, which can have a balance-of-plant impact on fly ash and associated wastewater discharges. Ammonia tends to adsorb on fly ash within the flue gas train as both free ammonia and ammonium-sulfate compounds. This ammonia can then desorb during subsequent transport, disposal, or use of the fly ash.

In cases where fly ash is placed in a pond, the ammonia may desorb into the pond water. Landfilling of ammoniated fly ash may also cause leachate or runoff waters to have increased concentrations of ammonia, again presenting another TN load.

Therefore, we suggest that a portion of the air deposition reductions in TN loading to the Bay be reserved and provided to the same facilities that have or will be installing these deNOx control devices.

Response

Response - Associated with some NOx emission control technologies are ammonia emissions, called “ammonia slip emissions” which occur in catalyzed reactions of NOx with ammonia (NH₄⁺) and result in emissions of harmless N₂ diatomic gas and water. The ancillary ammonia slip emissions associated with these emission controls are included in the CBP model simulations. Loads from the proper disposal of fly ash in permitted landfills or ponds are considered to be negligible and are absent from the CBP calculations.

20) The EPA should act to better control air emissions by better regulating and enforcing emission controls from all sources and include similar provisions for each state.

Response

The Clean Air Act (CAA) ozone and PM_{2.5} standards are fixed air quality standards that must be met. In many parts of the Chesapeake watershed, the State Implementation Plans (SIP plans) created by the states to control NOx emissions in effect already have offsets to account for growth as the CAA cap cannot be exceeded. The WIPs under the authority of the Clean Water Act are unable to require these offsets.

Organization: Utility Water Act Group

1. UWAG supports EPA's approach to air emission sources.

The Bay TMDL air allocation reflects EPA's modeled nitrogen deposition to the Bay, taking into account the reduction in air emissions expected from sources regulated under existing or planned federal Clean Air Act programs. See Bay TMDL at 5-20. UWAG strongly supports EPA's inclusion of air deposition within the nonpoint source load allocation, consistent with existing EPA regulations and practice. Without taking a position on the need for air-side reductions, UWAG also strongly supports EPA's decision to defer any such reductions to authorized programs and rulemakings under the federal Clean Air Act.

UWAG is aware that other commenters have asked EPA to more aggressively target air deposition. However, EPA has no authority to do so under the Clean Water Act.

In other TMDL proceedings, UWAG has expressed concern about EPA regions and states attempting to use the Clean Water Act to force air-side reductions. See, e.g., UWAG's comments on the Northeast Regional Mercury TMDL. Any such attempt would be unlawful, because the Clean Water Act does not confer any authority on EPA regions or states to regulate air emissions sources. If those sources contribute to a water impairment, then they should, and must, be accounted for as nonpoint sources in the load allocation. But that is where the statutory authority ends. There is no federally enforceable mechanism (other than grant funding) to implement or achieve the load allocation.

Response

Response – Thank you for your comment of support of the atmospheric deposition approach taken in the Chesapeake TMDL. The Chesapeake TMDL relies on the national programs of the Clean Air Act and the associated Federal and State laws and regulations. Over the last 30 years reduction in NO_x deposition in the Chesapeake watershed have declined by more than 30% due to Federal and State programs of air quality management. Further reductions in atmospheric deposition are expected from ongoing implementation of management practices to achieve the current air quality standards, as well as additional reductions that may be required by the new ozone standard to be set by July 2011.

9. Air Deposition: EPA assumes a 15.7 million pound nitrogen deposition cap based on assumed national EPA rulemakings between now and 2020. TMDL at 6-32. A number of these rules have yet to be adopted, however, and some might be changed before 2020. If EPA is going to allow the states to assume this limit on air deposition, the agency must adopt enforceable mechanisms to assure that they are in fact achieved, or that states are required to cut their load allocations by the amount of any shortfall in the hoped for air deposition reductions.

Response

The air reductions assumed in the Chesapeake TMDL include emission reductions due to regulations implemented through the Clean Air Act authority to meet National Ambient Air Quality standards for criteria pollutants in 2020. These are:

On-Road mobile sources: For On-Road Light Duty Mobile Sources this includes Tier 2 vehicle emissions standards and the Gasoline Sulfur Program which affects SUV's pickups, and vans which are now subject to same national emission standards as cars.

On-Road Heavy Duty Diesel Rule – Tier 4: New emission standards on diesel engines starting with the 2010 model year for NOx, plus some diesel engine retrofits.

Clean Air Non-Road Diesel Rule: Off-road diesel engine vehicle rule, commercial marine diesels, and locomotive diesels (phased in by 2014) require controls on new engines.

Off-road large spark ignition engine rules affect recreational vehicles (marine and land based).

EGUs: CAIR second phase in place (in coordination with earlier NOx SIP call); Regional Haze Rule and guidelines for Best Available retrofit Technology (BART) for reducing regional haze; Clean Air Mercury Rule (CAMR) all in place.

Non-EGUs: Solid Waste Rules (Hospital/Medical Waste Incinerator Regulations).

These reductions are fully backed by Federal and State law and regulations. Over the last 30 years reduction in NOx deposition in the Chesapeake watershed have declined by more than 30% due to Federal and State programs of air quality management. Further reductions in atmospheric deposition are expected from ongoing implementation of management practices to achieve the current air quality standards, as well as additional reductions that may be required by the new ozone standard to be set by July 2011.

Atmospheric nitrogen sources: It is estimated that approximately 20-25 percent of the total nitrogen delivered to the Bay from New York originates from airborne pollution from outside of the state . Since New York has no control over these sources, they should not be included in New York's load allocation . The Chesapeake Bay Airshed Model should be used to establish nitrogen allocations for the upwind states that contribute these airborne pollutants.

1. Air Deposition

The TMDL should have assumed that more reductions from air deposition will have been achieved through various Federal Clean Air Act regulatory programs. As NYSDEC pointed out in its Draft NY WIP, while air deposition accounts for over 34% of the nitrogen flowing to the Bay, the TMDL allocations only call for a 15.7 MPY reduction due to federal CAA regulatory requirements [FN25]. NYSDEC in its draft WIP has added in another 1,00,000 to 2,000,000 pounds per year reduction in atmospheric-related air deposition within New York related to NYSDEC regulatory programs. We believe the Draft TMDL's assumed reductions are significantly too low. NYSDEC's evaluations have indicated that just the federal nitrogen related air quality requirements that have already been put in place could lead to a 70% reduction from 2007 levels [FN26]. In addition, EPA has just received a petition from the Clean Air Administrators requesting that EPA promulgate even more NO_x related air regulations, in order to address nitrogen related water quality problems throughout the country [FN27]. Based on this, we believe that the final TMDL must increase the assumed load reduction stemming from required and anticipated CAA-related improvements in air quality. This increase should then be distributed to the Bay States in a fair and equitable manner.

[FN25] Draft TMDL at 6.4.1.

[FN26] New York Draft Phase I WIP at IV(A).

[FN27] The National Association of Clean Air Agencies, in a resolution adopted Oct. 19, 2010, asked EPA to draft and finalize rules for seven source categories that are responsible for the bulk of nitrogen oxides emissions, sulfur dioxide emissions, and mercury emissions. The petition is available at [http://op.bna.com/env.nsf/idijsun-8agsqy/\\$FileINACAAair.PDF](http://op.bna.com/env.nsf/idijsun-8agsqy/$FileINACAAair.PDF).

Response

The Chesapeake TMDL relies on the national programs of the Clean Air Act and the associated Federal and State laws and regulations. Over the last 30 years reduction in NO_x deposition in the Chesapeake watershed have declined by more than 30%. Further reductions in atmospheric deposition are expected from ongoing implementation of management practices to achieve the current air quality standards, as well as additional reductions that may be required by the new ozone standard to be set by July 2011.

The rate of nitrogen reduction from atmospheric deposition is one of the highest of all the different source sectors in the Chesapeake watershed and comparable to the rate of nitrogen reduction from point sources.

The air reductions assumed in the Chesapeake TMDL include emission reductions due to regulations implemented through the Clean Air Act authority to meet National Ambient Air Quality standards for criteria pollutants in 2020. These are:

On-Road mobile sources: For On-Road Light Duty Mobile Sources this includes Tier 2 vehicle emissions standards and the Gasoline Sulfur Program which affects SUV's pickups, and vans which are now subject to same national emission standards as cars.

On-Road Heavy Duty Diesel Rule – Tier 4: New emission standards on diesel engines starting with the 2010 model year for NO_x, plus some diesel engine retrofits.

Clean Air Non-Road Diesel Rule: Off-road diesel engine vehicle rule, commercial marine diesels, and locomotive diesels (phased

in by 2014) require controls on new engines.

Off-road large spark ignition engine rules affect recreational vehicles (marine and land based).

EGUs: CAIR second phase in place (in coordination with earlier NO_x SIP call); Regional Haze Rule and guidelines for Best Available retrofit Technology (BART) for reducing regional haze; Clean Air Mercury Rule (CAMR) all in place.

Non-EGUs: Solid Waste Rules (Hospital/Medical Waste Incinerator Regulations).

While additional atmospheric deposition reductions may be required in the future in national air programs for the primary air quality standard for human health or the secondary air quality standards for standard for environmental health, considerable progress has already been made in reducing Chesapeake atmospheric deposition loads.

As a point of clarification, the 15.7 million pound per year allocation for nitrogen atmospheric deposition is for deposition to the Chesapeake tidal waters only. Reductions in atmospheric deposition to the Chesapeake watershed are credited to the Bay States where the reductions occur through the WIP development process.

23.3 - FOREST LAND

Comment ID 0064-cp.001.003

Author Name: Hutchins Lawrence

Organization: Quail's Nest Industries

An issue for concern is that the TMDL and Pennsylvania's WIP currently equitably distribute the required load reductions among sector sources. But the majority of the forest sector load comes from natural forest acres, and is unable to be reduced through land-management activities (Some reductions can be achieved via additional federal and state clean air regulations). As a result, it is impossible for the forest sector to meet this current load reduction goal - even if all timber harvesting was eliminated in the state.

5. Sustainable forest management provides incentives for landowners to retain forest land in forest cover.

Today the greatest threat to water quality impairment in the Chesapeake Bay Watershed results from deforestation that results from the conversion of forests to non-forest uses that produce a higher economic value. The families, businesses and individuals that own nearly 60% of our nation's forests depend on the returns they get from the products their forests produce to make additional investments in sound, long-term forest management. When existing markets for their products are strong, or when new markets like energy emerge, they provide forest owners the means to keep their land forested by keeping their forests economically competitive with other uses. However, when regulatory costs are imposed, this reduces a landowner's ability to maintain the land in forest cover and at some point will tip the balance in favor of non-forest uses.

Response

Thank you for your comments. The Environmental Protection Agency supports the use of sustainable forest management.

1. Forest Sector Allocations - The Draft TMDL provides the states with allocations for various sectors, including forests. As we understand, the required reduction targets for sectors are proportional to the base load allocation. In the case of the forest sector, this allocation and proportional load reduction is problematic. Pennsylvania forest sector has been identified as the source of 20 percent of Pennsylvania's nitrogen allocation, 14 percent of the phosphorus allocation and 18 percent of the sediment allocation. Only a small portion of this is attributed to harvesting activities subject to land management practices. The vast majority of the allocation is attributed to air deposition on non-harvested forests. While the loading rate for non-harvested forests is the lowest of any land-use category in the Bay model, the sheer number of forested acres in Pennsylvania's portion of the Bay watershed results in a significant load. We feel that the presentation of this information in the TMDL and subsequent state WIP leads users and the public to incorrectly conclude that forest management is a significant source of nutrient and sediment pollution.

The ability for Pennsylvania's WIP to implement a reduction of the emissions from this sector is extremely limited. Pennsylvania must rely upon implementation of air reduction emission from EPA and other entities outside of its control to address air quality improvements from upwind states. As such, it is doubtful that the required proportionate reductions from the forest sector are even possible. Additionally, we believe that the inability to achieve the necessary reductions from non-harvested forests forces a greater burden of reductions on harvested forest activities and other sectors. In short, forests should be a desirable land-use, but in the Draft TMDL, they are an impediment to a state's successfully implementing its WIP. EPA should address this issue, preferably by revising the TMDL to relieve the states of their responsibility of reducing emissions caused by air deposition on non-harvested forests. Otherwise, the TMDL should redistribute forest allocations to other sectors within states to better reflect the realities of how forests contribute to emissions to the Bay.

Response

There have been numerous studies in the Chesapeake Bay Region documenting BMP effectiveness, many of which do not appear to have been considered by EPA. There have been numerous studies in the Chesapeake Bay Region documenting BMP effectiveness, many of which do not appear to have been considered by EPA. A brief synopsis of key findings from these studies is as follows.

A watershed study conducted in central Pennsylvania suggested that the BMPs were effective in controlling non-point source pollution from a 44.5-hectare commercial clearcut (Lynch et al. 1985). Among the BMPs used were: protective buffer strips; a prohibition on skidding over streams; supervision of logging by a qualified forester; division of timber sales into blocks with cutting restricted to one block at a time; no disposal of tops or slash within 8 m of streams; proper location of haul roads, skid trails and log landings; retirement of skid trails, haul roads and culverts after logging; posting of a performance bond prior to logging. Slight increases in stream temperature, turbidity, and nitrate and potassium concentrations were observed, but these increases did not exceed drinking water standards. The authors concluded that the slight increases in temperature and nutrients were possibly temporarily beneficial to the aquatic ecosystem.

Passhaus et al. (2003) used macroinvertebrate sampling to monitor ephemeral stream water quality in partially harvested and reference watersheds in the Catskill Mountain Region of southern New York. A variety of diversity indices showed no evidence that partial harvest using BMPs negatively impacted aquatic communities or water quality. Within the reference sites, the structure of the macroinvertebrate community varied greatly between years.

In New York, Schuler and Briggs (2000) found that implementation rates for 42 suggested BMPs were 78% for haul roads, 87% for landings, 59% for skid trails, 88% for equipment maintenance/operation, and 73% for buffer strips. Departures were common for BMPs concerned with draining water off haul roads and skid trails, and for stream

crossings; thus, the authors concluded that more attention must be devoted to those practices. BMPs were reported to be effective when they were applied correctly.

Wang et al. (2006) reported small changes in stream water chemistry following a partial harvest with BMPs in 2002 of a catchment in the Catskill Mountains of southern New York. Stream water chemistry concentrations increased significantly after harvest treatments and peak concentrations were reached 5 months or more after initiation of the harvest. Stream water chemistry returned to values similar to those of the preharvest period and to reference levels by early spring 2003. Nitrate concentrations, however, remained elevated above background levels for approximately 18 to 20 months after harvest.

In the Hubbard Brook Watershed of New Hampshire, Trimble and Sartz (1957) evaluated the performance of recommended buffer widths for protecting water quality for two situations. The authors concluded that, for municipal watersheds where minor impacts on water quality are not acceptable, a 50-ft buffer width on flat terrain would be adequate, and that width of the buffer should increase 4 ft for each 1-percent increase in slope between the road and stream. For general purpose situations where small or infrequent impacts on water quality can occasionally be tolerated, they concluded that a starting buffer width of 25-ft on level ground was effective and buffer widths should increase by 2-ft for each 1-percent increase in slope of the land between the road and stream.

In Frederick County, Maryland, MD DNR (2000) used a paired watershed design to monitor effectiveness of Maryland's BMPs for timber harvest operations. They found that total suspended solids, stream temperature, and benthic macroinvertebrate populations did not change significantly as a result of timber harvesting.

Martin et al. (2000) monitored stream water quality following clearcutting and progressive strip cutting in the Hubbard Brook Experimental Forest. Reduced transpiration and interception increased water yield while peak flows only increased moderately. Water yield and peak flow increases returned to normal levels within 4-6 years. Sediment yields increased during and after harvest but were maintained within normal ranges of reference streams. Increases in sediment yield and stream water nutrient levels returned to preharvest levels within 3-5 years due to rapidly growing vegetation and effective best management practices.

Martin et al. (1984) observed small differences in water chemistry between recently clearcut and reference watershed across a wide range of forest and soil types in New England. The amount of observed responses to clearcutting was of the same magnitude as natural variations among streams draining similar watersheds. They concluded that limiting clearcut sizes, utilizing patch and strip cutting, and installing streamside management zones all appeared to effectively reduce the magnitude of changes in stream water chemistry.

Wynn et al. (2000) evaluated the effects of clearcutting on water quality and the effectiveness of forestry BMPs in Westmoreland County, VA. One watershed was clearcut without BMPs, one watershed was clearcut with BMPs and a third watershed was left undisturbed as a control. Storm event concentrations and loadings of sediment, nitrogen, and phosphorus increased following clearcutting and site preparation when BMPs were not utilized. During the study period both the clearcut BMP watershed and the control watershed showed few changes in pollutant storm concentrations and loadings.

Author Name: Bertoni John

Organization: Wastewater Treatment Plant, Village of Endicott, New York

There are also uncontrollable factors contributing to the nutrient load From New York that are not being considered by the EPA. One being forest cover that is the cause of the majority of nutrient loading. Point source (wastewater plants) are a fraction of the loading source. In theory; if wastewater streams were eliminated completely from the streams and rivers flowing to the bay, the limit numbers reaching the bay recommended by the EPA could not be met.

Response

The states are responsible for allocating the tributary loads to the source sectors within their jurisdiction as part of the jurisdictions' Watershed Implementation Plan that will be used to inform the TMDL. A jurisdiction may choose to take action towards individual or more general sectors in achieving load reductions. Each jurisdiction has a unique set of practices they intend to use to meet water quality standards.

23.5 - NON-REGULATED STORMWATER RUNOFF

Comment ID 0571.1.001.016

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

V The TMDL Lacks Sufficient Detail to Allow the Public to Fully Understand Requirements.

The TMDL is just one component of an array of new documents, guidance, WIPs and other state and local actions that will place new requirements on various stakeholders. Unfortunately, the complexity and interrelatedness of these efforts is not always apparent and it is not clear what will need to be done differently to reach compliance.

a. Methods to Comply with the TMDL are Not in the Proposal

Clearly, the TMDL will impose new requirements on communities and landowners, but from reading the proposal, it is not clear what all of those new obligations will be. EPA will allow only "EPA approved" BMPs to be used to meet the pollution reduction requirements under the rule. Other BMPs not approved by EPA's Goal Implementation Team (GIT) will not be credited for pollutant reductions under the TMDL. For home builders, there are numerous BMPs now being used in the Bay watershed to meet state stormwater permit requirements. EPA has selected a subset of those BMPs, primarily low-impact development (LID) devices we assume, for home builders to use to reduce their nitrogen, phosphorus and sediment discharges. However, EPA has not included in the TMDL package a list of the BMPs that are acceptable to meet the rule. Nor has the agency given a rationale for selecting the subset of BMPs, supplied the performance expectations for the BMPs selected, or supplied data to demonstrate the effectiveness of the BMPs in real world applications. Given the extreme nature of the "backstop allocations" that the agency has applied to the WIPs of five of the Bay states, NAHB is very interested in seeing the supporting data that justifies the backstop standards proposed. NAHB requests that EPA immediately post to its website the supporting documents for the BMPs that EPA

proposes for home builder's use in stormwater management control programs under the TMDL, and the supporting documents that demonstrate that the "backstop allocations" for urban stormwater programs in the state WIPs are achievable in practice, as well as any cost information supporting EPA's decisions regarding those BMPs.

Response

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA clarifies that TMDL allocations, including proposed backstop allocations, are the loads that must be achieved in order to meet water quality objectives. While performances of various management practices have been considered in the decisions on how to feasibly split allocations amongst sectors, there is not a restrictive set of BMPs that practitioners are required to use. The TMDL does not include any specific implementation plan. EPA encourages practitioners to use innovative sets of management approaches that maximize performance, and will continue to update it's accounting systems to properly quantify the reductions those approaches can achieve.

Comment ID 0742.001.004

Author Name: Wells John

Organization: Town of Leesburg, Virginia

The Town of Leesburg has been responsibly developing within its corporate limits over the past three decades. The Town's development is in conformance to the current Town Code, Town Plan, Zoning Ordinance, Subdivision and Land Development Regulations, and a very detailed Design and Construction Standards Manual. The Town's professional staff is committed to updating these documents regularly to closely monitor and provide the minimum Federal and State guidelines to ensure that the environment is protected.

Additionally, in developing the Chesapeake Bay TMDL, we must all remember that the current conditions in our

urbanized watersheds developed over many decades with most of the land being privately owned. Plans and programs developed under the current initiatives need to take into account what can be achieved by the Town of Leesburg within the State of Virginia's governing laws. There are significant environmental benefits to redevelopment and transit-oriented development, as well as adverse environmental impacts associated with sprawl. If the costs of these stormwater management efforts are made to be too high, or if the stormwater management standards effectively become unattainable due to costs and unreasonable scientific measure, these beneficial redevelopment efforts will be hindered. A punitive focus on MS4 permits could ultimately prove detrimental to water quality by preventing development and redevelopment in already urbanized areas and driving new development into rural areas within the Chesapeake Bay Watershed.

Response

EPA appreciates the comment, and the acknowledgment that MS4 programs will be notable players in implementation of nutrient and sediment reductions in the watershed.

EPA agrees that redevelopment and transit-oriented development can provide environmental benefits when done correctly. EPA does not believe that well-formulated stormwater regulations are inconsistent with these types of development or the inherent goals, nor do they encourage sprawl.

19. The draft TMDL inadequately addresses the impact of legacy sediment to the Chesapeake Bay despite recent publications and studies addressing this source of nutrients and sediment found in the Chesapeake Bay Watershed (see Pennsylvania's draft WIP, p.128). When will EPA consider the impact of legacy sediment in its Chesapeake Bay Watershed Model?

Response

Within the watershed, legacy sediments and other erosion from the river system are inherently included in the calculation of sediment loads from the watershed in the Phase 5.3 Watershed Model. In simulated rivers, which are generally rivers greater than 100 cubic feet per second, erosion and scour are explicitly simulated and calibrated to about 130 sediment monitoring stations throughout the watershed. Based on the recommendations of the Sediment Work Group at the Chesapeake Bay Program, jurisdictions can get nutrient and sediment credit in their implementation plans for performing in-stream erosion control practices.

Organization: Binghamton-Johnson City Joint Sewage Board

B. As a part of the federal backstops, or otherwise, require Bay watershed jurisdictions that have not already done so in their WIPs to impose "common sense" LOT bans on TN and TP in lawn and other fertilizers, mandate the use of "slow release" fertilizers except in the first year of lawn seeding, and evaluate the results of such bans/mandates BEFORE "ratcheting down" on MS4s, CSOs, and WWTPs. Additionally, require that soil testing be required to justify "maintenance" fertilizer/nutrient spreading. Correspondingly, require jurisdictions that have not already done so in their WIPs to impose "common sense" LOT bans on TP in detergents, soaps, personal care, and cleaning products, and evaluate the results of such bans BEFORE "ratcheting down" on MS4s, CSOs, and WWTPs.

Response

EPA welcomes your input and suggestions on the actions the jurisdictions should be taking to reduce their nitrogen and phosphorous loadings to the Bay. EPA has deferred the development of the Watershed Implementation Plans (WIPs) to the jurisdictions. As such the states can develop their own plan and process to meet the allocations developed in the TMDL. EPA will not issue a backstop if the jurisdiction's WIPs are developed to meet their allocations and the expectations articulated in EPA's November 4, 2009 letter on WIPs (see link below). Fortunately, since the final state WIPs were much improved from the drafts, in the final TMDL EPA chose to reduce or remove the backstop allocations that were applied with the draft TMDL. The use of slow release fertilizers and TN and TP lot bans are not areas where EPA has regulatory authority. In regards to ratcheting down on MS-4s and CSOs please see the response to comment 0330.1.001.009.

18. The draft TMDL fails to adequately address real, practical mechanisms to reduce the loading from non-point sources, which account for the majority of the loadings to the Chesapeake Bay.

Response

The TMDL is a pollution budget for the Chesapeake Bay, the watershed implementation plans describe how the TMDL loading will be attained in the watersheds. The WIPs are the vehicles in which the mechanisms to reduce non point and other sources of nitrogen, phosphorous and sediment loads to the Bay are discussed.

Comment ID 0689.1.001.013

Author Name: Hann Steven

Organization: Capital Region Council of Governments TMDL Work Group

23. The draft TMDL notes that "EPA regulations require that in establishing the TMDL, the critical conditions... be identified and employed... " (p.6-3). The discussion regarding critical conditions for DO notes that, "the critical period for evaluation of the DO and water clarity WQS are based on identifying high flow period." As the draft TMDL further states, "high stream flow most strongly correlated with the worst DO conditions in the Bay. This is logical because most of the nutrient loading contributing to low DO comes from non-point sources... " The same assessment is true for water clarity and SAV. If EPA decides not to regulate loading reductions for non-point sources ("backstop allocation" approach), EPA would, by its own aforementioned statement, be ignoring the critical conditions that lead to the worst DO conditions in the Bay, which is contrary to EPA's own regulations that require "critical conditions to be identified and employed."

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). As an organization with a demonstrable commitment to clean water, we object to the waste inherent in EPA's threatened override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Response

EPA allowed jurisdictions the opportunity to develop a Watershed Implementation Plan that meets the TMDL allocations. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost as referenced in response 0139.1.001.017 which

discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay. Please see the response to comment 0501.1.001.005 addressing public sector point sources and the response to comment 0067.1.001.009 regarding WIP backstops in the TMDL.

Organization: Logan Township

Given the reality of the economic situation that exists for all in the Bay watershed and beyond, the implementation of the actions needed to restore the Chesapeake Bay will not occur unless there is sufficient funding by the federal and state governments. This was the conclusion of the Blue Ribbon Finance Panel created by the Chesapeake Executive Council in 2004. Will the recommendations of the Blue Ribbon Finance Panel be implemented and, if not, what effective funding and financing efforts will be made?

In an effort to identify the financial resources essential for cleaning up the nation's largest estuary, the Chesapeake Executive Council in December 2003 called for the creation of a Blue Ribbon Finance Panel to make recommendations for the effective funding and financing of the Bay clean-up effort. The Panel reached an early and strong consensus, however, that simply improving existing programs alone will not be sufficient. The Panel recognized that something more substantive and dramatic will be required. The Blue Ribbon Finance Panel proposed that the six Bay watershed states and the District of Columbia create a Chesapeake Bay Financing Authority, capitalized by the federal and state governments, with the capacity to make loans and grants. Their conclusion was that the Federal government should provide \$12 billion and the seven jurisdictions together should contribute \$3 billion.

Response

The recommendations of the Blue Ribbon Finance Panel are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish funding or sources of funding. For this reason, EPA considers the recommendations of the Blue Ribbon Panel not to be relevant to the TMDL, but instead to the implementation of the TMDL. EPA has outlined Federal efforts to the Bay in the response to comment 0038.1.001.024. Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

8. We think the State and U.S. EPA should look to other sources of nitrogen and phosphorous contributing to the Chesapeake Bay to do their fair share of TN and TP removal. This would spread the cost over the entire general population and should include other Bay States as well as Pennsylvania.

9. Targeting Bay watershed communities and businesses in Pennsylvania to remove 55% of incoming TN and TP to the Bay puts these affected portions of Pennsylvania at a severe economic disadvantage compared to businesses and communities that are outside the Bay watershed, even in Pennsylvania. Sewage treatment costs have already risen

and will continue to rise for these communities and businesses while competitors outside of the Bay watershed are unaffected.

Please allow time for the Chesapeake Bay Tributary Strategy, developed by the Commonwealth of Pennsylvania; to be implemented and to serve as the Commonwealth's plan for addressing the Chesapeake Bay water quality issues. Our biggest fear is that all of this money will be spent and it will end up having no measurable impact to water quality in the Bay due to impacts and forces not currently known or recognized as contributors to the Bay problems. Thank you.

Response

The states are responsible for allocating the tributary loads to the source sectors within their jurisdiction as part of the jurisdictions' Watershed Implementation Plan that will be used to inform the TMDL. A jurisdiction may choose to take action towards individual or more general sectors in achieving load reductions. A jurisdiction should work closely with the significant WWTPs in its jurisdiction to ensure that the above considerations are taken into account as part of sector-specific or individual WLAs distributed in its Watershed Implementation Plan development. Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Organization: Hanover Courthouse, Hanover County, Virginia

Additionally, the TMDL and Virginia WIP fail to adequately address gaps in funding, staff resources, and legislative authority. In particular, we request that adequate funding and authority for local governments be made a part of the reasonable assurance test and that comprehensive state and federal funding are made available to cover the costs of implementation. Current estimates for the urban retro-fit to achieve target loads listed in the proposed TMDL vary from \$267 to \$315 million, not including operation and maintenance and land acquisition cost, for Hanover County. This equates to between \$570 to \$1150 per year per household over the implementation period. These costs do not include the costs for point source treatment plant upgrades, which will be over \$30 million in capital costs (totaling approximately \$52 million when considering financing costs over 30 years) in addition to the increased operations costs. Consideration has not been given to the expenditures already made based on the current nutrient limits as well as other regulatory requirements, or for cost of agriculture best management practices contemplated under the proposed TMDL. New proposals for local utility based fees or general tax increases to support these expenditures are unpopular with many citizens and cannot realistically be funded by local government. This will make local government responses to mandated programs particularly difficult, if not impossible.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Please see the response to comment 0067.1.001.009 and Section 8 of the TMDL report regarding WIP backstops.

Comment ID 0257.1.001.003

Author Name: Christian Stephen

Organization: Berkeley County Development Authority, Berkeley County, Martinsburg, West Virginia

Because our publicly owned wastewater facilities in Berkeley County are not currently designed or required to remove nitrogen and phosphorus from the waste stream, significant capital investment in new treatment processes will be required. In addition, increased operations and maintenance expenditures will be necessary to operate and dispose of by-products generated by the new processes. The required investments for nutrient controls will raise sewer rates for customers in Berkeley County an estimated 40% to over \$66 per month for the average residential user. Rates for commercial and industrial users would likewise increase 40% over current rates. The costs of the nutrient removal processes will also likely result in a deferral or cancellation of other critical infrastructure extensions and/or improvements.

Organization: Chemung County Sewer Districts (CCSD)

With regards to the local impacts, there currently exist two special districts that have been established in Chemung County for the purpose of providing public sewer service to the more densely populated areas of the County. Each district has its own staff and budgets and operates on funds that are collected exclusively from those residences in the districts for the sole purpose of collecting and treating their wastewater. There is typically no contribution of federal or state funds that are received or used for such services. As it stands today it would appear that all the funding for nutrient removal for the purpose of addressing the environmental issues of the Chesapeake Bay would need to come from a very limited source.

In 2009 each District entered into an agreement with a licensed engineering firm to perform a nutrient removal study in accordance with the terms and conditions as stated in their respective NPDES permits. The study was to look at identifying possible cost effective ways to reduce nutrients being discharged from each treatment facility. In addition the study was to look at ways to reach Best Available Technology results for nitrogen and phosphorous removal (5.0mg/l N and 0.5mg/l P). Both treatment facilities currently use trickling filters for treatment and perform very well for the removal of BOD and TSS and the facilities have been found to be providing nitrification during most of the year. While trickling filters have proven to be a sound and effective means of providing secondary treatment, they do not, unlike activated sludge systems, allow for much if any process control that would provide for nitrogen or phosphorous removal. Therefore the results of the study indicated that a major upgrade at a cost of \$15M for one facility and \$14M for the other would be required to achieve any nutrient removal. The O&M costs consisting of primarily chemicals and energy was estimated in 2009 dollars to be \$1M/yr and \$0.75M/yr respectively. This would result in an approximate 50% increase to the current operating budgets of the facilities.

Response

Organization: Chemung County Sewer Districts (CCSD)

Second, it is felt that the EPA should take into account and consider the monies that have been invested over the years to preserve New York's, and ultimately the Bay's, water quality. And finally, should the EPA choose to proceed and adopt the TMDLs as proposed, recognize that the financial impact to taxpayers and businesses would be crippling and therefore not possible to accomplish or sustain.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

It is EPA's desire to credit all water quality improvements as they occur. EPA has requested that nitrogen, phosphorus and sediment controls be reported annually. This data will be compared with water quality monitoring throughout the watershed so that loads can be tracked and verified. Point source controls can be more easily be tracked because regulation requires that NPDES permits are consistent with TMDL waste load allocations. The only way that EPA can credit a BMP in the watershed is if it has been reported and BMPs installed voluntarily need to be reported in order to be credited.

Organization: U.S. House of Representatives

Hickory Township, Forest County, Pa. is currently tasked by the Pa. Department of Environmental Protection to update our Sewage Facilities Plan (Act 537) and thereafter, implement said plan. At this time it appears that the only way to satisfy DEP requirements will be the construction of a Sewage Treatment Plant that will serve 210 residences. While final costs cannot be determined at this point in the process, preliminary estimates suggest the project costs to be somewhere between four to five million dollars, with operating costs anticipated at 50 to 60 dollars per month for each unit served.

The areas to be served are comprised mainly of elderly folks living on fixed incomes, young people raising families and seasonal residences. Most of these folks are well below average income. With the exception of Intergovernmental Revenues dedicated to road maintenance, the annual income to Hickory Township's General Fund is about 74K. Since PENNVEST is not funding these types of projects at this time, the Engineers are applying to Rural Utility Services (USDA) to pre-qualify the township for funding. Whether that funding comes in the form of grants or loans, we can't say at this time.

According to the mandate from DEP (Consent Order and Agreement) construction must begin by the end of 2013 and be completed by October 31, 2014. The design phase of the project will begin upon DEP approval of the 537 Plan, expected to occur in the first quarter of 2011. Inability to obtain financing is not considered a reason for not starting or finishing the tasks set forth. Fines of \$100 per day commence when any schedule milestone misses its completion date.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

EPA cannot speak to issues that are a requirement of DEP, however Act 537 has been in place since 1967 for municipalities to resolve sewage disposal problems.

We are committed to restoring the Bay. However, no matter how laudable the intentions behind the development of the Chesapeake Bay TMDL, the most certain outcome will be another disappointing program failure if indifference at the federal level to economic and fiscal impacts continues. If concerns related to costs are not analyzed and addressed at the early stages of this initiative, the entire program will fail under the weight of the economic burdens it will impose upon many local governments and businesses and then to individual households. We understand, from EPA's public comments, that cost is not one of their considerations in developing the TMDL. However, without a firm understanding of the costs and how the burdens of meeting these costs will be distributed, there will be neither equity nor the true "partnership" advocated by the state and EPA, and local governments will be set up for failure.

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). As an organization with a demonstrable commitment to clean water, we object to the waste inherent in EPA's threatened override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Organization: City of Falls Church, Virginia

On September 7, 2010, the Commonwealth of Virginia issued a Chesapeake Bay TMDL Phase I Watershed Implementation Plan ("Draft WIP"). On September 22, 2010, the United States Environmental Protection Agency ("EPA") issued a Notice for the Public Review of the Draft Total Maximum Daily Load ("Draft TMDL") for the Chesapeake in the Federal Register. The purpose of this letter is to submit comments in response to the EPA Federal Register Notice and Virginia's Draft WIP on behalf of the City of Falls Church, Virginia. We appreciate the opportunity to provide comments on these documents, both of which will have profound impacts on our community and drive increased efforts to restore the Chesapeake Bay through 2025 and beyond.

Both draft documents outline sector-specific implementation measures for the different source categories that impact the bay. The ultimate responsibility for controlling most of these source sectors falls to local governments; and the cost to comply with the controls proposed will be borne by the same local tax and rate payers. Of these sources, the City of Falls Church is primarily concerned with the strategies for controlling urban stormwater runoff.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0379.1.001.007

Organization: City of Falls Church, Virginia

Looking Forward

The City of Falls Church is committed to restoring the Bay. However, no matter how laudable the intentions behind the development of the Chesapeake Bay TMDL, the most certain outcome will be another disappointing program failure if indifference at the federal level to economic and fiscal impacts continues. If concerns related to costs are not analyzed and addressed at the early stages of this initiative, the entire program will fail under the weight of the economic burdens it will impose upon many local governments and businesses and then to individual households. We understand, from EPA's public comments, that cost is not one of their considerations in developing the TMDL. However, without a firm understanding of the costs and how the burdens of meeting these costs will be distributed, there will be neither equity nor the true "partnership" advocated by the state and EPA, and local governments will be set up for failure.

Response

Please see response to 0159.001.001 to address economic impacts. For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Organization: Virginia Dept. of Agriculture and Consumer Services

VDACS strongly urges the EPA to work with the states and the District of Columbia to minimize the use of new regulations. New regulations can have a significant (and negative) impact on farm operations in the Bay watershed. We recommend that EPA further consider the use of existing state water quality programs with increased resources-to address TMDL objectives. VDACS feels that a greater level of reasonable assurance can be provided by better utilizing its existing state water quality programs. By increasing the currently limited resources dedicated to these programs, through a better coordination of efforts, and by better targeting of those resources, state programs can achieve much greater success in protecting water quality. It is much more cost effective for the Commonwealth to take this approach than to consider further regulation as a means of providing reasonable assurance as it pertains to the agricultural sector.

Response

EPA reminds the commenter that the TMDL is not a federal regulation. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0139.1.001.006 regarding agricultural funding. With regard to EPA's rationale behind WIP backstops, please see the response to comment 0067.1.001.009 and section 8 of the TMDL.

8. Construction General Permit - Erosion and Sediment Control

The State currently administers the NPDES permit for construction activities. However, the adopted regulations (administratively suspended until after the Bay TMDL) will delegate issuing authority to the localities. The Bay TMDL and the newly adopted Effluent Guidelines will increase the stringency of the permit. If a locality is administering this permit, then the locality must receive additional funding beyond the suspended State Stormwater Regulations that do not include the Bay TMDL or Effluent Guidelines. Therefore the regulatory fees as stands are less than adequate to administer this program. Finally, the locality administering this program must receive credit for these BMPs in the stormwater WLA assigned to its MS4 permit.

Response

EPA agrees that verifiable management measures should be tallied/credited in the accounting system for TMDL implementation. State programs are developing and refining the necessary tracking methodologies to accomplish this. The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

While everyone speaks about all the cost share dollars that will be available with the state of the national economy and debt, there needs to be some consideration that such dollars may not be forthcoming and look to a voluntary approach.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions. Future enhancements could include voluntary programs to implement practices that would reduce pollution run off.

24.1 - ECONOMIC IMPACTS

Comment ID 0038.1.001.008

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

According to Governor McDonnell in the introduction to Virginia's WIP, addressed issues of job loss and economic hardship. It's important to understand that initial costs may be higher, but many times in the long run, these actions and precautions will end up saving money. From another standpoint, the state tourism economy (which Governor McDonnell made a big focus during and after this year's General Assembly session) will take a negative hit. As a Virginia resident, I remember beaches in Virginia Beach being closed during the peak summer season due to pollution-induced high bacteria counts. Closer to home, the James River in the Richmond area has been affected with the same sort of pollution-based bacterial problems during the summer. The James is known for its rapids and Virginia Beach for its fun family atmosphere. If these areas and others like them continue to be plagued by pollution, tourists are going to venture to other places, far from harmful, polluted waters and in this economically hard time the state does not need to lose tourist revenue.

Response

Please refer to the response to comment 0159.001.001 to address economic impacts. Please also refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Below are examples of how clean waters have been shown to aid in a State's economy; it is EPA's desire to ultimately have a positive impact on water quality and the economy with this TMDL.

Between the years 2007-2010 funding for public access in the Chesapeake Bay watershed totaled \$14,187,419. In 2007, visitors to recreational and heritage sites generated \$18 billion in Virginia (21). Tourist and leisure related industries employed nearly 350,000 workers in Virginia as of June 2010 (22). More than 23 million people visited Virginia's national and state parks during 2009 (23). Statewide, travelers spent over \$17 billion during 2006 (24). Nationwide in 1996 nearly 14 million people spent close to \$20 billion hunting game and migratory waterfowl and 62 million people participate in wildlife viewing and photographing every year, spending more than \$29 billion (25). A 2006 study compared the 1996 water quality of the Bay with what it would have been without the Clean Water Act and estimated that the annual recreational boating, fishing, and swimming benefits of water quality improvements ranged from \$357.9 million to \$1.8 billion (26).

Were you aware a small turfgrass lawn provides oxygen for a family of 4 for an entire year. Turfgrass also is beneficial to the environment by filtering nutrients, dust, and carbon dioxide. Turfgrass even cools the surrounding areas and reduces the cost to cool houses.

Properly applied nutrients to a turfgrass lawn are used 100% by the grass plants. This study has been done at NC State by Dr. Tom Ruffy and various other land grant colleges throughout the United States. In fact in golf course situations, the turfgrass filters the nutrients so much so that the water entering the golf course is cleaner than when it entered the property.

I am a small business owner with 23 total employees. Current regulations such as mandatory reporting, black out dates and other regulations unfairly effect our industry and since we don't receive any state or federal funding, make it difficult

for us to run our businesses with substantial increases in costs.

Comment ID 0052.1.001.001

Author Name: Gross Penelope

Organization: Fairfax County Board of Supervisors

VACo strongly desires to play a constructive role in improving water quality in the Chesapeake Bay and all waters of Virginia, and we believe that a sound strategy for improving water quality to levels required by EPA will not succeed unless the economic costs associated with these efforts are fully understood, and a plan is developed for distributing these costs among the different levels of government.

It is important for EPA to understand that local governments in Virginia have major concerns about the costs that the TMDL initiative will impose upon local governments. In the current economic conditions, these initiatives could not be coming at a more difficult time.

Response

Please see response to Comment ID 0139.1.001.017

Comment ID 0052.1.001.003

Author Name: Gross Penelope

Organization: Fairfax County Board of Supervisors

For most local governments, the most direct impact is MS4 permits, combined stormwater permits where the TMDL may require retrofits, but says nothing about how local governments will pay for them. EPA needs to tell the states that they have an obligation to provide funding if they require major retrofits at the local level. For that matter, EPA says nothing about federal funding to help meet requirements of the TMDL. They do not understand the implications that local governments may, indeed will, have to raise taxes to meet the requirements, and the issues that raises with local taxpayers.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. While EPA is developing the TMDL for the

Bay jurisdictions, EPA is not assigning individual waste load allocations to individual municipalities and MS4 communities. States will work with their municipalities to determine the most appropriate allocations across a particular source sector. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Comment ID 0054-cp.001.002

Author Name: Dunning Rich

Organization: City of Hornell, New York, Water Pollution Control Plant

Since the EPA has no ability to control nutrient contributions to the Chesapeake Bay from run-off then the burden for reducing nutrients to the Bay falls to the above mentioned permitted entities.

For example, the potw's in New York State are responsible for only 1% of the nutrients delivered to the Chesapeake Bay. When the TMDL is established these same small communities will need to spend hundreds of millions of dollars in order to equip their facilities to meet the standard.

This is not only wasteful it is also ineffective.

Comment ID 0067.1.001.013

Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

Because of the unique characteristics of our production process and wastewater (which as noted above is almost entirely inorganic, not organic-based like sewage treatment plants), the GTP Facility cannot use biological treatment processes. Hence, the technologies that EPA considers to possibly be available to meet the limits of technology (what EPA describes as 3 mg/l of TN and 0.1 mg/l of TP) would not be effective or applicable to our situation. To even conceivably approach the levels that EPA describes as limits of technology (which are higher than what EPA has proposed to impose in the Backstop TMDL) would essentially require some combination of evaporation, crystallization, membrane separation, filtration, and revamped processes allowing recirculation, at astronomical costs, and engendering significant consumption of natural gas, electricity, and attendant NOx and other emissions. A preliminary, conservative estimate is that such a system would cost on the order of \$60 million, and engender operating costs of some \$35,000 per day (\$12,800,000 per year). The result would be to render operation of the GTP Facility uneconomic and unsupportable.

Response

Comment ID 0079.1.001.002

Author Name: Dunning Rich

Organization: City of Hornell, New York

If the Chesapeake Bay is a national treasure shouldn't all of the stakeholders pay for this project?

The Obama administration is attempting the clean up of the Chesapeake Bay by mandating the regulations that are required to clean up the Bay. By law the TMDL needs to be achieved in the next 15 years. Once the new regulations kick in treatment plants in the watershed will violate their permits. These violations will stir headlines. Permit violations will also trigger regulatory actions from the EPA that will require up to twenty- eight wastewater treatment plants to be upgraded or face daily fines for non-compliance.

Fact: Publicly owned treatment plants in New York State are responsible for about 1% of the nutrients delivered to the Chesapeake Bay. It is estimated that the cost to upgrade treatment plants in New York to remove the nutrients is \$1 billion.

Response

EPA reminds the commenter that the TMDL is not a Federal regulation. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 regarding municipal point sources. For a response regarding equity and the state of New York please see comment 0080-cp.001.002 and the response to comment 0267.1.001.006.

Comment ID 0079.1.001.005

Author Name: Dunning Rich

Organization: City of Hornell, New York

The cost to upgrade the City of Hornell Wastewater Plant was estimated to be \$6 million in 2005. The Operations and Maintenance expense for the new equipment will add 40% to our annual budget. This expenditure would be wasteful and ineffective because we are responsible for so little of the nutrient waste that reaches the Chesapeake Bay.

Response

EPA allowed jurisdictions the opportunity to develop a Watershed Implementation Plan that meets the TMDL allocations. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost as referenced in the response to comment 0139.1.001.017. For an additional response specific to New York please see comment 0080-cp.001.002.

Author Name: Myer Richard

Organization: Running Man Community Association, Inc.

The economic impact of these proposed changes has not been disclosed by the EPA. Within the SE Virginia region estimates run between \$600 per person per year to \$ 1,400 per household per year in order to implement these regulations. Homeowner Associations are also caught in the middle. The associations are responsible for storm water Best Maintenance Practice (BMP) lifecycle maintenance to include maintenance of dry and wet ponds. These pending EPA regulations may halt efforts to clean up BMPs for the next year or two until the Home Owner Associations understand how to implement processes to meet the new regulations. The EPA has not disclosed how localities, including homeowner associations, are supposed to meet these regulations and what will be necessary.

Response

Thank you for your comments. EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0089.1.001.004

Author Name: Hunter J. And M.

Organization:

The Bay TMDL, which requires Virginia to develop a Watershed Implementation Plan (WIP), will have a high cost for compliance for all sectors. While we agree that there is a benefit of clean waters within the Bay and local watersheds, the economic costs for compliance must be balanced, and water quality programs cannot be developed in a vacuum without considering economic impacts to the economy.

Before moving forward with a finalized Bay TMDL, EPA must conduct a non-biased economic impact analysis. Experts from land-grant universities from across the watershed could be called upon to evaluate the actual costs of meeting water quality standards for businesses, citizens, localities, states, and the federal government.

Agriculture has the benefit of estimating some expenses based on existing data on cost of implementing AgBMPs through current state and federal programs.

--Virginia estimates that just one practice (cattle fencing) could cost more than \$800 million to implement. Fencing cattle from streams, putting in crossings, providing alternative watering, etc. costs on average \$30,000 for a Virginia cattle farmer.

--Virginia's Natural Resources Commitment Fund says Ag BMP cost-share funds will need to be \$63.2 million annually from 2025 in order to get 60% NPS reduction goals from agriculture. This is only cost-share funding from the state--doesn't account for federal government's traditional share of funding or the money that comes from farmers.

--Current funding estimates are just based upon the cost of installing the practice, they do not account for costs like loss

of productive land, replacing practices when weather damages occur, fluctuations in markets, etc.

Economic conditions (lack of profits, increased input costs, additional credit not an option) means that extra money to meet regulations is non-existent.

Due to long-term devastating economic conditions for agriculture (like other sectors), federal backstops alone (mandatory permitting of small dairies, requiring some ag processing plants to do more) will be enough to drive some farmers out of business.

EPA's federal backstops requiring more unregulated lands to meet MS-4 (urban lands) requirements may cause significant economic hardship for urban landowners, including the green and turfgrass industries.

Honestly, the approach used by EPA smells too much like the animal rights approach. We are going to drive the livestock farmers out of business and force everyone to become vegetarians and Vegans like them. They are famous for telling things that are part truths and applying them falsely to animal farming and your use of poor modeling is going to do the same thing. You are going to drive farmers out-of-business with incomplete data and part truths. In fact you have not accounted for a lot of work that has already been done in our state.

Response

EPA understands the significant cost pressures that both states and municipalities are under given the current economic climate in the United States. There are several cost-share, grant and technical assistance programs that EPA is funding in order to assist the Bay community in this undertaking. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

It is EPA's desire to credit all water quality improvements as they occur. EPA has requested that nitrogen, phosphorus and sediment controls be reported annually. This data will be compared with water quality monitoring throughout the watershed so that loads can be tracked and verified. Point source controls can be more easily be tracked because regulation requires that NPDES permits are consistent with TMDL waste load allocations. The only way that EPA can credit a BMP in the watershed is if it has been reported and BMPs installed voluntarily need to be reported in order to be credited.

EPA models have been able to show that it is feasible and possible to meet the TMDL allocations. Part of EPA's intent in working with the jurisdictions in developing the Watershed Implementation Plans was to allow the individual jurisdiction to best choose how to meet the allocations of the TMDL. This would allow the individual jurisdiction to select the best course of action for the economics and the environmental quality.

I am a sheep farmer and have used cost-share programs to set up rotational grazing and fence-out practices. However, some of my land is in the flood plains of Hays Creek and it is cost prohibitive to maintain fencing in those areas. USDA has excellent programs to enforce good conservation practices and use no-till planting on all my land. So I am supportive of good conservation measures and you are welcome to come look at my approach to witness the same. But what you are doing is trying to drive livestock farming out of the valley of Virginia and I think that is very wrong.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0139.1.001.006 regarding agricultural funding. The implementation of this TMDL is not intended to limit livestock farming or impede economic vitality in any community. EPA allowed and encouraged jurisdictions to develop a Watershed Implementation Plan that meets the TMDL allocations in the manner most feasible for that jurisdiction. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost as referenced in the response to comment 0139.1.001.017. However, there are economic benefits to improving local water quality. A study by the University of Virginia found that implementation of the agricultural practices to reduce runoff pollution called for in Virginia's Chesapeake Bay "tributary strategy," such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts. Over a five year period these actions would create \$940 million in industrial output, a \$455 million impact on gross domestic product, and create nearly 12,000 jobs (42).

Organization: Headwaters Soil and Water Conservation District

Economics is a major factor in the farmer's ability to implement these practices. The average turkey hen litter has a nutrient analysis of 43 pounds of nitrogen, 50 pounds of phosphorus, 53 pounds of potash, and 1350 pounds of carbon organic matter. Using today's cost (provided by the local Cooperative) to replace these nutrients; the nutrient value of that ton of litter is \$85. If we assume no poultry farm needs additional phosphorus that ton of litter still contains \$49 of nitrogen and potash per ton that would otherwise have to be replaced with commercial fertilizer. A poultry farmer can sell his or her litter for only \$12 a ton. If the poultry farmer is prohibited from applying on-farm generated manure to their crops because of a base saturation cut off and must replace it with commercial fertilizer, it results in a net difference of \$37 per ton for the producer. An average poultry house produces 300 tons per year. This is an added cost to the

producer to raise his crops of \$11,100 per poultry house. The poultry farmer cannot sell organic nutrients off the farm and replace it with commercial fertilizer with the proceeds of those organic nutrients. We need to explore a cash incentive to address this negative cash flow.

While the poultry producer has an option transporting dry litter, the local small dairy has no alternative to selling the liquid manure. The cost of transport beyond two miles is greater than the nutrient value of the manure. If the dairyman is prohibited from applying on-farm generated manure to their crops they are out of business.

The examples above show that the cost of proposed regulations will have a detrimental effect on the viability of the agriculture sector.

Response

Thank you for your comment and the real life example of the economic impact to individual farmers. The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. EPA allowed and encouraged jurisdictions to develop a Watershed Implementation Plan that meets the TMDL allocations in the manner most feasible for that jurisdiction. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost as referenced in the response to comment 0139.1.001.017. However, there are economic benefits to improving local water quality. A study by the University of Virginia found that implementation of the agricultural practices to reduce runoff pollution called for in Virginia's Chesapeake Bay "tributary strategy," such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts. Over a five year period these actions would create \$940 million in industrial output, a \$455 million impact on gross domestic product, and create nearly 12,000 jobs (42).

Author Name: Farasy Tom

Organization: Maryland State Builders Association

Achieving the Chesapeake Cleanup goals will be enormously expensive. To have any chance to achieve those goals, we will need to use the most efficient methods available and target the biggest problems - instead using the methods and targets that are most politically correct.

Even the most optimistic estimates for a cleanup plan produce staggering cost estimates. For example, one recent (2004) estimate was for \$28 BILLION - a cost that would be borne largely by States with waterways that drain into the Chesapeake Bay like New York, West Virginia, Pennsylvania and Delaware as well as Maryland and Virginia and Washington, DC that have waterfront lands long the Bay's main stem. No funding has been identified to pay these costs and is difficult to see where the money would come from given competing needs for governmental funds. Given the federal deficit, we cannot depend on federal funds to pick up these costs. Yet dividing the \$28 billion cost estimate by the 17 million people living in the Bay watershed works out to be \$1,647 per person.

Response

The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. EPA does not dispute the costly nature of improving water quality in the Bay watershed. EPA reminds the commenter that we are under

legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. It is EPA's preference that each jurisdiction develops a Watershed Implementation Plan that meets the TMDL load allocations in a manner that best meets the needs of the jurisdiction both environmentally and economically. The states are responsible for allocating the tributary loads to the source sectors within their jurisdiction as part of the jurisdictions' Watershed Implementation Plan that will be used to inform the TMDL. A jurisdiction may choose to take action towards individual or more general sectors in achieving load reductions. Each jurisdiction has a unique set of practices they intend to use to meet water quality standards. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

The costs associated with retrofitting existing communities is daunting-according to a report published by the Center for Watershed Protection the Urban Suburban are estimated to cost a median of \$88,000 per impervious acre (in 2006 dollars-or over \$100,000 in 2010 dollars); so we are talking about costs between \$18 Billion and \$20 Billion-versus costs using today's model of between \$42 Billion and \$48 Billion.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0159.1.001.004

Author Name: Farasy Tom

Organization: Maryland State Builders Association

Thus far, the federal government has not appropriated the funding necessary to implement these new requirements. There has been no cost benefit analysis conducted and it is commonly accepted that these methods (urban retrofit) costs are an order of magnitude more costly than alternatives such as wastewater treatment plants upgrades. Most of the States will be unable to bear the cost burden without raising taxes. We need broad based programs to source the Bay Clean Up; we need also a balance of fiscal reality along with expected results.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. Author Name: Crim Martin

Organization: Town of Occoquan, Virginia

While it is unclear whether the EPA has any scientific basis for the proposed TMDLs, it is clear that imposition of the TMDLs will be ruinously expensive for localities. Actually meeting the TMDLs may be physically or fiscally impossible.

Response

EPA models have been able to show that it is feasible and possible to meet the TMDL allocations. Part of EPA's intent in working

with the jurisdictions in developing the Watershed Implementation Plans was to allow the individual jurisdiction to best choose how to meet the allocations of the TMDL. This would allow the individual jurisdiction to select the best course of action for the economics and the environmental quality. EPA and other federal agencies are providing increased funding to the Bay watershed as described in comment response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0169.1.001.008

Author Name: Crim Martin

Organization: Town of Occoquan, Virginia

Although a precise calculation of the cost of the proposed TMDLs is beyond the staffing and financial resources of the Town, one likely effect would be to prevent any development or redevelopment within the Town. The long term effects of that would be to strangle the Town's vitality. The short term effect would be litigation challenging the Town's ability to impose the draconian standards required under the TMDLs.

Response

The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. The CWA Section 303(d) requires TMDLs to be established for impaired or threatened waters at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety. Federal regulations at 40 CFR Section 130.7(c) track the statute and require TMDLs to be developed at levels necessary to attain and maintain the applicable narrative and numerical water quality standard with seasonal variations and a margin of safety and that take into account critical conditions. TMDLs are to include wasteload allocations for each point source and load allocations for nonpoint sources. Neither the CWA nor EPA's implementing regulations require the state or EPA to consider the costs to implement the TMDL when establishing the TMDL at a level necessary to implement the applicable water quality standards. However, there are economic benefits to improving local water quality.

A study in the City of Philadelphia estimates that installation of green stormwater infrastructure in the city will raise property values 2 to 5 percent, generating \$390 million over the next 40 years in increased values for homes near green spaces (33). Reducing pollution inputs from pipes and landbased sources can reduce locality costs to treat drinking water sources to safe standards. New York City's expenditure of \$1 billion over the last decade to protect the watersheds north of the city that supply its drinking water avoided the need to build a \$6 billion treatment plant (39). An EPA study of drinking water source protection efforts concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs (40). Proactive efforts to lessen stormwater flows today reduce future public costs needed to maintain navigation channels, remediate pollution and hazard flooding, and repair infrastructure and property damage caused by excessive runoff.

Organization: Bion Environmental Technologies, Inc.

The Chesapeake Bay models are the technical basis upon which EPA and state mandates for nutrient reduction are based. Unfortunately, these models are inaccurate as they relate to the quantification and impact from livestock waste. These errors prove costly to the rate/taxpayers that are paying the tab for this large scale remediation and they undermine the effectiveness of the effort.

Response

See response to 0182.1.001.004

In addition, there have been multiple studies that document the economic benefits to improving local water quality.

A study in the City of Philadelphia estimates that installation of green stormwater infrastructure in the city will raise property values 2 to 5 percent, generating \$390 million over the next 40 years in increased values for homes near green spaces (33). Reducing pollution inputs from pipes and landbased sources can reduce locality costs to treat drinking water sources to safe standards. New York City's expenditure of \$1 billion over the last decade to protect the watersheds north of the city that supply its drinking water avoided the need to build a \$6 billion treatment plant (39). An EPA study of drinking water source protection efforts concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs (40). Organization: Home Builders Association of Virginia (HBAV)

HBAV is a 4,300 business organization of home builders and companies that provide products and services to the housing industry in Virginia. As you may know, the home building industry and its numerous construction and retail partners in Virginia are currently experiencing the 5th straight year of an historic downturn in production and sales - a fact contributing significantly to unemployment throughout the Commonwealth. Unfortunately, prospects for improvements in the housing industry in 2011 are dim.

As such, we are astonished, that during this difficult economic period for the nation and Virginia, we find our industry along with numerous Virginia businesses, local governments, farmers and the Commonwealth itself facing an unprecedented and unfunded Federal mandate - an untenable TMDL for the Chesapeake Bay. Regrettably, the EPA has chosen not to conduct cost analysis for the Bay TMDL, and we believe this mandate will not only extend the so-called jobless recovery period, but expand it into many other sectors of the state's economy.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Just because there is no statutory responsibility to conduct a cost benefit analysis of a TMDL does not mean one should not have been done. Far smaller projects have cost/benefit analyses completed. This seems to be cast as, whatever the cost is so be it! This again is where non-point BMPs should be pursued rather than a new point source strategy. EPA seems to have elevated the Chesapeake Bay over other important issues facing Pennsylvania and the other states.

Response

EPA hears your concerns and thanks you for your comments on the Draft Chesapeake Bay TMDL. EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Organization: Rivanna Water & Sewer Authority

What is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that we at local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years).

We believe that in our current difficult economy, the public would be outraged if they fully understood the waste inherent in EPA's proposed override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Many presentations by Federal and State officials have referred to the Bay TMDL as a pollution diet, where the maximum amount of a pollutant the Bay can receive is determined while still meeting water quality standards. In many ways, local governments are dealing with a similar diet situation associated with their operations. During limited economic times, the County's fiscal and resources diet determines the extent of requirements, programs, and projects that can be achieved within the constraints of significantly reduced inputs. Local governments are operating very lean, with falling revenue, limited resources, and reduced staffing. The future local "diet" appears to look more questionable than promising.

Author Name: Carl Jimmie

Organization: Southern Tier New York WWTP

II. COST, FINANCIAL, AND COMMUNITY GROWTH IMPACTS

A. Costs

The cost to convert/upgrade each of the significant WWTPs in New York State to nutrient removal capabilities would be substantial. As per the NYSDEC's Tributary Strategy, an overall project cost of \$200 million was estimated in 2006, to upgrade each of the 28 significant WWTPs within New York State. Assuming a 5.5 percent increase in construction costs per year since 2006, a rough overall project cost (in 2010 dollars) is around \$250 million. Beginning in 2007, the Binghamton-Johnson City Joint Sewage Facility was upgraded for nitrogen removal for a project cost of approximately \$70 million, which equated to roughly \$2300 per equivalent dwelling unit (EDU).

In addition to the project costs, the annual operation and maintenance (O&M) costs would also be expected to increase on the order of 50 to 70 percent for a typical upgraded WWTP, due to increased electric, treatment chemicals, and increased sludge production. For the Binghamton-Johnson City Joint Sewage Facility, annual O&M costs increased by roughly 65 percent since 2006, for nitrogen removal (excluding phosphorus removal). This equates to an ongoing cost to be borne by local rate payers, including senior citizens on fixed incomes, businesses, and industries.

B. General Economic Climate

There has been a general loss of industrial base and population in the New York State portion of the Chesapeake Bay over the last 25 years. Loss of jobs and population is also reflected in the rather high percentage of population falling below the poverty line (about 22 percent). Furthermore, the median age of upstate New Yorkers is 37.5, more than two

years older than the nation as a whole. By 2020 the upstate New York population will reach a median age of 40. Presently, one in four of the region's households contain people aged 65 or older.

C. Financial & Community Growth Impacts

As it now stands, the pending TMDLs will place burdensome, unfunded mandates on the municipalities with a significant WWTP, and may force tax or rate increases to citizens to balance strapped municipal budgets. Many of our citizens are on fixed incomes with little ability to absorb additional expenses.

Furthermore, the cost of these requirements would further add to New York State's already stifling business environment, increasing the cost of doing business in a State with a high level of taxation. As you are aware, the high level of taxation and ongoing cost of doing business in New York State is evident in the number of companies who have fled to other, more accommodating states, not to mention overseas.

As an example, this could financially impact the treatment plant for Pollio Dairy in Campbell, New York, as well as existing municipal wastewater treatment plants that receive a portion of their waste stream from dairy operations, such as the Village of Waverly and the City of Hornell. Also, the expansion of existing industries and the development of new industries could be thwarted, depending upon the nature of their respective wastewaters.

the EPA's discriminatory, regulatory process disproportionately burdens New York State farm communities with costly mandates, weakens our rural economies, disrupts local food systems and provides no significant additional water quality protection for the Chesapeake Bay Watershed; and

WHEREAS, the EPA has failed to conduct a comprehensive environmental impact analysis of the implementation of TMDL including but not limited to assessment of socioeconomic related impacts,

Response

EPA reminds the commenter that the TMDL is not a Federal regulation.

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

For an additional response specific to New York please see the response to comment 0080-cp.001.002 and the response to comment 0267.1.001.006.

Comment ID 0212.1.001.004

Author Name: Greenland Victoria

Organization: Arlington County, Department of Environmental Services, Virginia

Beyond the question of whether the TMDL is ultimately feasible are the significant capital and operating resources that will be required to expand local stormwater programs. Arlington County established a dedicated tax in 2008 that generates approximately \$7 million annually to fund a comprehensive stormwater program, half of which is dedicated to watershed management and water quality initiatives. The County's capital improvement program from fiscal years 2011 through 2016 contains \$3.4 million for stormwater retrofit projects and \$2.6 million for stream restoration projects. These represent significant financial commitments to local water quality protection and the goals of the Bay TMDL.

Based upon estimated retrofit costs and the lower end of the Bay TMDL urban retrofit requirement of 30 percent to 50 percent of urban land, we estimate it would cost Arlington approximately \$500 million through 2025, or \$33 million per year, to comply with the Bay TMDL's unrealistic implementation schedule. This would require roughly a five-fold increase in the County's stormwater tax rate, and these estimates do not include a significant increase in staff and related operating expenses that will be required for planning, design, project management, and maintenance.

Given the current economic situation, it is vital that EPA and DCR consider the total costs of any regulatory approach in order to develop a cost-effective and equitable strategy for improving the Bay. For example, in 2003, well before TMDLs and the limit-of-technology (LOT) being considered for permit limits to address the nutrient and other challenges of the Chesapeake Bay were established, Arlington County committed to a \$568 million capital investment to upgrade its wastewater treatment plant ("WWTP"). The WWTP recently completed the major components of this upgrade and is currently discharging below the LOT for total nitrogen of 3 mg/L (averaging approximately 2.3 mg/L since June 2010).

This highly successful capital project clearly illustrates Arlington County's commitment to reducing its contribution to the Bay's nutrient problem and meeting stringent regulatory requirements, but this extensive capital upgrade also resulted in substantial increases in the water and sewer rate for Arlington residents. This rate has increased 145 percent over an 8 year period, from \$4.58 per thousand gallons in FY 2002 to \$11.20 per thousand gallons in FY 2010.

Arlington County also established a dedicated 'stormwater tax' in FY 2008 at a rate of \$0.01 per \$100 of assessed real estate value to support an expanded stormwater management program. In FY 2010, this rate was raised to \$0.013 per \$100 of assessed real estate value.

Response

EPA hears your concerns and thanks you for your comments on the draft TMDL and the efforts to address stormwater in your county. Please see the response to comment 501.1.001.005 for a discussion of public sector point sources and the response to comment 0067.1.001.009 addressing WIP backstops.

Comment ID 0213.1.001.010

Author Name: Daley Edwin

Organization: Hopewell Regional Wastewater Treatment Facility (HRWTF), Virginia

Proposed Backstop Allocations Direct Affect on HRWTF and the City of Hopewell: The cost of meeting 8 mg/l (LOT for HRWTF) is estimated in 2010 dollars to be \$73 million. If we have to add filters to meet TSS and phosphorus allocations, it is estimated that the cost could be as much as \$91 million. The City of Hopewell is a small city with a poverty rate of 18.3% and an unemployment rate of 10.3%; 14 highest in the Commonwealth of Virginia. To fund our \$30 million wastewater project currently under construction, the sewer rate in the City of Hopewell was increased by 69% in July of 2009. If we had to raise our sewer rates by 69% to fund a \$30 million project, how much of an increase will it take to fund a \$73 or \$91 million project?

In spite of the enormous capital costs, the bigger issue is the annual operation and maintenance costs. Very often partial grant funding is available to help offset the capital cost; however, there is no grant funding available to offset the yearly O&M costs. Our current O&M costs are \$9 million. If we are forced to meet the proposed backstop allocations in the TMDL, the estimated increase in O&M costs is \$5 to \$6 million/year. We do not believe that this much of an increase will be sustainable for the City or for the Hopewell industries or citizens.

EPA cannot provide “Reasonable Assurance” that placing significantly lower limits on point sources (with many industrial point sources below the limit of technology) will be implemented and successful.

This approach nets a fraction of the needed reductions from Pennsylvania and carries a huge financial burden to the rate-paying public.

Response

The existence of the NPDES regulatory program and the issuance of an NPDES permit(s) provide the reasonable assurance that the WLAs in the TMDL will be achieved. That is because federal regulations implementing the CWA require that effluent limits in permits be consistent with “the assumptions and requirements of any available [WLA]” in an approved TMDL [40 CFR 122.44(d)(1)(vii)(B)].

Organization: Duncansville Municipal Authority

5. If Backstop TMDL's become official, 100% grant funding and assistance with operation and maintenance costs increases is needed. Will the Federal government step up and provide this? Where will these funds come from? Further taxes on the general population to pay for this is merely squeezing the same Duncansville sewer customer as a sewer rate increase.

6. In Pennsylvania, we are facing significant electric power and natural gas rate increases in January 2011. These will drastically impact our annual treatment plant operational expenses and require sewer rates to rise just due to that. Furthermore our sewer customers will see these same electric and gas rate increases on their own home and business utility bills.

Response

The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. EPA does not dispute the costly nature of improving water quality in the Bay watershed. EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Please see the response to comment 0067.1.001.009 and Section 8 of the TMDL addressing WIP backstops. While EPA has no control over how utility rates are increased we appreciate your comments to recognize this possibility.

Comment ID 0224.1.001.004

Author Name: Fiala Barbara

Organization: Broome County Executive's Office

The implementation of the TMDL will require New York State and local communities to embark on a project addressing agriculture, urban stormwater and wastewater treatment plants at a cost on the order of billions of dollars. This will have dramatic impacts on the economies of the Southern Tier as farms close rather than bear the cost of compliance, and economic development is hindered by an additional cost of doing business.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Congress has recognized that the Chesapeake Bay is a "national treasure and resource of worldwide significance." [FN 23] Valued at over 1 trillion dollars, a restored and protected Chesapeake Bay is essential for a healthy and vibrant regional economy. Failure to "save the bay" threatens this economic driver and, in fact, economic losses have already occurred due to water quality degradation throughout the watershed. More importantly, investing in clean water technology creates jobs, generates economic activity, and can save money in the long run.

[FN 23] Chesapeake Bay Restoration Act of 2000, Nov. 7, 2000, P.L. 106-457, Title II, § 202, 114 Stat. 1967.

Response

EPA hears the concerns of the commenter. Please see the response to comment 0139.1.001.017 for a discussion of the consideration of cost. Also, please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Organization: Pennsylvania Council of Churches

Perhaps no other creature better exemplifies the Chesapeake Bay than the blue crab, *Callinectes sapidus*. For more than a half century, the blue crab has been at the apex of the Bay's commercial fisheries. Over one-third of the nation's blue crab harvest comes from the Chesapeake Bay. The average annual commercial harvest in Maryland and Virginia between 1999 and 2008 was about 55 million pounds. [FN 24] The dockside value of the blue crab harvest Bay-wide in 2008 was approximately \$ 70 million. [FN 25] The recreational fishery also provides a significant financial off-set for Bay residents - the cost of catching crabs is far less than having to buy them.

The overall trend, however, since the 1990's has been a decrease in landings despite increased crabbing effort. [FN 26] In addition, the number of crabs one year and older dropped from 276 million in 1990 to 131 million in 2008. [FN 27] When the broader impact on restaurants, crab processors, wholesalers, grocers, and watermen is added up, the decline of crabs in the Bay meant a cumulative loss to Maryland and Virginia of about \$640 million between 1998 and 2006. [FN 28]

As a result of the low population level, in 2008, Maryland and Virginia issued severe crabbing restrictions, in an attempt to restore the population. These restrictions placed severe economic hardship on Chesapeake Bay crabbers. In

response, members of Congress from Maryland and Virginia requested federal disaster relief for Bay crab fishermen. In September, 2008, the Secretary of Commerce determined that the Chesapeake Bay soft shell blue crab fishery had undergone a commercial failure as defined under the Magnuson-Stevens Fishery Conservation and Management Act (16 USC § 1861). In January 2009, the Department of Commerce allocated \$10 million of disaster relief to each state. This was a substantial taxpayer expense that will not be needed in the future if the Bay is restored to its former health.

In 2009, the number of spawning-age crabs rebounded to 223 million.[FN 29] Nonetheless, poor water quality continues to limit crab populations in the Chesapeake Bay. On average, over the last 10 years, more than 75% of the Chesapeake Bay and its tidal rivers have had insufficient levels of dissolved oxygen. [FN 30] Low oxygen levels drive blue crabs from their preferred habitat and kill many of the small bottom organisms on which the blue crabs feed. [FN 31] The low dissolved oxygen conditions caused by excess nutrients are the primary reason large sections of the Bay have become unsuitable as blue crab habitat. In addition, a study by the University of Maryland demonstrated that decreases in dissolved oxygen can reduce crab harvests and revenue to watermen.[FN 32]

Poor water clarity also has impacted crab populations. Poor water clarity has reduced the amount of underwater grasses necessary to protect juvenile crabs, molting crabs, and adults from predation. Studies have shown that crabs living in areas with little or no underwater grasses suffer higher mortality.[FN 33] Water clarity in the Bay has been decreasing since the 1990s and in 2009, only 26% of the Bay had acceptable water clarity. Until water quality improves, the blue crab population will not fully recover.[FN 34]

Another critical Bay species, commercially, recreationally, and as an important part of the Bay ecosystem, is the oyster. From the 1800s to the mid-1900s, the commercial oyster industry employed thousands of people catching, selling, shucking, and shipping oysters to market. Hundreds of skipjacks, sail powered dredges, plied the waters of the Bays in search of the delectable oyster. The industry generated millions of dollars a year to the Bay economy. Until the mid-1980s, the oyster was the leading commercial fishery in the Bay. Like the blue crab, Bay oysters spawned a rich cultural heritage.

In addition to their commercial and recreational value, oysters improve water quality because they are filter feeders. An individual oyster pumps over 50 gallons of water a day through its gills which strains out food, chemicals, nutrients, and sediment. In addition, oyster reefs provide valuable habitat for countless Bay creatures, most notably finfish, and serve as popular fishing areas.

Unfortunately, a combination of overharvesting, disease, and poor water quality has decimated the oyster populations in the Chesapeake Bay to around 1% of historic levels. Silt washed by rain from urban areas and agricultural fields can bury oyster beds, particularly those that have been flattened by dredges.[FN 35] Extended periods of zero oxygen conditions can be fatal to oysters.[FN 36] In addition, recent studies have indicated that low oxygen levels can stress the immune systems of oysters, making them more susceptible to disease.[FN 37] Pollution has also resulted in the closure of shellfish beds to commercial harvesting. Threats from sewage and bacteria forced Maryland and Virginia to close or restrict oyster harvesting in 223,864 acres of the Bay and its tributaries in 2008, about 8 % of the total shellfish beds.[FN 38] The decline of the Bay oyster over the last 30 years has meant a loss of more than \$4 billion for Maryland and Virginia.[FN 39]

The rockfish (also known as striped bass) has been and remains the most popular commercial and recreational fish in the Bay, generating roughly \$500 million of economic activity related to fishing expenditures, travel, lodging, etc. [FN 40]

Faced with a catastrophic collapse in the fishery, commercial and recreational fishing for rockfish were banned in the Maryland portion of the Bay from 1985-89 and in Virginia during 1989.[FN 41] The dramatic decline of the population was due to several factors including overfishing and low dissolved oxygen in deeper parts of the Bay. Today, the rockfish population is at its highest in decades. However, scientists are concerned about the high prevalence of disease which has been attributed to poor water quality and limited availability of its preferred prey.[FN 42]

In its entirety, the fisheries industry is a significant part of local economies. The 2008 Fisheries Economics of the U.S. report by the National Oceanic and Atmospheric Administration (NOAA) indicates that commercial seafood industry in Maryland and Virginia contributed \$2 billion in sales, \$1 billion in income, and more than 41,000 jobs to the local economy.[FN 43] In addition there are indirect benefits to the economy in terms of jobs and work created for those who sell fishing tackle, maintain and repair boats and equipment and provide other related goods and services.

The economic benefits of saltwater recreational fishing are equally as impressive, contributing \$ 1.6 billion in sales which in turn contributed to more than \$ 800 million of additional economic activity and roughly 13,000 jobs.[FN 44] The majority (90 - 98%) of the commercial and recreational saltwater landings in this region come from the Chesapeake Bay.[FN 45]

The economic losses associated with the decline in fisheries resources in the Bay are substantial. Between 1994 and 2004 the value of Virginia's seafood harvest decreased by 30% [FN 46] with Maryland's commercial landings exhibiting a similar decline during that time.[FN 47] Further, between 1993 and 2009 the number of Bay watermen declined from around 14,000 to 1,500.[FN 48 49]

A 2001 study compared the 1996 water quality of the Bay with what it would have been without the Clean Water Act. Results indicated that benefits of water quality improvements to annual recreational boating, fishing, and swimming ranged from \$357.9 million to \$1.8 billion.[FN 50] Fisheries declines since the 1990s indicates that early progress reducing pollution hasn't been sustained - we must reverse this trend.

These economic impacts are not restricted to the tidal regions of the Bay watershed. According to the Pennsylvania Fish and Boat Commission (PFBC), nearly 2 million people go fishing in Pennsylvania each year, contributing over \$ 1.6 billion to the economy. Among the most popular species for anglers are smallmouth bass and coldwater species, such as brook trout. The PFBC recently passed a proposal to be enacted Jan. 1 that mandates total catch-and-release of smallmouth bass in certain areas of the Susquehanna River because of population declines associated with water quality problems. Degraded stream habitat has restricted brook trout to a mere fraction of its historical distribution.

Virginia, and to a lesser extent Maryland, also support significant freshwater recreational fisheries, with roughly 1 million anglers participating and contributing millions to local economies[FN 51].By way of example, a fish kill in the Shenandoah River watershed in 2005, likely caused by a variety of factors including poor water quality, resulted in roughly a \$700,000 loss in retail sales and revenues.[FN 52]

If pollution to the Bay is left unabated, we will see more continued decline of the region's fisheries and the resulting economic impacts. In short, we cannot afford not to clean up the Bay. The comparatively modest up-front investments in doing so will pay enormous long term dividends to the entire watershed and its 17 million residents.

Unhealthy Waters Hurt Public Health and Local Economies

Unhealthy waters increase public health burdens associated with consuming tainted fish or shellfish or exposure to waterborne infectious disease while recreating. For example, one study estimated the cost associated with exposure to polluted recreational marine waters to be \$37 per gastrointestinal illness, \$38 per ear ailment, and \$27 per eye ailment due to lost wages and medical care.[FN 53] Furthermore, although closing a beach is meant to prevent illness, it directly and indirectly results in an economic loss for local businesses and the county where the beach is located. For example, a study by NOAA indicated that a one day beach closure in Huntington Beach, California was expected to result in thousands of dollars of lost income for local communities.[FN 54] There are hundreds of beach closures in the bay region each year,[FN 55] potentially resulting in hundreds of thousands of dollars of lost income for local economies.

Nature Based Recreation: Vital Economic Drivers for the Bay Region

Roughly 8 million wildlife watchers spent \$ 636 million, \$960 million and \$1.4 billion in Maryland, Virginia and Pennsylvania, respectively in 2006 on trip-related expenses and equipment.[FN 56] These estimates do not include other economic benefits of these expenditures such as job creation and the multiplier effect on local economies. Improvements to water quality, as well as the implementation of actions, such as afforestation, land preservation, and wetlands restoration, that will lead to improved water quality, will increase and enhance wildlife populations. A study in the Great Lakes indicates there would be substantial improvement in wildlife watching opportunities and associated economic benefits by improvements to wildlife habitat.[FN 57]

Recreational boating is also a strong economic driver in Maryland, Pennsylvania and Virginia. The total impact on the Maryland economy from recreational boating is estimated to be about \$2.03 billion and 35,025 jobs.[FN 58] Similarly, Pennsylvania residents spend \$1.7 billion on boating annually. The average expenditure per recreational boater is \$274. Of this amount, roughly \$113 a year is spent in direct boating-related expenses and \$161 is spent on trip-related expenses, including: auto fuel, meals, lodging and admission/entrance fees.[FN 59]

A recent study in Hampton, Virginia found that resident and non-resident boaters were responsible for \$55.0 million in economic impact to this city. This impact represents \$32.5 million in new value added, \$22.2 million in incomes and 698 jobs. [FN 60] The majority of expenditures were by out-of-region boating-visitors which represents an inflow of "new" capital into the community. The study also indicated that "water quality, fishing quality and other environmental factors" ranked among the most important, in terms of factors that influence a boater's decision on where to keep his/her boat.

Investment in Clean Water Technologies Stimulates Local Economies.

A study by the University of Virginia found that implementation of the agricultural practices such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts.[FN 61] Every \$1 of state and/or federal funding invested in agricultural best management practices would generate \$1.56 in economic activity in Virginia. Implementing agricultural practices, in Virginia, to the levels necessary to restore the Bay would create nearly 12,000 jobs of approximately one year duration.

A recent analysis of the value of investing in water and sewer infrastructure concluded that these investments typically yield greater returns than most other types of public infrastructure.[FN 62] For example, one dollar of water and sewer infrastructure investment increases private output (Gross Domestic Product) in the long-term by \$6.35. Furthermore, adding 1 job in water and sewer creates 3.68 jobs to support that job.

More specifically, upgrading sewage treatment plants across the watershed has created hundreds of construction jobs, and will create perhaps thousands more as the program begins to grow. Also, upgrading individual septic systems has employed installers, electricians and others involved in the business. These upgrades have pumped millions of dollars into the local economy. A real life example is Mayer Brothers, Inc. in Elkridge, MD.[FN 63] This company staved off significant layoffs this year when the small manufacturing company won a contract from the Maryland Department of Environment to help supply new septic technology throughout Maryland.

On the flip side, cuts to funding programs for clean water infrastructure will lead to job losses. Carter B. McCamy says he will probably have to lay off over 20 workers from his Arbutus, Maryland company if the Maryland legislature cuts the Chesapeake and Atlantic Coastal Bays 2010 Trust Fund.[FN 64] McCamy is CEO of Environmental Quality Resources, LLC, an environmental construction company that specializes in stream restoration, wetland mitigation, reforestation, shoreline stabilization and storm water management. The firm has received significant contracted work through the Trust Fund. He employs 115 full-time workers, and also supports an additional 100 subcontractors who provide trucking materials, concrete, paving and fencing required for stormwater mitigation projects.

Clean Waterways Increase Property Values

An EPA study indicated that clean water can increase the value of single family homes up to 4,000 feet from the water's edge by up to 25%.[FN 65] A 2000 study concluded that improvements in water quality along Maryland's western shore to levels that meet state bacteria standards could raise property values 6%.[FN 66] High water clarity was shown to increase average housing value by 4 to 5% or thousands of dollars. [FN 67 68] Homes situated near seven California stream restoration projects had 3 to 13% higher property values than similar homes located on damaged streams.[FN69] A study by the Brookings Institute projected a 10% increase in property values for homes that would about a proposed \$26 billion Great Lakes restoration project.[FN 70] The City of Philadelphia estimates that installation of green stormwater infrastructure in the city will raise property values 2 to 5 percent generating \$390 million over the next 40 years in increased values for homes near green spaces.[FN 71]

Pollution Reductions Lower Drinking Water and Utility Costs

Reducing pollution inputs from pipes and land-based sources can reduce locality costs to treat drinking water sources to safe standards. New York City's expenditure of \$1 billion over the last decade to protect the watersheds north of the city that supply its drinking water avoided the need to build a \$6 billion treatment plant.[FN 72] An EPA study of drinking water source protection efforts concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs.[FN 73] Similarly, a study by the Brookings Institute suggested that a 1% decrease in sediment loading will lead to a 0.05% reduction in water treatment costs.[FN 74]

Proactive efforts to lessen stormwater flows today reduce future public costs needed to maintain navigation channels, remediate pollution and hazard flooding, and repair infrastructure and property damage caused by excessive runoff. Philadelphia estimates that after 40 years their installation of green infrastructure will create more than \$2 in benefits for every dollar invested, generating \$500 million in economic benefits, \$1.3 billion in social benefits, and \$400 million in environmental benefits.[FN 75]

DEP's WIP fully addresses the necessary steps for Pennsylvania to be compliant. The committee also believes that the EPA's backstop TMDL will only cause more economic distress on the business community and ratepayers across the state.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

The WIP allows sources to meet DEP's Chesapeake Bay Strategy pollution limits through a combination of technology investment and the use of nutrient trading and offsets. For example, the compliance strategy of the region's largest sewage treatment plant, The Harrisburg Authority's Advanced Wastewater Treatment Facility, is estimated to cost \$35 million to construct, an additional \$1.8 million to operate, and million annually to purchase nutrient credits. This approach will result in an estimated \$90 per year increase in user rates, which represents a 40% increase.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). HRSD is in the final stages of completion of three major facility upgrades for nutrient removal totaling over \$150 million with a fourth facility undergoing a \$108 million upgrade for nutrient removal. These facilities designed and constructed to meet the EPA-approved Virginia Regulations, have not even come on-line providing no opportunity to measure the effectiveness of these significant nutrient reduction projects on water quality. Unbelievably, the Draft TMDL proposes significant changes to these same facilities.

EPA's Draft TMDL fails to acknowledge these efforts and the associated financial burden that has been placed on HRSD ratepayers. A disproportionate amount of the cost to clean up the Chesapeake Bay has been borne by the current residents within the Chesapeake Bay watershed that are connected to centralized sewage treatment facilities. The provisions included in the EPA Draft TMDL will continue to support this environmental injustice and financial inequity.

Response

Please see the response to comment 0184.1.001.005 which speaks to your concerns. EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Organization: Hampton Roads Sanitation District (HRSD)

In order to meet the requirements of the Nutrient Management Regulations of 2005 HRSD has plans to install or enhance exist nutrient removal at Army Base, James River, Nansemond, and York River treatment plants. These projects will reduce 2008 total nitrogen (TN) loadings by approximately 2.5 million lbs/yr at a capital construction cost of over \$400 million. Although Virginia provided over \$90 million of Water Quality Improvement Fund grants, HRSD ratepayers saw rates increase significantly over that period to fund the balance of the program. Despite the challenges created by the high costs and very short implementation schedule, HRSD will meet the 2005 waste load allocations by the compliance date of January 2011. Because these engineering studies, public contracts, and expensive construction projects are already underway the EPA must not suddenly override Virginia's new regulations and disrupt the State's plans, especially for wastewater treatment plants.

To comply with the TMDL as proposed, HRSD would require an investment in excess of \$693 million, in addition to the \$1.4 billion already required to replace and modernize aging infrastructure over the next 20 years. As a result, HRSD ratepayers would see double digit rate increases averaging 13 percent over the next five years. An average single family customer would see their annual sewage treatment bill rise from the current \$270 per year to over \$600 per year by 2025.

HRSD is fully committed to doing what is necessary to restore the Chesapeake Bay. HRSD has a history of full compliance with all environmental regulations and is prepared to do what is necessary to comply with the TMDL. Implementation will be very expensive, in excess of \$693 million, borne by the citizens of Hampton Roads. The return on that investment, however, remains highly questionable.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

B. Economic Development

Preserving current POTW allocations is also imperative for future healthy economic growth. Adequate sewer capacity is a critical part of future economic growth. If EPA's POTW allocations cuts stand, POTWs will not have the ability to serve additional customers, no matter their importance for Virginia's economic recovery.

While EPA points to the possibility of acquiring "offsets," the fact is that offsets are not widely available and thus not a viable option in Virginia on any meaningful scale. Further, offset development is only in an early developmental stage and is very expensive to implement.[FN40] To the extent that EPA believes POTWs will be able to avail themselves of non-point source offsets and thus be in a position to provide treatment capacity to new customers, HRSD responds that offsets are not widely available at the present time and thus do not represent a viable option for planning, financing or constructing major public infrastructure.

[FN40] Brent Fults, Managing Member of the Chesapeake Bay Nutrient Land Trust, LLC, a Virginia non-point source nutrient bank, gave testimony before the U.S. Senate, Committee on Environment and Public Works, Water and Wildlife Subcommittee on August 3, 2009 (attached as Appendix 21). According to Fults, "the costs associated with reducing nutrient loading by one pound from an acre of farmland can run into the thousands of dollars." This is because owners of agriculture land expect compensation for the costs of land conversion from agricultural use to forest plus the lost opportunity costs for not farming or developing the converted farmland.

Response

As explain in Section 10 of the TMDL, EPA expects Chesapeake Bay jurisdictions to account for and manage new or increased loadings of nutrients and sediment. Appendix S provides information regarding the development and implementation of offsets. EPA believes that offsets supported by credible and transparent offset programs are a viable approach to accommodate new or increased loadings within the watershed. The commenter's statement that "offsets are not widely available" may be accurate at this point in time. However, EPA believes that during the implementation of the TMDL, jurisdictions will be developing offsets programs and offset credits will be generated by many sources over time. In addition, offset credits can and should be generated by the source who is seeking additional loading capacity.

With regards to the testimony of Brent Fults, Managing Member of the Chesapeake Bay Nutrient Land Trust, LLC, EPA does not expect nor encourage that farmland be converted from agricultural use to forest. EPA anticipates that farmers will reduce their nutrient loads from their farms by choosing among many possible BMPs. For example, BMPs may be as simple as fencing livestock out of streams and ponds or choosing to convert to rotational grazing operations.

Author Name: Boepple Charles

Organization: Upper Occoquan Sewage Authority (dba Upper Occoquan Service Authority)

UOSA has already invested \$1.8 million in the design of the secondary treatment upgrades (a subset of a \$94 million nutrient reduction capital project) to be able to meet the TN WLA of 1.316 million pounds/year (based on 8 mg/L and 54 mgd) as flows increase. Reducing the UOSA TN WLA, as shown in the EPA Bay Draft TMDL, would require a delay and additional costs to allow UOSA to re-direct and re-start the design process. Such a re-direction would be a waste of scarce public funds and, as explained above, would be contrary to the protection of the Occoquan Reservoir, the Potomac River and the Chesapeake Bay.

As a Wastewater plant operator I do not know how we will meet the TMDLs proposed by EPA. The cost to upgrade plants will be exorbitant and to pass them on to the users won't work. It would cost our small plant millions to upgrade it and that does not guarantee success. We have limits now that we meet and most of the problems come from runoff which needs to be addressed. The public cannot afford this.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Organization: Virginia Crop Production Association, Inc. (VACPA)

The Bay TMDL, which requires Virginia to develop a Watershed Implementation Plan (WIP), will have a high cost for compliance for all sectors. While VACPA agrees that there is a benefit of clean waters within the Bay and local

watersheds, the economic costs for compliance must be balanced, and water quality programs cannot be developed in a vacuum without considering economic impacts to the economy.

Response

Thank you for your comments. The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. The CWA Section 303(d) requires TMDLs to be established for impaired or threatened waters at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety. Federal regulations at 40 CFR Section 130.7(c) track the statute and require TMDLs to be developed at levels necessary to attain and maintain the applicable narrative and numerical water quality standard with seasonal variations and a margin of safety and that take into account critical conditions. TMDLs are to include wasteload allocations for each point source and load allocations for nonpoint sources. Neither the CWA nor EPA's implementing regulations require the state or EPA to consider the costs to implement the TMDL when establishing the TMDL at a level necessary to implement the applicable water quality standards. However, there are economic benefits to improving local water quality.

A study by the University of Virginia found that implementation of the agricultural practices to reduce runoff pollution called for in Virginia's Chesapeake Bay "tributary strategy," such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts. Over a five year period these actions would create \$940 million in industrial output, a \$455 million impact on gross domestic product, and create nearly 12,000 jobs (42).

Agriculture has the benefit of estimating some expenses based on existing data on cost of implementing AgBMPs through current state and federal programs. Virginia estimates that just one practice (cattle fencing) could cost more than \$800 million to implement. Fencing cattle from streams, putting in crossings, providing alternative watering, etc. costs on average \$30,000 for a Virginia cattle farmer. Virginia's Natural Resources Commitment Fund says Ag BMP cost-share funds will need to be \$63.2 million annually from 2025 in order to get 60% NPS reduction goals from agriculture. This is only cost-share funding from the state doesn't account for federal government's traditional share of funding or the money that comes from farmers. Current funding estimates are just based upon the cost of installing the practice, they do not account for costs like loss of productive land, replacing practices when weather damages occur, fluctuations in markets, etc. Economic conditions (lack of profits, increased input costs, additional credit not an option) mean that extra money to meet regulations is non-existent. Due to long-term devastating economic conditions for agriculture (like other sectors), federal backstops alone (mandatory permitting of small dairies, requiring some ag processing plants to do more) will be enough to drive some farmers out of business. Cost share funding will be critical

to meeting demands of EPA. Agriculture has seen depressed profits, just as the State and local governments have been facing historic deficits. Individual businesses, farmers, and the State cannot meet this unfunded mandate from EPA without significant federal funding.

EPA cannot provide "Reasonable Assurance" that placing significantly lower limits on point sources (with many industrial point sources below the limit of technology) will be implemented and successful.

This approach nets a fraction of the needed reductions from Pennsylvania and carries a huge financial burden to the rate-paying public

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: Peninsula Housing & Builders Association (PHBA)

Our local members, along with numerous other Virginia businesses, local governments and farmers, simply cannot at this time absorb this unprecedented and unfunded federal mandate. The TMDL for the Chesapeake Bay not only will extend the historic decline of housing, and continue the so-called 'jobless recovery,' but we believe it will expand the decline into many other sectors of the state's economy.

Response

Thank you for your comments. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. A 1989 study from the state of Maryland that looked at fishing, tourism, property, and shipping activities estimated the value of the Bay to Maryland and Virginia to be \$678 billion (1). Considering inflation, an expert panel in 2004 placed the value at over \$1 trillion, with an annual economic benefit of \$33 to \$60 billion (2,3,4). A 2010 report said that waters that make up Delaware's portion of the Bay watershed—only 1% of the watershed—support 47,000 jobs and \$1 billion in annual economic activity (5). A study by the Virginia Institute of Marine Science estimated that in 2004 recreational and commercial fishing contributed \$1.23 billion in sales, \$717 million in income, and more than 13,000 jobs in Virginia, with two-thirds of the impact from recreation (6). Other studies focused just on sport fishing in Virginia found that salt waters alone generate \$1 billion and 5,000 jobs, and saltwater and freshwaters combined create over \$2 billion and 15,000 jobs (7,8).

Clean water decreases public health burdens associated with consuming tainted fish or shellfish or exposure to waterborne infectious disease while recreating. Mercury fish consumption advisories in Maryland result in annual losses of \$8.83 million for saltwater fishing and \$520,000 for the commercial striped bass fishery (34). Economic valuation studies indicate the annual human health benefits from reducing mercury pollution at tens of millions to billions of dollars from avoided health problems and lost productivity (35,36,37). Another study estimated the cost associated with exposure to polluted recreational marine waters to be \$37 per gastrointestinal illness, \$38 per ear ailment, and \$27 per eye ailment (38). Reducing pollution inputs from pipes and landbased sources can reduce locality costs to treat drinking water sources to safe standards. New York City's expenditure of \$1 billion over the last decade to protect the watersheds north of the city that supply its drinking water avoided the need to build a \$6 billion treatment plant (39). An EPA study of drinking water source protection efforts concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs (40). Proactive efforts to lessen stormwater flows today reduce future public costs needed to maintain navigation channels, remediate pollution and hazard flooding, and repair infrastructure and property damage caused by excessive runoff.

Philadelphia estimates that after 40 years their installation of green infrastructure will create more than \$2 in benefits for every dollar invested, generating \$500 million in economic benefits, \$1.3 billion in social benefits, and \$400 million in environmental benefits (41). A study by the University of Virginia found that implementation of the agricultural practices to reduce runoff pollution called for in Virginia's Chesapeake Bay "tributary strategy," such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts. Over a five year period these actions would create \$940 million in industrial output, a \$455 million impact on gross domestic product, and create nearly 12,000 jobs (42).

Comment ID 0253.1.001.008

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

The County is also concerned with EPA's lack of transparency regarding its lack of disclosure and analysis of costs related to urban stormwater. We understand that in other EPA documents urban stormwater costs for the Bay TMDL have been estimated at an annual cost of \$7.9 billion. Similarly, we understand that the Center for Watershed Protection has reported costs on the order of \$88,000 per acre for urban retrofits. To translate these types of costs estimates to the household level, last month a national engineering firm reported to the Virginia Municipal Stormwater Association ("VAMSA") that EPA's Draft TMDL's costs may be on the order of \$700 to \$1,800 per household per year, for urban stormwater management alone, during the 15-year implementation period. For Henrico County alone, these costs translate to \$848 million to \$1.25 billion over the implementation period, or between \$520/year to \$1,310/year per household. See COM Technical Memorandum dated October 27, 2010 (attached hereto and fully incorporated herein [Comment Letter contains additional information in the form of an attachment. See original comment letter 0253.2]). Obviously, costs in that range are extremely high if not completely unaffordable.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0253.1.001.014

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

What is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments, including Henrico County, have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). Since adoption of the current standard in 2005, local governments designed and constructed the required new facilities with long-term debt, which now must be repaid by the public over the next 20 to 30 years. As explained above, since 2005, the County has completed, or in the process of completing, over \$20 million in improvements to its WWTP. The County objects to the waste inherent in EPA's proposed override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Comment ID 0253.1.001.015

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

Regarding EPA's proposed backstop for MS4s, EPA's Draft TMDL fails to adequately consider a critical aspect relating to whether or not its TMDL will be successful for Bay restoration, namely cost as well as cost-effectiveness and cost-benefit. An expert national engineering firm has estimated the cost to Virginia's MS4 localities to restore 50% of existing untreated impervious area over a 15 year term (the level and manner of effort assumed by EPA in its Draft TMDL). The low estimated per household, annual cost is \$678 in 2011 and possibly as high as \$1,717 in 2025. Further, these staggering figures are only for the specific retrofits considered in EPA's plan and thus omit other significant existing and future costs for other MS4 permit obligations (such as under existing permits and potentially increased requirements under future permits and other TMDLs) and for general maintenance of the existing stormwater system. Furthermore, these costs do not include costs for land acquisition, which would inevitably be required for the property needed to construct the necessary retrofits and BMPs.

Comment ID 0256.1.001.007

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

More stringent regulations and expensive retrofits for stormwater facilities to meet TMDL requirements will have an enormous impact on the ability of local governments to pay for them. In Pennsylvania, for example, the state is reported to be facing a five billion dollar deficit which has already caused environmental programs and staff to be drastically reduced.

Comment ID 0260.1.001.003

Author Name: Brosious John

Organization: Pennsylvania Municipal Authorities Association (PMAA)

Equally troubling is that the amount of additional reduction from point sources that may now be required to treat to "limit-of-technology" essentially nets a fraction of the needed reductions from Pennsylvania. This mere fraction however carries a huge financial burden, basically more than doubling the \$1.4 billion* treatment plants have already invested in Bay nutrient reduction upgrades. From a public policy perspective, this represents a dubious planning and fiscal approach to actually achieving a successful strategy for compliance, forcing the rate-paying public to fund projects with little return on that investment.

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

The Hampton Roads Planning District Commission (HRPDC) appreciates the opportunity to submit these joint comments on behalf of the cities of Chesapeake, Hampton, Newport News, Norfolk, Poquoson, Portsmouth, Suffolk, Virginia Beach, and Williamsburg, and the counties of Isle of Wight, Gloucester, James City, Surry, and York on the Environmental Protection Agency's September 2010 draft Chesapeake Bay Total Maximum Daily Load (TMDL).

The cities of Chesapeake, Hampton, Newport News, Norfolk, Portsmouth, and Virginia Beach own Municipal Separate Storm Sewer Systems (MS4s) that operate under individual Phase I MS4 NPDES permits issued by the Virginia Department of Conservation and Recreation (DCR), while the cities of Poquoson, Suffolk and Williamsburg, and the counties of Isle of Wight, James City, and York own MS4s that operate under a general Phase II MS4 permit issued by DCR. At present, Gloucester and Surry are not designated as MS4s, but could be so designated in the future due to population growth or modification of the criteria used to designate MS4s.

At the Commission meeting on October 20, 2010, the HRPDC acted to endorse the following position and attached comments.

- The cost of achieving the urban runoff sector allocations per EPA's backstop allocations would place an unreasonable financial burden on the residents of Hampton Roads. The estimated \$1.05 billion in annual costs equates to a total average annual storm water fee of \$1,670 per household equates to 2.3 percent to 3.0 percent of median household income (MHI).

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0265.1.001.012

Author Name: Clark, Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

Exhibit B [Comment Letter contains additional information in the form of an attachment. See original comment letter 0265.1] shows that the average 54 (James) and 59 (York) percent load reduction needed to achieve the backstop allocation for phosphorus would require treatment of approximately 68 and 74 percent of the urban land area in the James River and York River basins, respectively.[FN 3] The estimated total costs of treatment are approximately \$9.8 billion (or approximately \$1.05 billion per year [FN 4]) after factoring in the added cost of designing storm water controls that would function effectively on the flat, low-lying terrain and in the soils and high water table that dominate the topography and hydrology in the Hampton Roads area.[FN 5] However, as explained below, these estimated costs do not include the added cost of acquiring new easements and construction in existing utility easements.

The magnitude of the financial burden that would be imposed on the residents of the Localities cannot be overstated. As shown in Exhibit C, the estimated \$1.05 billion in annual costs equates to a total average annual storm water fee of \$1,670 per household, or \$720 per person. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0265.1] These fees, in turn, equate to 2.3 percent of median household income (MHI), and 3.0 percent of MHI when the fees imposed on non-residential land owners are passed onto the consumer. Expressed another way, the estimated annual cost of attaining the allocations (without adding the cost of easement acquisition) represents 118 percent of the Localities' 2009 total annual expenditures for public safety (police and fire) and 37 percent of their total annual expenditures for schools. Further, as high as the estimated treatment costs are, they do not tell the whole story.

[FN 3] Although Exhibit B shows that the percent of urban land area that would have to be treated to achieve the load reductions needed to attain the total suspended solids (TSS) allocations are greater than the area that would have to be treated to attain the TP allocations, we have used TP as the benchmark for the cost estimates because it represents a mid-point in the percent reductions for TN, TP, and TSS. Further, the controls that will remove TP also serve to remove TSS. It is possible that the costs to achieve the TSS allocations could be higher than the cost to achieve the TP allocations in the York River basin.

[FN 4] In addition to the cost of designing and installing the controls, the estimated annual cost includes operation and maintenance costs and 30-year bond financing at a 5.5 interest rate.

[FN 5] The Localities evaluated three control scenarios to arrive at this cost estimate: (1) Scenario 1a - all best management practices (which includes voluntary urban nutrient management plans); (2) Scenario 1b - substituting storage for urban nutrient management plans; and (3) Scenario 1c - more reliance on storage than best management practices. See Exhibit C. Scenario 1c was selected as the control scenario reflecting the level of effort that would be required to achieve the allocations given the topography, hydrology, and soils in the coastal region and the Localities' experience to date with urban nutrient management plans.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

C. A knee-of-the-curve analysis further indicates that the James River allocations should be based on the Tributary Strategy

We recognize that EPA has a certain amount of discretion to rely on model predictions as the basis for its TMDLs, even when the predictions are acknowledged to reflect some uncertainty. However, there are limits to the exercise of that discretion; and this is one instance where EPA would be acting arbitrarily because in addition to unresolved flaws in the model, the model predictions are unable to reliably distinguish between model scenarios with immense cost implications as shown in the following knee-of-curve analysis, which was prepared by one of the Localities' consulting engineers, Greeley and Hansen.

[Figure 3] Knee-of-the-Curve Analysis for James River Chlorophyll-a WQS

Figure 3 shows the estimated capital costs of attaining the chlorophyll-a criteria against the percent attainment rate. The capital costs include estimates for basin-wide wastewater treatment plant reductions, agricultural BMPs, and urban runoff controls necessary to meet the allocations identified by EPA for the scenarios identified in Figure 3. The wastewater treatment plant capital costs are a function of design flows and level of treatment (biological nutrient removal, enhanced nutrient removal and limit of technology). Agricultural capital costs are based on BMP unit cost per acre and the BMP assumptions used in the Phase 5.3 Model. The urban runoff capital costs[FN 17] are based on the performance associated with the runoff reduction method for an estimated amount of retrofit controls that could be installed in a locality, which represents only a portion of the urban runoff costs. The costs for the remainder of the urban runoff reductions needed to meet the allocations would be achieved with storage and reuse. The estimated capital costs were prepared for the following EPA Scenarios:

- '91-'00 Base Scenario: Point "A" represents the James River TN and TP loading of 36.9 and 3.3 million pounds per year, respectively.
- EPA's Tributary Strategy: Point "B" represents the James River TN and TP portion of the Bay-wide loading, which is 27.5 and 3.3 million pounds per year, respectively.
- EPA's James Chl-a Compliance: Point "C" represents the James River TN and TP loading of 23.5 and 2.35 million pounds per year, respectively. EPA has selected this scenario as the basis for compliance with the James River chlorophyll-a criteria. EPA also refers to this scenario as "James Level of Effort at ½ Potomac". In Appendix J to the TMDL Report, EPA states "In the James, the nutrient loads are equivalent to the level of effort half way between Virginia's portion of the Potomac and the James for the 190/12 Loading Scenario."
- E3 (Everything, Everywhere, by Everybody): Point "D" represents the James River TN and TP loading of 16.1 and 1.5 million pounds per year, respectively. EPA considers this to be the "theoretical maximum levels of managed controls on all pollutant load sources". There are no cost and few physical limitations to implementing controls for point and nonpoint sources in the E3 scenario. This scenario is used with the No-Action scenario to define the "controllable" loads, i.e., the difference between No-Action and E3 loads." See TMDL Report at Appendix J.

The knee-of-the-curve analysis determines where the increment of pollution reduction achieved in the receiving water diminishes compared to the increased costs. There is a steep inflection at Point "B" that represents the knee-of-the-curve. Any reduction beyond Point "B" lacks a viable cost-to-benefit ratio and does not reflect a reasonable level of attainment. EPA has selected Point "C" as the basis for the James River compliance with the chlorophyll-a criteria, which is about half way between Point "B" and EPA's E3 scenario (Point "D"). If one assumes that the model predictions are accurate (about which there is substantial doubt), at Point "B", the James River would be 93 to 94 percent compliant with chlorophyll-a criteria compared to 99 percent at Point "C". However, the true difference in chlorophyll model output between Points "B" and "C" is only 2 to 3 g/L (three parts in a billion). Additionally, the sampling and testing accuracies for physical water measurements is 1 to 3 g/L. In other words, even if the loadings between Points "B" and "C" were achieved, it is unlikely that the difference in James River chlorophyll-a concentrations could be measured. The difference in the estimated cost of achieving the loadings between Points "B" and "C", on the other hand, is over \$10 billion.

[Figure 3- Please see original document]

[FN 17] Urban nutrient management was not included. The capital costs are based on meeting the waste load allocation for the Urban Runoff identified in Appendix Q-1 of the TMDL report.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. For additional information on your comment regarding the James River please see the response to Comment ID 0436.1.001.027.

Comment ID 0266.1.001.006

Author Name: Fagerstrom Angela

Organization: City of Binghamton, New York

WHEREAS, the Federally-designated TMDL, intended to limit nitrogen, phosphorous and sediment discharges into the Chesapeake Bay, is projected to cost New York State communities at least 2 billion dollars and New York State farmers 500 million dollars by 2025, without being able to satisfy EPA's regulatory goal

Response

EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. It is EPA's preference that each jurisdiction develops a Watershed Implementation Plan that meets the TMDL load allocations in a manner that best meets the needs of the jurisdiction both environmentally and economically. The states are responsible for allocating the tributary loads to the source sectors within their jurisdiction as part of the jurisdictions' Watershed

Implementation Plan that will be used to inform the TMDL. A jurisdiction may choose to take action towards individual or more general sectors in achieving load reductions. Each jurisdiction has a unique set of practices they intend to use to meet water quality standards. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York.

the unfair burden that this places on the communities and farmers in the Chesapeake Bay watershed in New York

Response

Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York.

Comment ID 0267.1.001.012

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

The proposed allocations also put a stranglehold on future economic growth within the region. Given that the allocations are impractical to achieve, communities in New York's watershed jurisdiction would be unable to develop agricultural or non-agricultural businesses that would jeopardize increasing loading from point or nonpoint sources. [FN 4]

[FN 4] 4 See Draft TMDL at app. S-2. Thus, since New York would not even meet its initial allocations, any additional loading would not even qualify as "new or increased loading" defined in the draft TMDL as occurring "after the point in time the source begins meeting its WLA or LA." We expect to do our part for the Bay restoration. In fact, our WWTP is in the process of being upgraded with nutrient removal technology. Our facility is under the final stages of design and is expected to go to construction in approximately mid 2012. This project is expected to cost approximately \$60 million. To pay for this project, rates will have to be increased. Increases will vary across the five jurisdictions that we serve, but are currently estimated to be in the 75 to 100% range over current rates.

Response

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). We object to the waste inherent in EPA's proposed override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Comment ID 0277.1.001.001

Author Name: Shambaugh Brenda

Organization: PA Association of Conservation Districts (PACD)

As is stated in the PA Water Implementation Plan (PA WIP), conservation districts are recognized as the primary staff for implementing Pennsylvania's agricultural programs. Among other programs, the conservation districts implement the Erosion and Sedimentation Control program and the Nutrient Management program. Without these dedicated local employees, the necessary "hands-on" technical assistance would not exist in Pennsylvania both in the Chesapeake Bay Watershed and the other watersheds throughout the Commonwealth. It is important to note the value of the conservation districts and to understand their importance when discussing nutrient reductions in Pennsylvania's waterways and ultimately water flowing into the Chesapeake Bay.

One of the top priorities for conservation districts is to assist landowners as they strive to comply with new and existing state and federal regulations concerning nutrient reductions. While recognizing the need for cost-effective and efficient nutrient planning, conservation district employees are the providers of technical assistance and a common sense approach to installing best management practices (BMP's). As a result, it is essential to provide adequate conservation district funding to provide a sufficient number of staff necessary for program success. Unfortunately, rather than increasing conservation district staff a recent employment history survey shows that out of the 58 conservation district responding, 32 have been forced to decrease their overall staffing levels for 2009 because of budgetary constraints. At the end of 2009 there were collectively 532 full or part time conservation district employees. By comparison, in 2010 conservation districts in PA employ a total of 485 full and part time workers, a reduction of 42 employees or nearly 10 percent of their total workforce. We recommend a Conservation District Fund allocation of \$15 million annually to cover the workload required because of the additional responsibilities associated with Chesapeake Bay activities.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions. Future enhancements include addressing current short falls in resources and proposed strategies to increase resources.

EPA does not have the authority to dictate where a jurisdiction allocates its funding.

Organization: Town of Laurel, Delaware

Having said that, I must on behalf of the people of Laurel protest the plant discharge water standards of 4.0 mg/l total nitrogen and 1.0 mg/l for total phosphorus as proposed by the State of Delaware-DNREC, on economic grounds. Laurel is an economically distressed area. Our median income is \$28,000 per year. Our Town needs to grow in territory and service so that we can attract new jobs to the area and increase our tax base. If we do not do that our people will be faced with a future laden with continuing increases in water and sewer fees.

Laurel is at a competitive disadvantage compared to its larger neighboring Towns to the north. They would be able to increase discharge capacity with proper upgrades as Laurel has done and increase their discharge capacity into the Nanticoke River. Because of a mathematical quirk our plant is permitted for 700,000 gal per day discharge. To accomplish our future growth economically the Town of Laurel should be permitted to discharge at least 2 million gallons per day into Broad Creek. Without a severe financial penalty we will have difficulty in meeting the proposed State of Delaware standards of 4.0 mg/l total nitrogen and 1.0 mg/l of total phosphorous at the 700,000 gal per day flow rate; expansion to 2 million gallons per day flow rate is virtually impossible.

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

Not only are allocations under the Virginia Regulations and Draft WIP more appropriate than those of the Draft TMDL for technical reasons and the above-stated policy reasons, but at some point the relentless regulatory pressure to increase wastewater rates must be considered. According to Draper Aden Associates' most recent annual water and wastewater rate report, Virginia wastewater rates rose an average of 5% last year and 67% over the last decade. Many VAMWA members have reported double-digit rate increases for multiple years. This comes at a time when unemployment levels are very high (currently at 9.6%). Consideration should be given to the impact of the higher costs that EPA is forcing on Virginia's families and businesses.

D. The Socio-Economic Impact of the Proposed Urban Runoff Allocations

According to an estimate prepared for the Hampton Roads Planning District Commission by the engineering firm of Greeley & Hansen, the anticipated cost to the City of Newport News of the implementation of the provisions by 2025 will be \$1,166,000,000.00 for infrastructure and additional employees and contractors. This breaks down to approximately \$110 million per year, and would result in an increase of the City's operating budget of 24.6%. If the City chooses to pay through the Stormwater Utility fee, this fee would have to increase from \$65.40 a year per ERU to \$871.00 per ERU per year, a 1194% increase. This increase will disproportionately affect low income persons, particularly the elderly and disabled persons on fixed incomes.

Response

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

Furthermore, EPA stated in their Draft EPA Position Paper on The Chesapeake Bay TMDL Framework dated April 6, 2009 that "an affordability assessment will be conducted to determine the degree of financial stress that the Bay TMDL loading reductions will place on the individual source sectors (e.g., wastewater treatment, agriculture, municipal stormwater runoff) and how those financial burdens might be addressed within the implementation plans". EPA's commitment to complete an affordability assessment is too important to the process to wait until after the final TMDL is published. VDOT respectfully requests that this assessment be conducted immediately and the results provided as part of another public comment period for the draft TMDL.

Response

EPA has developed this TMDL based on the requirements of Section 303(d) of the CWA and the implementing regulations found at 40 CFR 130.7. The CWA and federal regulations require that TMDLs be designed to meet existing, applicable water quality standards (numeric, narrative, uses and anti-degradation), include wasteload allocations (WLA) for each point source, load allocations (LA) for non-point sources (allocated to specific sources if data allow, or gross allotments to source types), consider seasonal impacts, and include a margin of safety. An affordability assessment is not needed to establish the TMDL.

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Comment ID 0304.1.001.002

Author Name: Thompson Glenn

Organization: U.S. House of Representatives

First, the reality is that if this TMDL proposal becomes law, our local boroughs, townships and municipalities will bear the brunt of these unfunded mandates. The TMDL requires that our local governments perform upgrades to point sources, such as water and sewage treatment facilities, if they don't meet these mandatory standards. This also includes upgrading management techniques for storm water runoff, erosion, and all other management activities that releases nitrogen, phosphorus or sediment in the watershed. Many of these small communities in rural Pennsylvania already have minimal budgets and simply cannot afford to spend hundreds of thousands to millions of dollars complying with these new rules. In other words, this proposal equates to costly unfunded mandates on local municipalities and boroughs that are often located in rural areas.

Secondly, this proposal alarms me because of its likely effects on Pennsylvania's farms and agribusiness. Because the TMDL mandate will regulate pollution levels from nonpoint sources, substantial new financial and regulatory burdens will be forced on many of Pennsylvania's farmers. Agriculture is Pennsylvania's largest single industry, and is the top job source in many areas in my district and throughout the watershed region. Many farms in Pennsylvania tend to be small family-run businesses; and generally, most farmers in the Commonwealth are not independently wealthy. In recent years, many farms in Pennsylvania have had their wallets further squeezed due to the economic recession. Take Pennsylvania's number one sector within the agriculture industry - dairy - for example. Dairy producers have seen record breaking low prices in the past few years. Dairy prices have been so low for extended periods of time that producers have been unable to meet the costs of production. This has resulted in great financial hardship for our dairy farmers across the commonwealth, throughout the northeast, and nationwide. In some cases, low prices have driven

some to bankruptcy, forcing the sale of the farm. The TMDL will without a doubt increase costs on Pennsylvania's farmers at a time when the nation is trying to pull out of a recession and many farmers are struggling just to meet their bottom lines.

Furthermore, this proposal concerns me because of the long-term impacts it likely will have on Pennsylvania agriculture and our rural economies. Due to market forces and well-intentioned federal policies, we unfortunately continue to see the trend of farms in rural Pennsylvania disappearing and agricultural lands taken out of production. This has been going on for decades and I strongly believe that a TMDL mandate such as this will inevitably result in the removal of more acres from agricultural production. Reducing our farm lands means less jobs and economic security in rural America and less food for our nation and abroad.

Response

EPA reminds the commenter that the TMDL is not a Federal regulation or law.

EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards and directs the commenter to agricultural funding sources outlined in Comment 139.1.001.006 and the Federal commitments to the Bay in Comment 0038.1.001.024.

Comment ID 0304.1.001.005

Author Name: Thompson Glenn

Organization: U.S. House of Representatives

Wellsboro has recently paid over \$15,000 for a study to put in effect a pretreatment ordinance that significantly reduces limits of phosphorus and nitrogen to our Waste Water Treatment Plant. Costs associated with another 25 percent reduction in these limits would cause an unfair burden on our users.

Response

Because industrial users typically treat wastewater before sending it to a WWTP, one would expect that if the WWTP is paying to treat industrial wastewater, these costs would be passed to the industrial user rather than the ratepayers. Wellsboro does not currently have a pretreatment program run by EPA (the pretreatment program is administered by EPA in PA). As WWTPs throughout the Bay watershed face upgrades as loadings are reduced through the TMDL, EPA does not agree that Wellsboro faces an unfair burden.

Author Name: Thompson Glenn

Organization: U.S. House of Representatives

In our case, an engineering feasibility study has been contracted by the Moshannon Valley Joint Sewer Authority (MVJSA), which provides options to meet the new standards. The option recommended by the study would cost over \$14 million. Even with favorable funding, this would increase the average sewer bill of Philipsburg Borough by at least \$55.00 a month, making our rates almost double the suggested average resident per month rate in Pennsylvania. This would be devastating to the many elderly and low income residents of our Borough. The same is true for the other municipalities served by the MVJSA as well as others in Pennsylvania.

We urge you to look into this problem and try to convince the EPA that there has to be some way to correct this problem on a more equitable basis than putting it on the backs of small municipalities such as the Borough of Philipsburg.

Organization: Commonwealth of Virginia

More importantly I am concerned that this haste to act and an overzealous and burdensome regulatory approach may do irreparable harm to Virginia jobs and the economy. The economic costs for compliance must be balanced. Federal backstops, in particular, could do more harm than good if permitting requirements drive farmers out of business and off their land or restrict wastewater treatment upgrades, resulting in capped growth in expanding communities.

Response

EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards by December 31, 2010.

With regard to balancing costs, please see the response to comment 0139.1.001.017 and the response to comment 0067.1.001.009 details EPA's WIP rational and how it has changed.

Organization: County of Fairfax, Virginia

Local governments support a healthy environment and have a constructive role to play in improving water quality in the Chesapeake Bay and in all waters of Virginia. However, we have significant concerns about the costs that the TMDL initiative will impose on local governments and their residents. A sound strategy for improving water quality to levels required by EPA, will not succeed unless the economic costs associated with these efforts are fully understood, and a plan is developed for distributing these costs among the different levels of government.

Further, given the current economic conditions, these initiatives could not be coming at a more difficult time. Because of Virginia's fiscal constraints, state aid to localities has fallen by \$1 billion since 2008. These cuts in state aid have affected our public schools, mental health programs, social services and public safety. The economic downturn and ongoing foreclosure crisis have directly impacted local government revenues and have forced many localities to cut back on the services they provide and on their workforces. From June 2009 to June 2010, 15,600 local government jobs in Virginia were eliminated. These points are not being made to suggest that local governments should not be active partners in improving water quality; in fact, we have done the lion's share of the work in this area. Our chief contention is that there is a major role that the federal and state governments must take in underwriting the costs of the very expensive programs that the Chesapeake Bay TMDL will generate.

Response

Please see the response to comment 0501.1.001.005 regarding public sector point sources and the response to comment 0038.1.001.024 outlining the Federal effort to the Bay.

Comment ID 0325-cp.001.001

Author Name: Bradshaw Sarah

Organization: Sand Hill Farm

Please, do not limit our ability to be profitable and remain a family farm. We're now in the sixth generation of farming in

Southampton County, VA. We have been doing everything we can to maintain our soil and water resources for the next generation and also for our bottom line. It just doesn't make sense not to take care of the land we depend on. The proposed TMDL will very likely put us out of business, costing the local government even more. Currently our farm doesn't need schools, roads, and other services. But if we are unable to farm, we will be forced to sell lots for development.

Cost share funding will be critical to meeting demands of EPA. Due to several recent weather disasters, Virginia grain farmers in some cases face their fourth failed crop consecutively. This causes little to no profit and in turn decreases their farm income average. Farmers cannot carry the burden of financing additional best management practices or paying to have documents created outlining how they already farm only to satisfy government regulations (ex - nutrient management plans cost \$3-\$5 per acre).

Please, don't regulate agriculture just because you can and you can't regulate homeowners that pollute the bay at larger numbers.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Organization: Old Plantation Oyster Company

As a small business owner in the rapidly growing aquaculture industry, I feel compelled to offer my comments on the draft TMDL. While some may complain that regulations will cut into their bottom lines, we all need to consider the impact of our own actions on the livelihoods of others.

There will be a substantial economic benefit from these actions to curb pollution, especially for industries like tourism, aquaculture, commercial fishing, and recreational angling. Virginia's decades long passive approach to water quality improvement has resulted in lost jobs and the forfeiture of economic growth in Bay-dependent sectors of the economy.

Reducing pollution will also increase the sustainability of upstream enterprises, making them more profitable now and in the long run. Market trends show that consumers of agricultural products, manufactured goods, and housing care about

how what they buy impacts the environment. Farms and businesses that can market produce as 'Bay friendly' will command price premiums. In many cases they will also be able to reduce their costs through practices and processes that use fewer polluting resource inputs. The sooner Virginia and other Bay states realize and embraces this, the sooner we will establish a green competitive advantage over producers from other states and countries.

Response

Thank you for the support in your comments. There are numerous studies that support your comments regarding the economic benefits of improving the water quality in the Chesapeake Bay. See response to 0038.1.001.008 which highlights some of those studies.

Author Name: Krasnoff Alan

Organization: City of Chesapeake, Virginia

Additionally, the City is very concerned that the Draft TMDL places a staggering burden on local governments during a time of significant economic distress. The HRPDC's estimate for the total cost of implementing the Draft TMDL in the

City of Chesapeake by 2025 is \$1.367 billion (\$210 million for Best Management Practice costs and \$1.157 billion in storage and re-use costs). This would modestly equate to an annual per capita cost of approximately \$437, which is calculated at the lower end of the range, and public and private expenditures of approximately \$98 million a year. The families and businesses of Chesapeake are already facing extreme financial hardships, making any additional burden of this magnitude completely untenable and unacceptable. Without significant state and federal assistance, this unfunded mandate will be impossible to support solely with local resources.

Response

A TMDL is not a federal mandate. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0330.1.001.013

Author Name: Krasnoff Alan

Organization: City of Chesapeake, Virginia

As proposed, meeting the TMDL goals recommended by the EPA would require significant reductions in pollutants through treatment of existing urban lands. Two immediate problems arise with this proposal. First, while new development has, and will continue to, construct and maintain BMPs to offset pollutant loading, the City has no authority to require existing development to retrofit private property to meet water quality goals. The only means of retrofitting existing private development would require the City to acquire land interests through acquisition or condemnation and install the necessary improvements. The costs associated with such an effort would be exorbitant and prohibitive. Thus, the EPA has failed to recognize that in the absence of re-development requiring local land use approvals, Virginia localities have no express or implied regulatory authority to require retrofits of existing private development. Second, the City is also severely limited in its ability to construct new BMPs needed to meet the pollutant reduction levels required by the Draft TMDL. The City directly controls less than 15% of property within the jurisdictional boundaries of Chesapeake, and the majority of that land is improved with roadway and utility infrastructure. This affords the City small opportunity for BMP retrofitting without the purchase of additional real property interests or the reconstruction of its existing public facilities. Both options would be costly, inefficient and wasteful of public resources.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to

meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to comment number 0232.1.001.004 in regards to retrofits.

Comment ID 0331.1.001.005

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

EPA's proposed backstop allocations for the James River basin provide some relief for urban runoff sector, but not nearly enough to provide reasonable assurance that the allocations can be achieved. The average 54 percent load reduction needed to achieve the backstop allocation for phosphorus would require treatment of approximately 65 percent of the impervious land area in the Hampton Roads Localities at a total estimated cost of \$9.5 billion, not including the cost of land acquisition, between now and 2025. As most of the land that will need to be acquired is already developed, the cost of acquiring sufficient land will be massive. The consequences of these expenditures will, of course, be exacerbated in the current economic climate, in which localities are already severely stressed financially.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

Comment ID 0331.1.001.009

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

D. The Socio-Economic Impact of the Proposed Urban Runoff Allocations-

It is impossible to predict the full extent of the socio-economic consequences of attempting to undertake an effort of this magnitude, because such an undertaking has never been tried before. However, it is clear that there is no assurance that the load reductions that would be required to achieve the backstop allocations can be accomplished by EPA's 2025 deadline, and that the cost would be totally out of proportion to any water quality benefit.

As the Hampton Roads area, like the nation as a whole, is in the grip of the worst economic times since the Great Depression, this is the worst possible time for the requirement of retrofitting, given the massive outlays of money it would require from the private and the public sector. As localities face previously unheard-of financial crises, and businesses, especially small and family-owned ones, struggle to remain afloat, the consequences of complying with the proposed EPA mandates will be devastating. And given the uncertainty of success in restoring the Bay by means of retrofitting urban areas, the proposed EPA action is unreasonable.

Further, the EPA has failed to consider an important aspect of the problem, the cost to the locality to implement the TMDLs. Given that cost is one of the main limitations on fully accomplishing the Bay restoration, EPA's failure to consider cost-effectiveness or cost-benefit is arbitrary and capricious.

Response

A TMDL is not a federal mandate. EPA disagrees with the comment that it is arbitrary or capricious for TMDLs to not consider cost. EPA is under a legal obligation to establish a TMDL that meets water quality standards in the Bay which is explained in the response to comment 0139.1.001.017.

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

THE FLAWS AND UNCERTAINTY IN EPA'S MODELED PREDICTIONS DO NOT JUSTIFY JAMES RIVER ALLOCATIONS MORE STRINGENT THAN THOSE ESTABLISHED IN THE 2005 TRIBUTARY STRATEGY

7. The knee-of-the-curve analysis shows that EPA's James River allocations would impose billions of dollars of additional cost while achieving reductions of in-stream chlorophyll-a concentrations that are within the margin of error of the test method. The justification of such costs is simply not present.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Comment ID 0331.1.001.022

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

The Model results that are the basis for the proposed allocations are clearly lacking in the level of precision and certainty required to justify the resulting billions of dollars in costs. EPA professes to be taking an adaptive management approach to the TMDLs; but in reality, EPA is taking an adaptive legal and regulatory approach to the TMDLs by establishing the TMDLs based on incomplete and flawed science and then seeking to supply the missing documentation after the fact. The only outcome of the EPA's course of action that is reasonably certain is that localities will be forced to dig deeply into the pockets of their citizens at a time when they can least afford it; the results that EPA hopes for are, by contrast, highly speculative at best.

Response

For a response to 0379.1.001.006 to address your concerns with the model. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Author Name: Miner Steven

Organization: Accomack County, Virginia

The County of Accomack is located on the Delmarva Peninsula, adjacent to the Maryland counties of Somerset and Worcester. It has a population of approximately 38,480 persons. Accomack's economy has several principal bases, including a Federal presence at Wallops Flight Facility, tourism and a high rate of entrepreneurship. However, as vital and important as these economic elements are to the county, agriculture remains the backbone of our economy. We are not wealthy, with 20% of our population at or above the Federal poverty level.

Accomack county has some 90,000 acres of farmland. It consistently leads or is close to the lead of the Commonwealth of Virginia's agricultural production in corn, potatoes, soybeans, green beans and tomatoes. Two major poultry brands, Purdue and Tyson Foods, operate plants in our county, providing a large percentage of our manufacturing jobs and a market for many landowners and farmers for grain and poultry grown in support of those major plants, which by themselves hire about around 3000 people. This industry today has, somehow, remained vital in the face of enhanced overseas competition. How long can they hold out and how much can they bear in costs before they too, are overcome by cheaper imports, which can be frozen and shipped to our markets, and none of which are faced with costs of such a nature? The destabilization of the economy which could result from unwise regulations which might place these plants out of any fair range of economic competitiveness with others within or without the nation would far, far, exceed the damage done to the Bay through a slower, more thoughtful and more creative process which eventually accomplishes the goals we all share.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0340.1.001.007

Author Name: Miner Steven

Organization: Accomack County, Virginia

Overall, this attempt will likely end in utter failure, litigation and further erosion of local confidence in the Federal processes at the state and local level designed to clean up the Bay we all love, as well as depend upon for our livelihoods. There is a very good chance that agriculture and businesses in the Bay shed will pay a disproportionate share of the cost. We ask if this is the time and if this is the manner in which the Federal EPA should go about trying to solve the issues it has identified.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0341.1.001.001

Author Name: Anderson David

Organization: Virginia Fountainhead Alliance

Without question, establishing a total maximum daily load (TMDL) and a watershed implementation plan (WIP) for the Chesapeake Bay will mark an important milestone in Virginia's necessary efforts to restore the Bay. However, it is also hard to overstate the potential effect that the TMDL process could have on Alliance members and the Virginia economy. Essentially, the process involves the EPA setting the levels of phosphorus, nitrogen, and sediment that Virginia can discharge into the Chesapeake Bay. Virginia is then required to provide "reasonable assurance" that those limits are met. If Virginia fails to provide such assurance, EPA will impose what it previously described as "consequences," but now refers to as "federal backstops." EPA imposed nutrient limits have the very real potential to become caps on business activities and economic growth.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please refer to the response to 0038.1.001.008 which gives examples of how improved water quality can have a positive impact on Virginia's economy.

Organization:

Farmers in my area of the Chesapeake Bay watershed have done a tremendous job of improving their practices over the years. I have been directly involved in the poultry industry for 33 years and over that time period the changes have been dramatic. If farmers are given a chance and sufficient time they will certainly do their part to save the bay. Farmers typically don't have an enormous opportunity to make substantial profit, and without help from state and federal governments they cannot afford the measures that are being thrust upon them by our federal government. I think the recent election shows how the majority of citizens feel about the way government is running our country and this Chesapeake Bay TMDL is just another example. I attended one of the TMDL public meetings and the audience was overwhelmingly on the side of farmers. Please do not rush into this and make decisions that will drive many farmers out of business. This country needs to begin to stop and think where their food actually comes from. It's not just the grocery store. Let's give farmers some time and money and they will do their part. The Chesapeake Bay didn't get in the shape it's in overnight and it certainly won't be fixed overnight.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Comment ID 0355.1.001.004

Author Name: Williams Jesse

Organization: Williams Cattle Company LLC

During the last 20 years on our farm, which is located near the Nansemond River, we have:

1. Installed many acres of buffer strips at our own expense.
2. Installed grade stabilization structures on all erosion sites, a total of eleven structures.
3. Established vegetative waterways where needed.
4. Dispersed and discontinued large swine and cattle operations.
5. Utilized 100% no till on all corn acreage and 90% no till on soybean acreage. 6. Utilized nutrient management plans.
7. Used GPS and auto controls on sprayers to reduce the amounts of chemicals being used.
8. Hired professional crop scouts who assist us in using minimum amounts of chemicals and fertilizers.
9. Utilized cover crops as cost share monies are available.
10. Followed BMP, Best Management Practices, on our wooded acres.

The EPA needs to recognize that the monies and hard work that we have been spending voluntarily to improve the water quality of the run-off from our farm, has to be paid for by the income from the property. The cost of new rules and regulations plus the increases in property taxes for the local government to cover their mandates will impose a harsh burden.

Response

Thank you for your comments and for all you have done to improve your farming operation and reduce nutrient input to the Bay. EPA understands the cost to farmers and appreciated those farmers, like yourself, that have voluntarily implemented practices that would reduce the nutrient load to your local waters and ultimately the Bay itself. The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. EPA does not dispute the costly nature of improving water quality in the Bay watershed. EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. For further information on funding sources, please see the response to Comment ID 0038.1.001.024 outlining the federal efforts towards Chesapeake Bay restoration. Please note that a TMDL is not a federal mandate.

Comment ID 0374-cp.001.002

Author Name: Hartgrove Charles

Organization: Town of Ashland, Virginia

Other EPA documents urban stormwater costs for the TMDL have been estimated at \$7.9 billion/yr. We understand that the CWP has reported costs on the order of \$88,000/ac for urban retrofits. These costs have been translated as roughly \$700 to \$1,800/household/yr for urban stormwater management alone during 15-yr implementation period. These costs are extremely high if not unaffordable.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Comment ID 0374.1.001.003

Author Name: Hartgrove Charles

Organization: Town of Ashland, Virginia

We understand that in other EPA documents urban stormwater costs for the Bay TMDL have been estimated at an annual cost of \$7.9 billion. Similarly, we understand that the Center for Watershed Protection has reported costs on the order of \$88,000 per acre for urban retrofits. To translate these types of costs estimates to the household level, last month a national engineering firm reported to the Virginia Municipal Stormwater Association ("VAMSA") that EPA's Draft TMDL's costs may be on the order of \$700 to \$1,800 per household per year, for urban stormwater management alone, during the 15-year implementation period. Obviously, costs in that range are extremely high if not completely unaffordable.

Response

Organization: PA Chamber of Business and Industry

The investments being made by significant industrial facilities in the basin must be viewed in the context of a business climate that is best described as extremely challenging -- where virtually all entities have been affected by a recession of global dimensions, and where efforts to preserve employment have been seriously strained. Many of our Chamber members are enduring costs that cannot be readily passed on to customers, given the nature of global competition and the minimum margins allowed in a competitive market - where producers in other regions or other parts of the world do not face such costs.

Comment ID 0379.1.001.003

Author Name: Shields Wyatt

Organization: City of Falls Church, Virginia

Although there is a limited amount of information available to assess how much it will cost to implement EPA's Draft TMDL. A national engineering firm with expertise in this area has recently prepared an estimate for how much it would cost Virginia's MS4 localities over a 15 year term, solely to treat 50% of existing impervious coverage. Shockingly, this analysis concludes that for urban stormwater controls, the TMDL would have an annual, per household cost of \$678 per year in 2011 and possibly as high as \$1,717 in 2025. Given the current economic conditions, these initiatives could not be coming at a more difficult time.

One of the main limitations on fully accomplishing the Bay restoration has been the tremendous cost. EPA's failure to consider cost, cost-effectiveness, or cost-benefit in its Draft TMDL ignores an important, maybe fundamental, aspect of the problem. We recognize that TMDLs do not typically address cost issues and that debates about the feasibility and cost of implementing a TMDL are typically the province of a use-attainability analysis (UAA). However, EPA has clearly stated during regional meetings that it will not allow a UAA with regard to the Chesapeake Bay; foreclosing this ordinarily available and lawful option. A sound strategy for improving water quality to levels required by EPA will not succeed unless the economic costs associated with these efforts are fully understood, and a plan is developed for distributing these costs among the different levels of government.

Response

Please see response to 0159.001.001 to address economic impacts. Author Name: Combs Tina

Organization: Chamber of Commerce, Martinsburg and Berkeley County, West Virginia

Because our publicly owned wastewater facilities in Berkeley County are not currently designed or required to remove nitrogen and phosphorus from the waste stream, significant capital investment in new treatment processes will be required. In addition, increased operations and maintenance expenditures will be necessary to operate and dispose of by-products generated by the new processes. The required investments for nutrient controls will raise sewer rates for customers in Berkeley County an estimated 40% to over \$66 per month for the average residential user. Rates for commercial and industrial users would likewise increase 40% over current rates. The costs of the nutrient removal processes will also likely result in a deferral or cancellation of other critical infrastructure extensions and/or improvements.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Comment ID 0382-cp.001.005

Author Name: Combs Tina

Organization: Chamber of Commerce, Martinsburg and Berkeley County, West Virginia

Berkeley County must not only reduce current levels of discharge, but must also account for and limit new and increased flows. Additional discharge resulting from development may be allowed only with corresponding nitrogen and/or phosphorus reductions elsewhere to achieve a "net zero" pollution rate. This will severely limit future economic growth opportunities for Berkeley County and effect land use restrictions. The "net zero" pollution rate will decrease development opportunities and act as a disincentive for business growth, both commercial and agricultural, in Berkeley County, if not the shrinking of industrial and agricultural activity in the Eastern Panhandle as a whole. This means lost job opportunities and lost revenue for Berkeley County as well as West Virginia.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Comment ID 0390-cp.001.005

Author Name: Fultz Fred

Organization: Municipal Authority of the Township of Union, Pennsylvania

EPA cannot provide "Reasonable Assurance" that placing significantly lower limits on point sources (with many industrial point sources below the limit of technology) will be implemented and successful.

This approach nets a fraction of the needed reductions from Pennsylvania and carries a huge financial burden to the rate-paying public.

Response

The existence of the NPDES regulatory program and the issuance of an NPDES permit(s) provide the reasonable assurance that the WLAs in the TMDL will be achieved. That is because federal regulations implementing the CWA require that effluent limits in permits be consistent with "the assumptions and requirements of any available [WLA]" in an approved TMDL [40 CFR 122.44(d)(1)(vii)(B)].

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 addressing public sector point sources. With regard to WIP backstops, please see the response to comment 0067.1.001.009.

Forgive me for including these printed pages in my reply to you. They will express my views better than I could, being an old (95 years) uneducated farmer.

I have always attempted to prevent run-off of my manure. It is too valuable. I have planted no-till for thirty-five years. I

have kept my soil in shape to prevent run-off.

Our farm produces a large tonnage of poultry litter. Your analysis indicates too much phosphorous for our corn and soybean crops. Therefore, we must sell and haul this litter to another watershed. We receive about 38 dollars per ton for it delivered. Included is many tons of nitrogen at the same price. If a crop calls for nitrogen, we have to pay over five hundred dollars per ton.

This is slowly draining the resources from our farm and someday we will just have to quit farming. Thanks to oysters and crabs in Chesapeake Bay.

Response

EPA appreciates all efforts made to keep nitrogen, phosphorus and sediment pollution out of the Bay. For information on agricultural funding sources, please see the response to comment 0139.1.001.006.

Organization: Public Works and Utilities, City of Manassas, Virginia

2. The City is facing layering of multiple requirements in the area of stormwater regulation. The State is considering possible expansion of the Chesapeake Bay Act, new State stormwater regulations, and the Watershed Implementation Plan (WIP) connected with the Bay TMDL requirements for which the City does not have resources to administer or to finance. Estimates in the range of \$7 - \$10 billion dollars have been quoted to fulfill the TMDL requirements in the Bay watershed. If the plan is approved it can not be an unfunded mandate. At a recent Stormwater Symposium sponsored by Virginia Tech, the cost to implement just the retrofit requirements were placed at \$700 per household per year. Most stormwater utilities in the Commonwealth range between \$1 - \$20/month. This would significantly impact residents and businesses in the worst economy experienced in over a generation.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 addressing public sector point sources. With regard to EPA's rationale behind WIP backstops and how it has changed, please see the response to comment 0067.1.001.009 and section 8 of the TMDL.

Comment ID 0412.1.001.003

Comment ID 0414.1.001.006

Author Name: Myers George

Organization: Milton Regional Sewer Authority

In the case of Milton Regional Sewer Authority, should cap loads be reduced from the current levels based on design capacity and 6 mg/l total nitrogen and 0.8 mg/l total phosphorus to limit of technology because other segments fail to meet their targets, it is likely that we would be facing increased capital expenses of over \$6 million and increased operations and maintenance costs of \$0.8 million per year. In addition, it is likely that additional lands would need to be purchased to site the required additional treatment units.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure. Please see response to 0159.001.001 to address economic impacts. Environmental Justice Threatened

The draft TMDL ignores the cost impact of the backstop limits to be imposed on Pennsylvania POTW's. EPA has not considered the environmental justice of such re-allocation given that larger populations of minorities and low and moderate income families reside in the cities and boroughs that are served by public sewers than in the agricultural and developed segments.

In the case of Milton (as is typical in other municipalities), over 50 percent of the population is of low and moderate income. These will be the people paying the cost of the additional treatment capital and operation and maintenance costs for meeting the backstop limits because those in the agricultural community would not be taking steps to address their non-point source nutrient discharges. It is inappropriate to require low income minorities to pay a disproportionate share due to the inactions of other non-minority, more affluent sectors.

Has EPA considered the environmental justice of its proposed backstop limits and has it sought outreach to representatives of minority and low and moderate income residents regarding the disproportionate impact of such approach?

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Author Name: Sharma Lalit

Organization: City of Alexandria, Virginia

V. THE CHLOROPHYLL-a WATER QUALITY MODEL SHOULD NOT BE USED TO ESTABLISH THE JAMES RIVER ALLOCATIONS

It does not appear that EPA's use of the chlorophyll-a water quality model to establish the James River allocations played a direct role in EPA's failure to include WLAs for captured CSS in the draft TMDL. However, use of this model and the resulting dramatic cuts in the James River allocations will have significant adverse consequences for Richmond's and Lynchburg's CSO control programs by greatly increasing their overall cost of wastewater treatment; thus making an already immense financial burden even greater. As explained above, both cities are already burdened with the highest wastewater rates in the state and have committed to future CSO control costs totaling over \$700 million in today's dollars. Preliminary estimates indicate that the backstop allocations in the draft TMDL would further increase the combined total cost of storm water control and wastewater treatment (exclusive of CSS control) for the cities to as much as \$1.7 billion and increase their total wastewater costs to over three percent of MHI. Although the cities employ different rate structures to fund the cost of their water quality programs (wastewater treatment, CSO control, and storm water), it is their residents who bear the burden of paying for these programs. There is a limit to their ability to pay, and it now appears that the combined costs of the cities' CSO control programs together with the added costs that would be imposed by the James River backstop allocations are beyond their individual financial capabilities. Moreover, it is apparent that the chlorophyll-a model-based allocations do not have a sound scientific basis.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure. Please refer to the response to comment 0379.1.001.006 which speaks directly to the watershed models used. Comment ID 0419.1.001.010

Author Name: Sharma Lalit

Organization: City of Alexandria, Virginia

In addition to unresolved flaws in the model, the model predictions are unable to reliably distinguish between model scenarios with immense cost implications for Richmond and Lynchburg as shown in the following knee-of-curve analysis, which was prepared by one of the Communities' consulting engineers, Greeley and Hansen.

Figure 4 - Knee-of-the-Curve Analysis for James River Chlorophyll-a WQS [Please see Figure 4 in page 15 of the original letter (Docket ID EPA-R03-OW-0736-0419.1)].

Figure 4 shows the estimated capital costs of attaining the chlorophyll-a criteria against the percent attainment rate. The capital costs include estimates for basin-wide wastewater treatment plant reductions, agricultural BMPs, and urban runoff controls necessary to meet the allocations identified by EPA for the scenarios identified in Figure 4. The wastewater treatment plant capital costs are a function of design flows and level of treatment (biological nutrient removal, enhanced nutrient removal and limit of technology). Agricultural capital costs are based on BMP unit cost per acre and the BMP assumptions used in the Phase 5.3 Model. The urban runoff capital costs [FN6] are based on the performance associated with the runoff reduction method for an estimated amount of retrofit controls that could be installed in a locality, which represents only a portion of the urban runoff costs. The costs for the remainder of the urban

runoff reductions needed to meet the allocations would be achieved with storage and reuse. The estimated capital costs were prepared for the following EPA Scenarios:

- '91-'00 Base Scenario: Point "A" represents the James River TN and TP loading of 36.9 and 3.3 million pounds per year, respectively.
- EPA's Tributary Strategy: Point "B" represents the James River TN and TP portion of the Bay-wide loading, which is 27.5 and 3.3 million pounds per year, respectively.
- EPA's James Chl-a Compliance: Point "C" represents the James River TN and TP loading of 23.5 and 2.35 million pounds per year, respectively. EPA has selected this scenario as the basis for compliance with the James River chlorophyll-a criteria. EPA also refers to this scenario as "James Level of Effort at 1/2 Potomac". In Appendix J to the TMDL Report, EPA states "In the James, the nutrient loads are equivalent to the level of effort halfway between Virginia's portion of the Potomac and the James for the 190/12 Loading Scenario."
- E3 (Everything, Everywhere, by Everybody): Point "D" represents the James River TN and TP loading of 16.1 and 1.5 million pounds per year, respectively. EPA considers this to be the "theoretical maximum levels of managed controls on all pollutant load sources". There are no cost and few physical limitations to implementing controls for point and nonpoint sources in the E3 scenario. This scenario is used with the No-Action scenario to define the "controllable" loads, i.e., the difference between No-Action and E3 loads." See TMDL Report at Appendix J.

The knee-of-the-curve analysis determines where the increment of pollution reduction achieved in the receiving water diminishes compared to the increased costs. There is a steep inflection at Point "B" that represents the knee-of-the-curve. Any reduction beyond Point "B" lacks a viable cost-to-benefit ratio and does not reflect a reasonable level of attainment. EPA has selected Point "C" as the basis for the James River compliance with the chlorophyll-a criteria, which is about half way between Point "B" and EPA's E3 scenario (Point "D"). If one assumes that the model predictions are accurate (about which there is substantial doubt), at Point "B", the James River would be 93 to 94 percent compliant with chlorophyll-a criteria compared to 99 percent at Point "C". However, the true difference in chlorophyll model output between Points "B" and "C" is only 2 to 3 micrograms/L (three parts in a billion). Additionally, the sampling and testing accuracies for physical water measurements is 1 to 3 micrograms/L. In other words, even if the loadings between Points "B" and "C" were achieved, it is unlikely that the difference in James River chlorophyll-a concentrations could be measured. The difference in the estimated cost of achieving the loadings between Points "B" and "C", on the other hand, is over \$10 billion.

[FN6] Urban nutrient management was not included. The capital costs are based on meeting the waste load allocation for the Urban Runoff identified in Appendix Q-1 of the TMDL report.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. For additional information on your comment regarding the James River please see the response to Comment ID 0436.1.001.027.

Comment ID 0420-cp.001.001

Organization: Moriah Farm LLC

We oppose the Chesapeake Bay restrictions on fertilizer applications which will decrease crop yeilds substantially . This will create fianicial hardships for both farmers and consumers.

We practice no till methods and are very cautious of run off's . We are committed to being good stewards of the environment and the Chesapeake Bay.

We can appreciate the EPA's concerns to preserve the Bay for future generations.

Response

EPA appreciates your concerns and efforts to reduce run off to the Chesapeake Bay. EPA has not imposed any restrictions on the use of fertilizer application in the Bay Watershed. A Nutrient Management Plan would address the appropriate amount of fertilizer to apply to fields and EPA recommends those plans be kept up to date and followed.

Comment ID 0428-cp.001.001

Author Name: Thomas Steven

Organization: Fulton County Planning Commission

The Fulton County Planning Commission strongly objects to the EPA's proposed TMDL for the Chesapeake Bay. Passing of the new regulations would cause significant economic hardship of the municipal authorities and residents linked to those systems. The proposed TMDL regulations are absolutely not economically feasible at this time in Fulton County. According to the Bureau of Labor and Statistics (Sept. 2010), Fulton County's unemployment rate is 13.7%. This is 2nd highest rate in Pennsylvania. Additionally, our largest plant, in McConnellsburg Borough, has already invested thousands of dollars into an upgrade project to meet the current requirements of 6 mg/l TN and 0.8 mg/l TP. Requiring them to meet more stringent loads would cause extreme hardship on the end-users, the residents.

While the intent of the regulations is commendable, the Fulton County Planning Commission can not support the proposed TMDL because of the severe economic impact that would be placed on our local communities.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA

established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please note that a TMDL is not a federal regulation.

Organization: City of Charlottesville, Virginia

Our most significant concerns with EPA's Draft TMDL and Virginia's WIP relate to the lack of transparency in this regulatory process, particularly regarding lack of disclosure and analysis of costs related to urban stormwater. We understand that in other EPA documents urban stormwater costs for the Bay TMDL have been estimated at an annual cost of \$7.8 billion. Similarly, we understand that the Center for Watershed Protection has reported costs on the order of \$88,000 per acre for urban retrofits. To translate these types of costs estimates to the household level, last month a national engineering firm reported to the Virginia Municipal Stormwater Association ("VAMSA") that EPA's Draft TMDL's costs may be on the order of \$700 to \$1,800 per household per year, for urban stormwater management alone, during the 15-year implementation period. Obviously, costs in that range are extremely high if not completely unaffordable.

The City of Charlottesville has performed an analysis of the potential costs of the proposed Chesapeake Bay TMDL and the Virginia Watershed Implementation Plan. If the current EPA backstop requiring "50% of urban land to meet aggressive performance standards through retrofit/redevelopment" remains in the TMDL, the resulting annual costs to the City of Charlottesville could be as much as \$15.6 million. Even without this backstop, the annual cost of this TMDL on the City is expected to be in the range of \$1.6 million to \$7.8 million per year. There are more cost effective ways than urban retrofits to achieve the needed nutrient reductions to the Bay. Treatment strategies to significantly reduce the agricultural loads, which are more cost effective per pound of nutrient removed, need to be explored.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. A "pollution diet" should not equate to economic starvation. A plan that does not provide affected persons the flexibility and meaningful opportunity to analyze the relative effects of pollution reduction measures and manage and finance the relative costs needed for implementation will not only alienate those for whom EPA has expectations of additional reduction. It will ultimately result in wasteful spending toward activities that have negligible environmental benefit and are capriciously performed under threat of regulatory sanction.

Response

Please see response to 0159.001.001 to address economic impacts.

Comment ID 0435.1.001.016

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

It is estimated that the cost to the residents of Norfolk would be approximately \$1.4 billion by 2025 to reduce phosphorus loads to comply with the backstop allocations. This cost includes designing BMPs that would function effectively on the flat, low-lying terrain and in the high water tables that make up the physical setting of the City. Furthermore, the cost estimate outlined above does not reflect the added cost of acquiring the land needed for the installation of structural BMPs and long-term maintenance of those systems.

Neither the EPA nor the Commonwealth has explained how BMPs will be accounted for when determining compliance with the nutrient and sediment allocations. It is unknown how the efficiencies of structural BMPs will be set. Currently state storm water regulations do not acknowledge the added efficiencies for BMPs in series. Further, EPA and Virginia fail to account for non-structural BMPs.

Additionally, it is impossible to predict the full extent of the socio-economic consequences of attempting to undertake an effort of this magnitude because such an undertaking has never been tried before. However, we can state with confidence that there is no assurance that the load reductions that would be required to achieve the backstop allocations can be accomplished by the 2025 deadline, and that, on a pound-for-pound basis, the cost would be out of proportion to any water quality benefits.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 regarding public sector point sources.

EPA has not taken socioeconomics into account as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Comment ID 0435.1.001.019

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

The Hampton Roads Planning District Commission (HRPDC) appreciates the opportunity to submit these joint comments on behalf of the cities of Chesapeake, Hampton, Newport News, Norfolk, Poquoson, Portsmouth, Suffolk, Virginia Beach, and Williamsburg, and the counties of Isle of Wight, Gloucester, James City, Surry, and York ("Hampton Roads Localities" or "Localities") on Virginia's September 2010 draft Phase I Watershed Implementation Plan (WIP).

The cities of Chesapeake, Hampton, Newport News, Norfolk, Portsmouth, and Virginia Beach own Municipal Separate Storm Sewer Systems (MS4s) that operate under individual Phase I MS4 NPDES permits issued by the Virginia Department of Conservation and Recreation (DCR), while the cities of Poquoson, Suffolk and Williamsburg, and the counties of Isle of Wight, James City, and York own MS4s that operate under a general Phase II MS4 permit issued by DCR. At present, Gloucester and Surry are not designated as MS4s, but could be so designated in the future due to population growth or modification of the criteria used to designate MS4s.

A. Concerns with the WIP

The Hampton Roads Localities appreciate Virginia's efforts to incorporate flexibility and cost effectiveness into the WIP;

however, the James and York river basin urban runoff sector allocations in the WIP would impose massive financial costs on the Hampton Roads MS4s in what surely would be a futile effort to reduce phosphorus loads by an average of almost 80 percent. As explained below, even with the larger backstop phosphorus allocation proposed by the U.S. Environmental Protection Agency (EPA) (average 54 and 59 percent phosphorus reductions for the James River and York River, respectively), the Localities would still have to expend an estimated \$9.8 billion, plus the cost of land acquisition, to achieve the backstop sector allocations. Although the State's proposed credit exchange concept would have helped to reduce the cost of compliance in the near term, we fear that the WIP's long-term financial consequences could have been even worse for the reasons listed below.

We also appreciate Virginia's efforts to provide relief to the urban runoff sector by proposing to make credits from the point source and agriculture sectors available to assist the MS4s in attaining their sector allocations. However, even if EPA had endorsed the State's credit exchange proposal, it is unlikely that it would have been sufficient to avoid the immense long-term financial consequences associated with an obligation to reduce phosphorus loadings by almost 80 percent for several reasons. First, there is no assurance that the credits would be generated when and where needed; second, those credits generated from excess flow capacity would only be available to the MS4s on a temporary; and finally, the reductions that would be required of urban runoff with the WIP allocations are so great that the demand for credits could exceed the supply, thus driving up their cost and limiting their availability to the Localities, particularly if the Localities are forced to compete with private developers for the credits.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 regarding public sector point sources.

For discussion of the WIP backstops, please see the response to comment 0067.1.001.009 and Section 8 of the TMDL.

Comment ID 0435.1.001.020

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

Impacts of the Proposed Allocations on the Hampton Roads Localities

Although the Hampton Roads Localities would fare better under EPA's James and York river basin backstop urban runoff sector allocations, the more than 50 percent reduction in phosphorus required to achieve the backstop allocation is still beyond a level that is practicable of attainment.

It is impossible to predict the full extent of the socio-economic consequences of attempting to achieve the backstop allocations because an undertaking of this magnitude has never been tried before. However, we can state with confidence that there is no assurance that the load reductions that would be required to achieve the backstop allocations can be accomplished by EPA's 2025 deadline, and that, on a pound-for- pound basis, the cost would be totally out of portion to any water quality benefit.

On average, the Localities and their residents would have to treat between 68 and 74 percent of the urban land area within their jurisdictions in order to achieve the over 50 percent reduction in phosphorus needed to attain the backstop allocations. It is estimated that it would cost the Hampton Roads Localities approximately \$9.8 billion (\$1.05 billion annualized) to reduce phosphorus loads to the levels needed to comply with the backstop allocations after factoring in the added cost of designing BMPs that would function effectively on the flat, low-lying terrain and in the soils and high water tables that reflect the dominate topography and hydrology in the Hampton Roads area. As explained in the enclosed copy of our comments on the draft TMDL, this equates to an annual storm water fee of \$1,670 per household, and \$720 per person.

Further, this cost estimate does not reflect the added cost of acquiring the land needed for the installation and maintenance of the BMPs required to achieve the backstop allocations. On average, the Localities own less than 15 percent of the 68 to 74 percent of urban land area that would have to be treated to attain the backstop phosphorus allocations. The remaining reductions would have to be achieved with retrofits on private land, and since the Localities cannot force private land owners to retrofit in the absence of redevelopment requiring local land use approvals, the Localities would have to negotiate for the purchase of the land needed for the easements or acquire the land by condemnation. Land acquisition is an expensive and time consuming process that will add greatly to the cost and time required to achieve the reductions.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 regarding public sector point sources.

For discussion of the WIP backstops, please see the response to comment 0067.1.001.009 and Section 8 of the TMDL.

EPA has not taken socioeconomics into account as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Comment ID 0436.1.001.002

Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Chesapeake, Virginia

The Hampton Roads Planning District Commission (HRPDC) appreciates the opportunity to submit these joint comments on behalf of the cities of Chesapeake, Hampton, Newport News, Norfolk, Poquoson, Portsmouth, Suffolk, Virginia Beach, and Williamsburg, and the counties of Isle of Wight, Gloucester, James City, Surry, and York on the Environmental Protection Agency's September 2010 draft Chesapeake Bay Total Maximum Daily Load (TMDL).

The cities of Chesapeake, Hampton, Newport News, Norfolk, Portsmouth, and Virginia Beach own Municipal Separate Storm Sewer Systems (MS4s) that operate under individual Phase I MS4 NPDES permits issued by the Virginia Department of Conservation and Recreation (DCR), while the cities of Poquoson, Suffolk and Williamsburg, and the

counties of Isle of Wight, James City, and York own MS4s that operate under a general Phase II MS4 permit issued by DCR. At present, Gloucester and Surry are not designated as MS4s, but could be so designated in the future due to population growth or modification of the criteria used to designate MS4s.

At the Commission meeting on October 20, 2010, the HRPDC acted to endorse the following position and attached comments.

--The cost of achieving the urban runoff sector allocations per EPA's backstop allocations would place an unreasonable financial burden on the residents of Hampton Roads. The estimated \$1.05 billion in annual costs equates to a total average annual storm water fee of \$1,670 per household equates to 2.3 percent to 3.0 percent of median household income (MHI).

Response

Please see the response to comment 0067.1.001.009 and Section 8 of the TMDL for EPA's WIP backstop rational.

Comment ID 0436.1.001.012

Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Chesapeake, Virginia

Exhibit B [Comment Letter contains additional information in the form of an attachment. See original comment letter 0436.1] shows that the average 54 (James) and 59 (York) percent load reduction needed to achieve the backstop allocation for phosphorus would require treatment of approximately 68 and 74 percent of the urban land area in the James River and York River basins, respectively.[FN 3] The estimated total costs of treatment are approximately \$9.8 billion (or approximately \$1.05 billion per year [FN 4]) after factoring in the added cost of designing storm water controls that would function effectively on the flat, low-lying terrain and in the soils and high water table that dominate the topography and hydrology in the Hampton Roads area. [FN 5] However, as explained below, these estimated costs do not include the added cost of acquiring new easements and construction in existing utility easements.

The magnitude of the financial burden that would be imposed on the residents of the Localities cannot be overstated. As shown in Exhibit C [Comment Letter contains additional information in the form of an attachment. See original comment letter 0436.1], the estimated \$1.05 billion in annual costs equates to a total average annual storm water fee of \$1,670 per household, or \$720 per person. These fees, in turn, equate to 2.3 percent of median household income (MHI), and 3.0 percent of MHI when the fees imposed on non-residential land owners are passed onto the consumer. Expressed another way, the estimated annual cost of attaining the allocations (without adding the cost of easement acquisition) represents 118 percent of the Localities' 2009 total annual expenditures for public safety (police and fire) and 37 percent of their total annual expenditures for schools. Further, as high as the estimated treatment costs are, they do not tell the whole story.

[FN 3] Although Exhibit B shows that the percent of urban land area that would have to be treated to achieve the load reductions needed to attain the total suspended solids (TSS) allocations are greater than the area that would have to be

treated to attain the TP allocations, we have used TP as the benchmark for the cost estimates because it represents a mid-point in the percent reductions for TN, TP, and TSS. Further, the controls that will remove TP also serve to remove TSS. It is possible that the costs to achieve the TSS allocations could be higher than the cost to achieve the TP allocations in the York River basin.

[FN 4] In addition to the cost of designing and installing the controls, the estimated annual cost includes operation and maintenance costs and 30-year bond financing at a 5.5 interest rate.

[FN 5] The Localities evaluated three control scenarios to arrive at this cost estimate: (1) Scenario 1a - all best management practices (which includes voluntary urban nutrient management plans); (2) Scenario 1b - substituting storage for urban nutrient management plans; and (3) Scenario 1c - more reliance on storage than best management practices. See Exhibit C [Comment Letter contains additional information in the form of an attachment. See original comment letter 0436.1]. Scenario 1c was selected as the control scenario reflecting the level of effort that would be required to achieve the allocations given the topography, hydrology, and soils in the coastal region and the Localities' experience to date with urban nutrient management plans.

Response

EPA has not taken socioeconomics into account as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Comment ID 0439.1.001.002

Author Name: Littrell Judy

Organization: New York Association of Conservation Districts

In 2007, EPA stated those that benefit the most from the Chesapeake Bay Recovery must do more. This idea should be followed during the TMDL Allocation. Because of New York's position at the headwaters of the Bay, New York receives basically no economic benefit from the clean-up of the Bay, yet New York is being threatened with unfunded mandates, in a time, when the New York State is in dire financial stress which flows directly to county budgets. This financial stress of the state will limit the resources available in terms of implementation - to fund projects, and have technical staff available for implementation.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions. Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York.

Comment ID 0439.1.001.005

Author Name: Littrell Judy

Organization: New York Association of Conservation Districts

Most farms cannot financially tolerate any additional unfunded mandates and additional regulations would force many out of business. Agriculture is the leading industry in the Upper Susquehanna region of New York, so to unnecessarily loose more farms, is an economic lose to the small rural communities the Basin. Farms going out of business would also be an additional lose of a source of locally produced food and jobs.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0439.1.001.010

Author Name: Littrell Judy

Organization: New York Association of Conservation Districts

New York does not receive any economic benefit from Bay clean-up, therefore, tidal states that do benefit economically from the clean-up, should be mandated to do more than what is being proposed for New York. If these unfunded mandates/reduction of load allocations with backstops, are placed on the back of the Upper Susquehanna Basin, it would severely damage the rural communities from an economic standpoint. Farms would go out of business, unemployment would rise, other small businesses would suffer, including support services like the Soil and Water Conservation Districts, and the tax base would be lost.

Response

Please see the response to comment 0267.1.001.006 addressing how New York's loading contribute to the downstream impairment in the Bay and the response to comment 0080-cp.001.002 addressing equity and the state of New York.

Comment ID 0446.1.001.004

Author Name: Beegle Douglas

Organization: Penn State University

A strategy must be developed to enable agriculture to meet the goals of the TMDL in a way that is sustainable. A common misconception is that more strict requirements for improved management practices to control nutrient losses will result in environmental improvement and economic sustainability. Farmer responding to global economics is what has driven this problem. If there were additional economic benefits to be derived from implementing more environmentally based management practices and BMPs, agriculture would already be doing this. The reality is that the economics of improved nutrient management for environmental quality are negative. The Chesapeake Bay Protection and Restoration Executive Order emphasized "Healthy Waters, Thriving Agriculture". Unless the negative economics associated with the structure of modern animal agriculture are addressed, "thriving agriculture" will not be possible under this TMDL as current drafted. If agriculture is given the where-with-all to change, it has been demonstrated over and over throughout our history that agriculture will respond positively. A fundamental underlying problem is that one of the reasons we have such cheap food in this country is that we are not paying for the environmental consequences of our current food production systems when we purchase our food. The reality is that if we what food produced in a way that does not result in water quality degradation, it will cost more and the food consumers not just the food producers should bear that cost. Improved management will automatically follow structural changes that provide appropriate incentives for change. This must be addressed as part of the TMDL if it is going to be successful. Any plan that assumes that we can simply manage our way to meeting the TMDL goals and maintain a viable sustainable agriculture is unrealistic. Ideally, in addition to improving nutrient management, emphasis must be placed on developing strategies for structural changes in the food system which recognizes and integrates the true cost of producing food without environmental degradation and pays for the other ecological, economical, and social benefits of agriculture as a land use in the watershed. Alternatively if policies cannot be developed to internalize these environmental costs in food production, these costs must be borne by public funds or the cost of addressing water quality concerns must be weighed against the other benefits of agriculture in the watershed and a decision to severely limited agriculture in the watershed may be necessary. The backstop plans in the TMDL recognize this reality of the costs associated with this TMDL because EPA is confident that these reductions can be achieved because point sources have the ability to pass the cost of environmental protection on to the consumer. Agriculture does not have this ability which is why EPA has little confidence in Ag NPS plans. Anyway you look at it there will be a substantial cost to achieving the goals of the TMDL. This must be explicitly recognized in any WIP. Someone has to pay for the TMDL. It is a matter of who and how that has not been addressed.

Response

In the TMDL, EPA is required to establish the loading reductions necessary to meet water quality standards given reasonable assurance, though establishing the funding or sources of funding necessary for implementation is beyond the scope of the TMDL.

Please see the response to Comment ID 0139.1.001.017.

For information on funding sources, please see the response to Comment ID 0038.1.001.024 outlining the federal efforts towards Chesapeake Bay restoration and the response to comment 0139.1.001.006 addressing agriculture.

Comment ID 0449.1.001.003

Author Name: Farry K.

Organization: Excalibur Farms

Imposing solutions that do not produce the desired result is irresponsible. In this case, it will force my family out of farming. Since it appears from your report that suburban development does not pollute the Bay, perhaps we should sell the farm to a developer.

Response

The Chesapeake Bay TMDL establishes nutrient and sediment loads that originate from many sources in the Bay watershed. Point sources of nitrogen, phosphorus and sediment include municipal wastewater facilities, industrial discharge facilities, CSOs, SSOs, NPDES permitted stormwater (MS4s and construction and industrial sites), and CAFOs. Nonpoint sources include agricultural lands (AFOs, cropland, hay land, and pasture), atmospheric deposition, forest lands, on-site treatment systems, nonregulated stormwater runoff, streambanks and tidal shorelines, tidal resuspension, the ocean, wildlife, and natural background. The Chesapeake Bay models estimated loadings of nutrients and sediments from each of these sources and established the nutrient and sediment reductions needed in each watershed to meet water quality standards.

Agricultural lands account for 22 percent of the watershed, making agriculture one of the largest land uses in the area, second only to forests (58 percent). As such, agriculture is the largest single source of nitrogen, phosphorus, and sediment loading to the Bay through applying fertilizers, tilling croplands, and applying animal manure. Agricultural activities are responsible for approximately 44 percent of nitrogen and phosphorus loads delivered to the Bay and about 65 percent of sediment loads delivered to the Bay. While agricultural lands are responsible for a significant percentage of sediment and nutrient loads, other sources have been identified as significant. For example, in 2009, EPA estimates that urban and suburban development and runoff contributed to 16 percent of the sediment loadings, 15 percent of the phosphorus loadings, and 8 percent of the nitrogen loadings to the Bay (Phase 5.3 Chesapeake Bay Watershed Model 2009 Scenario).

For an outline of agricultural funding, please see the response to comment 0139.1.001.006.

Comment ID 0464.1.001.001

Author Name: Bush J.

Organization: Virginia Forest Products Association (VFPA)

Virginia's forest products industry is one of the State's largest manufacturing activities. A recent government sponsored economic study¹ shows that forestry and agriculture comprise the largest economic segment of the Commonwealth, with forestry contributing \$23 billion annually in total economic impact while providing jobs for 144,000 Virginians. Forests are the largest land use in the State, covering 62% of Virginia's land mass, and forest products related economic activity is found in every county and city of the Commonwealth.

Recent economic conditions have placed a severe toll on the industry ... easily the worst since the Depression, with many facilities closing their doors either temporarily or permanently. As an example, studies have shown the number of sawmills in the State in 2009 is one-half of the total found in 1999, just 10 years previous. Any additional regulatory

burdens placed on the industry, particularly those that have questionable cost vs. benefit ratios, will put many more facilities at risk.

Response

Cost benefit ratio plays no part in the TMDL for reasons discussed in the response to comment 0139.1.001.017. EPA reminds the commenter that the TMDL is not a Federal regulation.

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

B. Uncertainty of TMDL Requirements Will Trigger Delays in Compliance and Add Significant Costs

1. In the specific case of the Authority, should cap loads be reduced from the current levels based on design capacity and 6 mg/l total nitrogen and 0.8 mg/l total phosphorus to the limit of technology, because other sectors fail to meet their target loading reductions, it is likely that the Authority will face increased capital expenses of over \$50 million and increased operations and maintenance costs of \$4 million per year. In addition, it is likely that additional lands would need to be purchased to site the required additional treatment units.

Response

Please see the response to comment 0067.1.001.009 for discussion of WIP backstops and the response to comment 0501.1.001.005 for discussion of public sector point sources.

Comment ID 0471.1.001.003

Author Name: Greenfield Elizabeth

Organization: Richmond Association of Realtors (RAR)

On behalf of the 4,700 members of the Richmond Association of REALTORS (RAR), I am submitting comments regarding the proposed rule issued by the Environmental Protection Agency (EPA) on establishing a Total Maximum Daily Load (TMDL) for states in the Chesapeake Bay Watershed.

Of particular concern to our industry are the urban and suburban stormwater retrofits that would be required of existing properties} including state and local highways. It will be extremely costly for existing developments to install the required stormwater controls and the benefits to be gained by these expensive retrofits do not justify the costs. In addition, requiring retrofits on existing infrastructure such as roads and parking lots will be extremely costly for the government and businesses and very disruptive to the community.

RAR appreciates the EPA's efforts to improve the health of the Bay, but we urge you to slow the process down and truly calculate the costs of the TMDL compliance on local governments, businesses, and citizens in the areas that are already struggling with unemployment, foreclosures and shrinking budgets. Thank you for your consideration of these important issues.

Response

EPA will not be calculating the costs of the TMDL compliance for reasons discussed in the response to comment 0139.1.001.017. EPA is under a legal obligation to establish a TMDL that meets water quality standards in the Bay by December 31, 2010. For consideration of public sector point sources, please see the response to comment 0501.1.001.005.

Author Name: Pechart Michael

Organization: Pennsylvania Department of Environmental Protection and Department of Agriculture

Pennsylvania has been an integral partner in Chesapeake Bay restoration efforts since 1983. This leadership derives from the Commonwealth's set of agricultural stewardship firsts, including:

- The first mandatory farm nutrient management plans;
- The first nutrient management program to regulate nitrogen and phosphorus;
- The first EPA-approved regulatory program for concentrated animal feeding operations (CAFOs);
- The first Chesapeake Bay state to permanently preserve 20% (more than 3 million acres) of land in the watershed;

--The first Chesapeake Bay state to meet its goal to plant 3,736 miles of forest buffers by the year 2010. The state has planted a total of 3,894 miles of forest buffers along waterways since 2002; and
--The Commonwealth is home to the largest Conservation Resource Enhancement Program (CREP) in the entire nation. Pennsylvania's CREP delivers more than \$50 million in state and federal assistance and targets key edge-of-stream best management practices (BMPs) to maximize water quality.

While Pennsylvania has been a leader in agricultural stewardship, we also believe that the Chesapeake Bay TMDL must recognize and respect co-equal goals of clean water and economically viable farms; we cannot have one without the other. The TMDL must recognize the reality of the economic hardship that the state and many of its farms (and especially dairy farms) have experienced over the past three years and that are projected to continue to experience over the next one to two years.

Response

Although EPA agrees with the commenter's point and thanks the Dept of Agriculture for all work on improving water quality, we remind the commenter that we are not able stop short of meeting water quality standards when establishing the TMDL. Please see the response to comment 0139.1.001.006.

Comment ID 0473.1.001.010

Author Name: Pechart Michael

Organization: Pennsylvania Department of Environmental Protection and Department of Agriculture

- The WLAs proposed in the draft TMDL for wastewater treatment plants would result in a 6 percent additional reduction in TN at an additional cost to Pennsylvania citizens of over \$1 billion. Individual WLAs for all significant point sources will be ineffective.
- The WLAs proposed in the draft TMDL for stormwater sources are not appropriate. The approach of requiring treatment of 100 percent of all urban land with either impervious reductions or retrofits is not practicable or attainable particularly for many older generation towns and cities. The feasibility and cost to attain such reductions is far in excess of the local communities' resources and makes the cost/benefit ratio questionable at best.

Response

Please see the response to comment 0501.1.001.005 for a discussion of public sector point sources. EPA has not considered cost/benefit ratios as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017.

C) Costs associated with implementing the TMDL and current economic conditions

Virginia officials recognized in their cover letter submitted to EPA on November 3, 2010 that the Bay TMDL and Virginia's WIP will have a high cost for compliance for all sectors. While we agree that there is a benefit of clean waters within the Bay and local watersheds, the economic costs for compliance must be balanced. Water quality programs cannot be developed in a vacuum without considering the impacts to all economic sectors. To this end, we strongly urge EPA to conduct a non-biased economic impact analysis and have encouraged Virginia to do so as well. Experts from land-grant universities from across the watershed could be called upon to evaluate the actual costs of meeting water quality standards for businesses, citizens, localities, states, and the federal government.

Agriculture is able to estimate some costs of TMDL implementation based on existing data of implementing Ag BMPs through current state and federal programs. For example, Virginia estimates that full implementation of just one practice (cattle fencing) could cost more than \$800 million to implement. Fencing cattle from streams, putting in crossings, providing alternative watering systems, etc. costs on average \$30,000 for a Virginia cattle farmer. Virginia cattle producers, many of whom farm part-time, do not have extra income from their farming operation available to afford an additional \$30,000 to implement this practice.

The 2009 Needs Assessment of the Virginia Natural Resources Commitment Fund states that Ag BMP cost-share funds needs will reach \$63.2 million annually in 2025 to get 60% NPS reduction goals from agriculture. This is only funding from the state and does not account for federal government's traditional share of funding or the shared match that comes from farmers. Current funding estimates are only based upon the cost of installing the practice, they do not account for costs such as loss of productive land, replacing practices when weather damages occur, and fluctuations in market conditions.

Current economic conditions within the agribusiness industry are extremely difficult. Just as the rest of the nation's economy has suffered over the past several years, agribusiness sectors have also suffered from several years of profit losses, increased input costs, and limited credit options for individual producers, companies, and operations. The current economic condition in our agribusiness industry simply means that for some, additional monetary resources necessary to meet new regulatory burdens is non-existent. Federal backstops, including new permitting of small dairies and additional, burdensome CAFO requirements, will be enough to drive some farmers out of business if implemented. EPA's federal backstops requiring more unregulated lands to meet MS-4 (urban lands) requirements may cause significant economic hardship for urban landowners, thereby impacting the green and turfgrass industries.

To meet reduction goals, cost share funding is more than critical in meeting the demands of EPA. Agriculture, lawn care, turfgrass, forestry, have all seen depressed profits, just as the State and local governments have been facing historic deficits. Individual businesses, farmers, and the State cannot meet this unfunded mandate from EPA without significant federal and state funding. These funds must be actually appropriated dollars, not just potentially empty promises.

Response

Please see the response to comment 0038.1.001.024 which outlines the federal effort towards the Bay and the response to comment 0139.1.001.006 addressing agricultural funding. EPA will not be conducting a cost analysis for reasons discussed in the response to 0139.1.001.017.

Organization: Choose Clean Water Coalition

IV. The Economic Argument for a Clean Bay

Congress has recognized that the Chesapeake Bay is a "national treasure and resource of worldwide significance." [FN 24] Valued at over 1 trillion dollars, a restored and protected Chesapeake Bay is essential for a healthy and vibrant regional economy. Failure to "save the Bay" threatens this economic driver and, in fact, economic losses have already occurred due to water quality degradation throughout the watershed. More importantly, investing in clean water technology creates jobs, generates economic activity, and can save money in the long run.

The Bay supports Important Commercial and Recreational Fisheries that Have Been Degraded by Poor Water Quality Perhaps no other creature better exemplifies the Chesapeake Bay than the blue crab, *Callinectes sapidus*. For more than a half century, the blue crab has been at the apex of the Bay's commercial fisheries. Over one-third of the nation's blue crab harvest comes from the Chesapeake Bay. The average annual commercial harvest in Maryland and Virginia between 1999 and 2008 was about 55 million pounds. [FN 25] The dockside value of the blue crab harvest Baywide in 2008 was approximately \$ 70 million. [FN 26] The recreational fishery also provides a significant financial off-set for Bay residents - the cost of catching crabs is far less than having to buy them.

The overall trend, however, since the 1990's has been a decrease in landings despite increased crabbing effort. [FN 27] In addition, the number of crabs one year and older dropped from 276 million in 1990 to 131 million in 2008. [FN 28] When the broader impact on restaurants, crab processors, wholesalers, grocers, and watermen is added up, the decline of crabs in the Bay meant a cumulative loss to Maryland and Virginia of about \$640 million between 1998 and 2006. [FN 29]

As a result of the low population level, in 2008, Maryland and Virginia issued severe crabbing restrictions, in an attempt to restore the population. These restrictions placed severe economic hardship on Chesapeake Bay crabbers. In response, members of Congress from Maryland and Virginia requested federal disaster relief for Bay crab fishermen. In September, 2008, the Secretary of Commerce determined that the Chesapeake Bay soft shell blue crab fishery had undergone a commercial failure as defined under the Magnuson-Stevens Fishery Conservation and Management Act (16 USC § 1861). In January 2009, the Department of Commerce allocated \$10 million of disaster relief to each state. This was a substantial taxpayer expense that will not be needed in the future if the Bay is restored to its former health.

In 2009, the number of spawning-age crabs rebounded to 223 million. [FN 30] Nonetheless, poor water quality continues to limit crab populations in the Chesapeake Bay. On average, over the last 10 years, more than 75% of the Chesapeake Bay and its tidal rivers have had insufficient levels of dissolved oxygen. [FN 31] Low oxygen levels drive blue crabs from their preferred habitat and kill many of the small bottom organisms on which the blue crabs feed. [FN

32] The low dissolved oxygen conditions caused by excess nutrients are the primary reason large sections of the Bay have become unsuitable as blue crab habitat. In addition, a study by the University of Maryland demonstrated that decreases in dissolved oxygen can reduce crab harvests and revenue to watermen. [FN 33]

Poor water clarity also has impacted crab populations. Poor water clarity has reduced the amount of underwater grasses necessary to protect juvenile crabs, molting crabs, and adults from predation. Studies have shown that crabs living in areas with little or no underwater grasses suffer higher mortality. [FN 34] Water clarity in the Bay has been decreasing since the 1990s and in 2009, only 26% of the Bay had acceptable water clarity. Until water quality improves, the blue crab population will not fully recover. [FN 35]

Another critical Bay species, commercially, recreationally, and as an important part of the Bay ecosystem, is the oyster. From the 1800s to the mid-1900s, the commercial oyster industry employed thousands of people catching, selling, shucking, and shipping oysters to market. Hundreds of skipjacks, sail powered dredges, plied the waters of the Bays in search of the delectable oyster. The industry generated millions of dollars a year to the Bay economy. Until the mid-1980s, the oyster was the leading commercial fishery in the Bay. Like the blue crab, Bay oysters spawned a rich cultural heritage.

In addition to their commercial and recreational value, oysters improve water quality because they are filter feeders. An individual oyster pumps over 50 gallons of water a day through its gills which strains out food, chemicals, nutrients, and sediment. In addition, oyster reefs provide valuable habitat for countless Bay creatures, most notably finfish, and serve as popular fishing areas.

Unfortunately, a combination of overharvesting, disease, and poor water quality has decimated the oyster populations in the Chesapeake Bay to around 1% of historic levels. Silt washed by rain from urban areas and agricultural fields can bury oyster beds, particularly those that have been flattened by dredges. [FN 36] Extended periods of zero oxygen conditions can be fatal to oysters. [FN 37] In addition, recent studies have indicated that low oxygen levels can stress the immune systems of oysters, making them more susceptible to disease. [FN 38] Pollution has also resulted in the closure of shellfish beds to commercial harvesting. Threats from sewage and bacteria forced Maryland and Virginia to close or restrict oyster harvesting in 223,864 acres of the Bay and its tributaries in 2008, about 8 % of the total shellfish beds. [FN 39] The decline of the Bay oyster over the last 30 years has meant a loss of more than \$4 billion for Maryland and Virginia. [FN 40]

The rockfish (also known as striped bass) has been and remains the most popular commercial and recreational fish in the Bay, generating roughly \$500 million of economic activity related to fishing expenditures, travel, lodging, etc. [FN 41] Faced with a catastrophic collapse in the fishery, commercial and recreational fishing for rockfish were banned in the Maryland portion of the Bay from 1985-89 and in Virginia during 1989. [FN 42] The dramatic decline of the population was due to several factors including overfishing and low dissolved oxygen in deeper parts of the Bay. Today, the rockfish population is at its highest in decades. However, scientists are concerned about the high prevalence of disease which has been attributed to poor water quality and limited availability of its preferred prey. [FN 43]

In its entirety, the fisheries industry is a significant part of local economies. The 2008 Fisheries Economics of the U.S. report by the National Oceanic and Atmospheric Administration (NOAA) indicates that commercial seafood industry in Maryland and Virginia contributed \$2 billion in sales, \$1 billion in income, and more than 41,000 jobs to the local economy. [FN 44] In addition there are indirect benefits to the economy in terms of jobs and work created for those who

sell fishing tackle, maintain and repair boats and equipment and provide other related goods and services.

The economic benefits of saltwater recreational fishing are equally as impressive, contributing \$ 1.6 billion in sales which in turn contributed to more than \$ 800 million of additional economic activity and roughly 13,000 jobs. [FN 45] The majority (90 - 98%) of the commercial and recreational saltwater landings in this region come from the Chesapeake Bay. [FN 46]

The economic losses associated with the decline in fisheries resources in the Bay are substantial. Between 1994 and 2004 the value of Virginia's seafood harvest decreased by 30% [FN 47] with Maryland's commercial landings exhibiting a similar decline during that time. [FN 48] Further, between 1993 and 2009 the number of Bay watermen declined from around 14,000 to 1,500. [FN 49] [FN 50]

A 2001 study compared the 1996 water quality of the Bay with what it would have been without the Clean Water Act. Results indicated that benefits of water quality improvements to annual recreational boating, fishing, and swimming ranged from \$357.9 million to \$1.8 billion. [FN 51] Fisheries declines since the 1990s indicates that early progress reducing pollution hasn't been sustained - we must reverse this trend.

These economic impacts are not restricted to the tidal regions of the Bay watershed. According to the Pennsylvania Fish and Boat Commission (PFBC), nearly 2 million people go fishing in Pennsylvania each year, contributing over \$ 1.6 billion to the economy. Among the most popular species for anglers are smallmouth bass and coldwater species, such as brook trout. The PFBC recently passed a proposal to be enacted January 1 that mandates total catch-and-release of smallmouth bass in certain areas of the Susquehanna River because of population declines associated with water quality problems. Degraded stream habitat has restricted brook trout to a mere fraction of its historical distribution.

Virginia, and to a lesser extent Maryland, also support significant freshwater recreational fisheries, with roughly 1 million anglers participating and contributing millions to local economies. [FN 52] By way of example, a fish kill in the Shenandoah River watershed in 2005, likely caused by a variety of factors including poor water quality, resulted in roughly a \$700,000 loss in retail sales and revenues. [FN 53]

If pollution to the Bay is left unabated, we will see more continued decline of the region's fisheries and the resulting economic impacts. In short, we cannot afford not to clean up the Bay. The comparatively modest up-front investments in doing so will pay enormous long term dividends to the entire watershed and its 17 million residents.

Response

EPA agrees that the Chesapeake Bay is a national treasure and when the aquatic life use is fully supported there will be huge financial benefits to all who enjoy the resources of the Bay. We firmly believe that this TMDL and its implementation will lead to a fully restored Bay.

Comment ID 0480.1.001.018

Organization: Choose Clean Water Coalition

Nature Based Recreation: Vital Economic Drivers for the Bay Region

Roughly 8 million wildlife watchers spent \$ 636 million, \$960 million and \$1.4 billion in Maryland, Virginia and Pennsylvania, respectively in 2006 on trip-related expenses and equipment. [FN 57] These estimates do not include other economic benefits of these expenditures such as job creation and the multiplier effect on local economies. Improvements to water quality, as well as the implementation of actions, such as afforestation, land preservation, and wetlands restoration, that will lead to improved water quality, will increase and enhance wildlife populations. A study in

the Great Lakes indicates there would be substantial improvement in wildlife watching opportunities and associated economic benefits by improvements to wildlife habitat. [FN 58]

Recreational boating is also a strong economic driver in Maryland, Pennsylvania and Virginia. The total impact on the Maryland economy from recreational boating is estimated to be about \$2.03 billion and 35,025 jobs. [FN 59] Similarly, Pennsylvania residents spend \$1.7 billion on boating annually. The average expenditure per recreational boater is \$274. Of this amount, roughly \$113 a year is spent in direct boating-related expenses and \$161 is spent on trip-related expenses, including: auto fuel, meals, lodging and admission/entrance fees. [FN 60]

A recent study in Hampton, Virginia found that resident and non-resident boaters were responsible for \$55.0 million in economic impact to this city. This impact represents \$32.5 million in new value added, \$22.2 million in incomes and 698 jobs. [FN 61] The majority of expenditures were by out-of-region boating-visitors which represents an inflow of "new" capital into the community. The study also indicated that "water quality, fishing quality and other environmental factors" ranked among the most important, in terms of factors that influence a boater's decision on where to keep his/her boat.

Investment in Clean Water Technologies Stimulates Local Economies.

A study by the University of Virginia found that implementation of the agricultural practices such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts. [FN 62] Every \$1 of state and/or federal funding invested in agricultural best management practices would generate \$1.56 in economic activity in Virginia. Implementing agricultural practices, in Virginia, to the levels necessary to restore the Bay would create nearly 12,000 jobs of approximately one year duration.

A recent analysis of the value of investing in water and sewer infrastructure concluded that these investments typically yield greater returns than most other types of public infrastructure. [FN 63] For example, one dollar of water and sewer infrastructure investment increases private output (Gross Domestic Product) in the long-term by \$6.35. Furthermore, adding 1 job in water and sewer creates 3.68 jobs to support that job.

More specifically, upgrading sewage treatment plants across the watershed has created hundreds of construction jobs, and will create perhaps thousands more as the program begins to grow. Also, upgrading individual septic systems has employed installers, electricians and others involved in the business. These upgrades have pumped millions of dollars into the local economy. A real life example is Mayer Brothers, Inc. in Elkridge, MD. [FN 64] This company staved off significant layoffs this year when the small manufacturing company won a contract from the Maryland Department of Environment to help supply new septic technology throughout Maryland.

On the flip side, cuts to funding programs for clean water infrastructure will lead to job losses. Carter B. McCamy says he will probably have to lay off over 20 workers from his Arbutus, Maryland company if the Maryland legislature cuts the Chesapeake and Atlantic Coastal Bays 2010 Trust Fund. [FN 65] McCamy is CEO of Environmental Quality Resources, LLC, an environmental construction company that specializes in stream restoration, wetland mitigation, reforestation, shoreline stabilization and storm water management. The firm has received significant contracted work through the Trust Fund. He employs 115 full-time workers, and also supports an additional 100 subcontractors who provide trucking materials, concrete, paving and fencing required for stormwater mitigation projects.

Clean Waterways Increase Property Values

An EPA study indicated that clean water can increase the value of single family homes up to 4,000 feet from the water's

edge by up to 25%. [FN 66] A 2000 study concluded that improvements in water quality along Maryland's western shore to levels that meet state bacteria standards could raise property values 6%. [FN 67] High water clarity was shown to increase average housing value by 4 to 5% or thousands of dollars. [FN 68] [FN 69] Homes situated near seven California stream restoration projects had 3 to 13% higher property values than similar homes located on damaged streams. [FN 70] A study by the Brookings Institute projected a 10% increase in property values for homes that would about a proposed \$26 billion Great Lakes restoration project. [FN 71] The City of Philadelphia estimates that installation of green stormwater infrastructure in the city will raise property values 2 to 5 percent generating \$390 million over the next 40 years in increased values for homes near green spaces. [FN 72]

Pollution Reductions Lower Drinking Water and Utility Costs

Reducing pollution inputs from pipes and landbased sources can reduce locality costs to treat drinking water sources to safe standards. New York City's expenditure of \$1 billion over the last decade to protect the watersheds north of the city that supply its drinking water avoided the need to build a \$6 billion treatment plant. [FN 73] An EPA study of drinking water source protection efforts concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs. [FN 74] Similarly, a study by the Brookings Institute suggested that a 1% decrease in sediment loading will lead to a 0.05% reduction in water treatment costs. [FN 75]

Proactive efforts to lessen stormwater flows today reduce future public costs needed to maintain navigation channels, remediate pollution and hazard flooding, and repair infrastructure and property damage caused by excessive runoff. Philadelphia estimates that after 40 years their installation of green infrastructure will create more than \$2 in benefits for every dollar invested, generating \$500 million in economic benefits, \$1.3 billion in social benefits, and \$400 million in environmental benefits. [FN 76]

Conclusion

Efforts to delay implementation of the Bay TMDL will only exacerbate the economic impacts this region has already experienced due to poor water quality. Furthermore, a recent poll in Virginia found that an overwhelming majority believe the state can protect water quality and still have a strong economy. [FN 77] Eighty percent of respondents agreed with the statement, "we can protect the water quality in rivers, creeks and the Chesapeake Bay and have a strong economy with good jobs for Virginians, without having to choose one over the other." Of those polled, 92% believe the Bay is "important for Virginia's economy." Implementation of the TMDL will result in clean water, a healthy Bay and a strong regional economy.

Organization:

I am a resident of the Shenandoah Valley. I am not a farmer, however I work closely with farmers everyday. I am concerned about the EPA's proposed TMDL for the Chesapeake Bay Watershed and the burden it is placing on our farmers. Farming is a dying industry. There is very little profit and a lot of hard work and long hours involved in farming. More and more farmers are opting to sell their land and get out of the business rather than deal with all the regulations coming out of Washington these days. How are we going to feed America and the World without farmers?! I personally do not want my food coming from China - I am far more confident in American farmers than I am imported food!

Response

EPA reminds the commenter that the TMDL is not a Federal regulation. Please see the response to comment 0139.1.001.006 for information on agricultural funding.

Organization: City of Hampton, Virginia, Department of Public Works

Exhibit B shows that the average 54 (James) and 59 (York) percent load reduction needed to achieve the backstop allocation for phosphorus would require treatment of approximately 68 and 74 percent of the urban land area in the James River and York River basins, respectively.[FN3] The estimated total costs of treatment are approximately \$9.8 billion (or approximately \$1.05 billion per year[FN4]) after factoring in the added cost of designing storm water controls that would function effectively on the flat, low-lying terrain and in the soils and high water table that dominate the topography and hydrology in the Hampton Roads area.[FN5] However, as explained below, these estimated costs do not include the added cost of acquiring new easements and construction in existing utility easements.

Exhibit B James River and York River Basins Urban Runoff Allocations and Percent Reductions [Please see the original letter EPA-R03-OW-2010-0736-0496.1]

The magnitude of the financial burden that would be imposed on the residents of the Localities cannot be overstated. As shown in Exhibit C, the estimated \$1.05 billion in annual costs equates to a total average annual storm water fee of \$1,670 per household, or \$720 per person. These fees, in turn, equate to 2.3 percent of median household income (MHI), and 3.0 percent of MHI when the fees imposed on non-residential land owners are passed onto the consumer. Expressed another way, the estimated annual cost of attaining the allocations (without adding the cost of easement acquisition) represents 118 percent of the Localities' 2009 total annual expenditures for public safety (police and fire) and 37 percent of their total annual expenditures for schools. Further, as high as the estimated treatment costs are, they do not tell the whole story.

Exhibit C Estimated Capital Costs, Average Stormwater Bills and Statistics for Hampton Roads Communities [Please see the original letter EPA-R03-OW-2010-0736-0496.1]

[FN3] Although Exhibit B shows that the percent of urban land area that would have to be treated to achieve the load reductions needed to attain the total suspended solids (TSS) allocations are greater than the area that would have to be treated to attain the TP allocations, we have used TP as the benchmark for the cost estimates because it represents a mid-point in the percent reductions for TN, TP, and TSS. Further, the controls that will remove TP also serve to remove TSS. It is possible that the costs to achieve the TSS allocations could be higher than the cost to achieve the TP allocations in the York River basin.

[FN4] In addition to the cost of designing and installing the controls, the estimated annual cost includes operation and maintenance costs and 30-year bond financing at a 5.5 interest rate.

[FN5] The Localities evaluated three control scenarios to arrive at this cost estimate: (1) Scenario 1a - all best management practices (which includes voluntary urban nutrient management plans); (2) Scenario 1b - substituting storage for urban nutrient management plans; and (3) Scenario 1c - more reliance on storage than best management practices. See Exhibit C. Scenario 1c was selected as the control scenario reflecting the level of effort that would be required to achieve the allocations given the topography, hydrology, and soils in the coastal region and the Localities' experience to date with urban nutrient management plans.

C. A knee-of-the-curve analysis further indicates that the James River allocations should be based on the Tributary Strategy

We recognize that EPA has a certain amount of discretion to rely on model predictions as the basis for its TMDLs, even

when the predictions are acknowledged to reflect some uncertainty. However, there are limits to the exercise of that discretion; and this is one instance where EPA would be acting arbitrarily because in addition to unresolved flaws in the model, the model predictions are unable to reliably distinguish between model scenarios with immense cost implications as shown in the following knee-of-curve analysis, which was prepared by one of the Localities' consulting engineers, Greeley and Hansen.

Figure 3 Knee-of-the-Curve Analysis for James River Chlorophyll-a WQS [Please see page 17 of the original letter EPA-R03-OW-2010-0736-0496.1]

Figure 3 shows the estimated capital costs of attaining the chlorophyll-a criteria against the percent attainment rate. The capital costs include estimates for basin-wide wastewater treatment plant reductions, agricultural BMPs, and urban runoff controls necessary to meet the allocations identified by EPA for the scenarios identified in Figure 3. The wastewater treatment plant capital costs are a function of design flows and level of treatment (biological nutrient removal, enhanced nutrient removal and limit of technology), Agricultural capital costs are based on BMP unit cost per acre and the BMP assumptions used in the Phase 5.3 Model. The urban runoff capital costs [FN17] are based on the performance associated with the runoff reduction method for an estimated amount of retrofit controls that could be installed in a locality, which represents only a portion of the urban runoff costs. The costs for the remainder of the urban runoff reductions needed to meet the allocations would be achieved with storage and reuse. The estimated capital costs were prepared for the following EPA Scenarios:

- '91-'00 Base Scenario: Point "A" represents the James River TN and TP loading of 36.9 and 3.3 million pounds per year, respectively.
- EPA's Tributary Strategy: Point "B" represents the James River TN and TP portion of the Bay-wide loading, which is 27.5 and 3.3 million pounds per year, respectively.
- EPA's James Chl-a Compliance: Point "C" represents the James River TN and TP loading of 23.5 and 2.35 million pounds per year, respectively. EPA has selected this scenario as the basis for compliance with the James River chlorophyll-a criteria. EPA also refers to this scenario as "James Level of Effort at 1/2 Potomac". In Appendix J to the TMDL Report, EPA states "In the James, the nutrient loads are equivalent to the level of effort halfway between Virginia's portion of the Potomac and the James for the 190/12 Loading Scenario."
- E3 (Everything, Everywhere, by Everybody): Point "D" represents the James River TN and TP loading of 16.1 and 1.5 million pounds per year, respectively. EPA considers this to be the "theoretical maximum levels of managed controls on all pollutant load sources". There are no cost and few physical limitations to implementing controls for point and nonpoint sources in the E3 scenario. This scenario is used with the No-Action scenario to define the "controllable" loads, i.e., the difference between No-Action and E3 loads." See TMDL Report at Appendix J.

The knee-of-the-curve analysis determines where the increment of pollution reduction achieved in the receiving water diminishes compared to the increased costs. There is a steep inflection at Point "B" that represents the knee-of-the-curve. Any reduction beyond Point "B" lacks a viable cost-to-benefit ratio and does not reflect a reasonable level of attainment. EPA has selected Point "C" as the basis for the James River compliance with the chlorophyll-a criteria, which is about halfway between Point "B" and EPA's E3 scenario (point "D"). If one assumes that the model predictions are accurate (about which there is substantial doubt), at Point "B", the James River would be 93 to 94 percent compliant

with chlorophyll-a criteria compared to 99 percent at Point "C". However, the true difference in chlorophyll model output between Points "B" and "c" is only 2 to 3 ug/L (three parts in a billion). Additionally, the sampling and testing accuracies for physical water measurements is 1 to 3 ug/L. In other words, even if the loadings between Points "B" and "C" were achieved, it is unlikely that the difference in James River chlorophyll-a concentrations could be measured. The difference in the estimated cost of achieving the loadings between Points "B" and "C", on the other hand, is over \$10 billion.

[FN17] Urban nutrient management was not included. The capital costs are based on meeting the waste load allocation for the Urban Runoff identified in Appendix Q-1 of the TMDL report.

Comment ID 0497.1.001.001

Author Name: Hobbs Jack

Organization: Town of Amherst, Virginia

The Town of Amherst owns and operates a municipal wastewater treatment plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

The Town expects to do its part for the Bay restoration. In fact, our WWTP was improved at a cost of \$4.1 million just before the latest round of nutrient removal requirements were known or required. This has been quite a burden for a community whose population is only 2,251 to bear. We expect that the additional mandated nutrient removal features will cost additional millions of dollars.

Response

Please see the response to comment 0501.1.001.005.

Comment ID 0497.1.001.010

Author Name: Hobbs Jack

Organization: Town of Amherst, Virginia

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements

including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years).

Simply put, the Town's recent WWTP improvements were designed and built to last for 20-30 years. We have absolutely no history of local health problems, significant "notice of violation" or "fish kills" related to our operation. Constantly changing regulations make it extremely difficult for the Town to justify additional capital expenditures unless and until we have some certainty that the regulations will stay fixed for a reasonable period.

Response

Please see the response to comment 0184.1.001.005 which speaks to your concerns.

Comment ID 0507.1.001.002

Author Name: Sullivan Sean

Organization: Liberty University and Thomas Road Baptist Church

Imposition of EPA's backstop requirements and the Draft TMDL will impose significant direct compliance costs on Liberty University's and TRBC's current operations and their future expansion. These costs may include retrofitting stormwater controls onto existing developments and significant nutrient reduction costs for new developments. In addition, Liberty and TRBC will incur significant indirect costs if the Draft TMDL and the backstop requirements become effective. For example, the City of Lynchburg has indicated that it expects to incur greater than \$60 million in compliance costs as a result of the backstop requirements. As the single largest landowners in the region, Liberty University and TRBC will bear the brunt of increased taxes, utility fees and market effects associated with EPA's proposed requirements.

Response

It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0510.1.001.015

Author Name: Haterius Stephen

Organization: National Association of State Departments of Agriculture (NASDA)

We are concerned about the significant economic impacts the Draft TMDL will have on agricultural producers in the Bay. Absent an assessment of the costs that will have to be borne by agricultural producers as the Draft TMDL is implemented, EPA should not proceed with issuing the TMDL. The Draft TMDL relied on E3 scenarios (Everything, by Everyone, Everywhere) to achieve the pollutant reductions called for in its backstop allocations even though EPA admits that the E3 scenario is not realistic and is not constrained by economic or technical feasibility. As a result, EPA has proposed pollutant reductions that are not realistic. In fact, EPA had previously determined that the water quality standards for the Chesapeake Bay were not attainable and a use attainability analysis (UAA) was needed. This action would have followed the recommendation of the National Research Council of the National Academy of Sciences in its 2001 report: "Assessing the TMDL Approach to Water Quality Management" (NAS 2001). In that report, the NAS

recommended that states or EPA first determine whether water quality standards are attainable, before developing a TMDL. NAS 2001, at 94. Unfortunately, EPA abandoned its UAA for the Chesapeake Bay. By issuing a TMDL without going through this analysis, EPA will be issuing a TMDL that cannot meet water quality standards, and therefore cannot meet the requirements of the statute.

To date, for the Chesapeake Bay, EPA has only considered changes to water quality standards when modeling has showed the standards are not achievable even if EPA could turn the clock back to the 1600s and impose complete reforestation on the Chesapeake Bay watershed. However, EPA should allow watershed jurisdictions to look at economic and social feasibility as well. For example, the Draft TMDL would result in significant adverse impacts on agriculture production, with significant impacts on the availability of affordable food. For example, it is important that a watershed jurisdiction be able to decide that because achieving water quality standards for all three pollutants in all segments and at all times would cause substantial and widespread economic and social impacts, that instead water quality standards could be met in most areas most of the time with far less impact. This analysis is critical to the development of the Chesapeake Bay TMDL.

Response

Please see the response to comment 0481.1.001.010 which explains that a UAA is premature at this time.

A cost benefit analysis is beyond the scope of the TMDL, as discussed in the response to comment 0139.1.001.017.

For the rational behind WIP backstops, please see the response to comment 0067.1.001.009 and Section 8 of the TMDL report.

Comment ID 0512.1.001.002

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

Comment #1 - As part of the County's Strategy, it was estimated that there are \$225 million of needed WWTP improvements to respond to the Bay requirements and wet weather compliance, and many of these improvements are already underway. This has resulted in a significant increase in the sewer treatment costs and rates in the County. If the backstop TMDL is implemented, it will result in a dramatic increase in this cost. If it is implemented while some of the improvements to the facilities are under construction and/or design, it would significantly increase the cost to the facilities and the rate-payers. Lycoming County has been working very hard for the past several years to meet the requirements of the Chesapeake Bay agreement and the possibility of EPA imposing a backstop TMDL is of great concern to the County, the wastewater treatment plants, residents, agriculture community, and all of the stakeholders that have assisted with the development of our strategy.

The financial impact to the citizens of the County is of great concern because Lycoming County qualifies as an area that is "economically distressed" as defined by Section 301 of the Public Works and Economic Development Act of 1965. Lycoming's per capita income is \$17,224 and is 79.8% of the national average [FN1] of \$21, 587

Response

Please see the response to comment 0501.1.001.005 for a discussion of the cost of public sector point source upgrades and the response to comment 0067.1.001.009 and Section 8 of the TMDL for discussion of EPA's WIP backstops.

With regard to Environmental Justice, please see the response to comment 467.1.001.026.

Comment ID 0512.1.001.004

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

Comment #3 - The EPA must consider that the backstop TMDL would go beyond what is necessary, appropriate and feasible infrastructure for our communities, and impose infrastructure requirements that are excessively costly with low incremental return (especially where receiving streams are not impaired) and many unintended consequences.

Comment #4 - The County believes EPA's TMDL would require Pennsylvania's wastewater treatment plants to be further upgraded to Enhanced Nutrient Removal, a severe restriction of Nutrient discharges. ENR should become a proven technology under more favorable conditions before it is seriously considered in Pennsylvania. Implementing ENR would represent a crushing economic burden to most residents served by public wastewater systems in our County. If this is ultimately required, significant federal dollars must accompany the federal mandate.

Comment #5 - If the draft backstop TMDL is implemented, it would have a serious impact on Lycoming County's economic development opportunities and efforts to create jobs within the County. The increased sewer rates and the possibility of not being able to connect to the sewer system in a timely manner are directly linked to the implementation of EPA's draft backstop TMDL. The County and its economic development partners have very serious concerns. The extremely high sewer rates that will be needed to address the improvements required by the backstop TMDL will be a deterrent to potential businesses and companies looking to locate in our County.

The County has partnered with the EPA to develop a brownfields strategy in the County. At the center of the strategy is the redevelopment of brownfield sites in our planned and designated growth areas. We are now at a critical stage in this strategy: implementation. The increased sewer rates (or a delay in connection to the sewer system that would result from the required infrastructure improvements to meet the backstop TMDL) will act as a deterrent to companies interested in redeveloping these brownfield sites. This would result in our County losing new opportunities to attract companies and create new jobs.

Comment #6 - With a significant increase in sewer rates, companies and residents located within the areas serviced by public sewer systems, the county's designated growth areas, may move into the rural parts of our County or even out of the County. The County's rural areas do not have public sewer systems. This shift of population and business from the

growth areas to the rural parts of the County would violate the EPA's Smart Growth principles, Pennsylvania's Keystone Principles, and the County's Comprehensive Plan.

Response

Please see the response to comment 0501.1.001.005 for a discussion of the cost of public sector point source upgrades and the response to comment 0067.1.001.009 and Section 8 of the TMDL report for discussion of EPA's WIP backstops.

Comment ID 0512.1.001.011

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

Comment #11 -The County recommends that funding considerations for awarding financial support for Bay recovery efforts should take into consideration that non-tidal states, like Pennsylvania, do not receive direct economic benefit from Bay restoration.

Response

Please see the response to comment 267.1.001.006.

Comment ID 0513.1.001.006

Author Name: Hoot Lynne

Organization: Maryland Grain Producers Association (MGPA)

MGPAs opposition to the Bay TMDL process should not be construed as opposition to clean water -to the contrary, MGPA supports most of Maryland's agricultural WIP activities as a way to improve water quality. We believe that given adequate financial and technical resources, Maryland's WIP is doable. We are concerned however that Maryland will be unable to achieve its WIP goals because there will be inadequate funding to achieve this extremely expensive program. Will EPA provide the funding for agricultural BMPs? EPA has completely ignored the economic status of the state, local jurisdictions and businesses in Maryland. Of particular concern to Maryland farmers is that we will be placed at an economic disadvantage to our competition from across the rest of the country and the world. Maryland's primary grain crops, number 2 dent corn, wheat, barley, and soybeans receive the same price regardless of their cost of production due to local requirement and regulations.

Response

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in

alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0514.1.001.001

Organization: American Forest & Paper Association (AF&PA) and National Alliance of Forest Owners (NAFO)

The American Forest & Paper Association (AF&PA) and the National Alliance of Forest Owners (NAFO) appreciate the opportunity to provide comments on EPA's Draft Chesapeake Bay Total Maximum Daily Load (TMDL) for nutrients and sediment.

AF&PA is the national trade association of the forest products industry, representing pulp, paper, packaging and wood products manufacturers, and forest land owners. Our companies make products essential for everyday life from renewable and recyclable resources that sustain the environment. The forest products industry employs approximately 1 million people and is among the top 10 manufacturing sector employers in 48 states.

NAFO is an organization of private forest owners committed to advancing federal policies that promote the economic and environmental values of privately-owned forests at the national level. NAFO membership encompasses more than 75 million acres of private forestland in 47 states. Working forests in the U.S. support 2.5 million jobs. View NAFO's interactive map to see the economic impact of America's working forests.

AF&PA and NAFO members own forest land in the Chesapeake Bay watershed. Those members could face unwarranted requirements to change their sustainable forest management practices as a result of incorrect assumptions in the TMDL.

Response

Please see the response to 0036-cp.001.001 outlining the federal effort towards forestry in the Bay watershed. For concerns regarding the model please see response to comment 0379.1.001.006.

Comment ID 0514.1.001.010

Author Name: Schwartz Jerry

Organization: American Forest & Paper Association (AF&PA) and National Alliance of Forest Owners (NAFO)

Sustainable forest management provides incentives for landowners to retain forest land in forest cover.

Today the greatest threat to water quality impairment in the Chesapeake Bay Watershed results from deforestation that results from the conversion of forests to non-forest uses that produce a higher economic value. The families, businesses and individuals that own nearly 60% of our nation's forests depend on the returns they get from the products their forests produce to make additional investments in sound, long-term forest management. When existing markets for their products are strong, or when new markets like energy emerge, they provide forest owners the means to keep their land forested by keeping their forests economically competitive with other uses. However, when regulatory costs are imposed, this reduces a landowner's ability to maintain the land in forest cover and at some point will tip the balance in favor of non-forest uses.

Response

A TMDL is not a federal regulation. For information on this topic please see the response to comment 0036-cp.001.001. The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

Comment ID 0515.1.001.010

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

Present and projected future costs must be addressed alike. In the case of our Facilities, the Phase III Improvements upgrades, net of grant funding, have cost an average \$2,229 per connected property (or, equivalent dwelling unit ["EDU"]) in the City of Binghamton and \$5,576 per connected property/EDU in the Village of Johnson City as shown by the attached chart following this letter [Comment Letter contains additional information in the form of an attachment. See original comment letter 0515.1]. Because of bonding, however, over the course of 30 years (running through 2040), even after crediting projected interest rate subsidies from the NYS-EFC, property owners in the Owner municipalities will be paying-out at least 2.25 times these principal amounts for the better part of two generations (i.e., over time \$5,015 will be paid per EDU in Binghamton and \$12,547 will be paid per EDU in Johnson City) for the capital costs of the upgrades alone, not to mention increases in the property owner's annual sewer bills, which presently reflect a gross 87% increase in our Facilities' annual operating and maintenance costs from \$4,947,856 in 2005 to \$9,256,034 under the 2011 budgets approved by the Facilities' Owners (but not including future increases in operating and maintenance costs, which may double by 2017 [from 2010] and double again by 2025 [from 2017, i.e., quadruple from 2010] if the TMDL is adopted in its presently-proposed form, especially given the apparent need to add, operate and maintain process upgrades for enhanced phosphorus removal). Thus, if anything, it appears there will be a net reduction in real property values (and taxable value "tax base" for property tax purposes [upon which local school district and local government funding are based]) which will result from the "overburden" these long-term costs place on the tax-paying property owners and ratepayers we serve. It is submitted that, if the TMDL contained complete and proper socioeconomic analysis, it would be clearly shown that any small potential improvement in local real property values from further improvement of New York's already unimpaired WQ in its portion of the Bay watershed will be offset many times over by the fiscal burden on real property values resulting from the heavy debt load and annual costs discussed above, thereby resulting in a net decrease in real property values within the New York portion of the Bay watershed owing to the TMDL. (The comment period's shortness precludes us from obtaining and presenting a more in-depth analysis).

Response

Author Name: DuVal Barry

Organization: Virginia Chamber of Commerce (VCC)

The Virginia Chamber of Commerce supports efforts to ensure a clean and healthy Chesapeake Bay, including reasonable measures to recover and reclaim, as well as to conserve and maintain valuable natural resources. However, VCC has major concerns regarding the economic impact of the proposed TMDL on the Commonwealth of Virginia.

As the voice of business in Virginia, VCC is concerned over how the proposed TMDL will strain an already stressed economy. This mandate will have broad reaching, adverse effects on Virginia businesses and on state and local government. Regrettably, the EPA has chosen not to conduct cost analysis for the Bay TMDL, and we believe this mandate will not only prevent growth, but extend the so-called jobless recovery period.

For that reason, VCC strongly urges the EPA to be responsive to the many concerns of the broad based business community, localities and other affected source sectors on the economic impact and cost associated with the implementation of the TMDL. Surely the EPA can slow down enough to find better balance between the economic impact of the TMDL and the "immediate" clean up needs of the Bay.

Response

Analysis of cost is beyond the scope of the TMDL, as discussed in the response to comment 0139.1.001.017. EPA has a court ordered deadline of December 31, 2010 to establish a TMDL that meets water quality standards.

Author Name: Romanello Anthony

Organization: County of Stafford, Virginia

Our most significant concerns with EPA's Draft TMDL and Virginia's WIP relate to the lack of transparency in this regulatory process, particularly regarding lack of disclosure and analysis of costs related to urban stormwater. We understand that in other EPA documents urban stormwater costs for the Bay TMDL have been estimated at an annual cost of \$7.9 billion. Similarly, we understand that the Center for Watershed Protection has reported costs on the order of \$88,000 per acre for urban retrofits. To translate these types of costs estimates to the household level, last month a national engineering firm reported to the Virginia Municipal Stormwater Association ("VAMSA") that EPA's Draft TMDL's costs may be on the order of \$700 to \$1,800 per household per year, for urban stormwater management alone, during the 15-year implementation period. Obviously, costs in that range are extremely high if not completely unaffordable. It is also unclear at this time whether any additional Federal or State funding will be provided to localities to assist with implementation of TMDL related programs.

Response

EPA reminds the commenter that the TMDL is not a Federal regulation. The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all seven jurisdictions. More

than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

Author Name: Golazeski Daria

Organization: Broome-Tioga Stormwater Coalition (BTSC)

The implementation of the TMDL will require New York State and local communities to embark on a project addressing agriculture, urban stormwater and wastewater treatment plants at a cost on the order of billions of dollars. This will have dramatic impacts on the economies of the Southern Tier as farms close faced with the cost of compliance and economic development is hindered by an additional cost of doing business.

Response

EPA directs the commenter to agricultural funding sources outlined in Comment 139.1.001.006 and the Federal commitments to the Bay in Comment 0038.1.001.024.

Comment ID 0540-cp.001.002

Author Name: Goodsell Martha

Organization: Fallow Hollow Deer Farm, LLC

New York farmers have worked hard and should not be unfairly punished. Farmers in other states, as well as other industries in all states, must do their share to limit and control run off. If not all are held to equal standards, then sacrificing a major farming region (the Southern tier of New York) - which contributes significantly to the food-shed of the Northeast - for the benefit of cleaning up the bay, will result in unintended consequences and additional economic hardship for an area already in distress.

Response

Comment ID 0542.1.001.002

Author Name: Hooker Patrick

Organization: New York State Department of Agriculture and Markets

We are deeply concerned about the economic consequences and implications to New York agriculture industry's ability to remain competitive with the draft TMDL's overly aggressive pollution targets. While we recognize that other states have varying magnitudes of delivered N and P to reduce, these other states also have diverse land use types allowing them to draw reductions from a wide range of sources. New York's is a small portion of the watershed's land base, largely forest (76%) with some agriculture (21 %) and urban development (3%). Under these land use dynamics load reductions must come from agriculture in New York. It is understood that all Bay States have a shared responsibility to achieve water quality standards. However, other states with higher loading thresholds, across all land uses, places an undue burden on New York farm families. As discussed in some of our previous memos this condition is best demonstrated by the fact that even the total elimination of the dairy industry in our portion of the Chesapeake Bay Watershed would still not allow New York to meet the proposed TMDL. When such a draconian measure is still inadequate, we are facing the worst kind of policy suggestion. There must be parity in the delivered load allocation amongst states in the Chesapeake Bay TMDL.

Response

Please see the response to comment 0080-co.001.002 for discussion of equity and New York. Also, please see the response to comment 267.1.001.006 for explanation of how loadings from New York contribute to the impairment in the Bay.

Organization: City of Fredericksburg, Virginia

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years).

- Requirements of S. 1816 and H.R. 3852 place farmers in the Chesapeake Bay Watershed at an economic disadvantage to farmers in other states. For example, in Virginia alone, fencing livestock away from streams that feed into the Chesapeake Bay could cost in excess of \$800 million.
- Farming is already an economically challenging business. Successful and implementable environmental measures must be practical, effective and not economically destructive to agriculture. Water quality programs cannot be developed in a vacuum without considering economic impacts to the economy.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Author Name: Eisel James

Organization: Delaware County, New York

At the same October 27th meeting, EPA staff pointed out that 1500 watermen were currently out of work due to pollution levels of the Chesapeake Bay. While Delaware County is sympathetic to the plight of individuals that rely on clean water for their livelihoods (as we do), we must insist on a better solution than trading the existence of our farmers for those of the Chesapeake Bay watermen. The solution lies in a more equitable distribution of pollution allocations, to hold accountable tidal states that have not been as proactive in their water quality protection efforts as we have in Delaware County.

Response

Please see the response to Comment 0080-cp.001.002 which discusses equity in regards to New York. EPA also reminds the commenter that the basic premise of this TMDL is that upstream loadings of pollutants contribute to the downstream non-attainment of water quality standards. Thus this and other TMDLs recognize that the downstream waters (the Bay and tidal tributaries) are impaired, that loadings of nitrogen, phosphorous and sediment cause and contribute to those impairments. New York and other bay jurisdictions contribute loadings of these pollutants and therefore are subject to the Bay TMDL.

Author Name: Payne L.

Organization: City of Lynchburg, Virginia

In order to meet these allocations, the City of Lynchburg would need to invest in an upgrade of our WWTP estimated at \$70 million. Lynchburg already has among the highest sewer rates in the state in relation to the median household income as a result of our ongoing CSO program which has been extremely successful in improving water quality in the James River by significantly reducing the volume of raw sewage being discharged into the river and its tributaries. However, we estimate that in order to complete the CSO program, an investment of over \$300 million still remains. As a result, the addition of another major capital expense at this time is simply unaffordable and would slow the progress of the CSO program to the detriment of water quality.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Comment ID 0607.1.001.007

Author Name: Bauhan Hobey

Organization: Virginia Poultry Federation (VPF)

Cost and Economic and Social Impacts

Tens of billions of dollars have already been spent on efforts to improve the Chesapeake Bay. The poultry industry has been a willing and proactive steward of the environment and allocated millions of dollars toward this objective, many directly related to the Bay restoration. The industry will continue to be a responsible environmental steward, guided by scientific research, technological advancements, and sensible consideration of economics.

Unfortunately, in addition to being beyond the scope of the law, the draft TMDL and associated mandates will exact an enormous economic impact at a time when our economy is already suffering. Poultry processors and farmers operate on thin margins, and cannot bear the burden of substantial new regulatory costs. Such costs could make the Bay region uncompetitive for poultry production. Causing the poultry industry to shift production to other areas of the nation or overseas would be bad for the Bay. The industry currently provides substantial farm income that helps maintain well-managed farmland, which is widely recognized as a one of the best land-uses for maintaining water quality. Jeopardizing the economic viability of the poultry industry will only lead to more impervious surfaces that will be counterproductive to Bay improvement goals.

EPA has not conducted an adequate assessment of its proposals' economic impacts. The agency should not proceed with its proposals without full analysis and consideration of the economic impacts.

Response

EPA will not be conducting an assessment of the TMDL's economic impacts for reasons discussed in the response to comment 0139.1.001.017.

Please refer to agricultural funding sources outlined in Comment 139.1.001.006 and the Federal commitments to the Bay in Comment 0038.1.001.024.

Comment ID 0608.1.001.001

Author Name: Pallansch Karen

Organization: Virginia Sanitation Authority, City of Alexandria

The City of Alexandria, Virginia Sanitation Authority owns and operates a municipal wastewater treatment plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We expect to do our part for the Bay restoration. In fact, our WWTP is in the process of being upgraded with nutrient removal technologies including chemical feed system improvements, centrate pretreatment, additional biological nitrogen removal tank volume, a nutrient load management facility and improvements to solids handling facilities to manage increased solids production. The program costs for these upgrades are nearly \$180 million, including land purchases, design and construction. In addition, these new upgrades have an impact on our operation and maintenance costs, with a projected increase of over 6% annually as a result of an increase in chemical and energy use. Finally, to achieve an upgrade project of this magnitude required to meet current regulations, the Authority's Board

has already authorized a rate revenue increase with additional increases annually for the next three years.

Response

Thank you for the information provided on how the City of Alexandria is working to improve local water quality with the upgrade of the wastewater treatment plant.

Comment ID 0609.1.001.003

Author Name: Aubertine Darrel

Organization: Senate of the State of New York

It should also be noted that agriculture is New York State's leading industry and is an integral part of the economy of the watershed region. Consequently, implementing a program that will severely curtail agriculture in the watershed will have significant negative effects for New York State's economy.

Negative Impacts on New York Agriculture

According to the Upper Susquehanna Coalition - an organization comprised of 19 Soil and Water Conservation Districts, 16 in New York and 3 in Pennsylvania - the TMDL will have the following impacts on agriculture in the watershed:

- Farms of any size will be regulated as Concentrated Animal Feeding Operations (CAFOs)
- Farms of any size will need a Comprehensive Nutrient Management Plan (CNMP)
- Farms of any size will be required to have manure storage
- Farms of any size will be prohibited from spreading manure during the winter
- All manure applied to crop fields will need to be injected
- All farms will be required to have ammonia emission controls on their facilities
- 800 additional farms will be regulated
- Large farms will be required to use Precision Feed Management

All of these impacts will result in increased costs to farmers and in all likelihood will ultimately mean the demise of many, if not all, of the farms in the watershed. Moreover, according to the New York State Commissioner of Agriculture and Markets not even the total elimination of the dairy industry in New York's portion of the watershed will enable New York to meet the proposed TMDL.

Increased Costs for Municipalities and Taxpayers

In spite of the fact that the load allocations envisioned in this TMDL are unattainable, municipalities and farmers will still be expected to spend billions of dollars for upgrades to equipment and infrastructure. According to Department of Environmental Conservation (DEC) Assistant Commissioner James Tierney, "the DEC's estimate that the plan could cost New Yorkers between \$3 billion and \$6 billion in upgrades to farms, sewer systems and wastewater treatment

plants is very conservative."

Response

Author Name: Brath P.

Organization:

As a resident of Pennsylvania, a municipal consultant, a boater and fisherman and a concerned citizen, I have followed and been involved in the Chesapeake Bay Tributary Strategy implementation and now the DEP's Watershed Implementation Plan. The Environmental Protection Agency's draft Backstop Chesapeake Bay TMDL is a disappointing action that must be reconsidered. I have included comments to the EPA's plan below.

Comment #3:

We Pennsylvanian's do not deny that some eutrophication (the growth of algae that depletes the dissolved oxygen

content of the water) and the associated dead zones are present in parts of our bays and rivers. Pennsylvania understands that we can and should do better to ensure that clean water is available for generations to come. We understand that the people of this state and our surrounding states enjoy our collective waters both up and downstream of our own. What the federal government and the EPA must acknowledge, is the two hundred billion dollar elephant in the room that represents the incredible costs of these programs. If this process is not pursued in a scientific yet cost-effective manner, it will be stifling to our economy, our municipalities, our businesses, and our personal lives. The science of the process must be clear and correct, and credit must be swift with appropriate adjustments made when progress is achieved. It is evident that the EPA cannot and does not care about the costs. It is also evident that the EPA is unable to quickly adjust the science of the process and provide credit swiftly with appropriate adjustments made when progress is achieved. The EPA should and must provide a better method of providing credit for improvements as they are made.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

It is EPA's desire to credit all water quality improvements as they occur. EPA has requested that nitrogen, phosphorus and sediment controls be reported annually. This data will be compared with water quality monitoring throughout the watershed so that loads can be tracked and verified. Point source controls can more easily be tracked because regulation requires that NPDES permits are consistent with TMDL waste load allocations. The only way that EPA can credit a BMP in the watershed is if it has been reported and BMPs installed voluntarily need to be reported in order to be credited.

The economic impact of the Draft TMDL should also be considered. Good public policy demands that the costs and benefits of various policy options be evaluated. The financial costs of various options should be considered when choosing an option. The Draft TMDL and EPA's improper demands upon Bay states do not address or seem to consider the substantial adverse economic impacts of the policy choices made by EPA in the Draft TMDL.

Response

EPA will not be conducting a cost-benefit analysis as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0656.001.010

Author Name: Dietrich Fredric

Organization: Town of Danby and Tompkins County, New York

The proposed allocations also put a stranglehold on future economic growth because permits would be withheld for failure to comply with the TMDLs. Given that the allocations are impractical to achieve, towns like Danby would be unable to experience agricultural or non-agricultural business growth that might result in increased loading from point or nonpoint sources. [FN7]

[FN7] See Draft TMDL at app. S-2 (thus, since New York would not even meet its initial allocations, any additional loading would not even qualify as "new or increased loading" defined in the draft TMDL as occurring "after the point in time the source begins meeting its WLA or LA." (emphasis in original)).

Cost of Compliance and Current Economy

- The Bay TMDL, which requires Virginia to develop a Watershed Implementation Plan (WIP), will have a high for compliance for all sectors. While we agree that there is a benefit of clean waters within the Bay and local watersheds, the economic costs for compliance must be balanced, and water quality programs cannot be developed in a vacuum without considering economic impacts to the economy.

- Before moving forward with a finalized Bay TMDL, EPA must conduct a non-biased economic impact analysis. Experts from land-grant universities from across the watershed could be called upon to evaluate the actual costs of meeting water quality standards for businesses, citizens, localities, states, and the federal government.
- Agriculture has the benefit of estimating some expenses based on existing data on cost of implementing AgBMPs through current state and federal programs.
 - o Virginia estimates that just one practice (cattle fencing) could cost more than \$800 million to implement. Fencing cattle from streams, putting in crossings, providing alternative watering, etc costs on average \$30,000 for a Virginia cattle farmer.
 - o Virginia's Natural Resources Commitment Fund says AgBMP cost-share funds will need to be \$63.2 million annually from 2025 in order to get 60% NPS reduction goals from agriculture. This is only cost-share funding from the state—doesn't account for federal government's traditional share of funding or money that comes from farmers.
 - o Current funding estimates are just based upon the cost of installing the practice, they do not account for costs like loss of productive land, replacing practices when weather damages occur, fluctuations in markets, etc.
- Economic conditions (lack of profits, increased input costs, additional credit not an option) means that extra money to meet regulations is non-existent.
- Due to long-term devastating economic conditions for agriculture (like other sectors), federal backstops alone (mandatory permitting of small dairies, requiring some ag processing plants to do more) will be enough to drive some farmers out of business.
- EPA's federal backstops requiring more unregulated lands to meet MS-4 (urban lands) requirements may cause significant economic hardship for urban landowners, including the green and turfgrass industries.

Response

EPA will not be conducting an economic impact analysis for reasons discussed in the response to comment 0139.1.001.017. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. The intent of the TMDL is not to put any farms or other businesses out of business. To explain what I'm trying to show on the next page, of course Ag is in the center, it has numerous spokes connecting to the outer circles.

Each of the outer circles are all part of agriculture, also each of these circles have their own, which are not included in the printing, including: medical, housing, banks, and so on.

If the new TMDL affects agriculture, it will affect the economics structure of the U.S.A.

My concern is that it be understood the impact this will have on a major portion of the economic field.

If there are any questions feel free to call: 540-867-5378

31. Has EPA conducted an economic analysis of its backstop allocation approach, which requires use of the "limit of technology" for both nitrogen and phosphorus, on the ratepayers of the municipal wastewater treatment plants in Pennsylvania?

Response

EPA has not conducted any economic analyses as discussed in the response to comment 0139.1.001.006.

Comment ID 0691.1.001.007

Author Name: Kirk Ken

Organization: National Association of Clean Water Agencies (NACWA)

The TMDL does not consider the cost-effectiveness of various nutrient and sediment controls and largely ignores the enormous cost to implement the proposed nutrient reductions. Combined with the aggressive schedule for meeting the TMDL goals, the cost burden on Bay watershed communities for meeting their load reductions will no doubt push beyond the limits of affordability. Combined with the other regulatory mandates these communities must meet, the TMDL simply does not reflect economic reality.

For stormwater, even EPA's own estimates put the cost of retrofitting at close to \$8 billion annually for the Bay watershed. The actual costs will likely be significantly higher than that, particularly because EPA's backstop for stormwater calls for cities to meet aggressive new performance standards for 50 percent of urban lands through redevelopment requirements and retrofits. The requirement for retrofits is particularly concerning to NACWA, as the costs to cities to replace existing stormwater management infrastructure will be severe and will be on top of significant sums already being spent to meet combined sewer overflow and sanitary sewer overflow consent decrees.

Response

Please refer to the response to comment 0139.1.001.017. Please see the response to 0501.1.001.005 for discussion of public sector point sources and the response to comment 0067.1.001.009 for consideration of WIP backstops.

Comment ID 0700.001.001

Author Name: Tamberrino Frank

Organization: Harrisonburg-Rockingham Chamber of Commerce

The agricultural community has taken and continues to take voluntary steps to reduce runoff and mitigate environment impacts from farming. In fact, our Chamber recognizes a farm family each year for their stewardship and sustainable agricultural practices. Much of agriculture is also already regulated by state agencies. Municipal and industrial wastewater treatment plants in the Valley have spent tens of millions of dollars to reduce their nutrient discharges. Developers have implemented storm water and erosion control practices.

Voluntarily, more can and will be done to improve water quality. However, the proposed TMDL and associated mandates will impose new regulatory burdens that will have a devastating economic impact upon Virginia, and the Shenandoah Valley in particular. The economic harm would be counterproductive to Bay restoration goals by depriving the private and public sectors with resources for continuing environmental progress.

Response

EPA commends all efforts made thus far to improve water quality. EPA is under a legal obligation to establish the TMDL and cannot wait to see how much progress can be achieved by voluntary efforts. Please see the response to comment 0139.1.001.017 for a discussion of the consideration of cost.

This letter is in response to the draft Chesapeake Bay total maximum daily load (TMDL) issued by your agency. Being a dairy farmer in New York State your rulings will directly impact us. We are beseeching you to please listen to and take into account our concerns stated throughout the rest of this letter.

The dairy industry has endured many financial blows the last several years testing us in all areas of our lives; we recently attended an EPA DEC meeting Elmira New York on the TMDL. We came away certain that our biggest test will be coming in the very near future . Your agency is regulating smaller Farms right out of business . We heard that there may be cost sharing ; although no one would talk about the cost to us or the State of New York.

As the financial crisis hits more sectors in our community. We often hear we need to put more money into more populated areas. This seems to be the case with the Chesapeake Bay TMDL. You will sacrifice the less populated areas for the greater good of the masses, even though there will be no financial or environmental impact on their lives. No one is forcing them to meet the standards that you will be expecting us to follow.

Response

The Chesapeake Bay TMDL is not a regulation. All parts of the Chesapeake Bay watershed will be reducing the nitrogen, phosphorus and sediment loadings that are contributed to the Bay in order to meet water quality standards. Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York.

Author Name: Belfield G.

Organization: Town of Tappahannock, Virginia

We expect to do our part for the Bay restoration. In fact, our WWTP has just completed an upgrade project with nutrient removal technology. Our existing 0.8 mgd WWTP was upgraded to a 4-Stage Bardenpho suspended growth activated sludge nutrient removal treatment system followed by deep-bed tertiary filters in order to meet Tributary Strategy requirements for the Rappahannock River basin and the assigned wasteload allocations issued via the general watershed permit . Chemical feed and storage facilities were also constructed for supplemental carbon and aluminum sulfate addition which are required to meet nutrient removal requirements. The total construction cost for the upgrade project was approximately \$8.7M and total project costs were approximately \$9.2M.

The upgraded facility will have significantly higher energy and chemical costs. It is estimated that at current flows,

additional energy and chemical costs attributed to nutrient removal will be 50,000 per year, increasing to an additional 100,000 per year at design flows. In the past two years, we have increased our rates thirty-two (32) percent to cover the debt service and increased operation and maintenance costs for the WWTP nutrient removal upgrade project.

Response

Please see the response to comment 0139.1.001.017 for a discussion of the consideration of cost. Also, please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 which discusses public sector point sources.

Comment ID 0726.001.005

Author Name: Belfield G.

Organization: Town of Tappahannock, Virginia

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years) . As an organization with a demonstrable commitment to clean water, we object to the waste inherent in EPA's threatened override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Response

Comment ID 0727.001.007

Author Name: Thigpen Janet

Organization: Steuben County Environmental Management Council

New York State is already a very good neighbor to the Chesapeake Bay, delivering clean water with lower pollutant loads than other parts of the watershed. This is the result of low intensity land use (76% forest), low population density, stable population, progressive natural resource management programs, regulatory programs that exceed federal requirements, and a strong environmental ethic among watershed residents . The depressed economy of this region cannot support costly additional measures to further reduce nutrient and sediment loads, particularly those in the proposed federal backstop . The proposed regulations would burden our farm communities with costly mandates that would weaken rural economies and disrupt local food systems. New York communities would be required to spend an estimated \$250 million to retrofit and rebuild Waste Water Treatment Plants . Extensive stormwater retrofits would also

be required, even though it is generally recognized that this approach is among the most expensive ways to reduce nutrient and sediment loads . The draft TMDL mandates these costly measures even though they are unlikely to achieve the unreasonably low load allocation that EPA has assigned to New York. Given the reality of limited financial resources, the TMDL should be revised to target the most cost-effective approaches and locations for achieving water quality objectives.

Response

Please see the response to comment 0080-cp.001.002 addressing equity and New York and the response to comment 0067.1.001.009 for discussion of EPA’s WIP backstops.

EPA will not be revising the TMDL to target cost-effective approaches for reasons discussed in the response to comment 0139.1.001.017.

The TMDL is not a proposed Federal regulation.

I am a farmer in Rockingham County, Virginia. I am also a member of the Mennonite faith. I'm concerned that several issues being discussed will affect my lifestyle and potentially my ability to farm. Please understand I choose not to participate in the legislative process or government programs for my personal financial benefit in accordance with my religious beliefs. That said I sincerely hope the following information will be considered when developing and implementing both the TMDL and the Watershed Improvement Plan for the State of Virginia.

Second: Many of the practices and requirements being discussed will be very costly to implement. High cost regulations without offsetting economic returns will place an extremely heavy burden on our farms and families - especially for those of us who don't accept government cost share. We hope required cures will be cost effective and have an implementation window long enough to allow them to be repaid with earnings.

Response

EPA reminds the commenter that the TMDL is not a federal regulation.

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0734.001.003

Author Name: Augenstern Robert

Organization: Southern Tier East Regional Planning Development Board (STEPDB)

The implementation of the TMDL will require NYS and local communities to embark on a project addressing agriculture, urban stormwater and wastewater treatment plants at a cost on the order of billions of dollars. This will have dramatic impacts on the economies of the Southern Tier. Farms will close due to the cost of compliance-and economic development will be drastically hindered by an additional cost of doing business.

Response

Please refer to agricultural funding sources outlined in Comment 139.1.001.006 and the Federal commitments to the Bay in Comment 0038.1.001.024.

Organization: James City County, Virginia

On September 24, 2010 the U.S. Environmental Protection Agency released a draft Chesapeake Bay Total Maximum Daily Load (TMDL), a mandatory "pollution diet" designed to restore the Chesapeake Bay and its vast network of streams, creeks and rivers. Being in the Tidewater region of Virginia, James City County understands the Bay is a complex ecosystem and an economic engine for the region, supporting a variety of industries from fishing to tourism.

James City County realizes the importance of protecting the Chesapeake Bay and its James and York River tributaries. James City is a leader in the Commonwealth of Virginia in our protection efforts. We are committed to not only providing mandated environmental programs, but also advanced initiatives authorized by our elected officials, to reduce nonpoint source pollution.

These commitments are characterized by the following: aggressive environmental goals, strategies and actions (GSA's) from our recently adopted 2009 Comprehensive Plan; implementation of a local erosion and sediment control program since 1975; implementation of the Bay Act program since 1990 (first locality in Virginia); implementation of a stormwater management program which adopted more stringent water quantity protections than required and unique water quality design standards; coverage under an MS4 General Permit for the NPDES Phase II program (VAR040037, 2003); the adoption of Special Stormwater Criteria for select areas in the County; implementation of recommendations from our Green Building Design Roundtable (2010); involvement with the Builders for the Bay, Better Site Design Roundtable in 2004, implementation of nutrient management plan programs for turf and landscape areas associated with private and municipal uses (Community Conservation Partnership, Turf Love and other similar programs); award winning water quality (PRIDE) and water conservation (JCSA Let's Be Water Smart) education programs; and a citizen water quality monitoring program.

In addition to these, and perhaps more importantly, is the County's commitment since 1999 to prepare individualized watershed management plans for the County's eleven subwatersheds . Adopted watershed management plans cover nearly 40 square miles (or 28%) of the County's 144 square mile land mass. Our watershed management plans are highly acclaimed as model watershed management plans in the Commonwealth of Virginia.

Response

EPA acknowledges the comment.

Author Name: Middaugh Robert

Organization: James City County, Virginia

James City County clearly understands the balance between the need for environmental protection and costs involved with the implementation of such efforts as the Chesapeake Bay TMDL. However, in many instances, these costs are imposed on the localities as unfunded mandates by federal and state legislation or agencies. Based on preliminary estimates by the Hampton Roads Planning District Commission, the costs of the pollution diet are staggering - approximately \$501M in capital costs and \$36M a year in annual maintenance costs to James City County. Even if the cost is overstated, costs of this magnitude will greatly inhibit the County's ability to provide basic services such as public safety, public education, family services, transportation and other established local priorities. Without the substantial assistance of the State and Federal governments, this effort will definitely create an adverse impact on our citizens and business community.

Response

Please see the response to comment 0139.1.001.017 for a discussion of the consideration of cost. Also, please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 for discussion of public sector point sources.

Comment ID 0742.001.001

Author Name: Wells John

Organization: Town of Leesburg, Virginia

Established in 1758, Leesburg is the seat of government for Loudoun County, Virginia, one of the fastest growing counties in the country. The Town has held on to the authentic sense of place, grounded in our 250 years of history, making Leesburg a real hometown. Town character is of paramount importance to Leesburg. In particular, the Old and Historic District is the basis of Leesburg's identity. The pressures for growth in the Town axe the result of the robust

regional economy that will continue to draw more businesses, government jobs and residents . Leesburg's challenge and planning vision is to accommodate its share of that growth while retaining and enhancing the Town's character and quality of life .

The Town owns and operates a Municipal Wastewater Treatment Plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a State-issued National Pollutant Discharge Elimination System ("NPDES") permit.

The Town is doing their part for the Chesapeake Bay restoration. In fact, our WWTP was upgraded several years ago consistent with Virginia regulations for nutrient removal at a cost of \$17.5 million. A more recent upgrade and expansion including nutrient removal cost \$.637 .5 million. Our Operation and Maintenance (O&M) costs have increased substantially because of the additional chemical feed, solids handling, energy use, and equipment and treatment processes maintenance. A further upgrade to the backstop levels included in the draft TMDL is estimated to cost approximately \$20 million dollars and will add thousands of dollars per month to our O&M costs. We are a small town of around 40,000 people . Our customers are already stressed because of the high cost of our recent upgrades . Any further cost will only aggravate the situation and the Town would have to borrow the money which might negatively impact our bond/credit rating because of higher debt.

Response

Please see the response to comment 0139.1.001.017 for a discussion of the consideration of cost. Also, please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 for discussion of public sector point sources.

Comment ID 0746.1.001.009

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

New York, and Particularly the Residents of Its Southern Tier, Cannot Afford To Pay The Costs Which Would Be Necessary To Achieve the Draft New York Allocations

Even if New York could achieve its Nitrogen allocation, there would be little or no measurable, let alone visible water quality benefit in New York [FN13]. Neither NYSDEC nor the USEPA can impose on New Yorkers, especially, as discussed below, those living and working in the Southern Tier, to bear virtually all of the New York's implementation costs. NYSDEC estimates that implementation of its proposed WIP will cost \$440 Million.[FN14] If the federal Backstops are included, the cost will likely be \$2 to 4 Billion. [FN15]

Wastewater or BMP installation and implementation rates costs cannot be looked at in isolation when considering whether something is affordable. The outdated USEPA assumption [FN16] that residents can afford to spend up to 2 % of their median householder income on wastewater-related fees cannot be used as a basis for concluding that the implementation costs that would be required if the Draft TMDL is adopted are affordable by New York Bay Watershed

residents. As shown in Table 3, this simplistic assumption ignores the financial realities of this portion of New York and given poverty levels, violates EPA's own "environmental justice" policies against environmental programs disproportionately negatively impacting such populations. Using Chemung County (CC) as an example, data from the US Census Bureau paints a stark picture of the current economic realities of live in much of New York's southern tier.

[See Table 3 on page 18-19 of original comment letter 0746.1]

* Source: US Census Bureau 2006-2008 American Community Survey for Chemung County [FN17]

In addition to the New York portion of the Bay Watershed being in an economically depressed area, its resident's cost of living for basic necessities is higher than much of the nation's. Consider the following facts compiled by The Tax Foundation [FN18] and the U.S. Energy Information Administration [FN19].

- New York's State/local tax burden is the second highest in the nation.
- New York's State and local sales taxes rank 11th in the nation.
- New York's gasoline tax, at 44.6 cents a gallon, is the highest in the nation.
- Chemung County's property taxes as a percentage of the median house value are the 4th highest in the Nation. Other New York Bay watershed counties which rank in the top 30 property tax counties in the Nation in this category include Onondaga (7th), Steuben (9th), Madison (10th), Oneida (19th), Broome (23rd) and Tompkins (28th).
- New York's residential electricity rate (as of July 2010) was 19.58 cents per kilowatt hour as compared to the national average of 12.01.

Put simply, residents of the New York portion of the Bay watershed simply do not have the wherewithal to pay the bulk of the cost to meet the requirements anticipated by the draft New York Phase I WIP, let alone the cost of any of the federal Backstops which are included in the final TMDL. The communities that are Coalition members understand that they must spend their tax dollars wisely and ask our residents, farmers and industry to do what is necessary, but this cannot include paying for things which will not benefit the local environment, are unachievable, do not require an equivalent magnitude of sacrifice from the communities that do directly benefit, and which are based on inaccurate and outdated assumptions which disregard progress made to date to achieve these objectives. The inclusion of any of the federal Backstop provisions in the final TMDL would amount to EPA endorsing a notion so implausible (that is, the concept that the required actions can all be funded between now and the end of 2025), so as to render the TMDL unapprovable. EPA's imposition of the TMDL causes a burden on interstate commerce that is excessive and not incidental to the local benefits that would be received by implementation of the TMDL. See *Sherwin-Williams Co. v. National Paint and Coatings Ass'n*, (334 F. Supp. 2d 187 (N.D.N.Y.2004)).

EPA's TMDL would place an excessive burden on interstate commerce because, among other reasons, the limits are not technically feasible, are stricter than the standards in other states, are proportionately more restrictive than the TMDL limits in other Chesapeake Bay states, imposes a financial and administrative burden on Coalition members and other entities that outweighs the benefits that would be received by Coalition members and the State of New York, alternative standards exist that would not burden interstate commerce and EPA's TMDL would impede the marketing of Coalition members' goods in New York State and the interstate marketplace in general.

As shown above, New Yorkers living within the Bay watershed certainly can't pay these costs by fee increases alone (e.g. bond issuances). While bonding most of the capital improvement costs might be feasible for some of these municipalities. New York municipalities have only two ways to pay for incurred costs. They must either increases local

taxes, or secure financing through increasing their indebtedness. Further, operation and maintenance (O&M) and other on-going expenses can only be paid by taxes or fees [FN20]. New York municipalities must be not only environmental stewards, but also good fiscal stewards. Before they can accept a new or modified individual or General SPDES permit from NYSDEC which would entail capital improvements, especially on the scale envisioned by the Draft TMDL with federal Backstops, the municipalities ensure that they have the ability to raise funds to pay both the capital and the ongoing O&M costs of these improvements. If they cannot pay for the improvements that would be necessary to meet the proposed permit requirement, they may not legally be able to accept the modified permit.[FN21]

Once the allocations are included in a final TMDL, if New York then accepts and adopts that TMDL (see section II(F) below), it will then be bound by the CWA and EPA's implementing regulations to include those allocations in its subsequent Individual, Industrial Stormwater, MS4 and CAFO General SPDES Permits. Because New York cannot approve a TMDL which it knows cannot be implemented within the timeframes built into the TMDL, due to cost and other reasons, it will have no option but to refuse to adopt the Bay TMDL. To approve it would be both contrary to the clear evidence before it achievement of the TMDL stated allocations and endpoints within the specified timeframe is impossible.

[FN13] NYSDEC has indicated that some of the streams within the New York portion of the Bay watershed are likely impaired to some extent by Phosphorus, and hence some of the Phosphorus reductions called for by the Draft TMDL would likely lead to a measureable and, perhaps even visible, water quality improvement within the State.

[FN19] See http://www.eia.doe.gov/electricity/epmltable5_6_a.html

[FN20] In general, and as an example, towns in New York have no general power to borrow money for municipal purposes or to pay town charges, the policy of the law being that such charges shall be met by taxation. A town may not be made liable for money borrowed on its credit simply because it has been applied for town purposes. *Wells v. Town of Sauna*, 119 N.Y. 280 (1890). Section 125 of New York's Second Class Cities Law provides that no person shall have power to make any purchase or contract any debt for which the city shall be liable unless specifically authorized. *Wooley v. City of Schenectady* 226 A.D. 383, (3rd Dept. 1929). Finally, New York municipalities must typically obtain specific legislative authority to contract virtually all indebtedness. *Adrello v. Dulan*, 1966, 2 NY.S.2d 738 (Sup. Ct. Oneida County 1966).

[FN21] The Coalition acknowledges that NYSDEC could issue Permits with these limits unilaterally. However, all this would do is force permit violations to accrue, adding significant monetary penalties on top of the capital costs (which the municipality would have already concluded could not be paid).

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0746.1.001.022

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

NYSDEC estimates that implementation of its proposed WIP, with its emphasis on all WWTPs optimizing their Nt and Pt removal capabilities and with a number of them having to also do chemical addition-related Pt removal will cost an estimated additional \$140 Million, plus significant increased ongoing O&M costs. If the federal Backstops are put into place, NYSDEC has estimated that the cost will skyrocket to \$1 to 1.5 Billion.

In addition, most of the New York Bay Significant WWTPs are small, especially compared to many of the municipal WWTPs in the southern part of the Bay watershed. As shown in Table 4, a 2009 EPA publication provided the following flow versus cost data for BNR upgrades. As can be seen, for WWTPs with flows less than 1 MGD, the cost to upgrade for BNR at a WWTP with a design capacity between 0.1 and 1 million gallons a day is 13.7 times as expensive as to do the same removal at a WWTP with a capacity higher than 10 MGD.

[See Table 4 on page 38 of original comment letter 0746.1]

Source: Based on data from MDE (2005) and CTDEP (2007), as summarized in Biological Nutrient Removal Processes and Costs available at

http://water.epa.gov/scitech/swguidance/waterquality/standards/upload/2009_01_21_criteria_nutrient_bio-removal.pdf

In addition to capital costs, BNR (for Nt and/or Pt reduction) and/or chemical removal for Pt requires a significant increase in the cost to operate the WWTP. For example, NYSDEC estimates that removing phosphorus at a WWTP costs approximately \$1 to \$20 per pound [FN38]. The combined increased annual O&M cost if upgraded to optimize two Chemung County Sewer District Plants for Nitrogen removal and to carry out chemically enhanced Phosphorus removal has been estimated to be \$1.75 Million/Year.

In addition, the 26 New York Bay Significant POTWs will be forced to also do other significant and costly mandated upgrades within the next 15 years, including:

- Disinfection, including possibly for some plants, post-disinfection chlorine removal.
- Wet Weather Issues, including significant III reduction and Sanitary Sewer Overflow (SSO) abatement and elimination and for some of Johnson City, implementation of its CSO Long term Control Plan.
- Mercury minimization and compliance.
- Removal of Emerging Contaminants of Concern.

As discussed in Section II (A) above, the entire New York Southern Tier is in the midst of very difficult economic times. Municipalities are struggling with the need to reduce their costs. There is simply no money available to pay for upgrades to the 26 Bay Significant municipal Wastewater Treatment Plants. Similarly, because the census data indicates that Chemung County (and, assumedly, the rest of the New York portion of the Bay watershed) has higher unemployment than the national average, we cannot allow the cost to our industrial dischargers to rise unfairly, because our residents and dairy farmers count on the jobs and services they provide.

In conclusion, our residents and tax payers already face one of the highest tax burdens in the nation. Therefore, unless EPA can commit money from outside New York to construct and operate the upgraded New York municipal and industrial WWTPs which would be necessary to meet the proposed New York WLA, it must be concluded that achieving the TMDL endpoints is implausible. Because of this, approval of the Draft TMDL would be arbitrary and capricious unless most of the capital and increased O&M costs for upgraded municipal and industrial wastewater treatment, whose benefit will largely be experienced by people living outside New York, is paid for by non-New York sources.

[FN38] Source: NYSDEC Factsheet on new ban on Phosphates Dishwasher Detergent and Fertilizers available at [http://www .dec.ny.gov/chemical/V67239 .html](http://www.dec.ny.gov/chemical/V67239.html).

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

Comment ID 0746.1.001.029

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

Agriculture is New York's most important industry. The farm economy generated \$4.45 billion in 2008. Farm income is used for employee compensation (\$461 million), maintenance and repairs (\$180 million), property taxes (\$223 million), marketing and transportation (\$106 million), and energy costs (\$267 million), according to 2007-08 data. [FN41] There are approximately 35,000 farms in New York State, 99 percent of which are family owned. A viable and strong agricultural industry is not only beneficial to the State's farm and food industry, but to the economy of the State as a whole, hundreds of local communities, and to all consumers of New York.

While the NY draft WIP's projection of \$170 Million of likely available federal and State moneys to support implementation of this part of the proposed Phase I WIP is probably reasonably accurate, it will only cover approximately 40% of the estimated \$420 Million [FN42] it will cost to implement the plans in this document.

The mainly small to mid-sized NY farms within the CB watershed can simply not afford to pay the other 60% (~\$250 Million). Even if this part of the proposed Plan is able to be fully implemented, it still will not achieve EPA's estimated NPS agriculture portion of the NY NPS allocation.

NYSDEC's estimate as to the cost to meet the identified federal Backstop BMPs for agriculture is between 1 and 3 Billion dollars. This cost simply cannot be born by our Bay watershed farms. If forced to do so, many of them will have no options but to cease farming.

Because neither the NY Draft WIP nor, especially, the federal Backstop NPS agricultural BMPs included in the TMDL can be funded by the identified combination of federal, State, local and farm-based sources of money, it is asserted that the proposed New York NPS allocation is both unfair and simply unachievable, at least by the year 2025.

It is noted that NYSDEC never agreed to the 2025 deadline, which we believe is unrealistic and unnecessary. While we realize that this deadline is court imposed, history has shown that EPA has often gone back to the courts to get unmeetable water-related deadlines extended where there is good cause. A recent examples include the nearly decade long CWA 316(b) Cooling Water Intake Structure rules in the schedule for the rule promulgations pursuant to *Riverkeeper, Inc. v. Johnson*, U.S. District Court, Southern District of New York No. 93 Civ. 0314 October 12, 2005 was amended twice.

[FN41] Source: NY Farm Bureau website.

[FN42] For example, New York State Agriculture Commissioner Patrick Hooker, has indicated that the measure would cost the 900 Southern Tier farms located in the Chesapeake Watershed approximately \$250 million over the next 15 years on top of the \$170 Million that is likely to be provided by State and federal agencies. See, http://www.nyfb.org/resources/topic_detail.cfm?ID=282.

Comment ID 0746.1.001.031

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

Retrofitting of Existing Storm Discharges

In New York, the stormwater sector represents only a small percentage of the overall nutrient loading leaving the state and reaching the Bay. According to the 2006 New York State Tributary Strategy for Chesapeake Bay Restoration, approximately 5 percent of New York's nutrient load is attributed to urban sources. Furthermore, it is anticipated that this percentage will become further reduced, given the recent New York State legislation placing restrictions on nutrients in home fertilizers discussed in Section I above.

If the urban stormwater federal Backstops are included in the final TMDL, the requirement for the retrofitting of existing stormwater discharges with structural treatment practices would place an immense financial burden upon municipalities, with little benefit in regards to nutrient reduction. The Draft TMDL's Backstop allocations would require 50 percent of the urban MS4 lands to meet aggressive performance standards through retrofit/redevelopment. The NYSDEC has estimated an associated cost of \$1 to \$6 billion to accomplish this. The cost-effectiveness of this requirement would be non-existent, given the limited additional nutrient reduction it would trigger.

In regards to MS4s within a watershed that has nutrient TMDLs, the requirement for the retrofitting of existing stormwater discharges should not automatically be imposed. In the case of the Chesapeake Bay Watershed within New York State, nutrient loads from MS4s within the watershed are only a small portion of the overall loads to the Bay. Furthermore, the ratio of cost (\$) per lb of nutrients removed is exceedingly high for urban stormwater. Simply, removing nutrients from urban stormwater via storm system improvements most likely is not a cost-effective means to reducing the overall nutrient load to the Bay.

Response

Federal backstops in the final TMDL will be based upon an individual jurisdictions final Watershed Implementation Plan submittal that was due on November 29, 2010. For more information on the backstops in the final TMDL please see Section 8 of the final TMDL where any actions taken will be described. Please see response to 0159.001.001 to address economic impacts. Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Organization: Cumberland County Planning Department

2. There are substantial resource needs that have not been addressed to implement the TMDL. Pennsylvania is facing a nearly \$3 billion deficit in 2011. Programs for agriculture nutrient reduction or stormwater management have been or will be severely reduced. In particular, PA's stormwater management program budget was zeroed out in the 2010 budget. Significant new financial resources will be required to implement the TMDL. Neither the TMDL or PA DEP's WIP has identified the funding sources that will support implementation of the necessary nutrient reduction measures.

Response

On May 12, 2009, President Barack Obama issued the Chesapeake Bay Protection and Restoration Executive Order 13508, which calls for the federal government to lead a renewed effort to restore and protect the Chesapeake Bay and its watershed. Among its directives was the requirement for the Federal Leadership Committee to publish an annual Chesapeake Bay Action Plan describing how Federal funding proposed in the President's Budget will be used to protect and restore the Chesapeake Bay during the upcoming fiscal year. EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0132-cp.001.003

Organization: Cumberland County Planning Department

3. EPA needs to consider the level of government that will implement the TMDL and the associated implications. The TMDL will span several states, all with different governmental structures and associated powers. Regardless of the state, the TMDL will create a huge administration and enforcement burden for the implementing level of government. PA DEP has suggested that counties are a likely level of government for implementation. In PA, County planning departments and county conservation districts have extremely limited staff and resources and often have to work with municipalities or farmers to accomplish agriculture or stormwater management regulatory objectives. Without additional

resources, these two organizations will not be able to implement, administer, or enforce the TMDL.

Response

Thank you for your comments. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions including staffing resources.

WHEREAS, the United States Environmental Protection Agency ("EPA"), Region 3, has issued draft Chesapeake Bay Total Maximum Daily Load (TMDL), which imposes new allocations and costly federal regulations on approximately 19 counties, 650,000 residents and 2,000 New York family farms within the New York State portion of the Chesapeake Bay Watershed area; and

Response

EPA reminds the commenter that the TMDL is not a Federal regulation, Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0212.1.001.008

Author Name: Greenland Victoria

Organization: Arlington County, Department of Environmental Services, Virginia

Our concern is that under the current draft TMDL, local governments, taxpayers, and others who are actively working to achieve water quality improvements under the Clean Water Act will be undermined by exposure to unrealistic requirements, as well as substantial legal and financial consequences of violating TMDL requirements currently under consideration by EPA. The proposed TMDL framework is not a realistic or sustainable path forward towards the goal of a healthy Bay that we all share.

Response

Comment ID 0231.1.001.011

Author Name: Boepple Charles

Organization: Upper Occoquan Sewage Authority (dba Upper Occoquan Service Authority)

What is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years).

Organization: U.S. House of Representatives

Pennsylvania's Fifth Congressional District comprises approximately 22% of the Commonwealth and more than half of its 17 counties lie within the Chesapeake Bay watershed. While I recognize the importance of restoring the Bay, I have considerable concerns over implementation of this TMDL draft and the effects it will have on my Congressional district and other areas of rural Pennsylvania. Specifically, I have concerns over the major impacts the TMDL will have on our local governments and farms across the watershed.

Response

Please see the response to comment 0501.001.005 addressing municipal point sources and the response to comment 0139.1.001.006 regarding funding for the agricultural community.

Comment ID 0410.1.001.002

Author Name: Pujara Karuna

Organization: Maryland State Highway Administration (SHA)

SHA has developed several scenarios for meeting the TMDL/WIP requirements and the costs are astronomical if

pavement stormwater retrofits are required. SHA made a number of assumptions concerning acceptable strategies and pollutant removal efficiencies in order to develop an implementation plan, schedule and the cost estimate. SHA owns over 24,750 acres of impervious surfaces in the nine MS4 Phase 1 counties. SWM facilities have been constructed since the mid 1980's (last 25 years) on all SHA projects and the current SHA SWM inventory contains over 2000 BMPs treating close to 2,500 acres of pavement. That represents approximately 10% of SHA owned impervious surfaces within the nine counties. The annual cost for maintenance of this SWM infrastructure is currently around \$3 million.

Although we do not have an impervious shape file for the remaining 14 counties, we have estimated the impervious coverage in these areas based on lane miles. In order to treat 40% of the SHA impervious in the MS4 Phase II and non-MS4 areas, controls would need to be installed for approximately 6,250 acres. The estimated cost for design and construction is significant. These costs would be in addition to the costs above for the MS4 Phase I jurisdictions. According to the TMDL, 40% treatment of impervious surfaces will be required but the MD WIP lists both 20% and 40% restoration requirements for these areas.

Based on our current budget and the demonstrated expense of stormwater impervious retrofits, our current capacity is 2% retrofit over the next ten years. Unlike local jurisdictions, SHA cannot legally impose a stormwater utility tax on the travelling public to generate a source of revenue to meet these restoration goals. For this reason, increased federal funding is essential for meeting the TMDL allocations.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 addressing public sector point sources. With regard to EPA's rationale behind WIP backstops and how it has changed, please see the response to comment 0067.1.001.009 and section 8 of the TMDL.

for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

24.3 - AVAILABILITY OF FUNDING

Comment ID 0036-cp.001.001

Author Name: Redman Bicky

Organization: Adams County Environmental Services

A few years back I worked with our local non-profit land trust on a very successful source water protection project involving the preservation of a number of tracts of land bordering a creek that serves as a drinking water supply for several municipalities. For these efforts, we received an award from EPA Region III. I bring this to your attention because one of the most successful ways to protect the Bay is to preserve and manage its land base, especially its forested areas. And, that is why I would like to garner your support for the protection of forested areas in the Bay's watershed by targeting funding efforts through the federal Forest Legacy Program. Make funding available (such as block grants) to qualified organizations to purchase permanent forestland easements for a set period of time, such as five years or longer to accomplish this task. Currently, the Forest Legacy Program is rather competitive so forestlands that could be protected now in Adams County await funding for many years. We hope they will be there in the future if funding becomes available.

Response

Between the years 2007-2010 funding for land preservation in the Chesapeake Bay watershed totaled \$494,608,685. In addition during that time frame \$29,597,371 went towards land conservation within the watershed. Please see the response to 0038.1.001.024 for additional information.

Comment ID 0044.1.001.003

Author Name: Blackwood Lorene

Organization: Virginia Green Industry Council

We feel that having specific funding for education and plan implementation, engaging the public, targeting school children and homeowners is vital for any successful Bay clean-up.

Response

Between the years 2007-2010 funding from federal sources for watershed education totaled \$13,817,955 and \$13,745,243 from State sources. Across those years funding across all sources totaled \$31,207,415. In addition there was \$19,534,616 across all funding sources focused towards citizen engagement, of that total \$14,336,075 came from federal sources. The President's proposed budget for FY 11 contains a half a billion dollars in federal monies for restoration of the Chesapeake Bay, included in that amount is funding for education and citizen engagement. Education and outreach are an essential piece to addressing environmental issues and EPA and other federal agencies are committed to further the education to all stakeholders in the Chesapeake Bay watershed.

Comment ID 0052.1.001.002

Author Name: Gross Penelope

Organization: Fairfax County Board of Supervisors

Please consider these realities under which local governments have operated in recent years:

- Because of the state's fiscal conditions, state aid to localities has fallen by \$1 billion since 2008.
- These cuts in state aid have affected the quality of our public schools, mental health programs, social services and public safety.
- The fiscal conditions of recent years have forced many local governments in Virginia to cut back services and their workforces.
- Between June, 2009 and June, 2010, in just one year, 15,600 local government jobs in Virginia disappeared.

These points are not being made to suggest that we should not be active partners in improving water quality. In fact, local governments have done the lion share of the work in this area. Our chief contention is that there is a major role

that federal and state governments must make in underwriting the costs of the very costly programs that the Chesapeake Bay TMDL will generate.

Response

Thank you for the constructive points on the economic realities we are facing. EPA does not dispute the costly nature of improving water quality in the Bay watershed. EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see our previous response to your comment Please see response to Comment ID 0139.1.001.017 where we discuss the desire for trading to aid in alleviating some of the financial burden across Bay jurisdictions.

Comment ID 0052.1.001.004

Author Name: Gross Penelope

Organization: Fairfax County Board of Supervisors

Five years ago, I was a member of the Chesapeake Bay Watershed Blue Ribbon Finance Panel, chaired by former Virginia Governor Gerald Baliles. The Blue Ribbon Panel issued a report stating that the "most up-to-date cost of implementing all strategies (associated with restoring the Chesapeake Bay") is \$28 billion in total upfront capital costs, including some items that are primarily for the benefit to local waters, and not the Bay itself." When issuing these estimates, the Panel criticized past efforts to restore the Bay as "poorly coordinated" partly because of its lack of "a permanent funding base that is sufficiently large to do the job." Despite the recent news by EPA about the availability of \$491 million in Bay restoration activities, we fear it falls far short the vast sums needed to restore water quality especially if urban storm water systems need to be retrofitted. These efforts will necessitate, among all participating states, billions of dollars in capital costs that will severely strain local government budgets. While we understand the need to undertake these projects, we need to have a very serious discussion about the legal and financial challenges associated with them that must be recognized by EPA.

Comment ID 0070.1.001.003

Author Name: Hughes Robert

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

EPCAMR believes that the focus should also be on working with the local community groups to raise the level of the segments that are impaired either by watershed or stream segment to become eligible for additional funding through other State Agency programs such as the PA DEP's Set Aside Program, under the Title IV, Surface Mining Control & Reclamation Act (SMCRA), 2006, as amended, as a Qualified Hydrologic Unit (Qualified Hydrologic Unit). Currently, throughout the Susquehanna River Basin, there are only 4 watersheds and or segments that qualify for additional Federal funding under SMCRA. For instance in Luzerne County, there is not a single watershed or stream segment that is impaired on the Federal List of Impaired Waters, formerly known as the 303 (d) List, that is eligible for Federal funding under this Title IV Program until a QHU Plan is developed. Our organization would like to assist in the development of these QHUs, provided that future funding is made available to provide the local community watershed associations and local governments with the technical expertise and assistance that would qualify segments within their watershed boundaries or political jurisdictions for funding. EPCAMR realizes that this is a separate funding source and that historically PA Growing Greener Funding under the Watershed Environmental Stewardship Fund through the Section 319 Program has provided funding for other types of projects, including AMD assessment and remediation.

Response

EPA agrees that encouraging and funding activities conducted by local community groups and organizations is important for the successful implementation of the TMDL. While federal resources and funding opportunities for projects and activities to reduce nutrient and sediment loads to the Chesapeake Bay may be limited, EPA does provide a number of funding opportunities through grants, loans and cost sharing. Please refer to our webpage located at http://water.epa.gov/grants_funding for more information. Regarding SMCRA funding, EPA is not responsible for funding sources under the Title IV, Surface Mining Control and Reclamation Act and can not speak to the qualifications or criteria for funding projects under SMCRA.

Comment ID 0070.1.001.025

Author Name: Hughes Robert

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

EPCAMR understands that without clean water, land, and water, the social, recreational, economic, and environmental vitality of the Commonwealth and in the Chesapeake Bay Watershed, our children will be severely disadvantaged for future generations. PA DEP and the US EPA should continue to be the true leader in the continuing efforts to research and implement remediation and reclamation techniques on abandoned mine lands and the other environmental issues that have plagued the Bay for decades. Not all decisions are best made at the Federal level or State level through regulations and compliance.

EPCAMR believes that given the adequate amount of funding, expertise, engineering assistance, technical assistance, and guidance from the Commonwealth, groups like ours and other community groups and municipalities at the local level CAN effectively and HAVE implemented many of the ideas presented or suggested in this public comment document. Too many stream miles have been on the Federal List of Impaired Waters due to AMD for as long as I have been the Executive Director for EPCAMR, and slowly some of them are being removed due to the hard work and efforts of community volunteers, watershed organizations, and assistance from various State, Federal, County, and Local level partners. Additional funding has to find a way down to the local level for implementation. Other states should follow our lead. Let's Change the Chesapeake! While I firmly believe the motto that "We All Live Downstream", I also believe that we need to lead by example and take care of PA's watersheds first.

Response

Thank you for your comments and interest in the Chesapeake Bay TMDL and for your commitment to clean and restore local waterways. While the main focus of this TMDL addresses nutrients, abandoned mine drainage is a source of sediment and impairment to local waterways. Between the years 2007-2010 funding for abandoned mine drainage in the Chesapeake Bay watershed totaled \$4,468,972. That entire funding amount went to restoration efforts in Pennsylvania. Please see the response to 0038.1.001.024 for additional information on federal funding efforts in the Bay Watershed.

Comment ID 0197.1.001.004

Author Name: Vickers Bradd

Organization: Chenango County Farm Bureau

Farmers throughout the watersheds would welcome the opportunity to do even more to protect water quality, they simply need more assistance to implement projects, not increased regulation and oversight proposed by the TMDL.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0139.1.001.006 regarding agricultural funding. EPA notes that a TMDL is not a Federal regulation.

Comment ID 0197.1.001.006

Author Name: Vickers Bradd

Organization: Chenango County Farm Bureau

If EPA were truly committed to improving the water quality of the Chesapeake Bay, rather than approach the issue by employing a TMDL that does not recognize the scope of the success of agriculture's efforts, it should advocate for a more constructive, stakeholder focused approach. Helping farmers implement BMPs through better targeting of the Section 319 funds and urging all stakeholders to support more implementation funds would significantly assist in practical water quality improvements.

Response

One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions. This approach includes having the State develop a process to target funding and implementation.

Comment ID 0201.1.001.005

Author Name: Fawver Gary

Organization: Pennsylvania Department of Transportation

EPA will never achieve the desired load allocation in the Bay Watershed solely through regulated point sources. This is easier for EPA given the fact that they have some statutory jurisdiction over these sources. However, to achieve the TMDL by placing more responsibility on the point sources will essentially eliminate necessary activities. For example, the State DOTs are also in a funding crisis. In PA, in response to changes in the NPDES program and litigation, PADEP has over the years increased their BMP requirements for both E&S controls and post construction controls which have resulted in increased project costs. As a result, fewer projects are completed. These shelved projects are based on public health, safety, and welfare needs. If the Bay TMDL plan imposes even stricter controls, project costs will again increase and even fewer needed projects will be completed. The same can be said of waste water treatment plants. These plants serve a critical need regarding a basic human bodily function. Imposing greater controls could cause some of these plants to go into bankruptcy or will result in greater costs to the general public which will result in an impact to the economy because the general public will have less to spend. The same can be said regarding the regulation of industrial discharges.

The Bay TMDL needs to be grounded in reality and directly related to the activities contributing to sediment loads. According the Pennsylvania's draft Watershed Implementation Plan (PA WIP) for the Bay (page 13), agriculture contributes to 70% of the sediment load allocations. Forest and the associated timbering activities contribute to 19% of the sediment load allocations. Stormwater from urban and developed areas contribute 10 percent and point sources contribute 0.6% of the sediment load allocations. The PA WIP (page 10) defines point sources as including permits for MS4s and construction activities which are the activities relevant to PennDOT projects. Imposing greater controls on regulated point sources which are contributing 0.6 % of the sediment load allocation will result in significant costs to the regulated and general public without realizing any real benefit to the Bay.

Given the reality of the economic situation that exists for all in the Bay watershed and beyond, the implementation of the actions needed to restore the Chesapeake Bay will not occur unless there is sufficient funding by the federal and state governments. This was the conclusion of the Blue Ribbon Finance Panel created by the Chesapeake Executive Council in 2004. Will the recommendations of the Blue Ribbon Finance Panel be implemented and, if not, what effective funding and financing efforts will be made?

In an effort to identify the financial resources essential for cleaning up the nation's largest estuary, the Chesapeake Executive Council in December 2003 called for the creation of a Blue Ribbon Finance Panel to make recommendations for the effective funding and financing of the Bay clean-up effort. The Panel reached an early and strong consensus, however, that simply improving existing programs alone will not be sufficient. The Panel recognized that something more substantive and dramatic will be required. The Blue Ribbon Finance Panel proposed that the six Bay watershed states and the District of Columbia create a Chesapeake Bay Financing Authority, capitalized by the federal and state governments, with the capacity to make loans and grants. Their conclusion was that the Federal government should provide \$12 billion and the seven jurisdictions together should contribute \$3 billion. The Chesapeake Bay has been rightly called a National Treasure but the draft EPA TMDL is requiring the ratepayers of point source wastewater treatment facilities to unfairly bear the majority of the cost for restoration.

Comment ID 0252.1.001.012

Author Name: Bond Arthur

Organization: City of Frostburg, Maryland

The second specific comment is that funding sources are not well defined in the Phase I WIP from Maryland, and we note use of the verb 'may' as indicates uncertainty about where funds will emerge. A mandatory stormwater utility bill has been drafted by the Chesapeake Bay Foundation; however, it is not certain that revenue can be collected commensurate with what will be required, and the smaller jurisdictions will be challenged to raise significant revenue without very high household fees. Trading options are not well understood in our region. Federal funds are seen as available primarily to the State, with the prospect of staffing help for MDE to provide technical assistance and enforcement as a primary State goal; local projects may see little Federal assistance. State and Federal budgets are and will be constrained by budget deficits and the still struggling economy. The concern is that the local governments will be burdened with the cost of this mandate to a great extent, and we do not see evidence otherwise in Maryland's Phase I WIP.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

Comment ID 0252.1.001.017

Author Name: Bond Arthur

Organization: City of Frostburg, Maryland

As a small municipality, Frostburg is concerned with the measure to mandate a 20% retrofit over 5 years (2012 - 2017).

The procedure and costs are not well understood at this time, but such a mandate could easily be a back breaker. In our region, the development community will not be in a position to fund these off site and unrelated development costs; therefore, we anticipate a mandate for local government capital investments at a rate of about 4% per year, with 18 months to gear up. While a stormwater utility could raise some funding, there are other needs for this revenue; we are beginning to develop a list and estimate of needs if the City will be responsible for efforts. Unless there is a major 'trading for cash' opportunity - also not well explained to date -or major sources of funding (outside of CSO funding that is critical to staying on our schedule), this will overwhelm our ability to pay.

The fifth and final specific comment is that the 20% retrofit mandate may not be fair to our small community unless specific funding is identified for local projects to supplement limited local revenue.

Response

Comment ID 0256.1.001.008

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

Local governments throughout the Watershed are facing the same kind of hard budgetary choices caused by the current economic downturn. It is simply not realistic to expect that while local governments reduce services to their constituents, they then ask them to pay increased fees and taxes to pay for expensive retrofits. The political costs at the local level are real and could lead to a backlash against local officials who do support efforts to restore and protect the Chesapeake Bay.

That is why it is absolutely necessary for EPA and the states to address the issues of funding projects at the same time they are communicating the requirements of the Bay TMDL. LGAC has supported local government actions needed to clean up the Bay, but has always told the Chesapeake Executive Council that increased federal and state funding to local governments is crucial to meeting the clean up and restoration goals of the Bay Program. While there have been impressive requests to Congress for additional funding through EPA and the Farm Bill, those increases have not yet been fully approved. LGAC has and will continue to support increased federal and state funding that will be necessary to implement the TMDL.

Response

Comment ID 0263.1.001.006

Author Name: Foley Sharon

Organization: Harrisonburg-Rockingham Regional Sewer Authority (HRRSA)

In closing, HRRSA observes that among the Draft Bay TMDL's many serious deficiencies is the lack of acknowledgement or appreciation for the major financial commitments that have already been made by HRRSA and many other local governments based on Virginia's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007. The decision by HRRSA and its member localities to enter into additional long term debt was made based on the state's pledge of 'regulatory stability' concerning the wasteload allocations set forth in the Watershed General Permit and the expectation that such regulatory stability would provide a foundation to responsibly plan for economic development and growth by our member localities.

Response

Thank you for your comments. EPA recognizes that there has been a significant financial commitment by all jurisdictions in efforts to reduce pollutant loadings to the Bay. Even with the significant efforts there still remains a need to do more to address pollutant impairments in local waterways and in the Chesapeake Bay itself. EPA will continue to work with jurisdictions to address water quality issues in the watershed.

Comment ID 0266.1.001.015

- Provide additional funding to New York through the Chesapeake Bay Implementation grants, Nonpoint Source Control grants, Section 106 grants for water pollution control programs, the Clean Water State Revolving Loan Fund, and the American Recovery and Reinvestment Act.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Federal funding levels are determined by Congress and are beyond the authority of EPA to revise or reallocate. The American Recovery and Reinvestment Act was a one time funding opportunity to stimulate the economy across the Nation.

Comment ID 0267.1.001.017

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

Important resources such as the New York State Agricultural Environmental Management Program (AEM) and the Upper Susquehanna Coalition [FN 6] (USC) have been successfully engaging in nutrient and sediment reduction efforts for many years. They are now poised for the work of implementing the Bay TMDL; we urge EPA to direct funding towards enhancing their capacity.

[FN 6] The USC is a bi-state network of 19 SWCDs with a mission to conserve soil and water resources in the headwaters of the Susquehanna River and Chesapeake Bay watersheds.

Response

EPA does not have a direct source of funding in which to allocate funds to any project. In addition EPA must follow the competitive process in accordance with the national program guidance. Information on these regulations can be found at Title 40 Code of Federal Regulations Section 30.43.

Comment ID 0267.1.001.021

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

We urge EPA to better recognize the contribution of AEM. EPA can do this by directing funding towards enhancing AEM capacity. The latter would be particularly helpful because there is currently no dedicated funding stream for agriculture in this watershed; AEM funds are usually obtained from competitive grants. In evaluating New York's WIP, EPA points out the need for information on how Chesapeake Bay Regulatory and Accountability Program (CBRAP) grants will be used towards enhancement of regulatory programs. We respond by noting that a major component of AEM is to assist farmers with CAFOs compliance,[FN 11] and the program's contribution to this type of regulatory enhancements should be recognized.

[FN 11] 11 See WIP I at 40.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the

individual jurisdictions Watershed Implementation Plan.

Comment ID 0267.1.001.023

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

EPA should work with the state to establish a dedicated funding source for AEM to help secure its capacity and long-term stability.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions, this includes strategies to improve and enhance funding.

Comment ID 0272.2.001.004

Author Name: Pippel Julie

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

We appreciate that EPA generally agrees with MAMWA's position on the critical issue of regulatory stability for POTWs relative to their recently-established WLAs:

...the large scale public investments (estimated at over \$4 billion) that are now being carried out throughout the watershed to upgrade and reduce nutrient discharges from point sources. A stable regulatory environment is a priority need for these facilities and a matter of fiduciary responsibility and public trust. Therefore, EPA considers requiring further point source upgrades to the limits of technology as an option of last resort and is avoidable if the Bay partners use our creative energies to deliver sufficient nonpoint pollutant reduction commitments. [FN10]

Despite MAMWA's support for this approach, we must note that funding has been and remains a critical issue for ENR upgrades. The State's Draft WIP recognizes this critical issue:

Upgrade of the major wastewater treatment plants is funded by Maryland's Bay Restoration Fund ["BRF"]. Full funding is available for implementation of the 2011 Milestone, but a funding gap is projected after 2012. Maryland's Bay Restoration Fund Advisory Committee has projected a deficit beginning in FY 2012 and has begun developing options to close this deficit. [FN11]

As the State considers how to address this funding shortfall, MAMWA urges the State to do so in a manner that fully

funds all of the 67 major ENR projects.

[FN10] Letter dated Sept. 11, 2008, from Donald S. Welsh, EPA Region III, to John Griffin, MDNR, Enclosure A at 4 (emphasis added).

[FN11] Draft WIP at 5-19.

Response

Thank you for your comments. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. EPA allowed jurisdictions the opportunity to develop a Watershed Implementation Plan that meets the TMDL allocations. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost. EPA appreciates your continued support to Maryland to assist in identifying the necessary funding needed to implement the TMDL.

Comment ID 0272.2.001.006

Author Name: Pippel Julie

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

MAMWA opposes the concept of upgrading non-expanding, non-significant municipal WWTPs for two very practical reasons.

First, as noted above, the BRF is facing a massive shortfall beginning in 2012. Thus, the State lacks the funding for the State's share of ENR upgrades at the larger "significant" WWTPs, much less at the contemplated five minor plants, and in this respect the proposal is not viable.

Second, the State has not provided any evidence that these upgrades would be cost-effective as compared to other management options. As MAMWA noted in its December Comments, cost-effectiveness should be one of the guiding principles for developing the TMDL. This is equally true for the State's Draft WIP. The limited available funding for the Bay restoration should be invested wisely. The State appropriately excluded the non-significant WWTPs as non-significant, and that prior decision should be upheld in the TMDL and WIP. Instead, MAMWA encourages the State to consider other measures with lower costs and more ancillary environmental benefits [FN16]. Further, MAMWA recommends that any future consideration of ENR-level WLAs and/or upgrades for non-significant plants include an evaluation of comparative cost data of various nutrient control options and an environmental review. [FN17]

[FN16] Ancillary benefits include extra societal benefits associated with requiring certain source sectors to further reduce their discharges. Some actions-like planting cover crops-can provide reductions and additional positive environmental and aesthetic impacts. EPA and Maryland should select these types of clean-up actions over others because of their ancillary benefits.

[FN17] On a related matter, MAMWA believes that there is a typo in the Draft WIP with regard to how Maryland established allocations for all non-significant municipal WWTPs. Maryland has said that "Maryland has identified aggregate target loads of nutrients for two levels of "non-significant" municipal treatment plants: For the plants with design flows of 0.1-0.49 MGD, target loads were assigned based on projected 2020 discharge flows and effluent permit concentration limits of 8 mg/l TN and 2 mg/l TP. For plants with design flows less than 0.1 MGD, loads were set based on 2020 projected flows and no upgrades for nutrient reductions." Draft WIP at 8-9. As noted above, the current Tributary Strategy approach for minors is based upon concentrations of 18 and 3, with no requirement for upgrades until the plant expands. As MAMWA understands it, Maryland has appropriately allocated based upon the TS approach, but has incorrectly stated the concentrations in the Draft WIP. MAMWA asks that Maryland correct this typographical error before it finalizes its WIP.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. Organization: PA Association of Conservation Districts (PACD)

Funding for conservation districts must be accompanied with cost share financial assistance to the agricultural community. Installing BMP's can be extremely expensive and significant cost share funds must be appropriated on the state and federal level to the agricultural community as they plan and install BMP's to reduce nutrient runoff.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Federal funding levels are determined by Congress and are beyond the authority of EPA to revise or reallocate.

Comment ID 0304.1.001.003

Author Name: Thompson Glenn

Organization: U.S. House of Representatives

In conclusion, I wholeheartedly encourage restoration efforts of the Chesapeake Bay, but believe that unfunded mandates to force pollution reductions on communities that likely can't comply are entirely the wrong approach. By contrast, I strongly support more of an incentive-based approach to restoring the Chesapeake Bay. This is why I am an original cosponsor of Congressman Tim Holden's H.R. 5509, which creates such incentives for pollution reduction and offers rural Pennsylvania opportunities. Farm communities will play a major role in cleaning up the Bay, but it is vital that we provide these areas with the appropriate means to help reduce levels of pollutants, rather than hastily subjecting them to unrealistic goals.

Response

EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards and directs the commenter to agricultural funding sources outlined in Comment 139.1.001.006 and the Federal commitments to the Bay in Comment 0038.1.001.024.

Comment ID 0321.1.001.001

Author Name: Fanfoni Kenneth

Organization: Augusta County Service Authority, Verona, Virginia

The Augusta County Service Authority owns and operates nine municipal wastewater treatment plants ("WWTPs") that clean and discharge highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We expect to do our part for the Bay restoration. In fact, three of our WWTP's have been upgraded with enhanced nutrient removal technology at a cost of \$65,000,000. For a small utility, this is a tremendous debt on our customers. Rates have been incrementally increasing since 2003 in anticipation of the needed improvements. Since 2003 and through 2012, the total sewer bills have increased 108%. Our future O&M costs are also going to increase significantly in order to operate these newly upgraded facilities. The projected electric cost increase is 6.4%, while the alum cost increase is 123%. Carbon addition will be another major expense in order to achieve the low Total Nitrogen values.

The increased usage of chemicals and energy supports VAMWA's points regarding environmental tradeoffs. The

proposed TMDL does not consider cost-effectiveness, sustainability, or overall environmental benefit. By increasing stormwater and agricultural BMPs, capital costs and operation and maintenance (O&M) costs could be reduced as well as reducing green house gas emissions.

Response

Please see the response to comment 0501.1.001.005 addressing municipal point sources and the response to comment 0139.1.001.017 regardless consideration of cost-effectiveness.

Author Name: Harrington Marilou

Organization: Town of Caroline, New York

Whereas, the federally-designed TMDL, intended to limit nitrogen, phosphorous and sediment discharges into the Chesapeake Bay watershed, is going to use New York State public funds without being able to satisfy EPA's regulatory goal; and

Response

A TMDL is not a federal regulation. EPA reminds the commenter that we are under legal obligation to establish a TMDL that

meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. It is EPA's preference that each jurisdiction develops a Watershed Implementation Plan that meets the TMDL load allocations in a manner that best meets the needs of the jurisdiction both environmentally and economically. The states are responsible for allocating the tributary loads to the source sectors within their jurisdiction as part of the jurisdictions' Watershed Implementation Plan that will be used to inform the TMDL. A jurisdiction may choose to take action towards individual or more general sectors in achieving load reductions. Each jurisdiction has a unique set of practices they intend to use to meet water quality standards. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0334.1.001.006

Author Name: Troutman John

Organization: Buchart Horn, Inc.

EPA considers Pennsylvania's funding initiatives inadequate. Pennsylvania government is in transition but recommendations for additional state funding have and will be pursued and dedicated to the Bay program. EPA needs to recognize the need for more federal financial assistance and portions dedicated to Chesapeake Bay nutrient reductions. A clean water needs survey developed every 4 years has been virtually ignored during budget discussions with the executive and legislated branches of the federal government for the last 16 years.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0334.1.001.009

Author Name: Troutman John

Organization: Buchart Horn, Inc.

EPA considers PA's goals for new technologies for non point source reductions to be excessive and unrealistic prior to PA's attempt to implement its program. EPA should provide federal level assistance to secure technical experts in the development of new technologies providing nutrient reductions. As PA has initiated pilot programs in Lancaster and Bradford Counties on local involvement of nutrient reduction possibilities and responsibilities, EPA needs to facilitate efforts in joint programs with other federal agencies such as the Department of Agriculture, Department of Energy, USGS, and Department of Interior to promote innovative technologies capable of significant nutrient reductions. The NRCS branch of the Department of Agriculture can also provide technical service providers to assist in reductions.

Response

EPA has been working with PA as they finalized their Phase I Watershed Implementation Plan. One of the topics has been how to best address the new technologies. EPA and PA Department of Environmental Protection have agreed to work together over the course of the next year to refine how to address the new technologies that are a part of PA's plan. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions, this includes technical assistance.

Comment ID 0342.1.001.004

Author Name: Levine Thomas

Organization: Moshannon Valley Joint Sewer Authority

At the public hearing on October 19, 2010, we heard that the federal government has set aside approximately \$20 billion annually for agricultural projects to reduce the nutrient load on the Chesapeake Bay. There was no mention of any funding for point sources such as the Authority. We strongly recommend that federal funding be appropriated for point sources (i.e., the Authority).

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Comment ID 0342.1.001.006

Author Name: Levine Thomas

Organization: Moshannon Valley Joint Sewer Authority

The Authority is deeply concerned that the population within their service area cannot financially sustain the costs associated with their current biological nutrient removal project. There is no possible way for the service area to afford any additional treatment improvements or credit purchases being discussed as part of the draft Chesapeake Bay TMDL.

The biological nutrient removal requirements of the Chesapeake Bay have squeezed the Authority for all that it has and then some. The Environmental Protection Agency needs to look nationally for the financial resources necessary to implement this "Draft" Chesapeake Bay TMDL if there is any chance for success.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Even if there is some promise of federal and/or state aid, the State Legislature has a long history of raiding supposedly dedicated local revenues in difficult budget times (like they have with Highway User Revenues.) We are concerned that the draft regulations will create tangible mandates with only the mere promise of funding. And even if some level of funding is provided, we fear that it will be subject to routine expropriation by the Legislature.

Response

A TMDL is not a federal mandate. For information on funding sources, please see the response to Comment ID 0038.1.001.024 outlining the federal efforts towards Chesapeake Bay restoration.

EPA cannot speak to future funding levels or potential budget changes or cuts that may occur.

Organization: Lynnhaven River NOW

Meeting the levels of the TMDL will put huge demands on city and counties to meet the new standards. The burden of some of this will necessarily need to be borne by the localities. Nevertheless, the EPA and the Commonwealth of Virginia have a responsibility to provide mechanisms to assist localities with these efforts.

Given the reality of the economic situation that exists for all in the Bay watershed and beyond, the implementation of the actions needed to restore the Chesapeake Bay will not occur unless there is sufficient funding by the federal and state governments. This was the conclusion of the Blue Ribbon Finance Panel created by the Chesapeake Executive Council in 2004. Will the recommendations of the Blue Ribbon Finance Panel be implemented and, if not, what effective funding and financing efforts will be made?

In an effort to identify the financial resources essential for cleaning up the nation's largest estuary, the Chesapeake Executive Council in December 2003 called for the creation of a Blue Ribbon Finance Panel to make recommendations for the effective funding and financing of the Bay clean-up effort. The Panel reached an early and strong consensus, however, that simply improving existing programs alone will not be sufficient. The Panel recognized that something more substantive and dramatic will be required. The Blue Ribbon Finance Panel proposed that the six Bay watershed states and the District of Columbia create a Chesapeake Bay Financing Authority, capitalized by the federal and state governments, with the capacity to make loans and grants. Their conclusion was that the Federal government should provide \$12 billion and the seven jurisdictions together should contribute \$3 billion. The Chesapeake Bay has been rightly called a National Treasure but the draft EPA TMDL is requiring the ratepayers of point source wastewater treatment facilities to unfairly bear the majority of the cost for restoration.

Response

Please see the response to comment 0217.1.001.003 regarding the recommendations of the Blue Ribbon Panel and addressing the cost to municipal point sources.

Funding is Not Addressed

There is not sufficient funding to implement the TMDL. In the point source segment this is also true especially in light of the previous studies on the unsustainable nature of Pennsylvania's wastewater infrastructure. Given that most of the benefit of Pennsylvania's efforts will be seen in other states, additional sources of monies should be provided by other than Pennsylvania residents. DEP does not sufficiently report in the WIP on the costs of compliance nor does it make the point that the WIP cannot be implemented without huge amounts of additional funding.

1. Will the Federal government contribute the billions of dollars required for compliance?
2. Will Pennsylvania face difficulty in competing in the world economy as a result of the TMDL?

Response

EPA hears the concerns of the commenter. Please see the response to comment 0139.1.001.017 for a discussion of the consideration of cost. 3.) Impacts upon agriculture

Agriculture serves as the economic base for many of Virginia's counties. For economic, environmental and other reasons, Virginia's county officials have a major interest in protecting the agricultural character of their communities. Regulatory approaches that excessively burden the farming community will threaten the long-term viability of agriculture as a major industry in Virginia. This is especially true if regulations become such a serious cost driver that farm owners will decide to convert their lands to more intensive uses, a phenomenon that introduces an entirely new set of future environmental problems. According to Section 4.7 of the Draft Chesapeake Bay TMDL, agricultural lands account for 22 percent of the watershed. Many county officials have interest in preventing a reduction in this percentage.

VACo is mindful of the fact that the most cost-effective actions for reducing non point source pollutant loadings are through agricultural Best Management Practices. Many farmers are interested in participating in cost-share programs, however funding, whether from state or federal sources have often been sporadic and unpredictable. Several years ago Virginia's General Assembly created the Natural Resources Commitment Fund, which assures that at least some percentage of Virginia's Water Quality Improvement Fund will be allocated to agricultural cost-share programs. Unfortunately, farmers may decline to participate in these programs if the availability of these funds varies with changing economic conditions.

Page 7-3 of the DRAFT TMDL provides some discussion of the role that federal funds (through the Farm Bill and other sources) can play in assisting farmers. However, the commitment in the narrative to sustained federal funding is weak, vague and provides little assurance of funding on a long-term basis needed to encourage more participation among farmers. Since Virginia's DRAFT WIP requires a 95 percent participation rate by the agriculture sector in order for its pollutant reduction goal to be met, adequate funding for the agriculture BMP cost-share program is critical. Also critical, is the inclusion of information about practices that have already been employed by farmers throughout the Chesapeake Bay watershed on a voluntary basis.

In 2009, DCR conducted a Natural Resources Commitment Fund Needs Analysis and concluded that a total of \$618.1 million would be needed over the next fifteen years (2011-2025) to financially support the cost share program at a level sufficient to achieve 60 percent of the non-point source pollution reduction goals for agriculture.

Below is the table provided in the 2009 Natural Resources Commitment Fund Needs Analysis (written by DCR and legislature in October 2009). Dollar figures are in millions.

[Table: Please see page 10 of original letter (Docket ID # 0736-0440.1)]

Recommendation: VACo supports well-financed state and federal programs to address the problem of non-point source runoff from agricultural operations that would effectively encourage implementation of priority best management practices such as nutrient management planning, use of cover crops, continuous no-till farming, development of

forested riparian buffers, and livestock stream exclusion. In this area, more financial assistance from the federal government is needed to encourage sustained participation in agricultural BMP cost-share programs. A system should be developed that takes an inventory, and grants credits for, agricultural best management practices undertaken on a voluntary basis over the past few years.

Response

Thank you for your comments. In establishing the TMDL EPA is required to establish the loading reductions necessary to meet water quality standards given reasonable assurance, though establishing the funding or sources of funding necessary for implementation is beyond the scope of the TMDL. For information on the rationale behind WIP backstops please see the response to comment 0067.1.001.010. Please also see the response to comment 0139.1.001.006 outlining agricultural funding efforts to the Bay.

Comment ID 0442.1.001.003

Author Name: Drzyzgula Cathy

Organization: Metropolitan Washington Council of Governments (COG)

2. EPA and States Must Enhance/Expand Funding

Existing funding mechanisms are insufficient to meet the proposed project implementation schedules in some jurisdictions, and the time required to augment funding may result in implementation delays. Federal and State leadership to assure funding support for locally based watershed implementation plans is necessary to meet the ambitious timelines currently proposed for Bay and tidal tributary restoration.

In particular, in most COG local jurisdictions, existing funding mechanisms are insufficient to meet the TMDL/WIP assumption that 60/70 percent of progress toward final allocations will occur by 2017 or that 100 percent of all necessary implementation will occur by 2025. The funding shortfall is exacerbated by the current economic downturn. According to both the National League of Cities and the National Association of Counties, their member governments continue to reduce their budgets from 2009-2010 levels.

More specifically, Maryland WIP proposals to achieve either a 30- 40- or 50-percent retrofit of existing older developed areas in Phase I MS4 communities by 2017 (See Section 5.2.2 of Maryland WIP document) and EPA's backstop proposal to achieve 50 percent retrofit by 2017 for all older urban lands in the Bay watershed portion of Virginia (ref. Section 8. WIP Evaluation & Draft Backstop Allocations, pp. 8-13 through 8-14) cannot be achieved in these time frames without substantial federal and/or state funding assistance.

Example: Various parties have recently tried to estimate the costs of stormwater retrofitting. These estimates are subject to a great deal of variability because there is to date insufficient experience with actual retrofit projects in the region and because there is not a clear-cut definition of what is meant by the term. For COG's Maryland and Virginia members, staff estimated the total amount of pre-1985 urban pervious and impervious acres using Version 5.2 of the watershed model. Using a fairly conservative average cost of \$88,000/acre from the Center for Watershed Protection,

staff estimated the cost of retrofitting 50 percent of this acreage at \$5.45 billion in initial capital costs. This estimate did not take account of the annual operations and maintenance costs for new facilities nor for the cost of acquiring land, since retrofitting at this extensive level cannot be accomplished strictly with projects on public land. Nor does it account for whatever retrofit requirements may be imposed on pervious land.

Recommendation #2: Provide Stormwater Funding Support

Both the wastewater and agricultural sectors have received and continue to receive significant federal and/or state support for implementation. Urban stormwater, by contrast, has received little such funding. We recommend that the proposed urban stormwater cost analysis be matched with a concrete proposal for federal and state support for retrofitting stormwater controls. One possibility is to resurrect the proposal for a federal-state financing authority for the Bay that was originally advanced by the Chesapeake Bay Blue Ribbon Financing Panel in 2004 and that would be capitalized by \$15 billion in federal and state matching funds. If such support is not forthcoming, and no changes are allowed to be made to the current deadlines, it is likely that we will subsequently recommend initiation of a Use Attainability Analysis, based on the questionable feasibility, economic and otherwise, of urban stormwater retrofitting.

Response

Please see the response to comment 0217.1.001.003 regarding the recommendations of the Blue Ribbon Panel and addressing the cost to municipal point sources.

Comment ID 0445.1.001.001

Author Name: Lerch Joe

Organization: Virginia Municipal League (VML)

State and local governments are faced with a difficult task in meeting the new legal deadline for cleaning up the Chesapeake Bay. VML is committed in partnering with Virginia and the EPA to meet this deadline. However, our member governments - at this time - simply do not have the financial resources to implement the measures currently prescribed in Phase I of the draft TMDL.

VML in partnership with the Virginia Association of Counties (VACo) performed a 2010 fiscal survey of 37 cities and 90 counties (see attached PowerPoint slides entitled 2010 Local Government Fiscal Survey Results, September 2010) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0445.1]. The results of the survey show a decline in local general fund revenues that have already resulted in a delay or cancellation of capital projects, along with severe cuts in personnel. Additionally, the Virginia Employment Commission (VEC) reports that Virginia local governments in FY 2010 (June 2009 to June 2010) shed more than 15,000 jobs. It is worth noting that during this same time period the federal government added more than 14,000 new jobs in Virginia. With local budget shortfalls, limited revenue generation capability, and evaporating debt service capacity, local governments require the necessary federal and state appropriations to meet the pollution load allocation as prescribed in the draft TMDL. As reflected in our recently adopted 2011 legislative statement on water quality funding, VML ... urges the federal government and the Commonwealth to provide adequate funding for these water quality improvements.

Please see the response to comment 0501.1.001.005.

Comment ID 0466.1.001.010

Author Name: Suarez Julie

Organization: New York Farm Bureau (NYFB)

Substantial Federal Funding Needed for Compliance New York's farm families need more than cost share support from EPA's TMDL implementation efforts. Forecasted federal funding is inadequate when compared with the total potential cost of \$350 million for TMDL compliance for New York agriculture with no availability from the State to close funding gaps. In 2011, \$150 million in 2008 Farm Bill funding has been dedicated for Chesapeake Bay restoration efforts for cost share projects - which means \$150 million must materialize from farms and other source sectors in order to secure such federal funding. Especially in the current economy, the farm community cannot absorb additional regulatory costs which do not contribute to sustainability or profitability.

The most important priority in any TMDL effort is increasing resources available to the farm community. This includes funding for on-farm BMP implementation, strengthening of local technical resources, such as local soil & water conservation districts, and increased applied research funding.

Every year New York farmers request significantly more funds to install BMPs within the Upper Susquehanna Watershed than are made available. During the past round of funding from federal and state sources the total amount of oversubscription exceeded \$8 million. Farms want to do more to protect water quality, but they need help, particularly from those entities gaining economic and social advantages from a cleaner Chesapeake Bay to accomplish these goals.

What is absolutely critical to ensuring water quality improvement is that farms have access to the technical resources necessary to adopt and implement the latest in water quality protection management practices. In New York, local soil & water districts within the Upper Susquehanna provide these valuable resources. Additional support is needed to support the work of these dedicated entities.

Response

Please see the response to comment 0080-cp.001.002 addressing equity and New York and the response to comment 267.1.001.006 which describes the how the pollutant loads from New York contribute to the downstream impairment.

Organization: Choose Clean Water Coalition

The Federal Commitment to Restoration of the Chesapeake Bay

Congress and the Administration have increased commitments of financial and agency support for restoration and protection of the Chesapeake Bay watershed since the 1980s. There has been a considerable amount of federal support to states, local governments, farmers and others to implement on-the-ground practices that will be needed to succeed. This funding support has been increasing over the years as the TMDL has gotten closer.

EPA has also provided implementation funds, \$100,000 annually beginning in Fiscal Year 2002, to the three Headwater states of Delaware, New York and West Virginia after they signed the Water Quality MOU. That has incrementally increased to \$500,000 this year. In Fiscal Year 2005 EPA began a new annual grants program for implementation activities in the Chesapeake Bay watershed, primarily targeting nutrient and sediment reduction. The program was funded at \$7.8 million the first year and the amount has fluctuated in the years since. EPA has also been providing additional funds to all of the states to hire or retain staff in regulatory programs in order to help develop and implement the TMDL and the state WIPs. New Chesapeake Bay watershed-specific grant programs have been developed over the past decade by the National Oceanic and Atmospheric Administration and USDA's Natural Resources Conservation Service (NRCS). In the 2008 Farm Bill, Congress allocated \$188 million over six years in mandatory spending for agricultural conservation practices on farms in the Chesapeake Bay watershed portion of the six states. This is a critical source of substantial funding for farmers to implement practices to support efforts to meet the requirements of the TMDL and their state WIPs.

In May 2009, President Obama issued Executive Order 13508 "Chesapeake Bay Protection and Restoration," which aligned the Federal government with efforts necessary to restore the Bay's water quality and other restoration and protection goals. This historic effort will ensure unprecedented Federal support for efforts to restore the Bay and to meet the TMDL. In September 2009, USDA Secretary Vilsack announced that there would be \$638 million over five years from various USDA programs devoted to Chesapeake Bay restoration activities - though this is not all directly for water quality. EPA's Chesapeake Bay Program budget increased from \$31 million in FY 2009 to \$50 million in FY 2010, and the President proposed \$63 million for FY 2011 - all unprecedented amounts. EPA's Clean Water State Revolving Fund (SRF), a national program with a set formula for dissemination of money to the states, went from \$689 million in FY 2009 to \$2.1 billion in FY 2010 and the President's FY 2011 budget request is \$2.0 billion.

As part of the President's Executive Order, on September 30, 2010 the Obama Administration recently announced that it is providing a substantial amount of funding support from more than a dozen Federal agencies - proposing over \$490 million in funding support for Chesapeake Bay in Fiscal Year 2011, which has just begun. Some funding highlights from this effort to target water quality specifically in the Chesapeake Bay watershed include EPA programs, such as the Clean Water SRF (\$169.51 million); Section 319 non-point source grants to the states (\$10.37 million); \$5.89 million in Section 106 Water Pollution Control grants to the Bay states; and \$4.7 million to support state tidal monitoring programs. NRCS is targeting \$72 million in financial and technical assistance to help farmers in high-priority

watersheds. In addition, through the newly established Chesapeake Bay Regulatory and Accountability Program and State Implementation Grants, EPA will provide more than \$20 million directly to the Bay states to help them develop and implement the Chesapeake Bay TMDL and the state WIPs.

Response

EPA notes the comments and agrees that a substantial amount of funding is being provided in support of efforts within the Chesapeake Bay watershed.

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

A certified BMP will result in the removal of nitrogen, phosphorus, and/or sediment from the County's waterways and ultimately the Chesapeake Bay. The non-point sources can use assistance in understanding the types of BMPs that are available as well as implementing the BMPs. The County recommends that the EPA and PA DEP work more closely together to provide outreach and technical assistance to the non-point sources in order to develop a more realistic means of obtaining improvements from them.

The BMPs are sometimes expensive for a land-owner to implement on their property. Therefore, the County would recommend that EPA and PA DEP invest more funding into programs that will allow our non-point sources to develop and implement BMPs and thus reducing these pollutants in the Chesapeake Bay. An excellent example of a successful program that should be fully funded is CREP.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions, including potential funding sources.

H. From a Policy Standpoint, the EPA Must Ensure Adequate Resources to Carry-Out the TMDL and WIPs

If the Bay is to be given proper attention and care as a "national treasure", then identification of adequate federal funding must be an integral part of the TMDL. Overwhelming costs will be required to restore and protect the Bay in a way befitting its declared "national treasure" status. The NYS-DEC estimates that implementation of the TMDL could cost in the range of \$2 - 6 billion within New York State alone, yet the State of New York is in a fiscal crisis and is cutting back spending throughout all state government agencies. The Bay watershed is a very small portion (13%) of New York's total land mass. We do not expect, and we do not believe that the federal government can realistically expect, that New York State and local governments can devote the resources necessary to effective TMDL implementation, administration, and/or enforcement without substantial new federal funding provided for this purpose.

Response

Please see the response to comment 0501.1.001.005.

Organization: Binghamton-Johnson City Joint Sewage Board

C. Provide Adequate Federal Funding and Assistance.

Meeting the objectives of President Obama's declaration that the Bay constitutes a "national treasure" is a federal obligation. Accordingly, the federal government must lead this effort and demonstrate its commitment by providing adequate funding and assistance to the states and localities required to participate directly in the clean-up and restoration efforts. Provisions for adequate federal funding must be built-into the TMDL. Instead, as written, the draft TMDL would require the taxpayers and ratepayers of point source wastewater treatment facilities to unfairly bear the majority of the cost for Bay watershed restoration through the EPA's emphasis on exercising control via the permitting process for point-source dischargers without building-in provisions for adequate federal funding and assistance.

In an effort to identify the financial resources essential for cleaning up the Bay, in December 2003 the Chesapeake Executive Council called for the creation of a "Blue Ribbon Finance Panel" to make recommendations for the effective funding and financing of the Bay clean-up effort. The Panel reached an early and strong consensus, however, that simply improving existing programs alone will not be sufficient. The Panel recognized that something more substantive and extensive would be required. The Blue Ribbon Finance Panel proposed that the Bay watershed jurisdictions create a "Chesapeake Bay Financing Authority", capitalized by the federal and state governments, with the capacity to make loans and grants. Their conclusion was that the federal government should provide \$12 billion and the seven Bay jurisdictions together should contribute \$3 billion (in "2005 dollars"). Because of the interstate nature of such an entity, only the federal government could provide it a charter.

Other important federal assistance for carrying-out the TMDL should include:

1. Army Corps of Engineers - maintain/dredge-out dams and "deltas" along the Bay watershed tributaries on a routine basis; doing so maintains/maximizes "trapping capacity" of dams and minimizes resuspension of sediments and

bound pollutants, especially in ice jam and major storm events.

2. USDA - provide increased financial and technical assistance to Soil & Water Conservation Districts and farms.

3. Department of Housing and Urban Development - provide direct grants (akin to Community Development Block Grants) to local governments in the Bay watershed for stormwater control, management, storage/infiltration, and/or treatment programs as well as "smart growth" and "smart development" planning practices.

4. EPA and Department of Energy R&D Funding - the federal government must take the lead in sponsoring R&D programs to drive advances in technologies and practices (present and future) so as to promote the best environmental quality of the Bay (and beyond), including:

a. for WWTPs - process improvements for enhanced nutrient removal (even to the extent of developing "standard designs" with documented "real world" performance capabilities) and pilot programs (similar to those funded and carried-out through the National Research Council of Canada),

b. sustainable technologies of general application (such as "air flush" toilets and self-composting toilets) as well as commercially-viable technologies (see G.2, below), and

c. stormwater and greywater management, storage, and reuse practices.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions.

Federal funding levels are determined by Congress and are beyond the authority of EPA to revise or reallocate. EPA does not have a direct source of funding in which to allocate funds to any project. In addition EPA must follow the competitive process in accordance with the national program guidance. Information on these regulations can be found at Title 40 Code of Federal Regulations Section 30.43.

Comment ID 0515.1.001.031

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

Because no TMDL is self-implementing, the EPA must continue to work with the President and Congress in order that adequate federal funding will be afforded those Bay jurisdictions, local governments, and agencies which will carry-out the implementation plans after the TMDL is finalized. Finally, in order to promote compliance and accountability, the

EPA should also consider targeting some available federal funding so as to be conditioned on the progress achieved as well as establishing a clearly-defined system/menu of consequences to penalize failure to achieve required WQ standards or milestones.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Organization: Northern Virginia Regional Commission (NVRC)

Expanded Funding Requirements

Existing local government funding mechanisms are insufficient to meet the TMDL/WIP assumption that 70 percent of progress towards the final allocations will occur by the year 2017, and the time required to augment existing funding will likely result in implementation delays. Federal and State leadership is required to assure funding support for locally based watershed implementation plans is available to meet the ambitious timelines currently proposed for the Bay and tidal tributary restorations. Historically, both the wastewater and agricultural sectors have received, and continue to receive, significant federal and/or state funding support for implementation in the form of cost-share or outright grants. By contrast, the Urban stormwater sector has received virtually no such funding. The Northern Virginia Regional Commission staff recommends that the proposed cost analysis describe above be coupled with a funding proposal for federal and state support for retrofitting stormwater controls.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 501.1.001.005 for discussion of public sector point sources.

Comment ID 0536.1.001.004

Author Name: Belin Hedrick

Organization: Potomac Conservancy

Agricultural runoff is a significant pollution source that has shown some improvement, but still has far to go. Sustained progress will require a balance of regulation and inducements, including cost-share assistance from both federal and state levels. EPA must marshal backing from its sister federal agency, the Natural Resources Conservation Service, to help in this regard. And states must be persuaded to match that support for their own agricultural sectors.

Comment ID 0541.1.001.003

Author Name: Knapp Leslie

Organization: Maryland Association of Counties (MACo)

Federal Funding Needed for County Governments: The estimated costs of implementing the TMDL requirements and achieving the target loads are enormous. In Maryland, costs for potential stormwater retrofits alone could run in the billions. Even in prosperous times that figure would be daunting, but when the State's local aid has been significantly reduced and counties are still feeling the effects of the recession, it becomes unattainable. Some counties anticipate having to double their planning staff. There is no way certain counties could raise taxes or fees to a level that would cover their anticipated TMDL costs. With federal legislation like Senator Cardin's S. 1816 and its House counterpart H.R. 3852 moving slowly or stalled, counties need some assurance from EPA that federal funds will be forthcoming.

Technical Assistance Needed for County Governments: In addition to the significant cost burdens imposed by the TMDL on local governments, there is also a need for technical assistance. Local governments, and in many instances the State, lack the scientific expertise necessary to fully comprehend the impacts of the many nutrient reduction strategies that will be proposed and implemented. Counties expect the private sector and even some in the public sector to propose many new and innovative strategies for achieving the TMDL goals and they need help to analyze the effectiveness of these strategies and develop adequate tracking systems.

Response

Although funding is very relevant to the implementation of the TMDL, it is beyond the scope of the TMDL. In establishing the TMDL, EPA is required to allocate loadings of the pollutants of concern to all the sources in the watershed such that water quality standards are achieved. Please see the response to comment 0038.1.001.024 outlining the Federal effort for the Bay and the

response to comment 0501.1.001.005 for discussion of public sector point sources.

Organization: Delaware County, New York

Financial burden

NYC provides a significant amount of funding for compliance with its watershed rules and regulations through the Delaware County Soil and Water Conservation District (DCSWCD), the Catskill Watershed Corporation (CWC) and the Watershed Agricultural Program (WAP). Funding sources include the Delaware County Stream Corridor Management Program and the Catskill Streams Buffer Initiative out of DCSWCD, which work with landowners and municipalities to fund a wide variety of projects that have direct benefits to water quality; CWC's grant programs for stormwater and septic system retrofits; and WAC's sponsorship of whole farm planning and installation of best management practices for water quality on farms. These programs have been very successful at protecting water quality at little or no expense to landowners and communities. Note that none of this funding is available in the Susquehanna watershed.

Land use in Delaware County has changed dramatically within the last 50 years. Prior to 1950, 80% of our lands were cleared for farming and settlement, and 20% of the land was forest. Today, those statistics have flip-flopped, with approximately 81% of our lands in some kind of forest cover. A number of factors have contributed to this reforestation. First and foremost, farm-gate practices have not supported smaller family farms. As these farms went gone under, many of them were subdivided into 7-10 acre building lots. Little land was actually sold, however, and the swaths of land remained vacant, succeeding eventually into forest. Currently, about 17% of our lands are agricultural, down from 20% in 2002. [FN6] About 2% of our lands are in some kind of settlement. It is impossible to reduce N and P contributions in any meaningful way from forest lands. Given this fact, the geography of Delaware County means that the burden of achieving N and P reductions will fall in large part on our farmers, many of whom are already teetering on

the brink of bankruptcy. The stagnant economy in Delaware County and New York State, coupled with low farm-gate milk prices (dairy is our main form of agriculture) will conspire with this TMDL to drive many of our farmers out of business.

In 1999, New York State adopted EPA's phase II stormwater regulations which identified population centers that were in excess of 100,000 persons be required to incorporate Municipal Separate Storm Sewer Systems (MS-4) standards. In New York State, municipalities that have attempted to meet these standards recognize the high cost associated with implementing these standards. Given our experience with implementing storm water controls in the New York City watershed, the cost versus benefit for pollution control has proven to be very low. To require MS-4 technology throughout rural New York State will provide infinitesimal nutrient reduction while exhausting huge sums of public funding and creating an onerous regulatory threshold of compliance.

At the October 27th meeting with the Upper Susquehanna Coalition, EPA staff made vague references to "funding following the regulations" in the TMDL. Not only is there no commitment by EPA to consistent funding, this is compounded by the fact that any funding that does appear will more than likely go to other areas of the watershed. As we noted above, Delaware County has been committed to improving water quality for decades, and our work has resulted in water that is much cleaner than other jurisdictions. If the concentrations of N and P in our water are lower, then it stands to reason that their extraction will be more difficult and consequently more expensive. Why would any funding entity spend money in Delaware County when the reductions achieved per dollar are much smaller here than other areas in the watershed? The funding will go where it is most effective, and unfortunately that is not anywhere in New York. We do not expect any meaningful financial support for compliance with the TMDL, although we sincerely hope we are proven wrong.

[FN6] http://www.agcensus.usda.gov/Publications/2007/Online_Highlight/County_Profiles/New_York/cp36025.pdf

Response

EPA appreciates the dedication to improve local water quality as explained by the commenter. EPA is not able to direct funds to any jurisdiction in the watershed due to competition regulations, however EPA hears the concerns regarding funding in New York for Chesapeake Bay restoration. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York.

Comment ID 0568.1.001.009

Author Name: Eisel James

Organization: Delaware County, New York

Funding

1) EPA needs to commit to significant funding for communities and landowners to come into compliance with this TMDL

a) One suggestion might be that the taxpayers of Maryland, Virginia and Delaware (the direct beneficiary of a clean-up program) pool their resources and commit to a watershed program not unlike that of the City of New York.

Equity

1) Revisit TMDL to hold tidal jurisdictions more accountable

Next steps/drill down

- 1) Involve local jurisdictions in TMDL planning
 - a) Conduct targeted outreach in each county
 - b) Clearly explain what the local obligations will be
 - c) Provide technical support for achieving reduction targets

Response

It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish funding or sources of funding. Please see the response to 0038.1.001.024 outlining the Federal effort towards the Bay and the response to 0080-cp.001.002 discussing equity and New York.

Funding

The Chesapeake Bay Water and Ecosystem Restoration Act of 2000 [FN7] contain impressive numbers for allocations to aid jurisdictions to address water quality issues. Unfortunately, the numbers become inconsequential when compared to the upgrade cost of each community waste water treatment facility. The watershed has 483 significant waste water treatment facilities. [FN8] It would not be unreasonable to believe that at least 1/2 of these systems would require an upgrade upon adoption of the TMDLs. Based on recent history when New York City upgraded smaller systems for a single nutrient as to attain a 2 mg per liter phosphorus level, [FN9] (which was underway almost 10 years ago and lower construction costs) the total cost for the upgrades could likely leave no money available for any farm programs necessary to address CAFOs. Delaware County demands that any future Bay clean-up initiative will be fully funded. In the New York City watershed, the residents of the watershed were required to implement an elevated watershed protection program. The program is almost fully funded by the rate payers of the City of New York.

[FN7] S. 1816: Sponsored by Senators Cardin (MD), Carper (DE), Mulkowski (MD), Kaufman (DE). Placed on Senate legislative calendar.

Conclusion

In closing, we again emphasize that we understand and appreciate that many individual farmers have undertaken conservation practices to mitigate the release of nutrients and sediment from their operations. Many of these valuable efforts have been supported, in part, with federal and state cost-share programs. We are hopeful that funding and technical assistance will be available in the future, particularly to assist small and limited-means farmers to undertake important conservation practices, including stream fencing, and we believe that the state WIPs should document plans for increasing these resources.

Response

EPA directs the commenter to agricultural funding sources outlined in Comment 139.1.001.006 and the Federal commitments to the Bay in Comment 0038.1.001.024. For discussion of WIP requirements, please see the response to comment 0067.1.001.009 and Section 8 of the TMDL report.

Author Name: Bruce D.

Organization: Rainbow Hill Farm

Burdensome regulations will only hurt us, and put us out of business. Farmers know that if you don't take care of it, you lose it. We work very hard to care for the environment, and make very little money in the process. We aren't rich! You might look to the commercial plants that pollute, and communities who allow residents to pour toxic things down the drain. The TMDL is a flawed model, and unjustly blames farms for the ills of the Chesapeake Bay. If there will be requirements made to the farmers, which are good for the land and water, then there must be money provided to the farms for implementing them. In this time of deficit spending by our government, how can we expect the state or federal government to help us? No farms, no food.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Comment ID 0654.001.004

Author Name: Igli Kevin

Organization: Tyson Foods, Inc.

EPA has coerced the states into developing WIPs and in many instances improperly rewritten these WIPs through its "backstop allocations." The WIPs reflect the policy choices of the states of how to best utilize their own limited financial and regulatory resources to manage the land uses, sources and industries within their borders. Implementing the WIPs as unilaterally modified by EPA in the Draft TMDL will require substantial funding from the state and federal government. EPA appears to have proposed its Draft TMDL without securing the funding to implement these plans. It is important to understand the financial gap in funding the BMPs envisioned in the WIPs. Tyson recommends that a gap analysis be conducted, as well as a cost-benefit analysis of implementation of all WIPs.

Response

EPA will not be conducting a cost-benefit analysis as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Please refer to the response to comment 0067.1.001.009 for discussion of WIP backstops. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0656.001.002

Organization: Town of Danby and Tompkins County, New York

Rural highways tend to be an orphan in watershed management programs. We wish to remedy that serious gap. Our ability to do so will obviously depend upon having adequate resources to do so. We trust that the evolution of the Chesapeake Bay Watershed Program will facilitate the ability to access needed resources to address a singly most important source of nutrients and sediment as we collectively work towards the remediation on the Chesapeake Bay.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. There are federal and state resources that are available to address run off from impervious surfaces such as highways. The following website provides information on all federal grants, with the ability to search for funds specific to your concerns, <http://www.grants.gov/>.

Comment ID 0656.001.008

Author Name: Dietrich Fredric

Organization: Town of Danby and Tompkins County, New York

More specifically, we are concerned that the draft TMDL neglects to consider innovative methods to address the nutrient levels in rural areas like Danby. Danby has in fact been developing a proposal aimed at doing so, one that could be a model for other areas, but needs financial support from the EPA to implement it.

Response

The TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

There are grant programs available to address run off in rural areas such as the USDA's Resource Conservation and Development

(RC&D) program. The purpose of this program is to accelerate the conservation, development and utilization of natural resources, improve the general level of economic activity, and to enhance the environment and standard of living in designated RC&D areas.

Comment ID 0656.001.011

Author Name: Dietrich Fredric

Author Name: Reese Jodi

Organization: CET Engineering Services

Given the reality of the economic situation that exists for all in the Bay watershed and beyond, the implementation of the actions needed to restore the Chesapeake Bay will not occur unless there is sufficient funding by the federal and state governments. This was the conclusion of the Blue Ribbon Finance Panel created by the Chesapeake Executive Council in 2004. Will the recommendations of the Blue Ribbon Finance Panel be implemented and, if not, what effective funding and financing efforts will be made?

In an effort to identify the financial resources essential for cleaning up the nation's largest estuary, the Chesapeake Executive Council in December 2003 called for the creation of a Blue Ribbon Finance Panel to make recommendations for the effective funding and financing of the Bay clean-up effort. The Panel reached an early and strong consensus, however, that simply improving existing programs alone will not be sufficient. The Panel recognized that something more substantive and dramatic will be required. The Blue Ribbon Finance Panel proposed that the six Bay watershed states and the District of Columbia create a Chesapeake Bay Financing Authority, capitalized by the federal and state governments, with the capacity to make loans and grants. Their conclusion was that the Federal government should provide \$12 billion and the seven jurisdictions together should contribute \$3 billion. The Chesapeake Bay has been rightly called a National Treasure but the draft EPA TMDL is requiring the ratepayers of point source wastewater treatment facilities to unfairly bear the majority of the cost for restoration.

Response

Please see the response to comment 0217.1.001.003 regarding the recommendations of the Blue Ribbon Panel and addressing the cost to municipal point sources.

Cost of Compliance and Current Economy

The Bay TMDL, which requires Virginia to develop a Watershed Implementation Plan (WIP), will have a high cost for compliance for all sectors. While we agree that there is a benefit of clean waters within the Bay and local watersheds, the economic costs for compliance must be balanced, and water quality programs cannot be developed in a vacuum without considering economic impacts to the economy.

Before moving forward with a finalized Bay TMDL, EPA must conduct a non-biased economic impact analysis. Experts from land-grant universities from across the watershed could be called upon to evaluate the actual costs of meeting water quality standards for businesses, citizens, localities, states, and the federal government.

Cost share funding will be critical to meeting demands of EPA. Agriculture, lawn care, turfgrass, forestry, have all seen depressed profits, just as the State and local governments have been facing historic deficits. Individual businesses, farmers, and the State cannot meet this unfunded mandate from EPA without significant federal funding.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Author Name: Thigpen Janet

Organization: Steuben County Environmental Management Council

If Chesapeake Bay restoration requires additional load reductions from the already clean waters originating in New York, funding should be provided to enable implementation of those measures. Due to the high existing water quality, the Susquehanna and Chemung Basins are not top funding priorities for use of New York's limited resources . If restoration of the Bay necessitates additional load reductions from New York, those improvements should be fully financed by federal sources and/or the states that stand to benefit financially from Bay restoration . This approach has worked in southeastern New York, where New York City pays for and benefits from water quality improvements in the watersheds that supply the City's drinking water.

Response

Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York and the response to comment 267.1.001.006 for discussion of how New York's pollutant load must be considered in the TMDL. Comment ID 0731-cp.001.001

Author Name: Jamison Peggy

Organization: Garrett Co. Municipalities

In general, there will be serious implications from this Phase I WIP and the impact on the small, budget-challenged towns of Garrett County is going to be significant. The local governments continue to be faced with major budget deficits and there does not appear to be an end in sight to the loss of revenue facing the towns. We wholeheartedly agree with the Garrett County Planning Commission that any cost for the implementation of this program must be accompanied by adequate funds to offset the costs.

Response

Author Name: Comment Anonymous

Organization: Lower Allen Township Authority

Federal Mandate No Funding - The EPA Chesapeake Bay TMDL as supported by the Executive Order places a federal mandate on local governments with no funding, which by definition is a tax. The EPA backstop Pennsylvania WIP results in a further punitive tax against point sources that are working toward compliance and rewards non-point sources for noncompliance. EPA's backstop Pennsylvania WIP should identify the funding resources necessary to implement the Agency WIP with a gap analysis to provide reasonable assurance, identify the federal resources for actual upgrades to plants. The total federal, state, local and private cost burden to each should be identified in the TMDL.

Response

Please see the response to comment 0067.1.001.009 for discussion of EPA's WIP backstops.

Please refer to response to comment 0139.1.001.017 regarding cost analysis.

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Please note that a TMDL is not a federal mandate.

Comment ID 0746.1.001.010

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

The Draft TMDL's basic approach for the restoration of the Chesapeake Bay generally consists of the establishment of nutrient allocations for each jurisdiction, of which the individual Bay States and their Bay Watershed municipalities and residents would be responsible to achieve by funding the associated necessary improvements. This would place very large unfunded mandates upon each state in the Bay watershed. Some of these states, including New York State, geographically are remote from the Bay, already have good water quality, and derive no direct benefit from the Bay.

The Draft TMDL current allocation approach appears to be more of a political solution that diffusely spreads "responsibility" across the entire watershed, as opposed to devising cost-effective solutions by focusing the greatest burden on the communities whose development both cause the greatest impacts and derive the greatest direct benefits from their proximity to the resource.. Because resources to address the restoration of the Bay are limited and the need for cost-effective solutions is paramount, it is doubtful that "biggest bang for the buck" opportunities to reduce nutrients exist in New York State, given its already good water quality and its low nutrient delivery factors. At a time when there is already a large State Budget Deficit indicating that, in all likelihood, most of the significant implementation costs (up to \$4 billion) would have to be paid by the relatively low population-base within this portion of New York.

Other more equitable funding approaches for the Chesapeake Bay restoration initiative exist, as opposed to placing unfunded mandates upon the individual states, some of which cannot pay them. In addition, these alternate funding approaches, if applied, may lead to the development of cost-effective solutions which would allow actual water quality improvements to occur within the Bay.

b. A Significant Federally Funded Approach Is Needed

The Chesapeake Bay has been widely acknowledged by various national figures as a "national treasure" leading to the obvious conclusion that the most fair solution for its restoration likely extends across state boundaries. Therefore, a federally administered and funded approach is be the most equitable method to fund Bay restoration. The federal government's ability to lead the Chesapeake Bay restoration effort would be significantly diminished by anything less than a largely federally funded approach, compromising the effectiveness of this initiative and risking its failure.

If a National funding approach, dedicated to restoring this national treasure is adopted, comprehensive solutions that ignore state boundaries as they could then be selected based upon cost-effectiveness and creativity (as opposed to political "solutions" that focus upon creating the appearance of allocation equity without providing the funding needed to achieve these allocations).

c. New York City Watershed Model as a Funding Model

A template for a potential funding approach for the Chesapeake Bay Restoration Initiative may already exist with the New York City Watershed model. In the New York City Watershed program, a downstream entity (New York City) requiring improved water quality has paid for upstream improvements which were not needed to address upstream local

water quality but solely/largely to achieve downstream water quality benefits. The New York City/NYC Watershed scenario parallels the Bay States/New York State relationship in regards to the Chesapeake Bay Restoration Initiative.

Our Coalition calls upon the federal government to shoulder the majority of both the capital and increased operation and maintenance cost of implementing the final TMDL, at least within the headwaters, non-Bay touching states of New York, West Virginia and Pennsylvania. Those States whose shores directly touch the Bay which, perhaps not coincidentally, are also experiencing the highest population growth, whose residents, for the most part, are more affluent than the Bay watershed headwater residents, and who directly benefit from their proximity to the Bay, should pay a greater share of their TMDL-related costs directly.

Response

A TMDL is not a federal mandate. For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Author Name: Abel Katie

Organization:

The rivers and bays are natural habitats for seafood and clean water. Forests are natural habitats for game and naturally clean our air and water. Conversely, crops and livestock provide us with food that wouldn't naturally occur in our ecosystems on the large scale that they do on farms. The negative impacts these farms have on watersheds are a direct result of our desire for livestock and crops. Therefore, we the consumers and growers of farmed meat and produce should be willing to pay the price to clean up the resulting byproducts.

The same applies to urban development. We all want our piece of land, but we must be willing to take responsibility for the contamination we introduce into the storm water as it runs off our property.

A creative way to finance these mandates would be to allow farmers to gain tax credits from "non farm" income to use for improvements such as fencing. Not tax "write offs" but actual tax credits. The credits could be transferable so as an example:

Farmer Jojn needs a fence to hide the creek from the cattle. He has low income and low cash. Lawyer/Envrionmentalists "Bill" makes a lot of money. He puts in a fence for Farmer John with his "tax credit" and sells the fence to farmer John for whatever he can afford. His sale price would come out of his credit, and farmer john would be able to write off whatever he paid to Bill for the fence.

The government does in effect does pay for the fence but it is spread out all over the place. The fence gets done sooner, the water gets clean sooner and the costs savings of cleanup will more than pay for the fence over the long run.

This way envrionmentalists can put their money where their mouth is and farmers will not be bankrupted by government intrusion into their constituional rights.

8. Conduct economic impact study

Response

The Clean Water Act (CWA) Section 303(d) requires TMDLs to be established for impaired or threatened waters at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety. Federal regulations at 40 CFR Section 130.7(c) track the statute and require TMDLs to be developed at levels necessary to attain and maintain the applicable narrative and numerical water quality standard with seasonal variations and a margin of safety and that take into account critical conditions. TMDLs are to include wasteload allocations for each point source and load allocations for nonpoint sources. Neither the CWA nor EPA's implementing regulations require the state or EPA to consider the costs to implement the TMDL when establishing the TMDL at a level necessary to implement the applicable water quality standards.

The cost of implementing the Bay TMDL has not yet been determined. In order to provide a good cost estimate it is necessary to first determine which sources need to install what type of controls. This information is only available after the Watershed Implementation Plans are completed. Each jurisdiction has a unique set of practices they intend to use to meet water quality standards. Furthermore, the true cost of implementation can be dramatically reduced if progressive trading, particularly, point to non-point trading is used to achieve the needed load reductions. Approximately 5 years ago, a Blue Ribbon panel estimated the cost of the state tributary strategies. These strategies provided similar level of controls as the current jurisdiction's watershed implementation plans. The estimated cost of implementing those tributary strategies was \$20-30 billion, much of that for the control of stormwater.

Clean water decreases public health burdens associated with consuming tainted fish or shellfish or exposure to waterborne infectious disease while recreating. Mercury fish consumption advisories in Maryland result in annual losses of \$8.83 million for saltwater fishing and \$520,000 for the commercial striped bass fishery (34). Economic valuation studies indicate the annual human health benefits from reducing mercury pollution at tens of millions to billions of dollars from avoided health problems and lost productivity (35, 36, 37). Another study estimated the cost associated with exposure to polluted recreational marine waters to be \$37 per gastrointestinal illness, \$38 per ear ailment, and \$27 per eye ailment (38). Reducing pollution inputs from pipes and land-based sources can reduce locality costs to treat drinking water sources to safe standards. New York City's expenditure of \$1 billion over the last decade to protect the watersheds north of the city that supply its drinking water avoided the need to build a \$6 billion treatment plant (39). An EPA study of drinking water source protection efforts concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs (40). Proactive efforts to lessen stormwater flows today reduce future public costs needed to maintain navigation channels, remediate pollution and hazard flooding, and repair infrastructure and property damage caused by excessive runoff.

Philadelphia estimates that after 40 years their installation of green infrastructure will create more than \$2 in benefits for every dollar invested, generating \$500 million in economic benefits, \$1.3 billion in social benefits, and \$400 million in environmental benefits (41). A study by the University of Virginia found that implementation of the agricultural practices to reduce runoff pollution called for in Virginia's Chesapeake Bay "tributary strategy," such as livestock stream exclusion, buffers, and cover crops, would generate significant economic impacts. Over a five year period these actions would create \$940 million in industrial output, a \$455 million impact on gross domestic product, and create nearly 12,000 jobs (42).

Comment ID 0200.1.001.002

Author Name: Devilbiss Thomas

Organization: Carroll County Government, Maryland

While the TMDL and WIP offer admirable, necessary goals, whether or not the capacity to achieve the lofty expectations, especially at the local level, is in place or possible is questionable. The question cannot begin to be answered without cost estimates and specific workload analysis. Both the draft TMDL and WIP were silent in regards to cost estimates. These cost estimates and local government loading reduction expectations need to be included with the TMDL and WIP drafts in order for local jurisdictions to evaluate the level of commitments that can feasibly be made to achieve these goals. Local planning staff, as well as decision makers and the public, need to be aware of the fiscal and resource demands of the drafts.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0202.1.001.007

Author Name: Carl Jimmie

Organization: Southern Tier New York WWTP

C. Remoteness from Chesapeake Bay & Associated Benefits

New York State is remote from the Chesapeake Bay and would derive no direct benefit from improvements to its water quality. Those benefits, associated with improved Bay water quality, would be enjoyed by those states immediately adjacent to the Bay. As such, without financial assistance, New York State taxpayers will be paying largely to the benefit of those that live and work around the Chesapeake Bay. What benefit will the affected residents of New York State realize, and has this been documented in any semblance of a socio-economic impact study?

Response

EPA is not conducting a socio-economic impact study as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. Also, please see the response to comment 0267.1.001.006 and the response to comment 0080-cp.001.002 which are specific to NY.

Comment ID 0202.1.001.013

Author Name: Carl Jimmie

Organization: Southern Tier New York WWTP

Furthermore, beyond the initial construction costs, increased annual O&M costs would also be significant and a recurring financial burden for rate payers. A funding mechanism by which increased O&M costs can be defrayed should be developed and instituted. A template of such a funding mechanism may already exist with the New York City/New York City Watershed program. In the NYC/NYC Watershed example, a downstream entity requiring improved water quality paid for upstream WWTP improvements (and increased O&M costs), that were not needed for upstream water quality but for downstream water quality benefits. It is felt that the NYC/NYC Watershed scenario parallels the Bay States/New York State situation currently at point.

Response

One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions. This includes looking at all options in order to reduce pollutants and the possibilities involved with trading which could alleviate some of the burden of cost.

Please see the response to comment 0501.1.001.005 regarding public sector point sources.

Comment ID 0225.1.001.005

Author Name: Locke Latana

Organization: Fredericksburg Area Association of Realtors (FAAR)

FAAR appreciates EPA's efforts to improve the health of the Bay, but we urge you to slow down and truly calculate the costs of TMDL compliance on local governments, businesses, and citizens in areas that are already struggling with unemployment, foreclosures, and shrinking budgets.

Response

EPA is using the best available data to develop this TMDL. At such time as new data is received EPA will use that information to update and improve upon the model. EPA allowed jurisdictions the opportunity to develop a Watershed Implementation Plan that meets the TMDL allocations. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost as referenced in the response to comment 0139.1.001.017.

Comment ID 0228.1.001.004

Author Name: Rolband Michael

Organization: Wetland Studies and Solutions, Inc.

Separating the total loadings of pollutants by sector (i.e. Agriculture, Urban Runoff, Wastewater, On-Site Septic, Forest and Non-Tidal Deposition) without clearly articulating the interconnection of some sectors leads to unnecessary conflict and a loss of one critical, big-picture item: that the vast majority of the people who contribute to detrimental urban runoff are also the people connected (through home and/or work) to a Wastewater Treatment Plant (WWTP). WWTPs are funded by a combination of "tap fees" (fees charged for new connections for compensation of system capital costs attributed to new users) and user fees to pay for plant upgrades and their operation and maintenance costs. These same "WWTP users" occupy housing, utilize shopping centers, work in office and industrial facilities, drive on roads, and utilize public facilities. The very lifestyles of these WWTP users cause the existence of surfaces that create urban runoff [FN3]. Thus, these two sectors are inexorably linked and should be examined collectively in relationship to the other sectors. Allocations for both should be developed to achieve the total desired pollutant reduction in the most cost-effective manner. The same people will pay for upgrades to WWTPs and/or urban stormwater retrofits through either general revenue taxes, storm utility fees, or stormwater service district taxes.

[FN 3] There is also, of course, urban runoff from low-density developed areas whose sewage is handled by on-site septic systems, so the correlation is not perfect. However, in low-density development areas, more of these surfaces are "disconnected impervious surfaces" which are commonly accepted as a low-impact development technique because much of the runoff can sheet-flow into pervious areas to be filtered, infiltrated, or evapotranspired. Disconnected impervious surfaces have less of an effect upon water quality than similar surfaces in higher-density areas (those commonly served by WWTPs). For example, in the Occoquan Watershed in Fairfax County, Virginia,

nonstructural Best Management Practices (BMPs) in the form of minimum size five acre lot zoning without SW/BMPs has protected the Occoquan Reservoir's water quality since the mid-1970s. (Higher density areas in this watershed must provide SWM/BMPs.)

Response

EPA has included in this TMDL Individual and Aggregate WLAs that cover approximately 500 significant dischargers and 4000 non significant dischargers in the Bay watershed. The TMDL also provides aggregated loads all nonpoint sources including non-regulatory stormwater runoff. In order to develop a TMDL that is protective and meets the water quality standards of the Bay, it is not necessary to discuss the link between users of a WWTP and homeowners who might have stormwater runoff. The allocations that are provided are designed to assist the States, organizations, dischargers, and others in understanding the most significant sources of nutrients and sediments. States should use this information to provide strategies and permit conditions in their watershed implementation plans to achieve the allocations. While the similarities in some sectors that you mention are valid, EPA chose to have separate allocations for these sectors because the regulatory and control mechanisms are vastly different for these source sectors.

With regards to the comments concerning, low density developed areas, EPA agrees that disconnecting impervious surfaces is an effective low-impact development technique that can improve water quality of the watershed.

Comment ID 0228.1.001.010

Author Name: Rolband Michael

Organization: Wetland Studies and Solutions, Inc.

Exhibit 2 [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] also contains an order-of-magnitude cost estimate using Bay Program data for four WWTP nutrient reduction options, as summarized in Table 4, below:

Table 4: Order-of-Magnitude Cost Estimate for WWTPs [Please see page 7 of the original letter (Docket ID 0228.1.001.010).] [FN16]

An examination of Tables 2 and 4 shows that WWTP upgrades are roughly an order of magnitude (approximately ten times) more cost-effective than urban stormwater management retrofits per pound of pollutant removed. Therefore, the requirement to retrofit urban areas in lieu of upgrading WWTPs will result in a much greater cost burden on urban- and suburban-dwelling citizens of the Commonwealth, as discussed above.

[FN 16] Limits of Technology (TN = 3.00 mg/L; TP = 0.10 mg/L)

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. In addition, while retrofits are costly, there are numerous low cost to no cost approaches to reduce urban loadings (i.e. reduce fertilizer usage on residential properties)

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

EPA Has Inappropriately Failed to Consider Cost, Cost-Effectiveness, and Cost Benefit

EPA's Draft TMDL allocates reductions among various source sectors. For example, EPA has made the determination in the Draft TMDL to shift allocations from Virginia's wastewater sector to the agriculture sector. Yet, it would appear that EPA's decision is not based in any way on cost issues. This is unacceptable, particularly in light of the fact that there is insufficient federal funding for the clean-up and state and local resources are strained in a way that they have not been for many decades.

Given this economic backdrop, EPA's decision to rewrite Virginia's Draft WIP and ignore potential economic impact on Bay dischargers in the allocation process is arbitrary if not irresponsible, especially in light of the fact that EPA stopped its effort to conduct a Use Attainability Analysis as part of this TMDL process.

The proposed TMDL also does not consider cost-effectiveness, sustainability, or overall environmental benefit. Because VAMWA believes that ancillary benefits of controls should be considered as a part of the development of this TMDL to produce increase overall environmental benefit, VAMWA contracted with Malcolm Pirnie to develop a Best Management Practices Benefit Planner (BMP-BP) model to examine this issue. The BMP-BP was peer-reviewed by Virginia Tech. This peer-reviewed model was designed to consider implementation costs, energy requirements, green house gas emissions, and ancillary environmental benefits (e.g. creation of wildlife habitat, flood protection, human health protection) to support environmental decision making.

VAMWA has used this model to compare EPA's recommendations for the York River basin with an alternative scenario that would achieve a similar level of nutrient reduction. The alternative scenario consisted of returning municipal point sources to Virginia's recently adopted wasteload allocations based on TN= 6 mg/L and TP=0.7 mg/L (down from typical secondary treatment levels of approximately TN = 18 to 25 mg/L and TP = 6 to 8 mg/L, and slightly higher than EPA's proposed backstop level of TN = 4 mg/L and TP = 0.3 mg/L), reducing urban stormwater BMP acreage by 50% and increasing agricultural BMPs by 20%. The results indicated the following:

- Reduced capital costs by approximately 50% (approximately \$1 billion)
- Reduced operation and maintenance (O+M) costs by 50% (\$32 million per year)
- Increased (improved) carbon sequestration by approximately 20%
- Significantly reduced green house gas (GHG) emissions
- Increased ancillary benefits associated with wildlife habitat, flood hazard protection, and base-flow projection.

This example demonstrates that greater environmental benefit can be achieved under Virginia's WIP than EPA's TMDL backstop allocations. EPA's decision to choose a higher-cost alternative and disregard a lower-cost alternative without any justification is arbitrary and capricious.

Response

Organization: Hampton Roads Sanitation District (HRSD)

XI. EPA HAS INAPPROPRIATELY FAILED TO CONSIDER COST, COST-EFFECTIVENESS, AND COST BENEFIT

In order to withstand appellate scrutiny by a Federal Court, EPA must be able to meet the "arbitrary and capricious" standard of review for a federal agency action mandated by the Administrative Procedure Act. [FN81] Specifically, a Federal Court will "...hold unlawful and set aside agency action, findings, and conclusions found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law..." [FN82] The U.S. Court of Appeals for the D.C. Circuit explained that an action will be held arbitrary and capricious:

...if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise... [FN83]

EPA's failure to consider cost, cost-effectiveness, or cost-benefit in its Draft TMDL is the epitome of agency decision making that fails "to consider an important aspect of the problem." [FN84]

EPA's Draft TMDL allocates reductions among various source sectors. HRSD believes that considerations of cost, cost-effectiveness and cost-benefit are imperative parts of determining how to make these allocations. It is hard to imagine how EPA could have made a reasoned decision on this issue without considering cost, cost-effectiveness, and cost-benefit. EPA certainly should not have, given the scope of the Bay TMDL. In addition, a consideration of cost issues, in particular a careful review of which options are the most cost-effective, would benefit EPA, by providing more reasonable assurance for this TMDL. Cost-effective measures are much more likely to actually be implemented, and implemented on schedule, as compared to measures that are extraordinarily expensive. EPA's refusal to consider cost contradicts its own demands for reasonable assurance.

For example, EPA has made the determination in this Draft TMDL to shift allocations from Virginia's wastewater sector to the agriculture sector. Yet, it would appear that EPA's decision is not based in any way on cost issues. The record for this TMDL contains no information on the wisdom of mandating additional, costly reductions in wastewater in lieu of requiring additional BMPs by agricultural sources which are typically far more cost-effective. [FN85] This is unacceptable, particularly in light of the fact that there is insufficient federal funding for the clean-up and local resources are strained in a way that they have not been for many decades. [FN86]

Although economics at the state level have improved slightly over the last year, local governments continue to suffer with tightening local budgets and reduced revenues. According to an October, 2010 Research Brief from the National League of Cities ("NLC"), "Local and regional economies characterized by struggling housing markets, slow consumer spending, and high levels of unemployment are driving declines in city revenues." The October brief shows that concerns over local fiscal health remain at the highest level in the 25 year history of the survey. Two of the major issues plaguing cities are declines in personal property and sales tax. As a result, NLC concludes that:

2010 reflects a number of downward trends for city fiscal conditions. The impacts of the economic downturn are becoming increasingly evident in city projections for final 2010 revenues and expenditures, and in the actions taken in response to changing conditions. The local sector of the economy is now fully [sic] the midst of a downturn that will be

several years in length. The effects of a depressed real estate market, low levels of consumer confidence, and high levels of unemployment will likely play out in cities through 2010, 2011, and beyond. [FN87]

The National Association of Counties also conducted a survey of a sample counties across the United States in June, 2010 ("How are Counties Doing? An Economic Status Survey"). According to the Executive Summary: "This survey reveals that the downturn continues to be widespread with counties of all sizes feeling the crunch from many directions." Furthermore, "[c]ounties report that they are using furloughs, layoffs and service curtailment to help reduce budgets that in many cases remain problematic because of continuing shortfalls." [FN88]

A. Case Study Demonstration: James River Basin

The James River basin alone faces extraordinary costs if EPA's allocations are finalized. As the knee-of-the-curve below shows, it would cost over \$10 billion more on the James to comply with EPA's Draft TMDL allocations for chlorophyll-a.

<Figure 11: "Knee-of-the Curve Analysis for James River Chlorophyll-a WQS" on page 59 of Comment Letter EPA-R03-OW-2010-0736-0230>

Figure 11 shows that the cost of the Tributary Strategy is approximately \$9 Billion. In addition, the Figure shows the estimated capital costs of attaining the chlorophyll-a criteria against the percent attainment rate. The capital costs include estimates for basin-wide wastewater treatment plant upgrades, agricultural BMPs, and urban runoff controls necessary to meet the allocations identified by EPA for the scenarios identified in Figure 11. The wastewater treatment plant capital costs are a function of design flows and level of treatment (biological nutrient removal, enhanced nutrient removal and limit of technology). Agricultural capital costs are based on BMP unit cost per acre and the BMP assumptions used in the Phase 5.3 Model. The urban runoff capital costs [FN89] are based on the performance associated with the runoff reduction method for an estimated amount of retrofit controls that could be installed in a locality, which represents only a portion of the urban runoff costs. The costs for the remainder of the urban runoff reductions needed to meet the allocations would be achieved with stormwater capture/storage and reuse. The estimated capital costs were prepared for the following EPA Scenarios:

- '91-'00 Base Scenario: Point "A" represents the James River TN and TP loading of 36.9 and 3.3 million pounds per year, respectively.
- EPA's Tributary Strategy: Point "B" represents the James River TN and TP portion of the Bay-wide loading, which is 27.5 and 3.3 million pounds per year, respectively.
- EPA's James Chl-a Compliance: Point "C" represents the James River TN and TP loading of 23.5 and 2.35 million pounds per year, respectively. EPA has selected this scenario as the basis for compliance with the James River chlorophyll-a criteria. EPA also refers to this scenario as "James Level of Effort at ½ Potomac". In the Draft TMDL (Appendix J), EPA states "In the James, the nutrient loads are equivalent to the level of effort half way between Virginia's portion of the Potomac and the James for the 190/12 Loading Scenario." In other words, EPA is referring to a new theoretical scenario that is more stringent than the Virginia Regulations as to the James River but not quite as stringent as Virginia's Regulations require for the Potomac River, which have a far greater impact on Bay water quality.

- E3 (Everything, Everywhere, by Everybody): Point "D" represents the James River TN and TP loading of 16.1 and 1.5 million pounds per year, respectively. EPA considers this to be the "theoretical maximum levels of managed controls on all pollutant load sources". There are no cost and few physical limitations to implementing controls for point and nonpoint sources that are recognized in the E3 scenario. This scenario is used with the No-Action scenario to define the "controllable" loads, i.e., the difference between No-Action and E3 loads." See Draft TMDL at Appendix J.

The knee-of-the-curve analysis determines where the increment of pollution reduction achieved in the receiving water diminishes compared to the increased costs. There is a steep inflection at Point "B" that represents the knee-of-the-curve. Any reduction beyond Point "B" lacks a viable cost-to-benefit ratio and does not reflect a reasonable benefit. EPA has selected Point "C" as the basis for the James River compliance with the chlorophyll-a criteria, which is about half way between Point "B" and EPA's E3 scenario (Point "D"). If one assumes that the model predictions are accurate (about which there is substantial doubt), at Point "B", the James River would be 93 to 94 percent compliant with chlorophyll-a criteria compared to 99 percent at Point "C." However, the true difference in chlorophyll model output between Points "B" and "C" is only 2 to 3 g/L (three parts in a billion). Additionally, the sampling and testing accuracies for physical water measurements is 1 to 3 g/L. In other words, even if the loadings between Points "B" and "C" were achieved, it is unlikely that the difference in James River chlorophyll-a concentrations could be measured. The difference in the estimated cost of achieving the loadings between Points "B" and "C," on the other hand, is over \$10 billion- a sum that cannot only be measured, but will be paid by Virginians, if EPA's Draft TMDL is adopted as is on this issue.

In summary, it is incumbent upon EPA to reconsider the basis for the James River allocations considering the magnitude of the costs of attaining levels of load reductions required to produce a difference in modeled chlorophyll-a concentrations so small that they cannot be reliably measured. Further, it is incumbent upon EPA to consider these staggering costs as it finalizes its TMDL. At a minimum, EPA should not pass the knee-of-the-curve identified at Point "B" of the above graph. Assuming there is any real water quality improvement beyond Point "B," it would not be cost effective, could not be physically measured, and could not be reasonably attained. The only reasonable response is to set James River basin allocations based on the Tributary Strategy allocations.

Given this economic backdrop and weaknesses in the model's predictive abilities at such a small scale, [FN90] HRSD cannot begin to understand EPA's decision to sidestep discussing the potential economic impact of the Bay TMDL on Bay dischargers. Furthermore, as noted above, EPA has said that it will not consider requests for a UAA to determine the feasibility of this TMDL. EPA's determination that it will take a lawful option off the table to consider cost-related issues and impacts is indefensible.

B. Case Study Demonstration: York River Basin Agricultural management practices include most of the practices that EPA and others (e.g., Chesapeake Bay Commission, 2004) have identified as the most-cost effective, including nutrient management, conservation tillage, cover crops, and riparian buffers. Compared to many urban and wastewater-based practices, these practices provide much higher levels of ancillary environmental benefits such as wildlife habitat, stream habitat protection, flood control, and greenhouse gas reduction (VAMWA, 2010). To illustrate these points, Appendix 43 presents a case study of alternative nutrient controls for the York River basin using the Virginia Tech peer reviewed BMP Benefit Planner ver. 1.1 (Malcolm Pirnie, 2010). For the case study the above referenced model was used to compare EPA's recommendations for the York River basin with an alternative scenario that would achieve a similar level of nutrient reduction. The alternative scenario consisted of returning municipal point sources to existing requirements (TN= 6 mg/L, TP=0.7 mg/L @ design flows), reducing urban storm water BMP acreage by 50% and

increasing agricultural BMPs by 20%. The results indicated that the following:

- Reduced capital costs by approximately 50% (~\$1B)
- Reduced operation and maintenance (O+M) costs by 50% (\$32M/yr)
- Increased carbon sequestration by approximately 20%
- Significantly reduced green house gas (GHG) emissions
- Increased ancillary benefits associated with wildlife habitat, flood hazard protection, and base-flow projection

This case study is significant because it demonstrates that greater environmental benefit can be achieved at significantly lower cost if flexibility is allowed in the TMDL. EPA's decision to choose a higher-cost alternative and disregard a lower-cost alternative without any justification is arbitrary and capricious.

This case study approach is consistent with the intent of EPA's Healthy Watersheds Initiative. This initiative advocates for a holistic approach to management that includes geomorphology, landscape condition, hydrology, habitat, and biological integrity (http://water.epa.gov/learn/training/wacademy/upload/2010_10_13_slides.pdf).

EPA has contradicted its own concepts with the Bay TMDL by a narrowing its focus to only nutrient loadings at the exclusion of other end-points important to healthy watersheds.

The monitoring data also indicates that a focus on non-point sources will offer greater potential for Bay improvement. The results of Williams and others (2010) indicate that the drought period of 1999 to 2002 coincided with improving bay-wide trends in most of the metrics that were analyzed. These results demonstrate that non-point source nutrient loads are the key drivers of Chesapeake Bay water quality rather than point sources. As such the TMDL must include more emphasis (not less, as suggested by the draft TMDL) on controlling non-point sources of pollution.

[FN82] 5 U.S.C. § 706(2)(A).

[FN83] *Eagle Broadcasting Group, Ltd. v. F.C.C.*, 563 F.3d 543, 551 (D.C. Cir. 2009) (emphasis added).

[FN84] EPA materials from April, 2009, show a willingness on EPA's part to consider affordability as a part of this process. See April 20-21, 2009 Presentation from B. Koroncai to PSC (Chesapeake Bay Water Quality Big Picture) at slide 13 ("An affordability assessment will be completed") (attached hereto as Appendix 31). Yet, EPA's Draft TMDL leaves the question of affordability entirely unaddressed.

[FN85] See attached *Cost-Effective Strategies for the Bay* (Chesapeake Bay Commission, December 2004) (attached hereto as Appendix 47).

[FN86] In November, 2009, the Governors of Virginia and Maryland wrote to the President asking that he consider the

need for federal assistance for Bay clean-up efforts (attached as Appendix 48). Note that the letter was written in response to the Executive Order strategy and reports. VAMWA submits that the financial need is even more dire now given the requirements of the Draft TMDL. See also June 15, 2010 Letter from Virginia Governor Robert E. McDonnell to Lisa P. Jackson, EPA Administrator (attached hereto as Appendix 19).

[FN87] October Research Brief at 7 (available online at http://www.nlc.org/ASSETS/AE26793318A645C795C9CD11DAB3B39B/RB_CityFiscalConditions2010.pdf).

[FN88] Survey results available online at: <http://www.naco.org/research/pubs/Documents/Surveys/Research%20Surveys/How%20are%20Counties%20Doing%20An%20Economic%20Status%20Survey%20July%202010.pdf>

[FN89] Urban nutrient management was not included. The capital costs are based on meeting the waste load allocation for the Urban Runoff identified in Appendix Q-1 of the Draft TMDL.

[FN90] See earlier discussion regarding modeling issues at Section VII.

Response

A TMDL is not a federal mandate. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

For additional information on your comment regarding the James River please see the response to Comment 0436.1.001.027, 0288.1.001.016.

Author Name: Helsel, Jr. Gordon

Organization: City of Poquoson, Virginia

While the EPA may not be required to perform financial assessments under the Clean Water Act its decision to forego cost/benefit analyses is resulting in the development of unrealistic requirements that our citizens cannot afford.

In response to questions concerning program cost, EPA staffers have discussed affordability in general terms and suggested that local governments and citizens consider the benefit of a healthy Chesapeake Bay. The economic advantages of a clean Bay are not in dispute. The issue is whether the EPA TMDL, backstop measures and implementation schedule constitute the best approach to Bay cleanup. We question the merits of the program, not its goal. Is the EPA TMDL program achievable and cost effective? In lieu of any quantifiable EPA cost/benefit data, our regional planning district commission and our staff have had to analyze what information is available. In order to be fiscally responsible to our citizens, these analyses must include "worse case" scenarios, which appear to be the EPA backstop measures. In the absence of EPA data, given what information we do have, it is apparent that the TMDL program is overly burdensome, too costly, and likely unachievable.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0235.1.001.016

Author Name: Helsel, Jr. Gordon

Organization: City of Poquoson, Virginia

The EPA program is inordinately expensive, and the lack of OMB-type cost/benefit analyses or realistic program cost estimates is leading to overly burdensome requirements. Regardless of whether or not the Clean Water Act requires financial analysis, it is unconscionable not to provide an economic analysis of a program that will change the way of life of over 17 million people and fundamentally alter land development in 64,000 square miles.

Response

EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Please see the response to comment 0067.1.001.009 and Section 8 of the TMDL report which address backstops in the TMDL.

Organization: Virginia Crop Production Association, Inc. (VACPA)

Before moving forward with a finalized Bay TMDL, EPA must conduct a non-biased economic impact analysis. Experts

from land-grant universities from across the watershed could be called upon to evaluate the actual costs of meeting water quality standards for businesses, citizens, localities, states, and the federal government.

Response

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality with regards to stormwater and response to 0245-cp.001.003 for information on agriculture.

Comment ID 0251.1.001.003

Author Name: Duckett Robert

Organization: Peninsula Housing & Builders Association (PHBA)

It also appears apparent that the EPA has chosen to rush in this direction, heedless of its cost, because as we have learned, the EPA has chosen not to conduct a cost analysis for the Bay TMDL.

We strongly urge the EPA to conduct such a cost analysis. We strongly urge the EPA to slow down and take into account the significant concerns of the national housing industry, the business community, and numerous local governments affected by the economic impact the Bay TMDL. York County, one of our local governments, has learned that the estimated costs associated with implementing the TMDL would take up one-third of its existing budget.

Response

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0252.1.001.011

Organization: City of Frostburg, Maryland

we have a good relationship with Allegany County at the staff and elected official level at this time, the implications of the TMDL mandate process further limit municipal autonomy and create budget pressures that our tax base cannot reasonably bear.

Frostburg is already under consent order to address what was estimated to be a \$25M, 20-year program to separate its combined sewers, which began in 2003. The City has made a concerted effort to keep on track, and has received significant help from the State via MDE and the Federal government via EPA, CDBG, and even ARC funding. However, a significant local CSO surcharge has been levied and was recently increased to ensure that the City can remain on target. With new mandates on the horizon, the taxpayers in this small town are facing yet additional charges from this

mandate, on top of an expected increase in the Bay Restoration Fund assessments that sends money to MDE, and which we acknowledge have helped pay for our CSO efforts.

Response

EPA hears your concerns and thanks you for your comments on the Draft Chesapeake Bay TMDL and the efforts to address stormwater in your municipality. It is EPA's intention to reduce or remove some of the backstops and allow jurisdictions to implement their plans. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Comment ID 0253.1.001.003

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

The County's WWTP is in the process of being upgraded with nutrient removal technology. The current project consists of installing two new Enhanced Nutrient Removal basins and converting two existing Biological Nutrient Removal Basins to Enhanced Nutrient Removal Basins. This project will effectively increase ENR capacity to ensure continuous compliance with an annual average total nitrogen concentration of 5.0 mg/L. The total capital cost for this project (Phase 7) is approximately \$20,186,000. Previous projects and plant expansions (2000 through 2004) provided nutrient removal facilities to achieve compliance with an annual average total phosphorus concentration of 0.5 mg/L and an annual average total nitrogen concentration of 8.0 mg/L. Capital cost for these projects was approximately \$54,000,000. Capital costs do not include design and construction management fees. Additionally, the Operational and Maintenance costs associated with the facilities move from an "ammonia removal" facility to Enhanced Nutrient Removal is conservatively estimated to cost the County an additional \$1,500,000/year moving forward.

Response

Please see response to 0501.1.001.005 which addresses the costs associated with the increases in cost to update infrastructure.

Organization: Cornell Law School Water Law Clinic

B. The Upper Susquehanna Coalition

Floods and high river flows following storms account for most of the nutrients and sediment loads carried in the Susquehanna River in New York State. Over the last ten or more years, the USC, with some assistance from the Clinic, has developed an innovative wetland and riparian corridor program. Wetlands absorb the energy of flood and storm waters and reduce pollutant loads. Riparian corridors are the last barrier against water quality degradation. The USC program aims to attenuate peak and stormwater flows and maintain the integrity of stream corridors. As a result, the transport of nutrient and sediment loads delivered from New York State is significantly reduced. EPA can enable similar achievements for the benefit of the Chesapeake Bay by directing Chesapeake Bay Program resources towards enhancing the capacity of USC and similar bodies in other states.

Recommendation:

- Because wetlands and riparian corridors are local responsibilities, EPA should support and foster the capacity of local communities, through technical providers such as the USC, to adopt technical and legal tools that protect wetlands and riparian corridors to control and limit nutrient and sediment transport to streams.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan. Please see response to 0501.1.001.005 for additional information on federal funding towards the Chesapeake Bay Watershed.

Comment ID 0267.1.001.027

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

In the likely event that natural gas drilling on the Marcellus Shale occurs in New York, it will be necessary for the state to expand enforcement of its water quality regulations to achieve its Bay TMDL allocations. A consistent theme in EPA's evaluation of New York's draft Phase I WIP is how the state will go about strengthening enforcement of the Clean Water Act. Given their technical expertise and strong relationship with rural New York communities, Soil and Water Conservation Districts can play many useful roles in accomplishing this task. For example, they can: (1) provide technical assistance to municipalities in reviewing Stormwater Pollution Prevention Plans (SWPPPs) required for new road construction sites; (2) act as thirdparty inspectors to assist municipalities in monitoring SWPPP compliance and to ensure that storm drainage best management practices are employed on access roads and pipeline right-of-ways; (3) assist local municipalities in delineating and protecting ecologically sensitive areas such as wetlands, which act to reduce pollutant transport to streams; and (4) assist gas companies in locating access roads so as to avoid such ecologically sensitive areas.

Technical providers such as New York's Soil and Water Conservation Districts are essential for successful TMDL implementation the New York portion of the Chesapeake Bay watershed. In areas where natural gas drilling may occur, EPA can limit the impacts of gas drilling activities on roads, and hence reduce pollutant loading, by enhancing the capacity of these local technical providers.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan. Please see response to 0501.1.001.005 for additional information on federal funding towards the Chesapeake Bay Watershed. Please see the response to 0190-cp.001.002 to address your comments on natural gas drilling.

- EPA should direct greater institutional and financial support to local technical providers such as a state's SWCDs.

Response

EPA does not have the authority to dictate where a jurisdiction allocates its funding. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay.

Comment ID 0267.1.001.031

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

EPA should direct its education and outreach resources towards encouraging local communities to access and participate in online forums, such as that provided by the Clinic's blog, in order to quickly and easily share information about what works, what does not, and how to go about addressing water quality and quantity concerns in their jurisdictions.

Response

EPA is not able to direct funding to any project because EPA must follow the competitive process in accordance with the national program guidance. Information on these regulations can be found at Title 40 Code of Federal Regulations Section 30.43.

Comment ID 0280.1.001.005

Author Name: Newcomb Jim

Organization: Dorchester Soil Conservation District

The Dorchester Soil Conservation District has reviewed Maryland's Watershed Implementation Plan (WIP) and would like to make the following comments. In closing we would like to stress that all the planning in the world will not produce results if there is not the staff or resources available on the ground to implement the plan.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions. Future enhancements include addressing current short falls in resources and proposed strategies to increase resources.

EPA HAS INAPPROPRIATELY FAILED TO CONSIDER COST, COST-EFFECTIVENESS, AND COST BENEFIT

In order to withstand appellate scrutiny by a Federal Court, EPA must be able to meet the "arbitrary and capricious" standard of review for a federal agency action mandated by the Administrative Procedure Act.[FN81] Specifically, a Federal Court will "...hold unlawful and set aside agency action, findings, and conclusions found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law..." [FN82] The U.S. Court of Appeals for the D.C. Circuit explained that an action will be held arbitrary and capricious:

...if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise... [FN83]

EPA's failure to consider cost, cost-effectiveness, or cost-benefit in its Draft TMDL is the epitome of agency decisionmaking that fails "to consider an important aspect of the problem." [FN84]

EPA's Draft TMDL allocates reductions among various source sectors. VAMWA believes that considerations of cost, cost-effectiveness and cost-benefit are imperative parts of determining how to make these allocations. It is hard to imagine how EPA could have made a reasoned decision on this issue without considering cost, cost-effectiveness, and cost-benefit. EPA certainly should not have, given the scope of the Bay TMDL. In addition, a consideration of cost issues, in particular a careful review of which options are the most cost-effective, would benefit EPA, by providing more reasonable assurance for this TMDL. Cost-effective measures are much more likely to actually be implemented, and implemented on schedule, as compared to measures that are extraordinarily expensive. EPA's refusal to consider cost contradicts its own demands for reasonable assurance.

For example, EPA has made the determination in this Draft TMDL to shift allocations from Virginia's wastewater sector to the agriculture sector. Yet, it would appear that EPA's decision is not based in any way on cost issues. The record for this TMDL contains no information on the wisdom of mandating additional, costly reductions in wastewater in lieu of requiring additional BMPs by agricultural sources which are typically far more cost-effective.[FN85] This is unacceptable, particularly in light of the fact that there is insufficient federal funding for the clean-up and local resources are strained in a way that they have not been for many decades.[FN86]

Although economics at the state level have improved slightly over the last year, local governments continue to suffer with tightening local budgets and reduced revenues. According to an October, 2010 Research Brief from the National League of Cities ("NLC"), "Local and regional economies characterized by struggling housing markets, slow consumer spending, and high levels of unemployment are driving declines in city revenues." The October brief shows that concerns over local fiscal health remain at the highest level in the 25 year history of the survey. Two of the major issues plaguing cities are declines in personal property and sales tax. As a result, NLC concludes that:

2010 reflects a number of downward trends for city fiscal conditions. The impacts of the economic downturn are becoming increasingly evident in city projections for final 2010 revenues and expenditures, and in the actions taken in response to changing conditions. The local sector of the economy is now fully [sic] the midst of a downturn that will be several years in length. The effects of a depressed real estate market, low levels of consumer confidence, and high levels of unemployment will likely play out in cities through 2010, 2011, and beyond.[FN87]

The National Association of Counties also conducted a survey of a sample counties across the United States in June, 2010 ("How are Counties Doing? An Economic Status Survey"). According to the Executive Summary: "This survey reveals that the downturn continues to be widespread with counties of all sizes feeling the crunch from many directions." Furthermore, "[c]ounties report that they are using furloughs, layoffs and service curtailment to help reduce budgets that in many cases remain problematic because of continuing shortfalls." [FN88]

A. Case Study Demonstration: James River Basin

The James River basin alone faces extraordinary costs if EPA's allocations are finalized. As the knee-of-the-curve below shows, it would cost over \$10 billion more on the James to comply with EPA's Draft TMDL allocations for chlorophyll-a.

[Figure 11: Knee-of-the-Curve Analysis for James River Chlorophyll-a WQS. Please see the original document 0288.1]

Figure 11 shows that the cost of the Tributary Strategy is approximately \$9 Billion. In addition, the Figure shows the estimated capital costs of attaining the chlorophyll-a criteria against the percent attainment rate. The capital costs include estimates for basin-wide wastewater treatment plant upgrades, agricultural BMPs, and urban runoff controls necessary to meet the allocations identified by EPA for the scenarios identified in Figure 11. The wastewater treatment plant capital costs are a function of design flows and level of treatment (biological nutrient removal, enhanced nutrient removal and limit of technology). Agricultural capital costs are based on BMP unit cost per acre and the BMP assumptions used in the Phase 5.3 Model. The urban runoff capital costs [FN89] are based on the performance associated with the runoff reduction method for an estimated amount of retrofit controls that could be installed in a locality, which represents only a portion of the urban runoff costs. The costs for the remainder of the urban runoff reductions needed to meet the allocations would be achieved with stormwater capture/storage and reuse. The estimated capital costs were prepared for the following EPA Scenarios:

-- '91-'00 Base Scenario: Point "A" represents the James River TN and TP loading of 36.9 and 3.3 million pounds per year, respectively.

--EPA's Tributary Strategy: Point "B" represents the James River TN and TP portion of the Bay-wide loading, which is 27.5 and 3.3 million pounds per year, respectively.

--EPA's James Chl-a Compliance: Point "C" represents the James River TN and TP loading of 23.5 and 2.35 million pounds per year, respectively. EPA has selected this scenario as the basis for compliance with the James River chlorophyll-a criteria. EPA also refers to this scenario as "James Level of Effort at ½ Potomac". In the Draft TMDL (Appendix J), EPA states "In the James, the nutrient loads are equivalent to the level of effort half way between Virginia's portion of the Potomac and the James for the 190/12 Loading Scenario." In other words, EPA is referring to a new theoretical scenario that is more stringent than the Virginia Regulations as to the James River but not quite as stringent as Virginia's Regulations require for the Potomac River, which have a far greater impact on Bay water quality.

--E3 (Everything, Everywhere, by Everybody): Point "D" represents the James River TN and TP loading of 16.1 and 1.5 million pounds per year, respectively. EPA considers this to be the "theoretical maximum levels of managed controls on all pollutant load sources". There are no cost and few physical limitations to implementing controls for point and nonpoint sources that are recognized in the E3 scenario. This scenario is used with the No-Action scenario to define the "controllable" loads, i.e., the difference between No-Action and E3 loads. See Draft TMDL at Appendix J.

The knee-of-the-curve analysis determines where the increment of pollution reduction achieved in the receiving water diminishes compared to the increased costs. There is a steep inflection at Point "B" that represents the knee-of-the-curve. Any reduction beyond Point "B" lacks a viable cost-to-benefit ratio and does not reflect a reasonable benefit. EPA has selected Point "C" as the basis for the James River compliance with the chlorophyll-a criteria, which is about half way between Point "B" and EPA's E3 scenario (Point "D"). If one assumes that the model predictions are accurate (about which there is substantial doubt), at Point "B", the James River would be 93 to 94 percent compliant with chlorophyll-a criteria compared to 99 percent at Point "C." However, the true difference in chlorophyll model output between Points "B" and "C" is only 2 to 3 g/L (three parts in a billion). Additionally, the sampling and testing accuracies for physical water measurements is 1 to 3 g/L. In other words, even if the loadings between Points "B" and "C" were achieved, it is unlikely that the difference in James River chlorophyll-a concentrations could be measured. The difference in the estimated cost of achieving the loadings between Points "B" and "C," on the other hand, is over \$10 billion- a sum that cannot only be measured, but will be paid by Virginians, if EPA's Draft TMDL is adopted as is on this issue.

In summary, it is incumbent upon EPA to reconsider the basis for the James River allocations considering the magnitude of the costs of attaining levels of load reductions required to produce a difference in modeled chlorophyll-a concentrations so small that they cannot be reliably measured. Further, it is incumbent upon EPA to consider these staggering costs as it finalizes its TMDL. At a minimum, EPA should not pass the knee-of-the-curve identified at Point "B" of the above graph. Assuming there is any real water quality improvement beyond Point "B", it would not be cost effective, could not be physically measured, and could not be reasonably attained. The only reasonable response is to set James River basin allocations based on the Tributary Strategy allocations.

Given this economic backdrop and weaknesses in the model's predictive abilities at such a small scale,[FN90] VAMWA cannot begin to understand EPA's decision to sidestep discussing the potential economic impact of the Bay TMDL on Bay dischargers. Furthermore, as noted above, EPA has said that it will not consider requests for a UAA to determine the feasibility of this TMDL. EPA's determination that it will take a lawful option off the table to consider cost-related issues and impacts is indefensible.

B. Case Study Demonstration: York River Basin

Agricultural management practices include most of the practices that EPA and others (e.g., Chesapeake Bay Commission, 2004) have identified as the most-cost effective, including nutrient management, conservation tillage, cover crops, and riparian buffers. Compared to many urban and wastewater-based practices, these practices provide much higher levels of ancillary environmental benefits such as wildlife habitat, stream habitat protection, flood control, and greenhouse gas reduction (VAMWA, 2010). To illustrate these points, Appendix 43 [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A43] presents a case study of alternative nutrient controls for the York River basin using the Virginia Tech peer reviewed BMP Benefit Planner ver. 1.1 (Malcolm Pirnie, 2010). For the case study the above referenced model was used to compare EPA's recommendations

for the York River basin with an alternative scenario that would achieve a similar level of nutrient reduction. The alternative scenario consisted of returning municipal point sources to existing requirements (TN= 6 mg/L, TP=0.7 mg/L @ design flows), reducing urban storm water BMP acreage by 50% and increasing agricultural BMPs by 20%. The results indicated that the following:

- Reduced capital costs by approximately 50% (~\$1B)
- Reduced operation and maintenance (O+M) costs by 50% (\$32M/yr)
- Increased carbon sequestration by approximately 20%
- Significantly reduced green house gas (GHG) emissions
- Increased ancillary benefits associated with wildlife habitat, flood hazard protection, and base-flow projection

This case study is significant because it demonstrates that greater environmental benefit can be achieved at significantly lower cost if flexibility is allowed in the TMDL. EPA's decision to choose a higher-cost alternative and disregard a lower-cost alternative without any justification is arbitrary and capricious.

This case study approach is consistent with the intent of EPA's Healthy Watersheds Initiative. This initiative advocates for a holistic approach to management that includes geomorphology, landscape condition, hydrology, habitat, and biological integrity (http://water.epa.gov/learn/training/wacademy/upload/2010_10_13_slides.pdf).

EPA has contradicted its own concepts with the Bay TMDL by a narrowing its focus to only nutrient loadings at the exclusion of other end-points important to healthy watersheds.

The monitoring data also indicates that a focus on non-point sources will offer greater potential for Bay improvement. The results of Williams and others (2010) indicate that the drought period of 1999 to 2002 coincided with improving bay-wide trends in most of the metrics that were analyzed. These results demonstrate that non-point source nutrient loads are the key drivers of Chesapeake Bay water quality rather than point sources. As such the TMDL must include more emphasis (not less, as suggested by the draft TMDL) on controlling non-point sources of pollution.

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

EPA Has Inappropriately Failed to Consider Cost, Cost-Effectiveness, and Cost-Benefit

Of particular relevance to Urban Stormwater and thus eventually to MS4s, EPA's Draft TMDL fails to adequately consider a critical aspect relating to whether or not its TMDL will be successful for Bay restoration, namely cost and feasibility, as well as cost-effectiveness and cost-benefit. VAMSA has similar concerns regarding the WIP as to Urban Stormwater.

An expert national engineering firm has estimated the cost to Virginia's MS4 localities to restore 50% of existing untreated impervious area over a 15 year term (the level and manner of effort assumed by EPA in its Draft TMDL at

page 8-14 to 8-15). The low estimated per household, annual cost is \$678 in 2011 and possibly as high as \$1,717 in 2025.[FN1] Further, these staggering figures are only for the specific retrofits considered in EPA's plan and thus omit other significant existing and future costs for other MS4 permit obligations (such as under existing permits and potentially increased requirements under future permits and other TMDLs) and for general maintenance of the existing stormwater system.

On a state-wide basis (for localities in the Bay Watershed), a second expert engineering firm has confirmed the extraordinary costs for urban stormwater.[FN2] The firm has estimated the total capital costs for Virginia localities in the Bay Watershed to be approximately \$39.4 billion, with an annual cost (including O&M) of \$4.2 billion. Based upon a typical industry approach to calculating stormwater bills, this translates to approximately \$1,200 per year for a representative residential house, \$11,100 per year for a representative small business (e.g., convenience store or gas station), \$73,800 per year for a representative neighborhood shopping center, \$24,600 per year for a representative church or place of worship, and \$1.1 million per year for a representative regional mall. This would place a high burden on a household based upon median household income (approximately 2.0% to 2.7%).

Elsewhere, EPA has estimated that the cost for retrofits for existing MS4s may be \$7.9 billion per year for the Bay TMDL watershed. Furthermore, the nationally-recognized Center for Watershed Protection has estimated urban retrofit costs at on the order of \$88,000 per acre.

Given the current economic environment and the level of associated costs, VAMSA cannot begin to understand EPA's decision to sidestep discussing the potential economic impact of the Bay TMDL on the residents of the Bay watershed, especially in light of the fact that EPA stopped its effort to conduct a Use Attainability Analysis as part of this TMDL process.

[FN1] Stormwater Retrofit Cost Estimate Case Study, D. Mason and C. Tabor, CDM (Oct. 12, 2010) (attached as Appendix 1 [Comment Letter refers to additional information in the form of an attachment. See comment 0574.1.001.001]). VAMSA hereby incorporates Appendix 1 by reference to these comments (all of VAMSA's Appendices are incorporated hereto by reference). Additionally, VAMSA incorporates by reference all EPA files or documents, no matter the form, and all materials from EPA Chesapeake Bay committees or subcommittees pertaining to Bay clean-up efforts. VAMSA is aware that a growing number of localities and planning district commissions throughout Virginia may have similar concerns and to the extent that such entities file comments on the Draft TMDL or WIP, VAMSA recommends that EPA and Virginia carefully consider those comments as well.

[FN2] Range of Estimated Costs for Virginia Urban Runoff (Stormwater), E. Cronin, Greeley & Hansen (Nov., 2010) (attached as Appendix 1 [Comment Letter refers to additional information in the form of an attachment. See comment 0574.1.001.001]).

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA

established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

EPA HAS INAPPROPRIATELY FAILED TO CONSIDER COST, COST-EFFECTIVENESS, AND COST-BENEFIT

Available cost estimates indicate that the Bay TMDL could have cost impacts on the order of \$700 to \$1,800 per household per year. Yet, EPA has failed to consider this significant issue in its Draft TMDL.

In order to withstand appellate scrutiny by a Federal Court, EPA must be able to meet the "arbitrary and capricious" standard of review for a federal agency action mandated by the Administrative Procedure Act.[FN3] Specifically, a Federal Court will "...hold unlawful and set aside agency action, findings, and conclusions found to be arbitrary, capricious, an abuse of discretion, or otherwise not in accordance with law..."[FN4] The U.S. Court of Appeals for the D.C. Circuit explained that an action will be held arbitrary and capricious:

...if the agency has relied on factors which Congress has not intended it to consider, entirely failed to consider an important aspect of the problem, offered an explanation for its decision that runs counter to the evidence before the agency, or is so implausible that it could not be ascribed to a difference in view or the product of agency expertise... [FN5]

Given that one of the main limitations on fully accomplishing Bay restoration has been the tremendous cost, EPA's failure to consider cost, cost-effectiveness, or cost-benefit in its Draft TMDL is the epitome of agency decision-making that fails "to consider an important aspect of the problem." [FN6]

EPA's Draft TMDL allocates reductions among various source sectors. VAMSA believes that considerations of cost, cost-effectiveness and cost-benefit are imperative parts of determining how to make these allocations. It is hard to imagine how EPA could have made a reasoned decision on this issue without considering cost, cost-effectiveness, and cost-benefit. EPA certainly should not have, given the scope of the Bay TMDL. In addition, a consideration of cost issues, in particular a careful review of which options are the most cost-effective, would benefit EPA, by providing more reasonable assurance for this TMDL. Cost-effective measures are much more likely to actually be implemented, and implemented on schedule, as compared to measures that are extraordinarily expensive. EPA's refusal to consider cost contradicts its own demands for reasonable assurance. This is unacceptable, particularly in light of the fact that there is insufficient federal funding for the clean-up and local resources are strained in a way that they have not been for many decades.[FN7]

Although economics at the state level have improved slightly over the last year, local governments continue to suffer with tightening local budgets and reduced revenues. According to an October, 2010 Research Brief from the National League of Cities ("NLC"), "Local and regional economies characterized by struggling housing markets, slow consumer spending, and high levels of unemployment are driving declines in city revenues." The October brief shows that concerns over local fiscal health remain at the highest level in the 25 year history of the survey. Two of the major issues plaguing cities are declines in personal property and sales tax. As a result, NLC concludes that:

2010 reflects a number of downward trends for city fiscal conditions. The impacts of the economic downturn are becoming increasingly evident in city projections for final 2010 revenues and expenditures, and in the actions taken in response to changing conditions. The local sector of the economy is now fully [sic] the midst of a downturn that will be several years in length. The effects of a depressed real estate market, low levels of consumer confidence, and high levels of unemployment will likely play out in cities through 2010, 2011, and beyond.[FN8]

The National Association of Counties also conducted a survey of sample counties across the United States in June, 2010 ("How are Counties Doing? An Economic Status Survey"). According to the Executive Summary: "This survey reveals that the downturn continues to be widespread with counties of all sizes feeling the crunch from many directions." Furthermore, "[c]ounties report that they are using furloughs, layoffs and service curtailment to help reduce budgets that in many cases remain problematic because of continuing shortfalls." [FN9]

In short, Virginia's local governments are in no position to fund an expensive and mandatory restoration/retrofit program. Of course, this begs the question: How much would it cost to implement EPA's urban restoration/retrofit proposal?

VAMSA submits for consideration by EPA and the State the attached Technical Memo by a national engineering firm with expertise in stormwater management.[FN10] The Technical Memo estimates urban stormwater costs for Bay TMDL implementation on an annual per household cost basis. For a level of effort that approximates that of the Draft TMDL, the analysis developed cost estimates to restore 50% of existing untreated impervious area over a 15 year term (the approach used by EPA in its Draft TMDL). The result was an annual per household cost from a low of \$678 per year in 2011 to a high of \$1,711 in 2025.

The Technical Memo's cost estimate is only for urban retrofits; it does not include costs for stormwater management in unregulated areas or to pay for other costs associated with existing MS4 programs. Thus, total stormwater management cost increases would presumably be considerably higher factoring in increasing requirements of MS4 permits, costs of implementing other TMDLs beyond the Bay TMDL, and generally increasing liability for infrastructure renewal.

On a state-wide basis (for localities in the Bay Watershed), a second expert engineering firm has confirmed the extraordinary costs for urban stormwater. [FN11] The firm has estimated the total capital costs for Virginia localities in the Bay Watershed to be approximately \$39.4 billion, with an annual cost (including O&M) of \$4.2 billion. Based upon a typical industry approach to calculating stormwater bills, this translates to approximately \$1,200 per year for a representative residential house, \$11,100 per year for a representative small business (e.g., convenience store or gas station), \$73,800 per year for a representative neighborhood shopping center, \$24,600 per year for a representative church or place of worship, and \$1.1 million per year for a representative regional mall. This would place a high burden on a household based upon median household income (approximately 2.0% to 2.7%).

Elsewhere, EPA has estimated that the cost for retrofits for existing MS4s may be \$7.9 billion per year for the Bay TMDL watershed.[FN12]

The nationally-recognized Center for Watershed Protection has estimated urban retrofit costs at on the order of \$88,000 per acre.[FN13]

A. Case Study Demonstration: York River Basin

Agricultural management practices include most of the practices that EPA and others (e.g., Chesapeake Bay Commission, 2004) have identified as the most-cost effective, including nutrient management, conservation tillage, cover crops, and riparian buffers. Compared to many urban and wastewater-based practices, these practices provide much higher levels of ancillary environmental benefits such as wildlife habitat, stream habitat protection, flood control, and greenhouse gas reduction. To illustrate these points, Appendix 5 [Comment Letter refers to additional information in the form of an attachment. See comment 0574.1.001.001] presents a case study of alternative nutrient controls for the York River basin using the Virginia Tech peer reviewed BMP Benefit Planner ver. 1.1 (Malcolm Pirnie, 2010). For the case study the above referenced model was used to compare EPA's recommendations for the York River basin with an alternative scenario that would achieve a similar level of nutrient reduction. The alternative scenario consisted of returning municipal point sources to existing requirements (TN= 6 mg/L, TP=0.7 mg/L, design flows), reducing urban storm water BMP acreage by 50% and increasing agricultural BMPs by 20%. The results indicated the following:

- Reduced capital costs by approximately 50% (~\$1B)
- Reduced operation and maintenance (O+M) costs by 50% (\$32M/yr)
- Increased carbon sequestration by approximately 20%
- Significantly reduced green house gas (GHG) emissions
- Increased ancillary benefits associated with wildlife habitat, flood hazard protection, and base-flow projection

VAMSA is providing this example not because we agree with the specific inputs (in particular the urban stormwater aspects), but to make the general point that it is possible to derive a greater environmental benefit at a lower cost if flexibility is allowed in the TMDL. EPA should consider these types of cost issues and options before it finalizes the Bay TMDL. To do otherwise is indefensible.

Organization: INVISTA - Waynesboro

I am writing on behalf of the INVISTA - Waynesboro manufacturing facility located in Waynesboro, Virginia. INVISTA's Waynesboro site makes a significant contribution to the Virginia economy. As of August 31, 2010, INVISTA employed approximately 500 individuals at the Waynesboro site - not including outside contractors - in a wide variety of roles that include management, administration, R&D, utilities, maintenance, mechanical, project management, and production

jobs. Based on an economic multiplier of 4.2 for fiber manufacturing in Virginia (as calculated by the U.S. Dept. of Commerce Bureau of Economic Analysis), INVISTA Waynesboro is responsible for the effect of creating more than 2,000 jobs in the Virginia economy

Response

EPA acknowledges the comment.

Organization: Virginia Department of Transportation (VDOT)

We understand that more detail will be provided in the Phase II WIP and revised TMDL. However, the cost implications of this program are too significant to wait until that time. Therefore, we request that EPA work in concert with the states and with input from stakeholders to conduct a comprehensive cost assessment related to WIP and TMDL implementation.

2. Concerns about the WIP implementation cost and the cost-benefit ratio of the water quality benefits. VDOT requests that EPA and the states analyze the cost implications of the draft WIP and draft TMDL for the various source sectors. VDOT also requests that the draft WIP and TMDL provide sufficient detail so that the costs of compliance can be understood by the regulated community within each source sector. For example, VDOT understands that the cost for Virginia to comply with the 2005 Tributary Strategy program (prepared as part of the 2000 Chesapeake Bay Agreement) was estimated to be about \$10 billion over a 15-year period (projected in 2005). As you know, the Tributary Strategy Program would fall short of meeting the target allocations required by the WIP and Chesapeake Bay TMDL. Therefore, the cost to Virginia for implementing the approved WIP/TMDL will exceed the \$10 billion estimated for the Tributary Strategy Plan, undoubtedly by a significant amount. The cost estimates for the Tributary Strategy Plan were based on 2005 dollars and the additional reductions required in nutrient and sediment loading to achieve the WIP/TMDL allocations would be significantly more costly per pound of removal compared to the Tributary Strategy Plan. The Hampton Roads Planning District Commission (HRPDC) conducted a preliminary cost analysis in 2010 for the 16 local governments in southeastern Virginia and concluded that the Chesapeake Bay TMDL implementation cost for the 16 local governments would be about \$679 million per year or about 10 percent of their total annual revenue. They also estimated that the capital cost of nutrient removal for the urban stormwater sector would be about \$15,000 per pound of nutrient removal. EPA's 2005 publication entitled National Management Measures to Control Non-point Source Pollution from Urban Areas estimates that the annual maintenance costs for typical BMPs used for nutrient removal to be \$2,200 for a sand filter and \$3,000-4,000 for a bioretention basin. According to the National Research Council publication entitled Urban Stormwater Management in the United States (2008), retrofitting an existing urban area with stormwater management designed for nutrient removal can be as high as \$850,000 per city block. According to the Center for Watershed Protection, the cost of stormwater retrofits per acre of treatment can range from \$40,000-120,000. All of these cost estimates reinforce the significant capital costs and operations and maintenance costs that will be necessary to implement the Chesapeake Bay TMDL. During a time of extreme budget challenges, VDOT and other affected public agencies cannot afford the costs of implementing the WIP/TMDL, without significant state/federal funding. In addition,

because the draft Virginia WIP and Chesapeake Bay TMDL is largely programmatic in its proposed initiatives, it is impossible for any agency to effectively estimate the magnitude of the cost implications of implementation. In our opinion, the lack of a comprehensive cost assessment and failure to identify and include specific funding mechanisms in the WIP and TMDL decreases the potential for successful implementation of these initiatives.

According to the EPA's draft TMDL, "the CWA authorizes EPA to provide funding to the Bay watershed jurisdictions through various sources, including but not limited to Chesapeake Bay Implementation grants, Non-point Source Control grants, Section 106 grants for water pollution control programs, the Clean Water State Revolving Loan Fund, the American Recovery and Reinvestment Act, and various grant programs targeting Chesapeake Bay restoration. The funding will help the jurisdictions meet their pollutant reduction targets." (Page 7-3 of the draft TMDL for the Chesapeake Bay). According to the EPA website on the Chesapeake Bay Executive Order (EO), more than \$490 million is targeted in FY 2011 toward meeting the outcomes and goals set forth in the EO Strategy, contingent upon appropriations by Congress. If the stated intent of Congress through the Clean Water Act is to provide funding to cover the WIP/TMDL costs, then EPA must analyze the cost of TMDL implementation and identify additional funding mechanisms to offset the implementation cost to the affected source sectors and affected parties.

- Incorporating estimates on the overall implementation cost of the TMDL benchmarks as well as a cost-benefit analysis on individual sector improvements within urban developments, on-site septic systems, agricultural lands and wastewater treatment facilities; and,

Response

EPA will not be performing a cost-benefit analysis or an estimate of implementation cost as part of the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Comment ID 0322.1.001.001

Author Name: Calamita F.

Organization: Stormwater Association of Maryland, Inc. (SWAM)

In the Draft WIP, the State has proposed three options for Phase I MS4 permittees. Option 1 would require that all Phase I MS4s retrofit/restore 30% of existing untreated impervious area by 2017. Option 2 would increase the retrofit/restoration percentage to 40%. Option 3 would increase the percentage to 50%.^[FN 2] If the 2017 goal is not met, the WIP indicates that these percentages would increase to 60% or even 70%:

If the strategies fall short of the 2017 goal, increase MS4 permit requirements for MD's largest counties and the State Highway Administration to require installation of stormwater controls on 40% or 50% of their impervious surface by 2017 in their jurisdictions that do not already have stormwater controls. The 2020 goal would increase to 60% or 70%, respectively, depending on the option selected.^[FN 3]

Likewise, the Draft WIP proposes to establish a mandatory 20% retrofit/restoration requirement for all Phase II localities.^[FN 4] There are no alternative options presented for Phase II communities.

In the Draft TMDL, EPA has largely adopted Maryland's Draft WIP approach. EPA has established what it is calling "minor-level backstops" for Maryland. This means that EPA has made minor adjustments to Maryland's nonpoint source ("NPS") allocations, but has made "[n]o changes to point source wasteload allocations that would affect NPDES permit conditions."^[FN 5] For purposes of urban stormwater, EPA explains that:

Maryland's draft Phase I WIP provides that 50 percent of the state's urban acres developed before 1985 in Phase I MS4 jurisdictions will be redeveloped or retrofit by 2020 to a 25% stormwater efficiency. Forty percent of the state's urban areas developed before 1985 in Phase II MS4 jurisdictions and smaller, non-MS4 areas will be redeveloped or retrofit by 2020 to a 25 percent stormwater efficiency. If those retrofit and redevelopment requirements are not sufficient to have practices in place by 2020 to meet Maryland's stormwater WLAs, EPA assumes that Maryland will increase these retrofit and redevelopment requirements accordingly.^[FN 6]

SWAM disagrees with EPA's and the State's approaches in that cost simply has not been reasonably considered or factored into the TMDL and WIP.

As both agencies are aware, local governments continue to suffer with tightening local budgets and reduced revenues. According to an October, 2010 Research Brief from the National League of Cities ("NLC"), "Local and regional economies characterized by struggling housing markets, slow consumer spending, and high levels of unemployment are driving declines in city revenues." The October brief shows that concerns over local fiscal health remain at the highest level in the 25 year history of the survey. Two of the major issues plaguing cities are declines in personal property and sales tax. As a result, NLC concludes that:

2010 reflects a number of downward trends for city fiscal conditions. The impacts of the economic downturn are becoming increasingly evident in city projections for final 2010 revenues and expenditures, and in the actions taken in response to changing conditions. The local sector of the economy is now fully [sic] the midst of a downturn that will be several years in length. The effects of a depressed real estate market, low levels of consumer confidence, and high levels of unemployment will likely play out in cities through 2010, 2011, and beyond.^[FN 7]

The National Association of Counties also conducted a survey of sample counties across the United States in June

2010 ("How Are Counties Doing? An Economic Status Survey"). According to the Executive Summary: "This survey reveals that the downturn continues to be widespread with counties of all sizes feeling the crunch from many directions." Furthermore, "[c]ounties report that they are using furloughs, layoffs and service curtailment to help reduce budgets that in many cases remain problematic because of continuing shortfalls."

In short, Maryland's local governments are in no position to fund an expensive and mandatory restoration/retrofit program that must be completed within the next nine years. Of course, this begs the question: How much would it cost to implement EPA's and Maryland's urban restoration/retrofit proposal?

SWAM submits for consideration by EPA and the State the attached Technical Memo by a national engineering firm with expertise in stormwater management. The Technical Memo estimates urban stormwater costs for Bay TMDL implementation on an annual per household cost basis. For a level of effort that approximates that of the Draft TMDL and Draft WIP, the analysis developed cost estimates to restore 50% of existing untreated impervious area over a 15 year term (the period required by EPA in its Draft TMDL). The result was an annual per household from a low of \$678 per year in 2011 to a high of \$1,717 in 2025. [FN 8]

The Technical Memo's cost estimate is only for urban retrofits; it does not include costs for stormwater management in unregulated areas or to pay for other costs associated with existing MS4 programs. Thus, total stormwater management cost increases would presumably be considerably higher factoring in increasing requirements of MS4 permits, costs of implementing other TMDLs beyond the Bay TMDL, and generally increasing liability for infrastructure renewal.

Elsewhere, EPA has estimated that the cost for urban stormwater control may be \$7.9 billion per year for the Bay TMDL watershed. [FN 9]

The nationally-recognized Center for Watershed Protection has estimated urban retrofit costs at on the order of \$88,000 per acre. [FN 10]

SWAM respectfully submits that the Draft TMDL and Draft WIP do not address these major cost issues in a reasonable manner.

For these reasons, at this time, SWAM finds unreasonable the proposals in the Draft TMDL and Draft WIP that would mandate major increases in Phase I MS4 restoration/retrofit and the establishment of similar requirements for Phase II MS4 permittees.

SWAM respectfully requests that EPA and the State each conduct thorough cost and cost-benefit, and affordability analyses before adopting a final TMDL or WIP with restoration/retrofit requirements beyond current permit requirements

Finally, SWAM requests that EPA and the State work closely with localities to define a reasonable approach and manageable level-of-effort that is affordable at the household level.

[FN 2] Draft WIP at ES-15; 5-23.

[FN 3]Draft WIP at 5-23.

[FN 4] Draft WIP at ES-15; 5-24.

[FN 5] Draft TMDL ES-8; 8-13.

[FN 6] Draft TMDL at 8-13. SWAM disagrees with the implication that MS4s are required to comply with WLAs or any other stated assumptions in a TMDL such as impervious area retrofit/restoration percentages. Section 402(p)(3) of the Clean Water Act provides that MS4s are to comply with the MEP performance standard ("Permits for discharges from municipal storm sewers-...(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable...") (emphasis added). This requirement operates in lieu of strict compliance with TMDL WLAs and other provisions of a TMDL. The final TMDL and WIP should incorporate the MEP standard for clarity on this point and consistency with the operative provision of the Clean Water Act.

Response

A TMDL is not a federal mandate. Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

EPA has reviewed the technical memo however, the recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan. EPA is not considering cost in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings

necessary to meet water quality standards given reasonable assurance that standards will be achieved.

Section 301(b)(1)(C) of the Clean Water Act, provides that there shall be achieved limitations such as those "necessary to meet water quality standards, treatment standards, or schedule of compliance. . . required to implement any applicable water quality standard." 33 U.S.C. § 1311(b)(1)(C); see also 40 C.F.R. § 122.44(d)(1). At the same time, the Clean Water Act also provides that permits for municipal dischargers "shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." 33 U.S.C. § 1342(p)(3)(B)(iii). EPA therefore recognizes that attainment of water quality criteria is an incremental process to be achieved over several permit cycles. See Preamble to the National Pollutant Discharge Elimination System--Regulations for Revision of the Water Pollution Control Program Addressing Storm Water Discharges, 64 Fed. Reg. 68722, 68731 (Dec. 8, 1999) ("At this time, EPA determines that water quality-based controls, implemented through the iterative processes described today are appropriate for the control of such pollutants and will result in reasonable further progress towards attainment of water quality standards. See sections II.L and II.H.3 of the preamble."); id. at 68753 ("EPA envisions application of the MEP standard as an iterative process."); id. at 68754 ("EPA also believes the iterative approach toward attainment of water quality standards represents a reasonable interpretation of CWA section 402(p)(3)(B)(iii).").

Organization: City of Chesapeake, Virginia

The City of Chesapeake, Virginia ("City") welcomes the opportunity to comment on the draft Chesapeake Bay Total Maximum Daily Load ("Draft TMDL") issued by the United States Environmental Protection Agency (EPA) on September 24, 2010.

The City has for many years operated under an individual Phase I MS4 National Pollutant Discharge Elimination System (NPDES) permit issued by the Virginia Department of Conservation and Recreation and is looking forward to its third renewal in the near future. The City has committed significant resources under our storm water utility program to further local and regional efforts to improve water quality in both the Chesapeake Bay and the Albemarle Sound in North Carolina. The City remains committed to doing its part to meet reasonable Total Maximum Daily Load (TMDL) goals.

The City is a member of the Hampton Roads Planning District Commission (HRPDC) and the Virginia Municipal Stormwater Association (VAMSA), both of which organizations have analyzed the Draft TMDL with the assistance of scientific and environmental experts. The City fully endorses the position adopted by the member localities at the HRPDC meeting on October 20, 2010, and the position of the VAMSA, which jointly include:

--The EPA fails to consider cost, cost effectiveness and cost benefit in the imposition of the Draft TMDL goals.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

During this difficult economic period for the nation and Virginia, we find our industry along with numerous Virginia businesses, local governments, farmers and the Commonwealth itself facing an unprecedented and unfunded Federal mandate - an untenable TMDL for the Chesapeake Bay. Regrettably, the EPA has chosen not to conduct cost analysis for the Bay TMDL, and we believe this mandate will not only extend the so-called jobless recovery period, but expand it into many other sectors of the state's economy. We request that EPA complete a comprehensive cost analysis.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Organization: Virginia Grain Producers Association (VGPA)

Agriculture is improving water quality through voluntary and incentive programs now. A recent USDA study (Conservation Effects Assessment Project) showed from 2003 to 2006, cropland reduced "edge of field" sediment by 64%, nitrogen by 36% and phosphorus by 43%. However, the impact to the Bay was only a 14% reduction in sediment, 15% in nitrogen and 15% in phosphorus. This presents three questions for us, "What is going on between the farm field? Why are farmers responsible for Bay impact beyond their fields? Will costly, additional mandates for agriculture really achieve EPA's water quality goals in the Bay?" In Virginia, agriculture has already met 52% of our nitrogen goals and 50% of phosphorus and sediment goals; according to calculations of those acres implemented through voluntary, incentive-based programs. We wonder if the goals set by EPA are achievable with today's population and need for food, fiber, feed and fuel. We believe that before millions more dollars are spent that EPA produce proof that the TMDL standards are achievable without economic disaster to the region. We also request proof that the current BMPs used in "Scenario Builder" and other model calculations actually will deliver significant water quality improvement in today's environment.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Organization: Virginia Grain Producers Association (VGPA)

Without assurance from EPA that goals can be met with the Bay region's economy intact, it is irresponsible for states and federal leaders to commit millions of taxpayer dollars towards the Bay clean-up effort. Virginia's agriculture and forestry contribute \$79 Billion to the Commonwealth annually making it by far the number one economic driver. This

sector must be protected and supported to thrive and grow. Water quality goals cannot be achieved without agricultural acres. By mandating restrictions, as EPA has in their "backstop" measures, EPA is hurting the industry that has and will continue to help them reach clean-up goals through voluntary measures. For example, a typical grain farm nutrient management plan (NMP) costs between \$3 and \$5 per acre. For a 2000 acre grain farm that is potentially \$10,000 for a plan that must be revised each year without any assurance that NMPs actually achieve improved water quality; especially considering farmers often apply less nutrients than called for in their NMP. The state of Maryland has required NMPs for some time showing no water quality improvements over states without a NMP requirement. Mandates do not achieve water quality but, willing participants do. Farmers work to mitigate any soil loss, put out as little fertilizer as they can and apply as few crop protectants as possible because each of these issues costs the farmer money and profits. EPA needs to allow our Virginia farmers to continue their already significant progress without additional regulations or mandates. We request an economic analysis from EPA of full Bay clean-up efforts including a breakdown of cost to each source sector.

Response

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Organization: Virginia Manufacturers Association VMA

Virginia has enacted legislation requiring implementation planning for TMDLs. Va. Code § 62.1-44.19:7. That legislation requires that such plans include an analysis of the associated costs, benefits and environmental impact of addressing impairment. Id. EPA has failed to do so here. As noted above, EPA does not have any independent authority to require or impose implementation plans on states. The Virginia WIP, if required at all, is required by Virginia law and, accordingly, must address all of the elements outlined in the relevant statutory provision.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

C. While The LI Sound TMDL Used a Cost-Effectiveness Metric In Determining Reductions, the Draft Chesapeake Bay TMDL Specifically Avoids Consideration of Cost-Effectiveness.

New York and Connecticut examined two alternative scenarios in developing the nitrogen pollution reduction plan under the LI Sound TMDL: (i) a "limit of technology" or "LOT" approach; and (ii) a "cost sensitive scenario [that] identified a level of nitrogen reduction estimated to maximize increases in [pollutant] levels relative to the implementation cost." LI Sound TMDL at 22. The LOT scenario, examined first, "reflected loading of nitrogen at the current limits of control

technology for point and nonpoint sources" at an estimated to cost \$2.5 billion to implement. Id. By contrast, the cost-effectiveness approach showed that, "[a]lthough the water quality improvements were nearly the same as the LOT scenario, the estimated cost of implementing the point source actions was \$650 million" -- a quarter of the cost associated with the LOT scenario. Id. at 23. Because of the vastly lower cost, the TMDL recommended -- and EPA approved -- "a 58.5 percent reduction in nitrogen from point and enriched nonpoint in-basin sources" as specified under the cost-sensitive scenario. Id.

EPA also allowed consideration of costs in examining the proposed participation of upstream states:

In this case, the states estimated 25 percent reduction in nitrogen loads from point sources (primarily POTWs) is reasonable because this level of reduction has been demonstrated as feasible through Biological Nutrient Removal (BNR) retrofits of existing facilities. These low cost retrofits were implemented at numerous Connecticut POTWs during Phase II of the Long Island Sound nitrogen reduction program. The reductions achieved by these retrofits support the predicted 25 percent reduction by out-of-basin sources. EPA believes that these estimates of future reductions make sense.

EPA Approval at 13. Indeed, as noted, the proposed upstream point source reductions were based on the less stringent and costly controls already implemented by Connecticut during an earlier phase of the TMDL. Of course, Connecticut and New York are employing more stringent and costly controls under Phase III of the LI Sound TMDL.

By contrast, the Chesapeake Bay TMDL expressly does not consider cost-effectiveness. Moreover, under the E3 and "relative effectiveness" scenarios adopted by EPA, each of the States is theoretically being treated the same. As we explain below, however, these scenarios penalize New York in two ways that it has no control over:

(i) New York's mere proximity in the Chesapeake Bay watershed causes its nitrogen inputs to be more "valuable" than inputs from certain parts of the southern watershed; and (ii) New York's climate makes it much harder to reduce nitrogen from treatment facilities -- a matter we discuss in more detail below. The result is that New York -- which does not benefit from a restored Chesapeake Bay watershed -- is being required to implement measures that are not cost-effective, while other States within the watershed will be able to employ cost-effective controls. [FN12]

[FN12] 12 While EPA may claim that the offset provisions of the Draft TMDL allow for a "leveling of the playing field" when it comes to cost, the reality is that NY sources are in no position to purchase offsets. This issue is discussed further below.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to Comment ID 0080-cp.001.002 for discussion of equity and allocations to New York.

I am a farmer in Rockingham County, Virginia. I am also a member of the Mennonite faith. I'm concerned that several issues being discussed will affect my lifestyle and potentially my ability to farm. Please understand I choose not to participate in the legislative process or government programs for my personal financial benefit in accordance with my religious beliefs. That said I sincerely hope the following information will be considered when developing and implementing both the TMDL and the Watershed Improvement Plan for the State of Virginia.

Sixth : Adding costly regulations without economic benefit may make young and beginning farmers unable to enter agriculture . The average age of farmers in the Chesapeake Bay watershed is increasing . Young and beginning farmers already face significant financial and environmental challenges which make farming difficult . Proposed regulations without offsetting financial benefit will only make this worse.

I appreciate the chance to comment on the proposed regulation. The environment is important to me and my family. We have worked hard to improve water quality in the Chesapeake Bay watershed . We hope all proposed regulations will be fair without putting our region, businesses and lifestyles at an economic disadvantage to other regions .

Response

EPA reminds the commenter that the TMDL is not a federal regulation.

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Organization: Virginia Association of Counties (VACo)

- Local fiscal impacts: Chief among VACo's concerns to local fiscal impacts. For example, the consulting firm, CDM, estimated that the costs associated with urban stormwater retrofits expected by EPA in the Virginia portion of the Chesapeake Bay Watershed will range between \$678 and \$1,717 per household per year until 2025. (To address the issue of cost and economic impacts, the comments suggested the establishment of high level study group similar to the Chesapeake Bay Blue Ribbon Panel. This Panel was chaired by former Governor Gerald Baliles and established in 2004 by the Chesapeake Bay Executive Council to "identify funding sources sufficient to implement basin-wide clean-up plans." After estimating total clean up costs to be \$28 billion, the Panel's chief recommendation was the creation of a regional \$15 billion Chesapeake Finance Authority. \$12 billion would be capitalized through federal appropriations, and \$3 billion from state contributions. These recommendations did not appear to receive serious consideration.)

The Metropolitan Washington Council of Governments (COG) is a regional association of 21 local governments in the Washington metropolitan region, whose combined population represents more than one-quarter of the population of the entire Bay watershed. I serve as Chair of COG's Chesapeake Bay and Water Resources Policy Committee, which developed these comments on behalf of the COG Board of Directors. I note that the District of Columbia, which has a different status in the Chesapeake Bay Program than the rest of COG's membership, does not share all of the concerns expressed in these comments.

Comments

1. EPA and States Should Address Financial Considerations

As described in EPA's TMDL document (ref. Section 6. Chesapeake Bay TMDL Development, Section 7. Reasonable Assurance & Accountability Framework, Section 8. WIP Evaluation & Draft Backstop Allocations, and Section 10. TMDL Implementation & Adaptive Management), neither the TMDL nor the WIPs address affordability, cost-benefit considerations, or the availability of funding for implementation. The absence of financial considerations leads us to question whether the load reductions specified by the proposed source allocations are financially feasible. The importance of such financial considerations will become more obvious during the development of the Phase II WIPs. (ref. Section 5.3 Phase 5 Chesapeake Bay Watershed Model).

Example:

Both state WIPs propose the use of highly ambitious levels of urban stormwater retrofits (Maryland, directly through several proposed options for reducing urban stormwater WLAs; Virginia, indirectly, through one of the EPA's proposed backstopping actions). Most COG members will not be able to achieve such levels without a significant amount of cost-share assistance. Moreover, on a cost-per-pound basis, urban stormwater retrofits are among the most costly ways of reducing nutrient pollution compared to other practices.

Recommendation #1: Provide a Comprehensive Cost Analysis

We recommend that each state, as part of its Phase II WIP and Two-Year Milestone development and in consultation with local governments, include a thorough cost analysis for urban stormwater retrofits as part of an overall analysis of cost affordability and cost effectiveness among the different sources of pollution and reduction practices. This analysis should be designed so that every local government with MS4 responsibilities will know just how much capital and operating expenses they will face as a part of their implementation responsibilities. The degree to which stormwater retrofits are required to achieve load allocations should not be set in the TMDLs themselves nor in the Phase I WIPs and should be periodically adjusted based on adaptive management principles (see Comment # 6) (ref. Section 10. TMDL Implementation & Adaptive Management).

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to comment 0501.1.001.005 regarding public sector point sources. EPA should address achievability of the Draft TMDL from a socio-economic perspective. It does not appear that EPA has taken the steps to assess the overall achievability of the allocations set forth in the Draft TMDL. We believe such an assessment is critical to the process particularly with respect to the socio-economic impact that the TMDL may have on the many businesses, states and regional economies falling within its wide scope. EPA should step back and perform such a full analysis, then allow review and comment from interested stakeholders.

Response

EPA will not be performing a socio-economic impact analysis in the TMDL for reasons discussed in the response to comment 0139.1.001.017. It is not EPA's intention to do economic harm to businesses and communities within the watershed.

Organization: Virginia Forest Products Association (VFPA)

Third, we have concerns regarding the potential cost of compliance taking into consideration the current economy. The Bay TMDL, which requires Virginia to develop a Watershed Implementation Plan (WIP), will have a high cost for compliance for all sectors. While we agree that there is a benefit of clean waters within the Bay and local watersheds, the economic costs for compliance must be balanced, and water quality programs cannot be developed in a vacuum without considering economic impacts to the economy.

Before moving forward with a finalized Bay TMDL, EPA must conduct a non-biased economic impact analysis. Experts from land-grant universities from across the watershed could be called upon to evaluate the actual costs of meeting water quality standards for businesses, citizens, localities, states, and the federal government.

Current funding estimates are only based upon the cost of installing the practice, and they do not account for costs like loss of productive land, replacing practices when weather damages occur, fluctuations in markets, etc. Economic conditions (lack of profits, increased input costs, additional credit not an option) means that extra money to meet regulations is non-existent.

Cost share funding will be critical to meeting demands of EPA. Forestry, as well as agriculture, lawn care, turfgrass, and others, have all seen depressed profits, just as the State and local governments have been facing historic deficits. Individual businesses, landowners, farmers, and the State cannot meet this unfunded mandate from EPA without

significant federal funding.

Response

EPA will not be considering economics or conducting an economic impact analysis as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to comment 0038.1.001.024 outlining the Federal effort towards the Bay.

Author Name: Wood Heather

Organization: Virginia Port Authority (VPA), Norfolk, Virginia

Need to consider cost-effectiveness:

The draft TMDL includes no consideration for cost-effectiveness or cost-benefit, which is unacceptable for a multi-billion dollar regulation that will affect stakeholder for decades to come. Retrofitting existing urban/industrial development with stormwater quality controls is the single least cost-effective method for achieving the Bay TMDL. For example, many agricultural practices and wastewater treatment plant upgrades can reduce phosphorus loads at capital costs of \$5-200 per pound per year. Industrial stormwater retrofits, by contrast, cost \$10,000-25,000 per pound per year. It is in the interest of VPA that the Bay TMDL recognize this disparity, and avoid saddling the industrial stormwater sector with impractical reduction requirements. Rather, the Bay TMDL allocations should be consistent with redevelopment-driven improvements.

Response

A cost benefit analysis is beyond the scope of the TMDL, as discussed in the response to comment 0139.1.001.017. EPA reminds the commenter that the TMDL is not a Federal regulation.

Author Name: Stainman S.

Organization:

8. EPA should fund WWTP upgrades where they will help comply with TMDL emissions.

Response

Funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems is relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish funding or sources of funding. For this reason, EPA does not consider funding to be relevant to the TMDL, but instead to the implementation of the TMDL.

That being said, EPA understands the significant cost pressures that both states and municipalities. There are several cost-share,

grant and technical assistance programs that EPA is funding in order to assist the Bay community in this undertaking. The \$11.2 million increase in Chesapeake Bay funding now totaling \$50 million will help the seven Bay watershed jurisdictions to develop new regulations, design Watershed Implementation Plans (WIPs), reissue and enforce permits, and provide technical and compliance assistance to local governments and regulated entities.

In addition, under the Clean Water State Revolving Loan Fund (CW SRF) program and American Reinvestment and Recovery Act (ARRA), the Chesapeake Bay jurisdictions received \$536.2 million in FY 2009 and FY 2010, which they can use to fund projects that help local governments reduce nutrient and sediment pollution affecting the Bay, including pollution from stormwater. Under the President's FY 2011 Budget, the Bay jurisdictions would receive an additional \$155 million in CW SRF funding.

Furthermore, two additional grant programs which target Chesapeake Restoration include the Water Pollution Control State and Interstate Program Support (CWA 106) and the Nonpoint Source Program (CWA 319). These programs will be receiving \$27 million and \$23 million, respectively, in FY 2010.

The challenges of protecting and restoring the Chesapeake Bay are significant, and we are continuing to work closely with all our partners to identify the funding needs required of future initiatives.

Organization: Binghamton-Johnson City Joint Sewage Board

The TMDL does not consider or address its socioeconomic impact as to each of the affected 92 Bay watershed segments. This is a material part of a required environmental impact assessment in New York and is also an essential tool to evaluate whether the TMDL violates the constitutionally-protected equal protection rights of citizens and residents in each Bay watershed segment. In the New York portion of the Bay watershed, for example, human population declines in the 20% range have occurred between 1970 and 2000. Federal estimates indicate that the human population in the New York portion of the Bay watershed continues to decline, and 22% of this population subsist on incomes that are below the federal poverty line. Thus, the TMDL's discussion of increasing population is not applicable to the New York portion of the watershed. The TMDL cites some data regarding the economic impact of the Bay itself, but the economic discussion is incomplete because there is no mention of the economies of all Bay watershed communities or the socioeconomic impact implementation of the TMDL will have on them. Each of the sub-sheds draining or discharging into the affected 92 segments covered by the TMDL must be fully-evaluated for socioeconomic impact, including cost-benefit analysis in relation to direct economic benefit each segment derives from the Bay itself. Given our nation's heritage of honoring the principle of "equal protection" under the Constitution, federal laws and regulations, the TMDL must be fully inclusive of watershed-wide demographic and economic data analysis and point-out variations in conditions that exist and impacts that will result by region as well as within each of the 92 Bay watershed segments affected by the TMDL.

Response

Please see the response to comment 0080-cp.001.002 for a discussion of equity and New York and the response to comment 267.1.001.006 for a discussion of New York's responsibility to downstream states in regards to this TMDL.

EPA did not consider socioeconomic impacts for reasons discussed in the response to comment 0139.1.001.017.

E. Require Chesapeake Bay Impact Analysis for All Bay-Watershed Planning and Zoning Actions

To address potential concerns about uncontrolled or over-development, the EPA should consider requiring via the TMDL or WIPs that all local planning, zoning and land use matters in the Bay watershed include a mandatory Chesapeake Bay impact analysis. Such analysis appears necessary to control growth in shoreline states to the extent that further expansion and development threatens the Bay's WQ. If the Bay is to be restored, the unbridled development described in the TMDL which has contributed in large part to the degradation of the Bay MUST be brought under control (even to the point of imposing federal backstops which restrict or limit growth in Bay shoreline jurisdictions that do not attain their assigned WQ standards or required milestones).

Response

EPA does not have authority to require local planning or zoning ordinances. EPA has funded organizations to develop model ordinances which have been used as examples within jurisdictions. EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

EPA will not be estimating cost burdens as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay and the response to 0501.1.001.005 for discussion of public sector point sources.

Comment ID 0519.1.001.005

Author Name: Gibb G.

Organization: Northern Virginia Regional Commission (NVRC)

Cost Concerns

Local governments in Virginia strongly desire a constructive role in improving water quality in the Chesapeake Bay and all waters of Virginia. The Commission staff believes that a sound strategy for improving water quality to levels required by EPA will not succeed unless the economic costs associated with these efforts are fully understood, and a plan is developed for distributing these costs among the different levels of government. The USEPA need to understand that local governments in Virginia have major concerns about the costs that the TMDL initiative will impose upon local governments, especially with those associated with stormwater retrofits.

Unfortunately the USEPA has acknowledged in recent public meetings that the TMDL does not consider affordability or cost-effectiveness. Local governments have a responsibility to their citizens to seek cost-effective solutions. By ignoring cost, EPA's disapproval of Virginia's WIP essentially conflicts with the public interest in efficient and affordable regulations. The Commonwealth of Virginia additionally needs to undertake a cost analysis of the alternatives associated with individual allocation scenarios in the development of the Phase I and Phase" WIP. This analysis should be designed in a manner in which every local government will be able to understand how much capital and maintenance/operating expenses will be required as a result of their implementation responsibilities.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to comment 501.1.001.005 for discussion of public sector point sources and comment 0067.1.001.009 and Section 8 of the TMDL report for discussion of WIP backstops.

Comment ID 0530.1.001.005

Author Name: Gulibon Grant

Organization: Pennsylvania Builders Association

Issue #2: The cost of implementing the Chesapeake Bay TMDL, including the identification of funding sources and the associated economic impact, has not been fully considered.

PBA believes that EPA must encourage innovative pollution reduction options and support Pennsylvania's existing collaborative approach to the Chesapeake Bay TMDL in large part because it is acutely concerned about the costs associated with the Bay's restoration efforts. The activities currently being considering regarding builders and developers, such as no new discharges and requiring special septic systems, will have significant and lasting impacts on the industry's ability to continue to run their businesses and provide affordable housing. Likewise, the extraordinary costs of this rule are likely to further depress the already troubled economies of the Bay states, decrease tax revenues, and add to job losses.

EPA must assess the cost implications and affordability associated with the regulatory requirements it considers. The cost of the proposed new requirements on new development, and redevelopment in urban centers, for example, are

likely to be significant, and must be compared to other options that may be available to meet the same goals. The public is not an endless source of financing and the rule must be affordable to succeed. Many localities cannot currently afford to deliver the services needed by their citizens. Given the fiscal status of the federal and many state and local governments, as well as the continuing sluggishness of the national economy, serious questions exist as to where any proposed new public resources for the TMDL's implementation may come from. EPA has a responsibility to determine these costs, share that analysis with the public, and implement the most cost-effective solutions.

To be effective, the TMDL and its implementation plans must optimize costs and benefits and be designed to be implemented using available resources. To date, however, it is uncertain whether the proposal meets any of these goals, as EPA has included little data or information regarding how much the TMDL will cost or how its implementation will be funded. Absent this information, the public is at a loss to fully understand the overall plan or provide meaningful input. While EPA is quick to point out that the agency is not legally obligated to do a cost analysis for a TMDL, anyone who has had a hint of the potential cost of the new requirements will agree that a cost analysis is deserved for those who must foot the bill in these difficult economic times. A full cost analysis is also necessary because of the number of unique factors associated with the proposed Chesapeake Bay TMDL, including:

It is unprecedented in size and scope, as it extends over portions of 6 states and Washington, DC, an area of 64,000 square miles, a total of 92 watersheds, and 17 million inhabitants;

EPA expects it to be held up as a model for similar nutrient reduction programs that will occur around the country;

EPA is, in this proposal, taking an expansive view of its authority regarding state decision-making over land use, use of state finances, the stringency of state WIPs developed to meet the rule, and other matters that have traditionally been left to the states;

EPA intends to hold the states, municipalities, NPDES permit holders, and citizens responsible if the states do not live up to EPA's vision of complete compliance with the proposed rule; and

The stringency of the new pollutant reduction requirements will significantly strain the already challenged state and local government budgets and may simply be unaffordable for the states and localities covered by the rule.

For Pennsylvania's housing industry, the costs of the TMDL will be borne by the in the form of land, planning, and carrying costs; installation and maintenance of BMPs; and, given that Pennsylvania has set aside no pollutant allocation for future growth, the requirement to offset all pollutant loadings from new construction activities. These will ultimately be felt in the market as a combination of higher prices and lower output for the housing industry.

As output continues to decline and jobs continue to be lost in Pennsylvania's housing industry, other sectors of the economy that buy from or sell to the housing industry will also contract and lose jobs. Builders and developers already are being crippled by the economic downturn and the ability of the home-buying public to absorb significant new costs and the TMDL will further exacerbate these challenges. Further, because compliance costs are incurred prior to the home sales, builders and developers will be required to pay carrying costs, which add additional cost to projects. Because the vast majority of our membership consists of small businesses, even moderate cost impacts or variations between regulatory options can have dramatic and significant negative market impacts.

This rulemaking also promises significant consequences for commercial builders, contractors, proponents of public infrastructure projects, and virtually any facility operator that is contemplating expansion. There will be serious ramifications and unintended negative impacts on state and local governments responsible for completing their own construction projects, while also overseeing the implementation of the TMDL through the state and local permitting

programs. Obviously, the scope and the many unique features of the proposed rule alone constitute sufficient reason to conduct a comprehensive cost/benefit analysis of the Chesapeake Bay TMDL.

Response

EPA notes that the TMDL is not a Federal rulemaking. EPA will not be conducting a cost/benefit analysis as a part of the TMDL for reasons discussed in the response to comment 0139.1.001.017.

EPA is under legal obligation to establish a TMDL that allocates loadings of pollutants of concern to all sources in the watershed given reasonable assurance to meet water quality standards.

Author Name: Abraham Phillip

Organization: Virginia Association for Commercial Real Estate (VACRE)

VACRE urges EPA to delay adoption of the TMDL and any decision to impose backstops on the states for at least one year and until no sooner than December 31, 2011. We ask for this for the following four reasons:

Third, it is arbitrary and wrong for EPA to refuse to consider and incorporate cost-effectiveness into its proposed TMDL. EPA acknowledges it has not used any analysis of costs in the development of its proposed TMDL and says it has not done so because it is not required by law to do so. This decision in the urban/suburban sector of Virginia would require Virginia taxpayers to pay between \$12.5 billion and \$45 billion in costs for just the urban retrofit component of the TMDL allocation for Virginia over the proposed fifteen year period. As evidenced by the order of magnitude estimates prepared by Michael S. Rolband of Wetlands Studies and Solutions, Inc. and filed in this docket, much greater reductions in pollutant levels from the urban/suburban sector could be achieved at far less cost through the implementation of other available best management strategies, such as wastewater treatment (See Exhibit 2.1 of November 5, 2010 "Comments on the Commonwealth of Virginia Chesapeake Bay TMDL September 2010 Draft Phase I Watershed Implementation Plan" by Michael S. Rolband). Despite this evidence, one of the proposed EPA backstops for Virginia would require implementation of urban retrofits.

Organization: City of Rockville, Maryland

U.S. EPA should undertake an intensive effort to develop local program capacity to manage stormwater utilities.

As stated in the Maryland Draft Watershed Implementation Plan, the TMDL will heavily rely on local funding sources to implement the pollutant reductions expected on MS4 communities. Costs, time, and technical expertise will all be significant barriers to local stormwater programs enacting local funding sources. Therefore, we encourage U.S. EPA to devote substantial resources to building capacity in local programs to enact local funding systems, particularly stormwater utility fees. This capacity building effort should include read to use tools for assessing impervious surface cover, developing a rate structure, and billing customers. For example, U.S. EPA should consider hiring contractors to assist local communities to develop customized utilities.

This effort will yield a long term, stable funding source for local programs and will have greater benefits per dollar spent on individual pollution control projects. EPA may lack the funding to help every program build the stormwater retrofits required, but EPA can build the capacity for all programs to be successful.

Response

Although EPA agrees with the commenter that capacity building is an important part of the implementation of the TMDL, it is beyond the scope of the TMDL itself, which establishes the pollutant loadings to meet water quality standards. Please see the response to comment 0038.1.001.024 outlining the Federal effort for the Bay and the response to comment 0501.1.001.005 addressing public sector point sources.

Maryland should direct funding and technical assistance to NDPDES MS4 permit holders to support data gathering and asset management.

To help address the comment above, the Maryland Department of Environment can decrease the time lag between when NPDES jurisdictions receive their permits and the construction of retrofits by helping local programs assess their retrofit opportunities quickly and accurately. This assistance should include funding to hire contractors to prepare assessments, or for larger jurisdictions with more capacity, technical guidance on how to assess retrofit opportunities. In addition, MDE should also provide assistance to local programs so they may measure the performance of completed watershed improvements, which will help better guide the design and locations of future retrofits.

4. In the long run, implementing the TMDL will be less expensive than not doing so, for several reasons.

a. Unless we intend to completely abandon the commercial and recreational fishing industries that rely on the Bay, we cannot afford to allow water quality to get any worse, or even allow it to remain as bad as it is now. These industries have suffered terribly from the effects of poor water quality, and their troubles have had significant adverse effects on the economy of the Bay region. Strong action is needed to revitalize these industries so that they can again contribute to the region's economy.

b. Much of the region relies on the Bay and its tributaries for drinking water. According to EPA's own study [FN3], improving the quality of water in its natural setting is less expensive than treating that water to make it safe for drinking. As the region's population increases, demand for clean water will continue to grow. Allowing source water quality to continue to deteriorate will increase the costs of meeting future demand.

c. No discussion of the costs of implementing the TMDL is truly accurate or complete if it does not include an

examination of the economic benefits of the investments in clean water technologies that would result from implementation of the TMDL. Upgrading sewage treatment plants and implementing agricultural best management practices will support several thousand jobs in the watershed. Focusing exclusively on the costs of mitigation fails to take into account these economic benefits.

[FN 3] U.S. EPA. Economics and Source Water Protection. Presentation by Eric Winiecki.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. However, please see the response to comment 0251.1.001.002 for examples of how improved water quality benefits the local economy.

Comment ID 0571.1.001.005

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

These and other requirements will limit the affected state's ability to spend taxpayer dollars to the best advantage of its citizens. Yet these are the requirements that EPA wants other areas of the country to duplicate. As we have pointed out in previous comments, it is inappropriate for EPA to hold out the Chesapeake Bay TMDL as a model program for other water quality improvement programs to duplicate.

Response

EPA has communicated at public meetings that the nitrogen, phosphorus and sediment TMDL being established for the Chesapeake Bay watershed could provide lessons learned when nitrogen, phosphorus and sediment TMDLs are done elsewhere in the United States. As the Chesapeake Bay watershed enjoys a rich history of science and a wealth of data, the TMDL established will be defensible and will drive the control of pollution. Since nitrogen, phosphorus and sediment impairments are increasingly found on 303(d) lists throughout the nation, lessons learned in this watershed will likely be replicated as nitrogen, phosphorus and sediment TMDLs are developed elsewhere. States are required by law to develop TMDLs for waters identified as impaired on their 303(d) lists.

Comment ID 0572.1.001.004

Author Name: Robinson Steve

Organization: National Association of Conservation Districts (NACD)

We are concerned that EPA has proposed pollutant reductions that are not realistic nor economically or technically feasible, and has failed to quantify the associated costs and benefits. Before establishing a final TMDL, the agency should consider the economic and social impacts, providing transparent information regarding the cost of proposed water quality standards. The EPA should not move forward with a TMDL that is bound to fail due to unrealistic costs. NACD encourages the EPA to set achievable water quality standards and to fully take into account the economic and technical feasibility of reaching these goals.

Response

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. For this reason, EPA considers the comments and concerns not to be relevant to the TMDL, but instead to the implementation of the TMDL and the individual jurisdictions Watershed Implementation Plan.

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

II. EPA FAILURE TO CONSIDER COSTS IS ARBITRARY

A. Case Study Demonstration: James River Basin

The James River basin alone faces extraordinary costs if EPA's allocations are finalized. As the knee-of-the-curve below shows, it would cost over \$10 billion more on the James to comply with EPA's Draft TMDL allocations for chlorophyll-a.

[Figure 5: Knee-of-the-Curve Analysis for James River Chlorophyll-a WQS. Please see page 18 of original document 0575.1]

Figure 5 shows that the cost of the Tributary Strategy is approximately \$9 Billion. In addition, Figure 5 shows the estimated capital costs of attaining the chlorophyll-a criteria against the percent attainment rate. The capital costs include estimates for basin-wide wastewater treatment plant upgrades, agricultural BMPs, and urban runoff controls necessary to meet the allocations identified by EPA for the scenarios identified in Figure 5. The wastewater treatment plant capital costs are a function of design flows and level of treatment (biological nutrient removal, enhanced nutrient removal and limit of technology). Agricultural capital costs are based on BMP unit cost per acre and the BMP assumptions used in the Phase 5.3 Model. The urban runoff capital costs [FN 27] are based on the performance associated with the runoff reduction method for an estimated amount of retrofit controls that could be installed in a locality, which represents only a portion of the urban runoff costs. The costs for the remainder of the urban runoff reductions needed to meet the allocations would be achieved with stormwater capture/storage and reuse. The

estimated capital costs were prepared for the following EPA Scenarios:

- '91-'00 Base Scenario: Point "A" represents the James River TN and TP loading of 36.9 and 3.3 million pounds per year, respectively.
- EPA's Tributary Strategy: Point "B" represents the James River TN and TP portion of the Bay-wide loading, which is 27.5 and 3.3 million pounds per year, respectively.
- EPA's James Chl-a Compliance: Point "C" represents the James River TN and TP loading of 23.5 and 2.35 million pounds per year, respectively. EPA has selected this scenario as the basis for compliance with the James River chlorophyll-a criteria. EPA also refers to this scenario as "James Level of Effort at 1/2 Potomac". In the Draft TMDL (Appendix J), EPA states "In the James, the nutrient loads are equivalent to the level of effort halfway between Virginia's portion of the Potomac and the James for the 190/12 Loading Scenario." In other words, EPA is referring to a new theoretical scenario that is more stringent than the Virginia Regulations as to the James River but not quite as stringent as Virginia's Regulations require for the Potomac River, which have a far greater impact on Bay water quality.
- E3 (Everything, Everywhere, by Everybody): Point "D" represents the James River TN and TP loading of 16.1 and 1.5 million pounds per year, respectively. EPA considers this to be the "theoretical maximum levels of managed controls on all pollutant load sources". There are no cost and few physical limitations to implementing controls for point and nonpoint sources that are recognized in the E3 scenario. This scenario is used with the No-Action scenario to define the "controllable" loads, i.e., the difference between No-Action and E3 loads." See Draft TMDL at Appendix J.

The knee-of-the-curve analysis determines where the increment of pollution reduction achieved in the receiving water diminishes compared to the increased costs. There is a steep inflection at Point "B" that represents the knee-of-the-curve. Any reduction beyond Point "B" lacks a viable cost-to-benefit ratio and does not reflect a reasonable benefit. EPA has selected Point "C" as the basis for the James River compliance with the chlorophyll-a criteria, which is about half way between Point "B" and EPA's E3 scenario (Point "D"). If one assumes that the model predictions are accurate (about which there is substantial doubt), at Point "B", the James River would be 93 to 94 percent compliant with chlorophyll-a criteria compared to 99 percent at Point "C." However, the true difference in chlorophyll model output between Points "B" and "C" is only 2 to 3 ug/L (three parts in a billion). Additionally, the sampling and testing accuracies for physical water measurements is 1 to 3 ug/L. In other words, even if the loadings between Points "B" and "C" were achieved, it is unlikely that the difference in James River chlorophyll-a concentrations could be measured. The difference in the estimated cost of achieving the loadings between Points "B" and "C," on the other hand, is over \$10 billion- a sum that cannot only be measured, but will be paid by Virginians if EPA's Draft TMDL is adopted as is on this issue.

It is incumbent upon EPA to reconsider the basis for the James River allocations, considering the magnitude of the costs of attaining levels of load reductions required to produce a difference in modeled chlorophyll-a concentrations so small that they cannot be reliably measured. Further, it is incumbent upon EPA to consider these staggering costs as it finalizes its TMDL. At a minimum, EPA should not pass the knee-of-the-curve identified at Point "B" of the above graph. Assuming there is any real water quality improvement beyond Point "B," it would not be cost effective, could not be physically measured, and could not be reasonably attained. The only reasonable response is to set James River basin allocations should be based on the Tributary Strategy allocations.

Given this economic backdrop statewide and on the James and given the weaknesses in the model's predictive abilities at such a small scale,[FN 28] VAMSA cannot begin to understand EPA's decision to sidestep discussing the potential economic impact of the Bay TMDL on Bay dischargers. Furthermore, as noted above, EPA has said that it will not consider requests for a UAA to determine the feasibility of this TMDL. EPA's determination that it will take a lawful option off the table to consider cost-related issues and impacts is unjustifiable.

While VAMSA appreciates the more flexible approach evident in the WIP, VAMSA has similar cost concerns regarding the overall level of effort in the WIP as to Urban Stormwater.

[FN 27] Urban nutrient management was not included. The capital costs are based on meeting the waste load allocation for the Urban Runoff identified in Appendix Q-I of the Draft TMDL.

[FN 28] See discussion at Section i.e. regarding modeling issues.

Author Name: Knapp Leslie

Organization: Maryland Association of Counties (MACo)

Technical Assistance Needed for County Governments: In addition to the significant cost burdens imposed by the TMDL on local governments, there is also a need for technical assistance. Local governments, and in many instances the State, lack the scientific expertise necessary to fully comprehend the impacts of the many nutrient reduction strategies that will be proposed and implemented. Counties expect the private sector and even some in the public sector to propose many new and innovative strategies for achieving the TMDL goals and they need help to analyze the effectiveness of these strategies and develop adequate tracking systems.

Response

Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. One of the expectations of the jurisdictions Watershed Implementation Plans was to provide assurance to meet the TMDL allocations which includes an explanation of future program enhancements above and beyond current program capacity that will aid in meeting the required reductions, including technical assistance. This issue will be important as each jurisdiction develops their Phase II Watershed Implementation plans which will look at the TMDL on a more local level. Phase II is an excellent opportunity for the commenter to work with their jurisdiction to include more detail and suggestions to address the need for technical assistance for local governments.

Comment ID 0652.1.001.003

Author Name: Pandish Steven

Organization: William H. Gordon Associates, Inc.

The EPA has often spoken of the TMDL effort as "a pollution diet" for the Bay. This is a thoughtful phrase as it implores us to realize the Bay is living, and begins a dialogue about the health and welfare of the Bay utilizing medical terminology. Any medical treatment always involves the discussion of efficacy, a discussion of the benefit and potential "side effects" to the patient. In this case, the treatment is the regulation. The potential "side effects" from the proposed treatment (the regulations) may be economic stress and loss of jobs to our economy as jobs may move to other areas of the country.

It is arbitrary and wrong for the EPA to refuse to consider and incorporate cost-effectiveness into its proposed TMDL. EPA acknowledges it has not used any analysis of costs in the development of its proposed TMDL and says it has not done so because it is not required by law to do so.

The unknown associated costs may be the greatest impediment to an effective program. The economic impact of the proposed regulations must be understood, especially in consideration of the current economic challenges in the region. It is incumbent the EPA delay adoption of the TMDL and backstops, using this additional time to develop an analysis of costs and cost-effective solutions, to ensure we are moving in the right direction to achieve our goals.

Response

Please see the response to 0683-cp.001.003. EPA reminds the commenter that the TMDL is not a regulation.

Organization:

I am a farmer in Rockingham County, Virginia. I am also a member of the Mennonite faith. I'm concerned that several issues being discussed will affect my lifestyle and potentially my ability to farm. Please understand I choose not to participate in the legislative process or government programs for my personal financial benefit in accordance with my religious beliefs. That said I sincerely hope the following information will be considered when developing and implementing both the TMDL and the Watershed Improvement Plan for the State of Virginia.

Sixth: Adding costly regulations without economic benefit may make young and beginning farmers unable to enter agriculture. The average age of farmers in the Chesapeake Bay watershed is increasing. Young and beginning farmers already face significant financial and environmental challenges which make farming difficult. Proposed regulations without offsetting financial benefit will only make this worse.

I appreciate the chance to comment on the proposed regulation. The environment is important to me and my family. We have worked hard to improve water quality in the Chesapeake Bay watershed. We hope all proposed regulations will be fair without putting our region, businesses and lifestyles at an economic disadvantage to other regions.

Response

EPA reminds the commenter that the TMDL is not a federal regulation.

Please see response to 0159.001.001 to address economic impacts. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report also describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For additional information please see the response to 0139.1.001.017 which discusses the issue of cost analysis and EPA's desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

25 - WATER QUALITY DATA & MONITORING

Comment ID 0230.1.001.033

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

E. The historical chlorophyll-a monitoring data are too limited to support the TMDL

The level of data is inadequate for assessment according to EPA guidance. Data from the monthly fixed site data collection program from 1991-2000 was used as the TMDL base-line. Although the data is considered appropriate for monitoring of general status and trends (for which it was designed), it is considered too coarse to reliably support a TMDL with such high cost implications. For example, most James River segments are characterized by only 2 stations per river segment per month and the TMDL is constructed to address each water body segment individually. Because chlorophyll-a has been shown to be spatially patchy and dynamic [FN63] basing the segment interpolation (the basis for non-attainment calculations) on only a few stations would lead to unrepresentative results (see example in Figure 3) - especially during periods that the algae blooms are initiating, peaking, or dissipating. Because of these issues, the EPA has established in guidance that an "adequate" assessment of chlorophyll-a should employ a combination of fixed sites and DataFlow (EPA 2003). Also, according to EPA 2003, "the uncertainty associated with assessment of chlorophyll a criteria attainment using only the fixed station monitoring program would be expected to be quite high."

<"Example of patchy chlorophyll a distribution" Figure 3 on page 37 of Comment Letter EPA-R03-OW-2010-0736-0230>

To address these issues, one of VAMWA's members, HRSD, has been conducting weekly DataFlow (DFLO) on the lower James River (JMSMH and JMSPH) segments since March 2005. Monitoring of the LAFMH and ELIPH segments was added in March 2008. The Virginia Institute of Marine Science has been conducting DFLO cruises on JMSTF1, JMSTF2, and JMSOH segments on a monthly schedule. The VIMS and HRSD DFLO data, made available on the Virginia Estuarine and Coastal Observing System (VECOS) <http://www2.vims.edu/vecos/> in combination with traditional fixed sites, have been used by the VADEQ in order to improve the reliability of the resulting assessment. To evaluate the effect of the DFLO data collection on the regulatory assessment of James River chlorophyll standards, the VADEQ assessed the 303(d) results both with and without DFLO information.

The most recent results from the draft 2010 Integrated Report indicate that the regulatory outcomes (i.e., pass-fail) remained the same. However, non-attainment rates were consistently reduced by DFLO in all of the James River segments by an average of 6% (Figure 3a). The potential impact associated with the use of DFLO on the TMDL dataset (1991-2000) is not possible to determine because the DFLO technology did not exist at the time. However, the comparison above suggests that the use of only fixed-site data in the TMDL caused the allocations to be lower (and predicted non-attainment higher) than would have resulted if data would have been collected as EPA recommends. If DFLO is required for a chlorophyll-a water quality standards attainment assessment to be adequate, failure to include DFLO data will result in an inadequate attainment assessment.

<Figure 3a, "Chlorophyll Non-Attainment (2006-2008) Fixed sites only v. Fixed sites+DFLO" on page 38 of Comment

Letter EPA-R03-OW-2010-0736-0230>

Differences in non-attainment rates (between fixed sites and DFLO) are believed to be due to the number of sampling points evaluated and their relative influence on the resulting spatial interpolation step used in the assessment. Experience has shown that weekly data collections with DFLO data are essential to adequately capture bloom dynamics (initiation, peak, and dissipation) over the dimensions of space and time under which they occur. Improvement resulting from the use of DFLO data varies from cruise to cruise depending on the level of "patchiness" observed in chlorophyll-a distributions.

[FN63] See EPA 2003 (attached hereto as Appendix 23)

Response

In many cases of TMDL development there may be less data available than what is deemed optimal, however, lack of optimal data is not a pretext to the delay of TMDL development. Federal regulations acknowledge that load allocations are best estimates of the loading which may vary from reasonably accurate estimates to gross allocations (40 CFR 130.2(g)). TMDLs are supported by varying levels of data from rapid bioassessments of physical, chemical and biological conditions to extensive, long-term historical data sets such as that of the Chesapeake Bay Program Partnerships long term water quality monitoring data. The Chesapeake Bay Water Quality Monitoring Program data set represents and is recognized as one of the best long term estuarine chlorophyll and overall water quality time series data sets in the world. Chlorophyll data are only one parameter in the Chesapeake Bay water quality model as the model is simultaneously calibrated to a suite of physical, chemical and biological parameters all collected at fixed stations across 92 segments. Chlorophyll is not monitored or modeled in isolation.

The Bay TMDL and the supporting suite of models are based on a monitoring extending well into its third decade, carried out following consistent field sample collection and laboratory analysis methods at hundreds of stations across the Bay tidal watershed and the streams and rivers of the surrounding watershed. All assessments of these high quality monitoring data are carried out in strict accordance with each jurisdictions' promulgated water quality standard regulations.

States have adopted a rotation of segment evaluations in which the shallow water mapping complements fixed site data. If shallow water mapping data are available and have been submitted as approved data for assessment, the assessments will include the best available data. The latest update to the methodology for Chesapeake Bay chlorophyll a assessment is published in Appendix G of USEPA 2010. Therefore, the Chesapeake Bay Water quality Monitoring Program has moved forward since 2003 by incorporating water quality mapping as a program element. The rotation of segments mapped each three year period is a function of balancing resources across a multi-dimensional environmental monitoring program for Chesapeake Bay. Assessment methodology involves three years of data for water quality standards evaluation. The three year time frame appreciates benefits from multiple years of data accounting for temporal and spatial variation influencing the water quality standards assessment.

The fixed station data provide one estimate of water quality conditions, the addition of Dataflow data provides a second estimate. Both are estimates of an unknown quantity. As you stated in your comments, the addition of DFLO to an assessment varies in its effects compared with fixed station monitoring from cruise to cruise depending on the level of "patchiness" observed in chlorophyll-a distributions. As pointed out from the updates provided in USEPA 2010, such monitoring assessment methodology is

recommended as part of water quality standards assessment. Note, however, that the Chesapeake Bay water quality monitoring program addresses data collection tracking and reporting on many water quality parameters besides chlorophyll. Not all segments are monitored with water quality mapping each year. There is a rotation schedule for segment assessments every three years with scheduling based upon available monitoring resources. If an institution or agency has the resources to annually provide data sets using fixed and Dataflow data that have been QA/QC'd and accepted by the Chesapeake Bay Program Office and USEPA, then assessments would be conducted with the best available data.

EPA acknowledges and applauds the efforts and commitment of the Hampton Roads Sanitation District to carry out Dataflow monitoring following the same rigorous sample collection and quality assurance protocols as adopted by the states. It is in everyone's collective interest to collect and utilize high quality data to improve all our environmental decisions.

EPA appreciates that the addition of Dataflow data provides a second estimate. Weekly monitoring assessments however remain a snapshot in time with the possibility of missing phenomenon related to tidal cycles or storm events occurring at sub-week timescales affecting the true mean and variability of the data. Such variability can be appreciated when examining fixed station continuous monitoring or vertical profiler data records for diel variability observed across Chesapeake Bay. Still to be evaluated with Dataflow is an assessment of whether adding Dataflow data to assessments provides a high or low bias to the estimate of the true mean. Leading Bay region statisticians and data analysts have raised significant concerns that need to be resolved to the satisfaction of the larger partnership. This required evaluation is the responsibility of the Chesapeake Bay Program's Tidal Monitoring and Analysis Workgroup and the Criteria Assessment Procedures Workgroup. Prior to application of the DataFlow data for making regulatory decisions on water quality standards attainment, the proper assessment procedures must be developed and approved by the partnership (through the Chesapeake Bay Program's Water Quality Goal Implementation Team), published by EPA as an addendum to the original 2003 Bay criteria document, and then formally adopted by each of the four Bay jurisdictions' into their respective water quality standards regulations. Following this process ensures all seven watershed jurisdictions continue to have the highest level of confidence in the full sets of MD, VA, DE and DC's Chesapeake Bay water quality standards whose attainment are driving investments of millions of dollars annually.

Fully consistent with the concept of adaptive management, EPA strives to maintain current and updated science associated with criteria development and assessment. As evidenced by its work with the partnership and outside experts from academia, Federal, state, local governments, River basin commissions, NGOs, independent contractors and industry in producing and supporting the Chesapeake Bay estuarine water quality criteria and protocols for their assessment, the criteria assessment procedures published from 2003-2010 replace and otherwise supersede similar criteria assessment procedures originally published in the 2003 Regional Criteria Guidance and the 2004, 2007, 2008, and 2010 addenda (U.S. EPA 2003, 2004, 2007a, b, 2008, 2010). Publication of future addendums by EPA on behalf of the Chesapeake Bay Program watershed jurisdictional partners is likely as continued scientific research and management applications reveal new insights and knowledge that should be incorporated into revisions of state water quality standards regulations in upcoming triennial reviews.

G. Recent monitoring data shows that higher allocations than those proposed by USEPA may achieve chlorophyll-a standards in the lower James River region

As part of the James River TMDL chlorophyll-a analysis, EPA recommended that the chlorophyll-a criteria assessment be changed from arithmetic averages to log-transformed (i.e, geometric) means. The VADEQ evaluated the effect of this methods change on 2008 and 2010 303(d) Water Quality Assessments (VADEQ, 2010). [FN65] Their results indicated that the non-attainment rates decreased substantially for the lower James River region. The revised results for the 2010 Assessment (for years 2006-2008) indicated 99-100% attainment for the lower James River segments. Based on these observed results VADEQ believes that the "dissolved oxygen based" James River allocation (TN=26.79 mpy; TP=2.69 mpy) would also attain the chlorophyll-a standard in this region. According to our analysis the lower James River would likely attain chlorophyll standards at a much higher level of loading than the dissolved oxygen based allocations because model estimates of 2006-2008 delivered TN loads for the James River ranged from 35 to 36 mpy respectively. Source: http://www.chesapeakebay.net/data_modeling.aspx. This considerably higher level of loading was associated with near attainment (99-100%) with chlorophyll standards. These results also demonstrate that our previous recommendation to establish the James River allocations at "Tributary Strategy" level is more than environmentally conservative.

EPA has not provided appropriate justifications for additional reductions in allocation below "tributary strategies." In fact, EPA's position on this point is directly contrary to its own approach used to find the Potomac and Anacostia Rivers in compliance with its chlorophyll-a standards. In the case of the Anacostia River, EPA used an existing non-attainment rate of 4% in the monitoring data to determine compliance based on "other lines of evidence." [FN66] EPA's inconsistency in conclusions here between the Potomac and James rivers demonstrates the arbitrary nature of the EPA's TMDL.

[FN65] Attached hereto as Appendix 33.

[FN66] Draft TMDL, Sec. 6 at 40.

Response

The James River allocation is based on all James River segments attaining water quality standards, not just the lower James River. The present allocation reflects that system perspective for James River allocations.

It is true that after a period of analysis and evaluations, conducted through the Chesapeake Bay Program's Criteria Assessment Protocol Workgroup with membership participation from across the Chesapeake Bay Program partnership, that EPA recommended that the chlorophyll a criteria assessment methodology be changed from arithmetic basis to log-transform basis. The sound scientific and statistical basis was developed and published in USEPA 2010 Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries: 2010 Technical Support for Criteria Assessment Protocols Addendum. EPA 903-R-010-002. Region III Chesapeake Bay Program Office, Annapolis, MD.

The Chesapeake Bay TMDL sets a 60% implementation target for 2017 with 100% of all the necessary practices and technologies in place by 2025. Virginia's Watershed Implementation Plan has outlined the Commonwealth's commitment to achieve 100% of

nitrogen and phosphorus reductions necessary to achieve its dissolved oxygen water quality standard based allocation by 2017 and 60% of the chlorophyll a water quality standard. If by 2017, Virginia has monitoring data that indicates achievement of the Commonwealth's chlorophyll a water quality standard within specific segments of or the entire tidal James River, that new assessment information can be factored into the 2017 evaluation of the Bay TMDL.

Observations and reports of algal blooms in the lower tidal James River this past summer clearly point out the river is still not a healthy ecosystem. EPA and Virginia will continue to closely monitor and assess the tidal James River along with many other organizations and citizens groups with a shared objective of restoring a healthy and productive James River ecosystem.

Author Name: Dickey Dean

Organization: Prince William County Service Authority (PWCSA), Virginia

In addition to the likely impairment of the areas drinking water supply, the imposition of a 4 mg/l TN based WLA on the UOSA facility would do virtually nothing to improve the water quality of the Potomac River or Chesapeake Bay. OWML has had an active monitoring program for over three decades and has decisively shown that very little of the UOSA nitrogen discharge passes over the Occoquan Dam to reach the Potomac River and the Bay. In fact, OWML research has demonstrated that reducing nitrate in the UOSA effluent could increase ammonia and phosphorous desorption rates from the reservoir sediments and potentially increase nutrient discharges to the Potomac River and Chesapeake Bay. Therefore, the expenditure of tens of millions at UOSA to reduce nitrogen discharges would have a negligible positive impact on any downstream waters and may in fact increase nutrient discharges from the Occoquan.

Response

Thank you for your comments regarding the TMDL. With respect to the issues related to water quality and Occoquan reservoir:

1. EPA does not agree that very little of the nitrogen in the Occoquan system passes over the Occoquan dam. According to a presentation to the modeling subcommittee by Dr Arthur Butt (VADEQ) on 11/14/96, 42% of the nitrogen reaching the Occoquan reservoir passes over the dam, based on OWML research. This percentage is higher than more than a third of the modeling segments with simulated rivers.
2. Given that a pound of reduction at the Occoquan facility is less effective than other sources in the lower Potomac and information on the Occoquan reservoir functioning VA may want to consider these points in the watershed implementation plans, however from that perspective of the tidal water, there is a load from the Occoquan that must be accounted for.
3. The Occoquan data you cite was not in the monitoring data prepared by USGS for the phase 5 watershed modeling effort. If you provide us access to the monitoring data and we'll use it calibrate the Phase 5.3.2 Chesapeake Bay Watershed Model.

Comment ID 0414.1.001.015

Author Name: Myers George

Organization: Milton Regional Sewer Authority

Nutrient Inputs to the Bay Is a Guess

While POTW's report exact nutrient contributions in their discharges in their monthly DMR's the volume of nutrients entering the Chesapeake Bay is a modeling guess. In the case of New York and Pennsylvania continuous sampling of just a few points would allow the exact calculation of nutrient contributions to the Bay.

It is troubling that the exact amount of nutrient and sediment reaching the Bay from Pennsylvania is not known through continuous measurement, but rather estimated by model. For example, DEP asserts that if more BMP's were reported in Pennsylvania, the model would predict that less nutrient and sediment would reach the Bay even if those BMP's had been implemented years ago. That does not make sense. The point source community monitors its effluent in accordance with their NPDES permits. Why does PA not monitor what it discharges into the Bay? Previous inquiries indicate that it is not DEP's responsibility to undertake such monitoring, but rather the USGS's. Why would the process of adding additional data into a model result in Pennsylvania discharging less to the Bay? This just does not make sense and causes one to question the entire TMDL process.

1. What are the results of sampling the Susquehanna River at the Mason-Dixon Line? Please describe the scope and extent of the data.
2. Please confirm that DEP's assessment in the WIP is correct and that the simple reporting of more BMP implementation would reduce Pennsylvania's contribution to the Bay.

Response

Thank you for your comments and questions regarding nutrients entering the Bay and their measurement.

Yes, the wastewater discharging facilities are regulated through NPDES permits and are required to monitoring their load contributions to the rivers and streams of the watershed. This data is used to help calibrate the Chesapeake Bay Watershed and Bay Water Quality Models as well.

PA does monitor what it discharges to the Bay through its work with the Chesapeake Bay Program's Nontidal Monitoring Network. It does this work in coordination with USGS. Monitoring is expensive. USGS and PADEP along with SRBC combine resources to make measurements that tell us how much and what kinds of nutrients and sediments are moving down the rivers and streams of PA.

The commenter is actually speaking about two different models. First, monitoring what comes out of PA is measured essentially at Conowingo Dam near the PA/MD border. The river flow is actually measured continuously. Nutrients and sediment concentrations are measured 20 times per year which largely reflects the balance of available, limited funding resources when we need to monitor 64,000 square miles of Chesapeake Bay watershed at different scales of space and time. Since TMDL is about a Total maximum

daily load, a nutrient or sediment load in its simplest form is the nutrient or sediment concentration measured multiplied times the measurement of river flow. That estimates your load at that point in time. To know the total load coming from PA, year round continuous measures of river flow data are used and combined, using statistics, measures of concentration at points in time filling in the gaps where we don't have concentration data but we know a lot about how flow and concentration are related. USGS has published the method used with the Susquehanna River and you can view that document from 2000, "A revised load estimation procedure for the Susquehanna, Potomac, Patuxent and Choptank Rivers" at <http://pubs.usgs.gov/wri/wri00-4156/wrir-00-4156.pdf>. This is known as The ESTIMATOR model.

This is not terribly different than the publicly owned treatment works (POTWs) measuring their discharges. Unless POTWs measure nutrient concentrations instantaneously, 24 hours a day, 365 days a year, then a POTW is not going to know exactly what is being discharged, it remains an estimate based on continuous monitoring of flows multiplied times concentrations collected at points in time. The difference between the POTW measures of discharge and the measures of the amount of nutrient going through Conowingo Dam comes down to error bars on the estimates and some differences in the model used to estimate the load. That said, technology has advanced and increasingly there are real time monitoring instruments coming online that allow for instantaneous evaluation of nutrients and sediments in flowing waters. It is likely that both in the field and at POTWs in the future that we will be able to talk about measuring 'exact' nutrient contributions, except that we can't measure every ounce of water with the point of a single meter. As you might imagine, not only is there variability in what comes down the river, there is variability in the concentration across the width of the Susquehanna River. There is also variability within the cross sectional flows of your discharge and there is likely variability between split samples in your QA/QC at a POTW - laboratory assessment variability. In each case, field and POTW, we get estimates of the nutrients in the flows.

Now, another concern here is regarding BMPs and whether or not accounting for more would result in less nutrients and sediments reaching the Bay. There is the Chesapeake Bay Watershed Model that includes an accounting of BMPs in place across the watershed. This is a different model than the one that tells us how much nutrient and sediment is coming over the fall line at Conowingo Dam, the ESTIMATOR model. How much nutrient and sediment coming over the dam is pretty well known because we do measurements through out the year, water flow all the time every day, nutrient and sediments monthly and in storms. The watershed model is a model that tries to capture all that occurs with weather, development, agriculture, urbanization, and more and from the interaction of all those activities and processes, it computes the water quality entering the stream. Real data serve to calibrate the model. Therefore, adding more BMPs to the watershed model can't make more nutrient and sediment go away because we have data that tells us how much is really there. The model has to fit the data as best it can. This is called tuning the model.

Once the model is calibrated, then you can input BMPs to look for how much improvement there is in water quality or whether there is any change at all.

Regarding "What are the results of sampling the Susquehanna River at the Mason-Dixon Line? Please describe the scope and extent of the data."

The Chesapeake Bay Program's nontidal watershed water-quality network (NTN) is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed established in the 1970s (34 sites) and enhanced in 2004 (with an additional 51 sites). This network is an essential component to reporting, tracking, and modeling nitrogen, phosphorus and sediment concentrations and loads in the Chesapeake Bay Watershed. The NTN provides the only long-term, consistent, and coordinated

monitoring effort across all jurisdictions in the Chesapeake Bay Watershed (see section 5.2.2 of the TMDL documentation for further details).

There is one station in the NTN on the Susquehanna River that is close to the Mason-Dixon Line at the Conowingo Dam. This site has been monitored since the 1980s, 20 times a year (once a month and then 8 targeted rainstorm events) for nitrogen, phosphorus and suspended sediment. There is also continuous real-time streamflow monitoring at this location. This station is part of a subset of the sites called the River Input Monitoring Sites where water quality is monitored upstream of the transition area between the tidal and non-tidal regions of the 9 major rivers of the Chesapeake Bay. For a comparison of (1) total nitrogen and total phosphorus concentrations (1985-98), (2) streamflow (1990-98), (3) load (1990-98), and (4) yield (1990-98), at the nine RIM stations see the following link for more information: <http://va.water.usgs.gov/chesbay/RIMP/watchemplots.html>.

Although these figures do not include the most recent 10 years of data, they do give a general idea about the relative status of 9 major river basins in terms of concentration, load and yield of pollutants. The boxplots show the distribution of the data with the middle line of the box plot representing the value that characterizes half of the data. The most recent statistics for the Conowingo Dam site are included in Table 1. The entire data record is available at: <http://va.water.usgs.gov/chesbay/RIMP/dataretrieval.html>. At this location, trends in nitrogen, phosphorus, and sediment concentrations have decreased, had no change, and decreased respectively from 1985-present (see links:

http://www.chesapeakebay.net/status_flowadjustednitrogen.aspx

http://www.chesapeakebay.net/status_flowadjustedphosphorus.aspx

http://www.chesapeakebay.net/status_flowadjustedsediment.aspx

Table 1. Basic statistics for water quality in the Susquehanna River at Conowingo Dam

	Total Nitrogen	Total Phosphorus	Total Suspended Sediment
	1981-present	1981 - present	1981-present
	kilograms/day	kilograms/day	kilograms/day
Min	13,300	336	81,200
Mean	168,653	6042	3,244,138
Median	130,500	3520	933,000
Max	1,070,000	62,900	84,100,000

In answer to your second question, the watershed model predicts changes in loads due to changes in management actions. If a change in management is reported, such as additional BMPs, then modeled loads will reflect that. EPA's policy is to guard against load changes in the model without real load changes in the system by requiring that only BMPs that were implemented since the watershed model was calibrated are included in scenarios.

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

Comments #9 - The County strongly supports increased water quality monitoring so that our county, DEP, and EPA can accurately determine the minor contributors and treat them appropriately, and identify the major contributors and treat them appropriately. The County believes the EPA should collect more data, including water quality monitoring, before implementing any backstop measures.

To the extent possible, any federal and state actions should be based on actual monitoring data rather than modeling. The County strongly opposes any regulatory allocation that is not based on concrete monitoring data. BMP improvements may take a significant amount of time from implementation until a measurable water quality improvement is noted through monitoring. The reliance on modeling has long been a concern to the Lycoming County Commissioners, who feel that models may not accurately reflect the local conditions. This is the reason that the County is currently working on a pilot water quality monitoring program as part of its Chesapeake Bay Nutrient Management Strategy.

Response

Thank you for your interest and concerns with water quality monitoring in the Chesapeake Bay and its watershed. EPA is aware of Lycoming County's leadership in Bay restoration efforts and the development of your own water quality monitoring program in Lycoming County. The Chesapeake Bay Watershed Monitoring Coordinator, located at the Chesapeake Bay Program Office in Annapolis MD, plans to stay in touch with you regarding your progress, challenges, and successes and potentially seeking your help in sharing lessons learned with other counties.

The Chesapeake Bay Program partners has made a long term investment in monitoring of the tidal waters and the free flowing streams and rivers now well into its third decade. The partnership has long relied upon a balance of scientific understanding, monitoring and assessment, and application of modeling tools to help support its decision making. But the bottom line—restoration of water quality to the Chesapeake Bay and a healthy Chesapeake Bay watershed ecosystem—will always be measured through monitoring observations.

Any monitoring program is a balance of system understanding, available resources to distribute monitoring frequency against spatial resolution, and the incorporation of technological advances that can effect efficiency and data density options in the data collection effort. For the Bay and its tidal tributaries, since 1985, the fixed-station water quality monitoring program as described in Section 5.2 of the draft Bay TMDL documentation has consisted of approximately 140 stations sampled 14-20 times per year. This Chesapeake Bay long term water quality monitoring program is designed to provide a long term record of water quality measurements that reflect seasonal and interannual variations in such parameters as dissolved oxygen. Changes in sampling frequency during a year have fluctuated due to funding resources and Chesapeake Bay Partnership priorities for the distribution of funding resources available. A shallow water monitoring program was deemed most appropriate for assessments of water clarity criteria linked with annual submerged aquatic vegetation monitoring via aerial photograph interpretation. For chlorophyll a, the recommendations for monitoring are combined fixed station plus shallow water mapping data. For further details that compare recommended, adequate and marginal levels of monitoring for dissolved oxygen, water clarity and chlorophyll a monitoring and assessment of water quality standards for Chesapeake Bay, please refer to Chapter VI: Recommended Implementation Procedures in USEPA (2003) Ambient Water Quality Criteria for dissolved oxygen, water clarity and chlorophyll a for Chesapeake Bay and its

tidal tributaries. April 2003. EPA 903-R-03-00. The document is available at the Chesapeake Bay Program publications website: http://www.chesapeakebay.net/content/publications/cbp_13142.pdf . There is an additional suite of addendum documentation supporting the original 2003 work:

U.S. Environmental Protection Agency. 2007b. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries –Chlorophyll a Addendum. October 2007. EPA 903-R-07-005. Region III Chesapeake Bay Program Office, Annapolis, MD.

U.S. Environmental Protection Agency. 2008. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries 2008 Technical Support for Criteria Assessment Protocols Addendum. September 2008. EPA 903-R-08-001. Region III Chesapeake Bay Program Office, Annapolis, MD.

The Bay data serve as one of the rare and most extensive continuous estuarine water quality monitoring data sets on earth having grown from approximately 10,000 data points collected per year in the 1980s to a current level of over 10 million data points collected per year for chemical, physical and biological attributes of the Chesapeake Bay and its tidal tributaries and embayments. These data pass through field, laboratory and database QA reviews according to EPA approved protocols. Data from these data sets are publicly available through the Chesapeake Information Management System housed at the Chesapeake Bay Program Office and are used not only for Clean Water Act 303d water quality standards assessments but also to calibrate and validate the Chesapeake

Bay Water Quality Model.

Further, the Chesapeake Bay Program non-tidal watershed water-quality monitoring network (NTN) is now a network of 85 stream flow gages co-located with water-quality sampling sites operating across the watershed. This network is an essential component to reporting, tracking, and calibrating models of nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed. The NTN provides the only methodologically consistent, QA consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. Primary nutrient and sediment load stations are sampled 20 times per year as 12 base flow measurements typically one sample per month to characterize base flow conditions of the annual seasonal cycle and 8 storm flow samples, ideally 2 storms per season to reflect storm conditions of the watershed interseasonally. Storm samples are needed to more accurately estimate the amount of nutrient and sediment moved by the elevated storm flow conditions. Because the water quality sampling events are linked to flow gages that track water flow conditions 24 hours a day, 365 days a year, we can understand the relationships of flows and concentrations in producing loads. A subset of stations known as secondary stations only has 12 base flow samples per year, typically collected once per month to characterize seasonal and annual cycles. Concentrations are computed but not loadings at secondary sites, a small subset of full network of stations. The coordinated Chesapeake Bay watershed NTN network was instituted in 2004, however, a subset of the stations have longer data histories started by other agencies or institutions. There are more stations that have valuable time series but were discontinued as data collection sites for varied reasons. This additional abundance of quality assured data serves to calibrate and validate the water quality dynamics for the watershed model. In 2010, funding was put in place to support 3 new water quality monitoring stations in the Chesapeake Bay Program NTN, specifically in small watersheds (two in Conewago Creek, PA and one in Smith Creek, VA) where increased BMP implementation is expected. These are "Showcase Watersheds".

Monitoring 3rd order stream sub basins, normalizing the pollution levels by relating them to standard average nutrient/sediment loads divided by discharge would allow problem areas to stand out either through exceeding the average, or not changing from the average. Third order sub basins in some cases may be large components of, or in some instances the entire basin. Regardless, it would be a practical level to monitor especially in the James and very extensive Susquehanna. Additionally, because it breaks up the non-tidal basins into manageable sections it might offer incite into where new development and atmospheric sources play the greatest roles. Increasing the resolution, it allows for more adequate monitoring and data collection on changes affecting the landscape. While some WIPs may address this, this should be a standard for all Bay states so that the data that come into the modeling programs continue to be based on the same standard.

Response

Thank you for the recommendation for a consistent monitoring program for 3rd order streams. However, using the 1:100K National Hydrography Database, it was calculated that there are 10,470 3rd order stream segments out of 97,080 total stream segments. Developing a monitoring program whose aim alone is to monitor 3rd order streams would be impractical from a financial perspective as monitoring for nutrient and sediment pollution can cost up to \$46,000/year per monitoring station.

The CBP nontidal watershed water-quality network (NTN) is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed established in the 1970s (34 sites) and enhanced in 2004 (with an additional 51 sites). This network is an essential component to reporting, tracking, and modeling nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed. The NTN provides the only long-term, consistent, and coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed (see section 5.2.2 of the TMDL documentation for further details). Therefore, this is the water quality monitoring network that will ultimately be used to determine the effectiveness of TMDL pollution reduction activities at improving water quality in local waterways.

The NTN is mostly comprised of larger streams (greater than 1000 square kilometers) with primarily forested land cover. Other aspects of the network are that it is also comprised of watersheds with mixed agricultural and forested landuse, and there are few sites in urban landscapes and small watersheds. In 2009 a review was conducted of this monitoring network; it was concluded that new sites should be added to the nontidal network to facilitate the best characterization of the water quality in the Chesapeake Bay Watershed and to meet a variety of programmatic objectives including TMDL monitoring objectives. The new design of the network was suggested based on the following revised monitoring objectives:

o Measure and assess the status and trends of nutrient and sediment concentrations and loads in:

- Major tributaries and sub watersheds
- Selected tributary strategy basins;

o Provide data suitable for the assessment of factors affecting nutrient and sediment status and trends from major pollutant source sectors;

o Measure and assess the effects of targeted management and land-use change;

o Improve calibration and verification of partners' watershed models;

o Support spatial and topical prioritization of restoration and preservation;

The extensive scope of the objectives for the nontidal network implies that stream monitoring locations must represent a wide range of sizes, physical settings, spatial distributions, hydrologic settings, and pollution source sectors (point and non-point, and urban, agricultural, and developing-suburban land uses, etc.). It is suggested that these improvements to the existing NTN would provide a more effective monitoring program for tracking TMDL and WIP progress than would a network that monitors strictly 3rd order streams.

There are several products that originate from this monitoring data that have been useful in identifying hotspots in pollution in certain areas and where pollution is either increasing or decreasing over time. These products include: the flow adjusted concentration trend indicators for nitrogen, phosphorus, and sediment (ex.

http://www.chesapeakebay.net/status_flowadjustednitrogen.aspx) that describe trends over the last 20 years, and the yield-trend indicators for nitrogen, phosphorus and sediment that describe status and trends in pollution over the past 5-10 years (in press).

Why must the TMDL be based on a model estimate rather than based on actual water measurements at the various EPA CB monitoring stations?

Response

A TMDL (Total Maximum Daily Load) is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards, and an allocation of that load among the various sources of that pollutant. Pollutant sources are characterized as either point sources that receive a wasteload allocation, or nonpoint sources that receive a load allocation. Point sources include all sources subject to regulation under the National Pollutant Discharge Elimination System (NPDES) program, e.g. wastewater treatment facilities, some stormwater discharges and concentrated animal feeding operations (CAFOs). Nonpoint sources include all remaining sources of the pollutant as well as anthropogenic and natural background sources. TMDLs must also account for seasonal variations in water quality, and include a margin of safety (MOS) to account for uncertainty in predicting how well pollutant reductions will result in meeting water quality standards.

The objective of a TMDL is to determine the loading capacity of the water body and to allocate that load among different pollutant sources so that the appropriate control actions can be taken and water quality standards achieved. The TMDL process is important for improving water quality because it links the development and implementation of control actions to the attainment of water quality standards. Models are used to quantify the linkage between the source of pollution in the surrounding watershed with impairments to water quality conditions in the receiving waters, the Chesapeake Bay and its tidal tributaries and embayment in this case. The Chesapeake Bay models are developed, calibrated, and verified using extensive set of water quality monitoring data collected in the watershed (for the Chesapeake Bay Watershed Model) and the estuary (in the case of the Chesapeake Bay Water Quality and Sediment Transport Model). Models enable us to answer questions like “if we reduced the level of pollutant loads from these sources by these levels, would water quality in the Chesapeake Bay be restored to level that would meet water quality standards.”

In Chesapeake Bay, there are dissolved oxygen, water clarity, submerged aquatic vegetation (SAV), and chlorophyll a water quality criteria that Maryland, Virginia, Delaware and the District of Columbia have adopted in their water quality standards regulations. The nutrient and sediment allocations within the Bay TMDL based on the maximum amount of those pollutants that will provide water quality that meet the standards is calculated from a model because water quality conditions now are out of attainment with the standards in most areas of the Bay. The models, calibrated and validated with actual monitoring data, peer reviewed by the scientific and management community, are used to compute how much we need to reduce pollutants and what the target levels of loadings are in order to achieve water quality standards that are in the regulations. Water quality monitoring data is used to assess whether Maryland, Virginia, Delaware and the District of Columbia are actually achieving their Chesapeake Bay water quality standards.

Analysis of water quality conditions will not provide the information necessary to establish limits on pollutant loadings necessary to restore water quality. At the same time, modeling results can not be used to determine if a jurisdiction’s water quality standards are

being achieved. However, applied together in their unique roles, monitoring data and model simulation can help support the decision making needed to take the actions needed to restore water quality in stream, rivers and the Chesapeake Bay.

It is commonly understood that if each of the Bay states had New York's current water quality (as measured near the Pennsylvania border near Sayre, Pa), excess nutrient and sediment issues would not exist in the Chesapeake Bay. This concept is reflected in NYSDEC's New York State Tributary Strategy that states "Monitoring data shows generally good water quality in New York and that nutrient and sediment levels are declining. This is largely due to a strong water stewardship ethic and an increasing amount of forest land cover."

At the Martinsburg, WV meeting, we were shown bar graphs with written amounts for discharge by agriculture, then after questions were told that they were established models. We were also told, after further questions, that these numbers came from sample points. I have farmed over 40 years, spent 8 years on the WV FSA State Committee, 6 years on the Jefferson County FSA Committee and 10 years on the NE SARE Committee and have visited hundreds of farms, but have never been aware of or seen a sampling device as described at the November 3, 2010 meeting.

Response

Thank you for your comment regarding watershed monitoring in West Virginia.

Please see Section 5.2.2. of the Chesapeake Bay TMDL document. A short summary of that section here is that the Chesapeake Bay Program nontidal watershed water-quality network (NTN) is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed. This network is an essential component to the reporting, tracking, and modeling of nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed as it provides the only consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed.

There are four NTN sites located in West Virginia. These are four stations out of the 85 total stations in the NTN across the entire Chesapeake Bay Watershed. The West Virginia sites are called primary sites and the following are true of each of these sites: 1) There is a USGS flow gaging station present operated 24 hours a day, 365 days a year,; 2) 20 water chemistry samples are collected annually over a range of stream flow conditions (i.e., 12 base flow and 8 storm flow),; and 3) all samples are analyzed for nitrogen, phosphorus and sediment. Below is a description of each of the four sites:

- Patterson Creek near Headsville (USGS gage 01604500)
- South Branch Potomac River near Springfield (USGS gage 01608500)
- Cacapon River near Great Cacapon (USGS gage 01611500)
- Opequon Creek near Martinsburg (USGS gage 01616500)

Additional information on land use distribution for areas upstream of the monitoring sites is provided by each Chesapeake Bay Partner that include agriculture, forest and urban acreage. Reported changes from the U.S. Census Bureau in housing, population and migration, land cover trends derived from satellite imagery, sewer service areas and county-level population projections are also available. Conversion of forests and farmland development is based on a thorough examination of urban development and land conversion trends derived from satellite imagery dating back more than 25 years. The total of land, air, and water quality science and data are used to develop, calibrate and validate the watershed model that allocates discharge by land use type.

Organization: Virginia American Water (VAW)

However, there is also a need to make sure that a scientifically sound method for eutrophic measurement is implemented to monitor the status of algae blooms. Due to the hottest summer on record this year, large levels of algae blooms were found at or nearby our drinking water intake on the Appotmattox River. These algae had the component MIB (2-methyl isoborneol). Even at maximum optimization of the drinking water process, only up to 65% of MIB was removed. The maximum level of MIB found in the river throughout the summer was 1253 ng/L. It should be noted that the accepted threshold for human detection concerning taste and odor problems in drinking water is 10 ng/L.

Response

Thank you for your interest in water quality monitoring with specific interest on monitoring the status of algal blooms. Your specific concerns regarding issues of taste and odor in drinking water supplies in the watershed related to algal bloom effects are appreciated and respectfully noted, however, they are not specifically a part of the Chesapeake Bay TMDL. Further, the TMDL addresses nutrient and sediments in the watershed above the fall line with the proposed allocations while monitoring the response of tidal Chesapeake Bay dissolved oxygen, water clarity and chlorophyll a is measured below and assessed against Virginia's Chesapeake Bay water quality standards in State regulations that apply below the fall line. The region you are concerned about, the Appomattox River, is above the fall line in the watershed. Please note that the reductions in nitrogen and phosphorus as a result of implementation of the Bay TMDL should benefit local waters by reducing the growth of algae.

In most places of the tidal Chesapeake Bay, narrative criteria apply for chlorophyll a where measurements of chlorophyll a provide an important index of algal populations. The narrative criteria adopted into Chesapeake Bay states and the District of Columbia's tidal water quality standards reflects "Concentrations of chlorophyll a in free-floating microscopic aquatic plants (algae) shall not exceed levels that result in ecologically undesirable consequences – such as reduced water clarity, low dissolved oxygen, food supply imbalances, proliferation of species deemed potentially harmful to aquatic life or humans or aesthetically objectionable conditions – or otherwise render tidal waters unsuitable for designated uses." (Table 3, Executive Summary, USEPA 2003. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries (Regional Criteria Guidance) April 2003. EPA 903-R-03-002. Region III Chesapeake Bay Program Office, Annapolis, MD. available at the website http://www.chesapeakebay.net/content/publications/cbp_13142.pdf).

There are a few areas where numerical criteria exist for the tidal waters of Chesapeake Bay, the tidal James River in the case of Virginia. Achieving water quality according to defined numerical criteria is generally expected to limit algal blooms. Chlorophyll a is measured in the Chesapeake Bay water quality monitoring program and assessment procedures are published in Appendix G of US EPA 2008. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries. 2008 Technical Support for Criteria Assessment Protocols Addendum. EPA 903-R-08-001 Region III Chesapeake Bay Program Office, Annapolis MD. (See http://www.chesapeakebay.net/content/publications/cbp_47637.pdf). For additional background on algal blooms and monitoring in our region, the most recent document devoted to Chesapeake Bay Chlorophyll criteria is US EPA 2007. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries. 2007 Chlorophyll Criteria Addendum. November 2007. EPA 903-R-07-005. Region III Chesapeake Bay Program Office, Annapolis, MD. (See http://www.chesapeakebay.net/content/publications/cbp_20138.pdf).

Many watershed organizations have a better understanding of their watersheds in regards to water quality data than the State of Maryland Department of Natural Resources and the Maryland Department of the Environment due to the lack of resources in the State of Maryland to conduct weekly monitoring in all Chesapeake Bay tributaries. Will the EPA grant funding to watershed organizations to gather data for the states if a watershed monitoring plan meets Chesapeake Bay Program monitoring guidelines? A more scientific approach can then be used to calculate a Bay TMDL for that Chesapeake Bay region. The TMDL needs to be monitored and tested near the sources, e.g., tributaries and their contributing watersheds.

Response

Thank you for your comments regarding the possibilities of an expanded water quality monitoring program in the Chesapeake Bay and its watershed.

At present, the Chesapeake Bay Program Nontidal Network supports watershed monitoring with federal Clean Water Act funding. The funding for this network has been openly competed as it was in 2009. It is possible that new competitions could occur should funding become available as a means of extending network partnerships, however, there are no such new competitions pending at this time.

EPA recognizes that an ever increasing number of watershed organizations are developing their monitoring programs. In Maryland, the South River Federation (SRF) is attempting to do what you recommend by establishing monitoring protocols from sample collection to analysis, data handling and QA/QC, that are EPA compliant. Maryland Department of Natural Resources is working closely with SRF and the Chesapeake Bay Program Office is providing guidance upon request. This is a pilot effort in Maryland to get data of regulatory quality that provides the more detailed information at smaller scales than can be supported as part of the larger Chesapeake Bay water quality monitoring program. The Bay water quality monitoring program is also funded through Clean Water Act funding, but these particular funds are dedicated in the federal budget for tidal water monitoring by the Chesapeake Bay Partner states. So while the pilot work does not have funding, there are State and Federal resources guiding SRF in meeting monitoring protocol standards. Again, new funding may be available in the future to assist a watershed organization in reaching this level of data collection and delivery quality, but there is no such funding stream available today through the Chesapeake Bay Program Office.

In Virginia, the Virginia Department of Environmental Quality oversees volunteer monitoring data that adds monitoring in areas beyond where the federally supported program. The Virginia data is quality assured and used in the overall Clean Water Act 303d listing assessment of Bay health according to some of the regulations on their books (specifically dissolved oxygen for example). The pilot work in Maryland with SRF represents Maryland's first steps toward involving a broader network of programs already collecting data but needing to coordinate with their programs before the data can be approved, accepted and submitted for inclusion in the water quality standards assessments.

Thank you again for your excellent work, your interest, and stewardship.

CAC recognizes that there are questions regarding the model, particularly in under-counting non-point source best management practices (BMPs). However, it is unlikely that a refined model that includes more non-point source BMPs will result in significant changes in the TMDL. Progress on meeting the water quality goals is still measured by water quality monitoring data from the tributaries and the Bay and thus we recommend more testing in more locations. Water quality can vary significantly between nearby areas. More monitoring stations will help alleviate some stakeholders' concerns that the TMDL is solely driven by a flawed model versus measured water quality data that shows which segments/tributaries are not meeting water quality standards. A better understanding of sources and sites of major pollution will help the partners to target limited restoration funds and achieve larger gains in meeting water quality standards throughout the watershed. This will be critical to the development and enforcement of the Phase II WIPs. Additionally, more monitoring data will provide a better understanding of the climate change impacts affecting the health

of the Bay.

Response

Thank you for your comments and concerns about monitoring efforts in the Bay and watershed.

The policy for assessing water quality standards in Chesapeake Bay has been to use the best available data. The desire for improving monitoring of water quality conditions assessments led to the initiation of the Shallow water monitoring program in VA and MD in 2003 adding fixed site continuous monitoring stations and the application of surface water quality mapping. Since that time there are pilot studies underway to extend technology that uses vertical profiling instrumentation. Pilot work has been conducted in Maryland and Virginia associated with MD DNR and VIMS/VA DEQ respectively. Further, In Virginia, not only does the Chesapeake Bay Program have data from the long term water quality monitoring network of fixed stations but there is a volunteer network that adds to the QA/QC'd data supporting their 303d listing assessments. Maryland is piloting similar work with South River Federation and looking to expand inclusion of these higher density data sets through additional oversight in the years ahead as Virginia has done. Not only has the Chesapeake Bay water quality monitoring continued to evolve its monitoring technology applications, the USEPA 2003-2010 Ambient Water Quality Monitoring Criteria publication and its addenda push forward advances in analysis approaches. New data streams also provide new opportunities for model development, enhancements and calibration.

In the watershed, the establishment in 2004 of a unified Chesapeake Bay Program Partnership nontidal water quality monitoring network solidified a program adhering to consistent methodology with common QA/QC requirements. The network was established at 85 stations and grew by 3 stations for 2011 with the establishment of showcase watershed monitoring stations in the Conewago Creek, PA and Smith Creek, VA. There is a plan for a limited number of additional sites that support key needs fulfilling the network and its utility for the partnership. there is a desire to further find ways to partner with other agencies and institutions or accomodate new technology and focused monitoring strategies that will meet watershed wide information objectives for adaptive management, including better understanding of climate change impacts affecting the health of the watershed and the Bay.

Thank you again for your concerns and recommendations regarding monitoring for Chesapeake Bay water quality standards assessment.

Organization:

With regard to monitoring water quality, even the EPA's own statements are ignored here with this Draft TDML.

"Monitoring the water resource in a watershed is necessary to identify and record pollution. Monitoring is also essential to constantly evaluate water quality and the health of the water resource. The most dependable way to ascertain if changes in land-based activities have affected water quality is to monitor the land and the water resource before,

during, and after a change in land management or restoration occurs (EPA, 1995)."

Where are the EPA stream monitoring systems and stations in West Virginia?

In a watershed, the relationship between changes in land management and water quality can only be established by following a plan, or monitoring protocol.

I think that West Virginia would be better served by placing stream monitoring stations in the source-waters (springs) as well as the exit points to the Potomac river to capture real data regarding what this area is contributing in Nitrogen, Phosphorus and sediment to the Bay.

Response

Thank you for your comments and concerns about the monitoring in West Virginia waters.

The Chesapeake Bay Program's nontidal watershed water-quality network (NTN) is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed. This network is an essential component to reporting, tracking, and modeling nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed as it provides the only consistent, coordinated monitoring effort under a common monitoring plan across all jurisdictions in the Chesapeake Bay Watershed. See Section 5.2.2. of the Chesapeake Bay TMDL document.

There four NTN sites in West Virginia. These are four stations out of the 85 total stations in the NTN across the entire Chesapeake Bay watershed. The West Virginia sites are called primary sites and the following are true of each of these sites: 1) there is a USGS gaging station present; 2). 20 water chemistry samples are collected annually over a range of stream flow conditions (i.e., 12 base flow and 8 storm flow); and 3) all samples are analyzed for nitrogen, phosphorus and sediment. Below is a description of each of the four sites:

- Patterson Creek near Headsville (USGS gage 01604500)
- South Branch Potomac River near Springfield (USGS gage 01608500)
- Cacapon River near Great Cacapon (USGS gage 01611500)
- Opequon Creek near Martinsburg (USGS gage 01616500)

Organization:

Monitoring the water is necessary to identify and record pollution events. Monitoring is also essential to constantly evaluate water quality and the health of the water resource. The most dependable way to ascertain if changes in land-based activities have affected water quality is to monitor the land and the water resource before, during, and after a change in land management or restoration occurs (EPA, 1995). At a watershed scale, the relationship between

changes in land management and water quality can only be established by following a precise experimental plan, or monitoring protocol. Detailed pursuits of both land management and water quality is important to supply needed information to know there are obtainable results from taxpayer monies spent on over-reaching programs that have historical been unsuccessful.

This stream monitoring will help to diminish the reliance on the current model, which I believe is flawed. A water quality-monitoring network will enable Jefferson County to portray accurately both trends and loads for nutrients and sediment from our contributing streams. It will allow rapid identification of problems and quick solutions to remedy the pollutant. This sampling program can also be used to improve and calibrate other CBP watershed models.

Response

EPA strongly agrees that water quality monitoring is absolutely critical to identifying and recording pollution events as well as a multitude of other roles in supporting decisions and actions directed towards restoring water quality.

The Chesapeake Bay Program partners has made a long term investment in monitoring of the tidal waters and the free flowing streams and rivers now well into its third decade. The partnership has long relied upon a balance of scientific understanding, monitoring and assessment, and application of modeling tools to help support its decision making. But the bottom line—restoration of water quality to the Chesapeake Bay and a health watershed ecosystem—will always be measured through monitoring observations.

The Chesapeake Bay Program's nontidal watershed water-quality network (NTN) is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed. This network is an essential component to reporting, tracking, and modeling nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed as it provides the only consistent, coordinated monitoring effort under a common monitoring plan across all jurisdictions in the Chesapeake Bay Watershed. See Section 5.2.2. of the Chesapeake Bay TMDL document.

There four NTN sites in West Virginia. These are four stations out of the 85 total stations in the NTN across the entire Chesapeake Bay watershed. The West Virginia sites are called primary sites and the following are true of each of these sites: 1) there is a USGS gaging station present; 2) 20 water chemistry samples are collected annually over a range of stream flow conditions (i.e., 12 base flow and 8 storm flow); and 3) all samples are analyzed for nitrogen, phosphorus and sediment. Below is a description of each of the four sites:

- Patterson Creek near Headsville (USGS gage 01604500)
- South Branch Potomac River near Springfield (USGS gage 01608500)
- Cacapon River near Great Cacapon (USGS gage 01611500)
- Opequon Creek near Martinsburg (USGS gage 01616500)

A county specific stream monitoring network within Jefferson County would certainly be an excellent addition to the Chesapeake Bay's watershed water quality monitoring (NTN or nontidal network). With appropriate sampling protocols and quality assurance, quality control procedures in the field, lab and data management, appropriate loads and trends for pollutants could be computed for

the county. Data collected and effectively managed in this rigorous manner would also provide opportunities for further calibrating and validating Chesapeake Bay Program and other (e.g. USGS SPARROW models) watershed models as recognized in your comment.

Data Source: USGS Open File Report 2007-1372 Changes in Stream Flow, Concentration and Loads in Selected Nontidal Basins in the Chesapeake Bay Watershed, 1985-2006. The measurement nutrient concentrations from New York of average total nitrogen and total phosphorus concentrations were taken at the United States Geological Survey (USGS) gauging station in Towanda, Pa and is represented by the dark red bar in each graph. The red line in the graph represents the average concentrations needed to meet water quality standards in the Bay.

River flow to the Bay in 2006 was 18.5 trillion gallons. To meet the Bay goal of 175 million pounds Total Nitrogen loading to Bay, a Nt concentration of $(175/8.34/18,500.000)$, or 1.13 mg/L and similarly a Pt concentration $(12.58/8.34/18,500.00)$ of 0.082 mg/L are needed.

Monitoring data do not exist for a large part of the developed watershed, particularly the Potomac, Rappahannock, Pamunkey, Mattaponi, James riversheds that are below the fall line (River Input Monitoring-RIMS) stations.

Response

Thank you for providing the above calculation. As described within the Bay TMDL document, allocations of nitrogen, phosphorus and sediment were based on the land-based and air-based sources of these pollutants, not stream concentrations alone.

In response to the comment that “monitoring data do not exist for a large part of the developed watershed, particularly the Potomac, Rappahannock, Pamunkey, Mattaponi, James riversheds that are below the fall line (River Input Monitoring-RIMS) stations”, this statement is not correct.

The fall line separates represents the head of tide on tidal waters of the Bay and tidal tributaries from its nontidal watershed. The tidal Potomac, Rappahannock, Pamunkey, Mattaponi, and James Rivers all have Chesapeake Bay Program long term water quality monitoring stations that have been monitoring 14-20 times per year, throughout the year, typically sampled in all seasons, since 1985. Each river has one or more stations in the region typically characterized as tidal fresh, oligohaline, mesohaline and where it may exist, the polyhaline waters. Further, in Virginia rivers below the fall line, there are volunteer monitoring network sites providing quality assured data to the Clean Water Act 303d water quality standard attainment listing assessments and evaluations. There are also shallow water monitoring stations, submerged aquatic vegetation and benthic invertebrate monitoring program elements in these river systems. Please see section 5.2.1 for a summary of the Chesapeake Bay monitoring network, specifically Figure 5-1 for the network of fixed station monitoring locations.

The Chesapeake Bay Program's nontidal watershed water-quality network (NTN) is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed. This network is an essential component to reporting, tracking, and modeling nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed as it provides the only consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. See Section 5.2.2. of the Bay TMDL document and Figure 5.5 specifically for the distribution of monitoring sites in the watersheds.

The intersection of the two monitoring networks for the entire Bay and basin (Figure 5-1 and 5-5) is comprised of approximately 225 Chesapeake Bay Program monitoring sites with representation throughout the basins of concern here with additional volunteer monitoring network contributions approved by VADEQ. Still further, as one example of other critical monitoring data in the watersheds, benthic invertebrate sampling is also used to index stream habitat conditions. Across the Chesapeake Bay basin, over 10,000 data points were contributed to an assessment of Chesapeake Bay watershed stream health including many sites in Virginia related to the Potomac, Rappahannock, Pamunkey, Mattaponi and James riversheds above and below the fall line. Abundant and diverse data are available for the Virginia watersheds of interest. All data mentioned in this response are available through the Chesapeake Bay Program's web site at <http://www.chesapeakebay.net> or summarized and interpretations available through Chesapeake Bay Program Office communication products.

Organization: The Elizabeth River Project

5) We commend DEQ's intention to undertake a James River Chlorophyll Study, as indicated in Appendix 2. The tasks appear well-thought out and offer promise for understanding the dynamics of the troubling algal blooms occurring in the James River including those originating in the Elizabeth and Lafayette. We recommend reducing the proposed study and rulemaking period to three years instead of five years. We understand that data has been collected for five years already, using the data flow system from the James River.

Response

EPA agrees with the comment and is committed to working with the Virginia agencies to conduct the study in a scientifically rigorous and timely manner as possible, recognizing the established timeframes within Virginia regulatory adoption process.

The historical chlorophyll-a monitoring data are too limited to support the TMDL

The level of data is inadequate for assessment according to EPA guidance. Data from the monthly fixed site data collection program from 1991-2000 was used as the TMDL base-line. Although the data is considered appropriate for monitoring of general status and trends (for which it was designed), it is considered too coarse to reliably support a TMDL with such high cost implications. For example, most James River segments are characterized by only 2 stations per river segment per month and the TMDL is constructed to address each water body segment individually. Because chlorophyll-a has been shown to be spatially patchy and dynamic [FN63] basing the segment interpolation (the basis for non-attainment calculations) on only a few stations would lead to unrepresentative results (see example in Figure 3) - especially during periods that the algae blooms are initiating, peaking, or dissipating. Because of these issues, the EPA has established in guidance that an "adequate" assessment of chlorophyll-a should employ a combination of fixed sites and DataFlow (EPA 2003). Also, according to EPA 2003, "the uncertainty associated with assessment of chlorophyll a criteria attainment using only the fixed station monitoring program would be expected to be quite high."

[Figure 3. Please see original document 0288.1]

To address these issues, one of VAMWA's members, HRSD, has been conducting weekly DataFlow (DFLO) on the lower James River (JMSMH and JMSPH) segments since March 2005. Monitoring of the LAFMH and ELIPH segments was added in March 2008. The Virginia Institute of Marine Science has been conducting DFLO cruises on JMSTF1, JMSTF2, and JMSON segments on a monthly schedule. The VIMS and HRSD DFLO data, made available on the Virginia Estuarine and Coastal Observing System (VECOS) <http://www2.vims.edu/vecos/> in combination with traditional fixed sites, have been used by the VADEQ in order to improve the reliability of the resulting assessment. To evaluate the effect of the DFLO data collection on the regulatory assessment of James River chlorophyll standards, the VADEQ assessed the 303(d) results both with and without DFLO information.

The most recent results from the draft 2010 Integrated Report indicate that the regulatory outcomes (i.e., pass-fail) remained the same. However, non-attainment rates were consistently reduced by DFLO in all of the James River segments by an average of 6% (Figure 3a). The potential impact associated with the use of DFLO on the TMDL dataset (1991-2000) is not possible to determine because the DFLO technology did not exist at the time. However, the comparison above suggests that the use of only fixed-site data in the TMDL caused the allocations to be lower (and predicted non-attainment higher) than would have resulted if data would have been collected as EPA recommends. If DFLO is required for a chlorophyll-a water quality standards attainment assessment to be adequate, failure to include DFLO data will result in an inadequate attainment assessment.

[Figure 3a- please see original document 0288]

Differences in non-attainment rates (between fixed sites and DFLO) are believed to be due to the number of sampling points evaluated and their relative influence on the resulting spatial interpolation step used in the assessment. Experience has shown that weekly data collections with DFLO data are essential to adequately capture bloom dynamics (initiation, peak, and dissipation) over the dimensions of space and time under which they occur. Improvement resulting from the use of DFLO data varies from cruise to cruise depending on the level of "patchiness" observed in chlorophyll-a distributions.

F. Chlorophyll-a conditions in the lower estuary do not correlate with nutrient reductions accomplished to date

Dauer and others (2008) provide an analysis of long term trends and nutrient loadings for the James River from 1985 to 2007.[FN64] The results indicated increasing chlorophyll-a trends in the James River mouth (JMSPH segment) and no trends in the JMSMH segments. These increasing trends in chlorophyll-a exist despite considerable progress made in achieving point source nutrient reductions below the fall line. As shown in Figure 4, below fall line PS TN loads decreased from approximately 22.5 mpy in the mid 1980's to about 12.5 mpy in the most recent 5 years (~44% reduction). Reductions in below fall line PS TP loads decreased approximately 2.5 mpy (77% reduction). These trends are consistent with Chesapeake Bay Model runs that compare 1985 and 2007 Progress point source nutrient loads below the fall line. Dauer and others (2008) report those reductions as 38% for TN and 74% for TP. This level of nutrient reduction is considerable and represents capital expenditures of hundreds of millions of dollars without improvements in chlorophyll-a, which is the indicator being used to represent designated uses in regards to nutrients.

[Figure 4- please see original document 0288.1]

The available monitoring data brings into serious question the ability to predict chlorophyll-a levels in the lower James River with existing models. It is necessary to gain a better understanding of the system's drivers given the level of uncertainty that presently exists with regard to expected response. One critical area of research is the chlorophyll-a response in the James River associated with point source projects planned to meet the 2005 Water Quality Management Regulation. These nutrient controls are scheduled and will be completed by 2011. This offers an excellent full-scale opportunity to further study the effects of additional point source nutrient reduction on chlorophyll a levels and response of HABs. These efforts along with the stated needs for improving the chlorophyll a standards are fully consistent with the principles of adaptive management supported by EPA.

[FN64] Analysis attached hereto as Appendix 36. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A36.]

Response

See response to comment 0230.1.001.033.

EPA recommends the commenter look to the Potomac River basin to better understand the magnitude of nitrogen and phosphorus reductions needed to cause a significant reduction in algal biomass measured as chlorophyll. Decades of significant wastewater treatment facilities technology upgrades well beyond those in place today in the James River watershed complimented by widespread nonpoint source reduction best management practices, decadal trends in the chlorophyll a concentrations and reductions in bloom conditions are visible to the reader.

[See Attachment 1 to the Response to Comment document for the figure titled "Potomac Tidal Fresh Chl a Monitoring Data."]

The above figure from the Bay TMDL report illustrates tidal Potomac River chlorophyll a monitoring data compared with the District's chlorophyll a water quality criteria. DC station PMS44 is on the Potomac River at the Woodrow Wilson Memorial Bridge

(50 meters upstream of the draw span). The Maryland station TF2.1 is on the Potomac River at Buoy 77 off the mouth of Piscataway Creek. This is just one time series plot illustrating changes in chlorophyll a concentrations over the past 10 years in a monitoring record that extends to 25 years. Clear evidence of significant reductions in the magnitude and frequency of algal blooms (concentrations over 30-40 ug/L) and a drop in the monthly and seasonal average chlorophyll a concentrations over time.

[See Attachment 1 to the Response to Comment document for the figure titled “Surface Chlorophyll a 1985-2009.”]

Above is another figure from the Bay TMDL report illustrating a comparable series of chlorophyll a data from the tidal fresh region of the tidal James River, where Virginia’s water quality standards apply a very similar summer seasonal average chlorophyll a criterion, 23 ug/L, to the District’s summer seasonal average chlorophyll a criterion of 25 ug/L. These two tidal fresh sections of two large tributaries to the Bay are very similar ecosystem with essential the same criteria applied, yet the time series of chlorophyll a concentrations are completely different.

Given these well known findings, EPA ran a series of series to understand what the tidal James River’s chlorophyll a response would be at nitrogen and phosphorus level at equivalent levels of effort—similar levels of wastewater treatment technologies, comparable levels of nonpoint source best management practice implementation, etc. At a level of effort equivalent to the Potomac River basin, nitrogen loads to the tidal James River would be reduced to 22.1 million pounds per year and phosphorus load reduced down to 2.22 million pounds per year, resulting in full attainment of Virginia’s James River chlorophyll a water quality standards. EPA set the allocations for the James River basin above these levels at 23.5 and 2.35 million pounds per year nitrogen and phosphorus, respectively.

With current estimated loads around 30.4 and 3.23 million pounds per year of nitrogen and phosphorus, respectively, the lack of a full response—significant responses in the seasonal average concentrations and reductions in the magnitude and frequency of algal blooms should come as no surprise. The tidal James River is still a significantly over nutrient enriched estuarine system that requires significant further reductions in nitrogen and phosphorus to reach a more ecological healthy state (i.e., achievement of Virginia’s James River chlorophyll a water quality standards).

G. Recent monitoring data shows that higher allocations than those proposed by USEPA may achieve chlorophyll-a standards in the lower James River region

As part of the James River TMDL chlorophyll-a analysis, EPA recommended that the chlorophyll-a criteria assessment be changed from arithmetic averages to log-transformed (i.e, geometric) means. The VADEQ evaluated the effect of this methods change on 2008 and 2010 303(d) Water Quality Assessments (VADEQ, 2010).[FN65] Their results indicated that the non-attainment rates decreased substantially for the lower James River region. The revised results for the 2010 Assessment (for years 2006-2008) indicated 99-100% attainment for the lower James River segments. Based on these observed results VADEQ believes that the "dissolved oxygen based" James River allocation (TN=26.79 mpy;

TP=2.69 mpy) would also attain the chlorophyll-a standard in this region. According to our analysis the lower James River would likely attain chlorophyll standards at a much higher level of loading than the dissolved oxygen based allocations because model estimates of 2006-2008 delivered TN loads for the James River ranged from 35 to 36 mpy respectively. Source: http://www.chesapeakebay.net/data_modeling.aspx. This considerably higher level of loading was associated with near attainment (99-100%) with chlorophyll standards. These results also demonstrate that our previous recommendation to establish the James River allocations at "Tributary Strategy" level is more than environmentally conservative.

EPA has not provided appropriate justifications for additional reductions in allocation below "tributary strategies." In fact, EPA's position on this point is directly contrary to its own approach used to find the Potomac and Anacostia Rivers in compliance with its chlorophyll-a standards. In the case of the Anacostia River, EPA used an existing non-attainment rate of 4% in the monitoring data to determine compliance based on "other lines of evidence." [FN66] EPA's inconsistency in conclusions here between the Potomac and James rivers demonstrates the arbitrary nature of the EPA's TMDL.

E. The historical chlorophyll-a monitoring data are too limited to support the TMDL

The level of data is inadequate for assessment according to EPA guidance. Data from the monthly fixed-site data-collection program from 1991-2000 was used as the TMDL base-line.

Although the data is considered appropriate for monitoring of general status and trends (for which it was designed), it is considered too coarse to reliably support a TMDL with such high cost implications. For example, most James River segments are characterized by only 2 stations per river segment per month and the TMDL is constructed to address each water body segment individually. Because chlorophyll-a has been shown to be spatially patchy and dynamic [FN 23] basing the segment interpolation (the basis for non-attainment calculations) on only a few stations would lead to unrepresentative results (see example in Figure 3a) - especially during periods that the algae blooms are initiating, peaking, or dissipating. Because of these issues, the EPA has established in guidance that an "adequate" assessment

of chlorophyll-a should employ a combination of fixed sites and DataFlow (EPA 2003). Also, according to EPA 2003, "the uncertainty associated with assessment of chlorophyll a criteria attainment using only the fixed station monitoring program would be expected to be quite high."

[Figure 3a. Please see page 13 of original document 0575.1]

To address these issues, one of VAMWA's members, RRSD, has been conducting weekly DataFlow (DFLO) on the lower James River (JMSMH and JMSPH) segments since March 2005. Monitoring of the LAFMH and EUPR segments was added in March 2008. The Virginia Institute of Marine Science has been conducting DFLO cruises on JMSTF1, JMSTF2, and JMSTF3 segments on a monthly schedule. The VIMS and HRSD DFLO data, made available on (the Virginia Estuarine and Coastal Observing System (VECOS), <http://www2.vims.edu/vecos/>. in combination with traditional fixed sites, have been used by the VADEQ in order to improve the reliability of the resulting assessment. To evaluate the effect of the DFLO data collection on the regulatory assessment of James River chlorophyll standards, the VADEQ assessed the 303(d) results both with and without DFLO information. The most recent results from the draft 2010 Integrated Report indicate that the regulatory outcomes (i.e., pass-fail) remained the same. However, non-attainment rates were consistently reduced by DFLO in all of the James River segments by an average of 6% (Figure 3b). The potential impact associated with the use of DFLO on the TMDL dataset (1991-2000) is not possible to determine because the DFLO technology did not exist at the time. However, the comparison above suggests that the use of only fixed-site data in the TMDL caused the allocations to be lower (and predicted non-attainment higher) than would have resulted if data would have been collected as EPA recommends. If DFLO is required for a chlorophyll-a water quality standards attainment assessment to be adequate, failure to include DFLO data will result in an inadequate attainment assessment.

[Figure 3b. Please see page 14 of original document 0575.1]

Differences in non-attainment rates (between fixed sites and DFLO) are believed to be due to the number of sampling points evaluated and their relative influence on the resulting spatial interpolation step used in the assessment. Experience has shown that weekly data collections with DFLO data are essential to adequately capture bloom dynamics (initiation, peak, and dissipation) over the dimensions of space and time under which they occur. Improvement resulting from the use of DFLO data varies from cruise to cruise depending on the level of "patchiness" observed in chlorophyll-a distributions.

F. Chlorophyll-a conditions in the lower estuary do not correlate with nutrient reductions accomplished to date

Dauer and others (2008) provide an analysis of long term trends and nutrient loadings for the James River from 1985 to 2007,[24] The results indicated increasing chlorophyll-a trends in the James River mouth (JMSPH segment) and no trends in the JMSMH segments. These increasing trends in chlorophyll-a exist despite considerable progress made in achieving point source nutrient reductions below the fall line. As shown in Figure 4, below fall line PS TN loads decreased from approximately 22.5 mpy in the mid 1980's to about 12.5 mpy in the most recent 5 years (-A4% reduction). Reductions in below fall line PS TP loads decreased approximately 2.5 mpy (77% reduction). These trends are consistent with Chesapeake Bay Model runs that compare 1985 and 2007 Progress point source nutrient loads below the fall line. Dauer and others (2008) report those reductions as 38% for TN and 74% for TP. This level of nutrient reduction is considerable and represents capital expenditures of hundreds of millions of dollars without improvements in chlorophyll-a, which is the indicator being used to represent designated uses in regards to nutrients.

The available monitoring data brings into serious question the ability to predict chlorophyll-a levels in the lower James River with existing models. It is necessary to gain a better understanding of the system's drivers given the level of uncertainty that presently exists with regard to expected response. One critical area of research is the chlorophyll-a response in the James River associated with point source projects planned to meet the 2005 Water Quality Management Regulation. These nutrient controls are scheduled and will be completed by 2011. VAMWA believes this would offer an excellent full-scale opportunity to further study the effects of additional point source nutrient reduction on chlorophyll a levels and response of HABs. These efforts along with the stated needs for improving the chlorophyll-a standards are fully consistent with the principles of adaptive management supported by EPA.

G. Recent monitoring data shows that higher allocations than those proposed by USEPA may achieve chlorophyll-a standards in the lower James River region

As part of the James River TMDL chlorophyll-a analysis, EPA recommended that the chlorophyll-a criteria assessment be changed from arithmetic averages to log-transformed (i.e, geometric) means. The VADEQ evaluated the effect of this methods change on 2008 and 2010 303(d) Water Quality Assessments (VADEQ, 2010).[FN 25] Its results indicated that the non-attainment rates decreased substantially for the lower James River region. The revised results for the 2010 Assessment (for years 2006-2008) indicated 99-100% attainment for the lower James River segments. Based on these observed results VADEQ believes that the "dissolved oxygen based" James River allocation (TN=26.79 mpy; TP=2.69 mpy) would also attain the chlorophyll a standard in this region. According to an analysis, the lower James River would likely attain chlorophyll standards at a much higher level of loading than the dissolved oxygen based allocations because model estimates of 2006-2008 delivered TN loads for the James River ranged from 35 to 36 mpy respectively. Source: http://www.chesapeakebay.net/data_modeling.aspx. This considerably higher level of loading was associated with near attainment (99-100%) with chlorophyll standards. These results also demonstrate that establishing the James River allocations at a "Tributary Strategy" level is more than environmentally protective. EPA has not provided appropriate justifications for additional reductions in allocation below "tributary strategies." In fact, EPA's position on this point is directly contrary to its own approach used to find the Potomac and Anacostia Rivers in compliance with its chlorophyll-a standards. In the case of the Anacostia River, EPA used an existing non-attainment rate of 4% in the monitoring data to determine compliance based on "other lines of evidence." [FN 26] EPA's inconsistency in conclusions here between the Potomac and James rivers demonstrates the arbitrary nature of the EPA's TMDL.

25.5 - GENERAL/MISCELLANEOUS

Comment ID 0038.1.001.039

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

This summer was the worst summer the county has seen in a long time with regular closures of recreational beaches due to elevated levels of enterococci bacteria. This bacteria is found in animal waste and bacterial levels rise as the water becomes continually warmer through nutrient pollution and algal blooms that insulate the water and reward mammals that stay to feed off of the abundance of algae.

Response

Bacteria closures are certainly of concern as a water quality issue. This Chesapeake Bay TMDL does not specifically address

bacteria as a criteria of water quality attainment. Bacteria counts are tracked and reported by States to the USEPA for its Clean Water Act 303d list of impaired waters. This TMDL does however address animal waste concerns targeted at nutrient loading issues which, coincidentally, can work to help reduce bacteria pollution.

It is indeed a concern that as climate warms that warm seasons will be longer and, if nothing was done about animal wastes, we could have longer seasonal periods for potential bacteria issues.

The Bay TMDL is dealing with nutrient pollution and is geared toward reducing nutrient loading that will also help reduce algal blooms as measured by chlorophyll a levels.

Comment ID 0169.1.001.024

Author Name: Crim Martin

Organization: Town of Occoquan, Virginia

Section 5 of the TMDL contains no background information given on the sampling theory used for monitoring the Bay and calibrating the watershed models. Assuming the Bay is no different from other natural features, its characteristics are cyclical. Sampling theory dictates a minimum of 2 samples per cycle; what are the pertinent cyclic parameters having an effect on the Bay, and how do the monitoring periods ensure capturing the data correctly? The monitoring periods have decreased from 20 times per year to 14, but no reason is given as to why this decrease has occurred. There is also no information given on when during the year those monitoring periods occur. If different pollution parameters have different cycles, then the monitoring periods must account for all the cyclic variations.

Response

Your comments speak to modeling, monitoring and their intersection in TMDL work. This response includes a brief review of the components of the Chesapeake Bay set of models as well as further background on sampling distribution and effort for Bay and watershed monitoring programs.

The Chesapeake Bay Water Quality Model consists of a set of submodels for the Bay and Watershed. The Watershed Model incorporates information about land use, fertilizer applications, wastewater plant discharges, septic systems, air deposition, farm animal populations, weather and other variables to estimate the amount of nutrients and sediment reaching the Chesapeake Bay and where these pollutants originate. The Watershed Model divides the 64,000-square-mile Chesapeake Bay watershed into more than 2,000 segments delineating political and physical boundaries. Each segment contains information generated by several sub-models:

- 1) The hydrologic sub-model uses rainfall, evaporation and meteorological data to calculate runoff and sub-surface flow for all land uses, including forest, agricultural and urban lands.
- 2) The surface and sub-surface flows ultimately drive the non-point source sub-model, which simulates soil erosion and pollutant loads from the land to rivers.
- 3) The river sub-model routes flow and associated pollutant loads from the land through lakes, rivers and reservoirs to the

Chesapeake Bay.

Scenario Builder can generate simulations of the past, present or future state of the Chesapeake Bay watershed to explore potential impacts of management actions and evaluate alternatives. Scenario Builder produces inputs for the Watershed Model based on factors from a wide range of land uses and management actions. For example, information such as acres of different crops, numbers of animals and extent of conservation practices is used to generate Watershed Model inputs for agricultural land use types.

The Airshed Model uses information about nitrogen emissions from power plants, vehicles and other sources to estimate the amount of and location where these pollutants are deposited on the Chesapeake Bay and its watershed. That information is fed into the Watershed Model.

The Land Change Model analyzes and forecasts the effects of urban land use and population on sewer and septic systems in the Chesapeake Bay watershed.

The forecasts are based on: Reported changes from the U.S. Census Bureau in housing, population and migration, land cover trends derived from satellite imagery, sewer service areas and county-level population projections. Conversion of forests and farmland development is based on a thorough examination of urban development and land conversion trends derived from satellite imagery dating back more than 25 years.

The Estuary Model examines the effects that pollution loads generated by the Watershed Model have on water quality. In the Estuary Model, the Chesapeake Bay is represented by more than 57,000 computational cells and is built on two sub-models: The hydrodynamic sub-model simulates the mixing of waters in the Bay and its tidal tributaries. The water quality sub-model calculates the Bay's biological, chemical and physical dynamics. Each submodel is calibrated to monitoring information from our region.

Any monitoring program is a balance of system understanding, available resources to distribute monitoring frequency against spatial resolution, and the incorporation of technological advances that can effect efficiency and data density options in the data collection effort. For the Bay and its tidal tributaries, since 1985, the fixed-station water quality monitoring program as described in Section 5.2 of the draft Bay TMDL documentation has consisted of approximately 140 stations sampled 14-20 times per year. This Chesapeake Bay long term water quality monitoring program is designed to provide a long term record of water quality measurements that reflect seasonal and interannual variations. Changes in sampling frequency during a year have fluctuated due to funding resources and Chesapeake Bay Partnership priorities for the distribution of resources available; the most recent changes occurred as a function of a multi-year assessment for a Chesapeake Bay monitoring program realignment. A shallow water monitoring program was deemed most appropriate for assessments of water clarity criteria linked with annual submerged aquatic vegetation monitoring. For chlorophyll the recommendations for monitoring are combined fixed station plus shallow water mapping data. For further details that compare recommended, adequate and marginal levels of monitoring for dissolved oxygen, water clarity and chlorophyll a monitoring and assessment, please refer to Chapter VI: Recommended Implementation Procedures in USEPA (2003) Ambient Water Quality Criteria for dissolved oxygen, water clarity and chlorophyll a for Chesapeake Bay and its tidal tributaries. April 2003. EPA 903-R-03-00. The document is available at the Chesapeake Bay Program publications website: http://www.chesapeakebay.net/content/publications/cbp_13142.pdf.

The Bay data serve as one of the rare and most extensive continuous estuarine water quality monitoring data sets on earth having grown from approximately 10,000 data points collected per year in the 1980s to a current level of over 10 million data points per year for chemical, physical and biological attributes of Chesapeake Bay. These data pass through field, laboratory and database QA reviews according to EPA approved protocols. Data from these data sets are publicly available through the Chesapeake Information Management System housed at the Chesapeake Bay Program Office and are used to calibrate the Chesapeake Bay Water Quality Model.

Further, the Chesapeake Bay Program non-tidal watershed water-quality monitoring network (NTN) is a network of 85 streamflow gages co-located with water-quality sampling sites operating across the watershed. This network is an essential component to reporting, tracking, and calibrating models of nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed. The NTN provides the only methodologically consistent, QA consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. Primary nutrient and sediment load stations are sampled 20 times per year as 12 base flow measurements typically one sample per month to characterize base flow conditions of the annual seasonal cycle and 8 storm flow samples, ideally 2 storms per season to reflect storm conditions of the watershed interseasonally. Storm samples are needed to more accurately estimate the amount of nutrient and sediment moved by the elevated storm flow conditions. Because the water quality sampling events are linked to flow gages that track water flow conditions 24 hours a day, 365 days a year, we can understand the relationships of flows and concentrations in producing loads. A subset of stations known as secondary stations only has 12 base flow samples per year, typically collected once per month to characterize seasonal and annual cycles. Concentrations are computed but not loadings at secondary sites, a small subset of full network of stations. The coordinated Chesapeake Bay watershed NTN network was instituted in 2004, however, a subset of the stations have longer data histories started by other agencies or institutions. There are further more stations that have valuable time series but were discontinued as data collection sites for varied reasons. This additional abundance of quality assured data serves to calibrate and validate the water quality dynamics for the watershed model.

EWG's recent research on Chesapeake Bay, to be released shortly, centers on mapping and analysis of soil test phosphorus data available from land grant universities for all counties in the watershed, spanning six states. Healthy plants require appropriate levels of available phosphorus in soil, but this nutrient builds up in the soil over time if more is applied in manure or fertilizer than crops require. As soils become overloaded, they reach a tipping point and begin to readily release this persistent pollutant, poisoning local aquatic ecosystems as well as the bay.

EWG's maps show for the first time just how widespread "excessive" levels of phosphorus are in the region - levels far in excess of what crops need to thrive and likely to cause environmental damage, according to parameters developed by each state. Our analysis indicates that in one of every five counties in the watershed, more than half the soils tested contained these "excessive" levels. These overburdened counties are located in all six states. Although such soils are already potentially dangerous sources of pollution, farmers are often permitted to apply additional phosphorus-rich manure, sewage sludge or fertilizer.

Response

Thank you for your comment regarding data availability for soil phosphorus in the watershed. Geographic and source specific phosphorus waste load and load allocations are part of the Chesapeake Bay TMDL as phosphorus loading to the Chesapeake Bay is recognized as a contributor to water quality conditions being out of attainment. Targeting BMP activities at areas with high nutrient and sediment yields is a means of strengthening the measurable return on restoration investment. EPA has since received a copy of EWG's report and has shared it with its Chesapeake Bay Program partners.

Comment ID 0388.1.001.003

Organization: Advocates for Herring Bay (AHB)

Ultimately, the only credible metrics for success will be tangible improvements in the quality of the water and aquatic and terrestrial habitats of the Chesapeake Bay. To ensure progress, the state must test the real-world performance of new technologies and verify that strategies are actually being deployed and performing as predicted.

Response

Thank you for your concern about measures of success of recovery progress for aquatic and terrestrial habitats of the Chesapeake Bay.

The Chesapeake Bay Program partners has made a long term investment in monitoring of the tidal waters and the free flowing streams and rivers now well into its third decade. The partnership has long relied upon a balance of scientific understanding, monitoring and assessment, and application of modeling tools to help support its decision making. But the bottom line—restoration

of water quality to the Chesapeake Bay and a healthy Chesapeake Bay watershed ecosystem—will always be measured through monitoring observations.

Any monitoring program is a balance of system understanding, available resources to distribute monitoring frequency against spatial resolution, and the incorporation of technological advances that can effect efficiency and data density options in the data collection effort. For the Bay and its tidal tributaries, since 1985, the fixed-station water quality monitoring program as described in Section 5.2 of the draft Bay TMDL documentation has consisted of approximately 140 stations sampled 14-20 times per year. This Chesapeake Bay long term water quality monitoring program is designed to provide a long term record of water quality measurements that reflect seasonal and interannual variations in such parameters as dissolved oxygen. Changes in sampling frequency during a year have fluctuated due to funding resources and Chesapeake Bay Partnership priorities for the distribution of funding resources available. A shallow water monitoring program was deemed most appropriate for assessments of water clarity criteria linked with annual submerged aquatic vegetation monitoring via aerial photograph interpretation. For chlorophyll a, the recommendations for monitoring are combined fixed station plus shallow water mapping data. For further details that compare recommended, adequate and marginal levels of monitoring for dissolved oxygen, water clarity and chlorophyll a monitoring and assessment of water quality standards for Chesapeake Bay, please refer to Chapter VI: Recommended Implementation Procedures in USEPA (2003) Ambient Water Quality Criteria for dissolved oxygen, water clarity and chlorophyll a for Chesapeake Bay and its tidal tributaries. April 2003. EPA 903-R-03-00. The document is available at the Chesapeake Bay Program publications website: http://www.chesapeakebay.net/content/publications/cbp_13142.pdf.

The Bay data serve as one of the rare and most extensive continuous estuarine water quality monitoring data sets on earth having grown from approximately 10,000 data points collected per year in the 1980s to a current level of over 10 million data points collected per year for chemical, physical and biological attributes of the Chesapeake Bay and its tidal tributaries and embayments. These data pass through field, laboratory and database QA reviews according to EPA approved protocols. Data from these data sets are publicly available through the Chesapeake Information Management System housed at the Chesapeake Bay Program Office and are used not only for Clean Water Act 303d water quality standards assessments but also to calibrate and validate the Chesapeake Bay Water Quality Model.

Further, the Chesapeake Bay Program non-tidal watershed water-quality monitoring network (NTN) is now a network of 85 stream flow gages co-located with water-quality sampling sites operating across the watershed. This network is an essential component to reporting, tracking, and calibrating models of nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed. The NTN provides the only methodologically consistent, QA consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. Primary nutrient and sediment load stations are sampled 20 times per year as 12 base flow measurements typically one sample per month to characterize base flow conditions of the annual seasonal cycle and 8 storm flow samples, ideally 2 storms per season to reflect storm conditions of the watershed interseasonally. Storm samples are needed to more accurately estimate the amount of nutrient and sediment moved by the elevated storm flow conditions. Because the water quality sampling events are linked to flow gages that track water flow conditions 24 hours a day, 365 days a year, we can understand the relationships of flows and concentrations in producing loads. A subset of stations known as secondary stations only has 12 base flow samples per year, typically collected once per month to characterize seasonal and annual cycles. Concentrations are computed but not loadings at secondary sites, a small subset of full network of stations. The coordinated Chesapeake Bay watershed NTN network was instituted in 2004, however, a subset of the stations have longer data histories started by other agencies or institutions. There are more stations that have valuable time series but were discontinued as data collection sites for

varied reasons. This additional abundance of quality assured data serves to calibrate and validate the water quality dynamics for the watershed model.

Landscape data are collected as well. One example of tracking metrics bridging aquatic and terrestrial would be wetland habitat acreage. Further details of metrics tracked for the Chesapeake Bay and Basin health status and restoration can be found in the Chesapeake Bay Program publication *The Bay Barometer*, most recently published in 2009:

Organization: National Farmers Union (NFU)

I encourage greater cooperation specific to data collection and utilization between EPA and federal partners with an interest in Chesapeake Bay restoration, such as the U.S. Department of Agriculture and the U.S. Geological Survey, as well as relevant state agencies.

Response

Thank you for your recommendation for greater cooperation among agencies and institutions across the Chesapeake Bay Program partnership. That is exactly what the President's Chesapeake Bay Executive Order is calling for. There two Memorandum of Understandings now in place between USDA and USGS directed towards significantly improving data collection and data sharing with the larger partnership. Both MOUs are focused on USGS having direct access to actual conservation practice data and making it available at a variety of geographic and jurisdictional scales to partners and the public at same time preserving the business confidentiality of individual producers. One MOU is with the Farm Services Agency and one MOU is with NRCS.

The data will remain privacy protected, however, analyses conducted across agencies and presented as consolidated results protecting that privacy will provide important advances in science and critical feedback for adaptive management across the watershed are being addressed here. EPA looks forward to even greater cooperative efforts across key agencies and institutions with the best interest of efficient and effective Chesapeake Bay restoration in mind supported by the best available data and resulting advances in restoration science.

1. What are the results of sampling the Susquehanna River at the Mason-Dixon Line? Please describe the scope and extent of the data.

Response

Thank you for your interest in the monitoring results for the Susquehanna River.

USEPA approved sample collection and analysis techniques are described online at the Susquehanna River Basin Commission (SRBC) website: at

<http://www.srbc.net/programs/CBP/collection.htm>.

The SRBC Nutrient Program website presents a suite of results you can view and access at :

<http://www.srbc.net/programs/CBP/nutrientprogram.htm>.

Look at the Conowingo Dam sampling location specifically for results pertaining to the Mason-Dixon line region you are interested in.

Further interpreted results can be found by looking at the SRBC website in their Technical Report

http://www.srbc.net/pubinfo/techdocs/publication_267/techreport267.htm.

Additional analyses of long term water quality trends have recently been published using a new statistical technique. See information for the Conowingo Dam location located in Figure 14 (lower left corner) for Susquehanna Total Phosphorus trends and Figure 15 (lower left hand corner) for Nitrate+Nitrite long term trends in recently published paper by Hirsch et al. entitled “Weighted Regressions on Time, Discharge, and Season (WRTDS), with an Application to Chesapeake Bay River Inputs” which is available online at <http://onlinelibrary.wiley.com/doi/10.1111/j.1752-1688.2010.00482.x/full>.

Finally, you may be interested in reading the most recent “The State of the Susquehanna” report for a broad look at the watershed's health: <http://www.srbc.net/stateofsusq/chesapeake.htm>.

Page 63 BMP Tracking

It is troubling that the exact amount of nutrients and sediment reaching the Bay from Pennsylvania is not known through continuous measurement, but rather estimated by model. For example, the Department asserts that if more BMP's were reported in Pennsylvania, the model would predict that less nutrient and sediment would reach the Bay even if those BMP's had been implemented years ago. Is this assertion true? The point source community monitors its effluent in accordance with their respective NPDES permits. Why does Pennsylvania not monitor what it discharges into the Bay? Previous inquiries indicate that it is not the Department's responsibility to undertake such monitoring, but rather the United States Geological Survey's. Why would the process of adding additional data into a model result in Pennsylvania discharging less to the Bay? This is not scientifically sound and questions the entire TMDL process.

Response

Thank you for your comment. There are a few issues intermingled here that we can sort out and help provide a better understanding of the interaction between monitoring and modeling as it relates to Pennsylvania.

First, Pennsylvania definitely does monitor what it collectively discharges to the Bay. Pennsylvania is a partner in the Chesapeake Bay Program's (CBP) Watershed Monitoring Network, sometimes called the nontidal network or NTN. See Section 5.2.2. of the Chesapeake Bay TMDL document for more information about the NTN and a map of site locations. In short, the CBP NTN is a network of 85 streamflow gages and water-quality sampling sites operated across the watershed. This network is an essential component to reporting, tracking, and modeling nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed as it provides the only consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. EPA, U.S. Geological Survey (USGS), PA Department of Environmental Protection, and the Susquehanna River Basin Commission combine financial and staff resources to collect data that tell us how much and what kinds of nutrients and sediments are moving down the rivers and streams of PA.

Next, the comment actually refers to two different models whether they realize it or not. First, monitoring what comes out of PA's Susquehanna River basin is measured essentially at Conowingo Dam near the PA/MD border. The river flow is measured continuously by USGS. Nutrients and sediment concentrations are measured 20 times per year which largely reflects the balance of available, limited funding resources when we need to monitor 64,000 square miles of Chesapeake Bay watershed at different scales of space and time. Since TMDL is about a load, and there are load allocations, then the definition of a nutrient or sediment load in its simplest form is the nutrient or sediment concentration measured in discrete samples multiplied times the measurement of river flow. That estimates the load at that point in time. To know the total load coming from PA, year round, continuous measures of river flow data are used and combined, using statistics otherwise known as a statistical model, with measures of concentration at points in time filling in the gaps where we don't have concentration data but we know a lot about how flow and concentration are related. USGS has published the statistical method used with the Susquehanna River and you can view that document from 2000, "A revised load estimation procedure for the Susquehanna, Potomac, Patuxent and Choptank Rivers" at <http://pubs.usgs.gov/wri/wri00-4156/wrir-00-4156.pdf>. This is known as The ESTIMATOR model.

The comment also raises a concern regarding BMPs and whether or not accounting for more would result in less nutrients and sediments predicted to reach the Bay. The answer is no and yes. EPA and its partners use the Chesapeake Bay Watershed Model to help predict the loads of nutrients and sediment delivered to the Bay under existing and future management conditions. The model takes into account the tracked and reported BMPs in place across the watershed in simulating existing and future loads. This is a different model than the the ESTIMATOR model that provides estimates of how much nutrient and sediment is coming over the fall line at Conowingo Dam. How much nutrient and sediment coming over the dam is pretty well known because USGS makes direct measurements through out the year, river flow all the time every day, nutrient and sediments on a monthly basis during baseflow conditions and during storm events. The Bay Watershed Model is a model simulates all that occurs with weather, development, agriculture, urbanization, and more and from the interaction of all those activities and processes, it computes the water quality entering the stream on a daily basis over a multiple year hydrologic period. Streamflow and in stream water quality monitoring are used to calibrate and verify the Chesapeake Bay Watershed Model.

Therefore, no, just adding more BMPs to the Chesapeake Bay Watershed Model can't make more nutrient and sediment go away because we have in-stream monitoring data that tells us how much is really there and is used to calibrate the model. On the other hand, incorporating a long term record of tracked and reported BMPs (that are in place on the ground and actually reducing nutrients and sediment) into the process for calibrating the Chesapeake Bay Watershed Model, as was done during calibration of the latest version of the Bay Watershed Model (Phase 5.3), results in a model which better matches the actual in stream monitoring data through time.

Once the model is in tune, calibrated, then you can add BMPs to look for how further much improvement there is in water quality or whether there is any change at all. This is how we predict a change in nutrient and sediments. Adding different BMPs to different areas of the watershed is known as producing a scenario. Each scenario can act as a guide about what to expect if we take certain actions. By running different scenarios in the model we can then compare how much less nutrient and or sediment reaches the Bay and make decisions about what might be approach to take to improve water quality in the local streams, the rivers, and eventually all the way down in the Bay.

EPA agrees that the NPDES permitted municipal and industrial waste water dischargers are monitoring their pollutant contributions to the rivers and streams of the watershed as required by their permit conditions. This data is also used to help calibrate the Bay Watershed Model.

B. Data selected to support the conclusions drawn.

The original data is based upon a small portion of the Chesapeake Bay with minimal reporting summaries. It is not representative of the health of the entire Chesapeake Bay. The information as presented has skewed the results, which has driven the concerns with the data.

C. Lack of explanation for sampling methods.

Section 5 of the draft TMDL lacks background information on the sampling theory used for monitoring the Chesapeake Bay and calibrating the watershed models. Assuming the Chesapeake Bay is no different from other natural features, its characteristics are cyclical. Sampling theory dictates a minimum of two (2) samples per cycle. The reporting monitoring periods have decreased from 20 times per year to 14, but no reason is given as to why this decrease has occurred. It is also not known at what times during the year those monitoring periods occur. If different pollution parameters have different cycles, then the monitoring must account for all the cyclic variations.

Response

Thank you for your comments and concerns regarding monitoring and methods in Chesapeake Bay and the watershed.

Any monitoring program is a balance of system understanding, available resources to distribute monitoring frequency against spatial resolution, and the incorporation of technological advances that can effect efficiency and data density options in the data collection effort. For the Chesapeake Bay and its tidal tributaries, since 1985, the fixed-station water quality monitoring program as described in Section 5.2 of the draft Bay TMDL documentation has consisted of approximately 140 stations sampled 14-20 times per year. This Chesapeake Bay long term water quality monitoring program is designed to provide a long term record of water quality measurements that reflect seasonal and interannual variations. Changes in sampling frequency during a year have fluctuated due to availability funding resources and Chesapeake Bay Partnership priorities for the distribution of the funding resources available; the most recent changes occurred as a function of a multi-year Chesapeake Bay Program Science and Technical Advisory Committee run assessment for a Chesapeake Bay monitoring program review and realignment that ended in 2009. In 2003, a shallow water monitoring program was deemed most appropriate for assessments of water clarity criteria linked with annual submerged aquatic vegetation monitoring and funding was shifted away from zooplankton to fill a gap in monitoring water quality habitat in the nearshore zone. For chlorophyll a, the recommendations for monitoring are combined fixed station plus shallow water mapping data. For further details that compare recommended, adequate and marginal levels of monitoring supporting dissolved oxygen, water clarity and chlorophyll a monitoring and assessment, please refer to Chapter VI: Recommended Implementation Procedures in USEPA (2003) Ambient Water Quality Criteria for dissolved oxygen, water clarity and chlorophyll a for Chesapeake Bay and its tidal tributaries. April 2003. EPA 903-R-03-00. The document is available at the Chesapeake Bay Program publications website: http://www.chesapeakebay.net/content/publications/cbp_13142.pdf.

The Chesapeake Bay monitoring data serve as one of the rare and most extensive continuous estuarine water quality monitoring data sets on earth having grown from approximately 10,000 data points collected per year in the 1980s to a current level of over 10 million data points per year for chemical, physical and biological attributes of Chesapeake Bay. These data pass through field, laboratory and database QA reviews according to EPA approved protocols. Data from these data sets are publicly available through the Chesapeake Information Management System housed at the Chesapeake Bay Program Office and are used in calibration and verification of the Chesapeake Bay Program Water Quality and Watershed Models .

Further, the Chesapeake Bay Program's non-tidal watershed water-quality monitoring network (NTN) is a network of 85 streamflow gages co-located with water-quality sampling sites operating across the watershed. This network is an essential component to reporting, tracking, and calibrating models of nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed. The NTN provides the only methodologically consistent, QA consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. Primary nutrient and sediment load stations are sampled 20 times per year as 12 base flow measurements typically one sample per month to characterize base flow conditions of the annual seasonal cycle and 8 storm flow samples, ideally 2 storms per season to reflect storm conditions of the watershed interseasonally. Storm samples are needed to more accurately estimate the amount of nutrient and sediment moved by the elevated storm flow conditions. Because the water quality sampling events are linked to flow gages that track water flow conditions 24 hours a day, 365 days a year, we can understand the relationships of flows and concentrations in producing loads. A subset of stations known as secondary stations only has 12 base flow samples per year, typically collected once per month to characterize seasonal and annual cycles. Concentrations are computed but not loadings at secondary sites, a small subset of full network of stations. The coordinated Chesapeake Bay watershed NTN network was instituted in 2004, however, a subset of the stations have longer data histories started by other agencies or institutions. There are further more stations that have valuable time series but were discontinued as data collection sites for varied reasons. This additional abundance of quality assured data serves to calibrate and validate the water quality dynamics for

the Chesapeake Bay Program Watershed Model as well as other important models used for example in targeting the highest nutrient or sediment yielding regions for focused BMP activities (e.g. USGS SPARROW models - Spatially reference regressions on watershed attributes, see <http://water.usgs.gov/nawqa/sparrow/FAQs/faq.html#1> for more information).

Comment ID 0568.1.001.002

Author Name: Eisel James

Organization: Delaware County, New York

Delaware County is quite familiar with the stewardship of water quality for downstream users. Slightly over 50% of our lands are within the upper Delaware River basin, which is part of New York City's drinking water supply watershed (NYC Watershed). Land use in the NYC Watershed is controlled by the strictest of regulations designed to avoid the need for filtering NYC's water supply, established by the Watershed Memorandum of Agreement of 1997. EPA is a signatory to this agreement. Delaware County immediately recognized the need to create ownership of the NYC Watershed regulations at the local level in order for them to be effective. In an effort to help our communities understand of the importance of water quality protection and its importance to economic vitality, we created the Delaware County Action Plan (DCAP). Finished in 1999, this document and its development established a locally led, multi-agency watershed program that brings sound science to bear on water quality protection throughout the entire county, not just in the NYC watershed, and assists Delaware County's farmer, businesses, and communities in meeting water quality goals while enhancing economic vitality. DCAP and projects under its umbrella are consistent with and complementary to the goals of the Chesapeake Bay program and the TMDL. Not coincidentally, the year after the DCAP was adopted by the Delaware County Board of Supervisors, they also passed a resolution in support of the Chesapeake Bay Program and its effort to improve water quality in the Bay. Since that time, DCAP and other water quality efforts in Delaware County have succeeded in reducing contributions of N, P, and sediment to both the Delaware and Susquehanna River systems. Given our experience with watershed management in the Delaware River basin, Delaware County has a unique perspective on the implications of this TMDL for farmers, businesses, and communities in New York. Our specific concerns are below.

TMDL models and monitoring

DCAP's monitoring and modeling efforts in the Cannonsville Reservoir Basin illuminate the challenges inherent in using models to allocate N&P contributions equitably. Massive amounts of data across spatial and temporal scales were required to create Cannonsville land use models. The monitoring program and the models were designed with the assistance of experts from Cornell University, the New York State Department of Environmental Conservation, NYC Department of Environmental Protection, Pennsylvania State University, USDA, State University of New York-Environmental Science and Forestry, the New York State Department of Health, the Delaware County Soil and Water Conservation District (DCSWCD), the Delaware County Planning Department, the Catskill Watershed Corporation (CWC) and the Watershed Agricultural Program (WAP), referred to as the Scientific Support Group (SSG). The Cannonsville program under the guidance of the SSG used 8 monitoring stations operated in conjunction with 20 locations where bi-weekly grab samples were collected from 1950 until the present day in a 455.12 square mile area to guide the development of land use models. [FN1] Members of the SSG have indicated that even this robust data set is not completely reliable for predicting nutrient losses. Contrast this with the dataset that EPA is using to determine N and

P allocations for New York; data collected over a 21 year period from just one monitoring station, to develop a model to predict nutrient losses from a variety of land uses, over a 6262 square mile area.

[FN1] Watershed Modeling of the Cannonsville Basin using SWAT 2000, Model Development, Calibration and Validation for the Prediction of Flow, Sediment, and Phosphorus Transport to the Cannonsville Reservoir, February 2004

Response

Thank you for your comment regarding modeling and monitoring affecting the allocations for NY.

EPA has received numerous comments that the nutrient allocations to NY are unfair. While the comments and reasons why the commenter believes the allocation to NY was unfair, this response provides EPA reasoning why the allocation to NY is appropriate.

EPA led a dialogue with all watershed jurisdictions, including NY, for over 2 years on the approach that should be used to allocate loadings to all states. While numerous methods were considered, EPA could not arrive at a consensus methodology for all states. The methodology used did enjoy the most agreement of any methodology considered among the jurisdictions.

The methodology used was, in part, based on the loadings expected under current land use and design flows from WWTP facilities. Current land use and design flow of WWTPs is a common approach used in developing TMDLs, including New York. Of the thousands of TMDLs developed in the Bay watershed, EPA is aware of only a few TMDLs that were based on past land use. The reason for this approach is straightforward. That is, in establishing a TMDL, one allocates to various sources contributing to the problem. When developing an allocation approach it stands to reason that the approach should consider the existence of those sources. So to suggest an approach that ‘pretends’ that the population and land use is different than the existing levels is inappropriate in EPA’s opinion.

Consistency with other TMDL practices is one of the reasons why the Bay partner states supported the method for allocating loads to the states that include using existing land use and design flows for WWTPs.

At an October 29, 2009 meeting among all states Principals’ Staff Committee members, including New York, the proposed method was accepted by all states except New York. New York abstained from an opinion during that meeting. Subsequent to that meeting New York and West Virginia expressed their disagreement with the method, citing various reasons.

Having no other method by which to allocate loads among the various jurisdictions, EPA used the method, with two significant exceptions, that gained widespread agreement among the states for the target loadings for nitrogen and phosphorus when these loads were provided to the states in a letter of July 1, 2010. Those exceptions were that EPA provided additional loading to both West Virginia and New York above that loading which those states would have received using the allocation methodology. More specifically, EPA ‘bumped’ the West Virginia allocation by 200,000 pounds per year of phosphorus and the New York allocation by 750,000 pounds per year of Nitrogen. This increase was intended to address the concerns raised but not limited to:

- o New York delivers cleaner water to the bay than other states.
- o New York is losing in population and farming operations over the

years while other states are increasing population.

- o New York's load is attenuated when being 'processed' thru the Susquehanna River on its way to the bay and therefore any reductions in load have less beneficial impact on the Bay.

Some of the comments cited statistics on the low loadings allocated to New York. While these statistics are helpful, the more relevant statistics are the amount of reductions expected of New York.

In that regard a few statistics may be helpful:

- o On a pound for pound basis, New York nutrient loads have a moderate impact on reducing dissolved oxygen in the bay, falling about in the middle of the various states and basins within the watershed.
- o While New York has a moderate impact on the Bay, because of the 'bump' in nitrogen allocation, the New York nitrogen allocation represents the lowest percent of controllable load of any jurisdiction in the watershed. Controllable load was considered by the Bay partners to be the best metric of load by which to make allocations decisions to the states.
- o The 'bump' in nitrogen allocation for New York represents a 25% drop in the loading reduction needed in New York.
- o The allocation for New York represents the second lowest pounds per acre reduction of all states (and the district) in the Bay watershed for both phosphorus and nitrogen.
- o As of 2009, New York lags far behind all other states (and the district) in the bay watershed in upgrading their wastewater treatment plants to control nitrogen and phosphorus.
- o The 2009 loading of nitrogen delivered to the Bay from New York is greater than the delivered loading from West Virginia, Delaware, and the District of Columbia and greater than the delivered load of any two of those jurisdictions combined.
- o The 2009 loading of phosphorous delivered to the Bay from New York is similar to the delivered loading from West Virginia, and greater than the combined phosphorous loading from Delaware and the District of Columbia.

Some commenters mentioned that EPA removed the allocation guide that said 'States that benefit more from a clean Bay must do more'. It is true that, based on extensive discussions with the Bay partners, this guide was removed. A primary reason why this was removed from the methodology used over 7 years ago was based on our improving science of the Bay. That is, when state allocations were established in 2003, the allocation method included an analysis (similar to today's method) that the more impact a state has on impairing the bay on a pound for pound basis, the more controls would be required of that state. While that same guide

applies today there is one critical difference. In 2003, based on less precise available models than today, the states' impacts on the bay were more qualitatively divided into 3 groups; high, medium and low impact. New York was grouped into the high impacting areas that included Pennsylvania in the Susquehanna basin, the western shore of Maryland, and the eastern shore of Virginia. Since there was such a crude qualitative approach to determining state impact, the bay partners used this guide of 'states that benefit from a cleaner bay' to reduce the controls from the upstream states. In contrast, the method used today to determine impact is quantitative, providing a measure of impact for each jurisdiction-basin. This allows one to already build into the allocation analysis the lesser impact that an upstream state may have on the bay. As a result the New York measure of impact is squarely in the moderate range as opposed to the previous high impact.

Furthermore, in EPA's opinion there is quite a neutralizing point to be made to counter the point that benefiting state must do more. That is, those bay states have been suffering the economic and other losses for more than a generation from an impaired Chesapeake Bay and that impairment is the result of loadings from all Bay states.

So the point remains that to restore the Chesapeake Bay, all jurisdictions and all sectors will need to achieve reductions of nitrogen and phosphorous. EPA used its discretion, based on extensive input from the Bay partners, to develop a rational science-based methodology to divide that allowable loading among the bay jurisdictions. To address the concerns raised by the headwater states of New York and West Virginia, EPA provided additional loadings to those states.

The Chesapeake Bay Program non-tidal watershed water-quality monitoring network (NTN) is now a network of 85 stream flow gages co-located with water-quality sampling sites operating across the watershed. This network is an essential component to reporting, tracking, and calibrating models of nitrogen, phosphorus and sediment concentration and loads in the Chesapeake Bay Watershed. The NTN provides the only methodologically consistent, QA consistent, coordinated monitoring effort across all jurisdictions in the Chesapeake Bay Watershed. Primary nutrient and sediment load stations are sampled 20 times per year as 12 base flow measurements typically one sample per month to characterize base flow conditions of the annual seasonal cycle and 8 storm flow samples, ideally 2 storms per season to reflect storm conditions of the watershed interseasonally. There are five stations within the network located within New York's portions of the Chemung and Susquehanna Rivers (not just a single station as referenced in the comment):

- Unadilla River at Rockdale, NY
- Susquehanna River at Conklin, NY
- Susquehanna River near Waverly, NY
- Cohocton River near Campbell, NY
- Chemung River at Chemung, NY

Data from all five stations were used in both calibration of the Chesapeake Bay Watershed Model as well as development of the Chesapeake Bay TMDL.

Author Name: Merrifield Ed

Organization: Potomac Riverkeeper, Shenandoah Riverkeeper

The Potomac Riverkeeper and Shenandoah Riverkeeper would like to thank you for the opportunity to comment on the Draft Chesapeake Bay Total Maximum Daily Load (TMDL). In addition to comments submitted on our behalf by Earthjustice, please consider this our addendum to those comments.

Transparency

In certain areas of the Bay watershed, the TMDL process has an opportunity to keep the public informed about progress being made on a daily - or close to daily basis. Anywhere in the watershed that both flow and pollutant numbers are collected will allow this. An example of this type of public information is to use the load (flow and concentration numbers) information available at Little Falls and Chain Bridge in the Potomac River. Publishing a daily (averaged) load number and keeping a summary towards an annual load number for the more that 11,000 square miles of watershed that is above this point can help focus the public's attention on both the successes and failures of Watershed Implementation Plans.

Although some scientists may balk at making this type of information easily available to the public without first "massaging" it or placing it into a model, the interested public can easily understand the problems with raw data, if any, that could be described to them in the same (web) document that gives the loads.

Since the data are already collected and being used in the Bay TMDL process, the cost of this type of immediate access by the public will be minimal. For the next ten to twenty years the EPA should work to have the public know on a daily basis how we are progressing towards a healthy Bay.

Response

Thank you for the comment regarding the delivery of watershed data to the public in realtime.

Near realtime flow data, where available, is served on the USGS website <http://waterdata.usgs.gov/md/nwis/sw>. You may select the State and then the sites where flow data is available. Such data are recognized as provisional and subject to adjustment based on quality assurance, quality control analyses and procedures.

For the Chesapeake Bay Watershed Monitoring Network, nutrient and sediment data are collected 12-20 times per year at 85 stations across the six states and the District of Columbia. The data are already freely available via the Chesapeake Bay Information System through the Chesapeake Bay Program partnership's website at <http://www.chesapeakebay.net>. Storm sampling is required for the annual load estimates. Load monitoring results are summarized annually. The discrete water samples require laboratory analysis and are therefore not suitable to providing real time or near realtime pollutant load calculations. Details regarding the Chesapeake Bay Watershed Monitoring program and additional information resources are available in the TMDL documentation Section 5.2.2. <http://executiveorder.chesapeakebay.net/file.axd?file=2010%2F9%2FDraft+Chesapeake+Bay+TMDL+Section+5.pdf>

TMDL load targets are developed based on a specific 10-year flow record agreed upon by the partnership (1991-2000). The most

similar comparison to TMDL targets would not be the raw monitoring data but flow normalized monitoring data. Such techniques for data handling, analysis and visualization are cutting edge and just now being developed and published.

The desirable technology to achieve realtime or near realtime load information you envision are sensors that detect pollutants in realtime to allow simultaneous availability of flow and concentration for an instantaneous calculation of load. Realtime insitu nutrient sensors for key water quality constituents like nitrogen and phosphorus (or their fractions) are similarly cutting edge in their development and use. They are expensive. No water quality monitoring sites that are part of the Chesapeake Bay Program Watershed Network have such technology in place at this time.

The vision suggested here is excellent and provides valuable insight into desirable delivery products for public communication and consumption as new technology, analyses, and means of visualization grow with the Chesapeake Bay Watershed Monitoring Network.

Author Name: Hann Steven

Organization: Capital Region Council of Governments TMDL Work Group

7. The draft TMDL asserts that "[e]xcessive nutrients in the Chesapeake Bay and its tidal tributaries promote a number of undesirable water quality conditions such as excessive algal growth, low dissolved oxygen ("DO"), and reduced water clarity." The TMDL fails to provide any information or evidence that flows from Pennsylvania contribute to this condition, specifically flows from municipal wastewater treatment plants.

8. Monitoring data presented in the draft TMDL does not demonstrate any relationship between point source discharges and low DO.

9. In the draft TMDL, chlorophyll-a is referred to as an indicator of algae level. However, chlorophyll-a is not always a reliable measure of algal biomass.

10. EPA is mandating that new water quality standards be developed by the tidal states. Has EPA evaluated the long-term impact on the restoration of the Chesapeake Bay under a scenario whereby the newly proposed water quality standards are adopted and implemented by Delaware, the District of Columbia, Maryland and Virginia?

11. The draft TMDL does not address the expected change in DO levels in the Chesapeake Bay Watershed if the draft TMDL is implemented in its current form.

12. The draft TMDL suggests a relationship between concentrations of chlorophyll a and low DO and harmful algal blooms. What is the specific concentration level of chlorophyll a that EPA believes triggers harmful algal blooms?

13. The draft TMDL does not specify whether data provided in Section 4.1 regarding jurisdiction loading contributions are delivered loads or edge-of-stream loads.

Response

Thank you for your various comments regarding the draft TMDL.

Regarding "The draft TMDL asserts that "[e]xcessive nutrients in the Chesapeake Bay and its tidal tributaries promote a number of undesirable water quality conditions such as excessive algal growth, low dissolved oxygen ("DO"), and reduced water clarity." The TMDL fails to provide any information or evidence that flows from Pennsylvania contribute to this condition, specifically flows from municipal wastewater treatment plants.", a TMDL (Total Maximum Daily Load) is a calculation of the maximum amount of a pollutant that a waterbody can receive and still meet water quality standards, and an allocation of that load among the various sources of that pollutant. Pollutant sources are characterized as either point sources that receive a wasteload allocation, or nonpoint sources that receive a load allocation. Point sources include all sources subject to regulation under the National Pollutant Discharge Elimination System (NPDES) program, e.g. wastewater treatment facilities, some stormwater discharges and concentrated animal feeding operations (CAFOs). Nonpoint sources include all remaining sources of the pollutant as well as anthropogenic and natural background sources. TMDLs must also account for seasonal variations in water quality, and include a margin of safety (MOS) to account for uncertainty in predicting how well pollutant reductions will result in meeting water quality standards.

The objective of a TMDL is to determine the loading capacity of the water body and to allocate that load among different pollutant sources so that the appropriate control actions can be taken and water quality standards achieved. This includes the point source sector in Pennsylvania.

Regarding your concerns that "Monitoring data presented in the draft TMDL does not demonstrate any relationship between point source discharges and low DO.", the TMDL process is important for improving water quality because it links the development and implementation of control actions to the attainment of water quality standards. Existing water quality in Chesapeake Bay shows dissolved oxygen out of attainment. This is a composite effect of point and nonpoint source sectors. The TMDL calculates out the allocations accounting for the impact of nutrient loadings from the various source sectors.

Regarding your concern that "In the draft TMDL, chlorophyll-a is referred to as an indicator of algae level. However, chlorophyll-a is not always a reliable measure of algal biomass.", the scientific basis for Chesapeake Bay chlorophyll criteria was originally published in U.S. Environmental Protection Agency. 2003. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries (Regional Criteria Guidance) April 2003. EPA 903-R-03-002. Region III Chesapeake Bay Program Office, Annapolis, MD. Subsequent updates to chlorophyll criteria basis and assessment protocol guidance have been provided in U.S. Environmental Protection Agency. 2007. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries –Chlorophyll a Addendum. October 2007. EPA 903-R-07-005. Region III Chesapeake Bay Program Office, Annapolis, MD and U.S. Environmental Protection Agency. 2010. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries – 2010 technical support for criteria assessment protocols addendum. May 2010. EPA 903-R-010-002. Region III Chesapeake Bay Program Office, Annapolis, MD.

Regarding your concern that "EPA is mandating that new water quality standards be developed by the tidal states. Has EPA evaluated the long-term impact on the restoration of the Chesapeake Bay under a scenario whereby the newly proposed water quality standards are adopted and implemented by Delaware, the District of Columbia, Maryland and Virginia?", no such mandate

is in place. Fully consistent with the concept of adaptive management, EPA strives to maintain current and updated science associated with criteria development and assessment. As evidenced by its work with the partnership and outside experts from academia, Federal, state, local governments, River basin commissions, NGOs, independent contractors and industry in producing and supporting the Chesapeake Bay estuarine water quality criteria and protocols for their assessment, the criteria assessment procedures published from 2003-2010 replace and otherwise supersede similar criteria assessment procedures originally published in the 2003 Regional Criteria Guidance and the 2004, 2007 and 2008 addenda (U.S. EPA 2003a, 2004a, 2007a, b, 2008). Publication of future addendums by EPA on behalf of the Chesapeake Bay Program watershed jurisdictional partners is likely as continued scientific research and management applications reveal new insights and knowledge that should be incorporated into revisions of state water quality standards regulations in upcoming triennial reviews.

Regarding your concern that "the draft TMDL does not address the expected change in DO levels in the Chesapeake Bay Watershed if the draft TMDL is implemented in its current form.", the TMDL addresses dissolved oxygen levels in Chesapeake Bay where water quality conditions are out of attainment with water quality standards. This TMDL does not specifically address dissolved oxygen levels in waters of the watershed, however, there are many local TMDLs addressing such issues where they exist in the watershed.

Regarding your concern that "the draft TMDL suggests a relationship between concentrations of chlorophyll a and low DO and harmful algal blooms. What is the specific concentration level of chlorophyll a that EPA believes triggers harmful algal blooms?", chlorophyll is not really considered as a trigger for harmful algal blooms, in many but not all cases, nutrients can provide triggers to harmful algal blooms. Harmful algal blooms represent a phenomenon that involves a range of species. What was illustrated in U.S. Environmental Protection Agency. 2007. Ambient Water Quality Criteria for Dissolved Oxygen, Water Clarity and Chlorophyll a for the Chesapeake Bay and Its Tidal Tributaries – Chlorophyll a Addendum. October 2007. EPA 903-R-07-005. Region III Chesapeake Bay Program Office, Annapolis, MD for Microcystis blooms, a proven toxin producing cyanobacteria found in the tidal fresh and oligohaline (i.e. slightly salty) waters with proven health risk implications to animals and humans, is that a chlorophyll threshold is reached where the likelihood of blooms with sufficient toxin can be present as a health risk. The analysis used Chesapeake Bay data and had comparable findings to other peer reviewed and published scientific findings across the globe. This Chesapeake Bay long term water quality monitoring program has sufficient resolution relative to the dynamics of this species that good science was established for water quality maintained below the recommended criteria that the probability of harmful conditions would be limited. Beyond this case study, USEPA 2007 provides scientific background as a reference to the available information on chlorophyll and Harmful algal bloom relationships when and where such support was available.

Regarding your interest in "The draft TMDL does not specify whether data provided in Section 4.1 regarding jurisdiction loading contributions are delivered loads or edge-of-stream loads" the jurisdiction loading contributions are dealing with delivered loads.

Thank you for your interest and concerns with elements of draft TMDL.

Organization: Town of Chenango, Binghamton, New York

The communities of New York State that comprise the headwaters of the Susquehanna and Chemung River watersheds have long recognized their role as partners in the restoration of the Chesapeake Bay. In acknowledgment of that role, New York State has made great strides to improve water quality through stringent regulations and programs in the areas of stormwater pollution prevention and agricultural environmental management, exceeding those mandated by the federal government. As a result, New York State water quality far exceeds that of other jurisdictions in the Chesapeake Bay watershed .

EPA's proposed TMDL imposes disproportionately heavy restrictions on NY. If other states reached the level of performance achieved in New York over the past decade for Nitrogen and Phosphorous, there would be no need for a TMDL. Even if other states in the watershed achieve their mandated allocations, their water would still contain more N and P than New York at present.

Response

EPA has received numerous comments that the nutrient allocations to NY are unfair. While the comments and reasons why the commenter believes the allocation to NY was unfair, this response provides EPA reasoning why the allocation to NY is appropriate.

EPA led a dialogue with all watershed jurisdictions, including NY, for over 2 years on the approach that should be used to allocate loadings to all states. While numerous methods were considered, EPA could not arrive at a consensus methodology for all states. The methodology used did enjoy the most agreement of any methodology considered among the jurisdictions.

The methodology used was, in part, based on the loadings expected under current land use and design flows from WWTP facilities. Current land use and design flow of WWTPs is a common approach used in developing TMDLs, including New York. Of the thousands of TMDLs developed in the Bay watershed, EPA is aware of only a few TMDLs that were based on past land use. The reason for this approach is straightforward. That is, in establishing a TMDL, one allocates to various sources contributing to the problem. When developing an allocation approach it stands to reason that the approach should consider the existence of those sources. So to suggest an approach that 'pretends' that the population and land use is different than the existing levels is inappropriate in EPA's opinion. Consistency with other TMDL practices is one of the reasons why the Bay partner states supported the method for allocating loads to the states that include using existing land use and design flows for WWTPs.

At an October 29, 2009 meeting among all states Principals' Staff Committee members, including New York, the proposed method was accepted by all states except New York. New York abstained from an opinion during that meeting. Subsequent to that meeting New York and West Virginia expressed their disagreement with the method, citing various reasons.

Having no other method by which to allocate loads among the various jurisdictions, EPA used the method, with two significant exceptions, that gained widespread agreement among the states for the target loadings for nitrogen and phosphorus when these loads were provided to the states in a letter of July 1, 2010. Those exceptions were that EPA provided additional loading to both West Virginia and New York above that loading which those states would have received using the allocation methodology. More specifically, EPA 'bumped' the West Virginia allocation by 200,000 pounds per year of phosphorus and the New York allocation by 750,000 pounds per year of Nitrogen. This increase was intended to address the concerns raised but not limited to:

- o New York delivers cleaner water to the bay than other states.

- o New York is losing in population and farming operations over the years while other states are increasing population.
- o New York's load is attenuated when being 'processed' thru the Susquehanna River on its way to the bay and therefore any reductions in load have less beneficial impact on the Bay.

Some of the comments cited statistics on the low loadings allocated to New York. While these statistics are helpful, the more relevant statistics are the amount of reductions expected of New York. In that regard a few statistics may be helpful:

- o On a pound for pound basis, New York nutrient loads have a moderate impact on reducing dissolved oxygen in the bay, falling about in the middle of the various states and basins within the watershed.
- o While New York has a moderate impact on the Bay, because of the 'bump' in nitrogen allocation, the New York nitrogen allocation represents the lowest percent of controllable load of any jurisdiction in the watershed. Controllable load was considered by the Bay partners to be the best metric of load by which to make allocations decisions to the states.
- o The 'bump' in nitrogen allocation for New York represents a 25% drop in the loading reduction needed in New York.
- o The allocation for New York represents the second lowest pounds per acre reduction of all states (and the district) in the Bay watershed for both phosphorus and nitrogen.
- o As of 2009, New York lags far behind all other states (and the district) in the bay watershed in upgrading their wastewater treatment plants to control nitrogen and phosphorous.
- o The 2009 loading of nitrogen delivered to the Bay from New York is greater than the delivered loading from West Virginia, Delaware, and the District of Columbia and greater than the delivered load of any two of those jurisdictions combined.
- o The 2009 loading of phosphorous delivered to the Bay from New York is similar to the delivered loading from West Virginia, and greater than the combined phosphorous loading from Delaware and the District of Columbia.

Some commenters mentioned that EPA removed the allocation guide that said 'States that benefit more from a clean Bay must do more'. It is true that, based on extensive discussions with the Bay partners, this guide was removed. A primary reason why this was removed from the methodology used over 7 years ago was based on our improving science of the Bay. That is, when state allocations were established in 2003, the allocation method included an analysis (similar to today's method) that the more impact a state has on impairing the bay on a pound for pound basis, the more controls would be required of that state. While that same guide applies today there is one critical difference. In 2003, based on less precise available models than today, the states' impacts on the bay were more qualitatively divided into 3 groups; high, medium and low impact. New York was grouped into the high impacting areas that included Pennsylvania in the Susquehanna basin, the western shore of Maryland, and the eastern shore of Virginia. Since there was such a crude qualitative approach to determining state impact, the bay partners used this guide of 'states that benefit from a cleaner bay' to reduce the controls from the upstream states. In contrast, the method used today to determine impact is quantitative, providing a measure of impact for each jurisdiction-basin. This allows one to already build into the allocation analysis the lesser impact that an upstream state may have on the bay. As a result the New York measure of impact is squarely in the moderate range as opposed to the previous high impact.

Furthermore, in EPA's opinion there is quite a neutralizing point to be made to counter the point that benefiting state must do more. That is, those bay states have been suffering the economic and other losses for more than a generation from an impaired Chesapeake Bay and that impairment is the result of loadings from all Bay states.

So the point remains that to restore the Chesapeake Bay, all jurisdictions and all sectors will need to achieve reductions of nitrogen and phosphorous. EPA used its discretion, based on extensive input from the Bay partners, to develop a rational science-based

methodology to divide that allowable loading among the bay jurisdictions. To address the concerns raised by the headwater states of New York and West Virginia, EPA provided additional loadings to those states.

26 - FUTURE GROWTH

Comment ID 0417-cp.001.002

Author Name: Comment Anonymous

Organization:

Pollution loads from growth are the one source of nitrogen and phosphorous bay-wide that is headed in the wrong direction. As the States create their Watershed Implementation Plans, the Environmental Protection Agency should give particular scrutiny to their efforts to minimize pollution from future growth and development.

I support a strong TMDL.

Response

The Bay TMDL includes an expectation that the Chesapeake Bay watershed jurisdictions will develop mechanisms that completely mitigate new and expanded discharges of nutrients and sediment to the Chesapeake Bay. Jurisdictions are expected to identify an allocation for growth or to develop offset and trading programs through which future growth and development projects could mitigate their discharges. EPA is working closely with the jurisdictions to ensure that these mechanisms are in place and operating as intended.

Comment ID 0442.1.001.011

Author Name: Drzyzgula Cathy

Organization: Metropolitan Washington Council of Governments (COG)

Recommendation #8B: Provide Flexibility for Addressing Growth between Sectors

EPA should maximize the options available for local governments and utilities to be able to address the demands of growth in those sectors (i.e., wastewater and stormwater) where they have responsibilities, without invoking premature application of federal 'backstop' measures (ref. Section 10.1 Future Growth).

Response

EPA is working with the Bay jurisdictions to promote growth planning and decision-making that supports the Chesapeake Bay TMDL. The TMDL does not dictate a specific approach to growth, but it incorporates a mechanism to ensure that any new or increased loadings of nutrients or sediment from point or nonpoint sources are offset by reductions in those pollutants from other sources. In this way, the TMDL makes clear the intention that growth is envisioned under the TMDL so long as the nutrient and sediment caps in the TMDL are met and offsets do not result in unintended exceedances of water quality standards elsewhere.

26.1 - ALLOCATIONS FOR GROWTH

Comment ID 0159.001.006

Author Name: Farasy Tom

Organization: Maryland State Builders Association

Further, future growth is not given proper analysis in the state's Watershed Implementation Plans. Maryland's plan, for example, relies on purchasing credits from a credit bank that has yet to be established, and fails to provide for the growth that will naturally occur if the State's economic development plans succeed.

Response

EPA worked with the Bay jurisdictions including Maryland to improve their WIPs with regard to accounting for growth. The TMDL establishes allocations of nutrient and sediment pollution that must be met to achieve applicable Bay water quality standards. To be consistent with these allocations and the TMDL, no new or increased discharges of nutrient and sediment pollution may be authorized unless the TMDL includes an allocation for the new or increased discharge or the new or increased discharge is offset. In the TMDL, EPA has called on the Chesapeake Bay watershed jurisdictions to establish mechanisms that completely offset new and increased discharges of nutrients and sediment to the Chesapeake Bay. To be consistent with the TMDL, jurisdictions must identify an allocation in the TMDL for such growth before such loadings can be authorized or, where no such allocation is made in the TMDL, offset such loadings. EPA is working closely with the jurisdictions to ensure that these mechanisms are in place and operating as intended. In some cases, the jurisdictions will need to develop or expand offset and trading programs to accommodate growth. The Bay jurisdictions are expected to adopt additional measures as necessary to meet the expectation for no net increases in discharges to the Chesapeake Bay.

Comment ID 0202.1.001.008

Author Name: Carl Jimmie

Organization: Southern Tier New York WWTP

D. Population Growth Distribution within Bay Watershed

It is estimated that the population within the Chesapeake Bay watershed has increased 14.2 million to 17.7 million people from 1990 to 2010, an increase of 3.5 million people over this period. Maryland and Virginia account for most of this population increase, adding 1.3 million and 1.8 million people, respectively. The population within the New York State portion of the Bay watershed stagnated or declined over this same period, with some of the larger municipalities having loss about 20 percent of their population between 1970 and 2000.

Response

EPA agrees that the New York State portion of the Chesapeake Bay watershed has experienced a population reduction in the recent past. EPA worked with New York State to ensure that if this trend reverses and nutrient loadings increase as a result of population growth, the state will implement mechanisms to account for new growth. For more information on the TMDL allocation to New York source see Section 8 of the TMDL and response to comment 0080-cp.001.002.

Comment ID 0228.1.001.014

Author Name: Rolband Michael

Organization: Wetland Studies and Solutions, Inc.

The draft WIP states, "Allocations for newly developed land will be set at a level that results in no increase above allowable 2025 average nutrient loads per acre from previous and uses; unless offsets are obtained in the event on-site controls will not fully achieve allowable loads [FN21]." This requirement will result in an allowable loading of 0.26 lb/ac/yr TP [FN22] (based on draft WIP allocations and 2010 acreages), as shown in Table 5, below:

Table 5: Analysis of 2025 Unit TN and TP Loads Across Sectors in Virginia. [Please see page 13 of the original letter (Docket ID 0228.1.001.014).] [FN22][FN23][FN24]

Since the draft WIP allocations for the Urban sector will directly influence upcoming stormwater regulations, it is important to understand the effect various allowable loads will have on pollutants in the Bay (yearly and in 2025). Table 6, below, calculates the difference in yearly loads between an allowable loading rate of 0.26 lb/ac/yr (draft WIP) and 0.45 lb/ac/yr (2010 proposed stormwater regulation).

Table 6: Effect of Stormwater Management Regulations. [Please see page 13 of the original letter (Docket ID 0228.1.001.014).] [FN26]

Table 6 indicates a difference of only 40,000 lbs in the total TP load change (2,700 lb/yr) between the two unit loads currently under consideration for the upcoming stormwater regulations. This is approximately 0.06% of the draft WIP-allocated annual TP load for the Urban sector (3,915,000 lb/yr); it is truly a trivial point of contention [FN27] and can be handled easily through the proposed Nutrient Trading Fund (see Section III.B.5, below).

[FN 21] September 2010 Draft Phase I Watershed Implementation Plan. (Page 13.)

[FN 22] The table also results in an allowable TN load of 2.40 lb/ac/yr, but the proposed stormwater regulations only regulate TP as currently written. Therefore, no further mention of TN is made in this section.

[FN 23] 2025 WIP allocations are from the September 2010 Public Review Draft WIP.

[FN 24] The 2010 sector acreages shown here were received from Russ Perkinson via e-mail on 8/12/2010.

[FN 25] This calculation assumes that "2025 average nutrient loads per acre from previous land uses" are the loads resulting from the straight average of forest and agriculture.

[FN 26] In Virginia for the 2009 Progress model year; based on the Phase 5.3 Chesapeake Bay Model, released 7/21/2010.

[FN 27] In fact, the total load change is only 1% of the yearly allowable load from the Urban sector.

Response

EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange in a manner consistent with the Chesapeake Bay TMDL. EPA has worked and will continue to work closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Organization: 1000 Friends of Maryland

III. Pollution Loads From Growth Require Particular Attention

The decline of the Chesapeake Bay stems from human activity that has altered the landscape throughout the Bay's 64,000 square mile watershed and all of the Bay states. The population in the watershed has doubled since 1950 (now around 17 million), and much of this growth and development - leveling trees, forests and wetlands and replacing farms with subdivisions and malls -- has taken place close to the Bay or to its sensitive tributaries, harming natural filters that are critical to a healthy ecosystem.

Pollution loads from growth are the one source of nitrogen and phosphorous bay-wide that is headed in the wrong

direction. As the Environmental Protection Agency reported in 2007, increased pollution loads from continued development were outpacing pollution reductions from all other sectors combined.[FN 5]

As the States create their Watershed Implementation Plans, the Environmental Protection Agency should give particular scrutiny to their efforts to minimize pollution from future growth and development.

[FN 5] Environmental Protection Agency, "Development Growth Outpacing Progress in Watershed Efforts to Restore the Chesapeake Bay," September 10, 2007.

Response

The TMDL establishes the expectation that Bay jurisdictions will offset new or increased loadings through a mechanism allowing for quantifiable and accountable offsets of the new or increased load in an amount necessary to implement the TMDL and applicable water quality standards in the Chesapeake Bay and its tidal tributaries. EPA is working closely with the Bay jurisdictions to ensure that this expectation is met.

26.2 - OFFSETTING NEW OR INCREASED LOADINGS

Comment ID 0039-cp.001.003

Author Name: Austin John

Organization:

In order for there to be attainment, future growth must be directed to areas served by advanced wastewater treatment with N & P removal. Areas that cannot be served by regional facilities must either treat to the same levels as the advanced systems or meet the levels through dilution/attenuation by the time the effluent reaches the property boundary. This would result in down zoning areas not planned to be served from one home per ½ acre to one home per 50-100 acres or less in limited growth areas.

Response

EPA is working with the Bay jurisdictions to promote growth planning and decision-making that supports the Chesapeake Bay TMDL. The TMDL itself does not dictate a specific approach to growth, but it incorporates a mechanism to ensure that any new or increased loadings of nutrients or sediments from point or nonpoint sources are offset by reductions in those pollutants from other sources. In this way, the TMDL makes clear the intention that growth is envisioned under the TMDL so long as the nutrient and sediment caps in the TMDL are met and offsets do not result in unintended exceedances of water quality standards elsewhere. EPA is optimistic that economic growth and Bay protection can be mutually supportive.

Comment ID 0270-cp.001.004

Author Name: Wardrop Denice

Organization: Chesapeake Bay Program's Scientific and Technical Advisory Committee (STAC)

a. 10.1.1 Designating Target Loads for New or Increased Sources. Sentence 2

Comment: Define "independent oversight." What are the expectations? Who can conduct such oversight? Many programs have third party oversight but they are contracted by the brokers. Would that qualify as "independent"?

b. 10.1.2 Offset Programs. Paragraph 2. Sentence 1

Comment: Define the ambiguous phrase: "public oversight."

c. 10.1.4 EPA's Oversight Role of State Offset Program. Paragraph 2. Sentence 2, "Such oversight generally will be conducted on a programmatic basis, not an individual offset basis."

Response

EPA intends for "independent oversight" in section 10.1.1 of the draft TMDL to mean third-party oversight of jurisdictional offset programs, including by firms under contract to the jurisdictions. In such cases, contracts ideally would specify the authority of the third party to arrive at conclusions without being influenced by the jurisdiction.

EPA intends for "public oversight" in section 10.1.2 of the draft TMDL to mean that jurisdictions should provide information about their offset programs with transparency, detail and explanation sufficient for members of the public to understand the programs, including how individual offset agreements are structured. Jurisdictions should also provide the public with opportunities to comment on offset programs and individual agreements under such programs. A routine process in which the public has the opportunity to comment on and appeal jurisdictions' decisions is the NPDES permitting process under the Clean Water Act. EPA envisions that offsets will often involve an NPDES permitted discharger in the context of that discharger's NPDES permit issuance or reissuance for an expansion of loading of a pollutant of concern.

EPA cannot predict or commit whether its budget will support specific activities in the future. EPA, however, has made protection and restoration of the Chesapeake Bay a priority, including the oversight of offset programs. Successful offset programs are an essential component of achieving the goals of the TMDL.

d. Appendix S. II. Definitions. 4. New or Increased loading

Comment: This definition is ambiguous. Does this definition imply that there can't be any new nonpoint source without offsets to its loadings? For example, this definition implies that no new animal feeding operations would be allowed without sufficient offsets to balance its expected loadings. The definition could also restrict cropping changes with higher than current loads. Thus, could moving to vegetable production from another less intensive loading crop be allowable?

e. III. Common Elements, 5. Credit Calculation and Verification, iv. Accounting rules for inclusion of practices implemented through public cost-share incentives

Comment: This section is vague and ambiguous. Will these practices be treated differently than others? Can expected nutrient savings be traded?

f. III. Common Elements, 6. Safeguards, (d) Ensuring temporal consistency between the period when a credit or offset is generated and when it is used

Comment: What does it mean when it is stated that "offset is generated"? Is the offset generated when it is installed, or when the quality of the receiving water body is improved?

g. III. 6. Safeguards (c) Protecting affected communities from disproportionate harm arising from offsets

Comment: This phrase is not well defined and is open to multiple interpretations. Does "disproportionate harm mean poorer water quality in "hot spots," or some other negative impact or cost? The phrase should be defined more specifically.

Response

Appendix S of the draft TMDL is intended to establish components and principles the Bay jurisdictions will include in their offset programs. With regard to "new or increased loading," the commenter has appropriately interpreted EPA's definition. As noted, point sources and nonpoint sources subject to wasteload and load allocations would be expected to mitigate any increased loadings through the use of offsets.

With respect to projected increases in nutrient loadings from changes in crops, EPA recognizes that jurisdictions will face practical considerations when tracking and identifying when new or increased loadings are expected to occur. Under the TMDL, new or increased loadings for which there are not allocations in the TMDL cannot be authorized unless they are offset. Implementing this policy, particularly for unregulated sources such as crop agriculture will be challenging. EPA recognizes that jurisdictions will have some flexibility in prioritizing and phasing in their programs.

With regard to "accounting practices for the inclusion of practices implemented through public cost-share incentives," EPA acknowledges that the Bay jurisdictions with established offset programs have divergent policies and rules on offsets implemented with public cost-share funds. For instance, Maryland does not allow trading of credits generated through projects funded with

public cost-share funds. This part of Appendix S establishes an expectation that jurisdictions will make their position on this issue clear.

With regard to establishing when the “offset is generated,” jurisdictions typically consider an offset as being generated when the project is actually implemented. Again, EPA expects clarity from the jurisdictions on this matter.

With regard to the Appendix S section on safeguards, EPA’s intent is for the Bay jurisdictions to provide specificity on how they will determine whether offsets would cause disproportionate harm, such as effects on economically disadvantaged communities or populations, and how they will address this matter at the programmatic level and in specific offset arrangements.

With regard to the statement that NPDES permittees should remain accountable for meeting WQBELs in their permits, EPA intends that offset transactions should not compromise the ability of NPDES permittees to meet WQBELs. Given that WQBELs based on wasteload allocations should be included and recorded in NPDES permits, this seems to EPA to be a key element for ensuring the legitimacy of an offset program, and is consistent with EPA’s Water Quality Trading Policy. EPA does not believe this approach compromises the viability of such programs.

With regard to failure or noncompliance with offset agreements, EPA believes that the permitting authority holds the primary responsibility for ensuring that NPDES permit requirements are clear and unambiguous so permit holders understand the terms of compliance, thereby minimizing the risk of failure or noncompliance. Where a permittee is party to an offset or trade, it is important that the permit reflect this fact and that the permittee establish a mechanism such as a contract to ensure it can enforce or otherwise ensure the offset or trade remains valid and in effect for the term of the permit.

B. Economic Development

Preserving current POTW allocations is also imperative for future healthy economic growth. Adequate sewer capacity is a critical part of future economic growth. If EPA’s POTW allocations cuts stand, POTWs will not have the ability to serve additional customers, no matter their importance for Virginia’s economic recovery.

While EPA points to the possibility of acquiring "offsets", the fact is that offsets are not widely available and thus not a viable option in Virginia on any meaningful scale. Further, offset development is only in an early developmental stage and is very expensive to implement.[FN40] To the extent that EPA believes POTWs will be able to avail themselves of non-point source offsets and thus be in a position to provide treatment capacity to new customers, VAMWA responds that offsets are not widely available at the present time and thus do not represent a viable option for planning, financing or constructing major public infrastructure.

[FN40] Brent Fults, Managing Member of the Chesapeake Bay Nutrient Land Trust, LLC, a Virginia non-point source

nutrient bank, gave testimony before the U.S. Senate, Committee on Environment and Public Works, Water and Wildlife Subcommittee on August 3, 2009 (attached as Appendix 21) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A21]. According to Fults, "the costs associated with reducing nutrient loading by one pound from an acre of farmland can run into the thousands of dollars." This is because owners of agriculture land expect compensation for the costs of land conversion from agricultural use to forest plus the lost opportunity costs for not farming or developing the converted farmland.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL. EPA's proposed reductions to POTW allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance demonstrated in draft Phase 1 WIPs. See response to Comment 0067.1.001.009 EPA is responsible for ensuring that nutrient and sediment allocations in the TMDL are based on reductions and measures envisioned in the final Phase 1 WIPs that will be achieved. Continued population growth and development in the Chesapeake Bay watershed without sufficient nutrient and sediment pollution prevention, treatment, and management is largely responsible for the current state of the Bay and the necessity for a TMDL. EPA understands that the TMDL will affect patterns of growth and economic development, including POTW and sewer capacity, in the watershed. Such adjustments are likely to be necessary to achieve the objective of the TMDL, which is to meet applicable water quality standards throughout the watershed.

In the TMDL, EPA has attempted to identify and promote options for the jurisdictions to accommodate growth while meeting the TMDL allocations. Offsets and trading provide an opportunity to use free market approaches to allow new and existing dischargers to meet their allocations by paying for pollutant reductions at another location. These approaches have been implemented in several Bay jurisdictions, including Virginia. Virginia is also seeking to expand its program to make offsets available to a wider range of dischargers. EPA supports this program expansion as discussed in Section 10 of the TMDL, and believes the success of the program expansion, particularly for stormwater and on-site or septic systems, depends on the jurisdiction's success in creating greater demand for load reductions from these sectors. EPA expects that creating additional pressure on sectors that have not traditionally felt a demand to decrease their loadings will stimulate market activity in this area.

Comment ID 0294.1.001.001

Author Name: Haley Mark

Organization: Virginia Nutrient Credit Exchange Association, Inc.

The Nutrient Exchange strongly recommends that the EPA TMDL and the Virginia WIP be made consistent with Virginia's existing point source nutrient allocations as reflected in the Virginia Water Quality Management Planning Regulation, 9VAC25-720, and the Chesapeake Bay Watershed General Permit Regulation (9VAC25-820) and related Registration Lists. The Exchange Compliance Plan is premised on these allocations and any major changes by EPA or Virginia would be highly disruptive to this substantial plan that draws on approximately \$2 billion in capital improvement projects for nutrient purposes and related trading.

At page 10-4 of the Draft TMDL, EPA requested comment on whether its proposed offset provisions for new or increased nutrient or sediment loadings should apply to water quality trades in the Bay jurisdictions generally. The point-point trades under the VADEQ-approved Exchange Compliance Plan are in this latter category. While the TMDL should certainly acknowledge the availability of trading including that of the Nutrient Exchange as an assumption of the TMDL, we strongly advise and request that this specific question be answered "NO". The Nutrient Exchange strongly urges EPA not to apply the Appendix S proposed offset provisions for new/increased loads to existing point-point trading programs such as the Virginia program implemented by the Nutrient Exchange.

Response

EPA appreciates the comment and recognizes Virginia for development of a viable trading program. EPA believes that some existing nutrient allocations, as under the jurisdictions' tributary strategies, may need to be adjusted to meet the Bay TMDL allocations. The degree to which such allocations will need to be adjusted varies by jurisdiction. In general, EPA does not intend to revisit the validity of credits sold or traded prior to the finalization of the Bay TMDL.

EPA disagrees with the comment in part and believes that existing nutrient offset and trading programs should include the elements described in Appendix S of the draft TMDL, but understands that existing programs may require some time to incorporate such elements. EPA is working with the Bay jurisdictions to ensure that they do include such elements in a timely fashion.

Comment ID 0294.1.001.003

Author Name: Haley Mark

Organization: Virginia Nutrient Credit Exchange Association, Inc.

Most importantly, this Virginia point-point trading program is working remarkably well and has been widely praised as a national model, including receiving credit in EPA's own publications. At this time, the Nutrient Exchange urges EPA to limit its consideration of new credit-related policies to the specific issue of offsetting new or increased loads.

Response

EPA appreciates the comment. The TMDL's provisions related to growth are limited to offsets for new and increased loads, but are also concerned with existing programs that oversee such offsets. EPA is working with the Bay jurisdictions including Virginia to ensure that existing nutrient credit trading programs such as the Virginia Nutrient Credit Exchange should be consistent with EPA's expectations as stated in Appendix S of the TMDL.

Comment ID 0294.1.001.005

Author Name: Haley Mark

Organization: Virginia Nutrient Credit Exchange Association, Inc.

-- "Net Improvement Offsets" (Page 10-2) - This item is objectionable in that it requires a source to do more than fully offset its own load. This essentially would penalize one party that is achieving zero-discharge for its new or increased activity, by requiring that party to also clean up for another source that should do so but has not. This violates the most basic notions of fairness and due process, reflects poorly on government, and should be deleted.

Response

EPA disagrees that the concept of “net improvement offsets” is inherently unfair. Several jurisdictions already require offset ratios higher than 1:1 as a means of more quickly achieving water quality standards. EPA does not believe this approach subsidizes noncompliance by sources, as compliance assurance and enforcement programs address such challenges. The TMDL recognizes that jurisdictions may need to establish additional authority to require net improvement offsets as appropriate and generally leaves the jurisdictions some discretion in the implementation of such approaches.

Comment ID 0300.1.001.018

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

According to Section 10.1.2 of the draft TMDL, EPA states that "new or increased loadings of nitrogen, phosphorus, and sediment in the Chesapeake Bay watershed that are not specifically accounted for in the TMDL's WLA or LA will be offset by loading reductions from other sources where such offset credits are generated under programs that are consistent with the definitions and common elements described in Appendix S." VDOT asserts that it is unfair to impose a moving standard for pollutant reduction on the regulated community. If offsets are required, then the TMDL should specify that the offsets would be the responsibility of the party that is introducing a new pollutant source and not the responsibility of other parties.

Response

EPA's intention in this language is to establish that entities generating new or increased loadings would be responsible for ensuring offsets for such loadings. EPA and the Bay jurisdictions assume that the prospect of economic opportunity for some entities will result in the creation and provision of offsets by such entities. Alternatively, polluters may be able to implement their own offsets without involving another party.

Comment ID 0302.1.001.009

Author Name: Williams Nat

Organization: The Nature Conservancy

Beyond the existing safeguards in Appendix S of the TMDL, EPA should consider providing additional requirements in

its offset program to ensure that new loads do not compromise healthy watersheds, as identified through state and federal programs.

Response

EPA is concerned that offset and nutrient credit trading programs not cause water quality or other environmental problems in the Bay watershed. EPA will continue to work closely with the Bay jurisdictions to ensure that such unintended consequences are minimized. Offset and trading programs, furthermore, rely on the principle that the sites and facilities providing offsets or generating credits meet all applicable federal and state regulations, including meeting applicable TMDL allocations and applicable water quality standards. This principle includes avoiding the creation of localized “hot spots” that cause or contribute to the exceedance of local water quality.

Organization: Natural Resources Defense Council (NRDC)

Delaware

Delaware does not yet have an offset policy and notes that it needs to develop one in order to provide adequate accountability. This is particularly true since the state views offsets as a "key element in achieving both water quality and quantity goals in this watershed and throughout Delaware." [FN 74] NRDC supports Delaware's outlined approach to establishing baselines that require specific performance measures that are at least as stringent as WLA or LA in the TMDL. We also support many other elements of the Delaware framework, as described in its WIP, though the program is candidly not yet developed in any detail. Currently there is no clear identification of a program to assure baseline compliance for nonpoint sources. The WIP notes the need for such a program for the Phase II WIP, but this effort should be fast-tracked before EPA approves participation in trading.

[FN 74] Chesapeake Interagency Workgroup, Delaware's Phase I Chesapeake Bay Watershed Implementation Plan, at 69 (Draft Sept. 1, 2010).

Response

EPA has worked closely with Delaware to expand the jurisdiction's Phase 1 WIP discussion on developing and offset program. In its final Phase 1 WIP, Delaware provides a detailed schedule for and discussion of its plans for developing and implementing an offset program. EPA looks forward to working with Delaware to ensure that the jurisdiction achieves its goals with regard to developing and implementing this program.

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

West Virginia

West Virginia supports the use of offsets to accommodate growth but there is little detail included on program design or baselines. NRDC supports their position that offsets should be based on delivered loads rather than edge of stream loads to ensure accuracy.

New York

New York takes a conservative approach to offsets. The state's WIP notes, and NRDC agrees, that a strong process to verify and track offsets must be in place before relying on nonpoint source reductions to counterbalance point source increases.

New York is exploring the use of mass balance analysis as a tool for measuring nutrient flows from agricultural operations through a pilot project with the Upper Susquehanna Coalition and Cornell. This program could be a useful tool for establishing and monitoring baseline data on nutrients at the farm level.

Finally, NRDC believes that New York's suggestion that it would achieve "elimination of septic discharges by connection" as a way of offsetting growth in wastewater treatment plants' increased discharge is a reasonable one. Such offsets, of course, need to be consistent with the various principles articulated elsewhere in these comments, in that they must be quantifiable, rigorously and publicly verified, accounted for in the load allocation, and surplus to other requirements (including any program that may exist in the state to promote sewer connection).

Response

EPA appreciates the support expressed in these comments and is working with West Virginia and New York to ensure that their approaches to managing growth under the TMDL will support the jurisdictions' wasteload and load allocations.

Comment ID 0444.1.001.003

Author Name: Allen Paul

Organization: Constellation Energy

Growth in the watershed is continuing and will continue for the foreseeable future; therefore, the Chesapeake Bay TMDL must have a mechanism to allow for growth while still meeting reduction targets and water quality goals. Maryland has already an established program for point source to point source trading (established in April 2008) and is developing complementary programs to administer trading and offsets between point sources and agricultural non-point sources. Furthermore, Maryland plans to use these two programs as a foundation for development of an appropriate framework for other point to non-point source trades (Maryland Watershed Implementation Plan, Executive Summary, p. ES-4). Constellation fully supports the use of offsets and trading as a means of allowing new and expanded discharges while continuing to meet load reductions.

Response

EPA agrees with these comments and is working with Maryland to ensure that its offsets and trading program support and are consistent with its TMDL wasteload and load allocations.

Comment ID 0476.1.001.005

Author Name: Farasy Thomas

Organization: Maryland State Builders Association (MSBA)

5. Beginning in 2011, for construction projects, every new structure in the Bay watershed will need to offset its potential impact on the Bay by purchasing credits from trading and offset programs that have yet to be developed.

6. The TMDL has been set up so that increases in population are not going to have the same levels of new housing available to them, increased pricing and in turn, limit the many financial benefits of new development.

Response

EPA does expect that new or expanded nutrient and sediment discharges in the Chesapeake Bay watershed will be offset so that there is no net increase in such discharges to the Bay. EPA is concerned about unintended consequences of the TMDL allocations, but also acknowledges continued population growth and development in the Chesapeake Bay watershed without sufficient nutrient and sediment pollution prevention, treatment, and management is largely responsible for the current state of the Bay and the necessity for a TMDL. EPA will continue to work closely with the Bay jurisdictions to ensure that such unintended consequences are minimized. EPA understands that the TMDL may affect patterns of growth and economic development, including POTW and sewer capacity, in the watershed. Such adjustments may be necessary to achieve the objective of the TMDL, which is to meet applicable water quality standards throughout the watershed.

D. Create or Foster a Bay-Wide Nutrient and Sediment Reduction or Offset Credit Trading Program

A federally-sanctioned credit trading program would provide opportunities to reimburse the costs of environmental improvements made by headwater states and would incentivize voluntary steps beyond minimum "compliance" levels. Thus, a Bay-wide nutrient and sediment reduction or offset credit trading program should be created or sanctioned by the EPA, or another federal agency, and included as an integral part of the TMDL. Because New York's portion of the Bay watershed is relatively small, it does not seem feasible that a viable credit trading program could be established within New York itself. Given that the benefits of any credit trading program would be realized on a Bay watershed-wide basis, we urge the EPA to include provisions to support creation of such a program as a part of the final TMDL. (In suggesting this, we do not mean to imply that the EPA or federal government should administer and control such a program: once sanctioned, we believe that private enterprise can carry-out and service the mercantile functions of such a program).

Response

EPA's current preferred approach to the development and implementation of an interstate nutrient credit trading program would be for the federal government to play a facilitative role as the jurisdictions work together to create such a program. Several Bay jurisdictions, including New York, have valuable experience with nutrient credit trading. New York, in fact, has suggested that its experience with such programs as applied to Long Island Sound would allow it to quickly create such a program for its part of the Chesapeake Bay watershed if circumstances necessitate such a program.

Comment ID 0516.1.001.013

Author Name: Winegrad Gerald

Organization: Senior Bay Scientists and Policy Makers for the Bay

9) While reducing agricultural nutrients and sediment loadings may be the immediate challenge as farm pollutants are the greatest source of loadings and the most cost-effective to reduce, offsetting the effects of population growth and development by 100% is essential to maintaining any progress made by other sectors. The EPA should act to include measures to expand MS4 jurisdiction over more developed lands, better septic system requirements, and improved growth control measures as these are essential and the EPA should require that these measures be included in each state WIP along with a requirement for completely offsetting growth related loads elsewhere in each of the 92 waterway segments under the TMDL in each state.

10) A requirement is critically needed for no net increases in stormwater discharge rate, volume, and pollutants for all new development for a 5-year storm. Current state stormwater laws clearly do not accomplish this. The EPA, both

through the MS4 permitting process and requirements for inclusion in each state's WIP, should assure that each state requires and enforces a no net increase in rate, volume, and pollutant loads from all new development. This will require mandatory on-site containment through environmental site design.

Response

The TMDL includes an expectation that the Chesapeake Bay watershed jurisdictions develop mechanisms that completely mitigate new and expanded discharges of nutrients and sediment to the Chesapeake Bay. Jurisdictions are expected to identify an allocation for growth or to develop offset and trading programs through which future growth and development projects could mitigate their discharges. EPA is working closely with the jurisdictions to ensure that these mechanisms are in place and operating as intended. The Bay jurisdictions are expected to adopt additional measures as necessary to meet the expectation for no increases in discharges to the Chesapeake Bay. For more information on MS4 requirements please see response to comment 0265.1.001.013 and 0293.1.001.008.

Comment ID 0530.1.001.003

Author Name: Gulibon Grant

Organization: Pennsylvania Builders Association

Finally, the TMDL EPA ultimately issues for the Chesapeake Bay watershed will drive the acceptable growth rate for communities within the watershed, including those in Pennsylvania. New growth within Pennsylvania's portion of the watershed will need to offset its pollutant contributions by drawing from an existing pollutant allocation, since the state has failed to set aside such an allocation in its Watershed Implementation Plan (WIP). Therefore, any new growth activities must purchase water quality credits, and an adequate program exists to allow new growth to purchase water quality credits. Without new growth, it is a virtual certainty that the billions of dollars likely necessary to implement the TMDL will not be generated.

Response

EPA agrees that Pennsylvania's offset program provides a valuable resource through which new growth can occur. EPA will continue to work with Pennsylvania to ensure that the program meets EPA's expectations.

Comment ID 0530.1.001.008

Author Name: Gulibon Grant

Organization: Pennsylvania Builders Association

If progress is to be made in restoring the Bay, all sources of pollution must be addressed and the greatest emphasis must be on the biggest sources of pollution in a cost-effective manner-all the while being guided by accurate science on

the Bay's condition. For example, the agency's focus should be on runoff from agricultural activities, as these are the biggest contributors of nitrogen, phosphorus, and sediment. PBA believes that the "stormwater BMP offsets" proposal included as an appendix to these comments has the potential to cost-effectively address this major source of the Bay's impairment while allowing for desperately needed economic growth to continue. Such an option would allow EPA and the states to work together to develop and implement a coordinated and enforceable strategy for addressing discharges from agricultural activities while accommodating and planning for future growth around the Bay.

APPENDIX PROPOSAL FOR PAYMENT OF A FEE BY LAND DEVELOPERS TO CONVERT OFF-SITE UNFORESTED STREAMSIDE AREAS TO FORESTED RIPARIAN BUFFERS

A new payment of fee option would be included in the model stormwater ordinance endorsed by PA D.E.P., and as part of NPDES regulations for stormwater discharge. The fees would be used for planning and physical installation of riparian forested buffers off of the developing site. The fee should be used if at all possible along a water way that receives runoff from the land development project, and as close to the project as feasible.

For simplicity, the fee amount would be tied to the amount of increased impervious coverage being created on a site. Existing pre-development (historical) impervious coverage would be credited since it is already generating runoff and hypothetical pollutants and thermal issues. Impervious area is an easily documented land use, and this use generates the most environmental issues (versus land use conversion of meadow to lawn). Proposed pervious pavement (porous concrete and asphalt, or interlocking pavers) would be credited, so there is an incentive for a developer to use such products over traditional pavements. Fees would be paid into a forested riparian buffer creation fund established within each county, to be administered by the county conservation district.

Each county conservation district would study streams in their county and maintain an inventory of areas where forested buffers are desirable. Initial mapping study could be done using recent aerial photos available on the internet; this could be supplemented by drive-by site visits as needed. The county conservation district, or designated entity, would work with landowners, and prepare detailed buffer installation plans, and implement those using the fees collected. Physical installation would most likely be via a hired contractor. Should a county run out of, or not have suitable areas for buffer implementation at a moment in time, the funds could be transferred to counties in a downstream watershed that receives runoff from the developing county.

A land developer would have the option to pay into the fund rather than implement normally required BMPs within the new development. This gives the developer three options:

- Implement BMPs per the BMP Manual (per the current scenario);
- Pay a fee for installation of off-site forest buffers (BMPs), and not implement BMPs on site (whether by choice, or because it is not physically possible to infiltrate due to soil and/or bedrock conditions); or
- A combination of the above: treat some areas on-site, and pay for other untreated onsite areas.

Note that stormwater release rate would still have to be regulated on the site per the municipal (or county) stormwater ordinance (the traditional requirements). Consequently, there would still likely be some treatment of runoff in the traditional detention basins that would be implemented.

The proposed fee schedule is based on information provided by the Dauphin County

Conservation District on a forested buffer project in Dauphin County. Per that study, the cost of installation of one acre of forested riparian buffer is \$2,270. For this proposal, we suggest rounding the cost amount up to an even \$2,300. The simple fee schedule for a developer would be as follows:

Pay \$2,300.00 for each acre of increased impervious area for which BMPs are not being provided per the BMP Manual.

Response

EPA agrees that all sources of nutrients and sediments to the Chesapeake Bay must be addressed for the Bay and its tributaries to meet applicable water quality standards. EPA will consider the proposal for a fee structure for offsets and will share these comments and raise in future discussions with the Bay jurisdictions.

3. UWAG supports EPA's approach to offsets for new or expanding dischargers.

The availability and legality of "offsets" for new or expanded dischargers has been in contention since the controversial Ninth Circuit Court of Appeals ruling in *Friends of Pinto Creek, et al. v. EPA*, 504 F.3d 1007 (9th Cir. 2007). UWAG believes that Pinto Creek was wrongly decided, and we strongly support the use of offsets to account for and manage new or increased loadings of pollutants causing impairment or subject to TMDLs.

The Bay TMDL assumes that the watershed states will accommodate any new or increased loadings of nitrogen, phosphorus, or sediment that do not have a specific allocation in the TMDL with appropriate offsets supported by credible and transparent offset programs subject to EPA and independent oversight. See Bay TMDL at S-1. UWAG supports this assumption, and commends EPA for preserving the use of offsets in the TMDL program.

Response

EPA agrees that offsets are an important tool for the Bay jurisdictions to have available to use to meet their wasteload and load allocations.

Comment ID 0590.1.001.013

Author Name: Chavez Jennifer

Organization: Earthjustice et al.

11. Offsets: EPA's proposal to authorize offsets to facilitate new or increased pollutant loadings to already-impaired waters is unlawful, arbitrary, and very poorly thought out. The Act and EPA provide no authority for offsets. Instead, they direct the establishment of TMDLs, comprised of WLAs and LAs. As noted above, a WLA is to be assigned in the TMDL to an individual point source. If EPA or a state wants to reallocate WLAs in any manner, they must do so by revising the TMDL through a public notice and comment process, not via some sort of ad hoc or case-by-case "offset" process that is not authorized by the Act or EPA rules, and that seeks to circumvent legally adopted WLAs and LAs.

EPA's guidelines for offsets are also unlawful because they provide no assurance that the loading limits required by the Act will be maintained at all times. The proposed guidelines in Appendix S fail to clear and explicit safeguards sufficient to prevent fictitious or overstated pollution reductions from being used as offsets. For example, the proposal appears to contemplate that nonpoint sources will be eligible to be credit generators, but sets no minimum monitoring requirements for such sources that would ensure verification that baselines and reductions from baselines are truly bona fide. Appendix S proposes only a vague requirement for "appropriately quantifying" credits and assuring equivalency, without specifying how. This creates a major risk of reliance on unreliable or unproven estimation techniques that vary wildly from case to case, and that EPA will lack the resources to oversee or validate. Moreover, EPA identifies no mechanism for monitoring or enforcing pollutant reductions used by nonpoint sources to generate credits. Allowing the use of such unenforceable reductions to effectively authorize point source increases that would otherwise violate the Act is itself flatly unlawful, as it effectively converts an enforceable effluent limitation into an unenforceable one. Furthermore, any attempt to allow an existing NPDES permitting to increase its pollution discharge without a permit amendment would violate the Act and EPA's rules, which require formal permit amendment to authorize pollution increases. EPA vaguely suggests various safeguards to protect local receiving water quality, but Appendix S appears to contemplate that the process for providing such protection could occur outside the NPDES permitting or amendment process, therefore illegal diluting the protection provided by existing rules to ensure protection of water quality standards.

Aside from their illegality, EPA cites no factual or reasoned basis for concluding that either the agency or the states can lawfully and effectively implement and oversee an offset program of the sort being proposed here. The agency cites no experience in administering a program of this magnitude, offers no estimate of the resources required from the agency and states to properly implement it, and provides no rational basis for concluding that EPA and states are capable of doing the job right.

Response

EPA disagrees that its offset proposal is "unlawful, arbitrary, and very poorly thought out." The Clean Water Act provides ample authority for permit writers to consider the effect of pollutant offsets when issuing WQBELs in NPDES permits. The most fundamental requirement for an NPDES permit is that it contains limits "necessary to meet water quality standards." CWA 301(b)(1)(C); 40 CFR 122.44(d)(1); 40 CFR 122.44(d)(1)(vii)(A). There is nothing in the CWA that bars a permit writer from considering the effect of pollutant reductions (offsets) generated by another source in deciding what a permittee's WQBEL for the same pollutant should be. It is not necessarily arbitrary (indeed, under the circumstances, it may be quite reasonable) to allow a new discharger to offset its contribution of pollutants with commensurate (and possibly less expensive) reductions from another source, provided that such reductions actually serve to offset the anticipated effects of the new discharge in the applicable waterbody.

While it is true that the TMDL regulations require the allocation of WLAs (and LAs) to individual and in some cases categories of sources, there is nothing in those regulations that precludes EPA (or a State) from establishing, as an “assumption and requirement” of a WLA, that the corresponding WQBEL may rely on documented offsets from another source and in doing so be “consistent with” the WLA’s assumptions and requirements. A State or EPA could hypothetically revise the TMDL and its WLAs everytime the permit authority sought to issue a WQBEL that relied on offsets, but EPA believes that would be an unnecessarily complicated and resource draining exercise. Rather, EPA believes the necessary flexibility can be built into the permitting process by making the need for (and ability to rely on) an offset one of the “assumptions and requirements” of the TMDL’s WLA. The ability of the public to comment on the appropriate use of such an offset is provided for in the NPDES permit issuance process.

The commenter says that EPA's guidelines for offsets are also unlawful because they provide no assurance that the loading limits required by the Act will be maintained at all times. The commenter says that the proposed guidelines in Appendix S fail to provide clear and explicit safeguards sufficient to prevent fictitious or overstated pollution reductions from being used as offsets. EPA disagrees with the comment. As the commenter notes, Appendix S is not a regulation. It is instead guidance that communicates EPA’s expectations for the jurisdiction’s offset programs. As guidance, it cannot by itself “require” that “loading limits required by the Act will be maintained at all times” or prevent “fictitious or overstated pollution reductions from being used as offsets.” However, as communicated in Appendix S, it is EPA’s expectation that offsets will be used appropriately by the jurisdictions, and Appendix S communicates those expectations in a clear and detailed manner. Moreover, EPA in its oversight capacity of the jurisdiction’s NPDES programs, would not stand by while jurisdictions issued permits that relied on “fictitious or overstated pollution reductions.” In the context of this TMDL, it is reasonable for EPA to address the offset issue by communicating clearly its offset expectations, building appropriate reliance on offsets into the framework of the TMDL as WLA “assumptions and requirements,” and using its NPDES oversight authority to ensure that offsets are used appropriately.

35. Does EPA expect that all new development within the Chesapeake Bay Watershed obtain offsets from existing sources prior to operation? Will these offsets be required from the same source sector as the new development?

Response

EPA does expect all new development in the Bay watershed to obtain offsets for any new or increased loadings of nitrogen, phosphorus, or sediment projected from such development. The individual Bay jurisdictions will determine whether the offsets will be required to be obtained from the same source sector as the new development, though this has not been the norm in jurisdictions with existing offset programs.

Chesapeake Bay Foundation Recommendations for Calculating Offsets
September 16, 2010

To achieve and maintain the pollution caps in the Bay's watershed, the States and D.C. must adopt offset policies that will ensure that, while we reduce loads from existing sources, we are not losing ground to new sources. This document provide a framework for how to calculate and track offsets relative to the Bay TMDL and associated Watershed Implementation Plans (WIPs) for each pollution source sector. Key issues include: What sources are included? What are the baseline pollution loads for comparisons? How would such a program be implemented? T underlying assumption is that some version of the state trading programs will provi~ the necessary legal and policy framework for purchasing offsets. The purpose of this document is to lay the framework for what constitutes a "new load" and how it should be quantified.

Offsets must be provided by all new and expanding point and nonpoint sources, including wastewater treatment plants, septic systems, municipal storm sewer systems, private development, and confined animal feeding operations (CAFOs). The basic tenants of the offset policy include:

- 1) All new and expanding private and public sources of pollution should be completely offset above a sector-specific "baseline" condition in place befon a new or expanding pollution loads begins.
- 2) Offsets should be on the ground and generating pollution reductions before they may be acquired, with the possible exception of smaller loads from single family homes, septic systems, and small development sites.
- 3) New loads from new development need to be offset in perpetuity, with the possible exception of smaller loads.
- 4) Offsets must achieve at least a 1:1 ratio, but preferably more. If nonpoint sources are involved, the offset credits required should be consistent with tr states trading policy (e.g., 2:1 in VA).
- 5) EPA should expeditiously develop and maintain the tools the states and locc government will need to estimate new loads and operate programs to delive offsets.

Proposed Policy for Each Pollution Source Sector:

1) Wastewater

Wastewater treatment plants (WWTP): Pollution loads from new or expanded municipal and industrial WWTPs of all sizes (from the largest significant discharge: to small package plants serving single family homes) should be offset. The mechanism for implementation and tracking is via NPDES permits and/or state regulations.

Septic: Loads from new or expanded conventional or alternative onsite septic systems (AOSS) of all size must be offset. This approach ensures consistency and equity across all sources of wastewater and prevents creating an incentive for placement of smaller, de-centralized systems that are inconsistent with local growth plans. An in-lieu fee program may be appropriate for smaller discharges. The mechanism for implementation and tracking should be state/local approval of the system or NPDES permits for systems that discharge to sensitive areas.

In addition, because water reuse, such as use for spray irrigation and industrial cooling water, is likely to become increasingly popular as a mechanism to "offset" additional loads from WWTPs and septic systems, we note that it is inappropriate to assume that nutrient loads from water reuse is zero. There will be some nutrient losses to the environment and these need to be estimated and offset as appropriate.

2) Urban and Suburban Runoff

Active Construction: Existing state construction general permits and related erosion and sediment control programs are woefully inadequate. We recommend that existing state programs be updated and revised by 2011 to ensure consistency with the federal effluent limit guidelines (ELGs) and specifically include more stringent rules for site stabilization and phasing. In the near term, rather than recommend offsets, we recommend compliance with the federal ELGs and improvements to existing programs. In the long term, depending on the success of these efforts to curb pollution from active construction, the issue should be revisited to determine if offsets are necessary. The mechanism for implementation and tracking should be the state CGP and/or local erosion and sediment control programs.

Post-Construction: For new development (i.e., greenfield), the baseline should be a forested condition. Offsets within the subwatershed that maximize pollution reductions, cost efficiency, and consistency with sound land use concepts should be encouraged. Further, note that the model used to simulate baseline and developed condition should be site specific (e.g., something like Nutrient Net, VA's runoff reduction spreadsheet, or Schuler's Environmental Site Design spreadsheet for MD). New loads from development that is 5,000 sq ft or greater should be offset in perpetuity. For projects closer to the smaller end of this size, the offset mechanisms should be flexible so as to not be too onerous, and could include fee in lieu type approach or restoration projects conducted within the community that is being affected. The mechanism for implementation and tracking should be the state CGP and/or state or local stormwater programs.

We are not seeking offsets for new loadings from redevelopment projects at this time as such projects should in the long-term reduce existing pollution loads even with lesser site level requirements than new development projects.

Increased Vehicle Miles Traveled: Emissions from cars, while important, may be difficult to quantify. Consequently, we advocate that the baseline for comparison of new loads from development be conservative because we recognize that we are not accounting for additional loads associated with other activities such as increased vehicle miles traveled.

Grandfathering: We recognize there will be a need to grandfather projects that are already in the permitting process. We recommend that any permits issued after December 31, 2010 be required to offset loads as described above.

3) Confined Animal Feeding Operations (CAFOs)

Confined Animal Feeding Operations (CAFOs) are regulated as point sources under the Clean Water Act. Hence, like other point sources, loads from new or expanding CAFOs must be required to offset new loads of nitrogen, phosphorus and sediment associated with increasing the number of animals in a watershed. Offsets must include all sources of pollution loading including volatilization and subsequent deposition of ammonia-nitrogen.

One approach to achieving this goal for the CAFO sector is to establish technology based effluent limitation guidelines for new or expanding CAFOs combined with an offset program for remaining loads that are technologically and/or

economically unfeasible to reduce through best available control technologies. Producers could be offered the choice of utilizing established loading emissions factors (perhaps on a per animal basis) or providing a professional analysis of loads utilizing EPA accepted estimation methodology.

CBF further suggests that there be a clearly defined process for incorporating new technologies and management practices that achieved enhanced nutrient removal CAFO load calculations.

Response

To date, EPA has left decisions regarding the details and specific mechanisms of offset programs to the Bay jurisdictions. As EPA continues to work with the jurisdictions in the development and implementation of such programs, it will consider the proposals included in these comments.

In the case of new sources the offset system must distinguish between the contractual or regulatory commitment of a point-source to acquire offsets for new loads and the actual purchase of the offsets as they are needed. Requiring the upfront full identification, purchase and offset of nutrient loads that are part of a facility modification and design flow expansion that may take years to fully utilize unfairly penalizes utility rate payers. Good financial and environmental accountability are more reasonably met through the laddering and mixing of offset sources over time in a way sufficient to assure annual compliance. Over-purchasing upfront simply increases costs to both the purchasing point-source customer base and any competing point-sources and defeats the market sensibility of the concept.

Response

EPA agrees that the planning for the acquisition of offsets so that regulatory requirements are met and economic impacts are limited is a significant element of a successful offset program. EPA will continue to work with the Bay jurisdictions to improve their offset and trading programs.

With relation to the modeling process, there was no mention of population growth and what that would do to land use changes and water demand. I understand the difficulty and added complexity of predicting land use change, but given the fact that urban development has increasingly become a major contributor to Bay nutrient and sediment pollution, this potential should have been explored. Also, as population grows, which in Virginia it is expected to grow a great deal, the issue of increased water demand seemed to be ignored in the modeling. The chosen 10 year hydrologic period may be complicated if water tables yield lower than expected flow. While this may decrease runoff, future development may counteract that with increased impervious surfaces. Therefore, the potential for sudden high discharge events (with urban sediment and nutrient pollution) associated with more impervious surface coupled with drastically lower discharges in summer when vegetation and human demand for water will be at its highest, a recipe for greater summer hypoxia is possible. Given that, I think that the modeling process should have addressed the issue of population growth.

Response

The Chesapeake Bay Land Change Model (CBLCM) forecasts change at the land-river-segment scale. Researchers from the USGS, EPA, Shippensburg University, and a private consultant developed the CBLCM which combines the strengths of GAME (growth allocation model) (Reilly 2003), with those of a cellular automata model, SLEUTH (slope, land use, excluded land, urban extent, transportation, and hillshade) (Clarke et al. 1997; Jantz et al. 2003). These models are used to estimate future landuse.

GAME projects future urban area by fitting total housing unit trends over the 1990s to a Gompertz (exponential S-shaped) curve, which is then used to extrapolate housing trends to the year 2030. County population projections converted to county-scale estimates of total housing demand were used to constrain the modeling segment scale forecasts generated using the Gompertz curve.

The proportions of urban growth occurring on farmland, forest land, sewer, septic, and within existing developed area boundaries were determined uniquely using the SLEUTH urban growth model, a stochastic cellular automata model customized for application in the Chesapeake Bay watershed (Jantz et al. submitted; Goetz and Jantz 2006).

The P5.3 CBLCM uses only GAME to project future development. GAME was updated to include (1) the most recent county-level population projections produced by each state; (2) updates to the Chesapeake Bay Protected Lands Database; (3) consideration of the 2009 population and housing unit estimates produced by the U.S. Census Bureau; (4) recalculation of the relationship between residential lot size and the percent of undeveloped land using the Maryland Department of Planning's 2007 parcel database; and (5) reapportionment of housing attributes from U.S. Census Block Groups to modeling segments using updated census and more accurate roads data.

For more information and to review the P53 land use documentation, visit <http://ches.communitymodeling.org/models/CBPhase5/documentation.php#p5modeldoc>

- Implementation of the WIPs will necessarily change the land use plans through the comprehensive planning process. However, it is not clear how the process will need to be different and how to incorporate the appropriate factors to achieve targeted reductions. Serious consideration needs to be given to the impact on the ability of a jurisdiction to actually focus growth within designation growth areas with all of these measures in place. The impact on property owners' ability to achieve economically viable use of their land is a key component of the planning process, but also is a key legal consideration.
- Increasing density within designated growth areas (sewered) is not an effective strategy for areas already projected to exceed WWTP caps without increasing density. Offsets will also not work as an option in these areas. Individual sites could develop buildings that have a smaller footprint and therefore are higher in density. However, the number of units on the site overall could not increase without running into problems with exceeding the WWTP caps. In this situation, minor reductions might therefore be realized through decreased building footprints. However, overall, a growth area will not have greater density, just more open space.
- It will be a challenge to determine how to reconcile State and local goals for agricultural land preservation with the need to reduce loads from the agricultural sector, particularly as one of the sectors with the highest percentage of needed reduction. Some additional description of how the State proposes to address this issue from the broader planning perspective would be helpful to incorporate to the document.

Response

EPA is working with the Bay jurisdictions to promote growth planning and decision-making that supports the Chesapeake Bay TMDL. The TMDL itself does not dictate a specific approach to growth, but it incorporates a mechanism to ensure that any new or increased loadings of nutrients or sediments from point or nonpoint sources are offset by reductions in those pollutants from other sources. In this way, the TMDL makes clear the intention that growth is envisioned under the TMDL so long as the nutrient and sediment caps in the TMDL are met and offsets do not result in unintended exceedances of water quality standards elsewhere. EPA is optimistic that economic growth and Bay protection can be mutually supportive.

The first specific comment is that the process is so far-reaching, affecting every aspect of development and land use, that the authority to plan, permit, enforce, and comply with new environmental requirements may cause the City to lose its historic prerogative to act locally on matters important to its citizens. This includes land use planning, permitting, and environmental protection.

Pollution loads from growth are the one source of nitrogen and phosphorous bay-wide that is headed in the wrong direction. As the States create their Watershed Implementation Plans, the Environmental Protection Agency should give particular scrutiny to their efforts to minimize pollution from future growth and development.

Response

The Bay TMDL includes an expectation that the Chesapeake Bay watershed jurisdictions will develop mechanisms that completely mitigate new and expanded discharges of nutrients and sediment to the Chesapeake Bay. Jurisdictions are expected to identify an allocation for growth or to develop offset and trading programs through which future growth and development projects could mitigate their discharges. EPA is working closely with the jurisdictions to ensure that these mechanisms are in place and operating as intended.

4. EPA should also use its partnership with USDOT, HUD, and the Sustainable Communities Initiative to encourage compliance with the TMDL. This is particularly true with encouraging as much growth to occur under Smart Growth strategies. EPA should work with the programs within HUD and DOT to promote sustainable communities and to prevent and discourage low density sprawl development. Chesapeake Bay clean water goals should be consistent with the other goals of EPA, HUD, DOT.

5. The difference between Smart Growth and typical sprawl or low density suburban development should be fully accounted for in the calculation of nutrient reductions and increases from growth. Smart growth results in less: conversion of permeable surfaces to road construction, runoff and salt from roads, nitrogen air emissions because of reduced vehicle miles of travel. Redevelopment of older urban areas with no or antiquated urban storm water runoff

measures results in reduced nutrients because of more modern storm water management measures and better erosion and sediment control measures.

6. The costs of sprawl development should include emissions from septic systems compared to the efficiencies of connections to waste water treatment plants.

Response

EPA fully intends to continue its partnership in the Sustainable Communities Initiative to support compliance with the TMDL while promoting economic growth consistent with Bay protection and restoration throughout the Bay watershed. EPA is highly supportive of smart growth approaches to development, but looks to the Bay jurisdictions to determine the most appropriate approaches to growth and development within the framework of the TMDL.

Organization: Biophilia Foundation

Current and future economic activity (development) must be used to help finance current and future pollution load offsets, to achieve Chesapeake Bay TMDL and WQS goals as quickly as possible, as well as provide environmental improvement. EPA and others (Environmental Defense Fund) have GIS based site design analytical tools that can be used to analyze the water quality impacts of development projects. Those impacts that cannot be mitigated economically on-site must be offset off site. This could be done as fee-in-lieu payments ("offset credits" issued by jurisdictions) which represent additional sources of dedicated funds to repays bonds used by jurisdictions to retrofit past stormwater and other point source pollution emissions. Additionally, development projects should also be required to buy "uplift credits" from nonpoint source polluters within the same watershed. Instead of first achieving a "baseline" to be eligible to generate an "uplift credit", each "uplift credit" would need to be bought along with the purchase of an "offset credit" from the nonpoint credit generator. This 3:1 scenario is much easier to achieve near term and with greater market creation potential than what has been proposed by proponents of a "Baseline first" approach.

Biophilia Foundation has been in discussion with several well known agricultural and development interests who approve of this approach. We have also been in contact with a jurisdiction who is interested in developing a demonstration project to test this approach for possible inclusion in their WIP II. If EPA is interested in this project, EPA's participation would be most welcome.

Response

EPA believes that its expectation for offset programs and net improvement offset authority for the Bay jurisdictions where appropriate address the issues raised in these comments. EPA will consider these comments as it works with the jurisdictions in the development and implementation of offset programs.

Author Name: Uzupis John

Organization: Synagro Technologies, Inc.

Sprawl Concerns

Many fear EPA's TMDL approach could actually encourage development sprawl in areas of the watershed with cleaner water. This would run counter to the emphasis of plans such as "smart growth" which aim to limit and confine environmental degradation, rather than spread it around. For example, officials may chose not to extend sewers into areas with aging septic systems because it would increase treatment plant discharge in an area of the watershed with an already borderline TMDL.

Many in agriculture and beyond consider H.R. 5509, introduced by Pennsylvania Congressman Tim Holden, Vice Chairman of the House Agriculture Committee, a common-sense solution that enables economic growth and job creation, as long as states are making progress toward reaching water quality objectives set by the EPA.

HR 5509 Support

--H.R. 5509 is a bipartisan alternative to H.R. 3852 (S. 1816), and provides a practical pathway for agriculture to be part of Chesapeake Bay restoration plans.

--H.R. 5509 provides incentives for implementation of environmental best management practices that go beyond minimum state regulatory compliance requirements.

--H.R. 5509 grants U.S.D.A. oversight of agriculture in the federal clean-up effort.

--H.R. 5509 encourages participation in a nutrient trading program and provides for multi-state trading arrangements.

--H.R. 5509 was unanimously approved recently by the U.S. House Agriculture Committee and reported to the full House with a recommendation for passage.

Response

Comment ID 0571.1.001.004

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

Another troubling requirement is that the TMDL will drive the "acceptable" growth rate for communities within the watershed. New growth will need to offset its pollutant contributions by drawing from an existing pollutant allocation if the state has set aside such an allocation in its Watershed Implementation Plan (WIP), or new growth activities must purchase water quality credits. Right now, if a state has no "growth allocation" set aside in its WIP, no adequate

program exists to allow new projects to purchase water quality credits. Even if such a program did exist, it not only adds a new cost, it also becomes the determining factor for all new growth considerations in the area of the state covered by the TMDL.

Response

EPA recognizes that concerns exist about growth and development implications of achieving TMDL allocations, but also acknowledges continued population growth and development in the Chesapeake Bay watershed without sufficient nutrient and sediment pollution prevention, treatment, and management is largely responsible for the current state of the Bay and the necessity for a TMDL. EPA understands that the TMDL may affect patterns of growth and economic development, including POTW and sewer capacity, in the watershed. Such adjustments should be expected if the objective of the TMDL, which is to meet applicable water quality standards throughout the Chesapeake Bay watershed, is to be achieved.

Comment ID 0731-cp.001.002

Author Name: Jamison Peggy

Organization: Garrett Co. Municipalities

As areas of existing development, the towns will be faced with disproportionate costs to correct or mitigate stormwater issues; yet, all the state's recent initiatives (Smart Growth and Sustainable Communities) encourage development in areas of existing development.

Response

EPA believes that approaches to development and redevelopment that reduce loadings may offer opportunities to lower construction and maintenance costs. EPA disagrees that developed areas face disproportionate costs of regulatory compliance under the Bay TMDL, particularly when infrastructure costs are considered.

Comment ID 0746.1.001.032

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

Nutrient Offsetting Requirement

If nutrient offsetting is required in the management of stormwater within MS4s within the New York State portion of the Chesapeake Bay watershed, development within MS4s would become extremely restrictive. Costs to develop within a MS4 would be significantly increased and permitting/approval processes for new development with a MS4 would become more complicated and extended.

The requirements of Retrofitting Existing Stormwater Discharges and Nutrient Offsetting would be restrictive for new development in an area of the Bay watershed that desperately needs to halt its population decline and which needs a reasonable amount of population and economic growth. It would be excessively expensive, and would generally inhibit growth within our southern tier MS4s. Furthermore, it is believed that the restrictive nature of these requirements for MS4s would effectively encourage development outside of the designated MS4 areas. This would place these MS4s communities at a competitive disadvantage with non-MS4 areas and growth/restoration of a MS4 would become increasingly stifled. It would also be contrary to the national policy of encouraging sustainable growth by channeling new growth into existing urban areas.

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

New technologies that can create electrical generation and power from AMD should be looked at further. Several of these types of projects have been funded in Western PA, but not in the East. The Old Forge Borehole, Jeddo Mine Tunnel, Solomon's Creek Boreholes, Susquehanna #7 Outfall, and other AMD discharges with high volume flows in the other Coal Regions within the Susquehanna River Basin could potentially become income generators and opportunities for economic redevelopment.

EPCAMR has been involved with the USDA, Capital Area Resource Conservation & Development Council, Pennsylvania Environmental Council, Chesapeake Bay Foundation, Foundation for PA Watersheds, Penn-State University, Conservation Districts within the EPCAMR Region, and other partners a few years ago to locate abandoned mine lands in close proximity to the more rural farms that had excess nitrogen and manure wastes from their Concentrated Animal Operations (CAOs) and Concentrated Animal Feeding Operations (CAFOs). EPCAMR provided all of the GIS mapping for the project and conducted the research with Conservation District Chesapeake Bay Technicians to obtain the necessary information to get the totals on the number of CAOs and CAFOs in the EPCAMR Region. Composting facilities and the Co-Generation Facilities in Eastern PA were also mapped. The Manure and Minelands Project was coordinated to be able to put the farmer and the land reclamation entities together to work out some nutrient trading or business transactions that would save them time, resources, and money. Abandoned mine lands need manure because they lack topsoil for the most part and farmers need to dispose of their excess manure to avoid any pollution problems to the streams within their farmland properties. Mushroom compost, horse manure, chicken manure, all have beneficial qualities to land reclamation and AMD remediation, if mixed with the proper constituents and are not too wet. Yet another win-win.

EPCAMR worked with The Conservation Fund and the Keith Campbell Foundation for the Environment earlier this year to provide them with written examples, photographs, and project successes to inform others in the region how they can improve the environment in their communities impacted by abandoned mine lands. My co-worker, Mike Hewitt, and I provided details on project successes related to the effort mentioned in the previous paragraph to Mr. David G. Burke, President of Burke Environmental Associates, and Mr. Joel E. Dunn, Program Coordinator, for Sustainable Chesapeake-The Conservation Fund. These two individuals edited and authored the publication, entitled, A Sustainable Chesapeake: Better Models for Conservation (2010). The book can be found online on The Conservation Fund website at (www.conservationfund.org/sustainable-chesapeake). It is a way to take a look at 31 projects that summarizes the principles of sustainability illustrated by the profiles contained within each project with creativity, outside of the box thinking, a great deal of volunteer time and effort, and much needed partnerships and funding sources to make them stand out from many others around the Chesapeake Bay.

Response

Thank you for this information. EPA is committed to working with the Chesapeake Bay jurisdictions in encouraging new technologies and their applications to environmental improvement. We appreciate this case study reference and will continue to work with our partners in the pursuit of a restored Chesapeake Bay watershed.

TMDL possibly could let farmers sell credits, 2009 was a unusually wet fall we hardly got our crops out and very little cover crop planted, does that mean we would have to buy credits?

Response

Under the Chesapeake Bay TMDL, sectors that exceed their TMDL allocations are called upon to reduce their loadings to the Bay and its tributaries to achieve their TMDL allocations. One method of accomplishing this would be to establish offsets or purchase nutrient credits. The state and EPA would likely look at such instances on a case-by-case basis.

Comment ID 0126.1.001.030

Author Name: Craun Ed

Organization: Augusta County Farm Bureau

Farm land preservation will be significantly impaired by planned financial incentives to retire farm land and unrestrained nutrient trading programs funded by urban developers.

Response

Several jurisdictions in the Chesapeake Bay watershed (PA and VA) include in their regulations and/or policies a prohibition on generating credits through the inactivation of farmland. EPA is unaware of the development of unrestrained nutrient trading programs in this watershed. In addition, all future growth must completely offset increases in nitrogen, phosphorous, and sediment loadings. EPA is optimistic that protection and restoration of the Chesapeake Bay is compatible with mechanisms such as offsets and trading.

Organization: Home Builders Association of Metro Harrisburg

If EPA fundamentally changes Pennsylvania's nutrient credit trading program, you will have set this process back

several years and will not see the type of pollution reductions that are expected. EPA will also alienate large numbers of stakeholders that have been learning how to operate under Pennsylvania's credit trading program as it stand now.

Why hasn't EPA led the charge for an inter-state nutrient credit trading program? These types of programs will be absolutely essential for new growth to continue inside the watershed.

Response

Pennsylvania's new regulations on nutrient trading require that nutrient trading be consistent with the Chesapeake Bay TMDL and the federal Clean Water Act. This is consistent with EPA's Trading Policy. Pennsylvania's plan to comply with the Chesapeake Bay TMDL is contained in its Phase I Watershed Implementation.

EPA remains interested in working with the jurisdictions and stakeholders in the development of an interstate nutrient credit trading program in the Bay watershed. EPA is collaborating with the World Resources Institute (WRI) in its project to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay Watershed. This project seeks to build a common integrated platform utilizing the existing MD, PA, and VA platforms. This integrated platform will facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools, and may serve as a foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA's NRCS to fund this project.

Organization: Algae Producers of America

In addition to reducing nutrients, the use of an algae-based solution to reducing nutrient loads at point sources (such as wastewater treatment facilities or industrial / Concentrated Agricultural Feed Operations [CAFO] sites) also brings several additional benefits, including:

--The ability to produce valuable co-products based on algae biomass (Note: This is a key area of focus for OTF 10-510). The Pennsylvania WIP includes a Nutrient Credit Trading Program. The first auction held on October 28 and 29 resulted in the exchange of 21,000 credits (Susquehanna nitrogen) at a price of \$3.04/credit. Adoption of a proven algae-based solution not only results in additional potential revenue from the production of valuable co-products, but also allows for additional potential revenue which could be realized through participation in this aspect of the WIP.

--The ability to reduce Greenhouse Gas (GHG) Emissions (controlled algae growth will use approximately 1.5 - 1.8 tonnes of CO₂ for each tonne of algae produced, plus release approximately 1.5 tonnes of oxygen in the process). As you may be aware, the process of nitrification and denitrification common as part of a Biological Nutrition Reduction (BNR), can actually increase GHG emissions through the process of release of N₂O (the Center for Sustainable Systems estimated that in 2006, 0.5% of all GHG emissions were related to wastewater treatment operations).

Response

Thank you for this information. EPA is aware of several pilot projects underway or being considered in the Chesapeake Bay Watershed using algae-based technologies. EPA encourages new technologies such as this one as part of the solution to the water quality impairments of the Chesapeake Bay.

The Nutrient Trading Exchange (NTE) outlined in the draft WIP does not currently exist as proposed; considerable time and effort will be needed to establish and expand the program to the point where it operates efficiently as outlined in the Draft WIP. In addition, as currently planned, the NTE does not propose perpetual credits from WWTPs; perpetual credits will be critical in order for the Urban sector to offset its perpetual loads. Without these credits to help offset the E3 levels of stormwater management retrofit to all urban lands in the Draft WIP input deck, the Urban sector is faced with an insurmountable task.

The NTE should also be enhanced with a trading fund, which should be set up before the NTE is finalized in order to generate income for the program as soon as possible. This is described in further detail in Section III.A.5, below.

Response

Thank you for your comments. EPA agrees that it will take time for states to develop and expand nutrient trading programs and EPA intends to work closely with the states and stakeholders in an orderly transition toward expanded programs. Your comments present some interesting ideas such as capitalizing a trading fund and facilitating perpetual or durable credits. EPA will take this concepts into consideration as it works with the states and stakeholders ensure trading programs are expanded in a manners that is orderly, accountable, transparent and effective.

5. Establish a "Nutrient Trading Fund"

The Nutrient Trading Exchange (NTE) should be enhanced with a trading fund, which should be set up immediately and can therefore operate before the NTE is finalized in order to generate income for the program as soon as possible. The proposed "Nutrient Trading Fund," which must be approved by the Virginia Board of Soil and Water Conservation, would collect fees both from septic field users without Best Available Technology (BAT) treatment systems and from

Virginia Stormwater Management Program (VSMP) permit holders who elect, pursuant to that regulation, to make a payment to offset the portion of TN and TP loadings not treated on site or through other offset mechanisms. This fee shall be established based upon:

- a) Avoided sewage fees (excluding "tap" fees) for new septic field users who do not provide TN removal treatment systems as described in Action Item #6, below; or
- b) 1.5 times the projected capitalized value [FN48] of the load [FN49] removed by upgrading sewage treatment plants [FN50] from Tier 3 to Tier 4 treatment levels.

The nutrient Trading Fund can be used to:

- a) Fund agricultural BMPs so long as at least 2/3 of the funding covers the costs of BMPs that exceed the draft WIP requirements (and therefore generate credits for the NTE);
- b) Fund WWTP flow reduction/conservation/reuse programs which reduce WWTP loads by reducing the effluent volume of a plant [FN51]; or
- c) Retrofit existing septic systems to meet BAT standards (currently, NSF/ANSI standard 245).

[FN 48] Capital plus operation and maintenance. This value is an estimate of the average WWTP upgrade cost needed to meet the TMDL/WIP.

[FN 49] Needing credits under a VSMP.

[FN 50] In the site's river watershed.

[FN 51] This reduces the loading rate because the draft WIP limits the effluent concentrations of TN and TP.

Response

Thank you for your comments. EPA agrees that it will take time for states to develop and expand nutrient trading programs and EPA intends to work closely with the states and stakeholders in an orderly transition toward expanded programs. Your comments present some interesting ideas such as capitalizing a trading fund and facilitating perpetual or durable credits. EPA will take these concepts into consideration as it works with the states and stakeholders ensure trading programs are expanded in a manner that is orderly, accountable, transparent and effective.

The Chamber & CREDC believe that a robust nutrient trading program is needed

Response

Thank you for your comment. EPA agrees that offsets and nutrient trading are essential tools for meeting the goals of the

Chesapeake Bay TMDL.

Comment ID 0229.1.001.007

Author Name: Black David

Organization: Harrisburg Regional Chamber & Capital Region Economic Development Corporation (CREDC)

A robust nutrient trading and offsetting program is necessary for the following reasons:

- Nutrient trading creates revenue opportunities and reduces cost;
- Nutrient trading accelerates pollution reduction;
- The cost effectiveness of pollution credit trading has been demonstrated; and
- Nutrient trading could benefit farmers, municipalities, utility ratepayers, wastewater treatment plants, entrepreneurs, local government and taxpayers.

Response

Thank you for your comment. EPA agrees that offsets and nutrient credit trading have numerous potential benefits and are important tools for meeting the goals of the Chesapeake Bay TMDL.

Organization: Hampton Roads Sanitation District (HRSD)

EPA's Decision to Reject Virginia's Expanded Trading Program Is Unreasonable

Virginia's WIP includes provisions for expansion of its existing nutrient trading program to include agriculture, urban stormwater, and other sectors. Implementation of an expanded trading program would enable affected parties to incorporate cost effectiveness into management decisions, which is essential as EPA has largely ignored cost considerations in developing the TMDL. In fact, EPA has acknowledged in recent public meetings that the TMDL does not consider affordability or cost-effectiveness. Unlike EPA, local governments (POTW owners and operators) have a responsibility to their customers to seek cost-effective solutions. By ignoring cost, EPA's disapproval of Virginia's WIP essentially conflicts with the public interest in efficient and affordable regulations. EPA's acceptance of Virginia's intent to consider trading program expansion would help address this major shortcoming of the TMDL.

Response

Thank you for your comment. EPA does not approve or disapprove the Bay jurisdictions' Watershed Implementation Plans. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers necessary to

stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

EPA Should Accommodate Virginia's Successful Point Source Trading Program

In Section 10 of the Draft TMDL, EPA addresses the subject of offsets and trading. As with the subject of POTW WLAs discussed elsewhere in these comments, this topic is another area in which the pace of Virginia's real implementation activities under the Chesapeake 2000 Agreement and related State statutes and regulations has far outpaced EPA's TMDL planning activities as of this draft. Given all that Virginia and VAMWA members have invested in the Virginia trading program, it is imperative that EPA be flexible and conform its new policies to the pre-existing laws, regulations and policies of Virginia as well as the associated compliance plan and related contracts of the Virginia Nutrient Credit Exchange Association discussed in the Draft WIP at pages 41-42.

Response

Thank you for your comment. EPA supports Virginia's proposed expansion of this Nutrient Credit Exchange and the proposed additional regulatory drivers necessary to stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

II. EPA'S "BACKSTOPS" JEOPARDIZE VIRGINIA'S HIGHLY-EFFECTIVE POINT SOURCE REGULATIONS, RELATED \$2 BILLION INVESTMENT, AND NATIONALLY-RECOGNIZED NUTRIENT EXCHANGE PROGRAM

On January 30, 2009, EPA sent a letter to the Director of VADEQ regarding Virginia's current regulatory approach with regard to existing nutrient cap loadings.[FN3] EPA's letter included clear support for Virginia's current program, and a confirmation that the cap loads were properly designed to meet Bay water quality requirements:

Virginia developed the Virginia Chesapeake Bay Watershed General NPDES Permit, and an associated trading program to specifically address the point source allocations for each Virginia watershed in the Chesapeake Bay. EPA's

Chesapeake Bay Program verified that those cap loadings were sufficient to achieve Bay water quality. Based on the assignment of wasteload allocations and EPA evaluation of the applicable cap load, EPA found that the General Permit ensured that individual point source discharges would not cause or contribute to an exceedance of the applicable Bay water quality standards.[FN4]

Inexplicably, 21 months later, EPA proposes to radically alter Virginia's regulatory regime and thus negatively impact the associated \$2 billion construction program and an established trading program. EPA's actions in its Draft TMDL are irresponsible and cannot be reconciled with any reasoned approach to TMDL development.

HRSD supports the embodiment of the Virginia approach to POTW wasteload allocations from Virginia law and regulations into its WIP, and urges EPA to accept this element of Virginia's WIP. The wasteload allocations ("WLAs") found in Virginia's Draft WIP are derived primarily from Virginia's Water Quality Management Planning ("WQMP") Regulation (9VAC25-720), Virginia's Chesapeake Bay Watershed General Permit Regulation (9VAC25-820), and "all SWCB-approved amendments" to those regulations. HRSD supports an approach that recognizes the need for this regulatory stability.[FN5]

Virginia's regulatory approach was developed beginning in 2005, with the agreement of a number of local government organizations including VAMWA and of the major citizen environmental groups. In 2005, the Virginia State Water Control Board ("SWCB" or "Board") adopted a package of stringent regulations;[FN6] in 2007, the SWCB adopted a related permitting regulation. These actions (listed below) established a comprehensive program for the (early) regulation of municipal dischargers (collectively, the "Virginia Regulations"):

- Water Quality Management Planning Regulation Amendments, 9VAC25-720
- Nutrient Enriched Waters Policy Amendments, 9VAC25-40-70
- Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820

These regulations were developed pursuant to a statute enacted in 2005 and codified at Virginia Code § 62.1-44.19:12 et seq.

Extensive deliberations and efforts went into the statewide effort to develop Virginia's regulatory wasteload allocations. The SWCB took final action based upon those considerations, and wastewater plants (including POTWs) across the Commonwealth made major investments based upon the Board's decision.

Based on the referenced statute and regulations of the SWCB, the Virginia Nutrient Credit Exchange Association, Inc. (the "Nutrient Exchange") was created, and the Nutrient Exchange and its participants have developed the Exchange Compliance Plan.[FN7] This represents the most extensive, proactive effort to plan and construct municipal wastewater treatment in Virginia since national requirement for secondary treatment established in the 1970s. The Compliance Plan addresses how participating facilities will achieve and maintain compliance with their regulatory nutrient allocations beginning January 1, 2011. VADEQ has approved the Nutrient Exchange's Compliance Plan each year beginning with the first such plan in 2007 through November 2010.[FN8]

The approved Exchange Compliance Plan is based on construction of a large number of advanced nutrient removal facilities throughout the five major river basins as well as a number of nutrient credit trades pursuant to the State Water Control Law's Chesapeake Bay Nutrient Credit Exchange Program article and the Board's Watershed General Permit.

These trades are also contractual obligations of the participants through the complex, multi-party Nutrient Credit Services Agreement, which was executed by the parties in 2007.[FN9]

To help support this construction program and related nutrient credit trading, the General Assembly has appropriated over \$600 million in cost-share funding for treatment upgrades.[FN10] The projects are constructed by the facility owners, and the State cost-share funding is disbursed, in accordance with the terms and conditions of numerous individual Water Quality Improvement Fund Grant Agreements to which VADEQ is a party.[FN11] Virginia's POTWs have also made significant investments in facilities to reduce loadings based upon 2005 nutrient allocations. In sum, Virginia's POTWs have estimated total costs between \$1.5 billion and \$2.0 billion to upgrade POTWs to meet nutrient loading reduction requirements.

As a result of these many efforts by the Commonwealth and local governments, Virginia is in the fortunate position of being able to testify in a recent congressional hearing to Virginia's remarkable progress, including the expectation of meeting its regulatory point source allocations by the December 31, 2010 deadline.[FN12] In his September 2009, testimony before the Subcommittee on Water Resources and the Environment of the House Committee on Transportation and Infrastructure, Virginia's Secretary of Natural Resources highlighted the State's financial participation and commended the Nutrient Exchange for its role in facilitating the nutrient upgrades.[FN13]

As noted above, EPA has previously agreed that regulatory stability should be a fundamental component of the Bay TMDL. Indeed, because of the significant investment made by local governments and the Commonwealth (as well as other Bay states), the EPA Regional Administrator publicly agreed that regulatory stability is a "priority need" and a "matter of fiduciary responsibility and public trust:"

...the large scale public investments (estimated at over \$4 billion) that are now being carried out throughout the watershed to upgrade and reduce nutrient discharges from point sources. A stable regulatory environment is a priority need for these facilities and a matter of fiduciary responsibility and public trust. Therefore, EPA considers requiring further point source upgrades to the limits of technology as an option of last resort and is avoidable if the Bay partners use our creative energies to deliver sufficient nonpoint pollutant reduction commitments.[FN14]

In addition, the Office of Inspector General has also agreed that allocations for significant wastewater treatment facilities should remain unchanged:

Although EPA and its Bay partners could obtain additional nutrient reductions from significant municipal wastewater treatment facilities..., these additional reductions are not cost effective or practical. Obtaining these additional reductions would require justifying additional expenditures, recalculating wasteload allocations, and reopening and modifying permits already being put in place. At this point, EPA has no plans to require additional reductions from wastewater treatment facilities.[FN15]

Indeed, according to the latest Phase 5.3 model runs, wastewater represented 21 and 25 percent of the average annual nitrogen and phosphorus load, respectively, to the Chesapeake Bay under the 2009 progress scenario. Under the critical 3-year condition for the TMDL (1993-1995), wastewater would represent an even lower proportion of the nutrient load with existing controls.

Moreover, wastewater treatment plants lead all sectors in nutrient load reduction. For example, the estimated 2008

wastewater loads represent a 45-percent reduction from 1985 levels and a 62- percent reduction from "no action" levels. Wastewater treatment plants are still in the process of completing major upgrades and are the only sector predicted to achieve tributary strategy loads shortly after 2010. With current levels of nonpoint source controls, the wastewater cap loads will represent only about 15-percent of the average annual nitrogen load to the Bay, and even less under critical hydrologic conditions.

Although the wastewater sector is proud of its progress in nutrient load reduction, most treatment plants are allocated at close to limit-of-technology levels, and there is almost no benefit to further reductions in point source allocations. Non-point source reduction will remain the primary means to achieve the overall loading caps.

In contrast, the Susquehanna River basin alone contributes 44 percent of the total nitrogen load to the Bay. This value actually underestimates the impact of the Susquehanna basin, because it is among the most "effective" basins at impacting hypoxia in the mainstem Bay. When relative effectiveness is considered, the Susquehanna River basin accounts for more than 60 percent of the "algal units" delivered to the Bay. Regardless of implementation actions in other basins, load reductions in the Susquehanna basin are the key to attaining water quality goals.

Despite the extraordinary efforts made by Virginia's POTWs, and EPA's own prior statements, EPA's Draft TMDL threatens to disrupt these very productive recent efforts.

EPA has concluded that Virginia's WIP fails to comply with EPA's July 1, 2010 and August 13, 2010 nutrient and sediment allocations [FN16] and does not adequately establish reasonable assurance. EPA has established what it is calling a "backstop allocation" in response.[FN17] This backstop is meant to "...reduce the point source loadings as necessary to compensate for the deficiencies EPA identified in the reasonable assurance components of the jurisdictions' draft Phase I WIPs addressing nonpoint source reductions." [FN18]

Each of the Bay States received a "minor," "moderate," or "high" backstop depending upon EPA's view of how severely the state had missed the allocation targets and reasonable assurance mandate. Virginia received a "moderate" backstop to bridge the gap between EPA's expectations and the Virginia Draft WIP.[FN19] The "moderate" backstop sets wastewater discharge allocations based on concentrations of 4 milligrams per liter ("mg/l") for total nitrogen ("TN") and 0.3 mg/l for total phosphorus ("TP") and design flows (i.e., plant capacity).[FN20]

EPA also established what it calls "full" backstops for all Bay States. For wastewater, "full" backstops set allocations for nutrients based upon limits of technology (3 mg/l for TN and 0.1 mg/l for TP) and historical flows (2007 to 2009 averages) rather than design flows.[FN21] According to the Draft TMDL, EPA will use the "full" backstops "...in any of the seven watershed jurisdictions if EPA determines that a jurisdiction's final Phase I WIP is weaker than its draft Phase I WIP and requires additional backstop actions to ensure that point and nonpoint source reductions sufficient to meet WLAs and LAs are achieved and maintained." [FN22] HRSD strongly opposes the use of either "moderate" or "full" backstops in Virginia. As discussed below, EPA's application of its reasonable assurance "regulation" is unlawful, unprecedented and certainly unwarranted under the circumstances. EPA has no justifiable basis (or legal authority) for setting any backstops in Virginia, much less "full" backstops as suggested by the Draft TMDL and Appendix Q-2.

For many of Virginia's POTWs, the concentration levels based upon the "moderate" backstop are significantly lower than the concentration levels used to derive the WLAs in the Virginia Regulations and now in Virginia's Draft WIP. As a result, EPA's "moderate" backstop reduces POTW WLAs in order to satisfy EPA's desire for additional reasonable

assurance.

EPA's Draft TMDL puts Virginia's POTWs at risk that additional dollars will be needed to complete additional upgrades that will comply with EPA's WLAs, or, even worse, that upgrades that have been completed or are well underway will be stranded in place. This is completely unjustifiable based upon EPA's earlier remarks, and is unwarranted based upon the minimal impact wastewater has on Bay water quality as compared to other sectors. In addition, as explained below, EPA's rejection of Virginia's Draft WIP is legally objectionable. The Clean Water Act does not give EPA the authority to review and/or approve WIPs, or to direct their specific terms. EPA's decision to overwrite Virginia's Draft WIP is unlawful per the Clean Water Act.

In addition, EPA's backstops set a universal technology standard on POTWs across Virginia. This is inconsistent with Virginia's more scientifically defensible site-specific approach in the Virginia Regulations. Virginia's allocations recognize that (1) the James and York River basins do not contribute to the mid-Bay impairments and instead are regulated differently for local quality objectives, and (2) a number of Virginia plants have valid site-specific needs for the allocations alternative allocations. As to the second point, for example, UOSA's allocation reflects the unique drinking water considerations of its immediate receiving water, the Occoquan Reservoir. EPA's backstop WLA would endanger the water quality of the Reservoir, and, in turn, drinking water for up to a million Northern Virginia residents. Other POTWs with particular WLAs under Virginia law include the City of Hopewell's POTW (80% industrial flow which is far higher than a typical municipal facility) and Virginia's CSO communities (City of Lynchburg and City of Richmond). EPA's failure to consider these important issues in its Draft TMDL is unreasonable.

Not only are allocations under the Virginia Regulations and Draft WIP more appropriate than those of the Draft TMDL for technical reasons and the above-stated policy reasons, but at some point the relentless regulatory pressure to increase wastewater rates must be considered. According to Draper Aden Associates' most recent annual water and wastewater rate report, Virginia wastewater rates rose an average of 5% last year and 67% over the last decade. Many VAMWA members have reported double-digit rate increases for multiple years. This comes at a time when unemployment levels are very high (currently at 9.6%). Consideration should be given to the impact of the higher costs that EPA is forcing on Virginia's families and businesses.

For these reasons above, HRSD objects to EPA's determination to "backstop" Virginia's Draft WIP for wastewater and supports the Virginia Regulations incorporated into the Draft WIP. EPA's backstops must be eliminated before EPA issues its final TMDL.

[FN3] Attached hereto as Appendix 2.

[FN4] January 30 Letter at p. 2. In this letter, EPA also confirmed that it sent a letter on December 14, 2006 in which it "reported 'no objection' to the General Permit..."

[FN5] VAMWA has consistently advocated regulatory stability throughout this process. For example, VAMWA provided recommendations on regulatory stability to the Chesapeake Bay Wastewater Treatment Working Group on June 9, 2009 (attached hereto as Appendix 3). See also December 11, 2008 Memorandum from VAMWA/MAMWA Chesapeake Bay Team to CBP Water Quality Steering Committee (Representation of VA and MD POTW Loads in Model Scenarios) (attached hereto as Appendix 4).

[FN6] For reference see September 12, 2005 and November 4, 2005 Memoranda from DEQ to SWCB (attached hereto as Appendix 5).

[FN7] Attached hereto as Appendix 6.

[FN8] VADEQ's approval letters are attached hereto as Appendix 7.

[FN9] See Appendix 6.

[FN10] Fifty-five (55) POTWs have signed grant agreements with the Commonwealth for partial grant funding for upgrades. In sum, these grant agreements represent an invest by the Commonwealth of approximately \$648.23 million. Despite the commitment made by Virginia and local governments (for the balance of the approximately \$2 billion effort), Virginia's program is facing significant funding shortfalls. Virginia is projecting a shortfall in funding of approximately \$112 million by July 2011, and has begun pro-rated payments in an effort to shore up the Water Quality Improvement Fund budget.

[FN11] A sample agreement is attached hereto as Appendix 8.

[FN12] In addition to strides made in Virginia, Baywide, the wastewater source sector was well on its way to achieving a significant percentage of their ultimate clean-up goals by 2005. As a presentation from the Chesapeake Bay Program Office ("CBPO") shows (pertinent page attached as Appendix 9), wastewater (both municipal and industrial) had achieved 63% of the nitrogen reduction goal (loadings reduced by 30.4 million pounds per year from 1985-2004) and 80% of the phosphorous reduction goal (loadings reduced by 4.9 million pounds per year from 1985-2004).

[FN13] Former Secretary of Natural Resources Preston L. Bryant's written comments are attached hereto as Appendix 10.

[FN14] Letter dated Sept. 11, 2008, from Donald S. Welsh, EPA Region III, to John Griffin, Maryland DRN, Enclosure A at 4 (attached hereto as Appendix 11).

[FN15] 2008 EPA Office of Inspector General's Report (08-P-0049) (attached hereto as Appendix 12).

[FN16] EPA's letters to Virginia Secretary of Natural Resources Doug Domenech establishing nutrient and sediment allocations are attached hereto as Appendix 13.

[FN17] Draft TMDL at 8-9.

[FN18] Draft TMDL at 8-9.

[FN19] Draft TMDL at 8-19.

[FN20] Draft TMDL at 8-11.

[FN21] Allocations for sediment also appear to be very stringent under the "full" backstop. For description of the "full"

backstop see Draft TMDL at 8-11; for allocations see Appendix Q-2 (Full Backstop; Annual Loads).

[FN22] Draft TMDL at 8-17.

Response

Thank you for your comments. EPA considered these as it finalized the TMDL. In addition, EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers necessary to stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0230.1.001.029

V. EPA'S DECISION TO REJECT VIRGINIA'S EXPANDED TRADING PROGRAM APPROACH IS UNREASONABLE

Virginia's WIP includes provisions for expansion of its existing nutrient trading program. Virginia proposes to expand the trading program to include agriculture, urban storm, and others. An implementation of such an expanded trading program would provide the necessary flexibility to achieve cost effectiveness. EPA has acknowledged in recent public meetings that the TMDL does not consider affordability or cost-effectiveness. Unlike the EPA, local governments have a fiduciary responsibility to their customers to seek cost-effective solutions. EPA's disapproval of Virginia's WIP essentially eliminates the flexibility needed to serve the best interests of the public. EPA's action in this regard is unreasonable.

Response

Thank you for your comment. EPA does not approve or disapprove the Bay jurisdictions' Watershed Implementation Plans. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers necessary to stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

XIII. EPA SHOULD ACCOMMODATE VIRGINIA'S SUCCESSFUL POINT SOURCE TRADING PROGRAM

In Section 10 of the Draft TMDL, EPA addresses the subject of offsets and trading. As with the subject of POTW WLAs discussed elsewhere in these comments, this topic is another area in which the pace of Virginia's real implementation activities under the Chesapeake 2000 Agreement and related State statutes and regulations has far outpaced EPA's TMDL planning activities as of this draft.

This basic timing issue leads to our main point. Given all that Virginia including VAMWA members have invested in the Virginia trading program, it is imperative that EPA be flexible or and conform its new policies to the pre-existing laws, regulations and policies of Virginia as well as the associated compliance plan and related contracts of the Virginia Nutrient Credit Exchange Association discussed in the Draft WIP at pages 41-42.

At page 10-4 of the Draft TMDL, EPA requested comment on whether its proposed offset provisions for new or increased nutrient or sediment loadings should apply to water quality trades in the Bay jurisdictions generally. HRSD's would strongly recommend that the answer be "no." It is not so much the case that HRSD would expect to find any major inconsistencies of environmental importance between (1) EPA's guidance and (2) and Virginia's laws, regulations and policies and the Nutrient Exchange's compliance plan, policies and contracts developed consistent with Virginia law. However, a thorough analysis of that question is in itself a major undertaking that simply cannot be performed with a 45-day comment period.

EPA's Draft TMDL calls for consistency with:

--Six (6) "source documents"

--A set of definitions

--A list of 10 "comment elements" with 38 sub-elements

Virginia's existing program includes:

--A complex statute (Va. Code 62.1-44.19:12 et set.)

--The Virginia Regulations (discussed elsewhere in these comments)

--The Chesapeake Bay Watershed General Permit (9VAC25-820) (see Draft WIP at page 41)

--The DEQ-approved Exchange Compliance Plan (2007, 2008, 2009 and 2010 Annual Updates)

--The Nutrient Exchange's 72-party Nutrient Credit Services Agreement

Consider:

--The Watershed General Permit itself contains 30 definitions and 17 pages requirements

--The Nutrient Exchange's 72-party Nutrient Credit Services Agreement is 30-page document with 39 definitions

--The Exchange Compliance Plan consists of hundreds of pages of associated facility plans and trades

This Virginia point-point trading program is working remarkably well and has been widely praised as a national model, including receiving credit in some of EPA's own publications. Therefore, at this time, HRSD's urges EPA to limit its consideration of new credit-related policies to the specific issue of offsetting new or increased loads.

As to the specific proposals advanced by EPA, HRSD offers the following comments:

NPDES Permit Noncompliance (Page S-4, Item 6 (b)) - This item is irrelevant to trading and certainly stands to disrupt trading in practice. For trading to be reliable and useful for the users as well as the regulators, it makes no sense that otherwise valid nutrient credits would be disqualified upon noncompliance of the credit generating facility. Consider just a few examples of potential noncompliance: failure to submit a complete renewal application or a required facility-related manual on time, laboratory testing errors, inadvertent exceedence of unrelated nutrient limits, etc. This provision will only inject unnecessary uncertainty into the trading or offsetting process, does not "safeguard" nutrient trades, and actually would work against EPA's stated objectives. This element should be eliminated.

"Disproportionate Harm" (Page S-4, Item 6 (c))- This provision is redundant of the many provisions in Appendix S that state that trading or offsetting must be consistent with water quality standards, which apply to human health and aquatic life. This provision is redundant of the standards that preclude harm by their own terms and, therefore, the provision should be deleted.

"Temporal Consistency" (Page S-4, Item 6 (d))- This provision should be clarified to provide that temporal consistency is satisfied for point sources when the credit is generated and used within the same 12 month period. This request is consistent with the annual basis for the TMDL and WLAs.

"Accountability" Provisions (Page S-5, Item 8) - Much of this section is redundant of the previous seven items in Appendix S. However, a number of the items are worded slightly differently than those prior items. This may lead to confusion and further complicate implementation. We suggest deleting all sub-elements that are addressed elsewhere in the document.

"Net Improvement Offsets" (Page 10-2) - This item is objectionable in that it requires a source to do more than fully offset its own load. This essentially would penalize one party that is achieving zero-discharge for its new or increased activity, by requiring that party to also cleanup for another source that should do so but has not. This violates the most basic notions of fairness and due process, reflects poorly on government, and should be deleted.

Response

Thank you for your comments. The load allocations and wasteload allocations in the TMDL are, with some exceptions, consistent with the load allocations and wasteload allocations proposed by the jurisdictions in their final Phase I Watershed Implementation Plans. In some cases, the load and wasteload allocations in the TMDL differ from what was contained in the draft TMDL for public comment, the jurisdictions' draft Phase I Watershed Implementation Plans, and/or the jurisdictions' tributary strategies. The

degree to which such allocations differ from these earlier documents varies by jurisdiction and sector. EPA recognizes the success of Virginia's Point Source Trading Program. EPA also supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

With respect to how jurisdictions' offset and trading programs will be evaluated by EPA, EPA expects to consider a jurisdiction's program in total, including those aspects of it that may be well established and aspects that are new or developing. In doing such reviews, EPA expects to exercise discretion to use the common elements and definitions contained in the TMDL Appendix, along with the existing applicable policy and guidance cited therein to assist in such evaluation. Many of the common elements in the TMDL Appendix articulate features of offset and trading programs EPA expects the jurisdictions to consider and address as they develop, refine, and implement their programs, rather than specific mechanisms, methods or requirements to which jurisdictions' programs must rigidly conform.

EPA believes that existing nutrient offset and trading programs should address the elements describe in Appendix S of the draft TMDL and EPA is working with the Bay jurisdictions to ensure that they do address such elements.

EPA disagrees that the concept of "net improvement offsets" is inherently unfair. Net improvements are fundamentally different than all other trade ratios. All other ratios, including PA's insurance, are geared to ensuring that the TMDL/WQS are actually met. They account for variations and uncertainties. Net improvements by their very nature are not meant to "account" for anything, but rather to go further and speed up implementation. This approach does not subsidize noncompliance by sources, as compliance assurance and enforcement programs will address such challenges. Moreover, the language on page 10-2 of the TMDL does not specify that jurisdictions should require net improvements. The language acknowledges that jurisdictions may choose to establish the authority for net improvement offsets as appropriate. EPA also notes that under the basic structure of the Clean Water Act, point sources are not guaranteed the right to discharge pollutants to waters of the United States. On the contrary, point source discharges of pollutants to waters of the United States, are subject to the effluent limitations and conditions established by EPA or the State, necessary to implement CWA technology based controls and achieve state water quality standards. EPA believes that in some cases, particularly where a waterbody is not attaining water quality standards it may be necessary for a discharger to achieve a net improvement in a waterbody in order to create the conditions necessary for the waterbody to be able to assimilate the discharger's pollutant load with a high enough level of confidence that the discharge will not result in an excursion of applicable standards. In any case, the net improvement offset is presented as a program feature that jurisdictions may wish to explore.

EPA does support Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Author Name: Helsel, Jr. Gordon

Organization: City of Poquoson, Virginia

The nutrient trading option is not a magic bullet that will address this concern. While we welcome the opportunity to participate in nutrient trading, the amount of credits that Poquoson would have to purchase to meet program goals would likely not be available and would be cost prohibitive, even under the most aggressive financing scenarios.

Response

Thank you for your comment. EPA agrees that there is not a single solution that will restore the Chesapeake Bay. Trading will be among the several choices for this restoration and EPA believes nutrient credit trading will be an important ingredient in a successful Bay restoration.

Comment ID 0260.1.001.007

Author Name: Brosious John

Organization: Pennsylvania Municipal Authorities Association (PMAA)

Nutrient Credit trading will be impacted by the delivery ratio issue raised above. Current and future trades may be suspect if delivery ratios change during the trading process. The EPA Bay TMDL and accompanying documents must lay out a clear program for interstate and intrastate trading programs so that uniform protocol can be applied. Also, EPA needs to ensure that oversight is in place so that it is guaranteed that agricultural credits surpass baseline and threshold (or whatever EPA recognizes as a compliance trigger) on a continuing basis in order to trade.

EPA should also consider how to make trading more beneficial between credit producers and credit buyers. This would include more EPA-state involvement in accepted BMP reductions, the approval of unique and innovative trading opportunities (such as oyster bed creation, planting of submerged grass beds, etc.), and extension of the life of a credit beyond the currently limited one-year lifespan.

Response

Thank you for your comment. EPA understands your concern regarding changing delivery ratios and is currently considering how to best address this issue in the near future. EPA also understands your concern about ensuring that trades have adequate oversight. EPA intends for “independent oversight” in section 10.1.1 of the draft TMDL to mean third-party oversight of jurisdictional offset programs, including by firms under contract to the jurisdictions. In such cases, contracts ideally would specify the authority of the third party to arrive at conclusions without being influenced by the jurisdiction.

EPA intends for “public oversight” in section 10.1.2 of the draft TMDL to mean that jurisdictions should provide information about their offset programs with detail and explanation sufficient for members of the public understand the programs, including how individual offset agreements are structured. Jurisdictions should also provide the public with opportunities to comment on offset programs and individual agreements under such programs.

EPA remains interested in working with the jurisdictions and stakeholders in the development of an interstate nutrient credit trading program in the Bay watershed. EPA is collaborating with the World Resources Institute (WRI) in its project to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay Watershed. This project seeks to build a common integrated platform utilizing the existing MD, PA, and VA platforms. This integrated platform will facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools, and may serve as a foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA's NRCS to fund this project.

c. NPDES permitting for Point Sources and Incentives. Under current NPDES requirements (as interpreted by Maryland and Virginia) point-to-non-point trading or offsets are unlikely to occur. Under current rules, point sources find that the risk of permit violations overwhelms trading benefits. EPA needs to more carefully consider the incentives for municipal wastewater plants to participate in a point-to-non-point trading or offsets program, and incorporate language in the document to increase incentives for these entities.

d. Additional Legal Issues and Uncertainties. The "net improvement offsets" provision found in §10.1.3 (Additional Offset Program Features) appears to state that jurisdictions would be required to levy a tax or fee on point sources to ensure net improvements. The TMDL rules need to clarify that a regulatory agency may be on questionable grounds if it attempts to levy a tax on point sources to pay for non-point source improvements. When EPA begins to discuss net improvement offsets in this way, it is moving from the realm of a trading program to a tax program. This may raise a legal issue if the jurisdiction is an administrative agency because administrative agencies do not have taxing authority. The document could be improved by making it clear that the authority to do net improvement offsets must come from a legislative body, not a regulatory agency.

Response

Thank you for your comments. Jurisdictions continually look for incentives to encourage participation in programs such as point to nonpoint nutrient credit trading. EPA is aware of approaches currently taken in the Bay watershed to minimize the type of risk to point sources described in your comment. For example, Pennsylvania employs an approach to insure point sources against default of credits they purchase. EPA will continue working with the Bay jurisdictions as they continue to develop their programs.

Regarding the "net improvement offsets" provision. Net improvements are fundamentally different than all other trade ratios. All other ratios, including PA's insurance, are geared to ensuring that the TMDL/WQS are actually met. They account for variations and uncertainties. Net improvements by their very nature are not meant to "account" for anything, but rather to go further and speed up implementation. This approach does not subsidize noncompliance by sources, as compliance assurance and enforcement programs will address such challenges. Moreover, the language on page 10-2 of the TMDL does not specify that jurisdictions

should require net improvements. The language acknowledges that jurisdictions may choose to establish the authority for net improvement offsets as appropriate. EPA also notes that under the basic structure of the Clean Water Act, point sources are not guaranteed the right to discharge pollutants to waters of the United States. On the contrary, point source discharges of pollutants to waters of the United States, are subject to the effluent limitations and conditions established by EPA or the State, necessary to implement CWA technology based controls and achieve state water quality standards. EPA believes that in some cases, particularly where a waterbody is not attaining water quality standards it may be necessary for a discharger to achieve a net improvement in a waterbody in order to create the conditions necessary for the waterbody to be able to assimilate the discharger's pollutant load with a high enough level of confidence that the discharge will not result in an excursion of applicable standards. In any case, the net improvement offset is presented as a program feature that jurisdictions may wish to explore.

h. III. 7. Certification and Enforceability. (a) Requiring that any offsets, along with the enforceable water quality-based effluent limits (WQBELs) based on the applicable WLA (e.g., zero for new dischargers), will be included and recorded in the NPDES permit

Comment: For trading programs to be attractive and feasible for permitted point sources, there must be flexibility by EPA in oversight of state programs. The statement in (f) "Ensuring that an NPDES permittee remains accountable for meeting the WQBEL(s) in its permit" appears to be inconsistent with the goal of enabling successful long-term offsets.

i. III. Common Elements 7. Certification and Enforceability. (d) Ensuring that transactions can be enforced by the jurisdiction or otherwise insured by the jurisdiction, for example through a credit reserve insurance account, in the event of failure by the offset generator.

Comment: Within the purview of EPA administrative actions, who is responsible for the risk of failure/noncompliance?

Response

Thank you for your comments. EPA's current national policy is that the NPDES permittee engaged in a water quality trade remains responsible for complying with the terms of their permit as required under the Clean Water Act. This arrangement creates the incentive for the permittee to ensure that the terms of the trade are such that it can enforce the terms of the trade. In addition, EPA is aware of approaches currently taken in the Bay watershed to minimize the type of risk to point sources described in your comment. For example, Pennsylvania employs an approach to insure point sources against default of credits they have purchase. EPA believes that the policy of requiring the permittee to retain liability for compliance with the pre-trade effluent limit, therefore does not conflict with the goal of enabling successful long-term offsets so long as the jurisdiction's program contains a feature to insure against credit default, the permittee has a contract with the credit generator, or the jurisdiction or the trading interests have established some other mechanism to mitigate the risk to the permittee of such default.

Author Name: Shambaugh Brenda

Organization: PA Association of Conservation Districts (PACD)

Nutrient trading should be an available tool for point and non-point pollution sources as they strive to reduce nutrients going into the Chesapeake Bay. Not only has PA produced at least 8 successful trades over the past 3 years, as recently as October 2010 PENNVEST conducted its first successful auction of credits. At that time, credits representing the annual removal of 21,000 pounds of nitrogen from the Susquehanna River watershed and the Chesapeake Bay over each of the next three years were sold. The PA Nutrient Trading program must be allowed to continue in its present form, without mandated changes from EPA.

Response

Thank you for your comments. EPA agrees that the agriculture sector must participate in the protection and restoration of the Chesapeake Bay watershed. EPA will continue to work with Maryland to insure that its nutrient credit program will support the goals of the Bay TMDL.

Author Name: Tabb Lyle

Organization: Lyle C. Tabb & Sons, Inc.

On the issue of selling credits from nonpolluters to polluters, I think this would only make it profitable to be out of compliance and I strongly disagree with this concept.

Response

Thank you for your comment. Under the Chesapeake Bay TMDL, dischargers are able to choose from a range of approaches to reduce their loadings. Market approaches such as offsets and nutrient credit trading are approaches to reducing overall pollutant loads and EPA disagrees that such approaches, where they are orderly, accountable, transparent and effective would reward noncompliance with applicable laws and regulations.

Comment ID 0288.1.001.014

Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

EPA'S DECISION TO REJECT VIRGINIA'S EXPANDED TRADING PROGRAM APPROACH IS UNREASONABLE

Virginia's WIP includes provisions for expansion of its existing nutrient trading program. Virginia proposes to expand the trading program to include agriculture, urban storm, and others. An implementation of such an expanded trading program would provide the necessary flexibility to achieve cost effectiveness. EPA has acknowledged in recent public meetings that the TMDL does not consider affordability or cost-effectiveness. Unlike the EPA, local governments have a fiduciary responsibility to their customers to seek cost-effective solutions. EPA's disapproval of Virginia's WIP essentially eliminates the flexibility needed to serve the best interests of the public. EPA's action in this regard is unreasonable.

Response

Thank you for your comment. EPA does not approve or disapprove the Bay jurisdictions' Watershed Implementation Plans. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0288.1.001.031

Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

EPA SHOULD ACCOMMODATE VIRGINIA'S SUCCESSFUL POINT SOURCE TRADING PROGRAM

In Section 10 of the Draft TMDL, EPA addresses the subject of offsets and trading. As with the subject of POTW WLAs discussed elsewhere in these comments, this topic is another area in which the pace of Virginia's real implementation activities under the Chesapeake 2000 Agreement and related State statutes and regulations has far outpaced EPA's TMDL planning activities as of this draft.

This basic timing issue leads to our main point. Given all that Virginia including VAMWA members have invested in the Virginia trading program, it is imperative that EPA be flexible or and conform its new policies to the pre-existing laws, regulations and policies of Virginia as well as the associated compliance plan and related contracts of the Virginia Nutrient

Credit Exchange Association discussed in the Draft WIP at pages 41-42.

At page 10-4 of the Draft TMDL, EPA requested comment on whether its proposed offset provisions for new or increased nutrient or sediment loadings should apply to water quality trades in the Bay jurisdictions generally. VAMWA's would strongly recommend that the answer be "no." It is not so much the case that VAMWA would expect to find any major inconsistencies of environmental importance between (1) EPA's guidance and (2) and Virginia's laws, regulations and policies and the Nutrient Exchange's compliance plan, policies and contracts developed consistent with Virginia law. However, a thorough analysis of that question is in itself a major undertaking that simply cannot be performed with a 45-day comment period.

EPA's Draft TMDL calls for consistency with:

- Six (6) "source documents"
- A set of definitions
- A list of 10 "comment elements" with 38 sub-elements

Virginia's existing program includes:

- A complex statute (Va. Code 62.1-44.19:12 et set.)
- The Virginia Regulations (discussed elsewhere in these comments)
- The Chesapeake Bay Watershed General Permit (9VAC25-820) (see Draft WIP at page 41)
- The DEQ-approved Exchange Compliance Plan (2007, 2008, 2009 and 2010 Annual Updates)
- The Nutrient Exchange's 72-party Nutrient Credit Services Agreement

Consider:

- The Watershed General Permit itself contains 30 definitions and 17 pages requirements
- The Nutrient Exchange's 72-party Nutrient Credit Services Agreement is 30-page document with 39 definitions
- The Exchange Compliance Plan consists of hundreds of pages of associated facility plans and trades

This Virginia point-point trading program is working remarkably well and has been widely praised as a national model, including receiving credit in some of EPA's own publications. Therefore, at this time, VAMWA's urges EPA to limit its

consideration of new credit-related policies to the specific issue of offsetting new or increased loads.

As to the specific proposals advanced by EPA, VAMWA offers the following comments:

NPDES Permit Noncompliance (Page S-4, Item 6 (b)) - This item is irrelevant to trading and certainly stands to disrupt trading in practice. For trading to be reliable and useful for the users as well as the regulators, it makes no sense that otherwise valid nutrient credits would be disqualified upon noncompliance of the credit generating facility. Consider just a few examples of potential noncompliance: failure to submit a complete renewal application or a required facility-related manual on time, laboratory testing errors, inadvertent exceedence of unrelated nutrient limits, etc. This provision will only inject unnecessary uncertainty into the trading or offsetting process, does not "safeguard" nutrient trades, and actually would work against EPA's stated objectives. This element should be eliminated.

"Disproportionate Harm" (Page S-4, Item 6 (c))- This provision is redundant of the many provisions in Appendix S that state that trading or offsetting must be consistent with water quality standards, which apply to human health and aquatic life. This provision is redundant of the standards that preclude harm by their own terms and, therefore, the provision should be deleted.

"Temporal Consistency" (Page S-4, Item 6 (d))- This provision should be clarified to provide that temporal consistency is satisfied for point sources when the credit is generated and used within the same 12 month period. This request is consistent with the annual basis for the TMDL and WLAs.

"Accountability" Provisions (Page S-5, Item 8) - Much of this section is redundant of the previous seven items in Appendix S. However, a number of the items are worded slightly differently than those prior items. This may lead to confusion and further complicate implementation. We suggest deleting all sub-elements that are addressed elsewhere in the document.

"Net Improvement Offsets" (Page 10-2) - This item is objectionable in that it requires a source to do more than fully offset its own load. This essentially would penalize one party that is achieving zero-discharge for its new or increased activity, by requiring that party to also cleanup for another source that should do so but has not. This violates the most basic notions of fairness and due process, reflects poorly on government, and should be deleted.

Response

Thank you for your comment. EPA recognizes the success of Virginia's Point Source Trading Program. EPA also supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented. With respect to how jurisdictions' offset and trading programs will be evaluated by EPA, EPA expects to consider a jurisdiction's program in total, including those aspects of it that may be well established and aspects that are new or developing. In doing such reviews, EPA expects to exercise discretion to use the common elements and definitions contained in the TMDL Appendix, along with the existing applicable policy and guidance cited therein to assist in such evaluation. Many of the common elements in the TMDL Appendix articulate features of offset and trading programs EPA expects the jurisdictions to consider and address as they develop, refine, and implement their programs, rather than specific mechanisms, methods or requirements that to

which jurisdictions' programs must rigidly conform.

Comment ID 0293.1.001.012

Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

Third, and lastly, EPA has inappropriately rejected an important element of Virginia's approach to reasonable assurance-i.e., expansion of the existing nutrient trading system to include additional source sectors. As a general matter, EPA should have provided due deference to Virginia's Draft WIP.

And, with regard to this issue, EPA should have allowed Virginia to move forward with its plan to develop an expanded trading program. Virginia has a stellar track-record with regard to market-based trading, having established a very successful PS trading program. Virginia has earned the right to show how it could expand that program in a way that would provide reasonable assurance of needed reductions.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange, including the incorporation of additional source sectors in the program. EPA also supports the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0293.1.001.015

Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

EPA'S DECISION TO REJECT VIRGINIA'S EXPANDED TRADING OPTION IS UNREASONABLE

Virginia's WIP includes provisions for expansion of its existing nutrient trading program to include agriculture, urban stormwater, and other sectors. Implementation of an expanded trading program would enable affected parties to incorporate cost effectiveness into management decisions, which is essentially as EPA has largely ignored cost considerations in developing the TMDL. In fact, EPA has acknowledged in recent public meetings that the TMDL does not consider affordability or cost-effectiveness. Local governments (including MS4 owners) have a responsibility to their citizens to seek cost-effective solutions. By ignoring cost, EPA's disapproval of Virginia's WIP essentially conflicts with the public interest in efficient and affordable regulations. EPA's acceptance of Virginia's intent to consider trading program expansion would help address this major shortcoming of the TMDL. As discussed above, Virginia has an excellent track record with regard to its existing trading program. There is no reasonable basis for EPA's rejection of

Virginia's approach to expanded trading.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0304.1.001.011

Author Name: Thompson Glenn

Organization: U.S. House of Representatives

The trading of these "Nutrient Credits" is going to be a nightmare. They will go to the highest bidder and that may or may not be us. The E.P.A. and D.E.P. have targeted our municipal authorities because they hold N.P.D.S. permits, this is wrong. They have gotten out of hand and out of touch with rural America. The motto seems to be damn the cost full speed ahead.

Response

Thank you for this comment. EPA identified NPDES permit holders, primarily wastewater treatment plants, as a highly significant category of sources of nutrient loadings adversely impacting the Chesapeake Bay. Some Bay jurisdictions have established nutrient credit trading programs to provide discharges with a cost-effective approach to reducing loadings. Trading programs have been and are being planned to be extended in Bay jurisdictions to provide the same benefits to nonpoint sources. To date, the price of credits has remained approximately the same for some time. EPA encourages all stakeholders to work their jurisdictions' trading representatives to ensure that regulations and policies are fair and equitable.

Comment ID 0330.1.001.011

Author Name: Krasnoff Alan

Organization: City of Chesapeake, Virginia

The EPA's wholesale rejection of Virginia's proposal to expand its existing nutrient trading program reflects a lack of understanding of each local government's direct accountability to its citizens for efficient and economical services.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers necessary to stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented. EPA is fully aware of the important role that local government provides its citizens in assuring that its citizens are provided efficient and economical services to the best of its ability.

EPA is aware that meeting TMDL allocations will involve local governments, which already manage a significant workload. EPA is working to identify means of providing technical support to local governments to reduce the burden of planning for the TMDL and implementing measures associated with the TMDL.

Comment ID 0356.1.001.001

Author Name: Miller Leah

Organization: Izaak Walton League of America

Thank you for the opportunity to provide comments on the Draft Chesapeake Bay Total Maximum Daily Load (TMDL). The Izaak Walton League strongly supports the U.S. Environmental Protection Agency (EPA) in taking a lead role in restoring the Chesapeake Bay through the TMDL process. In addition to the comments below, the League fully supports the detailed comments submitted by the Choose Clean Water Coalition.

Investments of time and money by government agencies, conservation organizations and other private entities over the past twenty-five years have moderately improved water quality in the Chesapeake Bay, but have fallen far short of meeting pollution reduction goals. As of 2009, these voluntary efforts to restore the Bay only met 24 percent of the water quality goals set in the Chesapeake 2000 agreement. At the current pace of voluntary programs, the nutrient reductions needed to restore the Bay would not be met until 2050.

Clearly, it is time to move beyond a purely voluntary approach to a more comprehensive effort that includes enforceable, Bay-wide pollution reduction standards. The Clean Water Act, three major Bay Agreements, three consent decrees, dozens of Memoranda of Agreement/Understanding, and a Presidential Executive Order all require development of a Bay-wide TMDL. Moreover, EPA has used its clear legal authority wisely. The public process of developing the TMDL has been highly transparent and provides states ample opportunity to prepare and revise draft Watershed Implementation Plans. In addition, the agency is seeking to implement pollution load allocations that are substantially equivalent to those the states have had since 2003.

Although the League supports implementation of the TMDL, we urge EPA not to use water quality trading to meet pollution reduction targets unless the following conditions are met:

- Water quality will not be degraded within any watershed.
- Water quality monitoring (not simply modeling) is used to verify load reductions from all point and nonpoint sources of pollution used as credits, including those that involve agriculture and forestry operations.
- Compliance and enforcement provisions are stringent and include record keeping, monitoring, reporting, inspections, and public input.

Again, we appreciate the opportunity to comment on the Draft Chesapeake Bay TMDL. We commend EPA for taking a leadership role in Chesapeake Bay restoration and encourage the agency to incorporate our suggestions into the final TMDL. We are optimistic that implementation of the TMDL will achieve pollution reduction targets for the Chesapeake Bay.

Response

Thank you for your comment. EPA agrees that oversight, accountability, and tracking are essential components of a legitimate and effective nutrient credit trading program. EPA will continue to work with the Bay jurisdictions to ensure that these elements are included in all such programs in the watershed.

Agricultural BMPs could be funded through a nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Response

Thank you for your comment. Several Bay jurisdictions are considering mechanisms, including mitigation funds, for providing resources for BMP implementation. EPA encourages jurisdictions to use all available tools to expedite restoration of the Chesapeake Bay.

Comment ID 0370-cp.001.007

Author Name: Page T.

Organization:

--While we support the study and establishment of an expanded nutrient trading exchange, allocations in the revised WIP should not be based on its availability. Such changes could be incorporated into the 2011 or 2012 revised Virginia WIP if the study requested by DEQ finds a workable and cost-effective exchange and/or fund can be established. The trading program proposed in the draft WIP is not workable and as a result would require levels of costly urban/suburban retrofits for existing development that far exceed even the draconian EPA urban/suburban retrofit backstop. VACRE supports establishment of a fund through which less expensive agricultural or wastewater BMPs could be installed through payments received from urban/suburban land disturbing projects while achieving greater and more easily verified pollutant reductions than can be achieved through the more expensive urban retrofits.

Response

Thank you for your comment. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and its proposed regulatory drivers necessary to stimulate demand in nutrient credit markets. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented. EPA encourages VACRE to continue discussions with Virginia with regard to establishment of a mechanism through which less expensive agricultural or wastewater BMPs could be installed.

Organization: Town of Ashland, Virginia

We appreciate and support Virginia's inclusion of an expanded trading program as a local implementation option. Virginia has a nationally recognized point-point trading program that currently includes domestic and industrial wastewater treatment plants. We believe that expansion of Virginia's trading program is one way to provide flexibility to help make attainment more feasible.

Response

Thank you for your comment. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA also agrees that an expanded

Nutrient Credit Exchange could provide flexibility to help meet the TMDL allocations in more efficient and cost-effective ways. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0376.1.001.021

Author Name: Smith Brooks

Organization: Virginia Manufacturers Association VMA

EPA's TSS Proposal Undermines the Nutrient Credit Exchange Program.

The Exchange was developed in reliance on the long-standing expectation that investments in technology to achieve nutrient and phosphorus reductions would in turn drive point source loadings of sediment. The drastic TSS limitations resulting from EPA's partial and full backstop proposals undermines this process, because different technologies will be necessary to achieve the TSS limitations. EPA's proposal, in effect, makes TSS the driver for technology investments rather than nitrogen and phosphorus. This is a marked shift in the program that undermines the investments and trading programs established under Virginia's regulatory trading program.

Response

Thank you for your comment. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, including sediment, contingency plans (backstops) are in place and able to be implemented. EPA believes that the Chesapeake Bay TMDL and the load and wasteload allocations in it for nitrogen, phosphorus and sediment will have the effect of improving treatment levels and management practices, and prompting the technology investments to support such measures necessary for increasingly effective reductions of all three types of pollutant loads, nitrogen, phosphorus and sediment.

Organization: PA Chamber of Business and Industry

The EPA Backstop TMDL suggests that perhaps the difference between the Table Q2 values and what is technically or economically achievable could be made up by purchasing credits. Such statements are mere fiction. As EPA well knows, there are nowhere near the number of credits available or predicted to be available to cover the differences between the Pennsylvania WIP loadings for point sources and the Backstop TMDL values. Moreover, EPA's other comments on the Pennsylvania WIP draw into serious question whether Pennsylvania's credit trading program will remain viable.

Response

Thank you for your comment. EPA believes that Pennsylvania's nutrient credit trading program will continue to play an important role in the restoration of the Chesapeake Bay. Pennsylvania's program requires that the program be evaluated periodically and make adjustments, if appropriate, in order to insure that it does not violate the federal Clean Water Act. EPA has worked closely with Pennsylvania to ensure that if the nutrient credit trading program and other programs are unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and are able to be implemented.

Interstate Trading is Biased Against NY Farmers & is Otherwise Ineffective

There are 2 kinds of trading programs being considered: (i) one for new and increased loadings only; and (ii) one that considers trades between sources contributing pollutant loadings to the same or different Bay segments - with important conditions. See Draft TMDL at 10-1 to 3. Neither program offers any help to New York and, if not properly formulated, will be grossly unfair to New York.

The first program will very likely not help NY because it is, unfortunately, very doubtful that sources within the Southern Tier will expand or that new sources will be added in the near future -- given the current population decline and basic demographics of the region. That is not the case with respect to Maryland and Virginia, which are both booming. Take Virginia, for example, its population has increased by over 40% since 1985.[FN14] [Comment Letter contains additional information in the form of an attachment. See original comment letter 0389.1] Not surprisingly, its wastewater load has increased by a similar amount. [FN15] While Virginia's actual wastewater flow has been around 600 mgd over the last few years, however, its current design capacity is around 1,000 mgd, a difference of 400 mgd. Assuming the offset approach -- like the TMDL -- will be based on design flow, Virginia will have a significant amount of nitrogen load to use on new and expanded sources in-state. The same goes for other states that are growing. The Draft TMDL (at 6-44) acknowledges this point, as well as the fact that growing states are given a competitive advantage. Since reduction of "design" load is not the same as an actual reduction, this program may also result in paper reductions that have little to no environmental benefit.

The "Water Quality Trading" program discussed in the Draft TMDL (at 10-3) will be available to "sources contributing pollutant loadings to the same or different Bay segments, provided such trades do not cause or contribute to an exceedance of WQS in either receiving segment or anywhere else in the Bay watershed." Without knowing specifically how EPA will enforce the condition that such trades "not cause or contribute to exceedances of WQS," it is difficult to know precisely how this program will function. Nevertheless, it is easy to see how this kind of program can be abused in a manner that prejudices New York-based sources, particularly farmers. Again, assuming that the Water Quality Trading Program is based on design, rather than, actual flow, large over-capacity sources in Virginia and Maryland will have a significant amount of "paper" loads to offer other sources that will find it more difficult to reduce pollutant inputs. For example, as discussed below, New York-based farmers will find it very difficult, if not impossible, to employ the kinds of

practices that EPA's backstop approach will require. [FN16] This kind of a trading program may place NY farmers in the untenable position of purchasing offsets from wealthy sewer districts in Maryland and Virginia, which would result in only a paper reduction and have no discernible benefit to the Bay. Forcing New York farmers to purchase offsets will only result in driving many of them out of business.

[FN14] See Data Tables attached as Exhibit 1.

[FN15] Id.

[FN16] While New York's design wastewater load is also greater than its actual load, the extra capacity is necessary to address significant stormwater and snowmelt flows from combined sewers located in New York's part of the watershed. In other words, the extra capacity is not available for trading.

Response

Thank you for your comment. EPA's proposed reductions to agriculture sector allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance demonstrated in the draft NY WIP. EPA is responsible for ensuring that nutrient and sediment reductions envisioned in draft WIP will be achieved. It is not EPA's intention to put New York farmers in an untenable position of purchasing offsets from sewer districts in Maryland and Virginia. EPA continues to work with New York on strategies that meet their TMDL allocations. With respect to your comment on excess design flows in metropolitan sewer districts, EPA notes that the nutrient trading outlined in the draft and final TMDL is fundamentally based on nitrogen and phosphorus loadings. The WLAs and LAs in the TMDL are expressed as pollutant loads and trades and offsets are presented as transactions designed to reduce pollutant loads. While facility design flow is certainly relevant, it alone does not determine pollutant loadings from a WWTP. Many WWTPs will need to reduce their loadings to achieve their WLAs in the TMDL.

Author Name: Preyer John

Organization: Restoration Systems (RS)

Since 1998 RS has been in the business of providing compensatory wetland, stream, and riparian buffer mitigation; through mitigation banks, as a third party provider of Permittee Responsible Mitigation, or as a Full Delivery (all the same tasks of a bank) provider to the state run In-Lieu Fee program, the North Carolina Ecosystem Enhancement Program (NCEEP).

RS has been an active member of the National Mitigation Banking Association since 1999 and helped found a state trade association, the North Carolina Environmental Restoration Association in 2001. Through these associations and separately, RS has been an advocate on behalf of the benefits to private sector mitigation projects as well as efforts to provide high regulatory standards for all types of mitigation and worked cooperatively with both the U.S. Army Corps of Engineers (USACE) and the U.S. Environmental Protection Agency (EPA) on policy initiatives to professionalize the delivery and use of compensatory mitigation.

In 2008 RS successfully permitted the first private mitigation bank for providing nutrient offset credits in the country in

North Carolina. This was a result of a change in state law in 2007 which for the first time ever allowed for private mitigation banks to provide nutrient offset credits to both point and non-point sources. Up until this change the state in-lieu fee mitigation program, the NCEEP, had been the only source for providing nutrient offset mitigation, most of which it obtained from mitigation companies like RS through the competitive bid Full Delivery process going back to the inception of state mandated nutrient offset requirements in 2001. The North Carolina General Assembly recognized that since almost all of the nutrient mitigation generated by the NCEEP came from private mitigation companies it made sense to let this private industry provide the offsets directly to the impactor as well.

The RS Wellons Farm nutrient offset bank was permitted by the North Carolina Division of Water Quality in October of 2008 and a second nutrient offset site, Lane Farm subsequently permitted in March of 2009. Together these two sites provide 170,451 pounds of nutrient offset mitigation in the Neuse River Basin of North Carolina.

Over the past twelve years RS has acquired, permitted, designed, constructed, monitored, and put under permanent protection (through conservation easements) a total of 42 different compensatory mitigation projects across the Southeast. Of these, nine stream and wetland mitigation projects have already met or exceeded their USACE prescribed five year monitoring success criteria.

The bulk of the remainder of the projects, wetland and stream, riparian buffer and nutrient offset, are in either their third or fourth year of monitoring. I cite this background in order to underscore that the comments that follow are based on our first hand experience in providing compensatory mitigation, including nutrient offsets, day in and day out, as opposed to theoretical or conceptual plans which have not been borne out in practice.

RECCOMENDATIONS

1) Unleash the full power of private sector mitigation efforts: officially authorize and encourage the use of offsets.

Despite well intended efforts by both government and non-profit entities the reality is that the water quality of the Chesapeake Bay has continued to get worse in spite of the hundreds of millions of dollars spent in order to prevent this very outcome. The key missing component of the efforts to restore water quality to the Bay thus far is the absence of any incentive for private mitigation projects to generate nutrient offsets. This must change and in order for this TMDL effort to be successful, the EPA needs to bring to bear the financial resource of private mitigation efforts.

For instance, RS has been providing nutrient offsets in North Carolina from the time state law allowed private entities to do so. Since then there are now three competing private mitigation companies also selling nutrient offsets in the same watershed which services one the fastest growing metropolitan regions of the country, the Raleigh, Durham, Chapel Hill Research Triangle.

All of these companies spent their own money to purchase land for their sites and perform the restoration work which provides pounds of nutrient offset mitigation as determined and permitted by the North Carolina Division of Water Quality prior to the impact which requires the offset, i.e. not only is there no temporal ecological loss there is a significant temporal gain.

2) Provide strict regulatory enforcement on non-performing in-lieu fee programs.

In Virginia the localities have the latitude to use ad-hoc in-lieu fee, pro rata share, and other programs to comply with state prescribed stormwater nutrient reduction requirements through the payment of an arbitrarily set fee. As is the case with most in-lieu fee arrangements, sometimes called 'pay and pave' the fee is always collected up-front and the actual offset mitigation done is on the back end if ever done at all.

There is an undeniable temporal ecological loss and if the obligated offset is not performed for years afterwards then there ought to be a penalty attached to it. We have heard anecdotal reports of some municipalities in Virginia using the fees collected for nutrient mitigation going to completely unrelated municipal services such as snow removal.

If existing programs are found to have substantial backlog obligations or deficits on the fees collected vs. implemented mitigation projects then the EPA should levy a 'cease and desist' order until the program procures the requisite amount of mitigation, including any penalty attached to it, from an approved offset facility including an offset mitigation bank. The in-lieu program should then be limited to only the procurement of approved offset projects going forward and not be allowed to implement its own projects.

3) The EPA should provide the jump start to encourage private mitigation offsets.

The time is now for the EPA to bring to bear the full power and resource of private capital and green investment opportunities in a truly unprecedented size and scope. The EPA should issue a Request for Proposal for 1,000 pounds of certified and approved offset credits from each Bay state concurrent with issuance of the final TMDL. This provides the 'stick and carrot' needed to focus the attention of all relevant parties to the process.

The same Request for Proposal process should be followed again in another six months with another 1,000 pounds from each Bay state. By the second issuance of the request there will no doubt be multitude of viable offsets offered in multiple locations. If successful there could follow a rolling Request for Proposal process every six months in order to keep fulfilling the demand.

Finally, it our hope that the EPA will refrain from instituting an overly cumbersome trading system involving multiple entities adding layers of complexity to what ought to be a simple transaction between the buyer and seller. This is best accomplished by refraining from top-down command and control of the process and letting the market work.

Please provide your response to the following question: what role does EPA envision for the ability of private offset to be utilized in conjunction with this TMDL?

Response

Thank you for your comment. EPA and the Chesapeake Bay jurisdictions would be interested in receiving further information and having further discussions about a private offset approach to loadings reductions.

Organization: Maryland State Highway Administration (SHA)

Given the fact that the SHA roadway system services all Maryland Bay watersheds, our challenges are exacerbated with the requirements that TMDLs be met in each segmented watershed. Unlike local governments, the SHA MS4 coverage is not limited to a small, manageable number of segmented watersheds, but rather we expect reduction goals will be assigned for SHA in all 58 segmented watersheds. For this reason, we would like to propose a banking strategy whereby a jurisdiction can over-manage in one watershed segment and achieve credit in another. This bank will be held only by the jurisdiction and would not address the concept of trading among sectors. It would be a tool by which the jurisdiction could achieve flexibility in meeting load reductions.

Response

Thank you for your comment. EPA is working with the Chesapeake Bay jurisdictions to ensure they will be able to meet their TMDL allocations through a combination of regulations, market mechanisms, voluntary actions, and enforcement. EPA suggests that SHA work with MDE and MDNR as well as with Maryland local governments to identify ways that SHA can meet its reduction goals. EPA's intent in the TMDL is to identify key components that Bay jurisdictions should include in their programs. EPA will continue to work closely with the Bay jurisdictions to ensure that their programs meet the agency's expectations.

Comment ID 0410.1.001.028

Author Name: Pujara Karuna

Organization: Maryland State Highway Administration (SHA)

Because the ability of SHA to mitigate stormwater runoff from impervious surfaces is often constrained by narrow rights-of-way, SHA is very interested in trade mechanisms to meet its obligations under the TMDL, and is particularly interested in opportunities to restore public and private property adjacent to state roads within severely impacted watersheds.

SHA remains committed meet its goals as specified in the Maryland WIP and also requests that the issues of trading and compliance tracking be given high priority in future discussions of the Chesapeake Bay Partnership, and that the adopted methods allow a high degree of transparency between government agencies and landowners.

Response

Thank you for your comment. EPA is working with the Chesapeake Bay jurisdictions to ensure they will be able to meet their TMDL allocations through a combination of regulations, market mechanisms, voluntary actions, and enforcement. EPA suggests that SHA work with MDE and MDNR as well as with Maryland local governments to identify ways that SHA can meet its reduction goals. EPA would be interested in receiving information on SHA's progress in identifying restoration opportunities.

--The Waste Load Allocation (WLA's) for industrial VPDES permit holders will likely require these companies to purchase expensive offsets if they are even available. EPA should be sensitive to this impact when evaluating any offset credit requirements.

Response

Thank you for your comment. EPA will take your comment into consideration as it works with the Chesapeake Bay jurisdictions to improve and establish nutrient credit trading programs that are orderly, accountable, transparent and effective.

Comment ID 0418.1.001.015

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

Most, if not all, Bay States envision relying on considerably expanded nutrient reduction credit trading to offset new or continued discharges. The challenges of reducing overall discharges through a trading mechanism is discussed elsewhere in this comment, however the reliance on this mechanism, through partially operational or undefined trading programs, raises serious "reasonable assurance" concerns. To date, current programs in Pennsylvania and other Bay states have only handled a handful of trades. Clarification of baseline requirements and program design features will require some time before offset programs can be relied upon to accommodate new discharges.

Response

Thank you for your comment. EPA acknowledges that development and implementation of new offset and trading programs and maturation of existing programs will require some time to reliably accommodate new discharges. Meeting the TMDL allocations and accommodating growth in the jurisdictions, however, will require such programs to be implemented or enhanced in a timely manner and with appropriate safeguards and transparency. EPA will continue working with the jurisdictions to facilitate the development of these programs.

Comment ID 0418.1.001.025

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

Over the last 7 years EPA has taken several steps toward developing a credible, enforceable framework for nutrient

credit trading in the Chesapeake Bay. NRDC commends the Agency's effort to ensure that nutrient trading programs are accountable and quantifiable, designed to facilitate compliance with TMDL requirements without risk of increased pollution loadings to impaired waters.

a. General Observations About Nutrient Trading

NRDC believes that the Chesapeake Bay TMDL is a good opportunity to demonstrate that a nutrient trading program, subject to strict oversight and carefully-crafted rules keyed to environmental performance targets, can help make a regulatory program function more economically efficiently. Trading is a locally appropriate tool to clean up the bay as it builds on unparalleled scientific research, modeling and data. NRDC does not endorse trading wholesale; rather, we hope that EPA and Bay states will demonstrate that a trading program does not undercut other critical water pollution goals by exacerbating local pollution problems or reducing the certainty that pollution reductions will take place. As with other elements of the Bay Program, successful work on offsets and trading in the Chesapeake Bay could serve as a powerful model to consider in other watersheds.

Trading arises in the TMDL in a few different contexts. First, because the TMDL does not provide an explicit allocation for new or increased sources of nutrients or sediment, any additional discharge of these pollutants would need to be offset by reductions elsewhere in order to be permitted.[FN 59] Second, because meeting the TMDL will require significant pollution reductions throughout the watershed, there is widespread interest in, and significant support for, a trading program that can help sources achieve needed reductions in an economically efficient manner. EPA says that it "recognizes that a number of Bay jurisdictions are already implementing water quality trading programs. EPA supports implementation of the Bay TMDL through such programs, as long as they are established and implemented in a manner consistent with the CWA, its implementing regulations," and a pair of EPA guidance documents.[FN 60] Finally, given that the problems the TMDL seeks to address are interstate in nature, EPA envisions taking steps to facilitate broad-scale trading. As the Agency observes, "EPA recognizes the value of implementing a strategy for offsets that, wherever possible, is consistent among the jurisdictions to increase credibility, scalability, and broader regional implementation such as interstate trading."

In general, NRDC believes that these different policy strands should be unified. That is, EPA should use its oversight of the state plans to meet the TMDL allocations and of state-issued permits to ensure that offsets for new growth and trades to meet reduction targets both operate by the same rules - rules that ensure transparency, accountability, scientific integrity, and consistency between jurisdictions. We believe that the circumstances are appropriate in the Chesapeake Bay for EPA to authorize interstate trades, so long as it provides detailed guidance for acceptable trades.

Appendix S, "Offsetting New or Increased Loadings of Nitrogen, Phosphorous and Sediment to the Chesapeake Bay Watershed", and Section 10, TMDL Implementation and Adaptive Management, outline broad expectations for offset programs within and between Bay states. NRDC strongly supports the use of a comprehensive set of definitions, common elements and program features that guide trading among both new and existing sources of nitrogen and phosphorous. Clear, rigorous and consistent rules will help maintain the integrity of a trading system while fostering market clarity and stability. The principles outlined in Appendix S, in combination with many strong elements in EPA trading policies, should be implemented to make sure that trading contributes to, and does not undermine, progress toward meeting the TMDL goals.

A Bay nutrient trading market will build on existing and pending state programs and help states and sectors more cost-

effectively achieve TMDL nutrient pollution limits. However, while NRDC supports consistent application of definitions and programmatic requirements, we believe that nitrogen and phosphorus should be the primary focus of the trading programs. Until proven systems are up and running and there is more science and data to evaluate program effectiveness, cross-nutrient trading and sediment trading is premature. Because Pennsylvania is the only state that currently includes sediment in its trading program, that program feature should remain distinct from the comprehensive system and be utilized for program evaluation.

[FN 59] See 40 C.F.R. § 122.4(i); *Friends of Pinto Creek v. U.S. EPA*, 504 F.3d 1007, 1014. (9th Cir. 2007) ("If point sources, other than the permitted point source, are necessary to be [controlled] in order to achieve the water quality standard, then the EPA must locate any such point sources and establish compliance schedules to meet the water quality standard before issuing a permit. If there are not adequate point sources to do so, then a permit cannot be issued unless the state or [proposed source] agrees to establish a schedule to limit pollution from a nonpoint source or sources sufficient to achieve water quality standards.").

[FN 60] Draft TMDL at p. 10-3.

Response

Thank you for your comments. EPA expects that carefully developed trading and offset programs for interstate and intrastate trading will not undercut other critical water pollution goals. EPA plans to use its oversight of the jurisdictions to ensure that offsets and trades are governed by rules that ensure transparency, accountability, scientific integrity, and consistency between jurisdictions.

Organization: Natural Resources Defense Council (NRDC)

b. Responses to Specific Trading Issues Raised By EPA

i. Trading Must be Protective of Water Quality.

NRDC strongly supports EPA's position that trading may only be used as a tool to improve water quality and that "trades do not cause or contribute to an exceedance of WQS in either receiving segment or anywhere else in the Bay watershed." [FN 62]

ii. Baselines for Creating Tradeable Credits Must Account for All Applicable Requirements.

The proposed definition of offset baseline as the "amount of pollutant loading allowed by a wasteload or load allocation" is significant. Having a clearly understood and enforceable baseline is a fundamentally necessary element of a credible program and NRDC supports EPA's approach.[FN 63] NRDC supports numeric baselines for credit generators rather

than suites of best management practices (BMPs). In the absence of a numeric baseline it is much more difficult to verify that BMPs are achieving results. In its Guide for EPA's Evaluation of Phase I Watershed Implementation Plans, the Agency asks each jurisdiction to ensure that offsets account for "attainment of the Bay TMDL or local water quality baseline by the generator of the offset." [FN 64] NRDC supports this approach.

In Appendix S, EPA establishes minimum controls for point source credit users as "relevant minimum technology-based standards or secondary treatment standards." NRDC agrees with this position; the Clean Water Act's success in large measure is attributable to the consistent application of technology-based standards, and we would not support trading out of such obligations.

iii. Credit Calculation and Verification Protocols Must be Rigorously Scientific.

NRDC supports EPA's approach of requiring appropriate metrics and verification systems to ensure that credits are producing expected reductions. Equivalency, distance accounting and accounting for overall uncertainty may require margins of safety in both allocations and trading ratios. Pages 19-23 in Section 6 of the TMDL draft discuss the Agency's conclusion that all pollution reductions are not equivalent. For example, "[n]orthern, major river basins have greater relative influence than southern major river basins, because of the general circulation patterns of the Chesapeake Bay..." Likewise, "[r]iver basins whose loads discharge directly to the mainstem Bay, like the Susquehanna, tend to have more effect on the mainstem Bay segments than basins with long riverine estuaries (e.g., the Patuxent and Rappahannock rivers)." In view of these observations, the trading program within the Bay needs to account for relative influence; for instance, if credits generated in less influential watersheds are used to offset growth in more influential ones, the Agency needs to secure a greater than 1:1 trading ratio.

As noted in Appendix S, monitoring is an important way of verifying that reductions used as credits actually occur. NRDC would go a step further; in general, we believe that, in order to create a tradable credit, the generator should monitor current conditions and then keep on monitoring to be sure the credit is in fact generated. If there are challenges to monitoring certain source categories EPA should issue guidance to establish appropriate monitoring protocols. [FN 65]

At a bare minimum, if EPA intends to permit credit generation in the absence of monitoring data, it is necessary to follow the Agency's suggestion (in section 5(a)(ii) of Appendix S) that using an increased trading ratio to account for a lack of monitoring. In this circumstance, significant compliance assurance efforts (regular inspections, etc.) are even more necessary. In addition, a trading ratio of some size would also create an appropriate margin of safety for those states that are relying on trading significantly to achieve the TMDL allocations.

iv. EPA Must Insist on Safeguards to Provide Assurance that Trades do not Undermine TMDL Compliance.

NRDC supports the inclusion of safeguards to ensure that water quality is protected. However, the policy reflected in Appendix S only "restricts" the use or generation of offsets by an unpermitted point source not in compliance with its NPDES permit or other legal requirement. NRDC believes that non-compliant entities should not be permitted to use or create offsets, because a trading program relies on full compliance by participants for its success. This policy should be clarified to "prohibit the use or generation of offsets by an unpermitted point source or source not in compliance with NPDES or a jurisdiction equivalent, or other federal or state law or regulation." [FN 66]

NRDC also suggests that all Chesapeake Bay watershed waters have objective numeric nitrogen and phosphorus criteria, or other criteria backed by well-understood guidance that translates them into numeric nitrogen and phosphorus targets, in place before allowing buyers within these waters to purchase credits towards meeting the Bay TMDL allocations or allowing credit generation within such waters. We suggest that states be required to put such criteria in place before trades begin, as those criteria are essential to any critical and objective evaluation of whether a given trading transaction will cause or contribute to a water quality standards violation.

v. Certification and Enforceability Mechanisms Are Essential.

EPA outlines a number of important certification and enforcement mechanisms in section 7 of Appendix S. NRDC supports EPA's approach. Having states estimate the increased pollutant loading from nonpoint sources and discharges from point sources that will not be permitted and acquiring offsets needed to fully offset such increases will be necessary in order to stay on track. We believe that the information must be clearly recorded in an instrument that is also publicly reviewable and that periodic review inspection and auditing occur to ensure that the estimates are an accurate reflection of actual loads.

Additionally, while NRDC believes that offsets and other trades must be reflected in permitted sources' NPDES permits, we also believe that offsets may occur without reopening or modifying a permit. Instead, EPA policy should ensure that credits and trade requirements are incorporated directly or by reference into enforceable permit requirements under the NPDES system established under section 402 or state permitting authority for all credit purchasers covered by such permits. This permitting approach would allow trading to occur without requiring the reopening or reissuance of permits to incorporate individual trades, but would incorporate any such trades directly or by reference as enforceable terms of those permits once the credit purchase has been approved by the permitting agency.[FN 67] Additional provisions to ensure that the buyer is responsible for making pollution reductions if the credits purchased are not realized are necessary.[FN 68]

To further support transparency and enforceability, EPA should develop model permit provisions for state use that allow for trades to occur during the term of the permit without reopening it, so long as the credit user remains responsible in its permit for any failure (including a failure by the credit generator) to meet WQBELs/WLAs, and the permit obliges the user to monitor, track, and report publicly on the use of the credit and the continuing validity of the credit. Finally, private contracts between credit buyers and sellers must contain adequate enforceability provisions and all agreements between offset generators and users should be civilly enforceable.

vi. Trading Can Only Support the TMDL If the System Requires Fully Accountable and Transparent Trades.

An accountable, trackable permit system must be in place in order to achieve meaningful results. Requirements to ensure that offsets are quantified and verified, that the location of the offset is established, that offsets not be sold more than once, and that offsets are reviewed and monitored are essential. Appendix provision 8(b) should be strengthened to ensure uniform basin-wide standards that are consistent with minimum EPA guidelines, not simply "standards established by the jurisdiction." Provision 8(i) likewise should be improved to require the demonstration of sufficient offsets being acquired over the period of increased or new loading.

In addition, while the need for accountability and transparency is referenced in EPA's policy, the current language is vague. The final TMDL should require a publicly accessible registry of trades and include explicit inspection, monitoring

and auditing protocols.[FN 69] The registry should record information used in the certification and verification process and the trading transaction information on creation, sale, amounts and use of credits. Finally, third party verification and certification of credits should be provided for under both state and interstate trading programs.

[FN 68] See *id.* ("In the event of default by another source generating credits, an NPDES permittee using those credits is responsible for complying with the effluent limitations that would apply if the trade has not occurred.").

[FN 69] See *id.* ("EPA supports public participation at the earliest stages and throughout the development of water quality trading programs to strengthen program effectiveness and credibility.")

Response

Thank you for your comments. EPA agrees that rigorous oversight, accountability, transparency, and measurement are important

components of a successful and legitimate offset and trading program. EPA is working with the Bay jurisdictions to incorporate such elements into the existing and planned jurisdictional programs. EPA will review the progress of the jurisdictions in developing or strengthening their programs in 2011 and will expect the jurisdictions to commit to needed improvements in their Phase 2 WIPs. EPA will consider the suggestions in the comments as it works with the jurisdictions in this effort.

c. Comments on State WIPs' Discussion of Trading and Offsets

Pennsylvania

Pennsylvania has done significant work to develop its state nutrient trading program and openly encourages EPA and other states to build on its groundwork. While there is much to be learned from Pennsylvania's pioneering work, NRDC does not support the baseline approach used by the state and encourages EPA to develop a consistent baseline approach throughout the watershed.

Pennsylvania's program specifies that its "baseline includes compliance with the erosion and sedimentation requirements for agricultural operations in Chapter 102 (relating to erosion and sediment control), the requirements for agricultural operations under § 91.36 (relating to pollution control and prevention at agricultural operations), § 92a.29 (relating to CAFOs) and the requirements for agricultural operations under Chapter 83, Subchapter D (relating to nutrient management), as applicable." [FN 71] Additional "threshold" requirements are included, such as: "[m]anure is not mechanically applied within 100 feet" of various surface waters; "[a] minimum of 35 feet of permanent vegetation is established between the field" and such waters; or the reduction credit claimed for the activity is discounted by 20%. [FN 72] The reductions resulting from many of these practices are difficult to account for and enforce and do not ensure that actual pollutant reductions are met.

In addition, Pennsylvania's WIP further explains that compliance with nutrient management plans will be determined by money spent and complaint-driven audits. Without verification of nutrient application practices and auditing of plan implementation, these requirements are woefully insufficient to guarantee pollution reductions.

NRDC believes that EPA should insist that Pennsylvania adjust its trading baseline to be a numeric one. We understand that the credit generation process - at least with respect to nonpoint sources -- will be somewhat predictive and thus needs to include several safeguards, [FN 73] and should incorporate monitoring mechanisms to verify reductions later. However, we do not believe that credits can solely be based on estimated reductions, so some mechanism to establish a numeric baseline prior to the credit-generating activity and verifying the reductions afterwards needs to be part of EPA's review of the reliability of state trading regimes and the Agency should object to permits that rely on trades that are unreliable or that are otherwise inconsistent with the TMDL.

Additionally, Pennsylvania's WIP relies heavily on expansion of nutrient trading opportunities to achieve compliance in

the stormwater sector. As discussed above, trading in sediment is still nascent and data have not yet established clear programmatic results. It is premature for Pennsylvania to rely on trading to achieve sediment reductions for stormwater.

Maryland

Maryland has done considerable work to develop its own trading policies. NRDC applauds Maryland's use of the local water quality standard of the TMDL as the baseline. NRDC also supports Maryland's pioneering approach to WWTP, requiring upgrades such that WWTP in Maryland may become a source of credits, rather than a purchaser, as envisioned in other state WIPs.

[FN 71] 25 Pa. Code § 96.8(d)(2)(i)

[FN 72] Id. § 96.8(d)(3).

[FN 73] See EPA Water Quality Trading Policy ("EPA supports a number of approaches to compensate for nonpoint source uncertainty. These include monitoring to verify load reductions, the use of greater than 1:1 trading ratios between nonpoint and point sources, using demonstrated performance values or conservative assumptions in estimating the effectiveness of nonpoint source management practices using site- or trade-specific discount factors, and retiring a percentage of nonpoint source reductions for each transaction or a predetermined number of credits.").

Response

Thank you for your comments. EPA appreciates the significance of the baseline for offsets and trading and will work with the jurisdictions to ensure that their baselines are appropriate and defensible. EPA will review the progress of the jurisdictions in developing or strengthening their programs in 2011 and will expect the jurisdictions to commit to needed improvements in their Phase 2 WIPs.

Comment ID 0418.1.001.032

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

Virginia

NRDC concurs with EPA's critique that Virginia's WIP is heavily reliant on achieving nutrient reductions through trading (an expanded Nutrient Credit Exchange), but that programmatic elements to ensure that reductions actually occur are lacking. In particular, clear baselines and enforceable standards must be in place for stormwater before EPA can base its reasonable assurance conclusion on the expansion of trading. EPA's substantive guidance also is needed to provide the state Assembly with direction about the needed components of any effort to expand the nutrient trading program.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange, which should address some of the issues identified in the comments. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0424.1.001.001

Organization: Tredegar Corporation and Falling Springs, LLC

Virginia has developed the Virginia Nutrient Credit Exchange Association (the "Exchange"), a trading program designed to enable point sources to trade nutrient credits. The program has since been expanded to address new stormwater discharges and agriculture and forest land. The Virginia Watershed Implementation Plan ("WIP") proposes to expand this program even further to allow full participation by all sources of wastewater, storm water and on-site septic systems. Virginia's WIP also includes significant reductions for urban storm water sources to encourage the trading of credits among municipal sources of nutrient discharges.

Virginia's expanded trading program represents an approach to water quality management that makes sense from an environmental and efficiency perspective. Virginia has documented its goals and expectations for the program, as well as a recognition that, through adaptive management, additional changes may be necessary in the future to ensure that the Bay water quality restoration goals are in fact achieved.

EPA appears to have rejected DEQ's trading proposal, citing a lack of "regulatory drivers to create a demand for credits within a specified time period." EPA Comments on Virginia's Draft WIP, October 4, 2010. Virginia's WIP has proposed stringent reductions, designed to achieve the desired Bay restoration goals, and a trading framework and trading partners have already begun establishment in reliance on that framework. Tredegar encourages EPA to allow Virginia's trading program to move forward. The adaptive management framework proposed by Virginia will enable revisions to be made if the trading program is not as successful as is expected. But, based on Tredegar's experience with environmental credit markets to date, the program can and should provide an effective means of achieving the desired nutrient reductions.

In order for the trading program to work, the baseline practices and requirements should provide sufficient flexibility to allow for source sector trading to meet ambitious reduction targets. Setting stringent baseline reductions and not allowing trading to occur until after those baseline reductions are achieved would eliminate most of the incentives and opportunities for an effective trading program. Consideration should be given to encouraging the private market to proactively mitigate (via offsets and/or credits) these regulated loads flowing into bay watersheds. Additionally and perhaps most unfortunately, EPA's changing focus from nutrients to sediment upsets the decision factors for facilities already committed to participating in the nutrient trading program.

Tredegar encourages EPA to continue to explore the opportunities for including trading as a proactive tool for achieving the Bay restoration goals. Virginia's Nutrient Credit Exchange Program offers a good platform for exploring new opportunities for trading. EPA's TMDL should not foreclose or eliminate the incentives associated with that program.

Response

Thank you for your comments. EPA does not approve or disapprove WIPs. EPA believes that rigorous oversight, accountability, transparency, and measurement are important components of a successful and legitimate offset and trading program. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers necessary to stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Organization: Pennsylvania Farm Bureau

9. Federal standards for nutrient credit trading should not contradict the rules and standards already established under state programs.

As EPA is aware, Pennsylvania has established a state program for trading of nutrient and sediment credits. This program is currently in operation, and numerous transactions for trading of credits have already been made. Pennsylvania and its stakeholders worked effectively and cooperatively in the creation of this program and the formation of the governing rules of nutrient trading to facilitate participation by potential buyers and sellers and encourage programs and practices for overall reduction in nutrient and sediment pollution.

Farm Bureau strongly believes that Pennsylvania's nutrient trading program is a legitimate and viable program that will provide significant future opportunities for implementation of economically and environmentally effective programs among public and private sectors in the Bay watershed. However, for this program to be successful, both buyers and sellers of nutrient trading must have high confidence that today's governing rules for generation of tradable credits will not be generally compromised in the future or compromised by application of "special" rules. Those who must rely on purchase of credits to attain legal compliance will not be willing to make the significant commitment of money to purchase credits if they fear the rules might be changed to make their credits unusable. And those who may be able to generate credits through best management practices will not be willing to incur the significant costs necessary to implement these practices if they fear the rules might be changed to reduce or eliminate the credits that may be generated.

We have concerns from EPA's recent administrative activities and communications that Pennsylvania's nutrient trading program will be seriously compromised under EPA's future demands of this program. We particularly are concerned that EPA might try to unilaterally superimpose unworkable nutrient trading rules, excessive prerequisites for trading and dismal limitations in the number of tradable credits to be generated from best management practices.

Where trades have already occurred and credits pursuant to trades have been legitimately generated under Pennsylvania's current trading rules, those credits purchased and relied on by the purchaser must be given full faith and

credit toward the purchaser's regulatory compliance, regardless of any future changes in trading rules and standards.

We are also seriously concerned with EPA's consideration to impose additional threshold requirements for attainment of TMDL loadings by individuals, land use sectors and regions as a prerequisite for generation of tradable credits from best management practices. These requirements would soundly discourage participation in nutrient trading to achieve regional nutrient and sediment reductions, and will stifle proactive efforts to direct capital resources toward environmental programs, which can be fostered through nutrient trading.

Response

Thank you for your comment. EPA is mainly interested in developing and expanding offset trading programs in consistent with the definitions and common elements described in the TMDL Appendix, and less so in revisiting the value of credits generated and relied on in the past under existing programs such as Pennsylvania's. EPA is working with the jurisdictions to ensure they will be able to meet their TMDL allocations through a combination of regulations, market mechanisms, voluntary actions, and enforcement. EPA believes that rigorous oversight, accountability, transparency, and measurement are important components of a successful and legitimate offset and trading program. The TMDL will have achieved its purpose when the Chesapeake Bay and its tributaries meet the applicable water quality standards.

Comment ID 0434.1.001.007

Author Name: Pryor Wayne

Organization: Virginia Farm Bureau Federation

--A trading program presents a sensible, cost-effective approach to achieving reductions and enables the agricultural community to serve as a much needed relief valve for sources that cannot achieve assigned reductions.

Response

Thank you for your comment. EPA is optimistic that offset and trading programs are compatible with achieving the loadings reductions required under the TMDL and may be an important mechanism for certain sectors.

Comment ID 0434.1.001.009

Author Name: Pryor Wayne

Organization: Virginia Farm Bureau Federation

II. There is an Important Role for Agriculture in the Trading Program Included in Virginia's WIP.

Virginia's WIP recognizes the costs and operational impacts of achieving the necessary nutrient and sediment

reductions. Accordingly, Virginia has structured a WIP that allows flexibility in how those reductions are achieved by including a comprehensive trading program.

EPA's proposed TMDL leaves no opportunity for trading or other creative, cost-effective solutions. By ratcheting down on all sectors unilaterally, there are no relief valves to encourage collaboration in achieving the Bay restoration goals. Due to the fact that neither EPA nor Virginia have regulatory authority over agricultural sources, the agricultural community has traditionally served as that relief valve, offering to partner with point sources and participate in innovative programs to make significant reductions. EPA's proposal eliminates those opportunities.

The agricultural community has a meaningful and important role to play in the trading process. Agricultural operations provide a lower-cost means of achieving nutrient and sediment reductions. Through trading, a farmer would be compensated for voluntarily reducing nutrient and sediment discharges from his/her farm. The baseline for establishing credits for agricultural operations should be set, as Virginia proposed, based on conservation plans established at the farm level. Farms can then determine additional voluntary projects to achieve greater reductions and generate credits.

The VA Farm Bureau encourages EPA to support Virginia's trading program. The trading program included in Virginia's WIP creates a strong framework for targeted reductions that encourage trading. EPA's proposed TMDL removes much of the incentives necessary for a successful trading program.

Response

Thank you for your comments. The Chesapeake Bay TMDL explicitly encourages the development and implementation of offset and nutrient credit trading programs to meet the TMDL allocations. EPA recognizes the success of Virginia's program and supports its proposed expansion together with the proposed regulatory drivers that are necessary to stimulate demand in nutrient credit markets.

Comment ID 0435.1.001.014

Organization: Department of Public Works, City of Norfolk, Virginia

I. Nutrient Credit Exchange

The Nutrient Credit Exchange program is a creative and adaptable means of reducing the target pollutants from entering the Bay. We are concerned with the high reliance on the availability of credits from the point source and agriculture sectors to assist the Municipal Separate Storm Sewer System (MS4) in attaining their sector allocations. The City may not be able to rely on the exchange of credits from an independent agency to balance storm water reduction loading as suggested in the Draft WIP. We believe that the state has failed to provide adequate details in the Draft WIP on how exchange program will be managed, thereby leaving the localities unable to thoroughly consider the impact of this program.

There is no assurance from the State or the EPA that nutrient credits generated beyond the boundaries of one

permitted MS4 will account for waste load allocations (WLAs) required within a different MS4. The ability to generate nutrient credits in a highly developed area such as Norfolk, with minimal agricultural exchange opportunities, is extremely limited. If trading across MS4 boundaries is not explicitly allowed nor managed at the state level, the use of nutrient credits by Norfolk for meeting its required storm water load reductions will be greatly limited.

Additionally, as you are aware, many municipalities in Virginia participate in regional waste water collection districts. City residents, for example, are customers of the Hampton Roads Sanitation District for wastewater treatment. These point source districts are issued their own allocation within the TMDL. There is no assurance that the sanitation districts will generate the additional credits when, where, and in the amount they will be needed to offset MS4 requirements. Also, a credit program with point source sectors is generated from excess flow capacity. With population growth in this highly developed urban area, the credit exchange program would only be available to the MS4 on a temporary basis.

The reductions that would be required of urban runoff with the Draft WIP allocations are so great that the demand for credits could exceed the supply in both available agriculture or point source sectors. The limited credits available for exchange will thus drive up demand and costs and limit their availability to Norfolk, particularly if Norfolk is forced to compete with private developers for those scarce credits. Due to the limited credits available for exchange, the program as outlined in the Draft WIP may have long-term financial consequences for the residents of a permitted MS4 such as Norfolk.

For the Nutrient Credit Exchange program to be successful, the Commonwealth would need to manage its implementation and associated agreements. This would add a substantial organizational element that needs to be outlined in the Final WIP.

Response

Thank you for your comment. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and agrees that the jurisdiction plays a critical role in the implementation of the program and its expansion. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented. EPA's TMDL document does acknowledge the flexibility of interbasin and intrabasin trading and trading between various sectors, provided that such transactions can be achieved in a transparent and accountable manner and conform with the safeguards outlined in the TMDL Appendix.

Organization: Metropolitan Washington Council of Governments (COG)

6. EPA and States Need to Provide Local Governments and Wastewater Utilities with as Much Flexibility as Possible

Because the state Phase I WIPs do not address reductions or implementation practices at the local level, it is not clear how much flexibility local governments and other stakeholders will have in pursuing implementation plans. The states should build in, and EPA should accommodate, the ability for local governments to reallocate assigned loads among

different source sectors (e.g., between stormwater, wastewater, and air loads), for local governments and utilities to trade allocations and load reductions among different wastewater plants, for local governments and utilities to be able to take advantage of viable trading programs outside their jurisdictional boundaries. However, we have major concerns as to whether such trading programs will prove to be successful, given their very limited track records to-date and the many uncertainties associated with determining what baseline conditions must be achieved before which trading can actually occur. Also, while EPA's TMDL (ref. Section 10.2 Water Quality Trading, and Appendix S. Offsets for New or Increased Loadings of Nitrogen, Phosphorus, and Sediment to the Chesapeake Bay Watershed), and the state Phase I WIPs clearly support trading - there are very few specifics regarding how trading from all sectors can actually be implemented, or what the baseline assumptions are.

Recommendation #6A: Conceptual Support for Maryland's and Virginia's Nutrient Trading Proposals

We support the expansion of Virginia's Chesapeake Bay Nutrient Credit Exchange Program, as proposed in the WIP (Virginia WIP, pp. 3 - 6), but much more detail must be developed before it can be ascertained whether the program provides local governments with a viable trading option. We support expansion of Maryland's Policy on Nutrient Cap Management and Trading (Maryland WIP, p. 3-10) to incorporate trades between sectors. We propose that assessments of the success of inter- and intra-state trading programs be made part of the 2-year milestone reporting process and that state implementation plans be adjusted accordingly.

Recommendation #6B: Federal Trading Guidelines Should Define Minimal Requirements & Greater Efforts Should be Made (by both federal and state) to Provide Incentives and Remove Barriers to Trading

It is important that the specific details of how trading can be implemented be defined so that local governments and utilities understand the range of options available to them and know how to implement them. And it is appropriate for EPA's TMDL to define minimal requirements to ensure that equity and water quality issues are addressed consistently across the Bay watershed; but the details of such trading programs and requirements should be defined in the state WIPs and programs. Also, there are many regulatory and programmatic issues that various sectors face when considering trading. EPA and the states should work together to eliminate barriers and develop incentives to help make trading a robust and viable process in the Bay watershed.

Response

Thank you for your comments. EPA acknowledges that plans to implement and enhance offset and trading programs in the Bay jurisdictions include a measure of uncertainty. EPA will continue to work with the jurisdictions to support the success of such programs and to implement all measures needed to meet the TMDL allocations. EPA supports the expansion of offset and trading programs to incorporate transactions across sector. EPA agrees that rigorous oversight, transparency, and accountability are important elements of successful and legitimate offset and trading programs.

Comment ID 0443.2.001.006

Author Name: Moore Shannon

Organization: Frederick County Government

The County provides the following comments on the Executive Summary of the TMDL: p. 7: We are also concerned

about the over-reliance on the state's agricultural trading program to provide offsets for all new development when the program is in its infancy, is currently only set up for trades between Ag and WWTPs, and has extremely low enrollment from farms.

Response

Thank you for your comment. EPA agrees that accommodating growth and reducing loads from the agricultural sector represent significant challenges for the Bay jurisdictions. EPA is working with the jurisdictions to ensure they will be able to meet their TMDL allocations through a combination of regulations, market mechanisms, voluntary actions, and enforcement. EPA is recognizes that implementation of the TMDL as envisioned in state Watershed Implementation Plans will very likely affect growth patterns, land use, and agricultural use preservation. The TMDL attempts to provide a framework through which each of these components can support the preservation and restoration of the Chesapeake Bay.

Comment ID 0445.1.001.004

Author Name: Lerch Joe

Organization: Virginia Municipal League (VML)

We support the expansion the Nutrient Credit Exchange (NCE).

By expanding this program to allow for full participation from wastewater, stormwater and on-site septic systems, local governments will be empowered with a necessary tool in making cost-effective decisions in meeting target loads at the sub watershed level. Understanding that EPA has specific concerns regarding the lack of details to this proposal, and that both the EPA and the State of Virginia are working to resolve this issue for inclusion in the final draft Phase I WIP, VML as a member of the Virginia TMDL SAG (strategic advisory group) offers our support in resolving any issues related to local government's role in facilitating and participating in an expanded NCE. Additionally, we contend that some details of an expanded NCE will most likely be addressed with development of the Phase 2 WIP.

VML recognizes that there are many other issues affecting our members -legal, technical, and scientific in nature - that need resolution prior to adoption of the Phase 1 TMDL. Given that many of our member governments belong to both VAMWA [See comment EPA-R03-OW-2010-0288.1] and VAMSA [see comment EPA-R03-OW-2010-0293.1], we offer our support for addressing these issues as outlined in the comments of both organizations.

Response

Thank you for your comments and offer of support. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. . EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

EPA is aware that meeting TMDL allocations will involve local governments, which already manage a significant workload. EPA

is working to identify means of providing technical support to local governments to reduce the burden of planning for the TMDL and implementing measures associated with the TMDL.

Comment ID 0463.1.001.002

Author Name: Sharma Lalit

Organization: City of Alexandria, Virginia

2. Reliance on an Expanded Nutrient Credit Exchange Program

Virginia's Draft Phase I Watershed Implementation Plan (WIP) relies heavily on an expansion of the VA Nutrient Credit Exchange Program for trading between all Source Sectors. Expansion of this state program will require a massive retooling and a great amount of resources to reach operability, and new regulations will be required. The implementation of this program must insure that there is no negatively impact local water quality. Credits generated from outside the local watershed may benefit the Bay, but has a potential of siphoning resources away from local water resources improvements in highly urbanized areas. However, effective administration of the program may provide trading needed to meet sector allocations if successfully implemented. Any existing programs based on similar principles that are designed to make water quality improvements locally should remain unaffected by such a program.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and its proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

EPA shares your concern that offset and nutrient credit trading programs not cause water quality or other environmental problems in the Bay watershed. This type of unintended consequence is directly addressed by the common elements of offset and trading programs in the draft and final TMDL as well as EPA's existing water quality trading policy and trading toolkit for NPDES permit writers (documents cited in the TMDL Appendix). It is EPA's view that if an offset or trade would result in local exceedances of water quality standards, that such a trade could not be authorized under EPA regulations. EPA will continue to work closely with the Bay jurisdictions to ensure that such unintended consequences are avoided. Offset and trading programs, furthermore, rely on the principle that the sites and facilities providing offsets or generating credits meet all applicable federal and state regulations, including meeting applicable TMDL allocations.

Comment ID 0467.1.001.013

Author Name: Williams Shannon

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

How will nutrient credit generation and purchase be calculated given different delivery ratios in the 5.3 Chesapeake Bay Watershed Model versus the 4.3 Chesapeake Bay Watershed Model, the latter of which was used by the Department to develop its trading program?

Response

Thank you for your question. The possibility exists that adjustments to delivery ratios, edge of segment factors, and best management practice efficiencies may be needed as the Chesapeake Bay Watershed Model is revised. Such changes may impact nutrient credit generation and purchases under the existing offset and trading programs, but EPA is committed to minimizing such impacts on existing offset and nutrient credit transactions to the extent possible and appropriate.

Comment ID 0467.1.001.019

Author Name: Williams Shannon

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

VII. Trading

A. It is clear that Nutrient Credit trading will be severely impacted by the delivery ratio issue discussed earlier in these comments. All trades, including those that have taken place, may be suspect if delivery ratios change during the trading process. The Bay TMDL should also address and delineate guidelines for both interstate and intrastate trading.

B Does EPA support Pennsylvania's trading program as currently set forth in Pennsylvania's draft WIP?

C. EPA's "backstop allocation" approach will dramatically hinder Pennsylvania's Nutrient Trading program, essentially eliminating all point sources as sellers of credits.

Response

Thank you for your question. The possibility exists that adjustments to delivery ratios, edge of segment factors, and best management efficiencies may be needed as the Chesapeake Bay Watershed Model is revised. Such changes may impact nutrient credit generation and purchases under the existing offset and trading programs, but EPA is committed to minimizing such impacts on existing offset and nutrient credit transactions to the extent possible and appropriate. EPA will continue to work with Pennsylvania to ensure that its trading program meets EPA's expectations, including by reviewing the jurisdiction's program in detail in 2011.

In establishing the TMDL, EPA is responsible for ensuring that nutrient and sediment reductions from both point and nonpoint sources in the TMDL are supported by a clear set of functional programs that provide the reasonable assurance the load allocations and wasteload allocations in the TMDL will be achieved. EPA carefully considered the content of the jurisdictions' draft and final Phase I WIPs in its preparation of the draft TMDL for public comment and in establishing the final TMDL for Chesapeake Bay.

EPA's proposed reductions to POTW allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance demonstrated in draft Phase I WIPs.

In the final TMDL, the load allocations and wasteload allocations are with some exceptions, consistent with the load allocations and wasteload allocations proposed by the jurisdictions in their final Phase I WIPs. In some cases, the load and wasteload allocations in the TMDL differ from what was contained in the draft TMDL for public comment, the jurisdictions' draft Phase I Watershed Implementation Plans, and/or the jurisdictions' tributary strategies. The degree to which such allocations differ from these earlier documents varies by jurisdiction and sector.

EPA recognizes that more restrictive WLAs on a POTW may affect that source's ability to generate nutrient credits. EPA has worked closely with Pennsylvania in the development of its trading program. With the finalization of the Chesapeake Bay TMDL, EPA intends to continue to work with the Commonwealth to help ensure that Pennsylvania trading program is successful in meeting the state's TMDL allocations.

5. The Pennsylvania Nutrient Trading Program was the first of its kind. To date, trades and commitments have been made based on this existing program. EPA should look to this as the model and use it. Rather than change it or develop another system. EPA needs to support the Pennsylvania Nutrient Trading and Offset Program. With the understanding that trading among States will be necessary to obtain overall compliance with the Chesapeake Bay restoration efforts.

Response

Thank you for your comments. EPA continues to support Pennsylvania's Nutrient Trading Program. EPA will continue to work with Pennsylvania to ensure that these programs meet EPA's expectations under the Chesapeake Bay TMDL.

With regard to interstate trading, EPA is aware that the World Resources Institute (WRI) is currently leading a collaboration to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed, and EPA remains very interested in this project. The project is intended to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to support this work.

Comment ID 0473.1.001.017

Author Name: Pechart Michael

Organization: Pennsylvania Department of Environmental Protection and Department of Agriculture

--EPA needs to support Pennsylvania's nutrient and sediment trading program, which is now supported by state regulations. It would be counterproductive for EPA to transform Pennsylvania's existing state trading program into EPA's ideal of a program. Pennsylvania maintains that flexibility is important and questions the appropriateness of including definitions and common elements of offset and trading programs as an appendix to a TMDL. If, nonetheless, the appendix remains in the final TMDL, EPA should remove references to sector allocations, more clearly define and use the terms "credit" and "offset," clarify what is meant by "water chemistry variations" and "intermediary segments," replace "sold" with "used" regarding offset or credit tracking, and reconsider the expectation that a state agency or other institutional entity would anticipate annual increased pollutant loading from nonpoint and unpermitted point sources and acquire offsets to cover them.

Response

Thank you for your comments. EPA continues to support Pennsylvania's Nutrient Trading Program. EPA will continue to work with Pennsylvania to ensure that its program meets EPA's expectations under the Chesapeake Bay TMDL. EPA has attempted to clarify terms presented in Appendix S of the draft TMDL to the extent possible and appropriate, and will continue to work with the Bay jurisdictions to consider and address these concepts in their programs.

Comment ID 0498.1.001.003

Author Name: Walls Brent

Organization: Potomac Riverkeeper

Nutrient Trading Nutrient

Hot Spots

Nutrient trading has the potential to create hotspots in local waters. Growth in the West Virginia Eastern Panhandle like many other urban areas connected to DC and Baltimore will continue to increase. These areas have predominantly wealthier residents paying taxes to local governments to handle their sewage. It is in these areas that governments can afford to purchase nutrient credits, and it will continue to be these areas that will receive greater and greater growth requiring ever increasing need for offsets through trading. Trading is not sustainable. These local rivers and streams will also be the first choice for residents to visit and recreate, but not if the nutrients discharging into these rivers creates a smelly algae soup.

Response

Thank you for your comments. EPA shares your concern that offset and nutrient credit trading programs not cause water quality or other environmental problems in the Bay watershed. This type of unintended consequence is directly addressed by the common elements of offset and trading programs in the draft and final TMDL as well as EPA's existing water quality trading policy and trading toolkit for NPDES permit writers (documents cited in the TMDL Appendix). It is EPA's view that if an offset or trade would result in local exceedances of water quality standards, that such a trade could not be authorized under EPA regulations. EPA will continue to work closely with the Bay jurisdictions to ensure that such unintended consequences are avoided. EPA understands that the TMDL will affect patterns of growth and economic development, including POTW and sewer capacity, in the watershed. Such adjustments are necessary to achieve the objective of the TMDL, which is to meet water quality standards throughout the watershed.

Comment ID 0498.1.001.005

Author Name: Walls Brent

Organization: Potomac Riverkeeper

Nutrient Trading can also violate local TMDLs. When a TMDL is developed, that waterbody has a specific load for that pollutant. It is necessary that all the sources that are within that waterbody decrease their load to the prescribed design of the best available technology. Unfortunately, since all the States, that share the responsibility of reducing nutrient loads to the Potomac, are not on the same page when it comes to developing Nutrient TMDLs, the Potomac's various river systems will never have an adequate nutrient accountability framework and reductions will never succeed. The Bay TMDL focuses on the Bay and does not provide protections for individual river systems like a local nutrient TMDLs

would.

Accountability: Regulated vs. Non-regulated

The current push for nutrient trading has been inspired by the trading of air pollution credits. There are two distinct differences though 1) the air sheds are not permanently delineated and are very dynamic, unlike a watershed that is defined by its boundaries and has little variability. 2) The buyer and the seller within the air credit trading program are both regulated by the States or EPA, unlike the current push for nutrient trading credits between unregulated farms and a regulated NPDES permitted discharger. The accountability of the non-regulated farms to continue supplying the same level of credit production cannot be guaranteed. Since waste water treatment structures are basically a permanent fixture and will require an endless supply of credits to remain nutrient neutral, the current unregulated agricultural system cannot be deployed. The credits generated will have no proof that the nutrient uptake is actual and not estimated. There is no accountability system that can guarantee credit production in the future.

Response

Thank you for your comments. Under the Chesapeake Bay TMDL, sources of loadings must meet their allocations and the requirements of all applicable laws and regulations even as they participate in offset or trading transactions. Offset and trading programs must not create violations of local water quality. The TMDL provides for the opportunity for more than one state to coordinate its restoration actions for waterbodies within the Chesapeake Bay watershed. EPA agrees that rigorous oversight, transparency, and accountability are important elements of successful and legitimate offset and trading programs. EPA's Water Quality Trading Policy recommends that accounting methods be adopted that account for the greater uncertainty in estimates of nonpoint source loads and reductions. EPA will review the Bay jurisdictions' progress in implementing and developing offset and trading programs in 2011. With respect to local TMDLs, where they exist, NPDES permitted activities that discharge to the waterbody are required under federal rules to be consistent with the wasteload allocations in the TMDL, and likewise state and locally managed nonpoint sources are also called upon to conform with the local TMDL's load allocations. In the absence of a TMDL, federal rules still govern point source discharges to the subject waterbody and such discharges must comply with effluent limits as stringent as necessary to meet the applicable water quality standards.

Author Name: Elliott James

Organization: Citizens Advisory Committee to the Chesapeake Executive Council

we recognize that a watershed-wide nutrient trading program has the potential to improve the cost effectiveness of meeting the nutrient and sediment reductions. As mentioned above we strongly support third party verification of non-permitted practices as one means to ensure reductions from nonpoint sources are realized. Verification/validation of real nutrient reductions will be critical to a successful trading program and stable market that protects both trading parties. The Chesapeake Bay Program partners should be very open and thoughtful on how to proceed with a nutrient trading program. We recommend there be serious discussions about how a trading program in the watershed can be effective, coordinated regionally and ensure strong elements of accountability and verification.

Response

Thank you for your comment. EPA agrees that verification and validation of nutrient reductions is an important component of a successful and legitimate offset and trading program. EPA believes that third-party verification provides an important option to parties implementing and participating in such programs.

As discussed more fully in the comments of the Virginia Association of Municipal Wastewater Authorities ("VAMWA"), the Draft TMDL ignores more efficient means of reducing pollutant loads in the James River, such as establishing a nutrient reduction credit trading program to allow pollutant reductions to come from the most economically efficient sources. [FN53] EPA has not explained why the backstop rule does not consider allowing point sources subject to federal wasteload allocations to accomplish those reductions through a federal credit trading program.[FN54] Rather, the agency simply rejected Virginia's WIP and concluded that the Commonwealth's state-based trading program does not satisfy EPA's reasonable assurance criterion.[FN55]

In addition to suggesting that EPA has not considered all relevant factors in developing the Draft TMDL, the agency's treatment of nutrient trading programs also reinforces the dubious nature of EPA's claim of authority to impose the requirement for WIPs or reasonable assurances at all. If Sections 117 and 303(d) contain a broad enough delegation of authority to establish requirements for WIPs and for reasonable assurances, why are those authorities insufficient to authorize a federally created trading program? In essence, EPA has prevented itself from considering the cost of implementing the Draft TMDL by way of an erroneous interpretation of the law. Given that an agency must provide a legally defensible justification for a proposed rule, EPA should withdraw the Draft TMDL for further consideration.[FN56]

[FN53] Liberty hereby incorporates the comments of VAMWA regarding the Draft TMDL by reference to the extent those comments are not inconsistent with its own.

[FN54] See *Motor Vehicle Manufacturers Association v. State Farm Mutual Insurance Co.*, 463 U.S. 29, 48-49 (1983) (explaining agency must justify rejection of alternatives within ambit of applicable law). Agency actions based on erroneous understandings of the law must be rejected.

[FN56] See *id.*

Response

Thank you for your comments. In establishing the TMDL, EPA is responsible for ensuring that nutrient and sediment reductions from both point and nonpoint sources in the TMDL are supported by a clear set of functional programs that provide the reasonable assurance the load allocations and wasteload allocations in the TMDL will be achieved. EPA carefully considered the content of the jurisdictions' draft and final Phase I WIPs in its preparation of the draft TMDL for public comment and in establishing the final TMDL for Chesapeake Bay. EPA's proposed reductions to POTW allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance demonstrated in draft Phase I WIPs.

In the final TMDL, the load allocations and wasteload allocations are with some exceptions, consistent with the load allocations and wasteload allocations proposed by the jurisdictions in their final Phase I WIPs. In some cases, the load and wasteload allocations in the TMDL differ from what was contained in the draft TMDL for public comment, the jurisdictions' draft Phase I Watershed Implementation Plans, and/or the jurisdictions' tributary strategies. The degree to which such allocations differ from these earlier documents varies by jurisdiction and sector.

EPA recognizes the success of Virginia's Point Source Trading Program. EPA also supports Virginia's proposed expansion of its Nutrient Credit Exchange and its proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

EPA has considered all relevant factors in developing this TMDL. It is EPA's opinion that CWA Sections 117 and 303(d) contain a broad enough delegation of authority to establish requirements for WIPs and for reasonable assurances as well as those authorities sufficient to authorize a federally created trading program.

Organization: County of Lycoming, Pennsylvania

Comment #8 - The County recommends that EPA recognize and approve interstate nutrient credit trading as a market-based mechanism to reduce the total cost of compliance and increase the speed and efficiency of reductions. This is a very important tool that can benefit Lycoming County, the Commonwealth of Pennsylvania, and the other Bay-region states. By increasing the marketplace for the trading and purchasing of nutrient credits, benefits will accrue to both non-point source and point source entities. It will expand the opportunities for the selling of nutrient credits from the non-point sources to point sources both inside and outside of Pennsylvania. This will increase the number of available nutrient credits that a point source can purchase as part of their efforts to comply with the Chesapeake Bay Tributary Strategy. It will also provide a cost-effective option to be coupled with infrastructure improvements as appropriate. It will also increase the amount of funding received by the non-point sources for the sale of the credits generated by the BMP. This will result in non-point sources (primarily, agricultural operations) having more available funding to invest in additional BMPs and new technologies, thereby further reducing the pollutants in the Bay.

Response

Thank you for your comment. EPA supports the development and implementation of a means of interstate nutrient credit trading in the Chesapeake Bay watershed. EPA is collaborating with the World Resources Institute (WRI) and its project partners in a project to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed. This project seeks to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay Watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project. EPA remains very interested in this project as it has the potential to greatly facilitate an orderly, accountable, transparent and effective means of accomplishing interstate nutrient trading.

Flexible Allocations and Permitting

EPA and the Commonwealth of Virginia must provide local governments with the necessary flexibility to implement the WIP. The draft Phase I WIP implies that allocations will next be made at the local government level, but does not address reductions or implementation levels at all. It is not clear how much flexibility that local governments will have in developing or addressing the implementation plans.

While the expansion of Virginia's Chesapeake Bay Nutrient Credit Exchange Program, as proposed in the draft WIP, might provide some degree of flexibility, there are virtually no details provided in the draft. Much more detail must be presented before it can be ascertained as whether or not the program can provide local governments with a viable trading option. As a result of the stormwater, septic and agricultural sectors essentially being set to the E3 levels in the draft WIP, there is concern about the potential availability of nutrient credits to be generated by a single sector, and thus, also being controlled by that single sector.

More and more states are adopting trading programs as a means of achieving water quality improvements. Trading in combination with flexible MS4 permitting may prove to be the indispensable tool to address the economic impacts of a total maximum daily load program through flexible and cost-effective implementation of such things as retrofitting stormwater systems as well taking advantage of natural stormwater management by identifying and adopting green infrastructure. Many of the MS4 permit requirements can be accomplished on a larger scale (e.g. County or Watershed). This concept is supported by the conclusions of the 2008 National Research Council's report entitled *Urban Stormwater Management in the United States*[FN4]. For example under a National Pollutant Discharge Elimination System (NPDES) bubble permit, a local government may find opportunities to trade internally among the other permits that it holds thus providing the flexibility of determining where pollutant reductions can be achieved most cost-effectively. Trading may help alleviate economic impacts previously detailed may also can be used to accelerate environmental gains by rewarding communities for pursuing innovative control solutions.

Similar to the bubble permit option, a "group compliance option" could allow one or more groups of permittees in the

same watershed to work collectively to meet the combined nutrient limits of its member facilities, rather than each facility being subject to its individual limits. Thus, it provides interested dischargers an alternative approach to pursue meeting the nutrient reduction goals of the TMDL and allows dischargers, as a group, the flexibility to develop their own strategy for doing so. Each group could be governed through a group Chesapeake Bay NPDES permit. The group permit would contain allocations for nitrogen, phosphorus and sediment only and would supplement the existing individual NPDES permits of the member local governments. The existing individual permits would remain in full effect, including other effluent limits and monitoring, reporting, and other requirements. The group permitting approach is expected to be similar to that already employed in the Neuse River basin.[FN5]

Drawing on the concept established by the State of New York through its MS4 General Permit it allows for covered entities to form a Regional Stormwater Entity (RSE) to implement stormwater retrofits collectively. [FN6] The covered entities must ensure that discharges of the pollutant of concern to the TMDL water body are reduced through these or an additional change to individual stormwater management plans so that the waste load allocation is met. Each regulated MS4 is responsible for an individual load reduction, which is a fraction of the total required load reduction in the TMDL. If the MS4s form a Regional Stormwater Entity and stormwater retrofits are approached collectively, the State would allow compliance with this condition of the general permit to be achieved on a regional basis. In this case the load reduction requirement for each participating MS4 would be aggregated, to create an RSE load reduction, to allow design and installation of retrofits where they are most feasible, without restricting MS4s to site retrofit projects within their municipal boundaries. Each member of an RSE is in compliance if the aggregate reduction number associated with the retrofit plans is met. If the aggregate number is not met, each of the participating MS4s would be deemed non-compliant until such time as they had met their individual load reduction requirements.

The Northern Virginia Regional Commission staff recommends that these concepts of a flexible MS4 permitting system be incorporated into the final TMDL and WIP documents by the USEPA and the Commonwealth of Virginia.

Response

Thank you for your comments and offer of support. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and the proposed additional regulatory drivers that will stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented. Virginia is seeking to expand its program to make offsets available to a wider range of dischargers. EPA supports this program expansion and believes the success of the program expansion, particularly for stormwater and on-site or septic systems, depends on the State's success in creating greater demand for load reductions from these sectors.

EPA is aware that meeting TMDL allocations will involve local governments, which already manage a significant workload. EPA

is working to identify means of providing technical support to local governments to reduce the burden of planning for the TMDL and implementing measures associated with the TMDL.

EPA will take these comments into account in its continued work with Virginia to ensure that the jurisdiction's provides local governments with a viable trading option.

1. A Robust Nutrient Trading Program That Allows Credit Transactions Across Political Boundaries and Hydrological Basins Will be Needed if the TMDL Is to Be Successfully Implemented

Numerous elements of the TMDL and the state Watershed Implementation Plans explicitly require the availability of nutrient offset credits. Chief among them are growth accommodation, enabling backstop provisions, and providing a cost-effective alternative for certain requirements.

Growth accommodation-The states had the choice of having the TMDL set aside specific nitrogen and phosphorus allocation for future growth, or to provide no allocation and rely on a nutrient trading program to provide credits to offset loads from future growth. None of the states (with one partial exception) chose to have a specific allocation set aside for future growth. All chose instead to rely on an offsets program. This is not just a future issue about how to maintain the cap once achieved; the demand for offset credits exists now. Proposed new and expanded discharges have no allocation under the TMDL and WIPs. This demand exists now and will only increase in the face of growth.

Backstop Provisions-The backstop provisions described in Section 8 of the TMDL are of necessity restricted to potential actions that EPA has statutory or regulatory authority to take. Hence they are directed solely at point sources that are, or could be, permitted under the Clean Water Act-municipal and industrial wastewater treatment plants, stormwater dischargers, and animal feeding operations. If WIPs "do not achieve the target allocations or do not provide adequate reasonable assurance" then the backstop action will be to lower the wasteload allocations for point sources to the degree necessary to compensate for the inability to sufficiently reduce nonpoint source loads.

Lowering allocations for existing wastewater treatment plants could have many serious adverse consequences, chief among them additional constraints on growth and development. The economic impact of sewer moratoria could be severe. Acquiring offset credits would be a way to avoid or minimize this impact, hence this backstop measure would result in additional demand for credits. If credit supplies were nonexistent or inadequate, this backstop measure could be very difficult to actually implement, and if implemented, could have severe social and economic impacts.

The proposed backstop measure for stormwater is to require additional retrofits of existing impervious surface by currently permitted stormwater systems (MS4) and issuing NPDES stormwater permits to jurisdictions not currently permitted. It is widely known that the stormwater components of the Bay restoration efforts will be extraordinarily expensive and might not even be affordable. WRI believes that giving stormwater utilities the ability to meet their TMDL

and WIP requirements at least in part through the purchase of nutrient credits will be critical for helping to make the stormwater requirements affordable. EPA should carefully consider the affordability of this backstop measure and recognize that a viable trading program and an adequate supply of credits might be critical to making it implementable.

Lowering Cost and Improving Affordability-The financial achievability of Bay restoration is of great concern to virtually all stakeholders-EPA, the states, regulated dischargers, nonpoint sources, and the public. Any measure that can increase cost effectiveness must be used if at all possible. Water quality trading is one such measure. It is currently being used in state trading programs to reduce costs for wastewater treatment plants to meet wasteload allocations. Greater use could significantly reduce wastewater treatment plant costs, especially in Pennsylvania and West Virginia. Even greater potential for cost savings exists in the stormwater sector. It is clear that a robust and reliable nutrient trading program will be a critical component of successful implementation of the TMDL and restoration of the Bay. It is also clear to WRI that the benefits of nutrient trading can only be fully realized if the trading program is an interstate one, and not merely four separate state trading programs. WRI intends to provide additional analyses over the next few months to help inform EPA's development of the trading program as addressed in Appendix S.

Response

Thank you for your comments. EPA supports the use of expanded nutrient trading programs to help achieve the pollutant load reductions called for in the TMDL. EPA also recognizes the important role that increased regulatory drivers that the TMDL is likely to induce will likely stimulate demand for and expanded trading market. EPA intends to continue to work closely with the jurisdictions to facilitate expansion of orderly, accountable, transparent and effective nutrient credit exchange programs.

EPA is aware that meeting TMDL allocations will involve local governments, which already manage a significant workload. EPA is working to identify means of providing technical support to local governments to reduce the burden of planning for the TMDL and implementing measures associated with the TMDL.

EPA's proposed reductions to POTW allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance demonstrated in WIPs. EPA is responsible for ensuring that nutrient and sediment reductions envisioned in draft WIPs will be achieved. EPA agrees that load and wasteload allocations in the TMDL may in some cases be highly challenging for sources and communities to achieve. Where this is the case, nutrient credit exchange programs are a potential means to achieve the necessary load reductions more efficiently and/or cost-effectively than would otherwise be the case.

In the TMDL, EPA has attempted to identify and promote options for the jurisdictions to accommodate growth while meeting the TMDL allocations. Offsets and trading use free market approaches to allow new and existing dischargers to meet their allocations by paying for pollutant reductions at another location. These approaches have been implemented in several Bay jurisdictions, including Virginia. Virginia is also seeking to expand its program to make offsets available to a wider range of dischargers. EPA supports this program expansion and believes the success of the program expansion, particularly for stormwater and on-site or septic systems, depends on the State's success in creating greater demand for load reductions from these sectors. Creating additional pressure on sectors that have not traditionally felt a demand to decrease their loadings should stimulate market activity in this area.

As you are aware, EPA is collaborating with the World Resources Institute (WRI) in WRI's project to build an online multistate

water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed. This project will build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay Watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project.

5. EPA Should Support and Facilitate Innovative Practices for Removing Nutrients from the Aquatic Environment

Oyster aquaculture is an example of an innovative practice for removing nutrients from surface waters. Other practices for doing this include constructing wetlands and harvesting algae (e.g. Algae Turf Scrubbing). In the long run, this type of "nutrient extraction" may prove to be of critical importance in restoring the Bay. It certainly has great potential. As with oyster aquaculture, the nutrient trading program can create financial incentives for these practices by providing a revenue stream from the sale of nutrient credits. EPA should support research and development of these practices and facilitate their introduction once they are shown to be beneficial and viable. EPA should also facilitate their entry into the nutrient trading market by establishing credit quantification requirements and procedures.

Response

Thank you for your comments and suggestions. EPA is aware of several pilot projects underway or being considered in the Chesapeake Bay Watershed using oyster aquaculture and algae-based technologies. EPA encourages new technologies such as these as part of the solution to the nutrient impairments of the Chesapeake Bay and encourages these projects to participate in the Bay jurisdictions' offset and trading programs.

Organization: World Resources Institute

Comments based on EPA's August 6, 2010 Memo

EPA's August 6 memo entitled "Common Performance Standards for and Elements of Offset and Trading Provisions in the Chesapeake Bay Watershed" listed a number of "discussion questions" that EPA seeks public feedback on through the TMDL commenting process. Following are WRI responses to some of these questions.

Offset Definition

1. At this time, should EPA focus only on new or increased discharges of nitrogen and phosphorus, and sediment or also address existing loadings of nitrogen and phosphorus as well as additional markets/ecosystem services such as sediment, aquatic habitat/wetlands, carbon sequestration, and/or flood storage?

EPA and the Environmental Market Team (EMT) should develop the trading program to accommodate both trading to meet wasteload allocation requirements and trading to offset new and expanding discharges. Trading for both purposes is needed now and delaying the development of program requirements for the first purpose might limit the availability of trading for some dischargers that want to reduce costs by buying credits instead of upgrading their treatment facilities. This would be particularly important for dischargers in basins with limited potential credit supply, dischargers that would benefit from the availability of interstate trading.

WRI does not see any benefit in delaying the development of the "trading to achieve" program. Developing the offsets program will of necessity address virtually all of the critical trading issues and necessary requirements, so there would actually be very little involved in extending the program for all trading purposes.

EPA and the EMT should focus on nutrient trading because of approaching deadlines for developing regulations to implement the TMDLs. The Principals' Staff Committee committed to establish all Bay TMDLs by December 31, 2010. Conceivably, entities could demand credits once the TMDLs and any subsequently revised NPDES permits are issued. The full interstate and interbasin nutrient trading program is needed as soon as possible and should be the first priority. Sediment trading has no precedent in the Bay watershed, and very little nationally. WRI believes that a great deal of work needs to be done to assess the viability and efficacy of sediment trading, work that will take some time to accomplish. This should not delay the development of the nutrient trading program.

EPA and the EMT should also consider other markets as possible. In particular, EPA and the EMT should consider both the hurdles to developing other markets for ecosystem services and the ways in which such markets could interact. In addition, EPA should consider whether to focus carbon sequestration efforts on regulated markets such as the Regional Greenhouse Gas Initiative (RGGI), voluntary markets such as the Chicago Climate Exchange, or both. A hurdle to working with RGGI is the limited opportunities it would provide to farmers in the Chesapeake Bay watershed because only New York, Delaware, and Maryland participate in the program. In all markets, EPA and the EMT should consider the potential for "stacking" credits.

2. Should an offsets/trading program under which nonpoint sources may be required to acquire credits or offsets go forward, given that jurisdictions have the discretion to determine whether and how to subject nonpoint sources to regulatory and administrative requirements?

Yes. If the possibility exists that states may impose such requirements on currently unregulated nonpoint sources, then the trading program should be designed to accommodate this. WRI does not see however, how this would affect the design of the trading program. It would simply create another category of credit purchasers and potentially increase credit demand. The need for special rules for this type of credit purchaser is not readily apparent.

In developing a program that would allow nonpoint sources to acquire credits, EPA does not infringe upon state's rights. States may allow or prohibit nonpoint sources from participating. By developing a program that allows the greatest number of participants possible, EPA simply opens the benefits of trading to all sectors that might benefit from it.

Baselines and Eligibility

5. EPA's current assumption is that the wasteload allocation established by the TMDL is the baseline necessary to achieve water quality standards and offsets are required for new or increased discharges above the baseline. The jurisdictions could set a more stringent baseline. What are some potential bases for setting a more stringent baseline?

Is it possible to ensure that nonpoint sources are included in whatever baseline is defined?

Nonpoint sources that seek to generate credits should be held to the criteria established in EPA's Guide for Evaluation of Phase I Watershed Implementation Plans of April 2, 2010 (Evaluation Guide). Consistency factor number 3 states that "EPA expects each Bay jurisdiction to address how its use of offsets would account for... attainment of the Bay TMDL or local water quality baseline by the generator of the offset" and number 6 adds that EPA will further expect states to demonstrate "...whether, as appropriate, the offset will offer a net improvement to the waterbody." Such requirements clearly make states prove that their nonpoint source baseline requirements meet the credit-generating entity's share of the applicable sector's load allocation.

6. Can an offset/trade generated be based on modeling? What would happen if subsequent monitoring shows less than the anticipated reduction? Would additional reductions be required by the generator, the user, or both?

Yes, for those BMPs and agricultural practices for which the Bay Program has established peer-reviewed long-term average efficiencies that have been incorporated into the watershed model. Credit generation methodologies based on BMPs or practices that do not have peer-reviewed established efficiencies should be addressed on a case-by-case basis by the regulatory agency charged with certifying the credits. Monitoring and/or uncertainty ratios should be required as necessary.

7. Should sources in impaired segments be eligible to purchase credits or offsets produced in other parts of the Chesapeake Bay watershed as long as such offsets or trades would not result in exceedances of water quality standards in the purchaser's impaired segment or segments downstream?

This question should more clearly define what is meant by "impaired segment." For the purpose of responding, WRI will assume that it refers to a non-tidal stream segment in the Bay watershed that is listed on the 303(d) list as impaired by nutrients. The answer to the question would depend on whether or not the discharger is an existing source or a new or expanding source and whether or not a TMDL has been implemented for the impaired segment and if so, whether the wasteload allocation for the point source is higher or lower than its Bay-related wasteload allocation.

Three cases can be defined:

Case 1 - The point source is an existing discharger and has a wasteload allocation under the Bay TMDL. A TMDL has been implemented for the local impairment. Case 1 can be divided into two subcases:

- Case 1a - WLA for local TMDL is lower than Bay TMDL WLA
- Case 1b - WLA for local TMDL is higher than Bay TMDL WLA

Case 2 - The point source is an existing discharger and has a wasteload allocation under the Bay TMDL. A TMDL has not yet been implemented for the local impairment

Case 3 - The point source is a new or expanding discharge that has no wasteload allocation under the Bay TMDL

For Case 1, the discharger should be allowed to purchase credits. The number of credits that could come from outside the watershed would depend on the subcase. The following excerpts from a WRI presentation graphically presents Case 1 examples dealing with phosphorus discharge and illustrate the constraints on the sources of credits that WRI recommends for each subcase.

In Case 2, the point source is an existing discharger and has a wasteload allocation under the Bay TMDL. A TMDL has not yet been implemented for the local impairment, hence the discharger does not yet know what its local wasteload allocation will be. Case 2 is directly addressed by EPA 2003 Trading Policy which states "EPA supports pre-TMDL trading in impaired waters to achieve progress towards or the attainment of water quality standards." The following graph illustrates the Case 2 situation and WRI's recommended constraints on the source of credits.

The point source is not likely to purchase credits to meet the local WLA because it does not yet know the local WLA. Purchasing credits to meet the Bay WLA makes progress toward meeting the local water quality goals, hence is consistent with the trading policy.

Case 3 involves a new or expanding discharge that has no wasteload allocation under the Bay TMDL. A TMDL has not yet been implemented for the local impairment. WRI recommends that credit purchase be allowed but that all credits must come from within the impaired watershed and upstream of the point source. To satisfy the trading policy requirement for "net progress" the point source would have to do something more than simply offset its discharges. Adding a retirement ratio to the trade would be one way of fulfilling this requirement.

8. To what extent can "programmatic offsets" be used as an option for categories of nonpoint source load allocations instead of the site-by-site offset or trading approach? How should the minimum expectations for accounting for programmatic offsets or trades for the accountability and tracking system be defined? For example, should a jurisdiction's nonpoint source sediment control program have allocations assigned to it? When an allocation is estimated to be exhausted, should the jurisdiction begin requiring offsets or trades?

WRI is skeptical of programmatic offsets. If they are allowed, trading program rules must be in place to ensure that the programs being credited actually produce quantifiable and verifiable delivered load reductions.

9. Will non-point sources be required to implement a minimum level of "best management practices" to be eligible to sell credits? If so, would this result in nonpoint sources exhausting their lowest cost options for reducing emissions, leaving only more expensive methods for use in generating credits? If credit prices do rise because only more expensive credit generation methods are available to nonpoint sources, how responsive will credit buyers be to the price increases?

Nonpoint sources should be required to reduce their share of their sector's load allocation before implementing practices to generate credits. Existing nutrient trading programs in the Bay watershed currently state whether nonpoint sources face performance standard or practice-based baseline requirements. While an interstate and interbasin nutrient trading program could result in changes to how states establish baseline requirements, such requirements are needed

and should be generally consistent throughout the watershed in the level of performance they produce.

If the baseline is practice-based, farmers will likely implement the required practice(s) and then implement additional practices to generate credits. If the baseline is a performance-standard, farmers could implement whatever practices they choose as long as they meet their share of the agriculture sector's load allocation. Farmers would likely implement low-cost practices first. However, their choice of which practices to implement will be affected by available cost-share funding. If an expensive practice becomes affordable because it can be subsidized by cost-share funds, the farmer could be more-inclined to use it to meet the performance standard.

Credit pricing is difficult to predict at this point. Price discovery will be affected by many factors, chief among them supply and demand. Some potential credit purchasers will be seeking to avoid very high costs (e.g. MS4s). Credit buyers are unlikely to be affected by slight increases in credit price. Poor trading program design itself could adversely affect pricing.

Credit Calculation Metrics

10. Under what circumstances should/will offset loads or credits generated be required to be in an amount greater than the new or increased delivered load or credit used?

WRI assumes that the question refers to requiring retirement ratios, net improvement ratios, or other types of ratios unrelated to delivered loads and equivalent water quality impacts. WRI does not object to such ratios being applied to trades as a sort of "water quality tax" but cautions that if they become too large, they could reduce the viability of trading and constrain the market. Given the critical role of trading in making the TMDL implementable, excessive ratios could actually be harmful to Bay restoration efforts.

Another type of ratio deserves mention. Reserve ratios put credit into a credit insurance pool. The insurance pool is a critical component in managing point-source risk. Since Clean Water Act legal liability cannot be transferred from the permitted credit purchaser to a nonpoint source supplier, point sources are very concerned about the possibility of credit defaults by unregulated suppliers. If credits could be purchased from a reliable insurance pool in the event of a default, point sources will be much less concerned about this risk. WRI supports the creation of the insurance pool and the use of a reserve ratio to supply it with credits.

11. Is it appropriate to allow an offset or credit for load reductions already achieved (e.g., can credits be for practices implemented within a specific period)?

This is a difficult question with many implications. A complete discussion is not possible within the context of TMDL comments. The only answer WRI could offer now is possibly. WRI urges EPA to seek input on this question, and others, in an ongoing process to develop trading program policy.

Certification of Credit and Offset Validity

12. What is the correct approach to credit or offset validity certification? Should certifications be done annually? Can this be accomplished by third parties?

EPA should be consistent with terminology used by the existing state trading programs. Credit certification is the process by which an entity wishing to sell credits submits an application to the appropriate regulatory agency. Verification is an annual inspection to verify that the credits are real and are being generated by load reductions as proposed in the application. The application should include, among other things, a description of the proposed quantity of credits to be generated, where and how they will be generated, the duration of the credit generation, and how applicable baseline requirements will be met. The regulatory agency should be a thorough review of the proposal to ensure that the proposal is valid in all respects. It can then certify the credits and they can be entered in the public trading registry. Once sold, an annual verification of the actual credit generation is required, generally through an onsite inspection. There is no a priori reason to preclude the possibility of third-party inspections.

Enforceability

13. Under the CWA and EPA's trading policy, where an NPDES-permitted discharger is the purchaser of a credit or offset, but the credit or offset producer does not perform, the permittee remains obligated to meet the permit's water quality-based effluent limit and subject to potential enforcement for failure to do so. In addition to this enforcement safeguard, is it important to ensure there is a civilly enforceable agreement between buyer and seller? Discussion Draft - 8/6/10 8 14. Should the consequences of significant noncompliance by permittees include restriction from trading for a certain amount of time? What impact would this have on trades or offsets already in place?

Credit transactions should be based on a civilly enforceable agreement between buyer and seller. An interstate and interbasin nutrient trading program could stipulate minimum requirements for such contracts, including:

Purpose of the contract;

Quantities of credits exchanged;

Prices of credits exchanged;

Duration of contract; Obligations of the seller;

--Agreement to undertake specified actions to reduce pollutant loads

--Agreement to properly maintain BMPs or other specified facilities

--Agreement to allow regular inspections by buyer and/or third parties

--Compliance with all federal, state, and local requirements

Obligations of the buyer; and

Provisions for violation.

In some trading programs, the reliance on private contracts has been augmented with regulatory sanctions against sellers of non-existent credits. For example, Michigan's trading rules stipulate that credit generators are subject to three times the amount of compensatory damages if they sell bad or insufficient credits.

WRI advises against provisions that would make state or federal agencies parties to private contracts, or give them enforcement authority over such contracts. Such provisions could greatly reduce the number of entities willing to supply credits. Existing contract law is sufficient to protect all parties

Accountability and Tracking System

15. An assumption herein is that offset or credit users are NPDES dischargers and that all offsets or trades must be

documented in the NPDES permits. Must credit or offset generators who are NPDES dischargers also have offsets or trades recorded in their NPDES permit? The Trading Toolkit states that "credit sellers' permits will include both the effluent limit that would apply without the trade and the effluent limit that applies with the trade."

WRI believes that the provisions included in the seller's NPDES permit should depend on the nature of the proposed trade. Two cases come to mind:

The trade could involve the permanent sale of WLA to another permit holder. In this case, the WLAs in both permits should be adjusted accordingly. "With and without trade" effluent limits would not be needed in the seller's permit, only the reduced WLA and possibly a statement in the fact sheet about why the WLA was reduced and by how much.

The trade involves the sale of a certain number of credits per year for X years. In this case, the seller's permit should reflect both trade and no-trade limits and the maximum number of credits that may be sold in a given year, if applicable.

16. Nonpoint source participation is important to maximize the success of offsets and trades, yet integrity of transactions involving nonpoint sources will be challenging, particularly in cases of nonpoint source-only transactions. Are there additional elements or standards that should be considered for ensuring the integrity of such transactions?

There are many additional elements and standards that must be included in a trading program involving nonpoint sources. As with Question 11, a complete discussion is not possible within the context of TMDL comments. WRI urges EPA to seek input on this question in an ongoing process to develop trading program policy.

Response

Thank you for your comments. EPA carefully considered these comments as it finalized the Chesapeake Bay TMDL and EPA intends to continue to work with the Bay jurisdictions to facilitate development and implementation of orderly, accountable, transparent and effective offset and trading programs. EPA will ensure that the EMT receives a copy of WRI's comments and we look forward to a continued collaboration with WRI.

Organization: Pennsylvania Builders Association

Issue #1: The TMDL must allow for innovative options to meet pollution reduction requirements, and EPA must facilitate, not hinder, existing cooperative efforts already underway in states like Pennsylvania.

Pennsylvania's home builders have always been stewards of the Chesapeake Bay and its ecosystem. Our activities across the watershed have been regulated at the federal, state, and local levels for many, many years, and those regulations have become more stringent over time. Because of the long-term emphasis placed on protecting environmental quality, most new developments in the Bay watershed must already install state-of-the-art stormwater

management facilities, use low impact development practices, and follow sustainable design principles to ensure that the projects minimize pollution and other adverse environmental impacts.

In many cases, Pennsylvania builders have found that state and local government practices, policies and regulations represent impediments to designing and completing environmentally sensitive development. Many current codes and ordinances include mandates that are inconsistent with that objective. For example, requiring 40-foot residential streets or sidewalks on both sides of a roadway can significantly increase the amount of imperviousness and the associated stormwater discharging from a site. PBA has supported the development of a document by the Pennsylvania Housing Research Center, titled Pennsylvania Standards for Residential Site Development, which contains possible solutions for issues such as the preceding. It can be accessed at <http://www.engr.psu.edu/phrc/Land%20Development%20Standards.htm>.

At the same time, the occasion of the Bay TMDL would seem to be an auspicious opportunity to develop and promote innovative pollution reduction techniques that achieve the greatest possible environmental benefit at the least possible cost, with particular emphasis on programs that allow for pollutant trading and offsetting. Without viable such programs, the efforts of EPA, the Bay states, local governments, and private sector stakeholders to restore the Bay to health—no matter how well-intentioned—will ultimately fail because no other mechanism can do as much to channel scarce financial resources to the lowest-cost methods of pollution reduction. The composition of the pollutant load in states such as Pennsylvania, in which agriculture is by far the dominant source of nitrogen, phosphorus and sediment to the Bay, as well as the far lower documented relative cost of pollutant removal achieved by agricultural best management practices (BMPs), argues powerfully for trading and offsetting as essential tools for the ultimate success of the Bay restoration efforts.

Given these realities, EPA must play a constructive role and allow and facilitate the use of innovative practices and principles, especially those related to trading and offsetting programs, which reduce environmental stresses on the watershed. In order to achieve the Bay cleanup in the most cost-effective manner possible, given the need to continue to provide jobs and opportunities for the people who will call the Bay watershed home today and in the future, it will be necessary to further identify and remove the roadblocks that exist to pollution trading and offsetting.

In particular, the stormwater pollutant reductions that will be mandated under the TMDL from new development, redevelopment, and the retrofit of existing impervious pavements in cities and towns will not be achievable without trading and adequate off-site mitigation alternatives. This is due to both the technical challenges posed by the urban setting and the cost of retrofits. Likewise, the future economic growth communities in the watershed will depend on the ability for new growth to purchase offset credits prior to construction. Further, without trading, agricultural entities, for the most part, will be unable to make sufficient pollutant reductions necessary to restore the Bay due to the sheer costs they may be asked to bear. Without a major contribution from agriculture that is proportional to agriculture's contribution to the impairment of the Bay, the Bay restoration goals may be unattainable.

PBA has created and championed a proposal to institute a stormwater BMP offsetting program for use by builders, municipal governments, and agricultural operations, and has discussed the details of the proposed program extensively with EPA officials. PBA is also currently involved in negotiations with the Pennsylvania DEP and other affected stakeholders regarding the structure of such an offsetting program. PBA's proposal is attached as an appendix to these comments. Finally, PBA has been intimately involved in the development of the existing DEP nutrient credit trading program, and continues to provide input as to how the program can be improved.

Response

Thank you for your comments. EPA commends PBA's involvement in the development of Pennsylvania's nutrient credit trading program and its continued input on improving the program. EPA supports the expansion of Pennsylvania's program to include stormwater and will continue to work closely with Pennsylvania to ensure the success and legitimacy of its program.

Comment ID 0530.1.001.004

Author Name: Gulibon Grant

Organization: Pennsylvania Builders Association

Given these realities, PBA urges EPA to work with state and local governments and private sector stakeholders to support existing innovative pollution reduction approaches, such as the Pennsylvania nutrient credit trading program and the PBA stormwater offsetting proposal, rather than impose draconian requirements that will impede the development and refinement of such efforts. Also, though EPA has endorsed the concept of water quality credit trading and has an active technical committee, the Water Quality Trading Forum, examining trading, nothing visible has been done to put pen to paper to actually move towards developing a robust, interstate water quality credit trading program. This will prove extremely problematic as the TMDL is implemented.

A viable and fair interstate trading program must be in place as soon as possible, as a large, broad-based trading program supported by EPA would allow NPDES permit holders to share in the low-cost agricultural BMPs that will be necessary to fund if the housing industry is to survive. To further assist in the development of water quality trading, the Chesapeake Bay Program should be working with the EPA's HQ permits section to provide appropriate trading language for incorporation into NPDES permits, identifying the elements necessary for an acceptable trading program in the Chesapeake Bay, and working to find an entity capable of overseeing the generation and selling of water quality credits. Home builders normally have short-duration permits of 9 months to a year, adding another complication to their participation in trading. However, without trading, there will certainly be further job losses in the housing industry during the beginning of the restoration program. PBA also strongly encourages the Chesapeake Bay Program Office to consider sediment trading as well as nutrient trading for the same reasons explained in the above paragraphs.

Response

Thank you for your comments. EPA is aware that the World Resources Institute (WRI) is currently leading a collaboration to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed, and EPA remains very interested in this project. The project is intended to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project. EPA also supports the expansion of existing jurisdictional offset and trading programs to incorporate additional sources of loadings and to provide innovative and flexible approaches for meeting TMDL allocations.

Author Name: Pritzlaff Richard

Organization: Biophilia Foundation

My comments are specific to Section 10 "TMDL Implementation and Adaptive Management", sections 10.1 through 10.3, and are especially responsive to the Draft Appendix S "Offsetting New or Increased Loadings of Nitrogen, Phosphorus and Sediment to the Chesapeake Bay Watershed".

The Biophilia Foundation has extensive experience generating measurable nutrient credits, with wildlife habitat co-benefits from our on farm project work. We have developed both a qualitative nutrient credit protocol and a quantitative standard assessed in situ post implementation by a third party using the Chesapeake Bay Watershed Model. These protocols and descriptions can be found as attachment A. [Comment Letter contains additional information in the form of an attachment. See comment letter 0550.5]

Biophilia Foundation currently has credits listed for presale online through Mission Markets Earth (www.missionmarkets.com). Although these credits are available for sale on a voluntary basis, nonetheless they represent the most credible, efficient, and direct philanthropic investment in Chesapeake Bay restoration currently available. It is precisely for these reasons that a robust, efficient, credible, and transparent regulatory marketplace must be created in the Chesapeake Bay Watershed. There is simply no other mechanism that can attract private capital and create private/public partnerships across economic and political interest boundaries sufficient to clean the waters of Chesapeake Bay.

I respectfully point out that as currently contemplated by most trading theoreticians, and as currently described in the draft document, trading programs will be very difficult to create, as the market will be slow to develop given the requirements of nonpoint source credit generators to first reach "Baseline". Additionally, waste water point sources have years of capacity to accommodate growth before they will have the need to purchase a few credits in only a few watersheds. Given these and other disincentives to market development (the most egregious example being Maryland Department of Agriculture's (MDA) insistence that MDA be allowed to determine practice efficacy, monitor practices internally, and restrict credit generation eligibility to no more than 15% of a farm's total acreage for conversion to the most efficient, measurable, and valuable BMP 's, those being wetland and vegetated buffer restoration) it is very possible that trading mechanisms will not contribute to achieving TMDL and WQS goals until after 2017, and even then only marginally.

This would be tragic, as trading mechanisms have tremendous potential to attract private capital, and provide an economically sound model around which private and public interests can form partnerships to achieve TMDL and WQS goals. There needs to be a true "Game Changing" creation of robust, quantifiable and accountable credit trading markets that bring substantial private funding and stakeholder participation to bear; in other words, there first needs to be an economically viable public/private partnership across political and private interest boundaries to first achieve TMDL WQS, and then achieve continued improvement, not the other way around as currently contemplated.

To better illustrate my vision and recommendations, as I have tried to articulate through my track changes and comments to the proposed TMDL sections, I offer the following scenario for consideration, based on the model and

success BF has had as described in attachment A. [Comment Letter contains additional information in the form of an attachment. See comment letter 0550.5] The track changes and comments that follow in the draft document are based upon implementing this scenario. [Comment Letter contains additional information in the form of attachments. See comment letters 0550.2 and 0550.3]

Response

Thank you for your insightful comments and recommendations. Your comments present some interesting ideas. EPA considered these as it finalized the TMDL and more importantly will take these concepts into consideration as it works with the states and stakeholders ensure trading programs are expanded in a manner that is orderly, accountable, transparent and effective. EPA agrees that it will take time for states to develop and expand nutrient trading programs and EPA intends to work closely with the states and stakeholders in an orderly transition toward expanded programs.

Author Name: Steidel Robert

Organization: City of Richmond, Virginia

We appreciate and support Virginia's inclusion of an expanded trading program as a local implementation option. Virginia has a nationally recognized point-point trading program that currently includes domestic and industrial wastewater treatment plants. We believe that expansion of Virginia's trading program is one way to provide flexibility to help make attainment more feasible.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange and its proposed additional regulatory drivers necessary to stimulate demand for an expanded trading market. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

c. Water Quality Trading and Other Flexibility and Cost-Effectiveness Provisions Are Critical to the TMDL's Success.

The stormwater pollutant reductions that will be mandated under the TMDL for new development, redevelopment, and

the retrofit of existing impervious pavements in cities and towns will not be achievable without a robust trading program and adequate off-site mitigation alternatives. This is due to both the technical challenges posed by the urban setting and the cost of retrofits. Likewise, communities that wish to add jobs and grow will depend on the existence of new growth to purchase offset credits prior to construction. Further, without trading, agricultural entities, for the most part, will be unable to make sufficient pollutant reductions necessary to restore the Bay due to the sheer costs they will be asked to bear. Without a major contribution from agriculture that is proportional to agriculture's contribution to the impairment of the Bay, the Bay restoration goals will be unattainable.

Though EPA has endorsed the concept of water quality credit trading and has an active technical committee, the Water Quality Trading Forum, that examines the concept, nothing visible has been done to put pen to paper to actually move towards developing a robust, interstate water quality credit trading program made necessary by the proposed TMDL. This will prove extremely problematic as the program is implemented. Maryland, for example, has not allocated any loadings for future growth in its WIP and expects that, beginning next year, all future construction will be offset through the purchase of water quality credits. The state, however, has no functioning program for trading between point sources and nonpoint sources or for trading between nonpoint sources. Likewise, EPA has itself not proposed a Chesapeake Bay-scale trading program.

A viable and fair trading program must be in place as soon as possible. NAHB submits that EPA is in an ideal place to do much more to help states bring this about. The agency is the only entity that has had full knowledge of the necessity for a large, broad-based trading program that would allow NPDES permit-holders to purchase credits from the low-cost agricultural BMPs that will be necessary to fund if the construction industry is to survive in the Bay watershed. To date, the agency has done nothing but publish papers on the many provisions that others must meet to put together a trading program. To further assist in the development of water quality trading, the Chesapeake Bay Program should be working with the EPA's HQ permits section to provide appropriate trading language for incorporation into NPDES permits, identifying the elements necessary for an acceptable trading program, and working to find an entity capable of overseeing the generation and selling of water quality credits. Home builders normally have short-duration permits of nine months to a year, adding another complication to their participation. However, without trading, there will certainly be further job losses in the housing industry during the beginning of the restoration program.

NAHB can find no language in the proposal that indicates when the purchase of offset credits comes into effect for new dischargers. While the TMDL is to be "finalized" at the end of 2010, does EPA really intend that offsets for new dischargers must take place for new construction permits as of Jan. 1, 2011? How are the pollutant loadings from construction projects to be determined? What are the loadings that EPA expects to result from the construction of a new home, and what data has led EPA to its estimate of pollutant loadings from home building?

NAHB has several outstanding concerns regarding the proposed use of water quality trading in the Chesapeake Bay watershed:

--We fear that the state trading programs may be reluctant to sell credits to private businesses to allow the state to retain a supply of credits to offset the new discharges from road building, construction activities, or other operations.

--The vast majority of home builders have NPDES permits that are required for nine months to a year, the time needed to build a single home. Their businesses may be disadvantaged in trading programs which are designed for use with industrial or MS4 permits, which normally span at least five years.

--It strains belief to think that every new NPDES discharger in the entire 64,000-square-mile watershed will be able to acquire the credits that they need to do business in 2011 when no state has anything approaching such a program now. The potential economic consequences of this requirement could be devastating to the region's economy. Without readily available, affordable, and adequate water quality trading options for businesses in the watershed, EPA must delay the effective date of the TMDL.

EPA should also consider the developing Ohio River Basin Trading Project as a possible model for trading in the Chesapeake Bay watershed.[FN 39] The Ohio River Basin project trades both nitrogen and phosphorus and should at least provide "lessons learned" for those working to bring trading to the Bay. We also strongly encourage the Chesapeake Bay Program Office to consider sediment trading as well as nutrient trading for the same.

[FN 39] See <http://mydocs.epri.com/docs/public/000000000001019305.pdf>.

Response

Thank you for your comments. EPA took these into consideration as it finalized the TMDL and continues to work with the Bay jurisdictions to develop and implement successful and legitimate offset and trading programs. EPA is aware that the World Resources Institute (WRI) is currently leading a collaboration to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed, and EPA remains very interested in this project. The project is intended to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project. EPA also supports the expansion of existing jurisdictional offset and trading programs to incorporate additional sources of loadings and to provide innovative and flexible approaches for meeting TMDL allocations. EPA is working with the relevant permitting authorities in the watershed to determine effective and appropriate methods for acknowledging offsets and trading in NPDES permits.

Pollution Trading

We are compelled to again point out to EPA the problems with trading pollution. The many process and administrative issues that have been documented with nutrient trading, pale in comparison to the simple fact that trading pollution is a violation in letter and spirit of the Clean Water Act. It is not only illegal but bad public policy and will not result in a Clean and Healthy Bay.

Response

Thank you for your comment. EPA disagrees that offset and trading programs violate the Clean Water Act. EPA does share your concern that offset and nutrient credit trading programs not cause water quality or other environmental problems in the Bay watershed. This type of unintended consequence is directly addressed by the common elements of offset and trading programs in the draft and final TMDL as well as EPA's existing water quality trading policy and trading toolkit for NPDES permit writers (documents cited in the TMDL Appendix). It is EPA's view that if an offset or trade would result in local exceedances of water quality standards, that such a trade could not be authorized under EPA regulations. EPA will continue to work closely with the Bay jurisdictions to ensure that such unintended consequences are avoided.

Comment ID 0590.1.001.014

Author Name: Chavez Jennifer

Organization: Earthjustice et al.

12. Trading: The above analysis of the illegality and arbitrariness of EPA's offset proposal applies with even greater force to EPA's suggestion (at 10-3 to -4) that inter-source (and inter-segment) trading should be allowed. There is no legal authority for such trading, and allowing it would undermine the enforceability and integrity of the entire Bay TMDL. As with offsets, a trading scheme raises the specter of nonpoint sources trading credits generated by unenforceable and unverifiable pollution cuts to allow pollution increases that otherwise would be forbidden (at risk of enforcement action by EPA or citizens). If the past decades of taught us anything about cleaning up the Bay, it is that we need stronger and more enforceable pollution limits, not weaker limits that can be circumvented and undermined by trading shell games. Furthermore, as with offsets, EPA cites no reasoned basis that either the agency or the states have the resources to adequately track and police trades involving potentially hundreds of sources throughout all of the Bay states.

Response

EPA intends for “independent oversight” in section 10.1.1 of the draft TMDL to mean third-party oversight of jurisdictional offset programs, including by firms under contract to the jurisdictions. In such cases, contracts ideally would specify the authority of the third party to arrive at conclusions without being influenced by the jurisdiction.

EPA has compiled scientific evidence which is referenced in the TMDL report's section 10-3 to -4 that provided the justification for allowing inter-source (and inter segment) trading. EPA has the legal authority to allow this as well as enforce when this trading fails to meet the trade requirements.

EPA intends for “public oversight” in section 10.1.2 of the draft TMDL to mean that jurisdictions should provide information about their trading and offset programs with detail and explanation sufficient for members of the public understand the programs, including how individual trading and offset agreements are structured. Jurisdictions should also provide the public with opportunities to comment on these programs and individual agreements under such programs.

EPA cannot make predictions about whether its budget will support specific activities in the future. EPA has made protection and restoration of the Chesapeake Bay a priority, and successful trading and offset programs are an essential component of achieving the goals of the TMDL.

Comment ID 0591.1.001.013

Organization: Eastern Panhandle Home Builders Association

The Chesapeake Bay TMDL will require many changes affecting our members in various aspects. Waste water treatment plants process effluent from houses we build and our members manage construction stormwater as well as construct storm water management facilities.

The creation and implementation of an interstate nutrient credit trading program would be essential for developers to meet the TMDL/West Virginia WIP. This is particularly true in our area because we are a relatively small part of the Chesapeake Bay Watershed and West Virginia's nutrient credit trading program may be not developed to a point where credits can be verified and sold. Without the interstate credit trading program, development would essentially stop here and the contributions from development to the TMDL would not happen.

There we urge EPA to fast track an interstate nutrient credit trading program for implementation before the current Constriction stormwater Permit expires in West Virginia so that options will be available can both project the Bay and make sense for business owners.

Response

Thank you for your comment. EPA is aware that the World Resources Institute (WRI) is currently leading a collaboration to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed, and EPA remains very interested in this project. The project is intended to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project. EPA also supports the expansion of existing jurisdictional offset and trading programs to incorporate additional sources of loadings and to provide innovative and flexible approaches for meeting TMDL allocations.

Comment ID 0614.1.001.009

Author Name: Street William

Organization: James River Association (JRA)

The Draft WIP Relies Too Heavily on Expanded Nutrient Trading - The draft Virginia WIP calls for a greatly expanded nutrient trading program. Currently, Virginia's nutrient trading program allows for trading to comply with wastewater discharge permits and stormwater permits for new development and is generally targeted to provide flexibility in reaching the last amount of pollution reductions which can be the most expensive. The Virginia Draft WIP would expand this to include all major pollution sources and proposes to utilize this mechanism to drive large levels of pollution reductions. The scope of the proposed pollution trading program extends well beyond any such program implemented to date in the nation. However, the plan does not provide sufficient detail on how the program would be established and whether there would be adequate supply and demand to create a market of the size and scope envisioned by the draft WIP.

As long as local water quality is sufficiently protected, JRA supports the development and use of a nutrient trading program to increase cost efficiencies of meeting the Chesapeake Bay allocations. We suggest that sector allocations be set at attainable levels and that the trading program be available as an option for appropriate sectors to reduce costs. Under the Draft WIP, some sectors would have no option but to trade in order to meet their allocation, which would distort the market and lead to less cost efficiencies.

Response

Thank you for your comments. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange together with the proposed regulatory drivers that are necessary to stimulate demand in nutrient credit markets. EPA has worked closely with Virginia and will continue to do so to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0681.1.001.013

Author Name: Baxter Russ

Organization: VA Department of Environmental Quality

The Commonwealth's existing Chesapeake Bay Nutrient Credit Exchange program allows trading among wastewater treatment facilities located within the same river basin, with one minor exception. Dischargers on VA's Eastern Shore may secure credits from plants located in the Shenandoah-Potomac and Rappahannock basins. The Bay TMDL is structured with 39 Virginia segment-sheds assigned separate TMDL equations for nitrogen and phosphorus. EPA's draft TMDL document does not explicitly acknowledge that dischargers within the same river basin, but are located within different segment-sheds in that river basin are allowed to exchange nutrients. Although the current TMDL wording expresses EPA's general support for trading, there should be no possibility that EPA or other stakeholders could misinterpret such general language as not allowing trading across different segment-sheds within the same river basin.

Recommendation: The final TMDL needs to explicitly acknowledge EPA's support for nutrient trading among Virginia wastewater dischargers located in different segment-sheds, but within the same river basin, with the one exception for the VA Eastern Shore noted above.

Response

Thank you for your comments. EPA supports Virginia's Nutrient Credit Exchange and its proposed expansion, including the proposed regulatory drivers that are necessary to stimulate nutrient credit markets. EPA interprets the language of the draft and final TMDL with respect to nutrient offsets and trades to support Virginia's nutrient trading program which allows nutrient trading among Virginia wastewater dischargers located in different segment-sheds, but within the same river basin, with the one exception as determined by Virginia for the Virginia Eastern Shore.

Author Name: Hann Steven

Organization: Capital Region Council of Governments TMDL Work Group

36. It is clear that nutrient credit trading will be severely impacted by the delivery ratio issue discussed earlier in these comments. All trades, including those that have taken place, may be suspect if delivery ratios change during the trading process. The Bay TMDL should also address and delineate guidelines for both interstate and intrastate trading.

37. Does EPA support Pennsylvania's trading program as currently established and as set forth in Pennsylvania's draft W1P?

38. EPA's "backstop allocation" approach will dramatically hinder Pennsylvania's Nutrient Trading program, essentially eliminating all point sources as sellers of credits.

Response

Thank you for your question. The possibility exists that adjustments to delivery ratios, edge of segment factors, and best management efficiencies may be needed as the Chesapeake Bay Watershed Model is revised. Such changes may impact nutrient credit generation and purchases under the existing offset and trading programs, but EPA is committed to minimizing such impacts on existing offset and nutrient credit transactions to the extent possible and appropriate. EPA will continue to work with Pennsylvania to ensure that its trading program meets EPA's expectations, including by reviewing the jurisdiction's program in detail in 2011.

In establishing the TMDL, EPA is responsible for ensuring that nutrient and sediment reductions from both point and nonpoint sources in the TMDL are supported by a clear set of functional programs that provide the reasonable assurance the load allocations and wasteload allocations in the TMDL will be achieved. EPA carefully considered the content of the jurisdictions' draft and final

Phase I WIPs in its preparation of the draft TMDL for public comment and in establishing the final TMDL for Chesapeake Bay. EPA's proposed reductions to POTW allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance demonstrated in draft Phase I WIPs.

In the final TMDL, the load allocations and wasteload allocations are with some exceptions, consistent with the load allocations and wasteload allocations proposed by the jurisdictions in their final Phase I WIPs. In some cases, the load and wasteload allocations in the TMDL differ from what was contained in the draft TMDL for public comment, the jurisdictions' draft Phase I Watershed Implementation Plans, and/or the the jurisdictions' tributary strategies. The degree to which such allocations differ from these earlier documents varies by jurisdiction and sector.

EPA recognizes that more restrictive WLAs on a POTW may affect that source's ability to generate nutrient credits. EPA has worked closely with Pennsylvania in the development of its trading program. With the finalization of the Chesapeake Bay TMDL, EPA intends to continue to work with the Commonwealth to help ensure that Pennsylvania trading program is successful in meeting the state's TMDL allocations.

EPA is collaborating with the World Resources Institute (WRI) and WRI's project partners to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed. This project seeks to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project.

Organization: Lower Susquehanna Riverkeeper

The Lower Susquehanna Riverkeeper, representing the members of Stewards of the Lower Susquehanna, has signed on to additional comments regarding the Pennsylvania WIP submitted by the York County, PA TMDL workgroup to DEP and cc'd to EPA. Our comments to the EPA's TMDL are dedicated to the use of Nutrient Trading as a tool for reducing pollutants, and as a tool to allow for continued population growth and development within the Chesapeake watershed.

The Clean Water Act and other laws protecting our environment were enacted for the purpose of creating a sustainable society for ALL future generations. In the Clean Water Act we find a mandate to reduce loads until ALL waters are Fishable, Swimmable, and Drinkable. A Nutrient Trading program that is not based on thorough monitoring and verification, does not contain a long-term easement-like trading system, or increases quantities of substances that are currently unregulated but are known or suspected carcinogens and endocrine disruptors, will inevitably fall short of the goals of nutrient reduction, and sustainable waterways and communities. From what we have seen so far, we cannot endorse Nutrient Trading. Here are our concerns.

Unlike existing air quality trading programs that relate easily measured discharges from one smokestack to another, Non-Point to Point Source trading occurs between a model estimate and a measured discharge. A recent report from

UMCES points out the "uncertainty associated with reducing nutrients through best management practices."

Perspectives from the University of Maryland Center for Environmental Science on the Draft Reports Addressing Key Challenges to Chesapeake Bay Protection and Restoration 9/23/2009

Market Approaches Must Yield Quantifiable Benefits. Markets are a popular idea for cost-effectively achieving environmental benefits, but they require appropriate regulatory caps (e.g., nutrient and sediment caps, impervious surface caps) and accurate quantification of the benefits (e.g. reductions in sources) achieved. The latter requirement poses great challenges for markets that would allow non-point sources to trade with point sources because of the high levels of uncertainty associated with reducing nutrients through best management practices. Market systems should be promoted in which buyers pay for results and not just the implementation of a practice. This requires more rigorous assessment of BMP performance.

A recent USGS report and subsequent news articles suggest that agricultural BMP's may not be as effective as predicted. The Agricultural Industry on the eastern shore of Maryland would have us believe that they have already implemented programs to reduce runoff, yet actual sampling suggests that their efforts have not been successful.

Chesapeake Bay progress uneven, study shows Data suggest sewage upgrades working, farm runoff controls aren't By Timothy B. Wheeler, The Baltimore Sun September 15, 2010

A new study shows some Chesapeake Bay rivers have gotten cleaner over the past three decades, while others are getting worse. The analysis, released Wednesday by the U.S. Geological Survey, suggests costly upgrades of sewage plants have helped, scientists say, but it raises questions about the effectiveness of efforts to date to curb polluted runoff, particularly from farms on Maryland's Eastern Shore. "We're going in the wrong direction in some places, and the right direction in others," said William Dennison, vice president for science applications of the University of Maryland Center for Environmental Science. He called the USGS analysis a breakthrough in tracking where the 27-year-old bay restoration effort is making progress - and where it's falling short.

Nutrient Trading does not just trade N's and P's, but trades solutions, wastewater treatment plant effluent and agricultural runoff, that contain complex mixtures of metals, hormones, antibiotics, pharmaceuticals, industrial and medical wastes, etc. We have found no analysis of these additional pollutants. We find significant difference in the makeup of the solutions, but have no understanding of the costs/benefits of trading wastewater mixtures for agricultural mixtures, or for suburban or urban stormwater mixtures.

Some of the differences that must be looked at further are flow rates, seasonality, and local ("hotspot") impacts. WWTP effluent releases occur daily at a relatively constant rate. Agricultural Run Off is usually produced only during precipitation or freeze/thaw streambank erosion. Agricultural Run Off is seasonal and annual trends vary, allowing for periods of healing (as has been occurring in the Bay in the recent low precipitation years). WWTP effluent contains tens of thousands of chemicals that are not tested for, including endocrine disruptors and antibacterials. Agricultural Run Off also contains other bioactive chemicals such as hormones, antibiotics, and herbicides. Which is worse? Constant loads or variable? Local concentrations or broad non-point input? The unevaluated mixture of chemicals in WWTP effluent and sludge, or the unevaluated mixture in various manures? And how will this impact individual waterways? We do not feel that these questions have been satisfied, and would request that they be satisfied before endorsement or creation of a Nutrient Trading program.

While concerns regarding the financial burden of upgrading aging WWTP's is understood, trading to put off these upgrades begs the question: How long until Point Sources have to upgrade? This plan to put off upgrades seems to miss two points, one regulatory and one economic. The NPDES Program is designed to ratchet down on pollution discharges by requiring 5-year assessments of treatment efficiency based on Best Available Technology. This is our mechanism to eventually reach zero discharge. Are we abandoning BAT for "lowhanging fruit"? And the economic question: If there is a deadline for WWTP upgrades (which we haven't seen), the best bet for financing appears to be (with any luck in the economy) sooner rather than later.

New Point Sources are our next concern. In the current Pennsylvania program, there is very little assurance that new sources will be able to fulfill their required commitment to provide for credits "for the life of the project". Here are the relevant references for PA's plan to accommodate development.

Pennsylvania's Chesapeake Bay Tributary Strategy Implementation Plan for Sewage Facilities Planning

II. New Discharges and Facility Expansions

Where credits are purchased for new land development projects that result in new discharges or facility expansions, a developer or municipality must commit in writing, as part of the sewage facilities planning process, to purchase nutrient credits sufficient to offset nutrient loads from the project. If the purchase of credits is necessary to maintain the zero net increase of nutrients, then the assurance must provide for those credits for the duration of the design life of the project.

PA Draft WIP Section 6. (page 50)

Guidance Document Number 392-0900-001: Final Trading of Nutrient and Sediment Regulation Credits - Policy and Guidelines

The Department will expect to see assurances in the proposal that the credits will be provided to assure the long-term compliance for the treatment facility to meet the regulations in Chapter 71, Section 71.72.

For instance, a formal agreement between the municipality and the developer/permittee that establishes the developer/permittee's responsibility for operating and maintaining the system by providing credits, and the responsibility of the municipality or local agency for oversight of the system, would normally be an acceptable assurance.

Long-Term Availability of Credit is required to make such assurances. No commitments to credit availability have been made by any Department of Agriculture or Farm Bureau as to the "perpetual" availability of credits, as would be needed by a new source.

The demand for credits could come from a broad spectrum of users: existing WWTP's, expanding WWTP's, new WWTP's and POTW's, Municipal Stormwater MS4's, new development stormwater offsets, new industrial sources, electric utilities, and others. The agricultural community is being looked at as the major source for these credits, but again, no commitment of credit availability has been made. Availability of credits will be tied to crop prices and real estate markets. Shifts in the economy such as the recent ethanol rush could take "credited" lands out of the program to be replaced with cash crops. Assurances based on long term availability of credits are questionable, at best.

An additional concern is the long-term impact of new development to the availability of credits, as much of the development occurs on former agricultural lands. We currently count on our agricultural lands to process much of our WWTP sludge, as well as most of our animal waste. As development grows, the sludge burden grows. At the same time, the amount of available cropland decreases due to development. Animal production has not decreased, so the ever-declining amount of land is expected to process our "organic" wastes? In addition to the environmental concerns, the economics of trading in this fashion could greatly increase the cost of credits. As available agricultural land is reduced, the availability of credits, or supply, is reduced, driving the price up.

This leads us back to the "assurances" given by developers. Consider this scenario. A new neighborhood links into an expanding WWTP. The new users are charged based on Credit Price. This price goes up substantially as demand increases. Fifteen years from now the neighborhood association that has inherited these payments revolts at the prices and the residents contact their politicians. The politicians are outraged at the price of credits, and they change credit requirements. Now, hundreds of new neighborhoods pollute without offsets. This is our concern for the future. PERPETUAL easements are the only way to assure credit availability.

Different agricultural BMP's have different effects on our waterways. Proper buffers will reduce nutrients, sediment and pesticides. Manure export addresses nutrients but NOT endocrine disrupting herbicides. These variations need to be taken into consideration when making trades. Trading wastewater treatment plant effluent for manure exportation credits may reduce nutrients, but add substantially to the "emerging contaminant" concentrations.

Manure exportation to neighboring watersheds is not a sustainable strategy. Currently 1.2 million pounds/credits of Nitrogen are immediately available "Contingent on Sale Project that has been certified but the project will only be installed if the credits are purchased" *PA DEP Credit Registry. Much of this manure will be spread in the Delaware and Allegheny/Ohio watersheds. This practice could explode with passage of Interstate Nutrient Trading, causing loads to those waterways to increase.

Manure exportation leads us to another concern. Will it be legal to export manure for credit, and fertilize with sludge for cash? We have found nothing in the existing programs that would prevent this if agricultural operations were inclined to do this.

Another environmental consideration must be made for recent research by USGS suggesting that wetland expansion in Phosphorus saturated soils will increase release of available Phosphorus, the Dissolved Inorganic Phosphorus (DIP). DIP is the phosphorus immediately available to the Cladophora algae blooms that are choking the Susquehanna River. USGS has shown substantial increases in the DIP levels since 1985, while PA DEP claims Phosphorus reductions. Wetland expansion in the lower Susquehanna must be evaluated for Phosphorus saturation before it is encouraged or credited.

We have additional concerns regarding Verification and Accountability. DEP, MDE, and DEQ are currently all grossly deficient in transparency and/or enforcement. Maryland continues to deny Waterkeepers the Nutrient Management Plans that were ordered to be released by the court. The MD Farm Bureau fights transparency for NMPs, claiming it would destroy the Maryland agricultural economy (note: PA NMP's are available at DEP or County Conservation Districts.) Even in PA, the brokers hide the actual client's identity. Why should the public expect that the Nutrient Trading program will be transparent?

We continue to have concerns with the Verification and Accountability of agricultural credits. While a great deal of science has gone into predicting the removal efficiencies of different practices, the upkeep of these practices, and run off event variability still produce potential for broad inaccuracies in the modeling. Pennsylvania's program, which DEP claims will remain the same, has no individual farm or in-stream verification. To our knowledge, no funding has been committed by states for the needed increased staff requirements. Some suggest that verification will be done by Third Parties. These Third Party Verifiers are yet to be named. A Third Party Verifier system must NOT include brokers, as the Chicago Carbon Exchange does. This includes other parties that have "sector interests," such as the Farm Bureaus or industry organizations. Allowing verification to be done by interested parties, particularly brokers, is far too similar to the temptations of the mortgage crisis. Profit will be based on numbers of transactions, while verification is extra work without profit. Disinterested parties, possibly governmental, must be found to perform annual verification.

Proponents of Nutrient Trading assure us that the Clean Water Act has powerful tools for citizen oversight of trading. Government agencies and environmental non-profits can't keep up with the work that needs to be done now, let alone having an additional convoluted system of trades to verify.

IF these entities are expected to help in this endeavor, Transparency must be developed. Interstate Nutrient Trading will create complex webs of transactions for credits that may be spread across six states and 64,000 square miles of the Chesapeake.

Environmental Justice issues are a concern when considering Nutrient Trading programs. Communities with available funds will be able to purchase credits more readily, and they could buy more credits at higher prices, allowing continued pollution. Poorer communities, that may actually need credits to put off upgrades until funds can be procured, are at a disadvantage.

In a program where credit prices are being determined by annual auction, as in Pennsylvania's program, there is great uncertainty in the cost to the municipal or homeowners' association budget. As demand for credits increases and the cost per credit increases, poorer communities will pay a higher percentage of total community income, creating a greater burden on poorer communities.

Our final comment regarding Nutrient Trading has to do with its effect on Innovation. Innovation is spurred by demand. Trading puts off demand. A technology invented that will reduce nutrient loads at 40% of today's cost will still not be competitive with agricultural credits that will be abundant for the first years of the program. Cost-effective technologies are being tested and put in place. The Ostara direct phosphorus removal system has been put in place at two Chesapeake watershed WWTP's, in York, PA and in Suffolk, VA. With experts predicting a "phosphorus peak" within 40 years, technology to save phosphorus needs to be put in place. Currently 10% of all mined phosphorus is passing through WWTP's. This needs to be recovered.

There are Alternatives to Nutrient Trading. EPA's Backstop TMDL is already designed to put pressure on the states to reduce non-point sources. The threat of the TMDL to reduce loads from WWTP's to Best Available Technology will encourage WWTP's to fund BMP's, without providing credits to increase pollution. This could be done on subwatershed levels where the actual reductions could be monitored and documented.

The Clean Water Act NPDES program was designed to combine funding with required technological improvements.

Funding is currently available at record-low interest rates. This is the perfect financial market to be taking out bonds for municipal WWTP upgrades.

Response

Thank you for your comments. EPA took these into consideration as it finalized the TMDL and continues to work with the Chesapeake Bay jurisdictions to develop and implement orderly, accountable, transparent and effective offset and trading programs. EPA shares your concern that offset and nutrient credit trading programs not cause water quality or other environmental problems in the Bay watershed. This type of unintended consequence is directly addressed by the common elements of offset and trading programs in the draft and final TMDL as well as EPA's existing water quality trading policy and trading toolkit for NPDES permit writers (documents cited in the TMDL Appendix). It is EPA's view that if an offset or trade would result in local exceedances of water quality standards, that such a trade could not be authorized under EPA regulations. EPA will continue to work closely with the Bay jurisdictions to ensure that such unintended consequences are avoided.

Organization: Metropolitan Washington Council of Governments (COG)

Is it EPA's view that the state WIPs must establish a WLA that is lower than the 2009 progress level for existing urban stormwater loads (Le. through application of retrofits) before they can establish reasonable assurance for a trading program?

Does this same point apply to septic (Le., state must establish a performance standard requiring load reductions before it can establish reasonable assurance for a trading program)?

Response

Thank you for your comments. The final TMDL is the baseline from which both point and non-point sources develop their credit generation protocols as part of their particular state's trading and offset programs.

EPA Needs to Play a Stronger Role in Governing Nutrient Trading and Offsets

For the last several years, CBF has been actively engaged in the development of the nutrient trading programs in

Maryland, Virginia and Pennsylvania. The Chesapeake Bay TMDL provides a unique opportunity to demonstrate that a nutrient trading program, subject to strict oversight and carefully-crafted rules keyed to environmental performance targets, can help make a regulatory program function in a more economically efficient way. In particular, there is the potential for nutrient trading to help local governments comply with stormwater permits in a more cost-effective way and as a framework to account for, and offset, new loads of nitrogen and phosphorus resulting from growth and development.

As with other elements of the Chesapeake Bay Program, successful work on offsets and trading in the Chesapeake Bay could serve as a powerful model to consider in other watersheds. Unfortunately, substantial differences currently exist among the trading programs that have developed in the watershed states. This not only presents issues of inequity, but also will hamper efforts to establish an interstate trading program that could present even more opportunities for economic efficiency. Consequently, EPA needs to work to harmonize the state programs and use its oversight of the WIPs and of state-issued permits to ensure that offsets for new growth and trades to meet reduction targets operate by the same rules - rules that ensure transparency, accountability, scientific integrity, and consistency - among jurisdictions. See EPA guidance entitled "Guide for the Evaluation of Watershed Implementation Plans," dated April 2, 2010 and attached Settlement Agreement of May 10, 2010, specifically Section III.B.4.f and 11 (EPA oversight of offsets a specific obligation.) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1, page 79 of the pdf]

EPA's Appendix S, "Offsetting New or Increased Loadings of Nitrogen, Phosphorous and Sediment to the Chesapeake Bay Watershed", and Section 10, TMDL Implementation and Adaptive Management, outline broad expectations for offset programs within and among Bay states. The use of a comprehensive set of definitions, common elements and program features that guide trading among both new and existing sources of nitrogen and phosphorous are necessary to further effectuate success. Clear, rigorous and consistent rules will help maintain the integrity of a trading system while fostering market clarity and stability. The principles outlined in Appendix S, in combination with many strong elements in EPA trading policies, must be implemented to ensure that trading contributes to, and does not undermine, progress toward meeting the TMDL goals.

In particular, EPA needs to play a strong and active role in defining "baseline." In this context, we are referring not only to the baseline that must be achieved before an entity can sell credits in the compliance market, but also the baseline for estimating new loads that need to be offset.

In the case of the former, EPA should require the states to demonstrate that their baseline for sellers equates to that entity's proportion of achieving the Bay TMDL. The current definition of baseline in Pennsylvania for agricultural producers would not meet this standard. EPA must establish a requirement for this demonstration from all states that wish to participate in nutrient trading. Furthermore, it is likely that the baseline will need to be a performance-based approach that requires a certain level of pollution reduction. This will provide greater flexibility in how achievement of the baseline occurs (when compared to a more prescriptive approach) and will ensure consistency with necessary pollution reduction targets.

In terms of setting the baseline for offsetting new loads, EPA action needs to reflect elements reflected in the policy document submitted by CBF in September in response to a request for informal comments on Appendix S. A copy of the document is attached and incorporated herein by reference. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1, page 297 of the pdf]

Finally, EPA must lead efforts to harmonize accounting and verification systems for nutrient credits, including the establishment of a regional nutrient credit registry. See attached Settlement Agreement, specifically Section III.B.11. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1, page 79 of the pdf]. Currently, there are at least two calculation tools that are being used to estimate pollution loads from farms: "NutrientNet" developed by the World Resources Institute and the "Nutrient Load Estimator" developed by Water Stewardship Inc. Potentially, the loadings output from these two models may be different and this disconnect has the potential to add an unnecessary layer of confusion and skepticism to the nascent trading market. In collaboration with the Natural Resources Conservation Service, EPA must drive a consensus on the calculation tool as well as verification procedures for nutrient credits.

Response

Thank you for your comments. EPA took these comments into consideration as it finalized the TMDL and will continue to work with the states in the development of their trading and offset programs. EPA agrees that rigorous oversight, transparency, and accountability are important for the development and implementation of successful and legitimate offset and trading programs. EPA is collaborating with the World Resources Institute (WRI) and project partners in their project to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed. This project seeks to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project. EPA also supports the expansion of existing jurisdictional offset and trading programs to incorporate additional sources of loadings and to provide innovative and flexible approaches for meeting TMDL allocations. Your comments with respect to EPA's role in establishing a rigorous baseline for credit seller eligibility and a clear baseline for estimating new loads that need to be offset are very much on point. EPA fully considered these points as it finalized the TMDL and will continue to focus in these key points as we work with the jurisdictions to in the development and expansion of orderly, accountable, transparent and effective nutrient credit exchange programs.

Finally, the TMDL and the NY WIP should explicitly allow trading and other mechanisms that DEC can use to change allocations within and between the six broad source categories listed in the Draft WIP for the Bay TMDL, without having to first have a modification to the TMDL (or the New York WIP) approved by USEPA.

Response

Thank you for your comment. EPA considered your suggestion as it finalized the TMDL and continues to work with the Chesapeake Bay jurisdictions to develop and implement offset and trading programs that incorporate appropriate levels of

flexibility for program participants.

Comment ID 0747.001.001

Author Name: Hankins Joseph

Organization: Jefferson County (West Virginia) Public Service District

A transparent and accessible framework for regional or inter-state water quality trading and nutrient offset provision must be developed. USEPA must take a leading role in assuring that a credible, defensible and efficient system is available to point source permit holders.

Response

Thank you for your comments. EPA is aware that the World Resources Institute (WRI) is currently leading a collaboration to develop an online multistate water quality trading platform and carbon estimation tool for the Chesapeake Bay watershed, and EPA remains very interested in this project. The project is intended to build a common integrated platform to facilitate the alignment of state infrastructure for registries, marketplaces, and calculation tools and could be the foundation for interstate trading in the Chesapeake Bay watershed. In 2010, WRI received a Conservation Innovation grant from USDA NRCS to fund this project. EPA also supports the expansion of existing jurisdictional offset and trading programs to incorporate additional sources of loadings and to provide innovative and flexible approaches for meeting TMDL allocations.

28 - REVISING THE TMDL

Comment ID 0038.1.001.026

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

After a presidential executive order making the Chesapeake Bay a high priority item, I feel that the most important part of the following steps is the "adaptive management." As progress continues and improvements are made, it is important to adapt the way water quality is being managed, but avoid the necessity of federal actions or consequences. If something is not written into the TMDL about revisiting the system besides at the two goal dates. What is the plan about monitoring the progress over time? Is there room for revision or are there requirements for revision to the TMDL?

Response

Please refer to Sections 5.2 and 7.2.3 of the final Chesapeake Bay TMDL document for a discussion on the Bay monitoring network and the accountability tracking system. Please refer to Section 10.3 of the final document which outlines plans and procedures for future revisions to the TMDL.

Adaptive management is important to such a long implementation period as that being employed for the Chesapeake Bay. With several 'reassessments' of the state Watershed Implementation Plans and the TMDL planned and the 2 year milestones, there is currently planned adequate opportunity for adaptive management of the Bay restoration. Much of the planning and actions for the restoration of the Chesapeake Bay is contained in the state Watershed Implementation Plans and not in the Bay TMDL. As such, these plans can be modified when necessary by the states.

In fact, EPA has effectively acknowledged that the model and model inputs are incomplete by announcing its intention to conduct additional model calibration after the TMDL is established.

Response

As stated in the letter from Shawn Garvin (EPA Region 3 Administrator) to the Principals' Staff Committee on June 11, 2010, "prior to 2017, EPA plans to review the full suite of the partnership's Bay models based on the best available science and decision-support tools and consider whether updated models should be developed to support phase III implementation plans and potential modifications to the Bay TMDL allocations."

New data and science will always continue to become available and, as stated in the above mentioned letter, EPA is using an adaptive management approach to incorporate new information as it becomes available with scheduled upgrades during 2011 and 2017. There is no anticipation of jurisdictions over-controlling nutrients in the interim.

As essential as TMDLs are to establish responsibility for water quality cleanup actions, they are also a flexible tool. EPA can propose modifications at any time based on changes in water quality standards and improvement of modeling and analytical tools. This is an important feature of TMDLs. We noted that EPA will evaluate modifications of the Chesapeake Bay TMDL as early as 2011 based on improvements in the state WIPs and other factors. There is a general commitment to continuous evaluation and improvement in the Bay Program.

VII. CONCLUSIONS AND RECOMMENDATIONS

EPA has promoted the Bay TMDL as employing an adaptive management approach to restoring the Bay and protecting the James River, yet its approach to establishing the allocations reflects anything but an adaptive approach. Rather than calling for incremental additional load reductions that account for the unresolved significant questions surrounding the accuracy of the chlorophyll-a modeling predictions and the absence of any quantifiable benefit from achieving load reduction greater than those called for in the James River Tributary Strategy, EPA appears to be determined to press ahead with proposed allocations that call for load reductions that may go well beyond those needed to restore the Bay and protect the James River. Adaptive management avoids wasted time and money by providing for the incremental commitment of resources until the applicable water quality standards are attained. EPA's approach will not achieve compliance with the standards any earlier, but it does pose a serious risk that the Localities and other sources in the James and York river basins will expend far more resources than needed to attain the applicable water quality standards.

If EPA is truly committed to an adaptive management approach to the TMDL, it will establish the TMDL based upon the allocations in the Tributary Strategies while working with the modeling community to address the unresolved issues with the Phase 5.3 Model and the chlorophyll-a modeling predictions. Once these issues are resolved, the TMDL can be updated and modified, if necessary, to reflect allocations based on a fully developed and calibrated Phase 5.3 Model, verified model inputs, and model predictions that (unlike the current predictions) do not have to be manipulated to produce results consistent with the observed data. In the meantime, progress toward attainment of the applicable standards can continue. Much remains to be done to attain the Tributary Strategies allocations so no time will be lost while the work needed to make the Model reliable enough to establish TMDL allocations and fix the model inputs continues,

The approach we recommend would achieve our mutual water quality goals for the Bay more efficiently, cost-effectively, and quickly by fostering the federal, state, and local partnership that is so critical to an undertaking of this magnitude. EPA's adherence to an artificial deadline for establishing the TMDLs and its heavy-handed approach to date

serves only to undermine that partnership and create distrust and resistance on the part of those who must bear the burdens of achieving the load reductions required to restore the Bay and protect the James River.

Response

The reason this TMDL is necessary is because the bay has not achieved the water quality goals by 2010 as committed by the Bay partners. One reason for not achieving a restored bay by that time is the practice of study and delay as suggested in this comment. The bay restoration is planned to take 15 years. If future studies suggest that different levels of controls are necessary to protect the bay, this TMDL can be modified to reflect that new information. Until then, this TMDL uses the best available science to support the loadings (and reductions) necessary to restore the Chesapeake Bay. In this way the TMDL sets the loadings needed to achieve the existing state water quality standards regulations as required under the Clean Water Act.

Comment ID 0298.2.001.027

Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC)

The Model results that are the basis for the proposed allocations are clearly lacking in the level of precision and certainty required to justify the resulting billions of dollars in costs. EPA professes to be taking an adaptive management approach to the TMDLs; but in reality, EPA is taking an adaptive legal and regulatory approach to the TMDLs by establishing the TMDLs based on incomplete and flawed science and then seeking to supply the missing documentation after the fact.

If EPA is truly committed to an adaptive management approach to the TMDLs, it would adopt them based upon the allocations in the Tributary Strategies and then update the TMDLs when the Phase 5.3 CBWM is fully transparent, developed and calibrated to within an acceptable margin of uncertainty. No time would be lost if EPA's accountability framework remains in place to ensure that progress toward achieving the Tributary Strategy allocations continues while work on the Phase 5.3 CBWM and model inputs are underway. In fact, the approach we recommend likely would achieve our mutual water quality goals for the Bay more efficiently, cost-effectively, and quickly by fostering the federal, state, and local partnership that is so critical to an undertaking of this magnitude. EPA's blind adherence to an artificial deadline for establishing the TMDLs and its heavy-handed and opaque approach to date serves only to undermine that partnership and create distrust and resistance on the part of those who will bear the burden.

Organization: Rapidan Service Authority (RSA)

In addition, as the Chesapeake Bay Program has long ago determined, the York River does not influence mid-Bay water quality and any regulation of York River nutrient discharges should occur only for local water quality protection. For about a decade, Virginia has been operating under a York River Tributary Strategy for this purpose. To this end, the State issued the Virginia Regulations governing WWTPs in the York River basin (and others). Local governments have designed and constructed the required new facilities with long-term debt, which now must be repaid by the public over the next 20 to 30 years.

Response

Please see response to comment # 0288.1.001.028.

Comment ID 0376.1.001.002

Author Name: Smith Brooks

Organization: Virginia Manufacturers Association VMA

Regulated wastewater and stormwater discharges from industrial sources are unique to each industrial site and process. Throughout the history of the Bay program, industry has worked collaboratively with EPA, Virginia's regulatory agencies and other stakeholders to assess and control industrial discharges as part of the industrial community's responsible share of the Bay reductions.

VMA has been an active participant in all of the Bay restoration efforts, including:

(i) In 1997, when Virginia enacted the Water Quality Improvement Act, establishing a process for developing goals and providing funds for both point source and non-point source improvements.

(ii) In 2005, when the Tributary Strategies were adopted. These strategies were instrumental in facilitating progress toward the Bay restoration goals by setting a cap on nutrient loads from significant point source dischargers. Virginia was the first state in the Bay watershed to establish such a cap.

(iii) In 2005 during the development of Virginia's Watershed General Permit, a permit lauded by EPA as an example for other states.

(iv) In 2005, 2006 and 2007 during the development and implementation of a Nutrient Credit Exchange Program (the "Exchange"), a program lauded by EPA as an example for other states. Two VMA member companies serve on the Board of Governors for the Exchange Association, and many of VMA's members participate in the Exchange, which has successfully developed trading strategies for the Virginia tributaries that discharge into the Chesapeake Bay.

(v) In 2009, the General Assembly expanded the Exchange by amending the Code of Virginia to allow for a stormwater nonpoint nutrient offsets program for new development.

(vi) In 2009-2010, VMA members volunteered to serve on the Stakeholder Advisory Group ("SAG") that assisted in formulating and reviewing Virginia's WIP.

Of course, VMA has not been alone in these endeavors. In Virginia, at least, the Bay restoration effort has been collaborative, with sustained involvement by all of the interested Bay stakeholders (from regulated industrial and municipal facilities to agricultural interests, homebuilders, watermen and environmental advocates, among many others). Working together, these stakeholders have made meaningful forward progress through consensus, compromise and cooperation. As a result of this collaborative partnership and a collective investment of more than \$1.5 billion over the past five years, Virginia has achieved significant reductions in nutrient loads discharged to the Bay from municipal and industrial wastewater treatment facilities.

To achieve their fair share of the necessary reductions, Virginia's industrial dischargers have made many significant strategic decisions about changing their production processes or their treatment technologies. By way of brief examples:

- One facility invested millions of dollars into a project that decreased its phosphorus loadings by more than 80%.
- Another facility replaced chemicals high in phosphorus with chemicals low in phosphorus, increasing operating cost but reducing loading.
- Still another facility segregated a concentrated phosphorus wastewater stream and supplied it to another treatment facility that lacked the required amount of phosphorus for its treatment system.

Nearly all of the major industrial dischargers in the watershed are registered to participate in the Exchange. Virginia's

General Assembly, regulatory agencies and regulated community have invested substantial time and money into the success of this program. The Exchange consists of local governments and industries discharging into the Chesapeake Bay watershed working together to achieve water quality goals responsibly and cost-effectively. The Exchange's compliance plans are based on accurate input from its members, and have helped to facilitate the timing and development of comprehensive wastewater treatment system upgrades needed to achieve the TN and TP reductions that Virginia has already committed to achieve.

Response

While much has been achieved thru the watershed general permit and VMAs cooperation, the available science and the TMDL has concluded that more controls are necessary in some parts of Virginia. It is EPA's expectation that this permit will be revised to be consistent with the WLAs of the established TMDL.

VII. CONCLUSIONS AND RECOMMENDATIONS

EPA has promoted the Bay TMDL as employing an adaptive management approach to restoring the Bay and protecting the James River, yet its approach to establishing the allocations reflects anything but an adaptive approach. Rather than calling for incremental additional load reductions that account for the unresolved significant questions surrounding the accuracy of the chlorophyll-a modeling predictions and the absence of any quantifiable benefit from achieving load reduction greater than those called for in the James River Tributary Strategy, EPA appears to be determined to press ahead with proposed allocations that call for load reductions that may go well beyond those needed to restore the Bay and protect the James River. Adaptive management avoids wasted time and money by providing for the incremental commitment of resources until the applicable water quality standards are attained. EPA's approach will not achieve compliance with the standards any earlier, but it does pose a serious risk that the Localities and other sources in the James and York river basins will expend far more resources than needed to attain the applicable water quality standards.

If EPA is truly committed to an adaptive management approach to the TMDL, it will establish the TMDL based upon the allocations in the Tributary Strategies while working with the modeling community to address the unresolved issues with the Phase 5.3 Model and the chlorophyll-a modeling predictions. Once these issues are resolved, the TMDL can be updated and modified, if necessary, to reflect allocations based on a fully developed and calibrated Phase 5.3 Model, verified model inputs, and model predictions that (unlike the current predictions) do not have to be manipulated to produce results consistent with the observed data. In the meantime, progress toward attainment of the applicable standards can continue. Much remains to be done to attain the Tributary Strategies allocations so no time will be lost while the work needed to make the Model reliable enough to establish TMDL allocations and fix the model inputs continues,

The approach we recommend would achieve our mutual water quality goals for the Bay more efficiently, cost-effectively, and quickly by fostering the federal, state, and local partnership that is so critical to an undertaking of this magnitude. EPA's adherence to an artificial deadline for establishing the TMDLs and its heavy-handed approach to date serves only to undermine that partnership and create distrust and resistance on the part of those who must bear the burdens of achieving the load reductions required to restore the Bay and protect the James River.

We are pleased to present our comments on the draft Chesapeake Bay Watershed TMDL. We believe that a TMDL which is fair and equitable and cost effective will provide the greatest level of reasonable assurance of a successful program results to clean up the Chesapeake Bay by 2025.

Additionally, we are very optimistic that there are substantive desires across the board for all of the sectors, and our political leadership to find practicable solutions that can achieve the Bay goals.

We respectfully submit the following comments on the draft TMDL:

1. EPA should rectify the Chesapeake Bay Model based on the Phase 5.3mod urban acreages and reassess the TMDL load allocations based on the corrected output before issuing the TMDLs.
2. EPA should restate the goal of retrofit based upon acreage so that any substantive change in the amount of impervious due to the corrected BayShed model that does not balloon the States' retrofit obligations.

Response

EPA has finalized the Bay TMDL based on available and defensible science.

Organization: Choose Clean Water Coalition

As essential as TMDLs are to establish responsibility for water quality cleanup actions, they are also a flexible tool. EPA

can propose modifications at any time based on changes in water quality standards and improvement of modeling and analytical tools. This is an important feature of TMDLs. We noted that EPA will evaluate modifications of the Chesapeake Bay TMDL as early as 2011 based on improvements in the state WIPs and other factors. There is a general commitment to continuous evaluation and improvement in the Bay Program.

Response

EPA agrees with this comment.

Author Name: Haterius Stephen

Organization: National Association of State Departments of Agriculture (NASDA)

There are five reasons, outlined below that we believe require EPA to reissue the Draft after reevaluating the rationale, data and/or authority for its proposed actions. Any one of the reasons is sufficient to question the validity of the EPA action to publish the rule as the agency has. The comments below reflect many of the same concerns expressed by a significant number of both national and local agricultural stakeholders. NASDA shares the concerns of the agricultural community and provides the following comments to express the serious concerns state regulators-from across the country-have with the Draft TMDL:

--Agriculture and Forestry, through state programs as well as other voluntary, incentive based programs, have made and continue to make significant contributions to improvements to water quality in the Chesapeake Bay that are not given credit in EPA's model.

--EPA has failed to provide meaningful public review of the Draft TMDL by having failed to be transparent regarding its data.

--The Draft TMDL is arbitrary and capricious as it is based on inputs the EPA has acknowledged are flawed.

--The Draft TMDL is contrary to existing law.

--The Draft TMDL, if actually implemented, would result in substantial and widespread economic and social impact that is not necessary to attain realistic goals.

Response

EPA strongly disagrees and has issued the final TMDL based on sound science.

- In spite of EPAs request for years for all information on the installed controls, there remain some BMPs that have not been reported. This does not invalidate the TMDL at all, but it does jeopardize a states demonstration of its progress in achieving the TMDL
- The Bay TMDL and its supporting information has been extremely well documented and is available to the public. Appendix B of the document provides the hundreds of documents that are available in support of the TMDL. Appendix C lists the hundreds of meetings, open to the public in support of the TMDL. Two EPA websites epa.gov/chesapeakebaytmdl/ and chesapeakebay.net both provide extensive information in support of the TMDL
- The TMDL is logical, well based on science, and is supported by the Clean Water Act
- The legal support for this TMDL is clearly described in Section 1
- No evidence is offered in support of the assertion that there will be widespread economic and social impact. One point that the

commenter overlooks is that the degradation of the Chesapeake Bay has already resulted in documented economic and social impact.

Organization: American Forest & Paper Association (AF&PA) and National Alliance of Forest Owners (NAFO)

Based on the deficiencies we have identified and the numerous other deficiencies in the other comments referenced above, AF&PA and NAFO concur with those comments that EPA should withdraw the TMDL, or, if EPA does not withdraw the TMDL, the agency should revise it significantly.

Response

The final document reflects substantial revisions from the draft TMDL. These revisions were informed by the public comments and the final state WIPs.

Comment ID 0528.1.001.019

Author Name: Barnes C.

Organization: County of Spotsylvania, Virginia

EPA professes to be taking an adaptive management approach to the TMDLs; but in reality, EPA is taking an adaptive legal and regulatory approach to the TMDLs by establishing the TMDLs based on incomplete and flawed science and then seeking to supply the missing documentation after the fact.

If EPA is truly committed to an adaptive management approach to the TMDLs, it would adopt them based upon the allocations in the Tributary Strategies and then update the TMDLs when the Phase 5.3 CBWM is fully transparent, developed and calibrated to within an acceptable margin of uncertainty.

9. EPA needs to take an even more iterative and less rigid approach to the TMDL.

EPA has signaled its support for adaptive management in the TMDL process, especially with respect to future course corrections in EPA's new "accountability" framework. However, the Agency has not gone far enough to embed adaptive management principles into the TMDL allocations, assumptions, or requirements.

Given the size and complexity of this TMDL, it is vital that EPA acknowledge the inherent limitations in its ability to predict with confidence the reductions that are needed to restore the Bay or the effect of EPA's proposed reductions on our Bay restoration goals. It is equally important that EPA recognize the shared roles and responsibilities of the federal and state government under the Clean Water Act - roles and responsibilities that Congress designed to be cooperative, not coercive.

Rather than fight over issues of precision and authority now - a fight that tends to polarize positions and divide stakeholders who otherwise might agree to work together in a cooperative manner - EPA should take a phased and adaptive approach, first identifying the immediate, near-term reductions for which there is general consensus, and then projecting future phases based on additional data collection and modeling refinements. Such an approach would allow for reasonable forward progress even in the face of uncertainty, and help to minimize (or narrow) the potential for a fight over EPA's final TMDL decision.

Oh behalf of our Bay Policy Committee Chair Cathy Drzyzgyula, other attendees at the meeting and COG staff, thank you very much for the precious 1 1/2 hours you spent with us on Sept. 29. We may not agree with every single one of your policy choices, but we certainly appreciate your willingness to talk and listen.

I had a series of rather technical questions about the TMDL that I did not get a chance to ask during the meeting. It was more important that you hear our members' concerns. However, in the spirit of further dialogue and in the hope that someone on your staffs may be able to respond, I have listed the questions I didn't get a chance to ask below. They are not so much comments on the TMDL itself as questions that were raised by my (still very incomplete) review of the TMDL documentation. I have copied Norm Goulet because many of the questions relate to EPA actions in response to the Virginia WIP and may well turn up at the stakeholder meeting in northern Virginia next week.

TMDL Technical questions:

Does the TMDL document itself state that the allocation numbers can or will be adjusted after Dec. 31, 2010, to reflect changes requested by states or other stakeholders, revised modeling results or errors in the original document?

Response

Section 10 contains an expanded explanation of the opportunities for future modification of the TMDL.

Comment ID 0740.001.013

Author Name: Hanmer R.

Organization:

Once the TMDL loads have been allocated officially to states and tributary rivers, the states finally will be able to subdivide the, loads to the responsible local jurisdictions (principally counties) and place accountability for local actions where it belongs. This will facilitate assessment of local economic issues, help identify the most efficient approaches, and finally mobilize all those who must act to restore the Chesapeake Bay estuarine waters and their natural resource abundance.

This TMDL process is designed to result in a clear and transparent allocation of nutrient and sediment loads within each state, and among sources and categories of sources, so as responsibly and cost-effectively to apportion responsibility for achieving compliance with water quality standards over a reasonable period of time. The continuing planning process which is built into the Clean Water Act (sec. 303), coupled with EPA's commitment in the TMDL to adaptive management, will allow the states and EPA appropriate flexibility to make mid-course corrections along the way - both to assure reasonable progress and to avoid unfair economic burdens on any particular sector or source.

Response

Agree.

29 - FEDERAL FACILITIES AND LANDS

Comment ID 0435.1.001.011

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

Federal Facility Responsibilities

Comment:

The land area of the City is 53.7 square miles. The Norfolk Naval Base, Norfolk Naval Air Station, Navy Saint Helena Annex and the Army's Fort Norfolk facility are located in the City of Norfolk. These federal facilities comprise nearly one tenth of the total land area within the City. The proposed EPA backstop for managing urban runoff is to retrofit 50 percent of the urban land area for storm water runoff. The City feels that the EPA has failed to address waste load allocations from federal lands.

Recommendation:

The TMDL should contain a clear statement that federal lands located within Bay jurisdictions shall be subject to the same waste load allocations and or backstops imposed by the EPA to ensure that the pollutant reductions are achieved by all point source dischargers equitably. EPA should clearly state how they will assist state agency personnel in monitoring implementation of commitments made by federal agencies on federal lands and provide enforcement assistance if necessary. Federal progress to meeting the WIP and/or backstops should also be publically reported in two-year milestones.

Response

EPA agrees that federal lands are subject to the provisions of the TMDL. A statement to that effect is included in Section 10.4 Federal Facilities and Lands (pg. 10-5) "EPA expects federal land owners to be responsible for achieving LA and WLA through actions, programs, and policies that will reduce the release of nitrogen, phosphorous, and sediment (CWA section 313, 33 U.S.C. 1323)." With regard to federal two-year milestones and tracking progress, Section 10.4 Federal Facilities and Lands (pg. 10-5) states "Federal agencies are expected to create 2-year milestones related to planned actions for inclusion in jurisdictions' Phase II WIPs. The milestones will be the basis for tracking progress and providing transparency on federal sector performance related to agency TMDL responsibilities in the watershed." EPA will assist the jurisdictions in monitoring implementation by including federal actions in the Bay Tracking and Accountability System (BayTAS).

Organization: Metropolitan Washington Council of Governments (COG)

12. EPA Needs to Require Federal Sector to Match or Exceed State and Local Standards

Consistent with the President's Chesapeake Executive Order (#13508) and the Fiscal Year 2011 Action Plan, the federal sector should "lead by example" and be held accountable to the highest overall reduction efforts. This goes beyond the currently defined air reductions and is particularly critical for federal facilities in urban areas that contribute stormwater-related loads to local waters. It should also be made clear that state facilities also must meet local requirements. Federal implementation efforts should be part of the formal 2-year milestone reporting process.

Example:

In the District of Columbia, federal facilities represent about 30 percent of the overall area of the city. Clearly, city-wide target for stormwater load reductions under the provisions of the city's proposed MS4 permit are unobtainable without the assistance of various federal agencies in proposed retrofit, green roofing and tree planting initiatives. In recent correspondence, GAO took the position that the federal government was not obligated to pay the District of Columbia's impervious surface fee. This position violates the spirit of "lead by example" and should be reversed.

Recommendation #12: Provide an Inventory of Stormwater Management on Federal Facilities

We request that EPA and the states take the lead in conducting an inventory of how federal facilities throughout the watershed manage stormwater. The states and EPA should set reduction targets for these facilities, including roads and highways, which will exceed those that may be required of local jurisdictions (ref. Section 10.4 Federal Facilities & Lands). The federal and state government experience in trying to meet these targets will provide a test case for the feasibility of achieving TMDL targets for other parties such as local governments.

Response

Federal agencies that own land in the watershed are required to implement the stormwater requirements of the Energy Independence and Security Act (EISA) section 438 during new development and redevelopment while following the EISA guidance issued by EPA. All of the agencies named in the EO 13508 are actively developing policies and procedures or already have such policies in place to conform with the EISA requirements. In some cases, the result will be more stringent performance requirements than those typically used on non-federal lands (e.g. a more rigorous stormwater retention standard). With regard to federal two-year milestones and tracking progress, Section 10.4 Federal Facilities and Lands (pg. 10-5) states "Federal agencies are expected to create 2-year milestones related to planned actions for inclusion in jurisdictions' Phase II WIPs. The milestones will be the basis for tracking progress and providing transparency on federal sector performance related to agency TMDL responsibilities in the watershed." EPA will assist the jurisdictions in monitoring implementation by including federal actions in the Bay Tracking and Accountability System (BayTAS).

Comment ID 0516.1.001.015

Author Name: Winegrad Gerald

Organization: Senior Bay Scientists and Policy Makers for the Bay

14) The EPA should ensure that all federal and state facilities and public lands in the watershed undertake stormwater retrofits to meet TMDL allocations and state 2-year milestones. The federal and state facilities and lands should follow guidance developed by EPA pursuant to Section 438 of the Energy Independence and Security Act and Section 502 of Chesapeake Bay Executive Order (13508). All new government construction should meet a requirement for no net increase in rate, volume, or pollutants for a 5-year storm.

Response

All of the elements mentioned in the comment are included in Section 10.4 Federal Facilities and Lands of the TMDL.

Comment ID 0517.1.001.003

Author Name: Miller Christopher

Organization: Piedmont Environmental Council

PEC commends the attention to the Federal government as a major landowner within the Chesapeake Bay watershed and the importance of federal land managers leading by example. Needless to say, there is much work to be done. Federal lands, Federal office space, and private office space constructed and managed to meet Federal agency needs are a huge component of real estate development in the region. One only has to visit the offices of the various Federal partners to the Chesapeake Bay program to observe that Federal criteria for leasing office space need to include clear language on the application of best management practices for Low Impact Development and buffering of riparian areas. In the Piedmont region, the Federal Emergency Management Agency facility at Mount Weather has reduced forest cover and increased impervious surface dramatically.

Similarly, Federal aid highway construction represents one of the largest conversions of land to impervious surface and a major sediment and erosion challenge. The recent experience of the persistent failures of storm water controls along the I-95 and Beltway is just the most glaring example of the need for a higher priority to protect water quality in Federal funded transportation and construction projects. EPA needs to reconsider the wisdom of allowing general permits for transportation agencies with respect to non-point source controls, especially for major transportation projects in the Chesapeake Bay region.

Response

Executive Order 13508 Strategy for Protecting and Restoring the Chesapeake Bay Watershed includes a commitment (pg. 34) to “Ensure that stormwater impacts are minimized as part of environmental review of federal-aid highway projects and other federally-assisted transportation projects”. The Department of Transportation is the lead agency for implementing this commitment.

9. Expectations for Federal Entities

EPA has repeatedly made it clear that there will be "consequences" for jurisdictions that do not develop and/or sufficiently implement watershed implementation plans or meet milestones. EPA's intent is for these "consequences" to be placed on the Bay States and District of Columbia, but in reality most of the consequences will impact point sources and the general public. To date; however, it is still unclear what the consequences will be for federal entities. This question was raised at the October 21, 2010 Principals' Staff Committee meeting in Baltimore, MD. Shawn Garvin, PSC Chair, stated that this was still under discussion and EPA would resolve the issue of consequences for federal entities during the development of the 2-year milestones. Given the significant burden the Chesapeake Bay TMDL will be putting on those affected, including our own industry, the federal government must be held to the same standards as other sectors. It is imperative that this inequity between the requirements for federal entities (including EPA) and everyone else is addressed in the same "equitable" manner that EPA has been touting during this TMDL development process.

Response

EPA agrees that federal lands are subject to the provisions of the TMDL. A statement to that effect is included in Section 10.4 Federal Facilities and Lands (pg. 10-5) "EPA expects federal land owners to be responsible for achieving LA and WLA through actions, programs, and policies that will reduce the release of nitrogen, phosphorous, and sediment (CWA section 313, 33 U.S.C. 1323)." While equitable in terms of expected load reductions, the legal provisions for applying consequences to federal agencies is different than with other sectors due in part to the absence of a waiver of sovereign immunity under the Clean Water Act. Nonetheless, EPA expects to use all available means of enforcing the commitments made by federal land owners in the jurisdiction WIPs including public accountability of progress on two-year milestones and, where appropriate, other enforcement actions including federal facility compliance agreements.

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

D. The Conowingo Dam Needs a Management Plan Now

The Conowingo Dam is unlike any other dam in the Chesapeake Bay Watershed. Like a large quasi-BMP, the Dam removes on average approximately 3.5 million pounds of TP and 2 million tons of silt from the river annually. Without the Dam, this load would go directly into the upper Bay and once filled, the load would enter the Bay directly.

According to USGS estimates, the Dam will reach capacity around 2025, roughly at the same time the Bay States are expected to finish installing management measures to meet TMDL nutrient loadings. Once the Dam reaches capacity, the sediment load will likely be deposited in the Bay with serious consequences to Bay living resources, including benthics and grasses.

VAMWA asserted in its December 2009 Comments that because of its unique qualities, including location on the Susquehanna River (critically important in meeting Bay water quality goals), large size/span, and age (built in 1928), the Dam needs a management plan.

VAMWA also suggested that EPA and other federal agencies participate in the on-going regulatory process to re-license the Conowingo Dam at the Federal Energy Regulatory Commission ("FERC"), and echoed United States Senator Cardin's comment in the relicensing proceeding that "...a comprehensive analysis of the threat posed by these sediments is only a first step. Exelon, in coordination with the Chesapeake Bay Program Partnership, should develop an effective sediment management strategy that will control this pollution threat throughout the term of the licensing agreement at a minimum."

EPA's Draft TMDL does what VAMWA cautioned against-it delays a discussion of this important issue until the future. EPA has stated that the Bay TMDL "incorporates the current sediment-trapping capacity of the Conowingo Dam at 55 percent, with nitrogen and phosphorus trapping at 2 percent and 40 percent, respectively," but that if those capacities change based upon a review of future monitoring EPA would consider adjusting Pennsylvania, New York, and Maryland's two-year milestones. [FN101]

VAMWA has no position on what the appropriate approach might be as the Conowingo Dam ages and loses capacity, but we do believe that this is a discussion EPA, the Bay States, and interested stakeholders should be having now. The looming threat that the Conowingo presents to all of our good efforts to reduce nutrients and sediments downstream is too important an issue to push off for a discussion on another day. EPA has erred in not considering it more carefully as a part of the development of the Draft TMDL.

[FN101] Draft TMDL at 10-8.

Response

Thank you for your comments on the topic of sediments behind the dams of the Susquehanna River. The issue of addressing the sediment behind the dams of the Susquehanna River, in particular the Conowingo dam, was brought before the Water Quality Goal Implementation Team and the Principle Steering Committee for the discussion of how to address the future impacts of the dam. Based on the discussions with the Bay stakeholders it was determined to address the current capacity of the dam and to account for changes in the storage capacity in the 2 year milestones. EPA encouraged the states above the Conowingo dam—Maryland, Pennsylvania, and New York—to include this discussion in their Watershed Implementation Plan. At this time there is a sediment task force consisting of multiple stakeholders from Maryland and Pennsylvania that are working on addressing the best approach to sustain the trapping capacity of the dam. The US Army Corps of Engineers is the lead for this sediment taskforce. EPA is an active member of this group. A major interest for the sediment taskforce is the relicensing of the dam. It was determined that as part of the relicensing process the owner of the dam, Exelon, will conduct numerous studies; one of the required studies is an impact study of current sediment input and the trapping capacity of the dam to retain a percentage of the sediment and prevent it from entering the main body of the Bay and potential techniques to remove sediment from behind the dam.

EPA is not able to predict the impact that future BMPs in PA, NY and MD may have on reducing the sediment loads behind the Conowingo dam therefore the WQGIT and PSC determined that the best course was to address this sediment issue in the 2 Year milestones.

EPA did consider catastrophic events and their impact on the Bay in the development of this TMDL. EPA is unable to predict when or where the next catastrophic event will occur. It has been documented that the effect of large scale events that bring large amounts of sediment from behind the dams has a varying impact based on the time of year when the event occurs. Given this information and the potential for sediment reductions as a result of BMPs implemented by Pennsylvania and New York EPA is not basing this TMDL on potential future catastrophic scenarios.

Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets the states' and the District's Chesapeake Bay water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. For this reason, EPA considers the recommendations for the further analysis of the sediment behind the dams not to be relevant to the Bay TMDL, but instead to the implementation of the TMDL.

According to USGS estimates, the Dam will reach capacity around 2025, roughly at the same time the Bay States are expected to finish installing management measures to meet TMDL nutrient loadings. Once the Dam reaches capacity, the sediment load will likely be deposited in the Bay with serious consequences to Bay living resources, including benthics and grasses.

VAMWA asserted in its December 2009 Comments that because of its unique qualities, including location on the Susquehanna River (critically important in meeting Bay water quality goals), large size/span, and age (built in 1928), the Dam needs a management plan.

VAMWA also suggested that EPA and other federal agencies participate in the on-going regulatory process to re-license the Conowingo Dam at the Federal Energy Regulatory Commission ("FERC"), and echoed United States Senator Cardin's comment in the relicensing proceeding that "...a comprehensive analysis of the threat posed by these sediments is only a first step. Exelon, in coordination with the Chesapeake Bay Program Partnership, should develop an effective sediment management strategy that will control this pollution threat throughout the term of the licensing agreement at a minimum."

EPA's Draft TMDL does what VAMWA cautioned against-it delays a discussion of this important issue until the future.

EPA has stated that the Bay TMDL "incorporates the current sediment-trapping capacity of the Conowingo Dam at 55 percent, with nitrogen and phosphorus trapping at 2 percent and 40 percent, respectively," but that if those capacities change based upon a review of future monitoring EPA would consider adjusting Pennsylvania, New York, and Maryland's two-year milestones.[FN101]

VAMWA has no position on what the appropriate approach might be as the Conowingo Dam ages and loses capacity, but we do believe that this is a discussion EPA, the Bay States, and interested stakeholders should be having now. The looming threat that the Conowingo presents to all of our good efforts to reduce nutrients and sediments downstream is too important an issue to push off for a discussion on another day. EPA has erred in not considering it more carefully as a part of the development of the Draft TMDL.

[FN101] Draft TMDL at 10-8.

Author Name: Allen Paul

Organization: Constellation Energy

As a partner in the Safe Harbor Water Power Corporation, located in Pennsylvania, Constellation has a vested interest in how sediments and associated nutrients that settle in the reservoirs behind hydroelectric dams are managed in the Draft TMDL. Accumulation of materials behind the dams is inevitable and serves to minimize downstream transport. EPA has taken this into account in the Draft TMDL (Draft TMDL Section 10.6). Some stakeholders suggested at the October 13, 2010 public meeting in Annapolis, MD that the loadings should account for a potential dam failure or extreme storm event that would release sediments and nutrients downstream. The dams are not the source of the sediments, upstream sources are. EPA has made provisions in the Draft TMDL for the respective states to adjust their allocations from upstream sources should the ability of the dams to trap nutrients and sediments change over time (Draft TMDL Section 10.6). Including a potential catastrophic failure of one or more of the dams is not appropriate and we encourage EPA not to stray from its current approach with regard to dams and a final TMDL.

Response

Thank you for your comments and support of EPA's approach to addressing sediment behind the dams on the Susquehanna River.

2. UWAG supports EPA's approach to hydroelectric dams.

The Bay TMDL acknowledges that "dams along the lower Susquehanna River are a significant factor influencing nitrogen, phosphorus, and sediment loads to the Bay because they retain large quantities of sediment and phosphorus, and some nitrogen, in their reservoirs." See Bay TMDL at 10-7. UWAG believes that it is appropriate for EPA to identify the benefits of these dams on downstream water quality.

UWAG is aware that other commenters have asked EPA to manage these dams through the TMDL. The dams are not sources of continuing load or loading to the Bay watershed. Rather, the dams have the effect of controlling or reducing upstream load or loading. Some commenters have posited that failure of the dams would result in catastrophic downstream impacts and, for this reason, the dams should be subject to either the wasteload or load allocation. However, the TMDL program is not designed to address contingent loading and there is nothing in the statute or regulations to account for such loading. Regulating the contingent impacts from the failure of a dam would be as absurd and unfounded as regulating the contingent impacts from an upset, failure, or event of noncompliance at a wastewater treatment plant. We support EPA's approach to the dams as set forth in the draft TMDL.

Response

Thank you for your comments and support of EPA's approach to addressing sediment behind the dams on the Susquehanna River.

a. Appendix T Does Not Adequately Address the Risks from the Conowingo Dam

The discussion in Appendix T makes some remarkable claims and leaves out some very important parts of the discussion related to Conowingo Dam. Upon Conowingo Dam reaching its sediment holding capacity in 15-20 years (precisely at the end of the Bay TMDL), the sediment and phosphorus loads from the Susquehanna will increase significantly to the Bay: 250% for sediment, 70% for phosphorus, and 2% for nitrogen[FN 37]. If Conowingo Dam ever reaches capacity near the end of the TMDL, the entire multi-billion dollar investment that the states have made in restoring Chesapeake Bay will be lost forever.

EPA's discussion on page T-5 dismisses this risk by stating that "EPA's intention is to assume the current trapping capacity of the dam will continue through the planning horizon for the TMDL (2025)." The possibility of reaching the dam's capacity during the TMDL is very real, and to address this risk would take another large investment of money. Page T-4 provides an estimate of nearly \$50 million per year to dredge out enough sediment to keep up with their

delivery from the Susquehanna River. EPA has not addressed the potential for a large storm with winds from the "right" direction to scour the sediments and send them over the dam. The risk of such a calamity increases each year of the TMDL as the sediment level climbs upward behind the Conowingo Dam. In fact, as EPA washes its hands of all responsibility for the risk of failure that this situation might bring to the TMDL program in Chesapeake Bay, the agency plans to punish the downstream states in a case where "the trapping capacity of the dam is reduced, then EPA would consider adjusting the Pennsylvania, Maryland and New York 2-year milestone loads based on the new delivery loads."

Prior to the effective date for the Bay TMDL, EPA, the U.S. Army Corps of Engineers and the Chesapeake Bay states should jointly hold a public meeting to discuss and seek a solution on this very real risk to the Chesapeake Bay Restoration Program. As EPA is aware, this is not just a money issue or even simply a risk of catastrophic failure of the TMDL. The STAC Workshop in May 2000 on "The Impact of Susquehanna Sediments on the Chesapeake Bay" found that the consequences that will result as sediment nears the lip of the dam include: (1) increased phosphorus in the Middle Bay; (2) an increased need for dredging navigation channels in the Upper Bay; (3) higher turbidity and faster sedimentation everywhere in the Bay, but especially in the navigation channels; (4) adverse effects on the recovery of submerged aquatic vegetation; (5) impacts to benthic organisms; and (6) impacts to fish. Without massive amounts of money spent to address the sediment pile up behind the Conowingo Dam, the listed impacts could begin to appear in Chesapeake Bay towards the end of the TMDL (2025), even after the Bay states spending billions of dollars to reduce their pollutant loadings to the Bay.

Organization: Hampton Roads Sanitation District (HRSD)

J. Filter feeders and menhaden offer another means to address chlorophyll-a compliance on the James River

We support EPA's efforts to consider the role of Atlantic menhaden in relation to management of chlorophyll-a. Recent modeling work has shown that their migration into the tributaries and associated consumption of algae has the potential to affect chlorophyll-a and associated compliance with the standards. We agree with the statement included in TMDL Appendix U "Although the influence of menhaden on water quality is estimated to be less than that of oyster filter feeders, even a small percentage of nutrient assimilation or chlorophyll reduction in the Chesapeake Bay would ease the pressure in meeting 2-year milestones." Menhaden stocks do not dramatically reduce chlorophyll as long term averages but their incremental effects are considered comparable to nutrient reduction.

HRSD recommends that additional analyses be conducted to evaluate menhaden effects on seasonal peaks and/or worst years in the record. Further, additional modeling enhancements need to address menhaden migration and residence time variability according to a food gradient. A number of papers indicate that menhaden consumption of algae increases in areas with higher chlorophyll-a. This is logical because the species would remain longer in an area with greater availability of food. Because the model does not presently capture these foraging effects the available reductions in chlorophyll due to menhaden (especially during bloom conditions) would be under-estimated.

Response

Please refer to the response to comment 0230.1.001.051 where EPA speaks to accounting for additional analysis for filter feeders.

Organization: Hampton Roads Sanitation District (HRSD)

A. EPA's Failure to Explicitly Include Filter Feeders and Alternative Technologies in the Bay TMDL is Unreasonable

In its December 2009 Comments, VAMWA made recommendations regarding how EPA should include filter feeders in the Bay TMDL. VAMWA explained that various studies and the Bay Program's own modeling efforts have demonstrated that increase biomass of oysters and menhaden have the potential to cause measureable improvements in dissolved oxygen, water clarity, and chlorophyll-a. Improvements in these living resources are among the Bay partner's most important goals, and their water quality benefits should be fully considered in the TMDL process. VAMWA suggested that EPA either (a) adopt nutrient and sediment loading caps that implicitly consider the benefits of filter feeder

improvements; (2) explicitly assign a certain proportion of the required load reduction to filter feeder restoration; or (3) allow filter feeder restoration to result in the availability of nutrient credits to offset other sources.

EPA ignored these recommendations in the Draft TMDL, choosing instead to note that:

EPA is basing the TMDL on the current assimilative capacity of filter feeders at existing populations built into the calibration of the oyster filter feeding submodel...Potential future changes would not be accounted for in the Bay TMDL. If future monitoring data indicate an increase in the filter feeder population, the appropriate jurisdiction's 2-year milestones delivered load reductions can be adjusted accordingly....[FN98]

EPA's decision is inappropriate. Oyster farming and aquaculture show real promise. In mid- October, 2010, several news outlets reported the formation of the State's first oyster cooperative, Oyster Company of Virginia. A private company formed a cooperative that will allow Virginia's watermen to lease bottomland from Virginia, plant, grow, harvest and sell oysters. Profits will be plowed back to fuel the endeavor. Although this is project is small in scope at this point, it is an important first step, and an excellent example of what Virginians could do to foster aquaculture. These types of efforts should be considered as a part of this TMDL. [FN99]

In addition, HRSD reiterates the support we included in our December 2009 Comments with regard to EPA's efforts to consider the role of Atlantic menhaden in relation to management of chlorophyll-a. Recent modeling work has shown that their migration into the tributaries and associated consumption of algae has the potential to affect chlorophyll-a and associated compliance with the standards. Although menhaden stocks do not appear to dramatically reduce chlorophyll (as long term averages) their incremental effects are considered comparable to nutrient reduction. HRSD recommends that additional analyses be conducted to evaluate menhaden effects on seasonal peaks and/or worst years in the record. Further, additional modeling enhancements should be made such that the menhaden migration and residence time varies according to a food gradient. A number of papers indicate that menhaden consumption of algae increases in areas with higher chlorophyll-a. This is logical since the species would remain longer in an area with greater availability of food. Because the model does not presently capture these foraging effects the available reductions in chlorophyll due to menhaden (especially during bloom conditions) could be under-estimated.

In addition to filter feeders, VAMWA also recommended that some portion of future reductions needed to meet water quality goals should be assigned to technological advancements, such as the Algal Turf Scrubber® ("ATS") and floating wetlands. Although VAMWA acknowledged these alternative technologies may not be ready for full deployment Bay-wide, VAMWA recommended that EPA acknowledge and encourage their possible future use in the Bay TMDL, including assisting with funding, to encourage research and development. Spending money on research that could make a major dent in clean-up efforts is far preferable to spending money to squeeze minimal reductions from POTW loadings.

EPA also ignored these recommendations in the Draft TMDL. EPA has established an extraordinarily aggressive approach in its Draft TMDL, but it has not left any room for the natural progression of technology-technology that could greatly assist in making nutrient and sediment reductions in lieu of expensive additional POTW upgrades.

For these reasons, EPA should revise its Draft TMDL to assign some portion of future reductions to filter feeders and alternative technologies.

[FN98] Draft TMDL at 10-8.

[FN99] Note that, according to news reports, the cooperative "...plans to lobby state and federal officials to include their efforts in the "pollution diet" the U.S. Environmental Protection Agency is drafting for the bay." Daily Press, Oct. 13, 2010 (attached hereto as Appendix 50).

Response

At the time of publication of the Bay TMDL, EPA cannot make management decisions on the potential future increase of filter feeders in the Bay. This topic was presented to both the Water Quality Goal Implementation Team and the Principle Steering Committee for decision in April 2010 on how to include filter feeders into the TMDL document. While there has been a significant effort invested by organizations in Maryland and Virginia in restoring the oyster population of the Bay, to date there has not been large increases in population numbers due to the challenges faced by disease and lack of suitable substrate for oysters in the Bay. EPA, based on agreement from the partners on the WQGIT and the PSC determined that until we can document increased population numbers of filter feeders in the Bay that there should be no assumptions made within the Bay TMDL on potential future populations. EPA did agree to consider accounting future population growth within the 2-year milestones if a jurisdiction is able to provide for contingency reductions if there is not a significant population increase to account for nutrient reductions. EPA encourages organizations to continue to work to increase filter feeder populations which are historically known for their ability to filter nutrients.

The Chesapeake Bay Program has a published mechanism for incorporating new technologies and practices in the Bay Watershed Model. The Chesapeake Bay Program partnership's protocol is available at <http://www.chesapeakebay.net/marylandbmp.aspx?menuitem=34449>.

There have been varying results from scientific studies on the benefits of menhaden in regards to pollutant reduction. As noted in your comments it is variable the amount of reductions menhaden provide and there is not solid scientific evidence that shows the nutrient removal potential during times of high chlorophyll a. Menhaden are a migratory species so it is difficult to calculate their population in the Bay at a given time. Scientific studies also note that the ability to filter chlorophyll a depends on the age class of the menhaden present in the Bay.

Large numbers of menhaden are removed from the Bay on a yearly basis for commercial harvesting which may impact the nutrient removal abilities depending on the time of year they are harvested. Also you note in your comments that menhaden may be present during time of high chlorophyll a and filtering large amounts of nutrients from the Bay water. However, one must also consider that the increased feeding also leads to an increase in the amount of waste produced from the fish, which may negate the impact of their filter feeding.

Further, EPA reminds the commenter that we are under legal obligation to establish a TMDL that meets water quality standards. This requires EPA to establish the loadings necessary to meet water quality standards given reasonable assurance that standards will be achieved. For this reason, EPA considers the recommendations for the further analysis of filter feeder populations, their impact on improving water quality, and technological advancements not to be relevant to the TMDL, but instead to the implementation of the TMDL.

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

Finally, given the immense costs and difficulty of attaining the urban runoff sector allocations, it is remarkable that the TMDL reflects so little interest on the part of EPA in seriously considering and pursuing additional, more cost-effective opportunities to achieve the basin-wide allocations. While assigning allocations to load reductions attributable to filter feeders such as oysters and menhaden would not provide reasonable assurance that the urban runoff sector allocations can be achieved, it would provide some relief to the impossible burden that the TMDL would impose on the Localities.

Response

EPA is under a legal obligation to establish a TMDL that meets water quality standards in the Bay. Please see response to comment 0139.1.001.017

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

EPA's Should Revise the TMDL Based on Consideration of Filter Feeders and Alternative Technologies in the Bay TMDL

In its December 2009 Comments, MAMWA made recommendations regarding how EPA should include filter feeders in the Bay TMDL. MAMWA explained that various studies and the Bay Program's own modeling efforts have demonstrated that increase biomass of oysters and menhaden have the potential to cause measureable improvements in dissolved oxygen, water clarity, and chlorophyll-a. Improvements in these living resources are among the Bay partner's most important goals, and their water quality benefits should be fully considered in the TMDL process. MAMWA suggested that EPA either (a) adopt nutrient and sediment loading caps that implicitly consider the benefits of filter feeder improvements; (2) explicitly assign a certain proportion of the required load reduction to filter feeder restoration; or (3) allow filter feeder restoration to result in the availability of nutrient credits to offset other sources.

EPA ignored these recommendations in the Draft TMDL, choosing instead to note that:

EPA is basing the TMDL on the current assimilative capacity of filter feeders at existing populations built into the calibration of the oyster filter feeding submodel...Potential future changes would not be accounted for in the Bay TMDL. If future monitoring data indicate an increase in the filter feeder population, the appropriate jurisdiction's 2-year

milestones delivered load reductions can be adjusted accordingly.... [FN25]

EPA's decision is inappropriate. Oyster farming and aquaculture show real promise. In mid-October, 2010, several news outlets reported the formation of a new oyster cooperative in Virginia, the Oyster Company of Virginia. A private company formed a cooperative that will allow Virginia's watermen to lease bottomland from Virginia, plant, grow, harvest and sell oysters. Profits will be plowed back to fuel the endeavor. In addition, Maryland has been very aggressively approaching aquaculture. According to a recent AP story, Maryland Governor O'Malley recently announced \$2.2 billion in loans for oyster aquaculture in FY11. The State's efforts are a follow-up to the development of a oyster restoration plan. Efforts in Virginia and Maryland are not hypothetical-they are actually happening on the ground. They should be considered as a part of this TMDL. [FN26]

In addition to filter feeders, MAMWA also recommended that some portion of future reductions needed to meet water quality goals should be assigned to technological advancements, such as the Algal Turf Scrubber ("ATS") and floating wetlands. Although MAMWA acknowledged these alternative technologies may not be ready for full deployment Bay-wide, MAMWA recommended that EPA acknowledge and encourage their possible future use in the Bay TMDL, including assisting with funding, to encourage research and development. Spending money on research that could make a major dent in clean-up efforts is far preferable to spending money to squeeze minimal reductions from POTW loadings.

EPA also ignored these recommendations in the Draft TMDL. EPA has established an extraordinarily aggressive approach in its Draft TMDL, but it has not left any room for the natural progression of technology-technology that could greatly assist in making nutrient and sediment reductions in lieu of expensive additional POTW upgrades.

For these reasons, MAMWA opposes these aspects of EPA's Draft TMDL. EPA should revise its Draft TMDL to assign some portion of future reductions to filter feeders and alternative technologies.

EPA's Failure to Explicitly Include Filter Feeders and Alternative Technologies in the Bay TMDL is Unreasonable

Various studies and the Bay Program's own modeling efforts have demonstrated that increase biomass of oysters and menhaden have the potential to cause measureable improvements in dissolved oxygen, water clarity, and chlorophyll-a. Improvements in these living resources are among the Bay partner's most important goals, and their water quality benefits should be fully considered in the TMDL process. VAMSA suggests that EPA either (a) adopt nutrient and sediment loading caps that implicitly consider the benefits of filter feeder improvements; (2) explicitly assign a certain proportion of the required load reduction to filter feeder restoration; or (3) allow filter feeder restoration to result in the availability of nutrient credits to offset other sources.

EPA's Draft TMDL is inconsistent with these recommendations in the Draft TMDL:

EPA is basing the TMDL on the current assimilative capacity of filter feeders at existing populations built into the calibration of the oyster filter feeding submodel...Potential future changes would not be accounted for in the Bay TMDL. If future monitoring data indicate an increase in the filter feeder population, the appropriate jurisdiction's 2-year milestones delivered load reductions can be adjusted accordingly....[FN40]

EPA's decision is inappropriate. Oyster farming and aquaculture show real promise. In mid-October, 2010, several news outlets reported the formation of the State's first oyster cooperative, Oyster Company of Virginia. A private company formed a cooperative that will allow Virginia's watermen to lease bottomland from Virginia, plant, grow, harvest and sell oysters. Profits will be plowed back to fuel the endeavor. Although this project is small in scope at this point, it is an important first step, and an excellent example of what Virginians could do to foster aquaculture. These types of efforts should be considered as a part of this TMDL.[FN41]

In addition, VAMSA supports EPA's efforts to consider the role of Atlantic menhaden in relation to management of chlorophyll-a. [FN42] Recent modeling work has shown that their migration into the tributaries and associated consumption of algae has the potential to affect chlorophyll-a and associated compliance with the standards. Although menhaden stocks do not appear to dramatically reduce chlorophyll (as long term averages) their incremental effects are considered comparable to nutrient reduction. VAMSA recommends that additional analyses be conducted to evaluate menhaden effects on seasonal peaks and/or worst years in the record. Further, additional modeling enhancements should be made such that the menhaden migration and residence time varies according to a food gradient. A number of papers indicate that menhaden consumption of algae increases in areas with higher chlorophyll-a. This is logical since the species would remain longer in an area with greater availability of food. Because the model does not presently capture these foraging effects the available reductions in chlorophyll due to menhaden (especially during bloom conditions) could be under-estimated.

In addition to filter feeders, VAMSA also recommends that some portion of future reductions needed to meet water quality goals should be assigned to technological advancements, such as the Algal Turf Scrubber® ("ATS") and floating wetlands. Although these alternative technologies may not be ready for full deployment Bay-wide, EPA should acknowledge and encourage their possible future use in the Bay TMDL, including assisting with funding, to encourage research and development. Spending money on research that could make a major dent in clean-up efforts is far preferable to spending money on expensive MS4 retrofits.

EPA has established an extraordinarily aggressive approach in its Draft TMDL, but it has not left any room for the natural progression of technology-technology that could greatly assist in making nutrient and sediment reductions in lieu of expensive additional POTW upgrades.

For these reasons, EPA should revise its Draft TMDL to assign some portion of future reductions to filter feeders and alternative technologies.

[FN40] Draft TMDL at 10-8.

Organization: Virginia Manufacturers Association VMA

Awarding Credits for Alternative Projects Must be Supported by Sound Science.

VMA supports EPA's willingness to give credit to Virginia for alternative projects to reduce nitrogen and phosphorus. Allowing such credits will foster creativity in achieving the water quality goals for the Bay. However, such credit should only be awarded where the available science supports the expected benefit.

For example, Appendix U provides that if states can show a change in the population of filter feeders (menhaden and Eastern oysters), then the state would receive a credit towards reaching the EPA's two-year milestone. However, EPA's assumptions about the role of menhaden conflicts with the available science.

During 2008 and 2009, researchers at the Virginia Institute of Marine Science (VIMS) conducted a study to assess the efficacy of menhaden behavior to remove nitrogen from the waters of the Chesapeake Bay through consumption of phytoplankton (Lynch et al 2010). While menhaden do filter large amounts of water and take phytoplankton particles into their mouths, it is not clear that they remove sufficient phytoplankton from the water to offset the introduction of nitrogenous products from anthropogenic sources.

VIMS' research, involving tank feeding studies, found that age 0, or young-of-the-year (juvenile) menhaden do consume measurable amounts of phytoplankton through their filter feeding behavior. This is consistent with research by Friedland et al. (2006) who found that the branchiospinules (sieving apparatus) inside the menhaden's gill chamber was small enough in age 0 fish to retain particles the size of most of the phytoplankton occurring in Chesapeake Bay. However, those researchers also found that as the juvenile fish grow, at approximately age 1, their sieving apparatus also grows to the point that most of the small phytoplankton particles are not retained. This finding is also consistent with the Lynch et al (2010) study that found that adult (age 1+) menhaden eat mostly zooplankton. Finally, Lynch and his colleagues found that all menhaden excrete large amounts of ammonia-N, a nitrogenous product that is more bio-available than the nitrogen from runoff. This finding is consistent with previous work by Oviatt et al. (1972). This excretion, around 60% of menhaden's total food intake, offsets the amount of phytoplankton consumed by age 0 fish and the small amount of phytoplankton consumed by age 1+ fish.

Atlantic menhaden are migratory along the Atlantic coast from Florida to Nova Scotia and constitute a single genetic population. Management of Atlantic menhaden is accomplished through the Atlantic States Marine Fisheries Commission, an interstate fishery management body that recognizes that migratory fish populations cannot be effectively managed by individual state action, but must be managed through coordinated interstate action. No single state could enact any fisheries provisions that would have a measurable impact on the status of the coast-wide

population that could be attributable to that state's action. The only state that allows a large reduction fishery is Virginia. Other states only allow small amounts of bait fishing for menhaden. It would be impossible for EPA to evaluate programs at the state level and conclude that any state did anything that resulted in increasing the menhaden population, even if they did have a significant impact on reducing nitrogen, which they do not, as evidenced by the research cited above.

It should also be noted that the Lynch et al. (2010) study found that zooplankton is the most significant consumer of phytoplankton in Chesapeake Bay. Recognizing that menhaden are a significant predator of zooplankton, it is likely that a large presence of menhaden in the Chesapeake Bay would negatively impact the ability of zooplankton to remove phytoplankton. This fact, along with menhaden's prodigious excretion rate of ammonia-N, leads to the conclusion that a large presence of menhaden in Chesapeake Bay will have an overall negative impact on nutrient removal.

EPA should review the available studies before agreeing to provide credit for nutrient reductions on the basis of menhaden serving as filter feeds. A listing of recent studies on this topic is provided below:

Lynch, P.O., MJ. Brush, E.D. Condon, and R.J. Latour. Net removal of nitrogen through ingestion of phytoplankton by Atlantic Menhaden, *Brevoortia tyrannus* in Chesapeake Bay. *Mar Ecol Prog Ser*, Vo1. 401: 195-209,2010.

Oviatt, C. A., A. L. Gall, S. W. Nixon. 1972. Environmental Effects of Atlantic Menhaden on Surrounding Waters. *Chesapeake Science*, Vol. 13, No.4, (Dec., 1972), pp. 321-323.

Finally, given the immense costs and difficulty of attaining the urban runoff sector allocations, it is remarkable that the TMDL reflects so little interest on the part of EPA in seriously considering and pursuing additional, more cost-effective opportunities to achieve the basin-wide allocations. While assigning allocations to load reductions attributable to filter feeders such as oysters and menhaden would not provide reasonable assurance that the urban runoff sector allocations can be achieved, it would provide some relief to the impossible burden that the TMDL would impose on the Localities.

G. Focus on "alternative" BMPs, sustainable approaches, and developing technologies to improve the Bay, including:

1. prevent over-fishing of filter feeders or other "looting" of the Bay's ecosystems by commercial fishing and harvesting operations; if necessary, require a permitting and reporting system so that the status of harvesting limits can be monitored and enforced on a federal level, and
2. investigate development of algae-channels and other algae-based technologies for use as in-stream and in-Bay nutrient removal strategies as well as renewable energy sources; use R&D emphasis to make technology transferable to WWTPs and other nutrient sources that have algae issues (see, on-line Comment Docket Comment Attachment #216.1 and <http://articles.baltimoresun.com/2010-09-26/features/bs-gr-algae-nutrients-energy-20100920_1_algae-tiny-aquatic-plants-renewable-energy>)

4. Oyster Aquaculture Should Be a Means to Generate Nutrient Credits

The draft TMDL discusses the importance of filter feeders to the Bay, chief among them oysters and menhaden. The Draft Programmatic Environmental Impact Statement for Oyster Restoration in Chesapeake Bay concluded that native oyster aquaculture would be a critical component of restoring the ecosystem services provided by oysters, chiefly filtering of Bay water. WRI recommends that EPA, other relevant federal agencies, and the states assign high priority to oyster restoration and work to facilitate and expand oyster aquaculture in the Bay. The nutrient trading program could play a large role in this expansion and provide additional financial incentives to oyster growers. The nutrient mass in oysters grown in the Bay and then harvested can be directly measured and can form the basis for nutrient credits. Sale of these credits would increase the profit margins for oyster growers and provide an incentive to expand production, resulting in additional filtering capacity and multiple environmental benefits. There is no doubt that much work still needs to be done before oyster-based credits can be certified for the market. EPA should facilitate and support the necessary analysis and seek to bring oysters into the trading program as quickly as possible.

I. Filter feeders and menhaden offer another means to address chlorophyll-a compliance on the James River

These comments support EPA's efforts to consider the role of Atlantic menhaden in relation to management of chlorophyll-a. Recent modeling work has shown that their migration into the tributaries and associated consumption of algae has the potential to affect chlorophyll-a and associated compliance with the standards. VAMSA agrees with the statement included in TMDL Appendix U "Although the influence of menhaden on water quality is estimated to be less than that of oyster filter feeders, even a small percentage of nutrient assimilation or chlorophyll reduction in the Chesapeake Bay would ease the pressure in meeting 2-year milestones." Menhaden stocks do not dramatically reduce chlorophyll as long term averages but their incremental effects are considered comparable to nutrient reduction.

Additional analyses should be conducted to evaluate menhaden effects on seasonal peaks and/or (worst years in the record. Further, additional modeling enhancements need to address menhaden migration and residence time variability according to a food gradient. A number of papers indicate that menhaden consumption of algae increases in areas with

higher chlorophyll-a. This is logical because the species would remain longer in an area with greater availability of food. Because the model does not presently capture these foraging effects the available reductions in chlorophyll due to menhaden (especially during bloom conditions) would be under-estimated.

The name "Chesapeake" was derived from the Native American word "Tschiswapeki" which loosely translates as "great shellfish bay." [FN1] Sadly, this name has become a modern misnomer as the current oyster population is estimated to be only one percent of pre-civilization levels.

To the uninformed, it may seem "obvious" that land use changes in the Chesapeake Bay watershed, together with overfishing, are responsible for the decline in oysters. Yet the facts strongly indicate that overharvesting (starting approximately 150 years ago - long before the regional increase in the human population during the 20th Century) and direct habitat destruction by dredging in the Bay are the primary factors and "proximate cause" of the decline in oyster populations.[FN2]

Equally important as we consider the Draft TMDL, the decline in the oyster population is directly responsible for much of the reduced water quality of the Bay itself. It is a well-established scientific fact that the native Eastern oyster (*Crassostrea virginica*) was the keystone species in the Bay. [FN3] In ecological terms, this means that the oyster population was the primary influence over the extent and quality of the Bay's habitat. Removing the oysters directly resulted in a decline in the amount of habitat and a reduction in the water quality available for all other species in the Bay.

Thus, in ecological (as well as legal) terms, EPA's approach to restoring water quality in the Chesapeake Bay has it precisely backwards - reducing the nutrient runoff in the Chesapeake Bay will not result in a restoration of the populations of oysters and other filter feeders and, therefore, cannot achieve overall water quality standards. In contrast, restoration of the oyster population (along with other native filter feeders) will, in fact, result in a reduction of the pollution levels in the Bay. Yet EPA has not produced any estimates of the relative contributions of these critical factors that underpin water quality in the Bay despite a requirement under the applicable law to provide to the public a transparent analysis of all significant causative factors. [For technical analysis, please refer to Appendix A.]

As a result, the Draft TMDL is an arbitrary and capricious Agency action that seeks to improperly impose land use restrictions (directly and indirectly) on State and local jurisdictions and private property owners within the larger Chesapeake Bay watershed.

THE IMPORTANCE OF THE OYSTER

According to the Chesapeake Bay Foundation:

Oysters purify the Chesapeake Bay as they filter the water for their food. An adult oyster can filter as much as 50 gallons of water a day.

Sediment and nitrogen cause problems in Bay waters. Oysters filter these pollutants either by consuming them or shaping them into small packets, which are deposited on the bottom where they are not harmful.

The oysters in the Bay could once filter a volume of water equal to that of the entire Bay (about 19 trillion gallons) in a week. Today, it would take the remaining Bay oysters more than a year. [FN4]

The National Oceanic and Atmospheric Administration agrees:

Oysters are filter feeders, consuming phytoplankton (free-swimming algae) and improving water quality while filtering the water for food. As generations of oysters settle on top of each other and grow they form reefs that provide structured habitat for many fish species and crabs. The Chesapeake Bay was once known for its abundance of oysters. Much of their recent decline was due to decades of overharvest and habitat destruction. More recently two parasitic diseases, MSX and Dermo, have devastated the remaining oyster populations in most areas of the Bay and its tributaries. [FN5]

Yet the impact of oysters on the Bay's ecology was not solely due to their prodigious capacity to filter the water and remove pollutants. Undisturbed oyster beds grew into enormous shell reefs which played a role in the Chesapeake Bay analogous to that of tropical water coral reefs.

Bay oysters used to grow in tall reefs that were much better for the Bay than today's flat oyster beds. The reefs were elevated, which kept oysters above the silty bottom and exposed them to food-rich currents above. The healthy oyster reefs of 100 years ago were so large that they were considered navigational hazards. [FN6]

As can be seen from the following bar graph [FN7], oyster populations were decimated long before the major modern development in urban and suburban areas of the Bay watershed.

[Original Comment letter contains additional information in Table 1 - Chesapeake Bay oyster landings by state, 1880-2008. Please see page 3 of the original letter (Docket ID 0589.1.001).]

In particular, note that the period selected by EPA as the "baseline" for its TMDL modeling corresponds to historically low levels of oysters in the Bay. EPA concedes that all of "The models used to develop the Chesapeake Bay TMDL simulate the same 10-year hydrologic period from 1991 to 2000." [FN8] [Emphasis added]

The current Draft TMDL simply fails to provide sufficient information to the public to determine whether EPA properly understands the role of oysters in the Bay - either in terms of historical importance in the past or potential importance in the future. Yet this information is crucial to the design of any plan to achieve water quality standards for the Bay. Consider this statement on the importance of oysters in the Bay:

The Bay's oyster population has severely declined over the past century due to over-harvesting, which removed huge volumes of oysters. Over-harvesting also led to the demise of the Bay's healthy oyster reefs, which were scraped away by dredging. Oyster beds are now usually limited to a flat, thin layer of dead shells and live oysters spread widely over the Bay's bottom.

These damaged habitats:

- Offer less surface area for oyster spat and other reef-dwelling invertebrates to attach themselves to. This impacts larger fish and blue crabs that live and breed around oyster reefs and prey upon these smaller species.
- Are easily covered by sediment, which smothers live oysters and can eventually bury a damaged reef.

... In addition to harvest pressure, the Bay's oysters face a number of other challenges. One of these is disease. Since the 1950s, the oyster diseases MSX and Dermo have decimated the Bay's remaining oyster population.

The Bay's oysters have also been impacted by poor water quality. [FN9]

Thus, although land use changes during the past 100 years may have had an additional impact on oyster populations in the Bay it is arbitrary and capricious to assume the majority of water quality impairments arise from land use changes, as the current draft TMDL apparently does.

The lack of formal property rights on the original oyster bars of the Chesapeake Bay (and, therefore, the inability of individual oystermen to exclude competitors) led directly to the overharvesting of this resource and a classic "tragedy of the commons" situation.[FN10] It would be ironic if the ecological problems created by this absence of property rights in the Bay itself led EPA to ignore the legitimate property rights of landowners in the surrounding watershed who have fully complied with the laws and regulations of their local jurisdictions for over a century.

In its Draft TMDL EPA indicates that it has considered various scenarios for pollution flowing into the Bay. However, EPA has not provided any estimate for the impact of filter feeders on pollution levels. Filter feeders (primarily oysters) do not play a role in the TMDL calculations despite the fact that their absence is the sine qua non for much, perhaps most, of the nutrient buildup in the Bay. The Draft TMDL acknowledges this failure when it says:

EPA's intention is to base the TMDL on the current population of filter feeders. Potential future population changes would not be accounted for in the TMDL.[FN 11]

It then suggests that future modifications to 2-year milestones for states are possible if they are able to increase the oyster population.[FN12] That is as far as EPA goes in its "analysis" of perhaps the single most important factor for nitrogen, phosphorus, chlorophyll a and dissolved oxygen levels in the Bay. [Please refer to Appendix A]

In other words, EPA has not fully established the cause-and-effect of Bay water quality impairment yet it seeks to impose extremely high costs on landowners and municipalities by requiring them to provide all mitigation efforts. Much of the projected expense of implementing this TMDL would come from new land-based water filtering systems - even as EPA has ignored the historical role played by oysters in maintaining the Bay's water quality. The Draft TMDL asserts

that stormwater runoff is the primary source of impairment of the Bay's ecology when, in fact, prior overharvesting of oysters reduced the natural filtering capacity of the Bay to such an extent that otherwise harmless levels of sediment/nutrients just "sit there" until they can trigger a host of other water quality problems. EPA should be required to calculate a specific level of oyster restoration (or range of possible levels) that must be reached before it imposes Bay-wide TMDL targets for stormwater runoff. Chesapeake Bay water quality levels are too dependent upon the oyster population to ignore the issue to this degree.

Unless and until the oysters are restored to some significant fraction of historical populations the Bay will never return to a balanced, healthy ecosystem. The initial cause of the water quality impairment was overharvesting of oysters and physical destruction of in-Bay habitat - not runoff from commercial and residential development or land-based agricultural practices. Even if the degree to which water quality depends upon oysters is uncertain, EPA cannot provide any reasonable estimate of proportionate responsibility without conducting a detailed and transparent analysis of the oyster population and its historic interaction with the Bay's water quality. Thus far, EPA has failed to conduct this necessary analysis and, therefore, has produced a severely flawed Draft TMDL. Appendix A of these Comments provides a technical analysis by LimnoTech that further addresses EPA's inadequate efforts to incorporate filter feeders in the Draft TMDL.

CONCLUSION

EPA has not demonstrated to what extent the independent decline in the oyster population is responsible for the decrease in dissolved oxygen or the increase in chlorophyll a, nitrogen, phosphorus or sediment. Thus it cannot logically assert any numerical relationship between land-based stormwater run-off and nutrient levels measured in the Bay. Merely mentioning filter feeders in the Draft TMDL is not sufficient to discharge this statutory requirement. To issue a TMDL without first producing these calculations for public review and comment would violate the Administrative Procedures Act (5 U.S.C. 553(c)) and the prohibition against arbitrary and capricious Agency actions (5 U.S.C. § 706(2)(A)).

Therefore, EPA should immediately withdraw its Draft TMDL and reissue it for public comment only after it has concluded the necessary analysis and transparently included those results in its TMDL assumptions.

APPENDIX A

ANALYSIS OF THE ROLE OF FILTER FEEDERS IN THE DRAFT CHESAPEAKE BAY TMDL

The draft Total Maximum Daily Load (TMDL) for total nitrogen (TN), total phosphorus (TP), and sediment in the Chesapeake Bay is deficient because it does not adequately inform the public of the important role that increased stocks of filter feeders could play in establishing and implementing the TMDL. Indeed, Appendix U of the draft TMDL understates the potential benefits of increased stocks of filter feeders because it is incomplete and relies on outdated information.

EPA should revise the draft TMDL to provide updated information about the beneficial impacts of filter feeders using the current Watershed Model and Water Quality Sediment Transport Model (WQSTM). EPA (to our knowledge) has not produced simulations of the benefits of filter feeders using the current models. Even if EPA does not have current model results, EPA should provide the information showing the benefits of filter feeders using previous versions of the models.

This is necessary so that the public can properly review and fully comment on the draft TMDL and the Watershed Implementation Plans (WIPs). For example, EPA should show the public which segments could fully attain water quality standards [FN1] with a modest level of restoration of filter feeders. EPA should provide a simulation to show how a modest level of restoration could reduce the onerous reductions in nutrients and sediment loads required in Scenario E3 [FN2].

EPA should also provide a full and transparent explanation in the draft TMDL as to why none of the scenarios conducted for the TMDL represented filter feeders at populations that are greater than their current levels. Accounting for restoration of filter feeders (not just oysters) as nutrient and sediment loads are reduced, has no less reasonable assurance than other assumptions EPA has employed in the draft TMDL (and for all potential final TMDLs presented by EPA). For example, Scenario E3 should include concerted efforts to restore filter feeders to the maximum extent practicable, even if that means relying on emerging and new technologies[FN 3]. It is unclear why the nutrient load reduction targets for Scenario E3 cannot be different if modest improvements in filter feeders would justify lower nutrient load reductions.

EPA should also acknowledge that additional work is needed to adequately address concerns raised during Chesapeake Bay Program meetings about the effect of filter feeders on nutrient and sediment allocations in the TMDL and the WIPs. This includes ensuring that resources will be directed to adequately determine load reduction adjustments if future monitoring data indicate changes in filter feeder populations during the 2-year milestones. It also means ensuring that data are available, including updated tools, to address these concerns prior to the 2011 and 2017 updates of the TMDL.

Updated information on the benefits of increased stocks of filter feeders would also provide information that could be used to evaluate whether a Use Attainability Analysis (UAA) is needed to determine the highest attainable uses for the Chesapeake Bay and its tidal tributaries. Under the UAA, the economic impact of attaining scenarios like E3 can be considered. EPA was considering the potential need for a UAA until 2009[FN 4, FN 5]. Conducting a UAA would not be a license for "more pollution" or letting hypoxia levels remain at the status quo. Instead, defining the maximum dollars available for restoration in 3-year (not 2-year) increments[FN 6], could result in development of realistic (yet still aggressive) WIPs and more specific (and achievable) milestones for load reductions and ecological restoration. This would allow the federal and state agencies and people that work and live in the Bay watershed to target scarce resources towards programs to maximize ecological and economic benefits, and experiment with new technologies. The UAA would be re-visited every three years during the State's triennial reviews, as required under the Clean Water Act.

It should be noted that a complete review of this issue was difficult within the shortened timeframe of the public comment period [FN7]. Information presented here is not complete, in particular because documentation on the version of the Chesapeake Bay WQSTM used for the draft TMDL is not available.

ADDITIONAL CONSIDERATIONS

A. EPA obviously understands and recognizes the importance and inter-relationships between water quality and filter feeders. The targets (i.e. water quality standards) in the draft TMDL are, in part, to ensure that water quality conditions are sufficient to restore and protect these filter feeders. EPA should therefore document in the TMDL how restoring filter feeders can achieve the same desired water quality in combination with load reductions.

Since 2002, the Chesapeake Bay Program has directed significant resources into developing tools to understand the beneficial impact of restoring filter feeders[FN 8, FN 9]. EPA apparently decided in April 2010 that the benefits of restoring filter feeders could not be considered in the TMDL and that States and the District of Columbia should not be able to count on taking credit for these impacts in their WIPs [FN 10]. This is confusing and at apparent counter-purposes for incorporating the effects of filter feeders in the WQSTM. The developers of the water quality model[FN 11] (WQM) stated:

"Our model agrees with a wide body of evidence that bivalves can modify their local environment. When bivalves are confined to only a small portion of bottom area, their ability to transform an entire estuarine system is limited. In view of the enormous cost and technological difficulties associated with controlling external loads, DO [dissolved oxygen] improvements on the order of tenths of a g m⁻³ [gram per cubic meter] and nitrogen removal on the order of 10% of system loading cannot be disparaged. These improvements have economic and ecological values and are to be encouraged" (Cercio and Noel, 2007, page 341).

EPA and the Chesapeake Bay Program were apparently considering including the effects of enhanced filter feeder (specifically menhaden and oyster) populations in the TMDL until the April 5-6, 2010 Water Quality Goal Implementation Team meeting, when this was abandoned. At this meeting, EPA presented its position that it was "not willing to project increase in population" (see Minutes [FN12] page 14). It should be noted that the tenfold and fifty-fold oyster scenarios with the current models were still pending as of the March 31, 2010 Quarterly Modeling Subcommittee meeting. It would have been interesting to have seen at least some of the WQSTM results in the presentation that EPA used at the April 5-6, 2010 meeting[FN 13].

Section 10.7 of draft TMDL acknowledges that filter feeders play an important role in the uptake of nitrogen and phosphorus. It fails, however, to provide a numeric allocation related to this uptake level. Nor does the draft TMDL acknowledge the benefits of filter feeders in reducing turbidity, particularly as to how the filter feeders can contribute to increases in submerged aquatic vegetation (SAV). The developers of the water quality model state "[o]ur model indicates enhanced SAV abundance is the most significant improvement to be attained through oyster restoration...The effectiveness of oysters in SAV restoration is attributed to the close proximity of oysters to the SAV beds" (Cercio and Noel, 2007, page 340).

Section 10.7 of the draft TMDL also limits discussion to the native Eastern oyster (market size) and menhaden fish. This section does not address the importance of other bivalves that are included in the WQSTM (namely *Corbicula* and *Rangia*) or important filter feeders that are not yet in the model (such as *Macoma balthica* or polychaete *Chaetoperus cf. variopedatus*). The water quality model developers make a compelling case that *Macoma balthica* and *Chaetoperus cf. variopedatus* (deemed OTFF in modeler's lingo) "should be modeled in oligohaline regions throughout the system" and that these two species "can exert substantial control on phytoplankton populations" (Cercio and Noel, 2010, page 1063). The developers further state:

"This activity has significant management implications in view of the attention paid to reducing chlorophyll concentrations via management of nutrient loads. Apart from direct controls on phytoplankton, OTFF contribute indirectly to eutrophication reduction by trapping carbon and nutrients in the upper, oxygenated portions of the estuaries, rather than allowing the material to pass to the lower estuaries where carbon contributes to bottom-water hypoxia and nutrients fuel phytoplankton production which clouds the water and contributes additional organic matter to

the bottom.

Loss of filtering capacity in Chesapeake Bay has been blamed for the eutrophication there (Newell, 1988) and restoration of bivalves is being explored as a management strategy (US Army Engineers, 2008). Restoration focuses primarily on native and exotic oysters (*C. virginica* and *ariakensis*) which have been the subject of extensive studies (Newell et al., 2002; Porter et al., 2004; Cerco and Noel, 2007). Less attention has been devoted to the ecological role of other bivalve filter feeders although these apparently already play a role in eutrophication control. Perhaps the lack of attention is due to the lack of commercial importance of these species. Clearly, the role of OTFF should be included in management models and their importance should be recognized in management activities." (p. 1063)

It should also be noted that there could be localized repercussions of dramatic reductions of nutrient loads. This phenomenon has adversely affected salmon populations in British Columbia and elsewhere[FN 14]. The draft TMDL does not discuss the possibility of local aquatic resources being "starved" of nutrient or sediment loads, if the reductions that are called for are greater than they should be from a local, biological perspective.

Finally, the draft TMDL does not even discuss the oyster management plan adopted by the Chesapeake Bay Program in 2005[FN 15]. The TMDL should have included an alternate TMDL that incorporates the oyster restoration goal (or the oyster management plan should be revised to reflect that EPA does not consider even modest increases in oysters as a realistic management objective).

EPA has not demonstrated in the draft TMDL that it acknowledges that water quality improvements associated with reductions in nutrient and sediment loads will positively affect filter feeder populations, which will then reduce the need for nutrient and sediment load reductions. EPA could have easily produced an alternate TMDL that showed the public the allocations for nutrients and sediments if filter feeders were restored to even a modest level.

B. Appendix U appears to rely on spurious or out-dated information and understates the potential benefit of increasing oyster populations on total nitrogen in the Bay.

Appendix U does not cite the most up-to-date documentation about the filter feeders that are in the current version of the WQSTM that is being used by EPA for the draft TMDL. Appendix U needs to be re-written and re-issued for public review and comment. LimnoTech identified three publications (Cerco and Noel, 2005; Cerco and Noel, 2007; and Cerco and Noel, 2010) that provide more up-to-date and complete information on the incorporation of filter feeders in the WQSTM. These publications show that Appendix U understates the potential benefit of a tenfold increase in oyster populations on reducing the need to obtain the TN load reductions in EPA's draft TMDL.

Appendix U cites a reference to a presentation by Dr. Cerco to the October 2005 Quarterly Meeting of the Chesapeake Bay Program Modeling Subcommittee, where the tenfold increase in native oysters "could remove 10 million pounds of nitrogen annually" (see draft TMDL, page U-2). LimnoTech could not verify this statistic based on Dr. Cerco's presentation or the meeting minutes where he presented this information[FN 16]. The version of the model presented in 2005 is not even the WQSTM that is being used for the TMDL. Nevertheless, 10 million pounds is 5 percent of the total basin/jurisdiction draft allocation of 187.44 million pounds (see draft TMDL, Table ES-1). Five percent is not insignificant when EPA is proposing "Moderate-level backstop allocations" to provide "[a]dditional adjustments to agriculture nonpoint sources as necessary to exactly meet nitrogen, phosphorus and sediment allocations" (see draft TMDL, page x, emphasis added).

The Cerco and Noel 2005 and 2007 publications provide an estimated 30,000 kilograms per day (or 24 million pounds per year) reduction in nitrogen from a tenfold increase in oysters. This is 13 percent of the draft allocation, which is even more significant than five percent.

Finally, as discussed above, Appendix U does not acknowledge the existence and potential benefits of other critical filter feeders in the Bay, such as *Macoma balthica* or polychaete *Chaetoperus cf. variopedatus*.

C. Statements in the "Other Issues of Concern" demonstrate how EPA is being inflexible in its efforts to produce a TMDL to restore the Bay. This inflexibility could have severe economic implications and potential ecological implications.

EPA should not, on one hand say that ecosystem benefits (such as with restoration of oysters) are important and can be counted towards measuring progress towards implementing the TMDL (see Section 4 of draft TMDL, Appendix U). Then on the other hand, say that oyster restoration is akin to "in-stream treatment" and could create a problem meeting local water quality standards in upstream jurisdictions (see Section 6 of the draft TMDL, Appendix U).

At a minimum, EPA should provide the appropriate references for its position on other issues of concern. EPA states "because pollutants are not reduced at or near the source, this strategy [of increasing filter feeder populations] could create a problem with meeting local water quality standards in the upstream jurisdictions" (see draft TMDL, page U-5). EPA needs to clarify this statement and provide information about which local water quality standards would not be met under this scenario.

D. EPA should include a "backstop" TMDL that includes the benefits of modest restoration of all filter feeders.

Accounting for oyster restoration to one-tenth of historical oyster biomass, or a tenfold increase from current estimated conditions, has no less reasonable assurance than other assumptions EPA has employed in the draft TMDL (and for all potential final TMDLs so far presented by EPA). For example, EPA has proposed establishing a TMDL to meet a number of water quality standards (WQSs) restoration variances (proposed and existing), in direct conflict with EPA's own guidance on TMDL development which notes that "States should be aware that a TMDL should be developed to meet the existing WQS, not a temporary variance that is less stringent than the existing WQS"[FN 17]. If EPA is willing to violate its own TMDL guidance, then surely it should also be willing to establish a TMDL based upon a reasonable assumption of oyster restoration in the Chesapeake Bay that is merely uncertain but would not violate TMDL guidance.

A reasonable level of oyster restoration should be assumed in the TMDL and the uncertainty should be dealt with through the appropriate jurisdiction WIPs and subsequent tracking mechanisms through 2-year (or 3-year) milestones, rather than being handed off as strictly an implementation question with uncertain load credits (or debits) to be accounted for by the jurisdictions.

E. EPA needs to ensure that adequate resources, including time and data for WQSTM simulations in which the benefits of filter feeders are included, are provided in subsequent updates of the TMDL.

During the April 5 and 6, 2010 Water Quality Goal Implementation Team meeting, the committee discussed a number of issues related to including filter feeder options in the Bay TMDL. Those minutes state:

- "At 5x current menhaden population we would see bay improvements in chlorophyll-a and D.O., but population cannot be assured
- Current model runs have been done with current populations of menhaden and oysters
- EPA is not willing to project increase in population
- For TMDL purposes, proposing to credit increases in filter feeder population not part of the TMDL but only if a monitored increase is found
- Population generally the same since 1985"

The discussion that follows indicates that there are issues associated with harvesting different classes of oysters and menhaden; issues with assigning "credits" or "debits" when adjusting the TMDL allocations for benefits associated with increased filter feeders; and incentives for obtaining federal funding for restoration. EPA needs to insure that the allocations will be adjusted in the 2011 TMDL update. EPA must also assure stakeholders that adequate federal funding will be provided to insure that the Chesapeake Bay modeling tools are adequate to meet this need for the 2017 update.

[FN 12] See Draft TMDL Section 10.7 at page 10-8. Section 10.7 is all of two paragraphs long.

APPENDIX A FOOTNOTES

[FN 1] Water quality standards for the Chesapeake Bay include dissolved oxygen, chlorophyll a, and clarity. It is important to note that these standards were established to protect aquatic life (such as oysters) in the Bay and its tidal tributaries. If there are other limiting factors (such as lack of habitat or toxic pollution in sediments), restoring water quality to these standards will not necessarily equate to increases in aquatic life.

[FN 2] "The E3 [everything, everywhere, everyone] scenario is a 'what-if' scenario of watershed conditions with theoretical maximum levels of managed controls on all pollutant load sources. There are no cost and few physical limitations to implementing BMPs [best management practices] for point and nonpoint sources in the E3 scenario" (see draft TMDL page J-4)

[FN 3] It is our understanding that Scenario E3 assumes that oysters and menhaden, as well as other (unspecified) filter feeders, are represented at current populations. For oysters, this means that populations are at 1 percent of their historic levels.

[FN 4] The specific date as to when any concept of a Use Attainability Analysis (UAA) for the Bay was dropped is unclear. The minutes of the June 16, 2009 Quarterly Meeting of the Chesapeake Bay Program's Scientific and Technical Advisory Committee attribute the following statement to J. Charles (Chuck) Fox, EPA Senior Advisor: "We did a use-attainability analysis about five years ago and it is an enormous suck of energy. This should always be up for consideration, but given the realities of the day and lack of progress and public knowledge, we need to see how far we can get in the next few years." <http://www.chesapeake.org/stac/MeetInfo/june09mins.pdf>

[FN 5] Contrary to Mr. Fox's statement that EPA did a UAA five years ago, EPA did not evaluate the widespread social and economic factor which can be used to issue a variance or revise the water quality standards.

[FN 6] The Clean Water Act requires that States conduct triennial reviews of their water quality standards every three years. EPA should revise their 2-year milestone deadlines to coincide with the States' triennial review dates to ensure efficiencies in the Bay TMDL process.

[FN 7] EPA has continued to reduce the time for public review (see November 3, 2009 letter from William C. Early to Secretary Bryant where the anticipated 90-day public comment period was reduced to 60 days). EPA then reduced the public comment period on the draft TMDL to November 8, 2010 which allowed for only a 45-day review period.

Response

EPA hears your concerns and aware of the well documented importance of oysters to the Chesapeake Bay ecosystem. The oyster population has been in a severe decline for many decades and there are numerous compounding factors which contribute to their low population numbers. EPA is aware that increased oyster populations will aid in improving water quality, however we cannot rely solely on these animals to address and filter the large amounts of nitrogen, phosphorus and sediment entering the Bay from numerous sources throughout the watershed. Contrary to the comment in “Additional Considerations”, EPA has encouraged jurisdictions to include filter feeder restoration into their Watershed Implementation Plans in order to highlight their importance and to better account for future actions to increase populations in the 2-year milestones. While EPA encourages filter feeder restoration projects it is not sound science to account for large population increases at this time in the TMDL. Restoration efforts have been underway for years to increase filter feeder populations with minimal observed population change. The combined factors of disease, lack of suitable substrate and excess nutrients fuel the growth of algae blooms that deplete oxygen in deeper waters and can hinder the development of oysters. Until we are able to alleviate some of the stressors on the oyster population it is not practical to heavily rely on filter feeders to address the water quality issues in the Chesapeake Bay.

It is in EPA’s professional opinion that we have capture the most predominant filter feeders known to improve water quality; however we are well aware that there are numerous other filter feeding animals that benefit water quality. Please refer to the response to comment 0230.1.001.051 where EPA speaks to accounting for additional analysis for filter feeders. For information on how filter feeders are included in the modeling please refer to Section 5 of the Bay TMDL speaking to the Chesapeake Bay Water Quality and Sediment Transport Model.

EPA reminds the commenter that EPA is under a legal obligation to establish a TMDL that meets water quality standards in the Bay. Please refer to the response to comment 0038.1.001.024 outlining the federal effort towards the Bay.

Please refer to the response to comment 0481.1.001.010 to address your comments regarding a UAA.

Please see the following URL for EPA's statement on why we are not extending the TMDL deadline.

Balancing The Filter Feeding Biological Populations Within The Bay

The historic over exploitation of Eastern Oysters and the current over harvesting of Menhaden fish in the Chesapeake Bay have negatively impacted the water quality of the Bay, as Oysters and Menhaden are filter feeders that play an important role in the removal of nutrients from the Chesapeake Bay. The populations of both Eastern Oysters and Menhaden are reportedly declining.

In regards to Eastern Oysters, their current population within the Bay is only about 1 percent of the historic population. Historical over harvesting and loss of habitat is cited as major contributing factors in this decrease. The current goal of the Chesapeake Bay is to increase the Eastern Oyster population tenfold. With this tenfold increase, the oyster population could remove 10 million pounds of nitrogen annually from the Bay [FN28]. This increase in Nitrogen removal would be substantial, exceeding the respective current annual delivered total nitrogen loads of Delaware and West Virginia and being roughly equivalent to New York State's current total nitrogen load to the Bay.

Atlantic Menhaden are a vital link in the food chain, and a balanced, thriving population could have the ability to filter a volume of water equal to the entire Chesapeake Bay in than one day. Menhaden have the potential to consume up to 25 percent of the Bay's nitrogen. However, an intensive fishery seasonally depletes the population of Menhaden within the Bay, arguably one of the Bay's most valuable living resources. Atlantic Menhaden are the most important filter feeder and one of the most abundant species of finfish in the Chesapeake Bay, with the filtering capacity to consume approximately 10 times more phytoplankton than the Eastern Oyster. [FN29]

According to Appendix U to the Draft TMDL, since the Menhaden population has declined, the following trends in water quality and living resources have been observed.

- The populations of mesozooplankton, the food base for many species, have declined in mid-Bay and lower-Bay waters.
- Food (phytoplankton and zooplankton) generated in the highly productive open water habitats of the Bay has increasingly been shunted towards ctenophores (comb jellyfish) and bacteria and away from fish.
- Comb jellyfish, a predator of zooplankton, fish eggs, and larvae, are increasing in mid-Bay waters.
- Within the Bay main stem water clarity has been decreasing, while levels of nutrients have not changed significantly.

In contrast to the lack of reliance, when setting the TMDL's proposed allocations, on assuming reasonable increases in these important Bay indigenous aquatic species, the Draft TMDL assumes that New York farmers are required to install practices to reduce nutrients. The Draft TMDL recognizes that if a farmer remove a riparian buffer, the nutrient and sediment load goes up because the buffer is no longer filtering the water. Because restoring a balanced, indigenous

aquatic populations, including these two important filter feeding species is another important step in the total restoration of the Bay, the protection and proliferation of filter feeders should be a corner stone of the Bay Restoration Initiative and reasonable successes should be assumed in the base nutrient allocation in the final TMDL. Appropriate measures to protect these resources and ensure their proliferation are a paramount and a fundamental part of the Bay's integrated restoration should be assumed, by the final TMDL, this would increase the amount of allocable nutrients and sediments that is available to be fairly distributed among the Bay States.

[FN28] Strategies for Allocating Filter Feeder Nutrient Assimilation into the Chesapeake Bay TMDL, Prepared by TetraTech, Inc., for the USPA, September 24, 2010.

[FN29] Exploitation of Atlantic Menhaden Threatens Restoration of the Chesapeake Bay, James Price, Published in the Bay Journal, October 2001.

Response

EPA hears your concerns. Please see comment ID 0230.1.001.051 where EPA speaks to accounting for additional analysis for filter feeders.

32 - PUBLIC INVOLVEMENT

Comment ID 0298.2.001.001

Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC)

EPA has failed to provide the public with sufficient data and documentation needed to review, evaluate, and fully comment on the proposed allocations. The information and data that are available show that the model and model inputs are lacking in the level of precision that should be required of regulatory action with consequences as significant and widespread as the Bay TMDL.

Response

Please see response to comment 0419.1.001.013.

Comment ID 0376.1.001.024

Author Name: Smith Brooks

Organization: Virginia Manufacturers Association VMA

while EPA is quick to note that the efforts to restore the Bay have been ongoing since the 1980s, its proposal represents a marked change in both the expectations for the industrial dischargers under the full backstop allocations and its view of the Virginia regulatory program. EPA has not provided the public with the opportunity to understand how the model works and the implications of the changes in the input data sets. EPA has only allowed 45 days for comment on its proposal. The lack of transparency in EPA's proposal, coupled with a limited review period, stands in contravention to the regulatory process envisioned by the Administrative Procedure Act.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

With regard to the availability of modeling information, please see response to comment 0419.1.001.013.

EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

Comment ID 0410.1.001.031

Author Name: Pujara Karuna

Organization: Maryland State Highway Administration (SHA)

SHA thinks that the scope of the TMDL and WIP must allow for greater interagency cooperation and dialog. To that end, SHA requests that all entities, including SHA, with significant responsibilities under the TMDL be given greater access to discussions of the Chesapeake Bay Partnership, and much greater opportunity to participate in the future development of the TMDL and Chesapeake Bay Watershed Model.

Response

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

The Watershed Implementation Plans are not part of the TMDL. Although EPA has worked closely with the states in the development of their draft and final WIPs, the process for development and review are determined by the respective states and the District of Columbia.

EPA encouraged the involvement of state agencies in the development of the TMDL. In addition to the outreach opportunities, listed above, EPA has had a WIP coordinator assigned to work with each jurisdiction and all requests for information, data, scenarios and other items have been coordinated through that individual specifically to ensure that each request for information or assistance is addressed.

Comment ID 0434.1.001.018

Organization: Virginia Farm Bureau Federation

VII. The Data and Information Relied Upon by EPA to Establish Its Draft TMDL Have Not Been Shared with the Public.

EPA claims to have relied on the "Scenario Builder" model to develop inputs or assumptions for the Chesapeake Bay Watershed Model, which then generates data used to determine whether water quality standards will be met based on those inputs. See Draft TMDL, Section 8 and Appendix H.

Scenarios representing different nutrient and sediment loading conditions were run using the Chesapeake Bay Phase 6.3 Watershed Model [the Scenario Builder] and the resultant model scenario output was fed as input into the Chesapeake Bay Water Quality Model to evaluate the response of critical water quality parameters, specifically dissolved oxygen, water clarity, underwater bay grasses and chlorophyll a.

Draft TMDL, Appendix H at page 1. Despite the significance of this information, EPA did not make the Scenario Builder input decks and outputs for the partial backstop and full backstop scenarios and for EPA's evaluation of Virginia's WIP available until November 2, 2010 - over 4 weeks after the public comment period began. This gave stakeholders only 6 days to access and review the information. This is hardly enough time for stakeholders to meaningfully comment on such critical aspects of the modeling data.

In addition to shortchanging stakeholders, the expedited process established by EPA also does not allow sufficient time for the states to review and address comments received on the Bay TMDL as part of the WIP modification process. It is our understanding that the states will have only 4 days following the close of the public comment period on November 8 to develop revised input decks and request new model runs from the Chesapeake Bay Model. The states do not have enough time to process the comments received and incorporate them into their decisions about input decks and model runs for purposes of revising the WIP. The states will also have very limited time with which to evaluate the model run results and incorporate them into their revised WIP proposals. The accelerated pace established by EPA undermines EPA's claims that it values stakeholder input and desires a transparent and open TMDL development process. This is especially true given the fact that the consent decrees that EPA relies upon as the basis for the accelerated timetable don't require the Bay TMDL to be completed until May 2011. EPA itself has chosen to move the deadline up to

December 2010.

The process that EPA has established for the development of the Bay TMDL runs afoul of the spirit of the Administrative Process Act. Access to the underlying modeling data should be provided with sufficient time for stakeholders to meaningfully participate in the development of such a complex TMDL that will have significant effects on the agricultural community, and all stakeholders throughout the watershed.

Response

With regard to the WIP process, for several months, EPA worked closely with the states and the District of Columbia to strengthen the draft Watershed Implementation Plans submitted to EPA in early September. EPA had numerous constructive meetings and conference calls with each of the jurisdictions and reviewed preliminary WIP submissions. EPA also worked with jurisdictions after the submittal of final WIPs to minimize or eliminate the possibility of federal backstop measures. The Watershed Implementation Plans are not part of the Bay TMDL. The review processes for the WIPs were determined by the individual states and the District of Columbia.

The Bay TMDL schedule was not arbitrarily determined. The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator.

The 45-day public comment period was also the product of negotiation and agreement among the states and EPA. The December 31, 2010 date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010. In addition, a settlement agreement between EPA and the Chesapeake Bay Foundation requires EPA to issue the final TMDL by this date.

With regard to the availability of modeling information, please see response to comment 0419.1.001.013.

Organization: Virginia Association of Counties (VACo)

4.) Chesapeake Bay Program's Organizational Structure

Page 1 -8 of the DRAFT TMDL provides an organizational chart and devotes several paragraphs to a description of the Chesapeake Bay Program's (CBP) structure. As the chart illustrates, local government input is sought from the Local Government Advisory Committee which is located on the periphery of the decision-making process. Since the majority of expenditures and implementation of policies to improve water quality occur at the local level, VACo believes local government officials need to be more centrally positioned within the Chesapeake Bay Program's decision-making process.

Recommendation: VACo recommends the inclusion of technical experts from local governments on the Principals' Staff

Committee.

Response

The Principals' Staff Committee and the Executive Council rely strongly on its Bay Program committees for information and perspective, including the Local Government Advisory Committee. Here is a description of LGAC's functions:

LGAC is a body of officials appointed by the Governors of Maryland, Pennsylvania, Virginia, and the Mayor of the District of Columbia to improve the role local governments play in Bay restoration efforts and develop strategies to broaden local government participation in the Chesapeake Bay Program. Since its creation in 1988 LGAC has actively supported local government participation in the Chesapeake Bay Program. Quarterly meetings of LGAC provide the forum for policy development and periodic adjustment to programming functions and organizational direction. Improving communication, supplying technical assistance to local governments, and providing a local government perspective on policy development within the greater Chesapeake Bay Program are the chief means by which LGAC works to enhance the participation of local governments in the Bay restoration effort.

EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL. In addition, EPA has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had many other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report. EPA looks forward to more extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the jurisdictions offer allocations of pollution reduction responsibilities on a finer geographic scale, such as counties, conservation districts and sub-watersheds.

32.1 - PUBLIC MEETINGS

Comment ID 0043-cp.001.001

Author Name: Cormons Grace

Organization: Eastern Shore Local Food Project

I would like to be able to attend one of your hearings, but none are beng held nearby.

Response

EPA recognizes the strong interest expressed by the public in the draft Chesapeake Bay TMDL. EPA worked closely with each of the seven watershed jurisdictions in deciding the number, location, date and time of the public meetings. There were 18 public meetings on the draft TMDL held throughout the Bay watershed in the fall of 2010. EPA and the respective jurisdictions sought

facilities that were centrally located, easily accessible, and could accommodate at least 200 people. EPA also provided free Internet access to one meeting in each of the jurisdictions. to expand the audience to those who could not attend the meetings in person. Those accessing through the Internet had an opportunity to ask questions online. Of the 18 public meetings, two were held on the Eastern Shore (Georgetown, DE, and Easton, MD) and another in Hampton, VA. Further information can be found at: <http://www.deq.state.va.us/tmdl/chesapeakebay.html>

Organization:

Regarding the EPA presentations done at the meetings around the bay watershed, we believe they could be much better. The visuals should include the Virginia WQA table showing the results over the past twelve years. The public needs to know that our rivers are getting more and more polluted. Also, the Bay Report Card should be shown, since it also shows the continuing failure to clean up the bay. Without showing these two important elements, the public will assume that the rivers and bays of Virginia are getting better every day. By including more supporting data, the case can be better made for the EPA plan.

Response

There has been significant progress made by the states, D.C. and other members of the Chesapeake Bay Program partnership over the past three decades, however there is a long way to go. Through charts and other information, EPA's presentations were designed to show the major work still ahead to meet water quality standards in the Bay.

Author Name: Josenhans S.

Organization:

Several panel members passed a question to the panel down the line as they sat taking turns answering the acceptable questions. Chuckling, eye rolling and scoffing ended with the items eventual disappearance leading several in attendance wondering if it were their own question to the panel. I assume that to have been part of the process of screening questions. On leaving the Plether Center, I heard various comments concerning the 'strong armed' sense of empowerment on the part of our Federal public servants. I was saddened that there was no apparent appreciation for the time and commitment to participate on the part of the bulk of attendees.....trying to beat the little timeout clock..... sorry no time for spell check.

Response

EPA appreciates the time and effort of the public to attend the public meetings on the Bay TMDL and greatly values the opinions and perspectives of all in this process. EPA held 18 public meetings in six weeks across the Chesapeake Bay watershed to provide opportunities to explain the draft Bay TMDL and to get public input. The meetings were structured so that half of the time would be dedicated to hearing comments from the public and addressing questions. If there was a high volume of questions, our panel did its best to ensure that a good cross-section of the issues was addressed. A priority was placed on bringing to the podium those audience members who wanted to make a comment, regardless of whether that comment was in favor or in opposition to the TMDL.

Organization:

This, my 5th attempt to be "heard" on record only serves to underscore my initial attempt which along with the second were wiped from the text window as the website announced that I had "timed out" The two entries that this is meant to supercede, were reflective of not only the limitations of the meeting as referenced below, but indeed compounded by some sort of "beat the clock" programming built into this electronic system of public record, beyond the specified character limit.

I would like to thank a certain "Scott" who replied me by phone and who was so very helpful seeing to it that this one 'voice' might be entered into the record. I suspect that there were many beyond myself who may not have persisted and have now gone figuratively unheard.

On October 6th, 2010, as a resident citizen of the Commonwealth of Virginia, I attended an EPA public meeting at the University of Richmond. Though being very appreciative of the strong efforts of my state's public servants and officials to compliment the citizenry through that very service, I was troubled by the manner in which the meeting, or perhaps better yet; forum, was conducted. At the outset the attendees were advised that no commentary would be entered into the public record save that which happened behind the podium. Blank cards were passed about to eager hands while being told that they would be screened in order to filter out those which were redundant. When the cards selected were

read and addressed by panel members, it seem as if one of those soft ball interviews seen on the four letter cable news shows. In light of the limited number of attendees allowed to speak at the podium, the U of R Environmental Law Department staff and students seemed afforded unfair access as did at least one representative of a plaintiff in the Fowler v. EPA settlement. But a few voices were heard among the ranks of those likely to be most directly affected by this Bay process and they spoke well, respectfully and yielded respectfully as the red "stop sign" was presented. It is a shame that there was no meeting that night but only a carefully crafted forum. I feel saddened that the constraints placed on dialog that night in Richmond and subsequently in this electronic forum have hinder true and free expressiveness on the subject.

I applaud the Commonwealth's efforts at improving our natural resources and seeking a holistically balanced approach in those efforts. We in Virginia value and truly appreciate humbly dedicated and effective government and when finding ourselves faced with a lesser example, we recognize and acknowledge it as such readily.

Response

EPA held 18 public meetings in six weeks across the Chesapeake Bay watershed to provide opportunities to explain the draft Bay TMDL and to get public input. Clear instructions were provided about how to enter a formal comment for the record. The meetings were structured so that half of the time would be dedicated to hearing comments from the public and addressing questions. If there was a high volume of questions, our panel did its best to ensure that a good cross-section of the issues was addressed. A priority was placed on bringing to the podium those audience members who wanted to make a comment, regardless of whether that comment was in favor or in opposition to the TMDL. The commenters did not have to indicate the nature of their comment in advance.

32.3 - PUBLIC COMMENT PERIOD

Comment ID 0060.1.001.001

Author Name: Bredwell III Paul

Organization: U.S. Poultry & Egg Association, National Turkey Federation (NTF), and National Chicken Council (NCC)

The U.S. Poultry & Egg Association, the National Turkey Federation and the National Chicken Council respectfully request that EPA extend the comment period deadline on the proposed Chesapeake Bay TMDL to 120 days, in light of the scope, complexity and potentially severe impacts of the proposal on family farms and poultry processing operations.

Response

After careful evaluation, EPA determined it was not feasible to extend the 45-day public comment period for the draft Chesapeake Bay TMDL past November 8, 2010 and therefore delay finalization of the TMDL past December 31, 2010.

The completion date was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator.

The 45-day public comment period was also the product of negotiation and agreement among the states and EPA. The December 31, 2010 date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010. In addition, a settlement agreement between EPA and the Chesapeake Bay Foundation requires EPA to issue the final TMDL by this date. We were unable to extend the public comment period and meet our important commitment to the states and citizens of the watershed to complete the TMDL by December 31, 2010.

The draft Chesapeake Bay TMDL has been developed through a highly transparent and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in fall 2009 and fall 2010; a dedicated EPA website; a series of monthly interactive webinars; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

Additionally, EPA and the states and D.C. have been working together to develop the Chesapeake Bay TMDL since 2005. Officials and staff have been in constant discussion throughout the process, including in hundreds of conference calls and meetings, particularly through the Chesapeake Bay Program. The states and D.C. also involved stakeholders in the development of their draft Watershed Implementation Plans, providing another layer of outreach.

Author Name: Bodine Susan

Organization: Agricultural Retailers Association et al.

After EPA makes this information available, we respectfully request EPA to provide 120 days for the public to review and comment on the Draft TMDL.

Response

Please see the response to comment 0060.1.001.001.

Comment ID 0062.1.001.014

Author Name: Bodine Susan

Organization: Agricultural Retailers Association et al.

We are aware that EPA signed a settlement agreement with the Chesapeake Bay Foundation (CBF) agreeing to finalize a TMDL for nutrients and sediment for the Chesapeake Bay watershed by December 31, 2010. We respectfully submit that such a schedule would fail to provide for meaningful public comment.

Response

EPA acknowledges that the comment on the settlement agreement signed with CBF is accurate. EPA disagrees that the 45 day public review and comment does not provide a meaningful public comment period. Please also see the response to comment 0060.1.001.001.

Comment ID 0063.1.001.008

Organization: Fertilizer Institute (TFI)

Accordingly, we request that EPA [...] extend the comment period 120 days after this information is released to the public to ensure that all the relevant information used to establish TMDLs is publically available and that the public has sufficient time to review and comment on the Draft TMDL.

Response

Please see the response to comment 0060.1.001.001.

Comment ID 0063.1.001.010

Author Name: Jones Martin

Organization: Fertilizer Institute (TFI)

We appreciate your consideration of this request for an extension of the comment period for 120 days after EPA makes the scenario data and scenario results publically available. We trust that EPA is interested in receiving thorough comments on this complex issue and ensuring that the public has access to all the relevant information and, as such, will grant our request.

Response

While EPA is not extending the public comment period, EPA appreciates receiving comments on this proposed TMDL. Please see the response to comment 0060.1.001.001.

Comment ID 0065-cp.001.001

Author Name: Mason James

Organization: Virginia Poultry Growers Cooperative, Inc.

Our Co-Op request that an extention up to 120 days be granted for comments on the TMDL. A draft of this magnitude must have more time for everything to be looked at to make the itiems in the draph as accurate as possible.

Response

Please see the response to comment 0060.1.001.001.

Comment ID 0066.1.001.001

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

On behalf of the National Association of Homebuilders (NAHB), I respectfully request that the U.S. Environmental Protection Agency (EPA) extend the public comment period for the Draft Total Maximum Daily Load (TMDL) for the Chesapeake Bay, the availability of which was announced in the Federal Register on September 22, 2010, for an additional 180 days. This additional time is needed because of the technical complexity of the proposal and the need to afford all impacted parties an opportunity to fully understand and provide meaningful comments. It is also needed so that EPA can make all of the supporting documents available for review.

Response

Please see the response to comment 0060.1.001.001.

Comment ID 0066.1.001.007

Organization: National Association of Home Builders (NAHB)

EPA acknowledges that the Chesapeake Bay TMDL will be the largest, most complex TMDL in the country, and it will be held up to the nation as the bar to meet for the future nutrient reduction programs that will take place around the U.S.; yet EPA is, at the same time, proposing to short shrift the public by limiting its ability to study the proposal and offer comment. Indeed, EPA has asked the public to review and comment on the lengthy proposal and supporting documentation including state Watershed Implementation Plans, a highly-technical pollutant reduction model, land use assumptions, and 22 appendices. Appendix B alone includes a list of documents supporting the Chesapeake Bay TMDL that spans 16 pages - all of which should be analyzed and understood before making comment. Taken together, the sheer volume of information amounts to thousands of pages that cannot realistically be reviewed and analyzed within the given 45-day comment period. Moreover, because the proposal raises many legal and policy issues, careful consideration and research will be needed before suggested solutions can be drafted.

While the Administrative Procedure Act (APA) does not specify a minimum time period for comment on a proposed rule, Executive Order (EO) No. 12866 provides that most rulemakings "should include a comment period of not less than 60 days." [FN1] Likewise, for most TMDLs, EPA and the states provide a minimum of 60-90 days for public input. For example, EPA recently provided a public comment period of 60 days for the Accotink Creek TMDL in Virginia in the summer of 2010. Accotink Creek represents only one TMDL, vs. the 94 segments, or individual TMDLs, that make up the overall Chesapeake Bay TMDL. Following this example, it would be plausible that the Agency provide a 5,640 day comment period for the Chesapeake Bay TMDL (60 days per TMDL x 94 segments). NAHB is merely asking for additional 180 days.

[FN1] Exec. Order 12866, 58 Fed. Reg. 51735 (September 30, 1993).

Response

Please see the response to comment 0060.1.001.001. And EPA notes that the Chesapeake Bay TMDL is not a regulation.

Comment ID 0066.1.001.008

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

Furthermore, when the Agency has offered insufficient time to review similarly complex and expansive rulemakings, EPA has recognized the mistake, extended the comment period, and issued the complex rulemaking after due time for consideration. For example, EPA proposed 80 TMDLs in Louisiana and originally offered the public only 30 days for

review and comment. [FN2] Not surprisingly, EPA received several requests to extend the comment period, so EPA agreed to accept comments for an additional 60 days. [FN3] After reviewing comment from stakeholders who had additional time to review the data, EPA finalized the 80 TMDLs 7 months later. [FN4]

[FN2] 71 Fed. Reg. 41217 (July 20, 2006) (setting August 21, 2006 as the original deadline for public comment).

[FN3] 71 Fed. Reg. 59504 (Oct. 10, 2006) (agreeing to accept public comment until October 20, 2006, review the comments, and revise or modify the TMDLs as appropriate).

[FN4] 72 Fed. Reg. 19,703 (Apr. 19, 2007).

Response

Please see the response to comment 0060.1.001.001. And EPA notes that the Chesapeake Bay TMDL is not a regulation.

Comment ID 0066.1.001.016

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

Indeed, EPA states that the goal of these meetings is "to assist the public in their understanding of the Draft Bay TMDL and provide an overview of the TMDL process, especially the stakeholder review and comment process." [FN5] For stakeholders in Romney, West Virginia who are hoping to use their November 4 public meeting as an opportunity to be introduced to EPA's effort, their public comment period has effectively been reduced to 4 days (two if one only counts business days).

Only people who work in the affected industries can possibly know in full how the proposed rule will impact their operations and how their portion(s) of the rule will work in the real world. Therefore, their review and comment is absolutely necessary to fine tune the requirements and ensure the proper balance between environmental stewardship and the economic impacts is made. In order to ensure that these entities can make their voices heard, EPA must extend the comment period.

[FN5] 75 Fed. Reg. 5776 (September 22, 2010) (emphasis added).

Response

Extensive information on the Draft Bay TMDL, including access to the full document, has been available on the EPA web site, www.epa.gov/chesapeakebaytmdl since the start of the public comment period of September 24, 2010. In addition, the seven webinars EPA held throughout the fall in conjunction with the public meetings were available to the general public via the Internet and included general as well as state-specific information and the ability to ask questions online. The webinar registration links were available on the Bay TMDL web site.

Author Name: Nemura Adrienne

Organization: LimnoTech

We believe this request for a minimum 120-day review period is more than reasonable. As noted in numerous EPA public forums, this is the largest TMDL that has ever been done. The only other TMDL that was nearly as large and complicated as the Chesapeake Bay TMDL was the mercury TMDL for New England. In that TMDL, EPA was involved as outlined by the Clean Water Act to review and approve or disapprove the TMDL. The TMDL covered all the New England States and part of New York. Each state issued an individual TMDL and provided a 59-day comment period. The TMDL report was only a little over 100 pages long. Based on past practice of the Agency and other regulatory agencies, we cannot see how a 45-day comment period is appropriate. We recognize that EPA has entered into a consent agreement regarding the Bay; however, we do not feel this should preclude EPA from providing the public with an appropriate notice and comment opportunity.

We would appreciate your review of this request and ask that you notify us of your decision within the next 5 business days.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

Although the Bay TMDL is a detailed document, the public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls

with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

Organization: Mountaire Farms Inc.

Our organization respectfully requests that EPA extend the comment period deadline on the proposed Chesapeake Bay TMDL to 120 days, based on the complexity of the proposal and its potentially severe impacts on family farms and poultry processing operations in my state.

EPA's proposed action is the most ambitious TMDL initiative ever attempted by the agency. The proposal covers multiple state and local jurisdictions, relies on extremely complex methodologies, impacts a wide range of small to large businesses and treatment operations, and will affect tens of millions of citizens.

Having only 45 days to review and recommend changes to such a far-reaching proposal is not a meaningful comment opportunity, particularly when there are only several weeks left between now and when the TMDL is scheduled to be finalized at the end of this year.

Response

Author Name: Igli Kevin

Organization: Tyson Foods, Inc.

Tyson Foods, Inc. (Tyson) respectfully requests that the U.S. Environmental Protection Agency (EPA) provide a 120 day extension for comments on the draft Chesapeake Bay Total Maximum Daily Load released for public comment on September 24, 2010. 75 Fed. Reg. 57776 (Sept. 22, 2010) (Docket Number EPA-R03-OW-2010-0736) (hereinafter Draft TMDL). We all share the goal of ensuring the health and water quality of the Chesapeake Bay, but more time is needed for individuals and companies like Tyson to comment on such a significant document and associated materials. Furthermore, Tyson must also comment on the various state Watershed Implementation Plans during this same timeframe.

The 45 day comment period that EPA has provided does not allow for a full and careful review of the Draft TMDL. In EPA's documents, the agency acknowledges that the "Chesapeake Bay TMDL is the largest, most complex TMDL in the country, covering 64,000-square-mile area in seven jurisdiction." Moreover, in the document "A Coming Together for Clean Water: EPA's Strategy For Achieving Clean Water," that "the Chesapeake Bay watershed will be a model for watershed protection in other parts of the country." Hence, the Draft TMDL represents one of the most important Clean Water Act activities in the history of the Act.

The importance of this action necessitates giving the public at least 120 days to comment on this highly complex and nationally important Draft TMDL.

Extending the public notice period to a minimum of 120 days will allow Tyson and other potentially effected entities to review the proposal and make meaningful comments.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

With regard to the complexity of the TMDL, please see response to comment 0153.001.003.

Organization: Binghamton-Johnson City Joint Sewage Board

As the EPA acknowledges, the "Chesapeake Bay TMDL is the largest, most complex TMDL in the country, covering a 64,000-square-mile area in seven jurisdictions." See, TMDL, at pp. 2-7. Additionally, the EPA states that the Bay TMDL will be used as a model and set a precedent for the nation as the "standard" to be met for future nutrient reduction programs and TMDLs. Because the TMDL touches on many policy and legal issues, careful consideration and research are required before informed, meaningful comments and suggested changes can be developed and submitted. Due care is also necessary so as to avoid unintended consequences. A TMDL that cannot meet its intended goals serves no one. Allowing sufficient opportunity for the public to participate in the rulemaking process by providing input on the actions that can be taken to meet the goals, improve effectiveness, and lower the costs of the rule will better ensure that the Bay TMDL is not only practical and effective, but maximizes the chances that it will be properly and successfully implemented. Providing adequate time for this vital and necessary input thus affords substantial benefits to both the EPA and the public.

The Bay TMDL includes proposals for two separate sets of load allocations and wasteload allocations for three pollutants in 92 water body segments (one set to meet current water quality standards and one set to meet proposed water quality standards that may or may not be approved by the time the TMDL is issued). In essence, the Bay TMDL

consists of 552 separate TMDLs (6 TMDLs x 92 segments). The TMDL includes detailed implementation instructions directed at the seven watershed jurisdictions. Further, in addition to the TMDL "main" document - which consists of 365 pages - and voluminous appendices (the 22 appendices themselves add some 1,629 pages), numerous technical analyses and modeling information referenced in the TMDL each add to the range of separate documents and overall complexity of the information that must be reviewed in order to provide informed, thoughtful, meaningful, and credible comments. Appendix B alone - a list of documents which support or underlie the TMDL - spans 16 pages. All of those documents should be analyzed and understood in order to submit fully-informed, well-considered comments.

Despite acknowledgement that the TMDL is the most complex ever attempted, the EPA is presently allowing a mere 45 calendar days for public comment. Our Board believes that 45 days is insufficient under the Administrative Procedure Act ("APA") to provide for meaningful, informed public comment on the Bay TMDL by any person or entity. Therefore, we request a 120-day comment period extension beginning on the date that the EPA makes available for public review the inputs, outputs as well as the code for the Scenario Builder program.

Although the APA does not specify a minimum time period for comment on a proposed rule, Executive Order No. 12866 provides that most rulemakings "should include a comment period of not less than 60 days." [FN1]

Likewise, for most TMDLs, both the EPA and the states regularly provide a minimum of 60-90 days for public input. For example, one TMDL that affected an area nearly as large and had complexities like the Bay TMDL was the Northeast Regional Mercury TMDL, covering all of the New England States and part of New York. The Mercury TMDL report was 113 pages long. See, <<http://www.dec.ny.gov/chemical/31304.html>>. In that TMDL, the EPA was involved - as mandated by the Clean Water Act - in the review and approval of a regional TMDL sponsored by several states. Each state issued the TMDL and, including extensions, provided at least a 59-day public comment period. Four and one-half months were spent responding to comments, and the EPA took close to two months to review/approve. This summer, EPA Region III extended to 51 days (from 30) the comment period for the 135-page draft TMDL for Accotink Creek in Virginia, a single-pollutant TMDL to reduce sediment (in comparison to the 92 segments, or 552 individual TMDLs, in the Bay TMDL). See, <http://www.epa.gov/reg3wapd/tmdl/VA_TMDLs/AccotinkCreek/Accotink-Creek-TMDL6-30-2010DRAFT.pdf>.

Based on past practice of both the EPA and other federal regulatory agencies, we cannot see how a 45-day comment period is sufficient or appropriate in this case. We recognize that the EPA has entered into some voluntary settlement agreements and consent orders regarding the Bay; however, as discussed in detail below (in Section III), we do not believe this should be used by the EPA as a basis for depriving stakeholders and the public of a reasonable comment opportunity appropriate in length.

Moreover, on occasions when the EPA has initially offered insufficient time to review similarly complex and expansive rulemakings, the agency has recognized its mistake, extended the comment period, and issued such complex rulemakings only after due time for consideration of the comments received. For example, several years ago the EPA proposed 80 TMDLs in Louisiana and originally offered the public only 30 days for review and comment. [FN2] Not surprisingly, the EPA received several requests to extend the comment period, so the EPA agreed to accept comments for an additional 60 days. [FN3] After reviewing the comments submitted by the public and stakeholders who, as a result of the extension, had 90 days to review the proposal and supporting data, the EPA thereafter finalized the 80 TMDLs some six months later. [FN4]

[FN1] - Exec. Order 12866, 58 Fed. Reg. 51,735 (Sept. 30, 1993).

[FN2] - 71 Fed. Reg. 41,217 (July 20, 2006), setting August 21, 2006 as the original deadline for public comment.

[FN3] - 71 Fed. Reg. 59,504 (Oct. 10, 2006), agreeing to accept public comment until October 20, 2006, review the comments, and revise or modify the TMDLs as appropriate.

[FN4] - 72 Fed. Reg. 19,703 (Apr. 19, 2007).

Delmarva Poultry Industry, Inc. (DPI), the 2,000 member trade association for the meat chicken industry in Delaware, the Eastern Shore of Maryland, and the Eastern Shore of Virginia, supports the position taken by a coalition of organizations as expressed in an October 15, 2010 letter from Susan Bodine with the Barnes Thornburg legal group. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0165]

The enormity of the task of developing a Chesapeake Bay TMDL is daunting. Developing it correctly and in a scientific manner in the compressed time schedule being followed by EPA is unlikely. We concur that interested persons need more data and more time to fully understand the consequences of the proposed TMDL and allowing just 45 days to comprehend and offer substantive comments on the TMDL is ridiculous.

Our members have not been working on the TMDL for years as has EPA and they do not have degree of knowledge and background that EPA personnel have. Our members are kept busy producing chickens for America's consumers and do not have the luxury of dropping everything to work on the TMDL.

More time is needed to understand this huge undertaking, especially since it will set the pattern for future TMDL programs nationwide. We urge EPA to follow the recommendations in the letter from Mrs. Bodine that we have enclosed. [Comment Letter contains additional information in the form of an attachment. Organization: Town of Occoquan, Virginia

Despite the enormous size and complexity of the TMDL documents released on Sept. 24, the socio-economic consequences of the proposed allocations, and the arbitrary nature of EPA's decision to establish the TMDLs by Dec 31, 2010 when it could have given the public additional time to comment had it taken advantage of the May 2010 deadline in the consent decree, Occoquan does not have sufficient time to adequately review and respond to the TMDLs in detail. Occoquan will defend vigorously any claim of waiver due to failure to submit comments to the TMDLs on the basis that insufficient time was given to adequately respond.

Response

The decision to establish the TMDL by December 31, 2010 was not an arbitrary one. For background on the public comment period and the timetable for establishing the TMDL, please see response to comment 0060.1.001.001.

In response to the comment regarding waiver, as described in greater detail in response to comment 0060.1.001.001, EPA believes the public comment period was adequate.

Although the Bay TMDL is a detailed document, the public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

The Public Comment Period needs to be extended beyond 45 days.

The truncated public comment period of 45 days is totally inadequate and inappropriate. On September 24, 2010 EPA made available the draft Chesapeake Bay TMDL. The body of the report is 365 pages in length with 23 appendices totaling 262 pages that include seven tables with a total of approximately 22,000 rows of data and information in those tables. Three of these tables list cap loads for all point sources, significant and insignificant. There are 4,390 insignificant point sources listed in these tables that are unlikely aware of their inclusion and their need to review and comment on the TMDL. Forty-five days is not adequate to ensure that contact is made with appropriate representatives of these dischargers.

Comment ID 0253.1.001.006

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

The County has significant concerns with the transparency of EPA's Draft TMDL and Virginia's WIP regulatory process. Despite the enormous size and complexity of the TMDL documents released on Sept. 24, the socio-economic consequences of the proposed allocations, and the arbitrary nature of EPA's decision to establish the TMDLs by Dec 31, 2010 when it could have given the public and interested stakeholders additional time to comment had it taken advantage of the May 2010 deadline in the consent decree, the County does not have sufficient time to adequately review and respond to the TMDLs in detail. The County will defend vigorously any claim of waiver due to failure to submit comments to the TMDLs on the basis that insufficient time was given to adequately respond.

Response

With regard to additional time to review and comment on the Draft Bay TMDL, please see response to comment 0060.1.001.001. EPA made it a priority to be as transparent as possible in the TMDL process, holding meetings, webinars and other forums to explain details of the initiative and placing detailed information on two web sites, www.epa.gov/chesapeakebaytmdl and www.chesapeakebay.net. The Watershed Implementation Plans were not part of the TMDL and their processes were determined by the individual jurisdictions.

Comment ID 0255.1.001.002

Author Name: Gumm Gary

Organization: Washington Suburban Sanitary Commission (WSSC)

WSSC recognizes the tremendous challenges facing EPA, the District and our state and local partners to develop a comprehensive plan for implementation of the controls required to address the multifaceted sources of pollution to the Bay. Implementation of the controls required to address pollution loads from all sources that discharge to the Bay watershed, including the significant contribution of air borne pollutants, represents a tremendous fiscal challenge and commitment at all levels for this plan to succeed. In view of the tremendous significance of the Draft Bay TMDL and numerous implications for all stakeholders the 45 day comment period provided severely limits the level of detailed review and coordination possible. An extension of the comment period would provide time for a more comprehensive analysis and consideration of the multiple aspects of the Draft Bay TMDL.

IV. EPA HAS FAILED TO PROVIDE THE LOCALITIES WITH A REASONABLE OPPORTUNITY TO REVIEW, EVALUATE, AND COMMENT ON THE BASIS FOR THE PROPOSED ALLOCATIONS.

A. The length of the comment period is insufficient given the size of the docket and the complexity of the TMDL.

Although EPA has characterized this as the largest and most complex TMDL ever developed, it is providing only a 45-day period to review and comment on the over 2,000 pages of documents posted on the docket. While we recognize that EPA has a certain amount of latitude in establishing the length of its comment periods, we submit that in this case, EPA has abused its discretion and effectively deprived stakeholders such as the Localities with a reasonable opportunity to comment on this very complex and controversial proposal.

The 45-day comment period is inconsistent with Executive Order 12866, which provides that most rulemakings should include a comment period of not less than 60 days, as well as EPA's own Public Involvement Policy, which stipulates that "the comment period for public review of unusually complex issues or lengthy documents generally should be no less than 60 days".[FN 8] Further, even a 60-day comment period would be too short in this case as reflected in the fact that EPA has established comment periods longer than 60 days for large, complex or controversial proposals such as this TMDL. Examples include EPA's 2010 proposed Water Quality Standards for Florida's Lakes and Flowing Waters (90-day comment period); EPA's 2009 proposed Renewable Fuel Standard (120-day comment period); EPA's 2001 proposed Electronic Reporting Rule (180-day comment period).

[FN 8] See Public Involvement Policy of the U.S. Environmental Protection Agency (EPA 233-B-03-002 - May 2003) at page 13.

Response

Regarding the public comment period, please see response to comment 0060.1.001.001.

Also, EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL. In addition, EPA has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report.

EPA looks forward to more extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the states and the District offer allocations of pollution reduction responsibilities to the local scale, such as county, conservation district or sub-watershed.

EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

We take this position not because we are aware of any major inconsistencies of environmental importance between (1) the offset/trading provisions of the Draft TMDL and (2) Virginia's laws, regulations and policies and the Nutrient Exchange's compliance plan, policies and contracts developed consistent with Virginia law. However, a thorough analysis or comparison of that sort is in itself a major undertaking that simply cannot be performed within the short 45-day comment period. To the extent that EPA fails to adopt the Nutrient Exchange's position on the non-applicability of

the proposed new/increased load offset provisions to trading under the Nutrient Exchange, the Nutrient Exchange hereby requests a 90-day extension of the comment period and the opportunity for EPA, Virginia and the Nutrient Exchange to work closely to perform this analysis together.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Bay TMDL is a detailed document. That this why the TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all six states and the District of

Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

The expedited process established by EPA also does not allow sufficient time for the states to review and address comments received on the Bay TMDL as part of the WIP modification process. It is our understanding that the states will have only 4 days following the close of the public comment period on November 8 to develop revised input decks and request new model runs from the Chesapeake Bay Model. The states do not have enough time to process the comments receive and incorporate them into their decisions about input decks and model runs. The truncated process creates the perception that EPA does not take the states' interests, concerns and available expertise seriously because it has not allowed them sufficient time to review and address the comments that are received.

Response

It was EPA's strong preference that the Bay TMDL be based on the Watershed Implementation Plans submitted by the states and the District of Columbia. EPA worked closely with the jurisdictions over the months between the draft and final WIP submissions to strengthen the draft WIPs. EPA had numerous constructive meetings and conference calls with each of the jurisdictions and reviewed preliminary WIP submissions during that time. EPA also worked with the states and the District after the final WIPs were submitted with the goal of minimizing or eliminating the need for backstop measures.

Public comment period - The public meetings and public comment period did not allow adequate time for West Virginia residents to become informed and comment on the TMDL. The shortened public comment period resulted in the public meetings being squeezed into a very tight timeframe. West Virginia's public meetings were 2 working days prior to the deadline for public comments. While we recognize that we requested to have our meetings at the end of the process, had original time frames been adhered to by EPA or had EPA extended the TMDL deadline to May 2011 as requested by states during the process, this crunch would not have occurred.

Response

Please see response to comment 0060.1.001.001. As acknowledged, the timeframe for the public meetings in West Virginia was based on state recommendations. The Draft Bay TMDL document has been available on the Bay TMDL web site since the start of the public comment period. In addition, webinars broadcast from each state and the District of Columbia were available on the Internet for listeners throughout the watershed who had an opportunity to ask questions on line. The webinar registration links were on the Bay TMDL web site.

With regard to the public comment period, please see response to comment 0060.1.001.001.

EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL. In addition, EPA has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had many other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report. EPA looks forward to more extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the jurisdictions offer allocations of pollution reduction responsibilities on a finer geographic scale, such as counties, conservation districts and sub-watersheds.

EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

Organization:

First, I want to express my displeasure with EPA's decision to close public comments only two business days after completing public meetings in West Virginia. While we have had the document to review, we did not have the verbal comments and presentations to accompany the written WV WIP plan and subsequent EPA evaluation. Therefore, I feel my comments cannot fully express a thorough and effective scientific evaluation of the TMDL, the state WIP, the federal response or the public meeting presentations! That being said, I will still attempt to respond to several issues I have found in the aforementioned documents and question several premises used in the specific arguments related to the TMDL process, planning procedures and coming implantation. I will make these comments in accordance with my constitutional right to be heard, but feel you have not honored my perspective by simply refusing ample time to generate a significant response.

Response

The Draft Bay TMDL document has been available on the Bay TMDL web site since the start of the public comment period on Sept. 24, 2010. In addition, webinars broadcast from each state and the District of Columbia were available on the Internet for listeners throughout the watershed who had an opportunity to ask questions on-line. The webinar registration links were on the Bay TMDL web site. Also on the Bay TMDL web site were the EPA evaluations of the individual state and D.C. Watershed Implementation Plans (WIPs) as well as the plans themselves. The schedule for the public meetings was determined in consultation with the respective states. The Draft WIPs were not part of the Draft TMDL, but were used to inform the document. The states determined the process for review and comment on the WIPs.

Organization:

It also speaks very poorly of the mindset of those at EPA that so callously dismissed questions about the timing of the public meetings and the very short turnaround time for closing of the public comment period. Keep in mind that this accelerated time frame was clear in the decision to accelerate the entire process by six months.

Response

Please see response to comment 0060.1.001.001.

Comment ID 0450.1.001.009

Organization:

In closing, let me conclude with some general thoughts, specific recommendations and finally a serious question about our society. I found the entire process for the TMDL development, the state WIP and subsequent EPA evaluation and the public comment section to be unnecessarily rushed, hurried and at times thoughtlessly presented (the response to why WV was last with only 2 business days for response).

Response

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the

Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

The Watershed Implementation Plans (WIPs) were developed by the states and the District of Columbia and are not part of the TMDL. The respective jurisdictions determined the process for review of their WIPs.

Finally, the dates of the West Virginia public meetings were determined based on state preference. They were advertised in a Federal Register Notice prior to the start of the public comment period and included in press releases sent by EPA. Notice and information on the meetings was included in media news stories in advance of the sessions.

The public comment period for the draft Bay TMDL was widely publicized and the notice was widely disseminated. The TMDL document was available for review and comment on the Bay TMDL web site beginning September 24, 2010. There were 18 public meetings held across the watershed, seven of which were broadcast live over the Internet with an opportunity for listeners to ask questions. The webinar registration links were on the Bay TMDL web site.

I. Public Comment Period is Inadequate

A. In general, EPA provided insufficient time to review and comment on the draft TMDL, given the amount of data and the availability of such data that were used in the development of the draft TMDL.

B. There is not sufficient latitude in the TMDL implementation schedule to allow EPA time to consider all public comment and then to revise the draft TMDL. The impact of the TMDL will be felt for decades and will cost billions of dollars to implement. The schedule is not considerate of the weight of the issues presented in the draft TMDL.

C. Because the Bay TMDL will generate numerous comments, it will be impossible for EPA to appropriately consider the comments submitted within the current schedule. By not seeking an extension of time with the courts in this instance when in numerous other instances EPA has sought extension where a court-imposed deadline did not provide

adequate time, EPA appears to have pre-ordained the final Bay TMDL content and has reduced the benefit of the public comment process.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The schedule allowed sufficient time for EPA to consider public comments and revise the TMDL. A team of EPA sector experts began reviewing and preparing responses to the public comments once they began to be entered in the docket shortly after the public comment period began on September 24, 2010. The comments were taken into consideration by EPA as it moved from the draft to a final TMDL.

Comment ID 0467.1.001.029

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

Page 3 Background

There is not sufficient time in the schedule to consider public comment and then to revise the WIP. The impact of the WIP and the Chesapeake TMDL will be felt for decades and will cost hundreds of millions if not billions of dollars to implement. The schedule is not considerate of the weight of the issues presented in the WIP and the Bay TMDL.

Response

For several months, EPA worked closely with the states and the District of Columbia to strengthen the draft Watershed Implementation Plans submitted to EPA in early September. EPA had numerous constructive meetings and conference calls with each of the jurisdictions and reviewed preliminary WIP submissions. EPA also worked with jurisdictions after the submittal of final WIPs to minimize or eliminate the possibility of federal backstop measures.

As noted above, many of the undersigned organizations, as well as others, have asked EPA to extend the period of time available to comment on the Draft TMDL. Forty-five days is simply insufficient to provide meaningful public review of the Draft TMDL. However, it is not only the length of the comment period that is inadequate. EPA also has failed to provide the public with sufficient information to make meaningful comments.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars, and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting

agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

Comment ID 0482.1.001.004

Author Name: Bodine Susan

Organization: Agricultural Retailers Association et al.

A. Forty-Five Days is an Inadequate Comment Period for the Draft TMDL. As noted above, EPA acknowledges that the "Chesapeake Bay TMDL is the largest, most complex TMDL in the country, covering a 64,000-square-mile area in seven jurisdictions." Draft TMDL, at 2-7. In this TMDL, EPA is proposing two separate sets of load allocations and waste load allocations for three pollutants in 92 water body segments. See Draft TMDL, at Appendix Q. Thus, the Draft TMDL consists of 552 separate TMDLs.

These TMDLs include allocations for 1,006 individual residences, by individually naming the homeowners in Appendix Q. The Draft TMDL also would impose allocations on small entities that raise one or more animals, but are not large enough to require a permit under the Clean Water Act. According to the U.S. Department of Agriculture, in 2002 there were a total of 111,692 livestock operations of all sizes in Virginia, West Virginia, Maryland, Delaware, Pennsylvania, and New York. In 2001, EPA estimated the total number of animal feeding operations with 300 animal units or more in these states to be 4,360. While these are statewide numbers, and the number of operations in the Chesapeake Bay watershed will be smaller, these numbers indicate that a very large number of small livestock operations could be affected by the Draft TMDL. At this point, the potentially affected small farms are not individually listed in the Draft TMDL, but the threat to subject them to federal regulation is there.

Further, the Draft TMDL that EPA made available for review on Sept. 24, 2010, consists not only of these wasteload and load allocations, but also consists of detailed implementation instructions directed at the watershed jurisdictions. Thus, the Draft TMDL consists not only of the 370 pages of the Draft TMDL document, but also the 1,672 pages of the 22 appendices, as well as the technical analysis and modeling information that is referenced throughout the draft TMDL.

Although the APA does not specify the length of a comment period, it must be reasonable. Executive Order 12866 provides that most rulemakings "should include a comment period of not less than 60 days." Given the economic and social significance of the Chesapeake Bay TMDL, 45 days is an insufficient period of time for affected members of the public to learn about, evaluate, and comment on the Draft TMDL.

In denying the request of Congress Goodlatte and Congressman Holden for an extension of the public comment period, EPA cites the deadlines that EPA imposed on itself through Executive Order 13508 and through a settlement agreement with the Chesapeake Bay Foundation (CBF). An Executive Order is within the control of the Obama administration and can be changed. With respect to the Dec. 31, 2010, deadline agreed to by EPA in a settlement agreement with the CBF, we respectfully submit that it is clear that this deadline does not provide for meaningful public comment and should be changed. In fact, because the deadline is in a settlement agreement and not a judicial consent

decree, EPA need only ask CBF to agree to an extension. Even if CBF is unwilling to agree to a modification of the settlement agreement, the only remedy CBF has under that agreement is to reinstate its lawsuit against EPA, a position we believe is without merit.

EPA denied all other requests for an extension of the comment period on October 25, 2010, by posting a "Statement on EPA Decision Not to Extend the Bay TMDL Public Comment Period" on its website.

http://www.epa.gov/reg3wapd/pdf/pdf_chesbay/StatementonBayTMDLCommentPeriod.pdf In addition to the reasons given to the Congressmen, this statement relies on EPA's outreach efforts and interactions with states to justify a 45-day comment period.

Self-imposed deadlines, summary overviews of the TMDL in PowerPoint presentations, and non-public discussions with states, do not justify EPA's failure to provide the public with access to the information that EPA used to make its policy choices and EPA's failure to provide any person with adequate time to evaluate and offer comments on that information. Thus, the reasons provided by EPA for refusing to extend the period of time for the public to comment on the Draft TMDL are without merit.

Response

EPA respectfully disagrees that its statement on the public comment period is without merit.

Although the Bay TMDL is a detailed document, the public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. IV. EPA HAS FAILED TO PROVIDE THE LOCALITIES WITH A REASONABLE OPPORTUNITY TO REVIEW, EVALUATE, AND COMMENT ON THE BASIS FOR THE PROPOSED ALLOCATIONS.

A. The length of the comment period is insufficient given the size of the docket and the complexity of the TMDL. Although EPA has characterized this as the largest and most complex TMDL ever developed, it is providing only a 45-day period to review and comment on the over 2,000 pages of documents posted on the docket. While we recognize that EPA has a certain amount of latitude in establishing the length of its comment periods, we submit that in this case, EPA has abused its discretion and effectively deprived stakeholders such as the Localities with a reasonable opportunity to comment on this very complex and controversial proposal.

The 45-day comment period is inconsistent with Executive Order 12866, which provides that most rulemakings should include a comment period of not less than 60 days, as well as EPA's own Public Involvement Policy, which stipulates that "the comment period for public review of unusually complex issues or lengthy documents generally should be no less than 60 days".[FN8] Further, even a 60-day comment period would be too short in this case as reflected in the fact that EPA has established comment periods longer than 60 days for large, complex or controversial proposals such as this TMDL. Examples include EPA's 2010 proposed Water Quality Standards for Florida's Lakes and Flowing Waters (90-day comment period); EPA's 2009 proposed Renewable Fuel Standard (120-day comment period); EPA's 2001 proposed Electronic Reporting Rule (180-day comment period).

[FN8] See Public Involvement Policy of the U.S. Environmental Protection Agency (EPA 233-B-03-002 - May 2003) at page 13.

Response

Response

EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two

years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

As soon as model scenario input decks and outputs, documentation, and other related information were available, EPA made it available first to its jurisdictional partners and then to the public. As documentation on the suite of Bay models and the Scenario Builder was written and reviewed, EPA posted drafts and then final versions of that documentation. In many cases, EPA, working with its partners, was making decisions throughout the Bay TMDL development process that directly affected the formulation of model scenarios or was required prior to finalizing documentation. EPA took all possible steps to share data, information, and documentation in real time as it was being generated, reviewed and accepted.

EPA also took steps to ensure the underlying model code for the key modeling tools was available to its partners and the public, as part of a larger effort to make the models themselves, in addition to the input decks and the scenario outputs, as transparent as possible.

EPA made the Scenario Builder documentation available on 9/16/2010, the Scenario Builder code available on 10/29/2010, and the support database during the period 11/1-11/5/2010. The documentation, code, and database have been publically available at <ftp://ftp.chesapeakebay.net/Modeling/ScenarioBuilder/>. The scenario builder inputs and outputs have been publically available at ftp://ftp.chesapeakebay.net/Modeling/phase5/Phase53_Loads-Acres-BMPs/. As new management scenarios were developed using Scenario Builder and run as input decks through the Phase 5.3 Chesapeake Bay Watershed Model, those new results were made publically accessible through the same FTP site. The Phase 5.3 Chesapeake Bay Watershed Model, used in the development of the Bay TMDL, has been available at <http://ches.communitymodeling.org/models/CBPhase5/index.php>

The technical direction on development and review of the Scenario Builder has been accomplished through collaborative meetings and conference call of several groups within the Chesapeake Bay Program partnership's organizational structure. Prominent among these are the Water Quality Goal Implementation Team, the Modeling Workgroup, the Agricultural Nutrient and Sediment Reduction Workgroup (NRCS and University of Maryland representatives are co-chairs), the Urban Stormwater Workgroup, the Forestry Workgroup, and the Wastewater Workgroup. All of these meetings were open to the public. Each has broad representation from state and federal government, academics, and stakeholder groups. Links to records of these meetings and conference calls are be found in Appendix C of the final Bay TMDL. These links provide direct access to the briefing materials

prepared in advance of the meeting/conference call, the presentations given during the meeting/conference call, and the summary of decisions/actions coming out of the meeting/conference call.

After more than five years of development work, calibration and validation were completed in March 2010 and reviewed and approved by several of the above groups. All the Phase 5.3 Watershed Model calibration results are accessible at ftp://ftp.chesapeakebay.net/Modeling/phase5/Phase%205.3%20Calibration/Calibration_pdf/all_validation.pdf.

The Chesapeake Community Modeling Program, an organization supported by and staffed by academic institutions across the Chesapeake Bay watershed, hosts the open-source code of the Chesapeake Bay Phase 5.3 Watershed Model on its website. This model code has been accessed by and is being used by numerous academic institutions, states and others in supporting local, regional and state-wide decision making. The Phase 5.3 Watershed Model's code can be accessed at the Chesapeake Community Modeling Program's website at <http://ches.communitymodeling.org/models/CBPhase5/datalibrary.php>.

For more detailed documentation, please access the Phase 5.3 Chesapeake Bay Watershed Model report at http://www.chesapeakebay.net/model_phase5.aspx?menuitem=26169.

Organization: Binghamton-Johnson City Joint Sewage Board

J. The EPA Did Not Provide an Appropriate Comment Period In This TMDL Process

The EPA did not provide a public comment period of sufficient length considering the size and scope - as well as the anticipated impact - of the TMDL. See, Section II in our October 29, 2010 letter (on-line Comment Docket Comment Attachment #145.1) describing that, because the "Chesapeake Bay TMDL [i] is the largest, most complex TMDL in the country", [ii] will be used as a precedent-setting model for future nutrient reduction programs and TMDLs, and [iii] touches on many policy as well as legal issues, provision of adequate time for public input is vital and affords substantial benefits to both the EPA and the public. Our Board believes that the 45 days allowed has been insufficient under the Administrative Procedure Act ("APA") to provide for meaningful, fully-informed public comment on the Bay TMDL by any person or entity, and did not conform to Executive Order No. 12866, providing that most rulemakings "should include a comment period of not less than 60 days." [FN1] As noted several places in this letter, we have not had adequate time to provide more detailed analysis and better-informed comments and suggestions.

[FN1] - Exec. Order 12866, 58 Fed. Reg. 51,735 (Sept. 30, 1993).

Response

Author Name: Barnes C.

Organization: County of Spotsylvania, Virginia

II. EPA HAS FAILED TO PROVIDE SPOTSYLVANIA WITH SUFFICIENT TIME TO REVIEW, EVALUATE, AND COMMENT ON THE DRAFT TMDLs

Despite the enormous size and complexity of the TMDL documents released on September 24, 2010 the socio-economic consequences of the proposed allocations, and the arbitrary nature of EPA's decision to establish the TMDLs by December 31, 2010 when it could have given the public additional time to comment had it taken advantage of the May 2010 deadline in the consent decree, Spotsylvania does not have sufficient time nor staff to adequately review and respond to the draft TMDLs in detail. Spotsylvania will defend vigorously any claim of waiver due to failure to submit comments to the TMDLs on the basis that insufficient time was given to adequately respond.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Bay TMDL schedule was not arbitrarily determined. The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator.

The 45-day public comment period was also the product of negotiation and agreement among the states and EPA. The December 31, 2010 date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010. In addition, a settlement agreement between EPA and the Chesapeake Bay Foundation requires EPA to issue the final TMDL by this date.

The Bay TMDL is a detailed document. That this why the TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry

representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

a. Inadequate Time has been Provided for Review and Comment.

The Chesapeake Bay TMDL is a very complex, innovative and far-reaching new rule. Because of the impact the TMDL will have on the home building industry, communities, and the overall region, it is imperative that it be finalized only after all parties are provided sufficient opportunity to give careful thought and consideration to all aspects of the proposal and its supporting documents. EPA's efforts to accelerate the TMDL's completion by cutting a most important element in the development of the Bay restoration program - the public review and comment period - is misguided and wrong. We strongly urge the agency to provide the public more, not less time.

Under the Administrative Procedure Act (APA), a "[g]eneral notice of proposed rulemaking shall be published in the Federal Register" and the agency must "give interested persons an opportunity to participate in the rule making through submission of written data, views, or arguments." [FN 5] "The opportunity to comment must be a meaningful opportunity." [FN 6] Section 553 is designed to ensure that affected parties have an opportunity to participate in and influence agency decision making at an early stage, when the agency is more likely to give real consideration to alternative ideas." [FN 7]

The proposed Chesapeake Bay TMDL is a combination of 92 smaller TMDLs for individual tidal segments. It consists of 333 pages of main text and includes 22 appendices, some of which contain hundreds of pages of data. Furthermore, the Chesapeake Bay watershed touches six states and the District of Columbia and encompasses 64,000 square miles of land. Yet, the agency has provided the public with only 45 days to provide comments on its proposal and plans to finalize the TMDL by the end of December 2010. The 45-day time period does not allow the public to review all 92 "sub-TMDLs," or analyze the data and provide comments to allow the agency to make a better informed decision.

Furthermore, the TMDL is just one of several restoration actions under way. Amid the implementation of the directives of the Chesapeake Bay Executive Order 13508, the state WIPs, and newly proposed or revised MS4 programs, EPA

has proposed a TMDL with an unprecedented broad scope. In addition, the agency has recently scheduled a series of "listening sessions" during the TMDL comment period to discuss new Chesapeake Bay-specific portions of the national post-construction stormwater rule the agency is developing. EPA plans for that rule to have Chesapeake Bay-specific requirements that will come on top of the TMDL requirements. These similar, overlapping, but entirely different rules and their public meetings are confusing even to those intimately familiar with the national stormwater regulatory structure. Those most able to comment on the proposed TMDL and the post-construction rule are already occupied with analyzing and commenting on their revised state Phase I WIP.

Recognizing these challenges, on Oct. 15, 2010, NAHB submitted to the Chesapeake Bay TMDL docket, EPA-R03-OW-2010-0736, a request for extending the public comment period for the proposed TMDL by another 180 days and provided a detailed explanation of the reasons NAHB said that the request was prudent and necessary (see attachment A). Others filed similar requests, including twenty-one members of Congress. On Oct. 22, EPA responded to Congressman Goodlatte, stating "it is not feasible to extend the public comment period on the draft Chesapeake Bay TMDL past November 8, 2010 and therefore delay finalization of the TMDL by December 31, 2010." [FN 8] Reasons cited in the letter include an agreement that was made in June, 2008, negotiations between the states and EPA, a commitment included in the Executive Order 13508 Final Strategy and the settlement agreement between EPA and the Chesapeake Bay Foundation.

Importantly, contrary to EPA's contention, none of these agreements are legally-binding or unchangeable. Agreements can be renegotiated and commitments can be revised, and because the current deadline is simply an agreed-to date within a court settlement, EPA can renegotiate.[FN 9] In fact, the Settlement Agreement gives EPA flexibility to extend the Dec. 31 deadline and certainly does not limit or modify EPA's discretion to allow the public sufficient time to review and comment on the 92 Bay TMDLs.[FN 10]

NAHB stands by its earlier request to extend the public comment period and reiterates the negative impacts that will accrue by foregoing such a vital part of the rulemaking process. EPA owes the Chesapeake Bay communities, citizens, and stakeholders more than 45 days to analyze and comment on a proposed rule that will have a major impact on the lives of all people living and working in the Chesapeake Bay watershed. Likewise, as EPA intends for this TMDL to serve as a precedent for the nation, the public must be afforded sufficient time to review, understand, and provide meaningful comment. Finally, NAHB is extremely concerned that the time frame between the end of the comment period and Dec. 31 is not long enough for the agency to truly consider alternative ideas that may be provided by the public.

It is EPA's responsibility to schedule its regulatory activities to ensure that the public has sufficient opportunities for participation and sufficient time for review and comment. Likewise, the agency must give itself sufficient time to meet its rulemaking obligations. The agency has failed in both regards, with the many, overlapping, and confusing Bay-related regulatory proposals that it has issued in the latter part of 2010. EPA is urged to:

1. Extend the comment period for the proposed TMDL to allow adequate stakeholder input to the process,

[FN 5] 5 U.S.C. §§ 553(b) & (c).

[FN 10] *Fowler v. EPA Settlement Agreement*, Sections VI.A, D, & E. (noting that the agreement does not limit or modify EPA's discretion under the APA or require EPA to violate the APA, and allowing EPA to delay deadlines under certain circumstances upon notice to the plaintiffs).

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

The schedule allowed sufficient time for EPA to consider public comments and revise the TMDL. A team of EPA sector experts began reviewing and preparing responses to the public comments once they began to be entered in the docket shortly after the public comment period began on September 24, 2010. The comments were taken into consideration by EPA as it moved from the draft to a final TMDL.

Comment ID 0571.1.001.025

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

On behalf of the National Association of Homebuilders (NAHB), I respectfully request that the U.S. Environmental Protection Agency (EPA) extend the public comment period for the Draft Total Maximum Daily Load (TMDL) for the Chesapeake Bay, the availability of which was announced in the Federal Register on September 22, 2010, for an additional 180 days. This additional time is needed because of the technical complexity of the proposal and the need to afford all impacted parties an opportunity to fully understand and provide meaningful comments. It is also needed so that EPA can make all of the supporting documents available for review.

NAHB is a trade association representing more than 175,000 members involved in home building, remodeling, multifamily construction, property management, subcontracting, design, housing finance, building product manufacturing and other aspects of residential and light commercial construction. Known as "the voice of the housing industry," NAHB is affiliated with over 800 state and local home builders associations around the country. NAHB's

builder members will construct about 80 percent of the new housing projected for 2010. Because of the nature of their work, most of our members must obtain and operate pursuant to National Pollutant Discharge Elimination System (NPDES) permits for controlling the stormwater discharges stemming from their construction activities. The Chesapeake Bay TMDL's requirements will become a part of the stormwater permits issued for homebuilding projects in the Bay watershed. The Chesapeake Bay TMDL is a very complex, innovative and far-reaching new rule. Because of the impact the TMDL will have on the home building industry, communities, and the overall region, it is imperative that it be finalized only after all parties are provided sufficient opportunity to give careful thought and consideration to all aspects of the proposal and its supporting documents. EPA's efforts to accelerate the TMDL's completion by cutting a most important element in the development of the Bay restoration program - the public review and comment period - is misguided and wrong. Contrary to this approach, the Agency is strongly urged to provide the public more, not less time. NAHB believes that EPA should extend the comment period for a minimum of 180 additional days.

A Complex Proposal Demands Sufficient Review

EPA acknowledges that the Chesapeake Bay TMDL will be the largest, most complex TMDL in the country, and it will be held up to the nation as the bar to meet for the future nutrient reduction programs that will take place around the U.S.; yet EPA is, at the same time, proposing to short shrift the public by limiting its ability to study the proposal and offer comment. Indeed, EPA has asked the public to review and comment on the lengthy proposal and supporting documentation including state Watershed Implementation Plans, a highly-technical pollutant reduction model, land use assumptions, and 22 appendices. Appendix B alone includes a list of documents supporting the Chesapeake Bay TMDL that spans 16 pages - all of which should be analyzed and understood before making comment. Taken together, the sheer volume of information amounts to thousands of pages that cannot realistically be reviewed and analyzed within the given 45-day comment period. Moreover, because the proposal raises many legal and policy issues, careful consideration and research will be needed before suggested solutions can be drafted.

While the Administrative Procedure Act (APA) does not specify a minimum time period for comment on a proposed rule, Executive Order (EO) No. 12866 provides that most rulemakings "should include a comment period of not less than 60 days." [FN 41] Likewise, for most TMDLs, EPA and the states provide a minimum of 60-90 days for public input. For example, EPA recently provided a public comment period of 60 days for the Accotink Creek TMDL in Virginia in the summer of 2010. Accotink Creek represents only one TMDL, vs. the 94 segments, or individual TMDLs, that make up the overall Chesapeake Bay TMDL. Following this example, it would be plausible that the Agency provide a 5,640 day comment period for the Chesapeake Bay TMDL (60 days per TMDL x 94 segments). NAHB is merely asking for additional 180 days.

Furthermore, when the Agency has offered insufficient time to review similarly complex and expansive rulemakings, EPA has recognized the mistake, extended the comment period, and issued the complex rulemaking after due time for consideration. For example, EPA proposed 80 TMDLs in Louisiana and originally offered the public only 30 days for review and comment. [FN 42] Not surprisingly, EPA received several requests to extend the comment period, so EPA agreed to accept comments for an additional 60 days. [FN 43] After reviewing comment from stakeholders who had additional time to review the data, EPA finalized the 80 TMDLs 7 months later. [FN 44]

Finally, because EPA has plainly stated that the Chesapeake Bay TMDL will be used as a model for other waterbodies across the country, it is all the more important that the TMDL be accurate and fully vetted. A TMDL that cannot meet its intended goals serves no one. Allowing sufficient opportunity for the public to participate in forming the rule and

providing input on the actions that can be taken to meet the goals will better ensure that the TMDL is not only practical and effective, but that it will be properly implemented.

The Technical Data and Cost Information Are Not Readily Available

In addition to proposing a TMDL that is highly complex and confusing, EPA has not made all of the supporting documentation available for review. As a result, it is impossible for the public to fully understand the Agency's reasoning or follow its justifications. For example, EPA has provided no technical data to justify the need for the urban stormwater requirements contained in the backstop allocations or to demonstrate that they will meet the desired outcomes. Likewise, information on costs or the best management practices that can be used to meet the urban stormwater requirements have not been made available. Other technical and cost data is similarly absent from the docket, as is any way to quickly understand how the proposal will affect the various industries, communities, or individuals within the watershed. If the public does not have access to these baseline datasets, it is unable to provide meaningful comment. Similarly, if the public cannot understand how the proposal will affect their interests or businesses, their ability to provide useful input is significantly hindered. EPA is obligated to make all supporting information and documents available to the public prior to the start of the public comment period and to provide sufficient opportunities for its thorough review. The existing docket and schedule fails to do so.

The Breadth of Impacts Warrants Broad Opportunities for Participation

The Bay TMDL will impose additional, extraordinarily difficult regulatory requirements on the home building industry and the citizens and communities located around the Bay. As such, it is imperative that the TMDL get a thorough examination not just by home builders, but by all stakeholders. Not only will a 45 day review period fail to provide sufficient time for the public to conduct a meaningful review or the develop insightful comments that would result from that review, for most stakeholders, the publication of the proposal is the first glimpse they have gotten into the sweeping breadth of the rule, the assumptions that EPA has made concerning their industries, and the many details that may affect their particular businesses and/or properties located within the Bay's watershed.

Unlike other similar efforts, EPA has failed to include the public or the affected parties in developing the TMDL. While the Agency has held numerous meetings on the effort (outlined in Appendix V), very few have been targeted to those industries or stakeholders who will be impacted. For example, NAHB has been monitoring and participating in EPA's activities since 2009 (the overall regulatory effort began in 2008) and that was only after NAHB conducted significant due diligence and convinced the Agency to allow us to participate. In the technical meetings that NAHB has attended leading up to the proposal and on the technical conference calls in which we have listened in; we cannot recall a single representative of another industry at any of those meetings or on any of the calls. This represents a significant flaw in the Agency's process.

As a result of this failure to communicate or allow broad participation, the vast majority of industrial sectors that will be impacted by the TMDL have only just become aware of the coming rule and the potential severity of its requirements. The public meetings that EPA is currently holding may help in this regard, but many stakeholders will need more than the allotted 45 day comment period to fully understand the proposal and provide adequate technical comments on the draft rule. Indeed, EPA states that the goal of these meetings is "to assist the public in their understanding of the Draft Bay TMDL and provide an overview of the TMDL process, especially the stakeholder review and comment process." [FN 45] For stakeholders in Romney, West Virginia who are hoping to use their November 4 public meeting as an

opportunity to be introduced to EPA's effort, their public comment period has effectively been reduced to 4 days (two if one only counts business days).

Only people who work in the affected industries can possibly know in full how the proposed rule will impact their operations and how their portion(s) of the rule will work in the real world. Therefore, their review and comment is absolutely necessary to fine tune the requirements and ensure the proper balance between environmental stewardship and the economic impacts is made. In order to ensure that these entities can make their voices heard, EPA must extend the comment period.

EPA Retains Authority to Revise the Timeline/Allow a Longer Comment Period

EPA continually points to the TMDL schedule included in its May 2010 settlement with former Maryland state senator C. Bernard Fowler, the Chesapeake Bay Foundation, Maryland and Virginia watermen's associations, and others in *Fowler v. EPA* that calls for the completion of the Bay TMDL by December 31, 2010 as the reason for a truncated public review. The Agency, however, has full authority to revise the schedule and timeline to allow for a sufficient comment period. Indeed, because the current deadline is simply an agreed-to date within a court settlement, EPA can renegotiate. [FN 46] In fact, the Settlement Agreement gives EPA flexibility to extend the December 31 deadline and certainly does not limit or modify EPA's discretion to allow the public sufficient time to review and comment on the 94 Bay TMDLs.[FN 47] Because the very purpose of the public comment process is to allow stakeholders to analyze the proposal and provide comments and suggestions that may improve the effectiveness and lower the costs of the rule, providing additional time for this vital and necessary input provides benefits to both the Agency and the public.

It is only fair that the public be given ample time and opportunity to participate in the development and finalization of this important and sweeping proposal. The Chinese saying: "Find enlightenment through heeding many points of view. Find ignorance through heeding few" is one EPA should follow. EPA needs to give stakeholders the broadest opportunity possible for them to fully understand and make their suggestions on the proposed rule. The best way to do that is to provide a minimum of 180 additional days for the public comment period for the proposed Bay TMDL

[FN 41] Exec. Order 12866, 58 Fed. Reg. 51735 (September 30, 1993).

[FN 42] 71 Fed. Reg. 41217 (July 20, 2006) (setting August 21, 2006 as the original deadline for public comment).

[FN 43] 71 Fed. Reg. 59504 (Oct. 10, 2006) (agreeing to accept public comment until October 20, 2006, review the comments, and revise or modify the TMDLs as appropriate).

[FN 44] 72 Fed. Reg. 19,703 (Apr. 19, 2007).

[FN 45] 75 Fed. Reg. 5776 (September 22, 2010) (emphasis added).

[FN 46] *Fowler v. EPA Settlement Agreement*, Section IV.A. ("[t]he parties may modify any deadline or other term of this agreement in writing.").

[FN 47] *Fowler v. EPA Settlement Agreement*, Sections VI.A, D, & E. (noting that the agreement does not limit or modify EPA's discretion under the APA or require EPA to violate the APA, and allowing EPA to delay deadlines under certain circumstances upon notice to the plaintiffs).

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

With regard to the complexity of the Bay TMDL, please see response to comment 0153.001.003.

With regard to cost analysis, please see response to comment 0139.0.001.017.

EPA notes that the Bay TMDL is not a federal regulation.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

As soon as model scenario input decks and outputs, documentation, and other related information were available, EPA made it available first to its jurisdictional partners and then to the public. As documentation on the suite of Bay models and the Scenario Builder was written and reviewed, EPA posted drafts and then final versions of that documentation. In many cases, EPA, working with its partners, was making decisions throughout the Bay TMDL development process that directly affected the formulation of model scenarios or was required prior to finalizing documentation. EPA took all possible steps to share data, information, and documentation in real time as it was being generated, reviewed and accepted.

EPA also took steps to ensure the underlying model code for the key modeling tools was available to its partners and the public, as part of a larger effort to make the models themselves, in addition to the input decks and the scenario outputs, as transparent as possible.

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

With regard to stakeholders in Romney, West Virginia, and their opportunity to review and comment on the Bay TMDL, please see above references to the extensive public outreach, including the webinars open to anyone with an opportunity to ask questions. The TMDL document was available for review and comment on the Bay TMDL web site beginning September 24, 2010.

Organization:

The EPA did not have the public meetings in WV until Nov.3rd and 4th with the cutoff on comments on Nov. 8th. NOT MOCH TIME FOR COMMENTS FROM WEST VIRGINIA for the plan for the next 15 years.

Response

The public comment period for the draft Bay TMDL was widely publicized and the notice was widely disseminated. The TMDL document was available for review and comment on the Bay TMDL web site beginning September 24, 2010. There were 18 public meetings held across the watershed, seven of which were broadcast live over the Internet with an opportunity for listeners to ask questions. The webinar registration links were on the Bay TMDL web site.

The dates of the West Virginia public meetings were determined based on state preference. They were advertised in a Federal Register Notice prior to the start of the public comment period and included in press releases sent by EPA.

Furthermore, EPA has not followed appropriate administrative procedure in development of the Bay TMDL. A mere 45 days is inadequate and inappropriately brief to receive public comment on the massive, complex materials posted by EPA in the Federal Register on September 24. The draft TMDL document is 370 pages, with 22 appendices consisting of 1,672 pages. It contains complex, highly technical information. It is impossible for citizens to analyze this volume of material and assess its impact within 45 days. This duration thereby effectively denies the public adequate opportunity to comment.

Response

EPA provided the public with adequate opportunity to comment on the draft TMDL.

With regard to the public comment period, please see response to comment 0060.1.001.001.

With regard to the complexity of the TMDL, please see response to comment 0153.001.003.

Comment ID 0654.001.002

1. Tyson renews its request for an extension of time for the public comment period. There are literally thousands of pages that still need to be reviewed. Forty five days is simply not enough time to thoroughly review the Draft TMDL and the State WIPs.

Response

Please see response to comment 0060.1.001.001. The WIPs were not part of the Bay TMDL itself. The watershed states and the District of Columbia made their own determinations on public review of the WIPs.

Comment ID 0670-cp.001.003

Author Name: Reese Jodi

Organization: CET Engineering Services

The Public Comment Period needs to be extended beyond 45 days. The truncated public comment period of 45 days is totally inadequate and inappropriate. On September 24, 2010 EPA made available the draft Chesapeake Bay TMDL. The body of the report is 365 pages in length with 23 appendices totaling 262 pages that include seven tables with a total of approximately 22,000 rows of data and information in those tables. Three of these tables list cap loads for all point sources, significant and insignificant. There are 4,390 insignificant point sources listed in these tables that are unlikely aware of their inclusion and their need to review and comment on the TMDL. Forty-five days is not adequate to ensure that contact is made with appropriate representatives of these dischargers.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

As to the awareness of non-significant point sources to the provisions of the TMDL, EPA and the respective watershed states and the District of Columbia have done extensive outreach on the Bay TMDL to the general public and to stakeholder groups, including the wastewater treatment sector. EPA alone has held hundreds of meetings with groups interested and impacted by the Bay TMDL since 2008, placed general and technical information on its public web sites, and conducted numerous interviews with the media to get the word out about this important initiative.

Clearly more work is needed to improve the health of the Chesapeake Bay, but EPA's arbitrary deadlines and aggressive schedules are setting up the process for failure. Underlying all the debate about allocations, reasonable assurance, and backstops is a complex model and volumes of data which stakeholders and the public have simply not had enough time or opportunity to review. EPA should provide the public with more time to review the models and the draft TMDL in order to interact with EPA and support the development of meaningful comment on the TMDL. A 45-day comment deadline is not sufficient for such a complex watershed and TMDL.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Bay TMDL is a detailed document. That this why the TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

The Bay TMDL schedule was not arbitrarily determined. The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor

of the District of Columbia and the EPA Administrator.

The 45-day public comment period was also the product of negotiation and agreement among the states and EPA. The December 31, 2010 date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010. In addition, a settlement agreement between EPA and the Chesapeake Bay Foundation requires EPA to issue the final TMDL by this date.

The decision not to extend the 45-day comment period is both capricious and arbitrary. Further, it does not provide adequate time for local officials to discuss and assess the financial impact and facility requirements resulting from the stricter limits.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Bay TMDL schedule was not arbitrarily determined. The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator.

The 45-day public comment period was also the product of negotiation and agreement among the states and EPA. The December 31, 2010 date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010. In addition, a settlement agreement between EPA and the Chesapeake Bay Foundation requires EPA to issue the final TMDL by this date.

EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL. In addition, EPA has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had many other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report. EPA looks forward to more extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the jurisdictions offer allocations of pollution reduction responsibilities on a finer geographic scale, such as counties, conservation districts and sub-watersheds.

EPA's comment period is much too brief for a measure of this magnitude. The proposed TMDL consists of well over a thousand pages including appendices. Much of this material is highly technical and complicated. It is unreasonable to expect citizens to analyze and understand such a massive measure and file informed comments within such a brief period of time. EPA itself should have provided a comprehensive economic impact analysis and presented it as part of the hearing process.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

The Bay TMDL is a detailed document. That this why the TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017.

Given this extraordinary opportunity for public input on the development of the proposed TMDL, along with the long history of Chesapeake Bay restoration efforts and legal obligations to develop the TMDL, recent calls for an extension of the 45-day public comment period are disingenuous, at best. We wholeheartedly support EPA's decision to hold firm on its commitment, and that of the Bay jurisdictions, to complete the Bay TMDL by December 31, 2010, which is also legally supported by our recent settlement agreement with EPA in *Fowler v. EPA*. (Copy of the Notice of Intent of October 29, 2009, Complaint of January 5, 2009, and Settlement Agreement May 10, 2010, attached hereto and incorporated herein by reference.) Just as the information below regarding the attendees at the Martinsburg, WV public meeting shows that little effort had been made by the EPA to advertise the meeting held 4-Nov-2010, and then leaving participants 4 days to make a formal response.

I assure everyone that reads this, more people have been kept it the dark than me regarding this initiative as shown with the response below of how people heard about the Martinsburg, WV meeting.

How did you hear about this Meeting?

- Other (14) Chesapeake Bay Implementation Committee (2) Work (2) Word of Mouth (2) Radio WVDEP Local PSD Extension Service • Email/Listserve (11)
- Newspaper (1)
- Other Web Site _____ (0)
- U. S. EPA Web Site (4)

Response

The public comment period for the draft Bay TMDL was widely publicized and the notice was widely disseminated. The TMDL document was available for review and comment on the Bay TMDL web site beginning September 24, 2010. There were 18 public meetings held across the watershed, seven of which were broadcast live over the Internet with an opportunity for listeners to ask questions. The webinar registration links were on the Bay TMDL web site.

The dates of the West Virginia public meetings were determined based on state preference. They were advertised in a Federal Register Notice prior to the start of the public comment period and included in press releases sent by EPA. Notice and information on the meetings was provided in the media in advance of the sessions, including the Martinsburg Journal, the Associated Press, and an hour-long program on the WEPM-FM "Panhandle Live" show on the morning of November 3.

The West Virginia DEP did extensive outreach to help ensure the public was aware of the EPA public meetings. The DEP met twice with each of the eight county commissions in the Potomac drainage area to provide updates. Local newspapers carried notices of those sessions with the county commissions. The DEP also reached out to watershed groups to provide notice of the public

meetings. In fact, the Opequon Creek Project Team canceled its regularly scheduled meeting that night so its members could attend the EPA public meeting.

Notice of the meetings was also included for months on the DEP and EPA web sites.

EPA is obligated to make all supporting information and documents available to the public prior to the start of the public comment period and to provide sufficient opportunities for its thorough review. The existing docket and schedule fails to do so.

Response

The full Draft Bay TMDL and the various appendices with supporting information were available at regulations.gov and through the EPA web site, <http://www.epa.gov/chesapeakebaytmdl> during the public comment period. With regard to the time to review, please see response to comment 0060.1.001.001.

Comment ID 0066.1.001.013

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

The Bay TMDL will impose additional, extraordinarily difficult regulatory requirements on the home building industry and

the citizens and communities located around the Bay. As such, it is imperative that the TMDL get a thorough examination not just by home builders, but by all stakeholders. Not only will a 45 day review period fail to provide sufficient time for the public to conduct a meaningful review or the develop insightful comments that would result from that review, for most stakeholders, the publication of the proposal is the first glimpse they have gotten into the sweeping breadth of the rule, the assumptions that EPA has made concerning their industries, and the many details that may affect their particular businesses and/or properties located within the Bay's watershed. Unlike other similar efforts, EPA has failed to include the public or the affected parties in developing the TMDL. While the Agency has held numerous meetings on the effort (outlined in Appendix V), very few have been targeted to those industries or stakeholders who will be impacted. For example, NAHB has been monitoring and participating in EPA's activities since 2009 (the overall regulatory effort began in 2008) and that was only after NAHB conducted significant due diligence and convinced the Agency to allow us to participate. In the technical meetings that NAHB has attended leading up to the proposal and on the technical conference calls in which we have listened in; we cannot recall a single representative of another industry at any of those meetings or on any of the calls. This represents a significant flaw in the Agency's process.

Response

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. Organization: National Association of Home Builders (NAHB)

As a result of this failure to communicate or allow broad participation, the vast majority of industrial sectors that will be impacted by the TMDL have only just become aware of the coming rule and the potential severity of its requirements. The public meetings that EPA is currently holding may help in this regard, but many stakeholders will need more than the allotted 45 day comment period to fully understand the proposal and provide adequate technical comments on the draft rule.

Response

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

Article I, Section 27 of the Pennsylvania Constitution provides as follows:

Sec. 27. Natural Resources and the Public Estate

The people have a right to clean air, pure water, and to the preservation of the natural, scenic, historic and esthetic values of the environment. Pennsylvania's public natural resources are the common property of all the people, including generations yet to come. As trustee of these resources, the Commonwealth shall conserve and maintain them for the benefit of all the people.

This amendment, which was adopted in 1972, encompasses two basic principles. First, Pennsylvanians have a right to a decent environment, and second, Pennsylvania government has a trusteeship responsibility to protect that environment on behalf of future generations. EPCAMR is doing its part to uphold these Constitutional principles. As a public citizen, community leader, and active community volunteer, speaking on behalf of other Coalfield residents, I feel that I have done my part and continue to do so by actively contributing in this democratic public participation process of having my voice heard.

What I have failed to see is a concerted effort on the part of EPA and land owners to sell their respective positions. A good sale man is worth his weight in gold. What I see is a lack of effort to spell out the benefits to all concerned.

Response

In its extensive outreach efforts, EPA has sought to emphasize the significant public health, economic, recreational, cultural and quality of life benefits of the Bay TMDL's clean water outcomes.

Specifically, EPA has noted the benefits to drinking water, to local recreational pursuits like swimming, fishing and boating, and to area economies.

The Bay provides significant economic benefits to the region. An expert panel in 2004 placed the value of the Bay at over \$1 trillion, with an annual economic benefit of \$33 to \$60 billion, based on factors including fishing, tourism, property values, recreation, local business and shipping.

The Bay supports a major tourism economy and the commercial and recreational fishing industries.

Pollution reductions lower drinking water and other utility costs. For every \$1 spent on drinking water protection, an average of \$27 is saved in water treatment costs. Clean water also sustains aesthetic and cultural values.

EPA's outreach effort has involved two rounds of public meetings, monthly webinars, a robust web site, hundreds of stakeholder meetings and extensive media interaction. EPA has highlighted the benefits of the TMDL in all of these activities.

Perhaps the reason I may have missed certain elements may be due to the manner in which it is organized or written. Given that, I do admit that some of the very technical appendices, specifically those related to modeling and statistical analyses were a bit over my head. Admitting my basic lack of understanding there, it still may be worthwhile, especially with regards to effective communication and layman trust, to attempt to make it more clear in the final draft.

Response

EPA's goal is to provide a clear understanding of the Bay TMDL to a variety of audiences. The executive summary, in particular, is designed to offer a basic and concise overview of this initiative. There are some sections that are by necessity more technical than others. EPA's web site, <http://www.epa.gov/chesapeakebaytmdl> is another source of information on aspects of the Bay TMDL.

These decisions also reflect an exemplary decree of consultation with the states through what is now called the Water Quality Goal Implementation Team, using input from the Chesapeake Bay Program's expert work groups.

Response

Through the Water Quality Goal Implementation and other Chesapeake Bay Program committees, regular meetings and other forums and means, EPA and the states have worked together on the TMDL. Since September 2005, the seven jurisdictions have been actively involved in decision-making to develop the TMDL. Section 1.3 of the Draft Bay TMDL provides additional information on the joint work of EPA, the watershed states and the District of Columbia.

Comment ID 0256.1.001.009

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

In the recent round of public meetings on the Bay TMDL, local government officials have stressed that, while funding for restoration projects is critical, it is no more important than building broad general public support for the initiatives

required by the TMDL.

Response

EPA appreciates the perspectives of local government in the TMDL process. The agency has worked closely with the Local Government Advisory Committee and has met on many occasions with local officials regarding the TMDL. That interaction will be even more important in 2011 as the next phase of the Watershed Implementation Plans focuses on a more local level. The President's proposed budget for FY 2011 includes nearly a half billion dollars in funding for Chesapeake Bay restoration. EPA has stated that it will not be easy or inexpensive to restore the Bay and improve local waters in the process, but that it is our legal responsibility and our obligation to the citizens of the watershed.

Comment ID 0256.1.001.012

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

Secondly, EPA must take a stronger role in developing messages that local governments can use in explaining the need for TMDL compliance at the local level. Earlier this year in a letter to EPA Administrator, Lisa Jackson, in support of Senator Cardin's bill to reauthorize the Bay Program, LGAC requested that there be a strong communications and educational effort to explain to all citizens why and how this effort is critical to cleaning up the Chesapeake Bay. For those local officials facing their constituents, this is a vital component to communicating the message of Bay cleanup and restoration. LGAC will work with EPA to take a proactive role in helping to develop messages and educational efforts that will resonate at local government levels throughout the Watershed. We also recommend that the lessons learned from all the Pilot Projects be collected and made a part of whatever communication and outreach tools that are developed.

Some of our long standing LGAC members also wish to point out that the Chesapeake Bay Watershed Blue Ribbon Finance Panel called for a strong education and outreach component in their original report in 2004. This is one very important aspect of cleaning up and restoring the Chesapeake Bay, true then and true today, that neither EPA nor any of the Bay Partners can afford to ignore. We will succeed only if there is a full understanding of the stakes involved in our efforts.

Response

EPA fully agrees that education and communications to citizens about the importance of the Chesapeake Bay TMDL is essential. EPA will continue to build on its efforts to inform the public of the extensive benefits associated with cleaning up the Chesapeake Bay and the local rivers, streams and creeks that feed it. EPA looks forward to working in concert with LGAC to help develop new educational information for local governments, including a lessons learned document from the local pilot projects.

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

B. The opportunity for comment is limited further by EPA's failure to provide all the information and tools needed to review and evaluate the TMDL.

Despite the massive size of the docket, EPA has not provided the public with all of the information and tools needed to effectively review, evaluate and comment on the basis for the proposed allocations. This is also inconsistent with EPA's Public Involvement Policy, which provides that "the comment period should not open until materials are available for the public to obtain and review".[FN 9] The Localities have tried to overcome this impediment to their opportunity to comment, in part, by posing several written questions and requests for information to EPA in an effort to gain a better understanding of the basis for the urban runoff allocations, but EPA has been generally unresponsive to these questions and requests.

[FN 9] Id.

Response

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

The public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA is unaware of the specific set of written questions and requests for information referred to in the comment. EPA assigned an EPA Watershed Implementation Plan coordinator to work with each jurisdiction and all requests for information, data, scenarios and other items were coordinated through that WIP coordinator to ensure each request for information or assistance was addressed. Priority was given during development of Phase 1 WIPs to requests directly from the states and the District, but EPA did respond to many requests from localities and many other stakeholders at the same time.

Comment ID 0300.1.001.009

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

From VDOT's experience, tangible water quality benefits result from educating the public and VDOT's own staff about pollution reduction in stormwater discharges and identifying and preventing illicit stormwater discharges to the storm sewer system. Therefore, VDOT requests that the TMDL emphasize the positive benefit of public education and outreach and provide recognition of load reductions that can be achieved through an effective public education program.

Response

EPA fully agrees that an effective public education program on identifying and preventing illicit stormwater discharges to the storm sewer system would be highly beneficial. EPA will build on its efforts to get the message out about how the public can do its part in reducing pollution loads to the Bay and local waters.

Comment ID 0306-cp.001.001

Organization:

Your system timed out on me twice, erasing both offerings to the public record. I found I would have to scroll up in order to see the little pop-up. Allowing that I have 1500 Characters remaining, why would you have it set up to boot me out? This another means to squelch commentary for the public record and truly in keeping with that which I had twice attempted to submit. (TYPING REALLY FAST NOW!) I wonder how many others were again refused to be heard. In a nut shell & minus the politeness which was to be found in previous attempts: Terrible forum, Gum Chewing/Smackin by EPA was big hit, u OF r MOMOPOLIZED THE PODIUM.

Response

Please be assured that EPA has welcomed and encouraged all comments on the Bay TMDL, and facilitated the means for broad public participation.

EPA held 18 public meetings throughout the watershed during the public comment period and held numerous meetings with stakeholder groups while on the road.

Each of the public meetings, including the one held at the University of Richmond, featured a substantial question and answer and comment period, normally at least half of the meeting time.

Comment ID 0331.1.001.002

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

The EPA has failed to provide the City, as well as the public, with sufficient data and documentation to properly review, evaluate, and fully comment on the proposed allocations.

Response

EPA provided sufficient data and documentation for review and comment on the proposed allocations.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

As soon as model scenario input decks and outputs, documentation, and other related information were available, EPA made it available first to its jurisdictional partners and then to the public. As documentation on the suite of Bay models and the Scenario Builder was written and reviewed, EPA posted drafts and then final versions of that documentation. In many cases, EPA, working with its partners, was making decisions throughout the Bay TMDL development process that directly affected the formulation of model scenarios or was required prior to finalizing documentation. EPA took all possible steps to share data, information, and documentation in real time as it was being generated, reviewed and accepted.

EPA also took steps to ensure the underlying model code for the key modeling tools was available to its partners and the public, as part of a larger effort to make the models themselves, in addition to the input decks and the scenario outputs, as transparent as possible.

Comment ID 0340.1.001.005

Organization: Accomack County, Virginia

Having directly left counties out altogether, the TMDL regulatory process has not provided the States with enough time to include us in any reasonable manner. One could conclude that the Federal government is at this time the author of a huge catastrophe about to happen. Goals may be adopted, and forced on the states, which will in turn, end up requiring us to implement them - without financial support. Our citizens may be forced to pay to implement restrictions which could ultimately cost them their jobs. This is not right.

The draft state plans have had little or no distribution to localities, robbing the Commonwealth and its local partners of the opportunity to work together on possible solutions or interactions on the response to the Federal mandates. We object to this lack of time to work with the Commonwealth, with which Virginia local governments have long had a partnership arrangement on matters pertaining to our environment.

Response

With regard to public comment period, please see response to comment 0060.1.001.001. EPA held separate stakeholder meetings with local government representatives in each of the watershed states, including Virginia, during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA's draft TMDL and the draft state Watershed Implementation Plan were discussed during EPA's five public meetings in Virginia - the most of any state - in the fall of 2010. EPA also had other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. EPA sponsored a series of local pilot projects to help bring local perspective to state implementation plans. Virginia had two of those seven pilot projects. Virginia established a Stakeholder Advisory Group (SAG) to gather input for its implementation plan and held a public comment period on its draft plan. EPA participated in meetings of the SAG. EPA has also worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL.

Organization: Sustainable Community Initiatives

Translating these ecological assessment endpoints into ecosystem services would be valuable for refining objectives and for communication to the public and political decision makers. The TMDL water quality standards are linked primarily to the health of keystone species in the Bay. Those species are important for the Bay's fishery and recreation, as well as other services (or benefits) provided by Bay-related ecosystems. Highlighting these services will enhance community understanding and support for the TMDL objectives.

Response

EPA agrees that highlighting the services provided by Bay-related ecosystems would be beneficial. EPA will build on its efforts in this area.

Comment ID 0378.1.001.002

Organization: PA Chamber of Business and Industry

Given the enormous efforts and investments that are needed to achieve nutrient and sediment reductions, public support is essential. Such public support will never be forthcoming for proposed allocations that are arbitrary, outlandishly expensive and unaffordable, or which ignore constitutional structures and the limitations of governing bodies.

Response

The allocations were not arbitrarily determined, but were the product of the advanced watershed science of the Chesapeake Bay Program and its state and academic partners, and decisions by the state-federal partnership.

The states and the District of Columbia were given the opportunity to determine the practices and strategies and the sector responsibilities necessary to meet the allocations. For information on cost analysis, please see response to comment 0139.1.001.017. The allocations do not ignore constitutional structures.

Comment ID 0407.1.001.005

Author Name: Krouskop Dirk

Organization: MeadWestvaco Corporation (MWV)

MWV also questions whether or not EPA has complied with Administrative Procedure Act requirements regarding the development of the draft TMDL. EPA has not provided a reasonable opportunity to comment on the draft TMDL. EPA has used vast amounts of information that is not available to the public and the time requirements imposed on the states for WIP development and scenario comparisons has been far too short for a process of this magnitude.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001.

Although the Bay TMDL is a detailed document, the public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

For several months, EPA worked closely with the states and the District of Columbia to strengthen the draft Watershed Implementation Plans submitted to EPA in early September. EPA had numerous constructive meetings and conference calls with each of the jurisdictions and reviewed preliminary WIP submissions. EPA also worked with jurisdictions after the submittal of final WIPs to minimize or eliminate the possibility of federal backstop measures. The Watershed Implementation Plans are not part of the Bay TMDL. The review processes for the WIPs were determined by the individual states and the District of Columbia.

The Communities further agree with VAMWA, VAMSA, and HRPDC that the opportunity for comment is limited further by EPA's failure to provide all of the information and tools needed to review and evaluate the TMDL. Particularly significant is EPA's failure to make critical components of its TMDL decision support system (such as the Scenario Builder software, the Phase 5.3 Modeling Report, and reliable Phase 5.3 Model source codes and data) available to the modeling community outside of EPA. As HRPDC notes in its comments, without access to these components, modelers retained by stakeholders must blindly accept model inputs from EPA and must rely upon EPA to stitch together various patches and workarounds to get the Model to run. This has the effect of making an already inadequate 45-day comment period even shorter as modelers outside of EPA are forced to wait for EPA to run the Model and produce the results, leaving them without adequate time to evaluate and understand the data. Under these circumstances, there is little that the modeling community can do to apply the Phase 5.3 Model in any independent or meaningful manner within the very limited period of time provided by the comment period.

Response

With regard to the public comment period, please see response to 0060.1.001.001.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls with partners and stakeholders, on regular webinars, and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

With regard to modeling information, as soon as model scenario input decks and outputs, documentation, and other related

information were available, EPA made it available first to its jurisdictional partners and then to the public. As documentation on the suite of Bay models and the Scenario Builder was written and reviewed, EPA posted drafts and then final versions of that documentation. In many cases, EPA, working with its partners, was making decisions throughout the Bay TMDL development process that directly affected the formulation of model scenarios or was required prior to finalizing documentation. EPA took all possible steps to share data, information, and documentation in real time as it was being generated, reviewed and accepted.

EPA also took steps to ensure the underlying model code for the key modeling tools was available to its partners and the public, as part of a larger effort to make the models themselves, in addition to the input decks and the scenario outputs, as transparent as possible.

EPA made the Scenario Builder documentation available on 9/16/2010, the Scenario Builder code available on 10/29/2010, and the support database during the period 11/1-11/5/2010. The documentation, code, and database have been publically available at <ftp://ftp.chesapeakebay.net/Modeling/ScenarioBuilder/>. The scenario builder inputs and outputs have been publically available at ftp://ftp.chesapeakebay.net/Modeling/phase5/Phase53_Loads-Acres-BMPs/. As new management scenarios were developed using Scenario Builder and run as input decks through the Phase 5.3 Chesapeake Bay Watershed Model, those new results were made publically accessible through the same FTP site. The Phase 5.3 Chesapeake Bay Watershed Model, used in the development of the Bay TMDL, has been available at <http://ches.communitymodeling.org/models/CBPhase5/index.php>

The technical direction on development and review of the Scenario Builder has been accomplished through collaborative meetings and conference call of several groups within the Chesapeake Bay Program partnership's organizational structure. Prominent among these are the Water Quality Goal Implementation Team, the Modeling Workgroup, the Agricultural Nutrient and Sediment Reduction Workgroup (NRCS and University of Maryland representatives are co-chairs), the Urban Stormwater Workgroup, the Forestry Workgroup, and the Wastewater Workgroup. All of these meetings were open to the public. Each has broad representation from state and federal government, academics, and stakeholder groups. Links to records of these meetings and conference calls are be found in Appendix C of the final Bay TMDL. These links provide direct access to the briefing materials prepared in advance of the meeting/conference call, the presentations given during the meeting/conference call, and the summary of decisions/actions coming out of the meeting/conference call.

After more than five years of development work, calibration and validation were completed in March 2010 and reviewed and approved by several of the above groups. All the Phase 5.3 Watershed Model calibration results are accessible at ftp://ftp.chesapeakebay.net/Modeling/phase5/Phase%205.3%20Calibration/Calibration_pdf/all_validation.pdf.

The Chesapeake Community Modeling Program, an organization supported by and staffed by academic institutions across the Chesapeake Bay watershed, hosts the open-source code of the Chesapeake Bay Phase 5.3 Watershed Model on its website. This model code has been accessed by and is being used by numerous academic institutions, states and others in supporting local, regional and state-wide decision making. The Phase 5.3 Watershed Model's code can be accessed at the Chesapeake Community Modeling Program's website at <http://ches.communitymodeling.org/models/CBPhase5/datalibrary.php>.

For more detailed documentation, please access the Phase 5.3 Chesapeake Bay Watershed Model report at http://www.chesapeakebay.net/model_phase5.aspx?menuitem=26169.

Author Name: Reeves J.

Organization:

US EPA & its senior staff on this initiative:

8- should continue efforts toward pollution prevention and "no-discharge" in continuation to key ideas and thrust of PL 92-500 and its updates since 1972 passage.

9- should summarize the personal observations of Bay residents who have witnessed the degradation of this National Treasure. I grew up (> 10 yo) in Mathews County, Va. from 1958 and have seen/ witnessed many deteriorations and disasters on the Va. portion of this watershed. Those key Ches. Bay goals of 1983- as updated- are way past due date!

Response

Personal observations are important in chronicling the status of the Chesapeake Bay.

EPA agrees that meeting the goals or restoring the Chesapeake Bay are overdue,

The TMDL is designed to have all practices in place by 2025 to restore the Bay, paced by two-year milestones of progress.

Comment ID 0434.1.001.001

Author Name: Pryor Wayne

Organization: Virginia Farm Bureau Federation

The VA Farm Bureau has been a willing participant and partner in the Bay restoration efforts. Given the long history of the program and progress made to date, we are concerned that EPA is now trying to change the process without adequate opportunity for the public -- particularly those impacted by EPA's proposal -- to review, comment and understand the scope, nature, need and rationale for EPA's action. EPA has only allowed a 45 day comment period on the draft TMDL, which would materially disrupt Virginia's approach to water quality restoration with costly and unnecessary consequences for the agricultural community.

Response

With regard to the public comment period, please see response to comment 0060.1.001.001,

EPA recognizes the impact of the Bay TMDL on agriculture and, along with the watershed states, has done extensive and targeted outreach to the agricultural community over the past several years to explain developments with the TMDL and address questions.

The public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed

through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings, in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

B. The opportunity for comment is limited further by EPA's failure to provide all the information and tools needed to review and evaluate the TMDL.

Despite the massive size of the docket, EPA has not provided the public with all of the information and tools needed to effectively review, evaluate and comment on the basis for the proposed allocations. This is also inconsistent with EPA's Public Involvement Policy, which provides that "the comment period should not open until materials are available for the public to obtain and review". [FN 9] The Localities have tried to overcome this impediment to their opportunity to comment, in part, by posing several written questions and requests for information to EPA in an effort to gain a better understanding of the basis for the urban runoff allocations, but EPA has been generally unresponsive to these questions and requests.

[FN 9] See Public Involvement Policy of the U.S. Environmental Protection Agency (EPA 233-B-03-002 - May 2003) at page 13.

Response

Please see response to comment 0265.1.001.019.

Comment ID 0438.1.001.005

Author Name: Johnson Roger

Organization: National Farmers Union (NFU)

Finally, I am concerned that adequate public input was not provided in development of this tool. I strongly urge EPA to consider delay in implementing TMDL regulations until the public can adequately review all data inputs and assumptions. Until EPA can provide assurance that water quality data and assumptions are defensible, regulatory efforts in the Chesapeake Bay will likely be undermined by claims that the Agency has acted in a manner that is arbitrary and capricious. This problem can be corrected with the benefit of adequate public review.

Response

With regard to the public comment period, please see response to comment 0060.1.001.

With regard to the availability of modeling information, please see response to comment 0419.1.001.013.

With regard to the complexity of the Bay TMDL and the need for adequate public review, please see response to comment 0153.001.003.

Finally, EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

Comment ID 0442.1.001.017

Author Name: Drzyzgula Cathy

Organization: Metropolitan Washington Council of Governments (COG)

15. EPA & States Should Enhance Dialogue with Local Governments and Other Stakeholders.

Local governments and utilities were rarely consulted during development of the TMDL or state WIP documents and have little time in which to comment. As the process moves into Phase II WIP development, both federal and state officials need to do more to hear from local governments and utilities that will bear much of the burden of these implementation measures. Ultimately, all levels of government must work together to justify these efforts and the financial demands on ratepayers and the general public.

Recommendation #15: Issue Process for Phase II WIP Development, with Enhanced Stakeholder Participation
Maryland and Virginia should issue a detailed process for the development of Phase II WIPs as soon as possible and well before the publication of the final TMDL documentation. And EPA should make it clear that local input must be addressed to ensure that the issues of reasonable assurance and feasibility have been worked out with those entities

actually responsible for implementation, and allow sufficient time for that input to occur (ref. Section 11. Public Participation).

Response

EPA has had extensive interactions with local government representatives during the development of the Bay TMDL,

EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee and has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had many other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report. EPA looks forward to more extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the jurisdictions offer allocations of pollution reduction responsibilities on a finer geographic scale, such as counties, conservation districts and sub-watersheds.

The Watershed Implementation Plans are not part of the TMDL. The WIPs, both draft and final, were developed by the states and the District of Columbia and the development and review process for those documents was determined by the individual jurisdictions. The same is true for the Phase II WIPs.

However, as with the draft and final Phase I WIPs, EPA will be working closely with the states and local governments as the jurisdictions develop their plans, providing a variety of forms of assistance.

Comment ID 0463.1.001.014

Author Name: Sharma Lalit

Organization: City of Alexandria, Virginia

Localities had very limited input in drafting the Draft TMDL or WIP. We appreciate EPA's efforts to be inclusive in the decision making, especially given the abbreviated timeline. Unfortunately, the lack of input by localities during this phase excludes local expertise from contributing to the final document.

Response

EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL. In addition, EPA has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had many other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report. EPA looks forward to more

extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the states and the District offer allocations of pollution reduction responsibilities on the local scale, such as county, conservation district or small watershed.

With regard to the Watershed Implementation Plans, they are not part of the TMDL and the states determined their respective processes for development and review of those documents.

XI. Environmental Justice

A. In a recent federal register notice regarding EPA's national stormwater program and stakeholder input on stormwater rulemaking related to the Chesapeake Bay, EPA indicated that it will address environmental justice consideration as part of the process. EPA should have sought public input and addressed environmental justice considerations as part of the draft TMDL process.

Response

The implementation of the Bay TMDL and the achievement of water quality standards will benefit all areas, including environmental justice communities. Environmental justice is a priority of EPA.

EPA notes that the Chesapeake Bay TMDL is not a federal regulation.

B. The opportunity for comment is limited further by EPA's failure to provide all the information and tools needed to review and evaluate the TMDL.

Despite the massive size of the docket, EPA has not provided the public with all of the information and tools needed to effectively review, evaluate and comment on the basis for the proposed allocations. This is also inconsistent with EPA's Public Involvement Policy, which provides that "the comment period should not open until materials are available for the public to obtain and review". [FN9] The Localities have tried to overcome this impediment to their opportunity to comment, in part, by posing several written questions and requests for information to EPA in an effort to gain a better understanding of the basis for the urban runoff allocations, but EPA has been generally unresponsive to these questions and requests.

9. As EPA goes forward with its TMDL requirements, it should point out the economic benefits to the states of a cleaner, healthier Chesapeake Bay that can be enjoyed by all.

10. EPA should work with US Dept. of Interior and state parks agencies to increase public access and exposure to the Chesapeake Bay to show the benefits to the public of this cleaner, richer natural resource.

Response

In its presentations at the public meetings this fall on the Draft Bay TMDL, EPA noted the significant economic benefits of cleaner local rivers, streams and the Chesapeake Bay. One of the features of the President's Executive Order on the Chesapeake Bay is a focus by the U.S. Department of the Interior on expanding public access to the Bay and its rivers from public lands.

We believe that the Chesapeake Bay TMDL should have an educational component to address DIY lawn fertilization. Consumers should be encouraged to protect the Chesapeake Bay through a robust communications program based upon proven best management practices for lawn care.

Everyone within the Chesapeake Bay watershed wants to protect the bay and will take appropriate action with guidance from the EPA and the states. We look forward to joining other stakeholders to help create a plan for improving the bay.

Response

EPA agrees that education is important in helping the public do its part to protect the Chesapeake Bay and local waters. Lawn fertilization was the focus of a Chesapeake Bay Program-sponsored outreach campaign whose central message was "Save the Crabs, then Eat 'em." It encouraged lawn fertilization in the fall if at all and involved restaurants and lawn care companies. EPA will build on its current efforts to provide public education on the impact of lawn fertilization on nutrient pollution in the Chesapeake Bay.

As described in Section I of the National Association of Home Builders' ("NAHB") comments and Section ILA of the Federal Water Quality Coalition's ("FWQC") comments regarding the Draft TMDL,[FN37] EPA has not made much of the data and results of its Scenario Builder model available to the public for review[FN38] In addition, EPA has not published the specific model inputs and outputs used to develop the Draft TMDL.[FN39] Furthermore, EPA has not made the programming code for Scenario Builder available to the public.[FN40] Finally, EPA has admitted in public hearings and its website that the agency has not yet finalized the Scenario Builder model.[FN41] EPA's lack of transparency regarding this fundamental element of the Draft TMDL is contrary to the D.C. Circuit's statement in *Sierra Club v. Castle*:

The safety valves in the use of such sophisticated methodology are the requirement of public exposure of the assumptions and data incorporated into the analysis and the acceptance and consideration of public comment, the admission of uncertainties where they exist, and the insistence that ultimate responsibility for the policy decision remains with the agency rather than the computer [FN42]

The court also explained that:

[T]he agency must sufficiently explain the assumptions and methodology used in preparing the model; it must provide a "complete analytic defense of its model (and) respond to each objection with a reasoned presentation." The technical complexity of the analysis does not relieve the agency of the burden to consider all relevant factors and to identify the stepping stones to its final decision. There must be a rational connection between the factual inputs, modeling assumptions, modeling results and conclusions drawn from these results.[FN43]

Because of the lack of information available for the modeling that underlies the Draft TMDL, it does not appear that EPA can satisfy its burdens regarding providing the public with an opportunity to comment on the Draft TMDL.

[FN37] Liberty hereby incorporates the comments of NAHB and the FWQC regarding the Draft TMDL by reference to the extent those comments are not inconsistent with Liberty's.

Response

As soon as model scenario input decks and outputs, documentation, and other related information were available, EPA made it available first to its jurisdictional partners and then to the public. As documentation on the suite of Bay models and the Scenario Builder was written and reviewed, EPA posted drafts and then final versions of that documentation. In many cases, EPA, working with its partners, was making decisions throughout the Bay TMDL development process that directly affected the formulation of model scenarios or was required prior to finalizing documentation. EPA took all possible steps to share data, information, and documentation in real time as it was being generated, reviewed and accepted.

EPA also took steps to ensure the underlying model code for the key modeling tools was available to its partners and the public, as part of a larger effort to make the models themselves, in addition to the input decks and the scenario outputs, as transparent as possible.

EPA made the Scenario Builder documentation available on 9/16/2010, the Scenario Builder code available on 10/29/2010, and the support database during the period 11/1-11/5/2010. The documentation, code, and database have been publically available at <ftp://ftp.chesapeakebay.net/Modeling/ScenarioBuilder/>. The scenario builder inputs and outputs have been publically available at ftp://ftp.chesapeakebay.net/Modeling/phase5/Phase53_Loads-Acres-BMPs/. As new management scenarios were developed using

Scenario Builder and run as input decks through the Phase 5.3 Chesapeake Bay Watershed Model, those new results were made publically accessible through the same FTP site. The Phase 5.3 Chesapeake Bay Watershed Model, used in the development of the Bay TMDL, has been available at <http://ches.communitymodeling.org/models/CBPhase5/index.php>

The technical direction on development and review of the Scenario Builder has been accomplished through collaborative meetings and conference call of several groups within the Chesapeake Bay Program partnership's organizational structure. Prominent among these are the Water Quality Goal Implementation Team, the Modeling Workgroup, the Agricultural Nutrient and Sediment Reduction Workgroup (NRCS and University of Maryland representatives are co-chairs), the Urban Stormwater Workgroup, the Forestry Workgroup, and the Wastewater Workgroup. All of these meetings were open to the public. Each has broad representation from state and federal government, academics, and stakeholder groups. Links to records of these meetings and conference calls are be found in Appendix C of the final Bay TMDL. These links provide direct access to the briefing materials prepared in advance of the meeting/conference call, the presentations given during the meeting/conference call, and the summary of decisions/actions coming out of the meeting/conference call.

After more than five years of development work, calibration and validation were completed in March 2010 and reviewed and approved by several of the above groups. All the Phase 5.3 Watershed Model calibration results are accessible at ftp://ftp.chesapeakebay.net/Modeling/phase5/Phase%205.3%20Calibration/Calibration_pdf/all_validation.pdf.

The Chesapeake Community Modeling Program, an organization supported by and staffed by academic institutions across the Chesapeake Bay watershed, hosts the open-source code of the Chesapeake Bay Phase 5.3 Watershed Model on its website. This model code has been accessed by and is being used by numerous academic institutions, states and others in supporting local, regional and state-wide decision making. The Phase 5.3 Watershed Model's code can be accessed at the Chesapeake Community Modeling Program's website at <http://ches.communitymodeling.org/models/CBPhase5/datalibrary.php>.

For more detailed documentation, please access the Phase 5.3 Chesapeake Bay Watershed Model report at http://www.chesapeakebay.net/model_phase5.aspx?menuitem=26169.

Organization: Binghamton-Johnson City Joint Sewage Board

H. Have the TMDL provide that the EPA must convene and facilitate mandatory cross-jurisdictional meetings (for example, between New York and Pennsylvania; Pennsylvania and Maryland and Delaware; and West Virginia and Virginia) including corresponding elected federal, state, and local officials to promote common understanding, exchange information, identify and address concerns, as well as ensure all are "on the same page" and working harmoniously together with unified purpose toward TMDL implementation and Bay restoration, to share and learn from "best practices" and "success stories", and in order to minimize counterproductive cross-border actions or initiatives.

Response

EPA appreciates the recommendation of cross-jurisdictional meetings. In fact, EPA has promoted interaction between the various partners involved in Bay TMDL implementation on issues of best practices, success stories and common concerns, primarily through the committee structure of the Chesapeake Bay Program and other avenues. It is in the best interests of all involved to share information and benefit from one another's experiences. For example, EPA sponsored local pilot projects - and shared information from those initiatives - to help states receive input from local officials in the development of their Watershed Implementation Plans.

Organization: Utility Water Act Group

Some of the comments provided here were previously advanced in connection with EPA's Strategy for Protecting and Restoring the Chesapeake Bay, which was released on November 9, 2009, and finalized on May 12, 2010 ("Bay Strategy").[FN 2] UWAG elected to revive its earlier comments where EPA either failed to respond or failed to meaningfully address UWAG's concerns. UWAG believes that the response to comment process is a fundamental "minimum" in agency decisionmaking, and UWAG urges EPA to provide individualized responses to UWAG's comments before finalizing the Bay TMDL.

[FN 2] This Strategy was prepared pursuant to Section 203 of Executive Order 13508, dated May 12, 2009, and was accompanied by a series of reports, including EPA's so-called Section 202(a) report entitled, Report on the Next

Generation of Tools and Actions to Restore Water Quality in the Chesapeake Bay. According to EPA, the "Bay TMDL is a keystone commitment in the strategy developed by the federal agencies to meet the President's Executive Order." Bay TMDL at iii.

Response

Individual responses are being provided for comments on the draft Chesapeake Bay TMDL, even if the response is referencing a response to a similar or identical question.

The Bay TMDL is indeed a keystone commitment in the strategy developed by the federal agencies to meet the President's Executive Order.

Comment ID 0568.1.001.004

Author Name: Eisel James

Organization: Delaware County, New York

This seems to indicate that there has not been sufficient outreach to regional and local stakeholders to understand conditions at a finer scale.

Response

EPA has worked closely with the Chesapeake Bay Program's Local Government Advisory Committee in the development of the Bay TMDL. In addition, EPA has held separate stakeholder meetings with local government representatives in each of the watershed states during public meeting tours on the Bay TMDL in the fall of 2009 and in the fall of 2010. EPA has also had many other interactions with local government representatives during the development of the Bay TMDL, recognizing the importance of input from those on the local level closest to the people. A full list of the hundreds of meetings EPA has held on the TMDL over the past three years, including those with local governments, is available as an appendix to this report. EPA looks forward to more extensive discussions with local officials in 2011 as the Phase II Watershed Implementation Plans from the jurisdictions offer allocations of pollution reduction responsibilities on a finer geographic scale, such as counties, conservation districts and sub-watersheds.

Organization:

This plan is largely an EPA self-justification document. To maintain that it is science based is laudable, but hardly true. So is the idea that the "draft Chesapeake Bay TMDL was developed through a highly transparent and engaging process" as this is, in my humble opinion, not true.

Response

Advanced, peer-reviewed watershed science has been used in the development of the Bay TMDL.

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all six states and the District of Columbia in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all six states and the District of Columbia. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

Comment ID 0591.1.001.005

Author Name: Shields M.

Organization:

EPA's claim to have a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community may be true, but my guess is that these are self serving people, with their own private agendas and not really looking at all the issues.

Response

EPA and the other partners in the Chesapeake Bay Program greatly value the contributions of the Bay Program's committees and their dedicated volunteer members, whose expertise and perspectives assist the decision-making bodies of the Bay Program.

The three major committees include the Scientific and Technical Advisory Committee (STAC), the Citizens Advisory Committee (CAC) and the Local Government Advisory Committee (LGAC) – each providing key perspectives to further the work of the Chesapeake Bay Program.

STAC provides scientific and technical advice in various ways, including (1) technical reports and papers, (2) discussion groups, (3) assistance in organizing merit reviews of CBP programs and projects, (4) technical conferences and workshops, and (5) service by STAC members on CBP subcommittees and workgroups.

Members of CAC communicate with their constituencies to increase understanding of programs to restore and protect the Bay. The membership is broad-based with representatives from agriculture, business, conservation, industry, and civic groups. Since 1984, this group has provided a non-governmental perspective on the Bay cleanup effort and on how Bay Program policies affect citizens who live and work in the Chesapeake Bay watershed.

LGAC is a body of officials appointed by the Governors of Maryland, Pennsylvania, Virginia, and the Mayor of the District of Columbia to improve the role local governments play in Bay restoration efforts and develop strategies to broaden local government participation in the Chesapeake Bay Program. Since its creation in 1988 LGAC has actively supported local government participation in the Chesapeake Bay Program. Quarterly meetings of LGAC provide the forum for policy development and periodic adjustment to programming functions and organizational direction. Improving communication, supplying technical assistance to local governments, and providing a local government perspective on policy development within the greater Chesapeake Bay Program are the chief means by which LGAC works to enhance the participation of local governments in the Bay restoration effort.

However, we are concerned that the TMDL allocations as applied to New York are impractical, unrealistic, and unnecessary. The draft TMDL, with its top-down imposition of nutrient loads and lack of attention to key pollutant sources in rural areas, does not reflect the spirit of cooperation with stakeholder groups that has been emphasized by

the EPA and was central to the collaboration agreed to by EPA and the other Watershed Partners in creating a plan to restore the Bay.

Response

With regard to the New York allocations, please see response to comment 0080-cp.001.002.

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process during the past two years. it is crucial that EPA work collaboratively with State agriculture and environmental protection agencies, Soil and Water Conservation Districts, and local communities to address Bay watershed water quality concerns,

Response

EPA agrees it is crucial that it work collaboratively with the organizations identified in the comment. EPA has had extensive outreach and collaborative discussions with these agencies, districts and communities and will continue to do so as the process moves forward. A full list of EPA meetings with stakeholder groups, including the ones listed in the comment, is available as an appendix to the Bay TMDL.

Comment ID 0740.001.002

Author Name: Hanmer R.

Organization:

Some stakeholder organizations claim to be surprised or ill-informed about the basis for the TMDL. If that is the case, it is not the fault of EPA or the Chesapeake Bay Program. The basic information is well known, and the proposed nutrient allocations are quite similar to those which were issued by the Bay Program's Principals' Staff Committee in 2003. EPA and the states have made extraordinary efforts, since 2000, to seek public participation and action through all the processes which have finally led to the draft TMDL. Public documents have described the analytical processes and policy development in detail. The upgrading and use of the Bay Program models have been transparent processes.

Response

EPA agrees that extraordinary efforts have been made by EPA and the states to seek public participation and action through all the processes which have finally led to the TMDL.

Comment ID 0740.001.008

Author Name: Hanmer R.

Organization:

As Region III Water Protection Division Director and especially as head of the Chesapeake Bay Program Office, I led EPA's basic scientific and management processes that laid the foundation for EPA's development of the suite of TMDLs (Total Maximum Daily Loads) called the 'Chesapeake Bay TMDL', proposed in September 2010. These foundational processes included completing the recruitment of the Chesapeake Bay headwater states to participate in all of the Bay Program's water quality-related initiatives (2002) ; development and publication of Chesapeake Bay-specific water quality criteria for protecting aquatic life in the Bay and its tidal tributaries (2003), accompanied by EPA guidance for the states to use in designating water use zones for the same purpose, and for determining attainability of the uses and criteria, with state-of-the-art procedures for analyzing monitoring results and determining attainment; and production of "TMDL-like" load allocations for nitrogen, phosphorus and sediment, divided by major contributing river basin so that all seven basin states (six states and the District of Columbia) could prepare and implement tributary strategies for reducing the full range of polluting nutrient and sediment sources (2003).

These efforts supported revision of tidal water quality standards in Maryland, Virginia, Delaware and the District of Columbia (2004-5), approved by EPA. A basinwide, consistent federal-state network for nutrient water quality monitoring was established (2004), and an interstate strategy for Clean Water Act nutrient permitting of wastewater treatment discharges basinwide was developed by EPA and the partner states (2004).

Thus, development of the Chesapeake Bay TMDL has been based upon a long series of successive, supportive steps linking actions by the cooperative federal-state Chesapeake Bay Program and the EPA and state water quality regulatory programs. EPA's Clean Air Act program has also been involved. These steps were not carried out exclusively by EPA but rather by an active coalition of cooperating federal agencies and all states in the Chesapeake Bay basin,

with active public participation by representatives of wastewater treatment agencies, environmental groups, agricultural interests (mostly through state agriculture agencies) and local officials involved in urban stormwater programs.

Response

EPA appreciates the extensive and successive groundwork that has been laid to support this next step in the restoration process - the Chesapeake Bay TMDL. The comment also outlines the strong interaction between EPA, other federal agencies and the watershed jurisdictions in restoration efforts, as well as the active public participation process that began long before the TMDL was established.

Organization:

--Virginia has put over \$80 million into Agricultural Best Management Practice (Ag BMP) Cost-Share program since 2006. Farmers have matched this spending with \$0.60 of every dollar, and are lined up at the door to do more.

Annually, willing participants are turned away due to lack of adequate funds at the state and federal level.

--Even without cost-share funding, agriculture is taking action. Virginia farmers fence cattle from streams, practice conservation tillage, use proper nutrient management practices, and install buffers along waterways- without federal or state funds- and without being "counted" by EPA.

--Without regulatory pressure, the turfgrass/green industry requested that the state create an Urban Nutrient Management Program so that their professionals can have plans specifically tailored for their businesses.

--Lawncare operators have supported and signed Voluntary Water Quality Agreements with the state. Major home lawn fertilizer companies have signed agreements to reduce and/or eliminate phosphorus from maintenance fertilizers by 2012.

--Virginia's golf industry is developing a Best Management Handbook covering water quality, pesticide use, and water supply issues for their industry to implement.

Response

In 1997, EPA conducted a year long evaluation to assess the progress that has been made toward reduction of nitrogen and phosphorus delivered to the Bay. The evaluation noted that wastewater discharges reduced their loads by 51% and implementation of nutrient best management practices from nonpoint sources loadings of nitrogen and phosphorus reduced loadings by 7 and 9 percent, respectively. EPA and the seven impacted jurisdictions again reevaluated the nutrient and sediment reductions in 2007. The reevaluation found that sufficient progress had not been made toward improving water quality in the Chesapeake Bay and its tidal tributaries and that nutrients and sediment remained a source of significant impairment for the Bay.

After decades of regulatory and management initiatives to address the nutrient and sediment discharges, the Bay remains impaired. As required by Section 303(d) of the CWA and its implementing regulations, EPA is establishing this TMDL to address the impaired Chesapeake Bay and its tributaries. Section 1.2 of the final TMDL document provides a detailed description of the many activities and actions that have preceded this TMDL.

While EPA recognizes, appreciates and encourages the many voluntary activities that organizations, industry, and other groups are employing to reduce their contributions of nutrients and sediment to the Bay, EPA believes that for the Bay to reach an unimpaired state, a more comprehensive plan with a clear target must be applied. This TMDL with its accountability framework lays the foundation for achieving water quality standards within the Bay.

Around here everybody knows no one is enforcing the law. After 5PM and on Saturdays and Sundays you can see Amish farmers and none Amish individuals burning trash, burning huge plastic barrels, dumping manure, NOT spreading it, ...they know when "office hours" are in effect. The EPA has recently come to the conclusion that 'something isn't right' in PA. That something is DEP-they are NOT using their mandate to enforce. And people here laugh about teh lack of control or worse - complain that they have to wait til 5 (or the weekend)to burn and dump. No one is enforcing these laws so people think that there must not be much to them. This is how they frame their comments about this.

Response

EPA has certain authorities and responsibilities to implement the Clean Water Act including oversight over states (such as Pennsylvania) that administer parts of the CWA such as the NPDES permit. Many states have strong water quality protection and enforcement programs, but state compliance and enforcement vigor is uneven. Without consistent enforcement by EPA and states, there exists an unlevel playing field for businesses that do comply with the law, and also for our citizens who are not provided equal protection under our environmental legal framework. States labor under different political and resource constraints; nonetheless, EPA must ensure that states provide a minimum level of water quality protection and consistently apply the law by issuing protective permits and by pursuing appropriate enforcement. EPA articulates where the minimum requirements for acceptable state NPDES and water quality programs in its regulations, and consistently hold states accountable. Where states are not meeting these expectations, EPA has authority to object to inadequate NPDES permits and by pursuing independent federal enforcement against violators. EPA notes Pennsylvania's renewed commitment to more vigorous enforcement in the agricultural sector as discussed in their Pennsylvania's Final Phase I WIP.

If a citizen believes that individuals/facilities are illegally discharging pollutants to waters of the United States, EPA encourages each citizen to report violations through the State's environmental hot lines. In addition, EPA has an environmental hotline that can be used anonymously to report violations at 1-800-438-2474 or www.epa.gov/tips.

Finally, with relation to some proofreading and clarity issues in the document, I'd first like to bring to attention that in Section 6.1.2 the document directs the reader to Appendix F for more detailed technical documentation on deciding critical conditions for chlorophyll a and water clarity/SAV. However in Appendix F (titled "Determination of the Hydrologic Period for Model Application") there is no mention of chlorophyll a or water clarity/SAV critical conditions. Instead, the only mention of critical conditions is in relation to addressing the hydrologic period, when it says, "It is not to be confused with critical period of high stress." Instead, the correct information is found in Appendix G, which is titled "Determination of Critical Conditions for the Chesapeake Bay Total Maximum Daily Load (TMDL)." Additionally, I noticed two simple typos that may be something the writers would like pointed out. On page 5 of the executive summary in the third line of the third paragraph up from "Accountability and Goals" it says, "...the allocations happen to be more stringent than the allocations identified above." Here, I am sure that the word "than" was intended, but I figured it was worth sharing.

Response

Thank you for your comment. EPA has received numerous comments with suggested editorial or typographical revisions. EPA has reviewed each of these suggested revisions and where appropriate, has incorporated them into the final TMDL report.

Organization:

Chesapeake Bay Program Cleanup Strategy

The First Chesapeake Bay Conference was held in 1933; we've come a long way since then. The problems impacting the Bay have progressed geometrically with population density growth. As of 1983, industrial and agricultural pollution were designated as the foremost causes of the degradation of the Chesapeake Bay's health. The first and original Chesapeake Bay Program (CBP) was signed into law; in room 400 of the Senate Office Building in 1983; by 125 signers, of which I am one.

Today; we are faced with a far greater threat to the existence of the Bay. This threat is non-point source pollution caused by every individual living within the Chesapeake Bay Watershed (all 64,000 square miles of it). Our actions; whether corporate or private; are determining the life or death of our National Treasure; the Chesapeake Bay. At this point in time, the diagnosis for the Bay is dark and critical. We must act swiftly and decisively on the opportunity presented to us by President Obama; wherein he issued the Executive Order designating the cleanup of the Chesapeake Bay as a National Priority Project. Relying on the trial and error database evolution of the CBP is a good basic guideline for the avenues of remedy necessary to save the Bay. However; with the limited time given (September 9, 2009) to develop the Action Plan for funding; we must think and plan outside the box to ensure success from our efforts. The following is a small list of bullet point innovations for funded actions; which if properly implemented could show marked improvements in the "State of the Bay".

1. Expand the monitoring of the Bay to focus not only on the nutrients as the guide for the Bay's status; but to further toxic testing, monitoring, and studies throughout the Bay Ecosystem. The worst case scenario for nutrient damage is eutrophication. Toxic damage can effect every level of life within the Bay ecosystem. Also; over time, toxic pollution can and will change the physical chemistry of the entire ecosystem. To not pursue toxic study and monitoring with the same intensity as is- given to nutrients, would be a grave strategic error for any proposed cleanup action.
2. The Buffer Zones surrounding every waterbody; both tidal and non-tidal, must be greatly increased and enhanced to filter the non-point source pollution from the water-returning to the open waterways; with extreme focus on population growth density. At present, the needs of the ecosystem outweigh the means for protection of the Bay Ecosystem and its survival.
3. Integration of enhanced technologies to further expedite restoration throughout the Chesapeake Bay Ecosystem.
4. Bay wide Watershed BAN on dredging or disturbing high priority toxic and hazardous sediments. Redistribution releases of toxic pollution into the open waters of the Bay at present could very well preclude and nullify any restorative actions. The issues entered herein are only a brief statement of possible solutions to the Bay's Restoration efforts. I would be more than happy to further and explicitly define and technically outline specific measures for action funding in this most needed activity. As ever in service, I am,

Response

EPA notes and appreciates the support for Chesapeake Bay. EPA believes it will take the efforts and innovation of all organizations, industry and citizens to reach the goal of an unimpaired Bay. The Bay TMDL addresses the pollutants of concern, phosphorus, nitrogen and sediment but not toxics. While this TMDL does not address other pollutants that may be a source of impairment for the Chesapeake Bay, reductions to meet the TMDL allocations for nutrients and sediment, especially in the air and stormwater sectors, should also bring some indirect benefits in the reduction of toxics. EPA also agrees with the comment regarding the challenges posed by expanding populations and the importance of appropriate watershed buffer areas.

So by blocking progress in the gas drilling in New York State you are allowing the neighboring states to receive ALL the revenue possibilities and we in New York state get left out ! The gas is going to be pulled out from under New York state and we are NOT going to get any benefits! The water will be affected as it already has been in the past by

progress and we do need to protect our water however, why is nEW yORK BEING LEFT OUT OF THE MONEY BENEFIT! The neighboring states are NOT AS CLEAN AS NEW YORK STATE....why are we being punished for others states short comings of inadequate practices. LET US DRILL AND GET THE REVENUE WE ARE ENTITLED TO!

Response

The Bay TMDL does not prohibit any particular type of activity. Regarding Marcellus shale issues please refer to response to comment 0190-cp.001.002.

Comment ID 0169.1.001.026

Author Name: Crim Martin

Organization: Town of Occoquan, Virginia

Errors in Tables 8.3 and 8.4 go beyond mere typographical errors. If the entries in the TMDL are in error, then the ratings of some jurisdictions or river basins may change. Even if there are no changes, there are clearly errors in the draft TMDL table. If there are errors in the TMDL table, they could also impact the backstop allocations in Table 8.7.

Response

The commenter did not identify any specific errors in Tables 8.3 and 8.4, but rather made a general statement that there might be errors. It is EPA's best professional judgment that there were no errors in Tables 8.3 and 8.4 in the draft TMDL and the allocations are appropriate. EPA notes that the final TMDL has revised Tables 8.3 and 8.4 that reflect significantly improved state WIPs and significantly revised EPA allocations.

Organization: Natural Resources Defense Council (NRDC)

The Chesapeake Bay fish will be unfit for human consumption if the EPA does not enforce the law against the corporations that dump toxic pollution into the rivers that feed the Bay.

Response

It is beyond the scope of the Chesapeake Bay Nutrient and Sediment TMDL to address illegally toxic discharges to the Bay. If a citizen believes that individuals are illegally discharging, EPA encourages each citizen to report violations through the State's environmental hot lines. In addition, EPA has an environmental hotline that can be used anonymously to report violations at 1-800-438-2474 or www.epa.gov/tips. The reductions necessary to achieve the nutrient and sediment reductions, especially those from

stormwater and air reductions, should also provide an indirect benefit of providing some reduction to toxic discharges to the Bay.

Also note the fact that the hydraulic fracturing being carried out all over the United States is increasing the demand for frac sand and the need for strip mining of frac sand. Taking large and very ancient sandstone bluffs out of northern WI is not a pleasant, safe or healthy thing to see. Quarries will dot our countrysides. Please help us out in Wisconsin by stopping hydraulic fracturing in all the states where there is shale!!!!

Response

It is beyond the scope of this TMDL to discuss the merits or consequences of Marcellus Shale drilling operations. This TMDL does not address the impact of current Marcellus Shale Drilling operations as sources of sediment and nutrients to the Chesapeake Bay watershed. However, in this TMDL, States need to identify areas of future growth that may contribute to future sediment and nutrient loads to the Chesapeake Bay. EPA does see that drilling operations may have the possibility of contributing to nutrient and especially sediment loads to the Bay and should be included in the State's future considerations of sources of those pollutants. We encourage States to look at all possible future growth activities within their jurisdiction, including Marcellus Shale drilling operations to consider and potentially control their future load contribution of nutrient and sediment loads to the Bay.

Comment ID 0256.1.001.014

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

LGAC recognizes that the Draft TMDL will be revised and issued again before the end of the year, and that, next year, there will be further refinement of allocations down to a finer scale, quite possibly on a local government jurisdiction level. The TMDL will be a dynamic force to which the principals of adaptive management must apply. But, unless the issues we have raised are not addressed, there will be little chance of the kind of success that will be needed to restore and protect this incredible resource we call the Chesapeake Bay.

As elected and appointed local government officials, our job is to get elected, then beyond that, to govern. We are judged on our ability to provide services, manage our budgets, and provide leadership on a dizzying array of complex issues. Our collective experience over the years has shown us that, in order to be successful, we must find the right balance in a vast community of competing interests. Time and again, elected officials have been catalysts in finding common ground on which to govern. The challenge we have before us is to be aware of the essential economic well being of our communities as well as the need to provide a clean, healthy environment that will nurture those communities. Our choices are rarely either/or, rather they are of finding the right balance. As we go forward with the TMDL, we encourage all our partners to keep our goals in sight and to use common sense and balance in the decisions we need to preserve and protect our treasured national resource, the Chesapeake Bay.

Response

EPA agrees with the commenter that there are benefits to implementing the Bay TMDL in a flexible, adaptive management approach through each State's watershed implementation plan taking into account local government commitments and concerns.

Comment ID 0260.1.001.010

Author Name: Brosious John

Organization: Pennsylvania Municipal Authorities Association (PMAA)

EPA needs to partner with scientific and technical experts to develop new technologies that can be implemented in the various sectors contributing to the nutrient and sediment load. They need to encourage pilot programs and offer funding for new and innovative solutions to reductions. These efforts can be in conjunction with other federal agencies such as the Department of Agriculture, Department of Energy, USGS, etc. They should also be in conjunction with state agencies, local governments, and "vetted" providers of new technologies.

Response

EPA notes and agrees with the commenter, and notes that such constructive partnerships have been a cornerstone for the Chesapeake Bay Program and this TMDL.

WE, the beef cattle farmers of virginia are committed to responsible environmental stewardship by meeting 52% reduction goals for Nitrogen and 50% for phosphorus and sediment. Clean water and good soil are vital to our business. we urge you to consider the impact that this TMDL will have.

Response

EPA appreciates the commitment to environmental stewardship and clean water.

Comment ID 0343.1.001.001

Author Name: Gammill Nicholas

Organization: Maryland Turfgrass Council (MTC)

The Maryland Turfgrass Council (MTC) would like to respond to EPA's draft proposal for TMDL diet plan to the Chesapeake Bay. MTC represents Turfgrass stakeholders including golf courses, sod productions, lawn cares and sports turfs. We have 1200 members and we value our impact on the Chesapeake Bay eco -system and would like to work with EPA in limiting the TMDL to the Bay.

Steps already taken:

Golf Courses

1. Nutrient management plans are in place
2. Water quality measurements are taken monthly
3. Tight budgets limit the overuse of fertilizers
4. Locally produced poultry manure are used in most courses
5. Total turf cover limits the sediment runoff to zero
6. Increase use of mechanical management practices i.e. aeration
7. Increase participation in voluntary organizations i.e. Audubon Society (AS)

Sod productions

1. Nutrient management plans are in place
2. Budget impacts overuse of fertilizers
3. Newly laid sod is an important component for erosion and sediment control

Lawn cares

1. Have limited applications of phosphorus
2. Budget restraints limit over application
3. Standard practice is implemented which is remove any over application on hard surfaces
4. Increase use of mechanical management practices i.e. aeration

Homeowner Lawn cares

1. Retailers have limited phosphorus content in fertilizers
2. Increase acceptance of organic slow release fertilizers
3. Extension services are educating homeowners on proper application

Sports turfs

1. Education through the Sports Turf Management Association (STMA)
2. Increase use of mechanical management practices i.e. aeration
3. Reduction in fertilizer applications due to the increase use of artificial turf

Maryland Turfgrass Industry acknowledges these specified contaminants that are currently being addressed:

Nitrogen

1. More acceptable use of organic slow release nitrogen
2. Organic nitrogen has lower available nitrogen rates

Phosphorus

1. Lawn care, golf course , etc. have used fertilizers with little or no phosphorus
2. Phosphorus application is only used for seeding and new sod establishment

Sediments

1. Experts in the industry recognizes that when a healthy Turfgrass is well-maintained, you have little or no sediment moving off site
2. Sediment runoff occurs at new construction sites and on hard surfaces where no Turfgrass exists.
3. Turfgrass is nature's best water filter.

Benefits of healthy Turfgrass

- Turfgrass provides a runoff sink and recharges ground water reserves.
- Turfgrass provides a living biological surface with usable space for people to walk, play and recreate.
- Turfgrass provides a green expanse for visible security.
- Turfgrass can provide a temporary area for storage and parking that recovers quickly from these measures.

Storm Water Runoff

Most of Maryland's Storm Water Management (SWM) systems were designed and built over 50 years ago with the aim to remove as much water as quickly as possible. Retro fitting and redesigning is a necessary solution for urban and suburban runoff. This is an expensive, but extremely important part of MS4 development. Urban nutrient management is increasingly difficult because of the vast number of sites. When SWM system starts to fail, they are typically rebuilt to the original specifications instead of being retrofitted to current designs needed. Leaf collection has been cancelled at some municipalities because of budget restraints. Leaf removal should be a required activity for all developed properties as leaves contain a high degree of phosphorus. Maintenance is rarely done to remove contaminants from storm water intakes. Turfgrass can be an important part in achieving these goals of slowing down and filtering out storm water. Rain gardens have become popular recently in urban and suburban areas. This development should be promoted through education to the public.

Non-point sources

Turfgrass is typically wrongly viewed as a non-point source of pollution. As non-point sources are difficult to identify and the EPA has limited authority to restrict them, it would be better to concentrate efforts on point sources such as agriculture, waste water treatment plants, and erosion control on construction sites. These point sources will be much easier to calculate reductions in TMDL. Non point sources can be best reduced by education and acceptance of an environmentally friendly practice developed together with the green industry, environmental and local jurisdictions. The Maryland Turfgrass Council would like to work with the EPA and Maryland State government to develop strategies in order to achieve consumer and green industry compliance, and cleaner water standards for our State. The Maryland Turfgrass Council has been providing funding for the University of Maryland's Turfgrass program for over 30 years. We also provide education through our annual educational programs, our website and our periodical magazine. Biannually, we invite the public to The Maryland Turfgrass Farm to see the demonstration plots and to witness the ongoing research done by the Turfgrass program at University of Maryland College Park. We feel that the continued education

and research are the best solutions to solve the misconception that a healthy Turfgrass is causing pollution problems in the Chesapeake Bay. Turfgrass is part of the solution and not part of the problem.

Response

EPA appreciates the commitment noted by the commenter towards nutrient reduction and agrees with the beneficial effects of properly managed turfgrass. EPA agrees and encourages each State to consider all new and innovative methods and technologies in refining WIP and in two year milestones that will help achieve the nutrient and sediment load reductions established by the TMDL.

Comment ID 0387.1.001.001

Author Name: Crabtree Carol

Organization: Eastern Panhandle Regional Planning and Development Council, Region 9 (RPDC)

The Eastern Panhandle Regional Planning and Development Council- Region 9 held its regular Full Council meeting on October 18, 2010. At this meeting the Council established a committee to address EPA's comments on the deficiencies of West Virginia's Watershed Implementation Plan (WIP) and over the concerns of limited availability of federal and/or state funds for these mandates. Jefferson County Commissioner, Lyn Widmyer was asked to chair this committee.

EPA held a public meeting in Martinsburg, WV on Wednesday, November 3. At this meeting EPA indicated any public comment for the record needed to be submitted electronically to EPA via www.regulations.gov, Docket ID No. EPA-RO3-OW-2010-0736.

Response

Comments noted.

Comment ID 0391.1.001.001

Author Name: Downes Paul

Organization: Mountaire Farms Inc.

Mountaire Farms owns and operates facilities that produce or contribute to the production of poultry products. Mountaire Farms provides safe and affordable food for Americans all across the United States. Some of these facilities are located on or near the waters of the United States, and some are located within the 64,000 square mile Chesapeake Bay watershed.

Mountaire Farms would like to voice our support for the detailed comments on the Draft Total Maximum Daily Load (TMDL) for the Chesapeake Bay. 75 FR 57776 submitted by U.S. Poultry and Egg Association (USPOULTRY), National Chicken Council (NCC) and National Turkey Federation (NTF) on behalf of the poultry industry.

Response

EPA notes the commenters support for the comments submitted by U.S. Poultry and Egg Association, National Chicken Council and National Turkey Federation on behalf of the poultry industry. EPA responds to those comments elsewhere in the document.

Comment ID 0427-cp.001.001

Author Name: Phelps Harriette

Organization: University of the District of Columbia (DC)

My comments are as a professor studying the origins of EPA Priority Pollutants in the highly contaminated Anacostia River. EPA's Priority Pollutants are known persistent toxic chemicals that bioaccumulate in fish, birds etc e.g. Polychlorinated Biphenyls (PCBs), Pesticides like DDT and Chlordane and Polycyclic Aromatic Hydrocarbons. These EPA Chesapeake Bay Pollutants are NOT being addressed in the Draft TMDL. The Draft TMDL misleadingly calls nitrates and phosphates Pollutants when their historic designation is Nutrients. Sediment is also misleadingly called a Pollutant. The reasons for this deceptive and incorrect naming appears to be mostly political. The result is to bypass and not deal with EPA toxic pollutant problems in the Chesapeake Bay. EPA toxics will persist in the Bay and the Draft does not pass the scientific smell test.

Response

The definition of “pollutant” at Section 502(6) of the CWA means “dredged spoil, solid waste, incinerator residue, sewage, garbage, sewage sludge, munitions, chemical wastes, biological materials, radioactive materials, heat, wrecked or discarded equipment, rock, sand, cellar dirt and industrial, municipal, and agricultural waste discharged into water.” This broad definition includes nutrients and sediment. The Bay TMDL was appropriately established to address pollutants of concern, phosphorus, nitrogen and sediment, as defined by the CWA. This TMDL does not address other pollutants that may be a source of impairment for the Chesapeake Bay.

Comment ID 0440.1.001.006

Author Name: Land Larry

Organization: Virginia Association of Counties (VACo)

- Need for flexibility: The Chesapeake Bay TMDL should be flexible, and recognize likelihood of innovations over the next 15 years to expedite clean-up efforts (filter feeders, algae harvesting, wastewater land application for irrigation.)

Chief requests in comments: 1.) Create forum for understanding costs and how financial burdens should be distributed - especially urban stormwater retrofits; 2.) Extend deadline to correct model; 3.) Clarify meaning of "reasonable assurance;" 4.) Adopt flexible approach that will allow for innovations and allow time for an effective nutrient trading

system to apply to non point sources.

The following comments were approved by the Virginia Association of Counties Board of Directors on November 7, 2010

The Virginia Association of Counties (VACo) is a statewide organization representing all of Virginia's 95 counties. VACo exists to support county officials and to effectively represent, promote and protect the interests of counties to better serve the people of Virginia.

VACo appreciates this opportunity to comment upon the Draft Chesapeake Bay Total Maximum Daily Load (TMDL) document issued by the U.S. Environmental Protection Agency (EPA) on September 24, 2010. VACo commends all who were involved with the DRAFT TMDL document.

VACo has a strong interest and stake in the success of efforts to restore water quality in the Chesapeake Bay. County officials share U.S. EPA's interest in improving the quality of all of Virginia's waters. Because of the Chesapeake Bay Program's status as a model to emulate for future restorative efforts in other parts of the United States, it is essential that the strategy for implementing the Chesapeake Bay TMDL have as its foundation a strong partnership where federal, state and local government stakeholders reach agreements on how responsibilities should be shared and costs should be distributed. For the reasons detailed below, it is VACo's belief that the DRAFT TMDL released by EPA on September 24 is not a reflection of that type of partnership. On

August 6, 2010 VACo's Environment and Agriculture Steering Committee adopted the following policy statement relating to water quality issues. This statement, which provides the context for the comments below, was adopted by the committee largely in response to discussions about the anticipated Chesapeake Bay TMDL:

VACo supports effective partnerships among and across all levels of government to improve water quality.

VACo urges state and federal agencies to carefully consider impacts on local governments of any initiatives intended to reduce loadings of pollutants into state waters from both point and non-point sources. In order for comprehensive, watershed-wide, water quality improvement strategies to be effective, major and reliable forms of financial and technical assistance from federal and state governments will be necessary. VACo supports the goal of improved water quality but will vigorously oppose provisions of any strategy that threatens to penalize local governments by withdrawing current forms of financial assistance or imposing monitoring, management or similar requirements on localities without providing sufficient resources to accomplish those processes.

VACo's comments (below) address the following seven aspects of EPA's Draft Chesapeake Bay TMDL:

- Fiscal and economic impacts upon local governments;
- The Accuracy of the Bay Model; • Impacts of the DRAFT TMDL upon Agriculture;
- The Organizational Structure of Chesapeake Bay Program;
- Governance: "Accountability" and "Reasonable Assurance", and the Time Frame for Issuing the TMDL;
- The pending deadline for the Phase II WIP; and
- Consideration of more innovative and cost-effective measures.

Local government efforts to reduce pollutant loadings into the Chesapeake Bay are producing results. Between 1985 and 2009 nitrogen loadings into the Chesapeake Bay have declined from 86.5 million to 65.7 million pounds-a 24 percent reduction. Phosphorus loadings have declined from 11.31 million to 7.14 million pounds-a 37 percent reduction. These reductions have largely been achieved through the efforts local governments, the agricultural sector, and businesses.

In recent years many Virginia local governments, especially those in the Chesapeake Bay watershed, have invested heavily in upgrades to wastewater treatment systems and improvements to storm water management programs. Fifty-five publicly owned wastewater treatment plants have either installed, or are in the process of installing, biological nutrient removal systems totaling \$1.344 billion. More than half of this sum (\$696.4 million) will have been paid for by Virginia's local governments (whose primary revenue source is the real property tax), with the remainder being financed through contributions from Virginia's Water Quality Improvement Fund and other sources.

This financial commitment demonstrates the dedication of state and local government officials in Virginia to the improvement of water quality. Furthermore, through these investments, many wastewater treatment plants have been upgraded to comply with stringent standards established by the Virginia Water Control Board to limit nutrient discharges. These standards are embodied in a Watershed General Permit that became effective on January 1, 2007. In addition, with support from local governments, Virginia has embraced an innovative credit exchange program that has become a model for the nation.

Over the past two decades, many of Virginia's counties have amended their respective land use regulations to minimize impacts to surrounding waters from new development. While acknowledging that more needs to be accomplished to improve water quality, local officials in Virginia have worked, and will continue to work, hard to assure that lands within their respective borders are responsibly managed for the protection on natural resources. VACo also has an interest in enhancing efforts by the agricultural community to improve water quality. With VACo's support, Virginia has invested \$80 million into the Agricultural Best Management Practice (Ag BMP) cost-share program since 2006.

VACo is working with the Virginia Department of Conservation and Recreation (DCR) in the development of new state rules that will impose significant pollutant loading limits on new development. By statute, these new state storm water regulations must be adopted by the Virginia Soil and Water Conservation Board by December 11, 2011. VACo supports scientifically based limits on new development as a necessary measure for improving water quality. These comments will address several the key issues associated with the DRAFT Chesapeake Bay TMDL, the first of which will be the anticipated fiscal and economic impacts that will profoundly affect local governments.

Response

EPA believes that the TMDL process provides flexibility and opportunities for TMDL revisions as noted in Section 10 of the final TMDL report. Section 7.1 of the TMDL report provides a definition of “reasonable assurance” as requested by the commenter. With regards to the voluntary activities that are occurring within the commenter’s jurisdictions, please refer to response to comment 0089.1.001.002. With regards to comments concerning the models used in this TMDL, please refer to Section 5 of the TMDL and response to comment 0379.1.001.006. With regards to comments concerning trading, the TMDL document provides a discussion on trading found in Section 10.2. With regards to concerns about the economic impacts implementing this TMDL, please refer to response to comment 0501.1.001.005.

Recommendation:

Through improved storm water control and other programs, local government officials are willing to assume a reasonable share of responsibility for reducing non point source pollution problems. In the meantime officials at the state and federal levels may wish to consider policy changes that could result in significant reductions in non point source pollution. This is an area where it would be most appropriate for federal and state regulation to come into play, as it did when phosphates were banned from laundry detergents. Along those lines, there should be similar evaluations at the state and federal level of fertilizers and other commonly used products that are carried into state waters in storm water run-off.

To upgrade aging urban storm water systems in many urban areas, VACo suggests that the federal government assume a leadership role in developing an aggressive incentive program, with grants, low interest loans, and other financial inducements to encourage local and state governments to upgrade older infrastructure and improve the performance of existing storm water systems. Under this program, several different types of projects could be eligible for funding, including stream bed restoration, Low Impact Development (LID) projects, and others. Also, since air depositions have been identified as a major source of nutrient loadings, EPA should consider additional reductions for stationary and mobile sources with air emissions. The Chesapeake Bay Program Office (CBPO) has estimated that atmospheric sources account for about one third of the nitrogen reaching the Bay, and the majority of this load is attributable to areas outside the Chesapeake Bay watershed (EPA, 2010).

Response

EPA agrees that new federal and state regulations may play a part in reducing nutrient loads being delivered to the Bay. With regards to atmospheric deposition of nitrogen, please refer to Section 6.4.1 and Appendix L of the TMDL which discusses the atmospheric load calculations and the consideration of future federal regulations that will reduce nitrogen emissions. With regards to comments concerning funding, EPA provides a number of funding sources for stormwater projects. Please refer to EPA's webpage located at http://www.epa.gov/owow_keep/NPS/funding.html for more information about funding stormwater projects.

7.) Consideration of more innovative and cost-effective measures

The DRAFT TMDL fails to adequately consider the benefits increasing filter feeder populations (oysters, Atlantic menhaden) as a component of restoration efforts. The DRAFT TMDL also fails to acknowledge and incorporate such other innovations as algae harvesting for renewable energy, and land application of treated wastewater for irrigation purposes.

Recommendation:

The TMDL's language should be more flexible and be more receptive toward an adaptive management approach recognizing that over a 15-year period there will be technical advancements yielding vast improvements to restoration efforts in terms of efficiency and cost-effectiveness. For example, EPA's TMDL for the Chesapeake Bay should include the following practices as important restoration activities that could generate saleable credits to help all source sectors meet their pollutant reduction goals: the cultivation of filter feeder populations, the harvesting of algae, land application of treated wastewater, and other practices.

In order to allow for the utilization of innovative, more cost-effective practices that may emerge within the next few decades, VACo also believes the structure of the Chesapeake Bay Program should remain as flexible as possible.

Response

The Bay TMDL is meant to be implemented in a flexible, adaptive management approach through each State's watershed implementation plan. The best use of future technological advancements should be part of each State's deliberations as they plan to implement the TMDL to meet the necessary sediment and nutrient reductions. Section 10.7 and Appendix U discuss the role filter feeders play in the uptake of nitrogen and phosphorus from the Chesapeake Bay. The Chesapeake Bay TMDL does consider and appropriately incorporates the effects of filter feeders.

EPA is basing the TMDL on the current assimilative capacity of filter feeders at existing populations built into the calibration of the oyster filter feeding submodel of the Chesapeake Bay Water Quality/Sediment Transport Model. Potential future population changes in the filter feeders would not be automatically be accounted for in the Bay TMDL but may provide be a basis to adjust the actions necessary to meet the allocations. If future monitoring data indicate an increase in the filter feeder population, the appropriate jurisdiction's 2-year milestone delivered load reductions can be adjusted accordingly. Similarly if reductions in future filter feeder populations are observed that result in reduced nutrient assimilation, the 2-year milestone delivered load reductions can be adjusted to account for the change.

Organization: New York Farm Bureau (NYFB)

Farmers continually focus on improving their farm operations, including on-farm environmental management. Because of this continual desire to improve, any strategy for addressing water quality in the Chesapeake Bay Watershed needs

to include efforts that expand our applied environmental knowledge base. Support for evaluating better system feedback through data collection as well as improved processes through increased research funding is critical if we want to effectively increase water quality.

Response

EPA agrees with the commenter and plans to continue support such information gathering and sharing as part of the Chesapeake Bay Program.

Comment ID 0467.1.001.014

Author Name: Williams Shannon

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

Has EPA conducted an economic analysis of the impact of its backstop allocation approach on ratepayers of municipal wastewater treatment plants?

5. For the Authority's AWTF, EPA's imposition of the "backstop allocation" approach will require significant upgrades to achieve year-round complete nitrification and denitrification, accounting for maximum month flows and loads, refractory organics (rDON), temperature, and other factors that will affect optimum performance. Evaluations will be needed to determine the most cost-effective combination of processes to achieve the required limit of technology performance.

At this point it is representative to consider that in order to reduce TN to 3 mg/l, additional activated sludge facilities will be needed to insure complete nitrification and additional denitrification filters will be needed to increase denitrification efficiency. Regarding TP reduction to 0.1 mg/l, denitrification filters are not intended to achieve sufficient TSS removal to meet this low level. An additional enhanced flocculation process may be required. This introduces a complication, in that the low TP requirement may impact the growth of biological denitrifiers in the DN filters. Therefore, higher TP levels may need to be maintained through the DN filters and post chemical precipitation and finer media filtration may be needed to polish the DN filter effluent.

The enhanced upgrades described above to meet the backstop allocation will have significant impacts on both capital and O&M costs for the Authority's AWTF. In addition, site space constraints to accommodate these expanded facilities will probably affect the process selection/configuration and costs as well.

6. What are the expected additional capital, annual, and present worth costs associated with implementation of the backstop limits of 3 mg/l total nitrogen and 0.1 mg/l total phosphorus?

7. What are the expected savings in capital, annual, and present worth costs associated with implementation of the reallocation of additional total nitrogen and total phosphorus to the agricultural and developed segments?

8. What analysis has EPA made on the social impacts of such reallocation?

9. Has EPA considered the social justice of such re-allocation given that larger populations of minorities and low to moderate income families reside in the cities and boroughs that are served by public sewers than in the agricultural and developed segments?

Response

Based on significant improved State Final Phase I WIPs and consideration of comments, EPA has made significant changes in the final TMDL allocations including the removal of the PA WWTP backstop allocation. Please see Section 8 of the final TMDL for EPA's final decisions on backstops. EPA and the states hear your concern and understand that dischargers want set, certain limits that are attainable at a reasonable cost. EPA and the states want those things also, however, we also are in a position that past programs, controls and investments have not achieved the level of water quality necessary to meet the designated uses of our rivers, creeks, estuaries and the Bay. Accordingly, it is necessary to periodically evaluate how well we are doing and determine what additional steps are necessary to achieve water quality. We are in that position now, and it is EPA's best professional judgment that these additional steps will be sufficient to restore the Bay and surface water bodies. With regards to comments concerning an economic impact of the TMDL, please refer to response to comment 0139.1.001.017. Please see response to comment 0213.1.001.004 for a discussion of EPA's WIP backstops.

With regards to social justice please see the response to comment 0467.1.001.026.

Comment ID 0467.1.001.026

Author Name: Williams Shannon

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

WHEREAS EPA's proposed plan to impose more stringent discharge limits will cost the City of Harrisburg significant sums of money - through increased construction costs and/or additional purchase of nutrient credits.

WHEREAS EPA's proposed discharge limits will have a significant economic impact on the AWTF and its ratepayers, with rates anticipated to increase eighty percent (80%) of current rates (\$180 extra per year).

WHEREAS, the City of Harrisburg has a majority minority and low income population with twenty five percent (25%) below the poverty line.

WHEREAS, these same people often experience higher levels of environmental pollution and other social and economic burdens that result in poorer health outcomes, and fewer financial or advocacy opportunities to spend on many activities, including "greening" their communities.

WHEREAS, EPA's environmental justice policy requires review and evaluation of these social and economic burdens.

WHEREAS, the draft Chesapeake Bay TMDL has not evaluated the City of Harrisburg's environmental justice concerns.

Response

Please refer to response to comment 0139.1.001.017 regarding the economic costs of implementing this TMDL. The Chesapeake Bay TMDL provides allocations for all areas to ensure water quality standards are met throughout the watershed, regardless of the minority or low income population of a jurisdiction within the watershed. Environmental justice will be achieved through the Bay TMDL because all citizens of the watershed will enjoy the same degree of environmental protection regardless of race, color, national origin, or income.

Organization: Honeywell International, Inc.

The Hopewell Plant of Honeywell International, Inc. welcomes this opportunity to provide comments on EPA's Draft Chesapeake Bay Total Maximum Daily Load ("TMDL") for nutrients and sediment.

Honeywell International, Inc. operates a manufacturing facility in Hopewell, Virginia with nearly 700 full-time employees. Honeywell is proud to be a part of the economic, social and educational fabric of the local community, and is committed to protecting the environment, including water quality in the James River and Chesapeake Bay.

Honeywell's Hopewell facility holds a VPDES permit for wastewater discharges to the James River, and an Industrial User Permit for wastewater discharges to the Hopewell Regional Wastewater Treatment Facility. As a result, Honeywell's Hopewell facility will be uniquely affected by the Chesapeake Bay TMDL, both as a "permitted facility" and a contributor to another "permitted facility."

Honeywell is a member of the Virginia Manufacturers Association ("VMA") and supports their comments on EPA's Chesapeake Bay TMDL. We also support the comments that the City of Hopewell is filing on the TMDL. We request that EPA thoroughly consider and address all of the comments submitted by the VMA and City of Hopewell, which we support and hereby incorporate by reference as if fully set forth herein.

In closing, Honeywell supports regulatory actions based on good science and sound technical conclusions. In this spirit we urge EPA to carefully consider the significant and relevant information contained in the comments submitted by the VMA and City of Hopewell.

Thank you again for the opportunity to provide these comments. If you have questions or require additional information, please contact me at (804) 541-5631 or at scott.wolff@honeywell.com.

Response

EPA shares the commenter's commitment to sound science. EPA notes the commenter's support for the submitted comments of the VMA and City of Hopewell. EPA responds to those comments elsewhere in this document.

Organization: Choose Clean Water Coalition

Unhealthy waters increase public health burdens associated with consuming tainted fish or shellfish or exposure to waterborne infectious disease while recreating. For example, one study estimated the cost associated with exposure to polluted recreational marine waters to be \$37 per gastrointestinal illness, \$38 per ear ailment, and \$27 per eye ailment due to lost wages and medical care. [FN 54] Furthermore, although closing a beach is meant to prevent illness, it directly and indirectly results in an economic loss for local businesses and the county where the beach is located. For example, a study by NOAA indicated that a one day beach closure in Huntington Beach, California was expected to result in thousands of dollars of lost income for local communities. [FN 55] There are hundreds of beach closures in the bay region each year, [FN 56] potentially resulting in hundreds of thousands of dollars of lost income for local economies.

[FN 54] R. H. Dwight, et al. 2005. Estimating the economic burden from illnesses associated with recreational coastal water pollution a case study in Orange County, California. *Journal of Environmental Management*. Vol:95103.

[FN 55] http://stateofthecoast.noaa.gov/coastal_economy/beacheconomics.html.

[FN 56] NRDC. 2010. Testing the Waters: A guide to water quality at vacation beaches. <http://www.nrdc.org/water/oceans/ttw/ttw2010.pdf>.

Response

EPA agrees that pathogens can cause human health problems. The Bay TMDL addresses the pollutants of concern, phosphorus, nitrogen and sediment but not pathogens (bacteria). While this TMDL does not address other pollutants that may be a source of impairment for the Chesapeake Bay, reductions to meet the TMDL allocations for nutrients and sediment, especially in the stormwater and agricultural sectors, should also bring some indirect benefits in the reduction of pathogens.

Organization: Citizens Advisory Committee to the Chesapeake Executive Council

we are deeply committed to preserving healthy agriculture in our communities. Rural landscapes are integral to the fabric of our region's culture. Just as clean water is important to healthy communities, so are healthy, local food sources. We believe responsible agricultural practices are good land uses. The states have the lead in designing their WIPs to accommodate agricultural viability and responsible farming practices. However, we encourage the EPA to use the Chesapeake Bay Program as a venue to promote and share successful examples across the watershed that demonstrate healthy farm practices, the community ethos that support them and the mechanisms that promote practice verification.

Response

EPA appreciates the commitment to healthy farm practices and environmental concerns. In developing this TMDL, EPA has worked closely with the states and USDA to recognize and credit effective practices as reflected in the State WIPs and EPA allocations based on those WIPs.

G. The EPA Provides No Environmental Impact Assessment for the TMDL

Given the geographical extent of coverage of the TMDL, in New York the State Environmental Quality Review Act ("SEQR") mandates an environmental impact assessment and, likely, a full environmental impact statement be prepared and be subjected to a full, coordinated review. This is an essential planning process that can safeguard against unintended consequences. Just as full SEQR compliance is mandatory for development of nutrient and sediment-trapping wetlands and other control measures in New York when funded with federal dollars by the U.S. Department of Agriculture ("USDA"), this TMDL (an EPA rulemaking) should not be exempt from a full and proper environmental impact assessment process, such as New York's SEQR process would afford. Indeed, as a tool governing land use, New York's WIP-I - as well as the TMDL itself - should be subjected to such a process. The goal of SEQR is to protect the environment by promoting a full understanding of the effect of a proposed action or development, as well as safeguard against unintended consequences.

As proposed, the TMDL does not consider/address the carbon footprint/global warming impact of TMDL implementation, which may be significant and detrimental to the Bay. Specifically, the TMDL may have the unintended consequence of increasing other forms of pollution, including greenhouse gases believed by many to contribute to the potential of global warming, which if unchecked would have dire consequences for the Bay and its shoreline population at present water's edge, especially if a rise in sea level occurs. For example, in order for our Facilities to denitrify, somewhere in the range of 182,500 gallons per year of the chemical methanol is used as a carbon source. Because it is a distilled wood product, methanol requires large amounts of energy to produce, as well as the harvesting of trees that once had a moderating effect on ambient carbon dioxide. Further, this chemical must then be transported by ship, rail and/or truck to reach its delivery point, thereby requiring further consumption of energy with attendant emissions, including airborne TN from the oxides of nitrogen in vehicular exhaust. Moreover, upgraded solids handling equipment and the biological aeration filtration ("BAF") system installed at our Facilities to remove sediment and CBOD, break-

down ammonia through nitrification, as well as denitrify together consume large amounts of electricity. Between July 2007 (pre-BAF operation) and July 2009 (full BAF operation), our electricity consumption more than doubled (from 400,000 kwh per month to 1,005,115 kwh per month) and - owing to the augers, conveyors, centrifuges, large pumps, process air blowers, and compressors integral to these systems - the power "demand factor" of our Facilities has more than tripled (from 702.72 kw to 2,391.04 kw) over the same period. Much of the electricity consumed at our Facilities is generated through the burning of coal and fossil fuels. The TMDL provides no evidence that the EPA studied the overall environmental impact of upgrading a wastewater treatment facility such as ours to meet much more stringent TMDL and backstop standards in terms of the greenhouse gas and climate change effect from these emissions. In the quest to save the Chesapeake Bay, is one form of pollution being "exchanged" for another?

Throughout the Bay watershed, there are numerous power generation plants and other industrial operations which discharge cooling water warmer than ambient river temperature. Has the cumulative effect of thermal discharges of this type been studied? Neither the TMDL nor the draft CBWM documentation, though incomplete (and to the extent provided), includes any indication that this aspect of thermal pollution has been examined. Even though largely localized, the changes in habitat may have increasing downstream impacts that are detrimental to the Bay.

Response

This TMDL is not a new rule, law or regulation. EPA has developed this TMDL based on the requirements of Section 303(d) of the Clean Water Act (CWA) and the implementing regulations found at 40 CFR 130.7. The CWA and federal regulations require that TMDLs be designed to meet existing, applicable water quality standards (numeric, narrative, uses and anti-degradation), include wasteload allocations (WLA) for each point source, load allocations (LA) for non-point sources (allocated to specific sources if data allow, or gross allotments to source types), consider seasonal impacts, include a margin of safety and consider reasonable assurance that the allocations can be met. This TMDL meets all of these legal requirements. EPA is not required to conduct an Environmental Impact Assessment for New York.

Comment ID 0515.1.001.029

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

I. As the TMDL is implemented, the EPA should also take steps to more closely monitor the Bay watershed for the presence and impact of other pollutants or contaminants such as the byproducts of pharmaceuticals (including antibiotics [human and agricultural]) and byproducts of personal care products, hormones (including agricultural growth hormones, synthetic estrogens or "estrogen mimics"), and other endocrine disrupters (such as Bisphenol-A and Phthalates). In large areas of the Bay watershed, exploitation of the natural gas deposits in the Marcellus Shale formation are being pursued via horizontal drilling combined with hydrofracturing using chemical-laced "proppant cocktails" containing dissolved or suspended hydrocarbons, trace metals and solids. Some of these dissolved solids may become assimilated into the tissues of fish and other aquatic life. Consideration should also be given to importation of non-native invasive or nuisance species "hitchhiking" on drilling rigs and other vehicles brought into the Bay watershed. Discoveries of hermaphrodite fish as well as studies documenting the gender imbalance of fish populations downstream from wastewater treatment plant outfalls are indicia of the negative effects on species indigenous to the

Bay watershed. See, <<http://www.baltimoresun.com/features/green/bs-gr-fish-20101102,0,4595447.story>> for a very recent report of such a discovery in the Susquehanna River.

Response

EPA agrees that the Chesapeake Bay may be impacted by discharges of other pollutants such as toxics. The Chesapeake Bay has an extensive monitoring network as discussed in Section 5 of the TMDL report. The Chesapeake Bay tidal monitoring network includes tidal water quality monitoring for 26 parameters at over 150 stations distributed over the 92 Chesapeake Bay tidal segments, shallow-water monitoring addressing a select set of segments on a rotational basis, benthic community monitoring at fixed and random stations across the tidal waters and annual aerial and ground surveys of underwater Bay grasses. The EPA, the States and their partners will continue monitoring the health of the Bay and evaluate any cause or source of impairment. With regards to comments related to Marcellus Shale drilling operations, please refer to response to comment 0190-cp.001.002.

b. Bay Watershed Wetlands and Non-navigable Streams Are Essential to Restoring and Protecting the Chesapeake Bay Region.

Science has made clear that headwater streams and wetlands are crucial to the health of the Bay, and collectively have a significant nexus to the Bay and its navigable tributaries. In general, headwaters are important in achieving water quality and have enormous impacts on downstream waters, especially in light of climate change. For instance:

- Headwaters serve to reduce flooding by storing flood waters from rain events and snow melt, which will be increasingly important as major storm and flooding events increase;
- Headwaters recharge groundwater and replenish downstream flow, which will be increasingly important as water quantity and stream flow are stressed by increases in droughts and evaporation rates;
- By storing water, headwater wetlands moderate flow rates and can provide cooler waters to downstream streams and rivers, functions that will become increasingly vital as climate change places stresses on stream flow and causes temperatures in many waters to increase;
- Wetlands filter out harmful pollutants such as nutrients and pathogens, which will increase with increased intensity of storm events; and
- Small streams similarly have enormous potential to remove nutrients and other pollutants as water makes much more contact with the bed of the stream in smaller streams.

i. Bay Watershed Headwater Wetlands and Streams Filter Pollutants.

Chesapeake Bay's headwater wetlands and streams are essential tools in combating nutrient enrichment in the Bay because they absorb, filter, and recycle this pollution, preventing eutrophication.[FN104] Studies have shown that non-tidal wetlands near the Chesapeake Bay removed an estimated 89 percent of the nitrogen pollution and 80 percent of the phosphorus pollution that entered the wetlands through upland runoff, groundwater, and bulk precipitation.[FN105] In Eastern Maryland, concentrations of nitrate pollution have been found to decrease in watersheds with a prevalence of forested wetlands.[FN106] Wetlands restored in an agricultural area on the Delmarva Peninsula removed an average of 68 percent of nitrate nitrogen.[FN107]

As the Fourth Circuit explained in *United States v. Deaton*,[FN108] the filtering effect of wetlands is actually reversed, releasing trapped pollutants back into surface and groundwater, when wetlands are drained and developed. Protecting and restoring the Chesapeake Bay's wetlands and non-navigable tributaries is essential to reducing pollution downstream in the Chesapeake Bay and its major tributaries.

Organization:

I believe it to be true and logical that a full flowing river would provide cleaner water than a river that has been depleted of its normal flow. Hydrofracking for natural gas is and will continue to extract many more millions of gallons reducing water flow that will in turn allow organic vegetative growth to establish only to be taken down to the Chesapeake when fuller flow returns after rain storms etc. State and Federal regulators need to look at alternatives to so much river water use for hydrofracking eg requiring closed-loop systems etc.

Response

Please refer to response to comment 0190-cp.001.002.

I. Voluntary Action Is Not Enough

Years of voluntary restoration measures by the States have failed. It is time for strong action and real leadership from the EPA. The EPA, along with the Chesapeake Bay states, has worked for decades in a cooperative manner through a transparent and public process to reduce pollution leading to the Chesapeake Bay. Unfortunately, water quality goals set in the 1980s and in 2000 have not been met, triggering the development of the TMDL. In addition there is a clear and lengthy record of EPA, and the states, going to considerable lengths to ensure that both technical and economic attainability were addressed during this process. The new Chesapeake Bay tidal water quality standards are both scientifically valid and protective under the Clean Water Act, and at the same time, are economically and technically attainable.

Despite years of study and promises, the voluntary approach to Bay restoration has officially failed. A brief history of bay restoration efforts shows that the voluntary approach has been in place for almost forty years:

--1972: U.S. Senator Charles "Mac" Mathias (R-Md) introduced legislation directing the EPA to embark on a major research project to determine the Bay's problems and make recommendations on how to solve them.

--September 1983: the EPA released a lengthy report, Chesapeake Bay: A Framework for Action. The report also provided an innovative blueprint for the intergovernmental, inter-jurisdictional "Chesapeake Bay Program" that was formed in December when the Chesapeake Bay Agreement of 1983 was signed by a group that would be known as the Chesapeake Executive Council - the governors of Maryland, Pennsylvania and Virginia, the Mayor of the District of Columbia, and the Administrator of the EPA.

--1987: Congress passed the reauthorization of the Water Quality Act of 1987 (Clean Water Act or "CWA"), which included a new section entitled "Chesapeake Bay". This provision, known as Section 117, basically codified the Chesapeake Bay Program and authorized Congress to continue funding the restoration effort at \$13 million annually.

--December 1987: the Chesapeake Executive Council signed the 1987 Chesapeake Bay Agreement, which for the first time included specific quantitative goals and commitments. The centerpiece of the Agreement was a goal to reduce nutrient pollution to the Bay by 40% by 2000.

--1992: The 1992 Amendments to the Chesapeake Bay Agreement was signed by the Council and "capped" the 40% reduction goal after 2000. In addition, the 1992 Amendments recognized the need to reduce nutrients in the tributaries, and called for the states to develop "tributary-specific strategies" on how to meet the nutrient reduction goal. The states all drafted tributary strategies in the late 1990's which were not required to be reviewed or approved by anyone outside of state government. The Amendments also recognized the need for "intensified efforts to control nonpoint sources of pollution, including agriculture and developed areas...", as well as the need to engage Delaware, New York and West Virginia in the efforts to reduce nutrients in the tributaries.

--1998: A lawsuit filed by the American Canoe and American Littoral Society against EPA alleged Virginia was not timely and complete in listing its Clean Water Act Section 303(d) impaired waters and preparing TMDLs for those waters, and that EPA failed in its non-discretionary duty under the Clean Water Act to take over when the state had failed to do so. The lawsuit was settled with a consent agreement in the Federal Eastern District of Virginia court on June 11, 1999. Under the terms of the court agreement, EPA would ensure that Virginia completed its listing of impaired waters and developed TMDLs for all waters on the 1998 list by May 1, 2010. If Virginia did not do so, EPA would complete them no later than May 1, 2011.

--1998: the Chesapeake Executive Council adopted Directive 98-2, which directed the Bay Program to develop a new Chesapeake Bay agreement for 2000, and to present a draft set of options and recommendations to the Council in 1999. The new language made the intent to meld the voluntary and regulatory approaches clear.

--2000: The Chesapeake Executive Council signed the Chesapeake 2000 agreement. Although the 40% nutrient reduction goal from 1987 was still not met, the Chesapeake Bay Program adopted new stronger goals, and set up a clear path of regulatory and voluntary actions to ensure that the 2010 clean up goals would be met. Both Delaware and

New York signed an MOU with the other Chesapeake Bay Program partners and agreed to adopt the Water Quality goals of the Chesapeake 2000 agreement - West Virginia followed suit in 2002.

--April 25, 2003, Virginia's Secretary of Natural Resources Tayloe Murphy sent a memorandum to all of the Bay Program partners. The Memorandum, Summary of Decisions Regarding Nutrient and Sediment Load Allocations and New Submerged Aquatic Vegetation (SAV) Restoration Goals, clearly laid out the allocations which were to guide the development of state specific tributary strategies by 2004. These allocations were "TMDL-like", and are very similar to EPA's proposed TMDL nutrient allocations released earlier this year and again as part of this draft TMDL. [FN 1] All of the Bay states developed updated tributary-specific strategies, most final in 2004. For the past seven years all of the states have known what their load reduction allocations would be, and have developed strategies to meet them.

--2005: Technical work on the TMDL actually began unofficially with the convening of the Chesapeake Bay Reevaluation Steering Committee (now known as the Water Quality Goal Implementation Team) whose initial focus was on updating and revising the watershed and water quality models.

[FN 1] Using the Phase 5.3 Watershed Model, implementation of the Tributary Strategies is expected to result in annual loads of 189.7 million pounds of total nitrogen, 14.2.5 million pounds of total phosphorus and 6.4 billion pounds of sediment compared to the draft TMDL caps of 187.4 million pounds, 12.5 million pounds and 6.3 billion pounds, respectively.

Response

EPA agrees, the Bay criteria are based on scientific research in accordance with Sections 117(b) and 303 of the CWA to derive water quality criteria specifically for addressing the critical nutrient and sediment enrichment parameters necessary to protect designated uses in the Bay. EPA agrees that voluntary actions alone will be ineffective in achieving water quality standards for the Bay. Please refer to response to comment 0089.1.001.002.

Organization: Natural Resources Defense Council (NRDC)

There is another option.

Switch fertilizers.

Eliminate nutrient "runoff" from farms by using the Dutch fertilizer. It has no "runoff" since it is not water soluble.

Eliminate this "dead zone" without having to spend any taxpayer monies.

Just have the farmers buy the comparably priced Dutch fertilizer and start the cleanup at the source.

It would be "economically painless" to the taxpayers and environmentally superior for the "soils."

Response

While these specific recommendations are beyond the scope of this TMDL, EPA agrees that the kind of fertilizer, specific method of application and stormwater runoff are all components of agricultural and residential sources of nutrients. EPA notes that the the States and USDA have provided a number of innovative practices and recommendations to reduce the runoff of nutrients and overapplication of fertilizer. EPA's TMDL allocations are based on the proposed use of some of these practices.

Organization: Shenandoah Valley Network (SVN)

Shenandoah Valley Network (SVN), a coalition of citizens groups working on land use and land protection issues in six counties in northwestern Virginia, has signed on to the extensive comments filed by the Choose Clean Water Coalition in support of TMDL standards and planning.

We would like to make two additional points unique to our region: the need to consider the impacts of natural gas mining using hydraulic fracturing of Marcellus shale deposits and the management of public forest lands in the Shenandoah Valley in rulemaking for TMDL standards.

While the TMDL regulations focus on nitrogen and phosphorous levels from farm and wastewater treatment facilities, they do not address the impacts of gas mining wastewater or the significant sediment issues from the extensive land disturbance created around these gas well sites. EPA has a separate study underway on the impacts of Marcellus shale gas mining on drinking water resources. Our colleagues have been told this is "not related" to TMDL rulemaking. However, we believe intensive gas mining development in the Shenandoah Valley could lead to much greater degradation of water quality in the Chesapeake Bay tributaries in our region. Please see the attached map. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0628.1.001.001]

We were also told that there has been little coordination between TMDL rulemaking and U.S. Forest Service planning for the George Washington National Forest, as a new forest management plan nears completion. SVN strongly supports careful management of drinking water resources in the forest. Land disturbance for timber harvesting, road building and/or Marcellus shale gas mining are likely to have significant impacts on local drinking water quality and the Chesapeake Bay.

Response

With regards to comments about Marcellus Shale drilling operations, please refer to response to comment 0190-cp.001.002. With regards to comments concerning forest management plans, forest lands have been considered as a source of nutrients and sediment to the Bay. EPA has noted in Section 4.7.3 of the final TMDL document that forested areas represent a significant portion of the Chesapeake Bay Watershed as approximately 70 percent of the watershed is forested and open wooded area. However, this land use contributes the lowest loading rate per acre of all land uses. While most of the forest loads of nitrogen come from atmospheric deposition, sediment and phosphorus loads originate from poorly managed forest harvesting. Reducing loads from forested lands may be an important implementation strategy for States to consider. It is not within the scope of the Chesapeake Bay TMDL to address the impacts of forest management plans of the George Washington National Forest on the local drinking water quality.

Region 3
United States Department of Environmental Protection
Philadelphia, Pennsylvania Hand Delivered to Comfort Inn - Martinsburg

Re: Chesapeake Bay (WV Input - Herbicides & Above-Ground Pools)

Dear Members of the Region 3 Team:

I am writing to ask that the Region 3 Team be diligent in investigating the various sources of pollution from Berkeley County, West Virginia. A report of the loss of yet another tree of size for lumber has died on my land... most likely falling victim to the local "thugs" who want trees and indigenous plants forced into extinction so they can have a vinyl covered box on a piece of very dead, dry dirt.

Additionally, no monitoring of the amount of water being taken from large water sources such as Back Creek, is being done. More importantly, the swimming pools being filled are also being cleaned and discharged into Back Creek.

International Property Maintenance Code and the very recent Clean Safe Berkeley County Ordinance practically forbid people on rural land from growing or keeping maintaining indigenous plants and trees, even along Back Creek. Natural fields are being wiped out by development interests. (These laws have been initiated and voted upon unanimously by the current Berkeley County Commission members.

I hope you will come to my 5 acres and look at the devastation that people armed with right-of-way clearing strength herbicides can do. I am asking that my land also be tested to see if it is safe for habitation and for chickens to produce eggs, which I sell. My gardens and lily beds have been saturated with herbicide for approximately 7 years and WV Dept. of Agriculture refuses to enforce the herbicide regulations. My property adjoins Back Creek.

We have great difficulty even keeping an inspector in the Inwood Field Office and senior inspector(s) does not wish to come from Charleston. We need an increase in salary for that inspector and we need two (2) at the very least.

PLEASE HELP!

Response

It is beyond the scope of the Chesapeake Bay Nutrient and Sediment TMDL to address the loss of local trees or illegal toxic discharges to Back Creek. Nor does the Bay TMDL restrict local government zoning decisions. If a citizen believes that individuals are illegally discharging, EPA encourages each citizen to report violations through the State's environmental hot lines. In addition, EPA has an environmental hotline that can be used anonymously to report violations at 1-800-438-2474 or www.epa.gov/tips.

Organization: Waterfront Partnership of Baltimore, Inc.

The two areas which we would only ask that greater attention be paid are to a] indicators: we understand nutrients are a major challenge for the Bay; at the Harbor as in other urban areas, bacteria and trash are also major problems, and we would ask that some additional attention be paid to these pollutants.

Response

The Bay TMDL addresses the pollutants of concern, phosphorus, nitrogen and sediment but not pathogens (bacteria) or trash. While this TMDL does not address other pollutants that may be a source of impairment for the Chesapeake Bay, reductions to meet the TMDL allocations for nutrients and sediment, especially in the stormwater sectors, should also bring some indirect benefits in the reduction of other pollutants.

I live in the town of Thurston, NY. I am writing in regards to [redacted] the disposal of industrial sludge and raw sewage. We are one of the many little towns surrounded by [redacted] seventeen thousand acres where they apply millions of gallons of their sludge during the spring, summer and fall. It gets so unbearable from the odor that you can't even go outside, have windows open or even enjoy a cook out. It just makes you nauseous. The land here has a slope and where they apply the sludge it runs directly in all the streams and creeks, polluting our water and air. We too have tried to get some control over this increasing problem but to no avail. NY DEC doesn't seem to enforce or oversee the millions of gallons of this waste being applied to the land. I couldn't even get them to do a water sample of the creeks which are

now all brown and foamy. We were told they didn't have the funding. I would like to see some answers on a federal level and have this investigated as the assault on our environment gets worse every year.

[Personal information in this letter was redacted in accordance with the Privacy Act of 1974]

Response

It is beyond the scope of the Chesapeake Bay Nutrient and Sediment TMDL to address illegal discharges either inside or outside of the Bay watershed. If a citizen believes that individuals are illegally discharging, EPA encourages each citizen to report violations through the State's environmental hot lines. In addition, EPA has an environmental hotline that can be used anonymously to report violations at 1-800-438-2474 or www.epa.gov/tips.

Author Name: Prettyman J.

Organization:

I urge you to ACT IMMEDIATELY to save small-mouthed bass from pollution

Background:

90% of male small-mouthed bass are impacted by endocrine disruptors, chemicals that act like hormones. These chemicals come from multiple sources ranging from birth control pills to BPA, from agribusiness to industrial waste. Small-mouthed bass are dying from disease and their population has crashed. Fisherman are being told to catch and release only, but that's not enough.

And it's not just small-mouthed bass in the Susquehanna River that are at risk right now. The Chesapeake Bay, fed by the Susquehanna and all its Pennsylvania tributaries, has dead zones where no life can grow -- including blue crabs, the famous and amazing "beautiful swimmers" of the Chesapeake Bay.

The EPA is the only entity with the authority to crack down on polluters, including agribusiness with huge feedlots which generate intensive waste. The plan put together by PA environmental officials will NOT solve the problem It won't save the small-mouthed bass, the blue crab, or other incredibly interconnected life forms in the Susquehanna River watershed or the Chesapeake Bay.

I could ask you to "protect" the wide-mouthed bass but a better word is "save." EPA has authority to intercede and do what PA officials are failing to do -- SAVE the small-mouthed bass.

DO IT!

Response

EPA notes commentors support for protection of the small-mouthed bass. The Bay TMDL addresses the pollutants of concern, phosphorus, nitrogen and sediment but not pathogens (bacteria). While this TMDL does not address other pollutants that may be a source of impairment for the Chesapeake Bay, reductions to meet the TMDL allocations for nutrients and sediment, especially in the stormwater and agricultural sectors, should also bring some indirect benefits in the reduction of other pollutants.

I am frightened to hear the statistics of the Chesapeake Bay's condition. I am also dissapointed by the lack of involvement on the EPA's behalf. Both locals and the creatures of the Bay would appreciate and do expect your concern to grow as it seems the issue is.

Response

EPA, States, the District and their many partners have a long history addressing the environmental problems of the Chesapeake Bay. Please refer to Section 1 of the final TMDL which provides detailed information regarding EPA's past, present and future initiatives. In particular, Section 1.2.3 provides a description of the President Obama's Chesapeake Bay Executive Order which calls for the federal government to lead a renewed effort to restore and protect the Chesapeake Bay and its watershed.

**Response to Public Comments: Chesapeake Bay TMDL for Nitrogen,
Phosphorus and Sediment**

Issue Category: 34. TMDL Timeline

Pages 2935 – 3005

December 29, 2010

Docket #: EPA-R3-OW-2010-0736

34 - TMDL TIMELINE

Comment ID 0038.1.001.032

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

The EPA must give the states sufficient time to really understand the TMDL nutrient numbers and formulate detailed and specific step-by-step programs to achieve their goals. Deadlines and funding are key components of this document. Without setting strict deadlines, the pace of action tends to slow and eventually stall.

Response

Please see the response to comment 0060.1.001.001

Comment ID 0060.1.001.006

Author Name: Bredwell III Paul

Organization: U.S. Poultry & Egg Association, National Turkey Federation (NTF), and National Chicken Council (NCC)

Moreover, a 45-day comment period is especially inadequate given the complexity, breadth and potential economic impacts of the proposed TMDL. Providing a meaningful analysis of the proposal is also a time-consuming process. Although the industry already raised several preliminary technical concerns with EPA in recent months related to the Scenario Builder as part of the Bay modeling effort, we are troubled that some of these concerns may not likely be able to be addressed by EPA in time for even the final TMDL rule.

Response

Although the Bay TMDL is a detailed document, the public comment period was not the beginning of EPA's public outreach regarding the TMDL, which has been developed through a highly transparent, inclusive and engaging process during the past two years. The outreach effort has included hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community. Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

EPA has provided a wealth of documentation, background information, modeling data and other support material on its web sites (www.chesapeakebay.net, www.epa.gov/chesapeakebaytmdl), in public meetings, in stakeholder meetings, during conference calls

with partners and stakeholders, on regular webinars and through other means as part of an extensive, collaborative effort to develop the Bay TMDL, particularly over the past two years. Detailed scientific information has been posted as attachments to meeting agendas of the Water Quality Goal Implementation Team and in other places on the public web site, www.chesapeakebay.net, as the process has evolved.

EPA is working diligently to review and respond to all comments and modify the TMDL as necessary based on the public comments and EPA's responses. EPA's review process insured that comments requiring modification of the TMDL would be identified early in order to make the necessary changes were made if needed.

Comment ID 0062.1.001.004

Author Name: Bodine Susan

Organization: Agricultural Retailers Association et al.

We believe that EPA should withdraw the Draft TMDL and instead work with the states in the Chesapeake Bay watershed and the District of Columbia (Chesapeake Bay jurisdictions) to develop TMDLs in 2011 for tidal waters in the Chesapeake Bay watershed impaired by nutrients and sediments. This delay will allow EPA to gather more data to correct errors in the Chesapeake Bay Watershed model relating to assumptions regarding nutrient use and management as well as suburban land characteristics. See letter dated June 11, 2010, from Shawn Garvin, Regional Administrator, EPA Region III, to the Principal's Staff Committee (discussing plans to update the model to address these flaws).

Response

EPA will not be withdrawing the draft TMDL as mentioned in your comments. The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator. The date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010 and as mentioned in your comments included in the settlement agreement between EPA and the Chesapeake Bay Foundation.

Additionally, EPA and the states and D.C. have been working together to develop the Chesapeake Bay TMDL since 2005. During this time we have been modifying and enhancing the Bay model and collecting data from the Chesapeake Bay.

Comment ID 0066.1.001.004

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

The Chesapeake Bay TMDL is a very complex, innovative and far-reaching new rule. Because of the impact the TMDL will have on the home building industry, communities, and the overall region, it is imperative that it be finalized only after all parties are provided sufficient opportunity to give careful thought and consideration to all aspects of the proposal and its supporting documents. EPA's efforts to accelerate the TMDL's completion by cutting a most important element in the development of the Bay restoration program - the public review and comment period - is misguided and wrong. Contrary to this approach, the Agency is strongly urged to provide the public more, not less time. NAHB believes that EPA should extend the comment period for a minimum of 180 additional days.

Response

Please see comment 0060.1.001.006

The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator.

The 45-day public comment period was also the product of negotiation and agreement among the states and EPA. The December 31, 2010 date is also a specific commitment in the Executive Order 13508 Strategy issued in May 2010.

Comment ID 0069.1.001.005

Author Name: Nemura Adrienne

Organization: LimnoTech

First, the TMDL is very complicated and requires review of not only the TMDL report, but numerous supporting documents. The TMDL documents were provided piece meal on EPA's website (www.regulations.gov) and contain numerous typographic errors and missing references. Even EPA did not have sufficient time to ensure that these errors were addressed prior to the public comment period.

Response

All of the documents needed for review of the TMDL were uploaded onto regulations.gov one at a time during the first day of the public comment period, September 24, 2010. To EPA's knowledge no information was missing and an effort has been made to correct any typographical errors in the final report. With regards to comments concerning the models used for the TMDL, please refer to responses to comment 0379.1.001.006 and 0238-cp.001.002.

Comment ID 0069.1.001.006

Author Name: Nemura Adrienne

Organization: LimnoTech

Second, the massive size of the document makes review in a 45-day timeframe impossible. The current version of the report, including the Appendices, is more than 2,000 pages. This does not include the modeling documentation or the documentation to support the Scenario Builder, which forms the foundation of the distribution of the "pollution diet" across the multiple sources.

Response

Please refer to response to comment 0060.1.001.001

Comment ID 0069.1.001.007

Author Name: Nemura Adrienne

Organization: LimnoTech

Third, complete review of the TMDL requires review of the State-developed WIPs. The WIPs and their role in the TMDL are not at all clear. Generally, "implementation" plans are written after a TMDL is finalized. This is so all components of the TMDL are considered and can be implemented. In this TMDL process, EPA required that the states write a significant amount of the implementation plans before the draft TMDL was publicly available. After the WIPs were released, EPA indicated many of them were significantly flawed. If, as EPA has asserted, many of the WIPs are significantly flawed, this raises serious questions about the actual status of the WIPs and how they will work in relation to the TMDL. This uncertainty has a significant impact on the amount of time necessary to review both the TMDL and the WIPs.

Response

Please see the response to comment 0067.1.001.009 and section 8 of the TMDL report.

Comment ID 0070.1.001.014

Author Name: Hughes Robert

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

EPCAMR believes that before some WIPS can be completed that watershed assessments still remain to be completed for several watersheds in the Basin. Comprehensive watershed assessments should be completed before developing implementation plans. In the last round of PA's Growing Greener, watershed assessments were not a priority for funding, and in order for them to be eligible for other types of State and Federal funds they need to be. In the Coal Region, implementation plans need to take in to consideration the underground mining hydrogeology and complex geology of the Anthracite Region before we can jump to conclusions that treating in one location is going to improve another that is tied to an underground reservoir that fluctuates temporally and seasonally with rainfall and drought conditions. Loadings will also fluctuate in this situation. EPCAMR staff has assisted the PA DEP and many of our community watershed organizations in the completion of Watershed Implementation Plans in the past.

Response

EPA recognizes the Bay Watershed and the WIPs are not static and will be subject to refinements and revisions. As more or better information becomes available, it is EPA's expectations that the WIPs will reflect that information. EPA anticipates that all stakeholders in the implementation of the TMDL will continue to work together and provide the necessary data and perspective for the next phase of the WIPs.

Please consider delaying any implementation of new regulations until further study on existing programs and economic impacts are conducted to assure the proper Bay Model Accuracy.

Response

In developing the Bay TMDL, EPA is implementing requirements of the Clean Water Act. The Clean Water Act is the federal law that governs how to protect the nation's waters. There is no cost-benefit analysis required with the development of a TMDL; it may be appropriate for Bay states and the District of Columbia to address this issue during the development of the WIPs. It should be noted that pollution to the Bay has significantly impacted the livelihoods of stakeholders such as the watermen of the Chesapeake Bay. This is an industry that for generations farmed the Chesapeake Bay for crabs and oysters and for years has been dwindling. Therefore, negative economic impacts within the Bay have already occurred.

In recognition that it may be difficult to meet water quality standards in the Chesapeake Bay, EPA considered whether a use

attainability analysis (UAA) should be conducted. EPA determined that a UAA at this time is premature given that that Bay restoration will involve long term (15 year) implementation. Instead, energy should be focused on developing a Bay TMDL to achieve current standards and thereafter implementing that TMDL. In particular, with a 15 year implementation horizon, EPA believes likely advancements in technology will improve our ability to reduce nutrients and sediment and at a lower cost. A UAA at this time would not be able to anticipate those potential advancements in technology.

It is impossible to understand why the EPA is rushing the science, the policy decisions, and the public notice and comment period for such an important action.

Response

EPA's actions to improve the water quality of the Chesapeake Bay have been a deliberative and methodical process that began in the 1980s with a voluntary approach. This achieved some reductions in nutrient loads but was unable to allow the Bay to meet water quality standards. Since 2005, EPA has been collaborating with the states on the development of the TMDL.

Comment ID 0145.1.001.008

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

It appears to us that the EPA has rushed the development of this TMDL and has applied modeling tools that were originally designed for continued implementation of a voluntary, cooperative program. The TMDL documents were posted piecemeal (on <www.regulations.gov>) and contain numerous typographic errors and missing references. A corrected Executive Summary was posted shortly thereafter. Even the EPA did not have sufficient time to ensure that these errors and omissions were addressed before the public comment period began.

Response

Generally, "implementation plans" are written after a TMDL is finalized. This is so all components of the TMDL are considered and implementation can be carried-out in a coherent manner. In this TMDL promulgation process, however, the EPA required the jurisdictions to draft their WIPs before the TMDL was even publicly available.

Response

The jurisdictions have been working in collaboration with EPA on the development of the TMDL since 2005 and had the information for the development of the WIPs prior to the release of the draft TMDL to the public, please see the response to comment 0217.1.001.001. The WIPs are a vital component of the Reasonable Assurance of the TMDL and thus needed to be developed by the jurisdictions with the TMDL. EPA notified the jurisdictions and the public regarding the expected WIP schedule and approvability in letters dated 9/11/2008, 11/4/2009 and 4/2/2010.

Comment ID 0145.1.001.014

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

Until the TMDL, underlying documentation and modeling programs upon which it is based are ready to be reviewed in a final form, drafting WIPs is tantamount to aiming at a "moving target". The denitrification upgrade to our Facilities was designed to achieve a maximum 6 mg/L effluent TN, but the draft backstop allocations assigned to New York in Section 8 of the TMDL will require compliance with a 3 mg/L effluent TN limit by New York WWTPs, so it appears that substantial economic waste will have resulted from the upgrade of our Facilities, albeit undertaken in an effort to "do the right thing" for the Bay watershed, but designed and built to what the EPA now regards as "the wrong standard" according to the TMDL. Even in better fiscal times, few (if any) could afford not to "do it right the first time", so it is absolutely crucial that the TMDL and all underlying documentation and modeling first be complete in a final form before made public for review and comment so the "end limits" are fixed.

The EPA repeatedly points to the TMDL schedule included in its May 10, 2010 Settlement Agreement with former Maryland State Senator C. Bernard Fowler, the Chesapeake Bay Foundation, the Maryland and Virginia Watermen's Associations, and others in *Fowler v. EPA* - which calls for the completion of the Bay TMDL by December 31, 2010 - as "the reason" for a truncated public review and comment period.

Nevertheless, the EPA has retained unto itself full authority to revise the schedule and timeline in order to allow for an adequate public comment period. December 31st is but an arbitrary date in the continuum of time. There is no Presidential directive or federal legislation mandating a December 31st completion date for the TMDL.

There is no scientific reason why December 31st must be the completion date for what then would initiate a 15-year environmental restoration process. There have been numerous "slippages" of dates over the past decade - especially with respect to milestones set by the EPA for the EPA to release various components and updates of the Chesapeake Bay Watershed Model - for the convenience of the EPA. Indeed, because the current deadline is nothing more than an agreed-upon date in a voluntary settlement agreement (not a court-ordered deadline), the EPA can renegotiate.[FN5] In fact, the Settlement Agreement expressly grants the EPA flexibility to extend the December 31st milestone and certainly does not limit or modify EPA's discretion to allow the public sufficient time to review and comment on the 92-segment Bay TMDL.[FN6] In our own experience, we are well aware that even consent orders and compliance schedules can be renegotiated to take into account changing circumstances as well as to best serve the goal of "getting it right" even if it takes some more time to do so.

The EPA should not short-circuit the interests and rights of all stakeholders and the public throughout the Bay watershed jurisdictions by refusing to extend the public comment period, especially when it has reserved unto itself the full authority to afford adequate time in the *Fowler Settlement Agreement* and especially under circumstances in which all documentation and calculations underlying the TMDL have not yet been made public.

[FN5] - *Fowler v. EPA Settlement Agreement*, Section IV.A. (p. 22): "The parties may modify any deadline or other term of this agreement in writing." See, <<http://www.cbf.org/Document.Doc?id=512>>, Civil Action No.: 1:09-CV-00005-CKK (D. D.C.).

[FN6] - *Fowler v. EPA Settlement Agreement*, Sections VI. A., D., & E. (pp. 24-25): provides that the Settlement Agreement does not limit or modify EPA's discretion under the APA, or require EPA to violate the APA, and allows EPA to delay deadlines under circumstances "outside the reasonable control of EPA" upon notice to the plaintiffs - without requiring plaintiffs' prior consent).

First off, is the fact that EPA has used the December 31, 2010 deadline for a TMDL to be finalized. In effect, EPA has taken an enormous project and said we work backward from this premise. We have never seen a project of this magnitude run that way.

EPA to this day, has continually "moved the target" as states have been trying to respond by developing their watershed implementation plans. Even now, some decisions are based on different model runs and model runs to come.

Response

Please see the response to comment 0061.1.001.008. EPA has not moved the target on the jurisdictions and has been working with

them in an open and transparent manner of the TMDL since 2005. EPA sent letters to the states defining what was needed in the WIPs on 9/11/2008, 11/4/2009 and 4/2/2010. The jurisdictions knew what EPA was expecting in an approvable WIP and they were provided their load allocation prior to the release of the TMDL.

EPA needs to realize that a project of this magnitude will take time and has to be done as cheaply as possible. Don't let the timelines get in the way of coming up with public policy that is acceptable to all. If you start losing the PR battle, spur litigation and alienate stakeholders you will not achieve what we understand is the basic goal of EPA, and that is to clean the bay.

EPA has indicated that the final TMDL will be in place by the end of 2010. However, the final model run may result in a change to the December pollutant loadings, thus making the final allocations numbers in the 2010 WIPs only provisional. EPA underestimates the "damage" caused by a final TMDL be trumped by yet another model run.

Response

Please see the responses to comments 0061.1.001.008, 0379.1.001.006 and 0238-cp.001.002

Organization: Carroll County Government, Maryland

Given these constraints, the adoption of the TMDL should not occur until a revised WIP (Phase 1 & 2) conveying the cost and loading expectations at the local level are presented. With the expectation, from both EPA and the State of

Maryland, that a significant level of effort will need to be accomplished via local governments, serious consideration should be given prior to TMDL adoption as to implementation capacity.

Response

The TMDL is developed to meet water quality standards. The revisions of Phase 1 and 2 WIPs do not impact the findings of the TMDL and the loads needed that will allow the Chesapeake Bay to meet water quality standards.

Comment ID 0200.1.001.004

Author Name: Devilbiss Thomas

Organization: Carroll County Government, Maryland

- First and foremost, we suggest that delaying the adoption of the TMDL until the completion of both the Phase 1 and Phase 2 WIPs. It will be difficult to determine feasibility without allocations for source sectors and to determine what options the local jurisdictions could commit to without cost and feasibility information. The ability of a local jurisdiction to even fund all of the measures should impact the timing or other relevant portions of the TMDL before it is officially adopted.

Response

Please see the response to comment 0062.1.001.004 in regards to withdrawing the TMDL and the response to comment 0200.1.001.003 in regards to the TMDL and adoption of the Phase 1 and 2 WIPs.

Will jurisdictions be given more time to adequately develop the final WIPS?

The length of time provided to the jurisdictions for the development of the Watershed Implementation Plans was wholly inadequate and inappropriate, given the level of detail needed by EPA to satisfy "reasonable assurance". The nutrient allocations were released from EPA on July 1, 2010 and the sediment allocation on August 13, 2010. This is significantly later than the scheduled 2007 release of Phase 5 of the model and corresponding allocations to the jurisdictions! Draft WIPs were due to EPA on September 1, 60 days after receiving the nutrient allocations. So while EPA was able to substantially miss their schedule by years, jurisdictions were not afforded any additional time. Additional time must be provided to the jurisdictions to complete their WIPs in order to adequately address issues and avoid the unachievable backstop provisions that EPA has placed in the draft TMDL.

Response

EPA is not providing additional time to the Bay jurisdictions for watershed implementation plan (WIP) development. On November 3, 2009, EPA sent a letter to the Principal's Staff Committee (PSC) documenting preliminary basinwide target loads for nitrogen and phosphorous, a link to this letter has been provided below. The November 3, 2009 letter specifically states "These working targets allow each of the jurisdictions to begin development of their Watershed Implementation Plans (Plans) and to move the Chesapeake Bay Total Maximum Daily Load (Bay TMDL) development forward." The letter goes on to state "In spite of likely future changes to the basinwide target loads, EPA considers the preliminary target loads – 200 million pounds per year of nitrogen and 15 million pounds per year of phosphorous – to be appropriate for the purpose of distributing these loads to the basin jurisdictions as working target loads to initiate the watershed implementation planning process in all six Bay waster states and the District." Lastly, EPA clearly stated in the November 3rd letter that "EPA expects the Bay watershed states and the district to immediately move forward to engage local partners on development of the Plans and local level/source target loads." Though the final loadings went down slightly, the level of effort to achieve the new allocations is near identical.

In addition to the statutory requirements that EPA develop a Bay-wide TMDL, EPA is also required to take this action pursuant to the consent decree in the Fowler case. In that case, EPA was sued for failing to comply with Section 117(g) and the Bay Agreements. *Fowler v. EPA*, Case No. 09-cv-00005-CKK, D. D.C., January 5, 2009. That matter was settled by agreement between the parties. The agreement provides that EPA will develop a Bay wide TMDL "[b]y December 31, 2010, pursuant to 33 U.S.C. §§ 1313(d) and 1267..." Settlement Agreement Section III.A.1. That agreement set forth a number of other deadlines for submission and completion of state watershed implementation plans. Thus, EPA is also required pursuant to the settlement agreement in Fowler to develop a Bay wide TMDL.

The May 12, 2009 Executive Order

On May 12, 2009, President Obama issued an Executive Order 1350813 concerning restoration and protection of the Chesapeake Bay. The Order directed seven agencies of the federal government to develop recommendations for restoring the Chesapeake Bay. With oversight from the EPA Administrator, those agencies were to develop a final strategy for Bay restoration and protection. On May 12, 2010, such a strategy was issued. One of the goals of the strategy was for EPA to develop a Bay wide TMDL by December 2010 with full implementation by 2025.¹⁴ The

proposed TMDL, and its finalization by December 31, 2010, will implement this important goal of the Executive Order and "restoration strategy."

Response

The completion date for the Bay TMDL of December 31, 2010 was requested by the states in June 2008 and agreed to by the Chesapeake Executive Council, which includes the Governors, the Mayor of the District of Columbia and the EPA Administrator.

Some might argue that EPA should wait to establish the Bay TMDL until all the WIPs are done, new agricultural information has been completed for the model (such as accounting for voluntary practices), etc. We emphatically disagree that EPA should delay in establishing the TMDL. This essential legal framework must be established now. As comparison of the 2003 allocations and 2010 draft TMDL has shown, the basic information is well known. Changes in the TMDL allocations which may be envisioned will only be marginal. Bay cleanup will only get harder and more expensive with delays.

Response

EPA has considered the comments but will not delay the Bay TMDL.

Comment ID 0230.1.001.012

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

Before turning to these deficiencies, first we are compelled to point out the severe lack of a meaningful opportunity for public review and comment on these complex regulatory proposals. The development of the Bay models has required thousands of hours of time from dozens of EPA staff over many years. However, EPA has not provided an opportunity for the public to understand how the models work and the implications of changes to the input data sets for model results. These results define the allocations that EPA has proposed in the TMDL. Therefore, although the model is being used as far more than a "tool" and is essentially being used to define scope and extent of the TMDL requirements, it very much represents a "black box" that frustrates opportunities for meaningful public review and comment. Furthermore, VAMWA has made requests for information to better understand specific issues of interest in the models, but EPA has not responded to those requests. Against this background of complexity, EPA has only given the public 45 days to comment on what is arguably the most complex TMDL ever developed in the nation. We believe that the lack of transparency in combination with a limited review period fails to comply with both the spirit and the letter

of the Administrative Procedure Act.

Response

Please see the response to comment 0060.1.001.006. Also, please note that VAMWA has been participating in many of the Chesapeake Bay Program's workgroups since 2000.

We fear that implementing absurdly rigorous requirements will backfire, reducing public support of the Chesapeake Bay clean up movement. The EPA is choosing a highly political, rushed, enormous program. The bay would be better served if program development slowed down so that accurate input data, more independent scientific verification, phased implementation, and cost benefit analyses could be included.

We understand that efforts to clean the bay must be strengthened. We understand that restoring the Chesapeake Bay will improve our lives, our City and the region. The question is not whether the Bay should be restored, but how. We urge you to slow the process down, consider the feasibility of meeting requirements on a local level, and try to anticipate any unintended consequences that might result from this program. From the outside looking in, it appears that there is too much emphasis on meeting arbitrary deadlines, and not enough on scrutinizing technical details. The Chesapeake Bay, the millions of people living in its watershed, and our economic future depend on this program succeeding. It must be developed and implemented more thoughtfully.

The Chesapeake Bay TMDL program is too fast-paced to allow public comments to be made and considered in program development. As discussed in the Hampton Roads Planning District Commission comments, the 45-day public comment period is too short. It does not provide the public adequate time to analyze and comment on such a vast, complicated program.

The comment schedule also places too little time between public comment and TMDL publication deadlines. There is not sufficient time for the EPA to both review state strategies and adequately address the anticipated volume of public comments. There are only 57 calendar and 37 business days between the public comment deadline and final TMDL publication. There are only 32 calendar and 22 working days between Virginia Phase I WIP finalization and TMDL publication. Valid comments will not be given their due consideration in the interest of meeting a deadline.

If EPA is truly committed to an adaptive management approach to the TMDLs, it would adopt them based upon the allocations in the Tributary Strategies and then update the TMDLs when the Phase 5.3 CBWM is fully transparent, developed and calibrated to within an acceptable margin of uncertainty. No time would be lost if EPA's accountability framework remains in place to ensure that progress toward achieving the Tributary Strategy allocations continues while work on the Phase 5.3 CBWM and model inputs are underway. In fact, the approach we recommend likely would achieve our mutual water quality goals for the Bay more efficiently, cost-effectively, and quickly by fostering the federal, state, and local partnership that is so critical to an undertaking of this magnitude. EPA's slavish adherence to an artificial deadline for establishing the TMDLs and its heavy-handed and opaque approach to date serves only to undermine that partnership and create distrust and resistance on the part of those who will bear the burden.

we think that EPA has unnecessarily complicated the task by mandating a Dec. 31, 2010, deadline for issuing the TMDL, rather than taking full advantage of the later court-mandated deadline of May 2011. This aggressive schedule has also created problems for the states with the required schedule for development of their respective WIPs. VDOT requests that the EPA follow a more reasonable timetable for both the WIPs being developed by the states and the TMDL development. VDOT is concerned that the current schedule does not provide the time to accurately evaluate and model conditions in the stream sheds/Bay, to compile the necessary data, to develop detailed action plans, or to understand the cost implications to the regulated community. The compressed schedule has certainly contributed to the

deficiencies identified by EPA with all the draft WIPs developed by the states and especially to the failure in all WIPs to satisfy the reasonable assurance requirement. In striving to meet the interim deadlines, EPA has limited opportunities for stakeholders to understand the technical basis and policy choices on which the target allocations are based. Stakeholders should have several months, at a minimum, to understand the issues involved, to comment on the draft WIP and draft TMDL, and to assess the potential impacts. The proposed 45-day comment period is inadequate for stakeholders to provide informed comments and for EPA and the states to adequately address substantive comments. Therefore, VDOT respectfully requests that EPA evaluate the comments on the draft TMDL, reissue a revised draft TMDL in response to public comment, and allow another 45 day public comment period on the draft TMDL prior to the publication of the final TMDL.

As noted earlier, the compressed preparation period has led to a lack of detailed plans in the Virginia WIP, which has made it impossible for VDOT to evaluate the cost implications of meeting the draft TMDL and WIP requirements.

The ability to provide meaningful input is also hampered by the sheer scale and complexity of this TMDL and WIP process. For instance, in Virginia alone there are expected to be about 100 aggregated WLAs allocated by the TMDL among MS4 permittees. An additional complicating factor is the fact that the TMDLs and WLAs are issued by EPA, while the WIPs are issued by the state. Submitting TMDL comments to EPA and WIP comments to the state creates an artificial distinction between what are, essentially, inter-related issues. These complexities and limited time for review make it very challenging to provide meaningful input and provide recommendations that address the concerns of all stakeholders.

The EPA should give immediate consideration to the above issues and delay implementation of the TMDL allocations until such time as all parties can be assured of the true costs of these requirements.

Response

The Clean Water Act (CWA) Section 303(d) requires TMDLs to be established for impaired or threatened waters at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety. Federal regulations at 40 CFR Section 130.7(c) track the statute and require TMDLs to be developed at levels necessary to attain and maintain the applicable narrative and numerical water quality standard with seasonal variations and a margin of safety and that take into account critical conditions. TMDLs are to include wasteload allocations for each point source and load allocations for nonpoint sources. Neither the CWA nor EPA's implementing regulations require the state or EPA to consider the costs to implement the TMDL when establishing the TMDL at a level necessary to implement the applicable water quality standards

The proposed timeline for establishing the final TMDL (by December 31, 2010) does not allow sufficient time for EPA to develop equitable allocations or for the states to prepare realistic Watershed Implementation Plans to meet those allocations. New York's Local Pilot Project (for which STCRPDB is the local partner) has not yet resulted in any recommendations concerning the achievability and cost-effectiveness of the proposed scenarios that are being evaluated. These analyses were intended to inform the development of New York's Draft WIP, which was submitted on September 1. Technical support to the states has also been delayed. Additional time and guidance are needed to develop a TMDL and state WIPs that are equitable and achievable.

Organization: Baltimore County

The draft Phase II WIP is scheduled to be submitted to EPA by June 1, 2011. This time frame is too short to be able to compile a Watershed Implementation Plan given the number of stakeholders involved at the local level. The time frame for the draft submittal should be extended to September 1, 2011 with the final in place by December 31, 2011.

Response

The Bay jurisdictions voiced their concerns with the Phase II watershed implementation plan (WIP) timeline to the EPA at the October 2010 Principal's Staff Committee (PSC) Meeting. Shawn Garvin, the EPA Region III Regional Administrator informed the jurisdictions of his willingness to hear their concerns and discuss their options in January 2011 after the finalization of the Chesapeake Bay TMDL and Phase I WIPs.

Organization: City of Virginia Beach, Virginia

II. EPA HAS FAILED TO PROVIDE THE CITY OF VIRGINIA BEACH, VIRGINIA WITH SUFFICIENT TIME TO REVIEW, EVALUATE, AND COMMENT ON THE DRAFT TMDLs

Despite the enormous size and complexity of the TMDL documents released on September 24, 2010 the grave socio-economic consequences of the proposed allocations, and the arbitrary nature of EPA's decision to establish the TMDLs by Dec 31, 2010, when it could have given the public additional time to comment had it simply observed the May 2011 deadline in the consent decree, the City has not have sufficient time to adequately review and respond to the TMDLs in detail. Forty five days is certainly not adequate to assemble all of the information necessary to respond to the TMDLs. Further, the City will defend vigorously any claim of waiver due to failure to submit comments on the TMDLs on the basis that insufficient time was given to adequately respond.

Response

Please see the response to comment 0060.1.001.001. EPA is working diligently to review and respond to all comments and modify

the TMDL as necessary based on the public comments and EPA's responses. EPA's review process insured that comments requiring modification of the TMDL would be identified early in order to make the necessary changes were made if needed.

Comment ID 0331.1.001.023

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

If EPA is truly committed to an adaptive management approach to the TMDLs, it would adopt them based upon the allocations in the Tributary Strategies and then update the TMDLs when the Phase 5.3 CBWM is fully transparent, developed and calibrated to within an acceptable margin of uncertainty. No time would be lost if EPA's accountability framework remains in place to ensure that progress toward achieving the Tributary Strategy allocations continues while work on the Phase 5.3 CBWM and model inputs are underway. In fact, the approach the City recommends likely would achieve our mutual water quality goals for the Bay more efficiently, cost-effectively, and quickly by fostering the federal, state, and local partnership that is so critical to an undertaking of this magnitude. EPA's inexplicable adherence to an artificial deadline for establishing the TMDLs and its deeply-flawed approach to date serves only to undermine that partnership and instead cause significant hardship to the City of Virginia Beach and its citizens, who will ultimately be forced to bear the burden of compliance.

The EPA, however, set unrealistic deadlines for establishing the TMDL. Even though the EPA itself was unable to keep to the schedule, it insisted that Virginia and the other Bay states do so. Public comment was limited to a scant 45 days. It was not until July 1 that EPA produced the draft allocation numbers for nitrogen and phosphorus and not until August 15 that EPA produced a draft allocation for sediment. First drafts of the Virginia WIP were due September 1! Thus, Virginia was given two weeks to devise a sophisticated solution for a complex problem that has been more than 400 years in the making.

Organization: Virginia Manufacturers Association VMA

Virginia's regulatory programs, reviewed and approved by EPA, establish nutrient and corresponding sediment allocations that will achieve significant additional reductions in nutrient and sediment loadings to the Bay watershed. Industrial point sources have made significant investments based on these regulatory expectations. EPA has now threatened to turn the Virginia program on its head, proposing drastically different allocations and expectations, and it has done so through an expedited regulatory process that does not allow sufficient time to address fundamental technical and modeling concerns.

EPA acknowledges that the model is continuing to evolve, that there are technical errors to be corrected, and that the model results do not always accurately predict on-the-ground results. Yet the expedited process EPA has established does not allow time to address those deficiencies and concerns.

Response

In 1997, EPA conducted a year long evaluation to assess the progress that has been made toward reduction of nitrogen and phosphorus delivered to the Bay. The evaluation noted that wastewater discharges reduced their loads by 51% and implementation of nutrient best management practices from nonpoint sources loadings of nitrogen and phosphorus reduced loadings by 7 and 9 percent, respectively. EPA and the seven impacted jurisdiction again reevaluated the nutrient and sediment reductions in 2007. The reevaluation found that sufficient progress had not been made toward improving water quality in the Chesapeake Bay and its tidal tributaries and that nutrients and sediment remained a source of significant impairment for the Bay.

After decades of regulatory and management initiatives to address the nutrient and sediment discharges, the Bay remains impaired. As required by Section 303(d) of the CWA and its implementing regulations, EPA is establishing this TMDL to address the impaired Chesapeake Bay and its tributaries. Section 1.2 of the final TMDL document provides a detailed description of the many activities and actions that have preceded this TMDL.

While EPA recognizes Virginia's past regulatory programs, EPA believes that for the Bay to reach an unimpaired state, a more comprehensive plan with a clear target must be applied. This TMDL with its accountability framework lays the foundation for achieving water quality standards within the Bay. Please see the responses to comments 0060.1.001.001 and 0062.1.001.004 regarding the comment period and TMDL development deadline. Please refer to response to comment 0379.1.001.006 with regards to comments regarding the Bay models.

4. Process, Timetable and Public Comment - The Pennsylvania Department of Environmental Protection has made an effort at soliciting the feedback and assistance from stakeholder such as ourselves throughout the development of the WIP. As a stakeholder, we feel that the timetable established by EPA has been overly ambitious and its accelerated nature has been an unnecessarily detriment to the development of Pennsylvania's WIP, resulting in needless conflict as it relates to EPA's evaluation of Pennsylvania's WIP deficiencies and threats of backstop allocations. We feel that EPA has failed to appreciate the budget constraints being experienced by states during this WIP development process. We found the delays in EPA providing state's with the final draft sediment load allocations to be detrimental to the development of the WIP. We also find lack of information on the specifics of the Bay model an obstacle for stakeholders and the public when providing comment on the TMDL and state WIP. We would ask that EPA revise ease its timetable through the remainder of the process to support the development a better product.

Response

B. EPA Delayed Any Decision With Respect To Upstream Reductions in Approving the LI Sound TMDL.

Not only did EPA not require the upstream states to participate in the LI Sound TMDL, it approved a rather unspecified process that might, but not necessarily result in, the delayed participation of the upstream states. The LI Sound TMDL approved by EPA delayed even consideration of any upstream reductions until a planned "TMDL revision scheduled for 2003," the intent of which was to "describe a framework for managing these upstream sources and a schedule for implementing Phase IV nitrogen reduction actions." LI Sound TMDL at 46; see also id. at 33 ("Because New York and Connecticut cannot enforce nitrogen reductions from point and atmospheric sources in other states ..., EPA will need to take the lead on future interstate WLNLA needs."). Indeed, as of the filing of these comments, studies with respect to upstream reductions are continuing, but no TMDL revisions have yet been issued. See, e.g., EPA, "Total Maximum Daily Loads at Work in Connecticut & New York: Restoring the Long Island Sound While Saving Money, Lessons in Innovation and Collaboration," at 4 (Dec. 2009) (discussion of efforts to better define nitrogen sources and loads in the Upper Connecticut River Basin).[FN11] Thus, as things stand today, the upstream states have been allowed a nine-year delay in participating in the LI Sound TMDL. By contrast, EPA is not affording New York any additional time here.

[FN11] Found at http://www.epa.gov/owow/tmdl/tmdlsatwork/pdti/long_island_technical.pdf.

Response

The process and procedures used in the Long island Sound TMDL are not relevant to the Chesapeake Bay TMDL. Each TMDL is unique to its watershed, stakeholders, sources and point in time during the establishment of that TMDL. In order for the Chesapeake Bay to meet water quality standards, EPA can not accept an “unspecified process that might, but not necessarily result in, the delayed participation of the upstream states” as the commenter proposes. EPA has been working with all jurisdictions to develop the Chesapeake Bay TMDL since 2005. EPA has provided NY adequate time. Please refer to response to comment 0267.1.001.006 with regards to why upstream States need to comply with the TMDL.

The TMDL Implementation Deadline is Unfair to NY

Despite the time differences on when each state entered the Bay restoration effort all states now have same 2025 deadline to complete implementation of the proposed TMDL. EPA requiring the same implementation deadline of all states unfairly gives the Bay states 40+yrs for implementation and the headwater states, like New York, only 25 years.

Response

Since the initiation of the Bay TMDL all of the watershed jurisdictions have been working to meet the same achievement dates. Please see the response to comment 0080-cp.001.002.

Timeline - EPA did not honor deadlines to states yet held the states to strict and unworkable time frames. EPA did not deliver nutrient cap loads to states until July 1, 2010 and sediment allocations until August 13 2010, yet states were still required to submit draft WIPs by September 1, 2010. This did not allow adequate time to run scenarios through the model or to develop a sound implementation plan. In addition, in the haste to work with states to run scenarios, errors were often made by EPA causing additional delays for the states. Miscalculations and misunderstandings about how BMPs should be represented were an ongoing challenge between EPA and West Virginia that could have been avoided had more time been available. We are currently in the 9th hour without a successful scenario model run and have limited ability to modify our WIP.

Author Name: Salada Ian

Organization: Penn State University

1. The TMDL lists backstop allocations imposed by EPA because the jurisdictions WIP did not provide sufficient assurance that programs would be implemented to achieve the necessary pollution load reductions. The jurisdictions have until November 29, 2010 to re-submit a WIP that meets EPA criteria. Based on this, the final TMDL (due to be issued December 31, 2010) may or may not be the backstop values or values set by the WIP. Therefore, we think that it is counterproductive to expect the public to comment on a TMDL by November 8, 2010 that may or may not be the indicated backstop values. A time extension for comments should be granted to give the public opportunity to comments on the final TMDL.

Response

During the public comment period, EPA provided for the public both the Backstop allocations if the State WIPs did not meet EPA's criteria and allocations if the WIP's were acceptable. Commenters had the opportunity comment on both sets of allocations. Please refer to Section 8 of the final TMDL for information regarding EPA's final evaluation of the WIPs. EPA has reconsidered its approach to backstop allocations as proposed in the draft TMDL. This is in large part due to the improved final state WIPs and informative comments on the issue. The final TMDL places much greater emphasis on state WIPs and less emphasis on backstops in deriving the loading allocations for all sectors.

Organization: Virginia Dept. of Agriculture and Consumer Services

The draft Chesapeake Bay TMDL that the U.S. Environmental Protection Agency (EPA) has presented for public comment covers an extremely complex and critical initiative that will have long-term implications for Virginia's environment, its agricultural and forest producers, its agribusinesses, its other industries, its state and local governments, and its citizens. Such an initiative deserves careful review, assessment, and explanation by all parties. However, this was not possible due to the time frames set forth to develop the TMDL and the Watershed Implementation Plans. Although the urgency of the restoration of the Chesapeake Bay is shared by all, careful consideration and additional research is needed. If the Chesapeake Bay TMDL will serve as a model for future watershed restorations, it is imperative that this process not be hastily attempted.

Schedule Is Inadequate

There is not sufficient time in the schedule to consider public comment and then to revise the TMDL. EPA's schedule appears to be an effort to avoid significant consideration of public comment as much as to meet a court ordered deadline. The impact of the TMDL will be felt for decades and will cost billions of dollars. The schedule is not considerate of the weight of the issues presented in the EPA TMDL.

Due to the significant number of comments expected on EPA's controversial draft TMDL and the current schedule requiring the TMDL to be finalized by the end of the year, it would be impossible for EPA to seriously consider the comments submitted, thus making the public comment period a mere exercise to an EPA predetermined request (i.e., a sham). Additional time needs to be provided for EPA to be able to evaluate and respond to public comments. As EPA has done in numerous other instances, where a court-imposed deadline does not provide adequate time, additional time should be requested from the court. Only then can EPA seriously evaluate comments from the public.

Response

Please see the responses to comments 0060.1.001.001 and 0062.1.001.004.

Comment ID 0430-cp.001.001

Author Name: Owens James

Organization: Hampton Roads Association for Commercial Real Estate

The EPA should delay adoption of the TMDL and backstops for at least one year and until no sooner than December 31, 2011 for the following reasons:

- The regulatory development process EPA has used for the TMDL has been too rushed. EPA set unreasonable deadlines and provided inadequate opportunity for comment both from the public and from the states. It is wrong for EPA to fail to establish a reasonable adoption process for this federal program that will cost Virginia residents, businesses and local and state governments billions of dollars. It is illegal for EPA to claim it had to do this because it settled a lawsuit to which Virginia was not even a party.

Comment ID 0431.1.001.007

Author Name: Tolbert James

Organization: City of Charlottesville, Virginia

It is obvious that the Chesapeake Bay TMDL modeling effort and TMDL development process has taken longer than anticipated. It is inappropriate to rush the details of such an important endeavor to meet the December 31, 2010 deadline. More time is needed to discuss the details of the Bay TMDL, understand the cost ramifications, evaluate funding options, and coordinate with Virginia on its WIP before this program is finalized. "We understand that the Draft TMDL is materially flawed as a technical matter. Serious computer modeling deficiencies have been documented."

Response

Please see the responses to comments 0060.1.001.001 and 0062.1.001.004. Please refer to response to comment 0379.1.001.006 regarding comments relevant to the model.

Comment ID 0432.1.001.003

Author Name: William Neilson John Bell and

Organization: Pennsylvania Farm Bureau

The time frame used by DEP in the development and finalization of these standards has been longer than the arbitrarily accelerated period in which EPA has attempted to impose on Bay states in development of state WIPs. But the stakeholders in this process properly recognized that getting the final product done "right" was more important and more environmentally effective than completing the work under an artificial deadline.

The authoritarian manner that EPA has pursued so far to accomplish nutrient and sediment pollution reduction is counterproductive to the environmental goals that EPA wants to achieve. We in the regulated community also want to achieve these goals in as timely fashion as reasonably possible. And we recognize that in order to do so, there needs to be greater and more concentrated effort among stakeholders to develop and commit resources in implementing effective plans to improve water quality in the Bay. But these goals should not be achieved by economically decimating local communities and mass exodus of farm families from their farms.

Response

EPA considers the actions taken by PADEP, such as the promulgation of standards for erosion and sedimentation control and possible new standards for the application of manure, as some of the many activities needed to implement the TMDL. All sources of nutrient and sediment loads to the Bay must do their part in achieving load reductions to the Bay. EPA has evaluated each State's WIP and has reconsidered its approach to backstop allocations as proposed in the draft TMDL. This is in large part due to the improved final state WIPs and informative comments on the issue. The final TMDL places much greater emphasis on state WIPs and less emphasis on backstops in deriving the loading allocations for all sectors. Please refer to Section 8 of the final TMDL for information regarding EPA's final evaluation of the WIPs.

Comment ID 0432.1.001.007

Author Name: William Neilson John Bell and

Organization: Pennsylvania Farm Bureau

1. The period for development of Pennsylvania's WIP was drastically too short.

Recent actions and communications by EPA have strongly suggested that Bay states must develop WIPs that fully meet EPA's expectations by the Phase 2 deadline, or face immediate federal sanctions. Essentially, states were given a period of less than six months to devise Phase 1 WIPs, and are given until November 1 of next year to both "correct deficiencies" in the Phase 1 WIPs and devise a more detailed WIP that identifies pollution reduction activities and actions that each local area of the state will be performing.

Even with optimum knowledge, personnel and technical resources, completion of a viable and acceptable plan to

transform prevailing values and practices in pollution control within the area of the size of the Pennsylvania Bay watershed is a daunting task. So far, states have been provided far less positive and constructive support from EPA to complete this task within the time frame EPA established.

EPA's deadlines for completion of work by states have been extremely unreasonable and inflexible, and strongly discourage the type of interaction that is needed for development of plans that are both environmentally sound and workable and suitable to those individuals who may be affected. Unfortunately, EPA has viewed the finalization and implementation of WIPs as rigid and static. Yet changes in conditions, finances and technology may reasonably direct a state to make adjustments in plans. The process of development and implementation of activities under WIPs should be a dynamic and continuous one that allows states to make adjustments when pollution reduction can be achieved in a more efficient and less onerous way.

Response

Please see the responses to comments 0060.1.001.001, 062.1.001.004 and 0067.1.001.020. Please refer to Section 8 of the final TMDL regarding EPA's evaluation of the WIPs.

Comment ID 0432.1.001.020

Author Name: William Neilson John Bell and

Organization: Pennsylvania Farm Bureau

We have stated numerous times at public meetings held pursuant to Pennsylvania's WIP that the process of developing a workable and effective plan is a trial-and-error process. Basic common sense should cause EPA officials to realize it is hardly possible to develop a perfect and fully guaranteed plan to correct pollution ills of the Chesapeake within the timeframe EPA has imposed upon states in finalizing their WIPs. Sufficient time needs to be provided to analyze ideas that are proposed and to correct or provide more detailed information in response to perceived errors and deficiencies.

Response

EPA agrees with the commenter that the states can amend their future watershed implementation plans based on the experiences of previous WIPs and changing conditions of new technology and data.

Comment ID 0434.1.001.002

Author Name: Pryor Wayne

Organization: Virginia Farm Bureau Federation

Moreover, the process established by EPA allows Virginia less than 3 weeks to review and address the comments it receives before submitting a revised WIP to EPA. Such an accelerated schedule is unfair, particularly because the full

record of EPA's decision-making has not been provided to the public for review and because EPA has conceded errors in the model that will not be addressed until after the public comment period closes.

Response

C. EPA Cannot Demand Development of an Implementation Plan Before a TMDL is Established.

Through this process, EPA has demanded that Virginia develop its WIP even before a final TMDL has been established. This does not make any sense. The TMDL process is designed to establish the necessary allocations between various sources. The implementation planning process then determines the actions - both regulatory and non-regulatory - needed to achieve those allocations. EPA's requirement that Virginia develop its WIP even before the TMDL has been established is backwards and undermines the adaptive management framework envisioned by Virginia and the regulatory framework.

EPA has signaled its support for adaptive management in the TMDL process, especially with respect to future course corrections in EPA's new "accountability" framework. However, EPA has not gone far enough to embed adaptive management principles into the TMDL allocations, assumptions or requirements for the Bay. Given the size and complexity of this TMDL, it is vital that EPA acknowledge the inherent limitations in its ability to predict with confidence the reductions that are needed to restore the Bay or the effect of EPA's proposed reductions on the Bay restoration goals.

Rather than fight over issues of precision now - a fight that tends to polarize positions and divide stakeholders who otherwise might agree to work together in a cooperative manner - EPA should take a phased and adaptive approach, first identifying the immediate, near-term reductions for which Virginia has already established a regulatory framework and for which there is general consensus, and then project future phases based on additional data collection and modeling refinements. The process EPA is requiring here is not a step-wise approach, but rather an amalgam of steps (TMDL development and implementation plan together) that will only lead to controversy and confusion.

Comment ID 0435.1.001.004

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

Insufficient Time

Public Comment Period Time Frame Comment:

Understanding this is a priority at the highest level of the Executive Branch, the EPA has established a self-imposed restricted timeline for both the TMDL and Phase I Watershed Implementation Plan (WIP) development process. The EPA has mandated that the Final TMDL will be issued by December 31, 2010. The EPA released the Draft TMDL on September 24, 2010 with public comments due to EPA no later than November 8, 2010. This 45-day public comment period is an inadequate amount of time for review of this sophisticated complex document.

Simultaneously, the Commonwealth of Virginia, required by the EPA, also released a Draft WIP, for EPA and the public to review; also due not later than November 8, 2010. The EPA then required the Commonwealth to revise the WIP to incorporate any comments from both the public and EPA and to submit a Final WIP to them no later than November 29, 2010.

Because of the compressed schedule, self-imposed by the EPA, the Commonwealth of Virginia will have only three weeks to incorporate public comments into the Final WIP. Furthermore, the EPA will have only seven weeks to address and incorporate public comments from seven jurisdictions.

Response

Please see the responses to comments 0060.1.001.001 and 0062.1.001.004.

Comment ID 0435.1.001.006

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

The City recommends that the EPA modify the time line for the Final TMDL and WIP development to extend into May 2011. This additional time would allow for modifications to be made to the Bay Model and to allow for proper public comment review for both the TMDL and WIP.

A noted comment by the EPA on the Virginia WIP is lack of detail and commitment on program implementation. By extending the dead line for the Final TMDL and WIP into May 2011, it would allow the General Assembly for the Commonwealth of Virginia to begin approval of storm water legislation, providing the necessary commitment as outlined in the state WIP.

Comment ID 0440.1.001.013

Author Name: Land Larry

Organization: Virginia Association of Counties (VACo)

The schedule of deadlines under the Chesapeake Bay TMDL program appears arbitrary. Many policy decisions sought by EPA require legislative actions that can only be taken after the December 31, 2010 deadline for the Phase 1 TMDL to be issued. When developing its schedules and deadlines for certain tasks to be achieved, there appeared to be no consideration by EPA of each state's respective legislative or budgetary cycle. Another problem with EPA's schedule is that it has left little time for states to make thoughtful approaches in the development of nutrient credit exchange programs applicable to non point sources.

Response

EPA does not expect legislative actions or policy decisions affecting programs such as nutrient credit trading to occur prior to the establishment of the TMDL or the State WIPs. Please refer to section 8 of the final TMDL regarding EPA's response to State WIPs. Please see the response to comment 0062.1.001.004.

Comment ID 0440.1.001.015

Organization: Virginia Association of Counties (VACo)

6.) Phase 2 TMDL - not nearly enough time provided when considering the complexity of the task.

The March 10 issue of the Chesapeake Bay Journal had this description of the Phase II WIP process:

"(The Phase II WIP) will set nutrient and sediment goals to more local levels, probably counties. The goal is to make the nutrient and sediment goals more "real" for local governments, agencies and conservation districts that will actually need to take most of the actions. The local allocations are also intended to improve accountability, and the ability to track nutrient and sediment control actions."

VACo has already expressed many concerns over the time frame for developing and issuing the Chesapeake Bay TMDL. A deadline of November 1, 2011 for states to submit to EPA the locality-specific Phase II WIP is highly unrealistic.

Recommendation: VACo's first preference is that the November 1, 2011, deadline be extended. If extension of the deadline is not an option, EPA needs to be extremely flexible in its enforcement of the deadline for states to submit the Phase II WIP. Over the past year, many local governments have reduced their staffs due to serious revenue shortfalls.

Response

Comment ID 0442.1.001.004

Author Name: Drzyzgula Cathy

Organization: Metropolitan Washington Council of Governments (COG)

3. EPA and States Must Address Time Constraints

EPA and the states have set several deadlines for the implementation of practices to achieve TMDL allocations without consulting with local governments (60 percent of all needed implementation by 2017 -- or 70 percent in the case of Maryland -- and 100 percent of implementation by 2025 - or by 2020 in Maryland.) These deadlines do not take into account the amount of time local governments will need to put into place the level of practices that the TMDLs/WIPs propose. Local governments will need to develop local implementation plans, determine budget needs, pass new ordinances, and potentially raise new funds before they can even begin to design and build new projects. Design and construction schedules also will be subject to various scheduling constraints.

Recommendation #3: Do Not Mandate Specific Retrofit Levels in the TMDL or the Phase I WIPs

Neither the TMDL nor the state Phase I WIP documents should include reference to a specific level of stormwater retrofit for either MS4 or non-MS4 urban areas. (See recommendation #7 for more detail.)

Response

Please see the responses to comments 0265.1.001.005 and 0265.1.001.017.

Comment ID 0442.1.001.006

Author Name: Drzyzgula Cathy

Organization: Metropolitan Washington Council of Governments (COG)

5. EPA Should Change the Deadline for Completion of Phase II WIPs

Although EPA's current schedule calls for states to develop and submit Phase II WIPs by June 1, 2011, most local governments have barely begun to assess implementation options because the draft Phase I WIPs only allocate to the state or major basin level and it is not clear what practices or levels of reduction will be needed at the local level. It is also uncertain the degree to which such sub-allocations will be deemed 'enforceable' (ref. recent EPA presentation to PSC), and hence what level of controls are mandated. Planning has also been held up by delays in providing final load estimates from the Bay Program's Watershed Model (WSM) (ref. Section 5.8 Phase 5 Chesapeake Bay WSM). There also needs to be sufficient time to address the inconsistencies between the TMDL and Phase I WIP assumptions.

The Anne Arundel County Pilot WIP has demonstrated the complexities of assigning allocations and hence responsibility and defining accountability when there is a complex mix of federal, state, local and private entities. When this is coupled with uncertainties about the availability of the WSM to define local loads, it is unrealistic to expect credible Phase II WIPs to be prepared by the current June 1, 2011 due date. Further, the states will be facing a significant challenge in the critical task of effectively engaging local stakeholders who will be affected by the Phase II WIPs. This, too, will be problematic given the current timeline. (ref. Section 7. Reasonable Assurance & Accountability Framework, Section 10. TMDL Implementation & Adaptive Management & 10.3 Future Modifications to the Chesapeake Bay TMDL).

Example:

COG itself, as well as its member governments, has access to Phase 5.3 WSM output to assist in planning efforts. However, this output is of limited value given the reality that urban land use and load estimates will change, probably significantly, once the Bay Program completes its WSM upgrade. EPA originally promised that final watershed model data for use in the TMDLs would be available in late 2009; the latest information from EPA staff is that the new version of the WSM will not be available until sometime in early 2011.

Recommendation #5: Extension of the Phase II WIP Due Date

We request that the due date for the draft Phase II WIPs be changed to December 30, 2011, and the due date for the final Phase II WIP be changed to June 30, 2012. Doing so would allow time for stakeholders to become familiar with the revised watershed model and for the various parties to complete the studies of cost effectiveness, cost feasibility and physical feasibility that we are recommending. In the meantime, local government implementation actions, such as construction of enhanced nutrient removal facilities at wastewater plants, would continue. This expanded time frame will also allow for greater public participation at the local level which will be particularly important with the more localized load reduction targets.

Comment ID 0444.1.001.010

Author Name: Allen Paul

Organization: Constellation Energy

Although Constellation strongly supports efforts to improve water quality in the Chesapeake as well as the concept of a regional TMDL for the Bay, we are concerned that in various respects the Draft TMDL has exceeded the jurisdictional

bounds of the CWA as written. Such overstepping may compromise smooth progress toward a final TMDL that facilitates actual Bay restoration, a goal that all stakeholders desire.. For the reasons set forth above, it is respectfully suggested that EPA withdraw the Draft TMDL to allow sufficient time for the model updates to be completed. EPA should then solicit public comment on the model (complete with all supporting documentation) while providing enough time for stakeholders to perform thoughtful and insightful analysis on the data. In the interim, EPA should work with the states to continue their water quality improvement efforts. Once the model is updated and reviewed, its accuracy being then most assured, EPA should work with the states and District of Columbia to set TMDL's within the current legal bounds and regulatory framework of the CWA or otherwise seek legislative changes to secure proper legal authority to enact all aspects of the current Draft TMDL.

Response

Please see responses to comments 0060.1.001.001 and 0062.1.001.004. With regards to the model, please refer to 0379.1.001.006.

- Unreasonable timeline and rushed process do not make good policy.

The EPA is proposing major policy and regulations that impact a substantial swath of the mid Atlantic states. Decisions of this magnitude must be done properly. The process that EPA has used for the TMDL has simply been too rushed for something of this importance and enormity. From the beginning, unreasonable deadlines were set and inadequate opportunity was provided for public comment from property owners, industry and government. If approved, the implementation schedule for the changes proposed by EPA does not establish a reasonable adoption process. And, most importantly, the EPA has mandated a federal program which will result in billions of dollars in costs being imposed upon Virginia residents, businesses and local and state governments. Adding insult to injury, the EPA is expecting the citizens of the Commonwealth of Virginia to bear the burden of the costs of the outcome of a lawsuit that was brought against the EPA.

Some might argue that EPA should wait to establish the Bay TMDL until all the WIPs are done, new agricultural information has been completed for the model (such as accounting for voluntary practices), etc. We emphatically disagree that EPA should delay in establishing the TMDL. This essential legal framework must be established now. As comparison of the 2003 allocations and 2010 draft TMDL has shown, the basic information is well known. Changes in the TMDL allocations which may be envisioned will only be marginal. Bay cleanup will only get harder and more expensive with delays.

Response

EPA is committed to the development of the TMDL by December 21, 2010.

Comment ID 0510.1.001.005

Author Name: Haterius Stephen

EPA has failed to provide meaningful public review of the Draft TMDL. The Draft TMDL does not provide the public with information on the assumptions that have been made in the modeled scenarios that led to the TMDL allocations. Thus, EPA has not provided sufficient information for the public to provide meaningful comments under either the Administrative Procedures Act (APA) or the CWA. By not releasing this information, EPA also has made it difficult for policy-makers and the public to understand to what extent the Draft TMDL will have substantial and widespread economic and social impact, foreclosing a meaningful dialogue about the costs, benefits, and trade-offs among various policy choices.

Response

Please see the response to comment 0060.1.001.001.

Comment ID 0510.1.001.009

Author Name: Haterius Stephen

Organization: National Association of State Departments of Agriculture (NASDA)

By turning the TMDL program on its head and requiring implementation plans before the TMDL is issued, EPA is using that information to incorporate implementation measures into the Draft TMDL, even though implementation measures are not lawfully part of a TMDL. Thus, the TMDL that EPA made available for review on September 24, 2010, consists not only of wasteload and load allocations, but also consists of detailed implementation instructions directed at the watershed jurisdictions.

Response

Please refer to response to comment 0067.1.001.009 and Section 8 of the TMDL regarding EPA's evaluation of the WIPs.

Organization: Maryland Grain Producers Association (MGPA)

The task is overwhelming for EPA, the states, the local jurisdictions and the many sectors that will be required to make significant changes to their current operations. The allocations that make up the Draft TMDL are based on the 5.3 version of the Chesapeake Bay watershed model that has only been functional since June 2010. Parts of this model update were made available for public review on June 2, 2010. The target loadings for phosphorus and sediment were provided to the states on July 1, 2010. The target loadings for sediment were made available to watershed jurisdictions on August 13, 2010. EPA then demanded that watershed jurisdictions submit implementation plans based on these inaccurate loadings by September 1, 2010, allowing 62 days to develop plans for nutrients and only 19 days to develop plans for sediments, to implement what EPA acknowledges is the largest and most complex TMDL ever attempted. The timetable provided to the states is absurd.

Response

Regarding comments directed at the TMDL schedule, please see the response to comments 0067.1.001.020 and 0062.1.001.004. Regarding comments directed at the TMDL models, please see the response to comments 0379.1.001.006.

If the goals of EPA is to clean up the Chesapeake Bay, we believe that your potential to succeed will improve if the process is slowed and states are given more time to produce meaningful programs with input from all impacted sectors.

Response

EPA and the states have been working to address the water quality impairment on the Chesapeake Bay since the mid 1980s. Some of the programs were successful in reducing the nitrogen and phosphorous loading to the Chesapeake Bay non enable the Bay to meet water quality standards. EPA has been working with the states since 2005 on the development of the TMDL in a transparent and methodical manner. Please see responses to comments 0060.1.001.001 and 0062.1.001.004.

B. A TMDL Based On Incomplete or Inaccurate Modeling Will Lead to an Inefficient Planning Process

Because, as discussed above, the CBWM is not finalized, contains errors, and does not correctly reflect all aspects of Bay watershed, there is no sound basis to finalize the TMDL. Our October 29, 2010 letter (on-line Comment Docket Comment Attachment #145.1) pointed-out that the EPA intends to revise its CBWM in 2011. See also, the June 11, 2010 Garvin letter attached thereto. Given the EPA's intention to make near-term changes in the CBWM, with the likelihood that TMDL amendments will result, attempting to plan steps to implement the TMDL within the Bay jurisdictions is akin to "aiming at a moving target". A "start-stop-redirect- restart" approach is not an effective planning methodology: such an approach would encourage affected entities to "sit tight" until "the dust settles". The "Carpenter's Maxim" ("measure twice, cut once") should inform the EPA's course of action. Accordingly, promulgation of a final TMDL should be deferred until after all the necessary model corrections and refinements planned for 2011 are made. As discussed in Section III of our October 29, 2010 letter (on-line Comment Docket Comment Attachment #145.1), the EPA has retained unto itself full authority to take sufficient time to develop and finalize the TMDL, and it can renegotiate settlement agreements and consent orders in light of the enormity of the task and the number of corrections, revisions, and improvements that should be made as reflected by the many comments. In the interests of finalizing the best TMDL possible, the EPA should not rush merely to meet an arbitrary deadline.

Response

The Bay TMDL is based on the best modeling and science we have available. EPA has been collaborating with the Bay jurisdictions since 2005 on the development of the TMDL. For more information on the models, please refer to response to comment 0379.1.001.006. The TMDL will be developed by December 31, 2010. Please see comments 0060.1.001.001 and 0062.1.001.004.

Comment ID 0515.1.001.026

F. Take Adequate Time for the TMDL Process

To afford adequate time for the TMDL process and the correction/updating of the CBWM before the TMDL is finalized, the EPA should renegotiate consent orders and settlement agreements so that EPA has adequate time to follow the "Carpenter's Maxim" and pursue a "measure twice, cut once" approach. In this way, Bay watershed jurisdictions and local entities would not be faced with a repetitive and inefficient start-stop-redirect-restart planning process. Having the "end goal" clearly and firmly established before the TMDL is finalized best serves to promote efficiency and, as a result, the potential for success of the TMDL and overall effectiveness of the Bay restoration process.

Response

The TMDL was developed using the best science, modeling tools and data to date and represents the "end goal". Please see responses to comments 0060.1.001.001 and 0062.1.001.004.

Organization: Senior Bay Scientists and Policy Makers for the Bay

We fully support the EPA TMDL deadline of the end of this year and urge that there be no postponement.

Despite protestations by the affected states, these jurisdictions have repeatedly failed by wide margins to achieve the agreed upon nutrient and sediment reductions from agriculture and from existing and new development. This is due to a failure to adopt the necessary measures to accomplish these reductions. While we fully support increased federal funding for direct, verifiable reductions from nonpoint sources, we are more convinced than ever that the current mostly voluntary approach to agricultural pollutants, especially animal waste, has not and will not succeed without mandatory, enforceable regulations. At best, the farm sector has only achieved one-half of their agreed upon nutrient and sediment reductions after 27 years of funding enhancements. Further, pollutants flowing from developed lands are the only major pollution source that had been increasing, not decreasing, and it is clear that the states are not doing all that is necessary to control development and increased impervious surfaces, and to retrofit existing developed areas for better stormwater control as called for in the Tributary Strategies.

Response

EPA is committed to completing the TMDL by December 31, 2010.

Author Name: Gibb G.

Organization: Northern Virginia Regional Commission (NVRC)

Deadline for Completion of Phase II WIPs

The local Watershed Implementation Plan Pilot Projects funded by the USEPA have demonstrated the many complexities of assigning local nutrient and sediment allocations. [FN7] This is especially true when there is a complex mix of federal, state, local and private entities whom will be affected by the Phase II WIPs. Funded research has indicated that a significant amount of time and effort is necessary to understand, communicate and coordinate the many technical and policy related issues. Given the current uncertainties about the availability of the WSM to define local loads at the local level, it is impracticable to expect realistic Phase II WIPs to be prepared by the current due date of June 1, 2011.[FN8]

The Northern Virginia Regional Commission staff urges the USEPA to extend the due date for the draft Phase II WIPs and for the final Phase II WIP for a period of one year each, respectively. Additionally, as this process proceeds into the development of those Phase II WIPs, both federal and state agencies need to coordinate more effectively with those local governments and utilities that will bear much of the burden of the implementation measures to fully understand the implications to the taxpayers and ratepayers.

Author Name: Abraham Phillip

Organization: Virginia Association for Commercial Real Estate (VACRE)

The members of VACRE recognize the Chesapeake Bay is a national treasure. We support the goal of establishing a pollution diet for the Chesapeake Bay that would be achieved over a fixed period of years by equitably requiring reductions across all sectors producing pollutants throughout the Bay watershed through implementation of a variety of best management practices. We are committed to working with state and local officials, farmers, homeowners, the environmental community and the business community to equitably and cost-effectively achieve this goal through adoption and implementation of Virginia's Watershed Implementation Plan (WIP) for achieving this goal. We strongly

oppose, however, the timetable and process EPA has utilized to develop and proposes to implement the draft TMDL it released in September 2010 as well as the substance of the backstops it released at that time.

Response

Please see responses to comments 0060.1.001.001 and 0062.1.001.004. Please refer to Section 8 of the TMDL report regarding EPA's decision concerning backstops.

Comment ID 0531.1.001.002

Author Name: Abraham Phillip

Organization: Virginia Association for Commercial Real Estate (VACRE)

The members of VACRE wholeheartedly endorse the concerns previously raised with EPA by Virginia Governor Bob McDonnell over the Chesapeake Bay TMDL in his June 15, 2010 letter to EPA Administrator Lisa Jackson. We share the concerns also addressed by Virginia Secretary of Natural Resources Doug Domenech in his September 3, 2010 cover letter to EPA Region 3 Administrator Shawn Garvin submitting Virginia's draft WIP. Governor McDonnell correctly objects to the "short timeframes and opportunities for public comment by the very citizens and affected constituencies who will be responsible for reducing nutrient and sediment pollutants into the Bay" and properly calls for "sound science supporting the requirements being imposed on the states."

Response

The TMDL is based on the strongest modeling and science available. Virginia has been collaborating with EPA and the other Bay jurisdictions on the TMDL since 2005 and with EPA and the bay states since the mid 1980s. Please see comments 0060.1.001.001 and 0062.1.001.004 regarding the public comment period.

Comment ID 0531.1.001.005

Author Name: Abraham Phillip

Organization: Virginia Association for Commercial Real Estate (VACRE)

VACRE urges EPA to delay adoption of the TMDL and any decision to impose backstops on the states for at least one year and until no sooner than December 31, 2011. We ask for this for the following four reasons:

First, as emphasized by Governor McDonnell and Secretary Domenech, the regulatory development process EPA has used for the TMDL has been too rushed. EPA set unreasonable deadlines and provided inadequate opportunity for comment both from the public and from the states. It is wrong for EPA to fail to establish a reasonable adoption process for this federal program that will cost Virginia residents, businesses and local and state governments billions of dollars. It is illegal for EPA to claim it had to do this because it settled a lawsuit to which Virginia was not even a party. Allowing

a reasonable period of time for comments on and adoption of the TMDL and the resulting state WIP, would not prevent adoption of the kind of program envisioned by EPA. It will only make both the TMDL and WIP better, more cost-effective and greatly increase their chances of success over the time period envisioned.

Response

The Chesapeake Bay TMDL has been developed through a highly transparent, inclusive and engaging process with both the states and stakeholders during the past two years. EPA has worked side-by-side with its state and District of Columbia partners in developing the TMDL. EPA has also provided extensive hands-on assistance to the states and the District in the development of their Watershed Implementation Plans.

Through the Chesapeake Bay Program committees, principally the Water Quality Goal Implementation Committee (WQGIT), EPA has closely worked with the jurisdictions on all aspects of the TMDL. A list of meetings of the WQGIT and other meetings involving EPA and the states and D.C. are included as an appendix to this report.

Officials and staff have been in regular discussion throughout the process, including in hundreds of conference calls and meetings. Since September 2005, the seven jurisdictions have been actively involved in decision-making to develop the TMDL. In the October 2007 meeting of the Chesapeake Bay Program's Principal's Staff Committee, the jurisdictions and EPA agreed that EPA would establish the TMDL. Since 2008, EPA has sent official letters to the jurisdictions detailing all facets of the TMDL. Section 1.3 of the Draft Bay TMDL provides additional information on the joint work of EPA and the jurisdictions.

EPA's outreach effort to Bay stakeholders has been extraordinary, including hundreds of meetings with interested groups; two extensive rounds of public meetings, stakeholder sessions and media interviews in all seven jurisdictions in the fall of 2009 and the fall of 2010; a dedicated EPA website; a series of monthly interactive webinars accessed by more than 2,500 people; three notices published in the Federal Register; and a close working relationship with Chesapeake Bay Program committees representing citizens, local governments and the scientific community.

During the formal public comment period in the fall of 2010, EPA conducted 18 public meetings in all seven jurisdictions. More than 2,700 people participated in the public meetings and seven of the meetings were broadcast live online via webinar. As EPA officials traveled throughout the watershed for the public meetings, they also met separately with many stakeholder groups, including local governments, agriculture groups, homebuilder and developer associations, wastewater industry representatives and environmental organizations to clarify the TMDL and its process and address questions. EPA also had special meetings with state environment secretaries and their department staff and other state officials and elected representatives.

Since 2008, EPA staff has participated in nearly 400 meetings on the Bay TMDL attended by stakeholders.

b. Even assuming, for the sake of argument, that implementation planning were a part of the federal TMDL program, states cannot be expected to develop implementation plans until after the TMDL is established.

In the Chesapeake Bay context, EPA has mandated that states submit their WIPs even before EPA released the draft TMDL. This does not make any sense. Even worse, it will have a profound adverse impact on regulated point sources, like electric utilities, who may face premature permitting and business consequences from regulatory actions that are not appropriately informed by the comprehensive and systematic TMDL process.

By definition, until the TMDL is in place and final, states will not know the relative impact of different sources and/or causes of impairment. Nor will they know the specific reductions needed to achieve the loading cap. How can states meaningfully allocate and subdivide loadings among sources when they do not know what those loadings will be or the relative gravity of contributions from different sources?

In prior rulemakings, EPA has grappled with the implementation planning concept. In 2000, for example, EPA added implementation plans as an approvable element of TMDLs. However, as noted above, EPA's 2000 rule revisions never took effect. After abandoning the 2000 rule revisions, EPA embarked on significant additional public outreach. Based on this outreach, EPA concluded that implementation planning is best done outside of the TMDL process.

EPA believes that relying on the continuing planning process (CPP) developed pursuant to 303(e) of the CWA, and integrating the watershed approach into on-going State planning processes, can help assure that TMDLs will result in water quality improvements.

EPA believes that there are many advantages in providing for implementation planning outside of the TMDL process. First, the CWA authorizes use of the CPP as the mechanism for implementing TMDLs. Section 303(e)(3) requires each State and territory to have an approved CPP that will result in "plans" for all navigable waters in the State.... Moving implementation planning outside of the TMDL approval process may also expedite TMDL review and approval.... Finally, EPA believes that moving implementation planning outside of the TMDL approval process is a more effective way to ensure the development of realistic plans to achieve water quality standards. By allowing a jurisdiction to accomplish implementation planning after a TMDL has been established or approved, the jurisdiction has a greater opportunity to work with all stakeholders in the watershed to develop a coordinated implementation plan. This greater opportunity for public input in the planning process increases the probability that local controls will actually be adopted and pollutant reductions achieved.[FN 19]

UWAG strongly supports implementation planning under Section 303(e) after a TMDL is established under Section 303(d). Interestingly, the only Bay state with a detailed implementation planning requirement under state law - Virginia - has consistently interpreted that requirement to apply after a TMDL is in place. See, e.g., Guidance Manual for Total Maximum Daily Load Implementation Plans (July 2003), at p. 1 ("An IP is prepared at some point following development of the TMDL, and approval by EPA."). In fact, none of the 37 implementation plans finalized to date in Virginia arose until after the underlying TMDLs had been adopted by the State Water Control Board and approved by EPA.

b. Finalizing the TMDL Prior to Finalizing the Modeling Makes No Sense. EPA's stated plan is to produce a final TMDL by the end of 2010. To meet this deadline, the affected states must submit their final Phase I WIPs by Nov. 29 to EPA, which then approve or modify the state WIPs with backstop allocations as it thinks best. EPA, however, admits that the latest updates to the computer modeling, which were used to set the pollutant loading targets for both the TMDL and the WIPs, have proven to be unreliable. Therefore, the pollutant loadings that will be part of the "final" TMDL approved by Dec. 31 are to be considered "provisional." If necessary, after fixing the computer modeling, EPA will reopen the TMDL in 2011 to finalize the state loadings allocations for pollutants.

Any TMDL, especially one which will have such a significant impact on the states covered by the rule, should never be allowed to become final when it is known to have deficiencies. EPA's cavalier attitude about the costs and impacts of a rule known to be defective from the beginning does not do credit to the agency. NAHB urges EPA to fix the modeling and publish it for public review and comment before finalizing the TMDL.

Response

With regards to comments concerning the model, please refer to response to comment 0379.1.001.006 and 0238-cp.001.002.

3. WIP Implementation (Examples of Specific State Concerns)

The approach that EPA has taken with the development of the Chesapeake Bay TMDL includes the requirement for the jurisdictions to develop TMDL implementation plans prior to the finalization of the TMDL. As the target loadings were not provided to the jurisdictions until July 1, 2010 (nutrients) and August 13, 2010 (sediment) the jurisdictions had a very short window of time to develop the WIPs by EPA's September 1st due date. EPA then incorporated implementation measures addressed in the state WIPs into the Draft TMDL. Consequently, the Draft TMDL consists not only of wasteload and load allocations, but detailed implementation measures identified by the jurisdictions. It is unclear if the data from the WIPs are the baseline data for incorporation into the TMDL or if they are intended for use in determining how the TMDL allocations will be met. It is unclear how these WIPs can serve both purposes which is what how it appears EPA is using them.

The WIPs and associated implementation measures are not lawfully part of the TMDL. Under current law, a TMDL is the sum of the wasteload and load allocations necessary to meet water quality standards [40 C.F.R. 130.2(i)]. Implementation plans are not part of the TMDL and are not subject to EPA approval. Section 303(d)(2) of the CWA

requires states to incorporate approved TMDLs into the water quality management plans that the states maintain under section 303(e). This framework is carried through in EPA's existing TMDL regulations as well as its 1997 guidance document on TMDL implementation.

EPA's process has resulted in such an interconnected relationship between the TMDL and implementation plans (even before the TMDL is finalized) that is unclear how updates or modifications to either the final TMDL or WIPs will impact one another. Of particular concern is that the WIPs are being developed based on incomplete and inaccurate data and assumptions from EPA's modeling efforts.

Response

Please refer to Section 8 of the TMDL for more information regarding the State WIPs.

Titan America supports delaying adoption of the TMDL and backstops for at least one year and until no sooner than December 31, 2011 for the following reasons:

--The regulatory development process EPA has used for the TMDL has been too rushed. EPA set unreasonable deadlines and provided inadequate opportunity for comment both from the public and from the states. It is wrong for EPA to fail to establish a reasonable adoption process for this federal program that will cost Virginia residents, businesses and local and state governments billions of dollars. It is illegal for EPA to claim it had to do this because it settled a lawsuit to which Virginia was not even a party.

Please don't be pushed into missing deadlines and ignoring what can be achieved.

The Chesapeake Bay can't afford more excuses and delay. I urge you to finalize a strong, accountable final TMDL, and to continue working with the states to ensure that their plans will deliver much-needed results.

Response

EPA is committed to developing the Bay TMDL by December 31, 2010.

Author Name: Bertoni John

Organization: Wastewater Treatment Plant, Village of Endicott, New York

The timeline set forth by the EPA for finalization of the TMDL (December 31, 2010) does not allow adequate time to develop a fair or realistic plan to decrease loading numbers to the Bay. There are too many inconsistencies with the EPA's computer models as well as the incorrect data being used to determine such numbers. It is our hope that the EPA will extend the implementation timeline in order to work with the State agencies (NYS DEC) to better ensure water quality in the Chesapeake Bay. By doing so, we can see where we could get a better "bang for the buck".

Therefore, I urge the EPA to delay adoption of the TMDL and backstops for at least one year (no earlier than December 31, 2011). It is in this context the following is offered.

Response

Please see responses to comment 0060.1.001.001 and 0062.1.001.

Comment ID 0654.001.001

Author Name: Igli Kevin

Organization: Tyson Foods, Inc.

The Bay is an important and special resource that deserves protection. If developed in accordance with sound science, a TMDL is one of many steps that could enhance the protection of the Bay. Tyson believes the current Draft TMDL is being rushed without appropriate time to ensure full incorporation of good science, public policy review, public notice and comment, and legal analysis. Hence, the Draft TMDL will not likely accomplish the goals for which it has been developed because of the artificial and detrimental speed at which EPA is forcing this process forward without the necessary input and support of myriad stakeholders in the watershed.

Response

EPA has been working with the Bay jurisdictions to develop a TMDL since 2005 in a deliberate and methodical manner. Please see responses to comment 0060.1.001.001, 0062.1.001 and 0531.1.001.005.

Comment ID 0670-cp.001.001

Author Name: Reese Jodi

Organization: CET Engineering Services

Will jurisdictions be given more time to adequately develop the final WIPs? The length of time provided to the jurisdictions for the development of the Watershed Implementation Plans was wholly inadequate and inappropriate, given the level of detail needed by EPA to satisfy "reasonable assurance". The nutrient allocations were released from EPA on July 1, 2010 and the sediment allocation on August 13, 2010. This is significantly later than the scheduled 2007 release of Phase 5 of the model and corresponding allocations to the jurisdictions! Draft WIPs were due to EPA on September 1, 60 days after receiving the nutrient allocations. So while EPA was able to substantially miss their schedule by years, jurisdictions were not afforded any additional time. Additional time must be provided to the

jurisdictions to complete their WIPs in order to adequately address issues and avoid the unachievable backstop provisions that EPA has placed in the draft TMDL.

Response

Author Name: Kirk Ken

Organization: National Association of Clean Water Agencies (NACWA)

Although EPA is not under any legal obligation to finalize the TMDL by its December 31, 2010 deadline, the Agency denied the many requests it received for an extension of the comment deadline. It will also be difficult, if not impossible, for EPA to carefully consider comments and make revisions to the TMDL by the end of the year. Given the enormous regional and national implications of the TMDL, EPA should allow more time for public comment and more time for itself to consider public input.

Response

Please see responses to comment 0060.1.001.001, 0062.1.001 and 0531.1.001.005.

Comment ID 0699-cp.001.001

Author Name: Garvick Jeffrey

Organization: Board of Commissioners, Pennsylvania Township and York County

The PADEP was not afforded sufficient time to develop the Watershed Implementation Plan as the nutrient allotments were not released by EPA until 7-1-10. Sediment allocations were not released until 8-13-10. The fact that draft WIP's were due to EPA just 60 days after receiving the allocation means that more time must be given to address issues and avoid the backstop provisions that are unattainable anyway.

Response

Please see the response to comment 0217.1.001.001.

Comment ID 0727.001.009

Author Name: Thigpen Janet

Organization: Steuben County Environmental Management Council

The proposed timeline for establishing the final TMDL (by December .') 1, 2010) does not allow sufficient time for EPA to develop a realistic and achievable TMDL. We request that implementation of the TMDL be delayed until EPA can achieve the following : (1) Revise the allocations so that they are fair and technically achievable ; including establishment of allocations for atmospheric sources of nitrogen and sources within the Bay itself. (2) Work constructively with the states to evaluate alternatives and prepare realistic and cost-effective Watershed Implementation Plans (without federal backstop requirements). (3) Identify funding from federal sources or from entities that stand to benefit from Chesapeake Bay restoration to enable implementation of the required practices . If the TMDL is established before these conditions are met, it is unlikely to achieve the goal of restoring water quality in the Chesapeake Bay. A poorly crafted and un-successful TMDL would not benefit the Bay and could compromise EPA's ability to implement Clean Water Act provisions in other areas .

Response

Please see responses to comments 0067.1.001.009 and Section 8 of the TMDL regarding WIPs, 0038.1.001.024 regarding funding opportunities, and 0379.1.001.006 regarding the models used in the TMDL. Finally, this TMDL did consider atmospheric sources of nitrogen and provided allocations for sources within the Bay itself.

Comment ID 0731-cp.001.003

Author Name: Jamison Peggy

Organization: Garrett Co. Municipalities

Finally, we would echo the comments made by Allegany County and by the Garrett County Planning Commission that the overlap of the timelines for the comment/input phase and implementation phase of both Phase I and Phase II WIP do not allow for the towns to fully understand the requirements and the implications of those requirements.

December 29, 2010

Docket #: EPA-R3-OW-2010-0736

35 - TMDL SCHEDULE

Comment ID 0067.1.001.020

Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

EPA needs to give Pennsylvania a reasonable time to make those adjustments.

Response

For several months, EPA worked closely with the states and the District of Columbia to strengthen the draft Watershed Implementation Plans submitted to EPA in early September. EPA had numerous constructive meetings and conference calls with each of the jurisdictions and reviewed preliminary WIP submissions. EPA also worked with jurisdictions after the submittal of final WIPs to minimize or eliminate the possibility of federal backstop measures. The Watershed Implementation Plans are not part of the Bay TMDL. The review processes for the WIPs were determined by the individual states and the District of Columbia.

Comment ID 0089.1.001.013

Please refer to the response to comment 0067.1.001.020 and note that, the EPA and the states and D.C. have been collaborating on the development of the Chesapeake Bay TMDL since 2005.

Comment ID 0126.1.001.007

Author Name: Craun Ed

Organization: Augusta County Farm Bureau

The WIP needs to be flexible to allow for changing conditions and look at progressive application. It is also important to note that due to present loads in the system and the nature of nutrients in the system, particularly phosphorus, water quality response will most likely be delayed for sometime after implementation of installation of the BMPs. This is

especially true in non-point source evaluation by use of benthic monitoring.

Response

EPA agrees that the WIPs need to be flexible to allow for changing conditions.

Comment ID 0126.1.001.017

Author Name: Craun Ed

Organization: Augusta County Farm Bureau

Any evaluation of the effectiveness of the implementations recommended should consider the length of time needed for the ecosystem to respond to the BMPs.

Response

Please see the response to comment 0126.1.001.007

Comment ID 0193.1.001.002

Author Name: Newsome Michael

Organization: Home Builders Association of Virginia (HBAV)

For that reason, HBAV strongly urges the EPA to be responsive to the many concerns of the home building industry, the broad based business community, localities and other affected source sectors on the economic impact and cost associated with the implementation of the TMDL. Surely the EPA can slow down to find better balance between the economic impact of the TMDL and the "immediate" clean up needs of the Bay.

Response

Please see the responses to comments 0061.1.001.008 and 0101-cp.001.001.

Comment ID 0200.1.001.006

Author Name: Devilbiss Thomas

Organization: Carroll County Government, Maryland

- We know that many requirements will be incorporated to the NPDES permits, thereby making the local jurisdictions responsible for that portion of the reductions. However, the responsibility cannot fall solely on the local jurisdictions to ensure that all of the measures are in place by the 2017 and 2010 milestones/target dates just because a certain portion of the load falls within their jurisdictional boundaries. Many of the options for achieving the targets are not within the authority of the local jurisdiction to enable and/or enforce. It should be clear that the State is committed to implementing all of the options that are within State authority, not relying on local jurisdictions to achieve it all. This includes enabling legislation needed to accomplish much of the WIP (ex. utility tax/fee)
- Text to clarify whether or not the local jurisdictions are expected to comply with the State's accelerated schedule for getting the measures in place, or if that applies only to the measures the State will put in place. The State committed to having the measures in place by 2017 and 2020 to achieve the reductions, but do the local jurisdictions also have to have their share of the options in place as well, or do local jurisdictions fall under EPA's timeline for these achievements? It would also be useful to local jurisdictions to know if any punitive measures enforced by EPA would only apply to the percentage not achieved beyond EPA's original target dates or to the percentage not achieved based on the State's commitment of 70 percent rather than 60 percent.

Response

EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all involved including federal agencies and state and local jurisdictions. EPA encourages all to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals. EPA can not insure that local legislation is drafted in the state to accomplish the WIP. EPA has reviewed each State's WIPs to insure that the WIP has a reasonable assurance of being fully implemented. The state must develop the WIP to meet at a minimum, EPA's expectations as expressed in letters dated 9/11/2008, 11/4/2009 and 4/2/2010. The States' WIPs are not part of the TMDL. Please refer to comment 8 of the Final TMDL for further information regarding each States' WIPs.

Comment ID 0225.1.001.002

Comment ID 0252.1.001.001

Author Name: Bond Arthur

Organization: City of Frostburg, Maryland

Frostburg is a small, non-urban (under 10,000 population) City set in a generally rural environment near the headwaters of three Bay tributaries, owning land in a forth Bay tributary in neighboring Garrett County, all draining to the North Branch of the Potomac River. The City also owns land for its municipal water supply in the Piney Creek watershed that drains to the Gulf of Mexico, also in eastern Garrett County.

Frostburg understands the urgency of the need to address the Clean Water Act with regard to the Bay throughout the entire watershed; we do not request an extension.

Response

EPA notes comment.

Comment ID 0265.1.001.017

Author Name: Clark, Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

Aside from the question of EPA's legal authority to establish a deadline in the TMDL, the 2025 deadline would have significant consequences for the Localities because it would directly impact their MS4 programs and their ability to comply with their future permits should the permits contain, as expected, Bay TMDL-derived conditions based on the deadline. The other source sectors would be largely unaffected by the 2025 deadline. Municipal and industrial wastewater treatment plant upgrades are generally completed within the five-year terms of their permits, and while the widespread implementation of agricultural BMPs and onsite septic system retrofits may be a long-term undertaking, the deadline would not expose these largely unregulated sources to either the added costs of attempting to attain the allocations by an enforceable deadline or the risk of enforcement for permit non-compliance. The 2025 deadline would expose the Localities, on the other hand, to future NPDES permits containing retrofit implementation schedules that, as explained above, would, at a minimum, dramatically increase their compliance costs, or more likely, would be unattainable despite their best efforts to achieve compliance by the deadline.

Response

EPA has reconsidered its approach to backstop allocations as proposed in the draft TMDL. This is in large part due to the improved final state WIPs and informative comments on the issue. The final TMDL places much greater emphasis on state WIPs and less emphasis on backstops in deriving the loading allocations for all sectors.

Comment ID 0277.1.001.006

Author Name: Shambaugh Brenda

Organization: PA Association of Conservation Districts (PACD)

In conclusion, PACD strongly advocates that PA, not EPA, develop and administer the PA nutrient reduction program including all goals and timelines. The plan must be flexible and there must be reasonable timeframes to for the agricultural community develop and update conservation plans bringing farms into compliance. With the proper funding for conservation districts and cost sharing opportunities for the agricultural community, PA can, and will successfully meet the nutrient reduction goals associated with EPA mandates.

Response

The development, implementation and administration of the WIPs was delegated to the jurisdictions unless they failed to meet the requirements of the WIPs as outlined in letters dated 9/11/2008, 11/4/2009 and 4/2/2010.

Comment ID 0280.1.001.004

Author Name: Newcomb Jim

Organization: Dorchester Soil Conservation District

The Dorchester Soil Conservation District has reviewed Maryland's Watershed Implementation Plan (WIP) and would like to make the following comments.

- Maryland should stick to the federal timetable and not try to meet the goals 5 years earlier than all other Bay states. Especially in this economic climate the extra requirements tied to meeting these TMDL goals, in addition to being accelerated, will negatively impact all segments of Maryland while our partner states are not sharing in the burden equally.

Response

The Watershed Implementation Plans (WIPs) submitted by each State/Commonwealth/District of Columbia (D.C.) are part of the accountability framework outlined in the Chesapeake Bay Protection and Restoration Executive Order 13508. The WIPs help ensure implementation of the Chesapeake Bay Total Maximum Daily Load (TMDL) but are not an approvable part of the TMDL. Because this public comment period is specific to EPA's Chesapeake Bay TMDL, specific comments on each State/Commonwealth/D.C. WIP should be directed to the appropriate State/Commonwealth/D.C. agency for consideration.

Comment ID 0330.1.001.012

Author Name: Krasnoff Alan

Organization: City of Chesapeake, Virginia

The 2025 deadline for achievement of the Draft TMDL pollutant reduction goals will be extremely difficult, if not impossible, given the legal, land use and fiscal issues involved.

Response

It will be a challenge to meet the 2025 deadline but EPA is committed to work with its jurisdictional partners in order to achieve this.

Comment ID 0411.1.001.001

Author Name: Moon Michael

Organization: Public Works and Utilities, City of Manassas, Virginia

1. The Chesapeake Bay TMDL Program appears to be front-end loaded with a goal of achieving 60% nutrient targets by 2017. This should be phased to assist the state and localities to address the financial requirements necessary to implement the plan.

Response

The 60% by 2017 is slightly more ambitious than the 40% implementation needed in the 8 years after and represents a phasing of 15 years for the entire implementation.

Comment ID 0510.1.001.010

Author Name: Haterius Stephen

Organization: National Association of State Departments of Agriculture (NASDA)

Adding implementation measures has only added to the complexity of the Draft TMDL. The Draft TMDL consists not only of the 370 pages of the Draft TMDL document, but also the 1672 pages of the 22 appendices, as well as the technical analysis and modeling information that is referenced throughout the Draft TMDL. We have not attempted to quantify the volume of that supporting information.

Despite its acknowledgement that the Draft TMDL is the most complex ever attempted, EPA is allowing only 45 days for public comment. Forty-five days is insufficient under the APA to provide for meaningful public comment. In its October 22, 2010, letter to Congressman Goodlatte and Congressman Holden, EPA bases its refusal to extend the comment period on the deadlines that the administration has imposed on itself through Executive Order 13508 and through a settlement agreement with Chesapeake Bay Foundation even though these are self-imposed deadlines.

Response

Please see the responses to comments 0060.1.001.001 and 0062.1.001.004.

Comment ID 0254.1.001.001

Author Name: Hawkins George

Organization: District of Columbia Water and Sewer Authority

The detailed TMDL allocation tables presented in Appendix Q of in the draft Bay TMDL report are not well constructed and contain inconsistencies that make it impossible to know with confidence that EPA has adopted the waste load allocations (WLAs) proposed in the District Department of the Environment's (DDOE's) September 1,2010 draft Phase I Watershed Implementation Plan (Draft WIP).

Response

Please see the response to comment 0681.1.001.014.

Comment ID 0254.1.001.003

Author Name: Hawkins George

Organization: District of Columbia Water and Sewer Authority

DC Water assumes that EPA has included the Outfall 001 and CSO allocations from the Draft WIP in the Bay TMDL based on the allocation summary in Table ES-I and the summary of the backstop allocations in Section 8.3.3 of the draft TMDL Report, but, again, is unable to confirm that the WLAs are, in fact, in the Bay TMDL because of the construction of the allocation tables.

Response

Please see the response to comment 0681.1.001.014.

Comment ID 0254.1.001.004

Author Name: Hawkins George

Organization: District of Columbia Water and Sewer Authority

Further, inconsistencies in the allocation tables make it impossible to know which table reflects the allocations proposed for Blue Plains and the District's combined sewer system. The following table illustrates the extent of the consistency problem: [Table 9-1. See pg 2 of original document 0254.1] It is incumbent upon EPA to correct these inconsistencies and include detailed allocation tables in the final Bay TMDL that clearly identify and list the allocations assigned to Blue Plains and the District's combined sewer system. Nevertheless, in the absence of any evidence to the contrary, we will assume for purposes of these comments that EPA included in the draft TMDL all of the allocations proposed in the Draft WIP.

Comment ID 0272.2.001.020

Author Name: Pippel Julie

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

[Comment from footnote 24 of comment ID 0272.2.001.013]

On a related note, in Table Q-1, EPA's Draft TMDL appears to provide individual WLAs for non-significant WWTPs (including POTWs). This is in contrast to Maryland's Draft WIP (aggregates WLAs for non-significant WWPTs). MAMWA strongly supports the State's approach. These smaller plants are not being required to upgrade (see discussion above). EPA should correct its TMDL to provide aggregate loadings. Furthermore, EPA should make it clear in the text and in all appendices that reference loadings that insignificant WWTPs are being aggregated for purposes of the TMDL, but that they are not expected to upgrade to attain such loadings, nor should their permits reflect any individual loading.

Response

Please see the response to comment 0681.1.001.014.

Comment ID 0444.1.001.008

Author Name: Allen Paul

Organization: Constellation Energy

Appendix Q of the Draft TMDL contains EPA's calculated wasteload allocations. Appendix Q1 contains the loads to achieve proposed amended water quality standards and Appendix Q2 contains the full backstop allocations in the case EPA believes these are necessary. The methodology for arriving at the allocations, specifically for the "nonsignificant" discharges, is not clear. Some have allocated loads, others do not, but should have. For example, Calvert Cliffs Nuclear Power Plant, LLC, where Constellation has ownership interests, (line 6598 in Appendix Q1) has been allocated 0 pounds/year for nitrogen, phosphorus, and sediment which is not correct. Calvert Cliffs has an on-site wastewater treatment plant and uses nitrogen and phosphorus-containing compounds in its plant processes. As required by its NPDES permit, Calvert Cliffs submitted to the Maryland Department of the Environment estimated annual loadings of 15,000 pounds/year of total nitrogen and 100 pounds of total phosphorus. There was no requirement in the Calvert Cliffs permit to estimate sediment loads. Therefore, at a minimum, Calvert Cliffs should have wasteload allocations for nitrogen and phosphorus.

Maryland's Watershed Implementation Plan (Appendix C) did not allocate watershed loadings to all specific dischargers, but rather considered the "nonsignificant" dischargers as aggregated with individual loadings to be determined at a later date based on Tributary Strategies. This approach seems more appropriate given the fact that the model is still undergoing revision and that information upon which to base the individual loadings appears, in the case of our example, to be incomplete.

Based on this relevant example, EPA should withdraw Appendix Q and work with the states and the District of Columbia to prepare the individual wasteload allocations once all relevant information is known. The revised allocations must then be resubmitted for public review and comment.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Author Name: Frank Stephen

Organization: RRI Energy

Of specific concern is that our Shawville Generating Station may have been inadvertently overlooked through this multi year development process. While we are prepared to conduct additional monitoring of TN at the station to establish baseline loadings from our multiple outfalls, some data was collected in July and August of 2005. A summary of this data is included in Table 1 (attached) for your consideration.

[Table 1. Shawville Sampling Data. See original document 0502.1]

We request that the DEP and EPA evaluate the data associated with our discharges and allow the Shawville Generating Station adequate time to develop a discharge baseline and to be appropriately addressed in the PA WIP and Bay TMDL.

RRI Energy is committed to working with the DEP and EPA to establish TMDLs that are scientifically sound, legally defensible, cost effective, and equitable. Please do not hesitate to contact me at (724) 597-8310 if you have any questions or require additional information.

Response

Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Section 4.5.5 of the Draft Chesapeake Bay TMDL ("Draft TMDL") makes reference to industrial storm water as point

sources and notes that the Draft TMDL inventories the industrial storm water in Appendix Q. Allocations for Baugher Farm appear to be missing from Appendix Q and may not have been properly considered as part of the modeling for the Draft TMDL.

Response

Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Comment ID 0681.1.001.014

Author Name: Baxter Russ

Organization: VA Department of Environmental Quality

Industrial Stormwater VPDES Permit Aggregate Allocation

The TMDL Appendix Q-1 and Q-2 should clarify that industrial stormwater VPDES permit discharges are included in the Source "Stormwater-MS4".

Aggregate loadings for industrial stormwater VPDES permits should be included in Appendix Q as part of the "Stormwater-MS4" for each segment. DEQ previously submitted an updated spreadsheet that added 12 facilities and replaced EPA contractor Tetra Tech "estimated acres" with the area information found in the individual permit registration statements to the extent such information was available.

Wastewater

The TMDL Appendix Q-1 and Q-2 will need to be revised based upon the updated model input deck that DEQ will provide to EPA by November 12th . The submission will include corrected information from the September 2 submission.

Response

EPA has received numerous comments regarding the format of the allocation tables in Appendix Q including poor table construction, difficulty in locating specific facility wasteload allocations, and confusion regarding individual allocations provided to facilities that should have been part of an aggregate allocation. EPA has corrected Appendix Q to address these comments.

54 - APPENDIX S

Comment ID 0294.1.001.004

Author Name: Haley Mark

Organization: Virginia Nutrient Credit Exchange Association, Inc.

- NPDES Permit Noncompliance (Page S-4, Item 6 (b))- This provision is irrelevant to trading and, in practice, certainly stands to disrupt trading. For trading to be reliable and useful for the users as well as the regulators, it makes no sense that otherwise valid nutrient credits would be disqualified upon noncompliance of the credit-generating facility. Consider just a few examples of potential noncompliance: failure to submit a complete renewal application or a required facility-related manual on time, laboratory testing errors, inadvertent exceedence of unrelated effluent limits, etc. This provision will only inject unnecessary uncertainty into the trading or offsetting process, would not "safeguard" nutrient trades, and actually would work against EPA's stated objectives. This element should be eliminated.
- "Disproportionate Harm" (Page S-4, Item 6 (c)) - While the Nutrient Exchange aims to improve water quality and surely to do no harm, we note that this provision is redundant of the many provisions in Appendix S that state that trading or offsetting must be consistent with water quality standards applicable to human health and aquatic life. This provision is redundant of the standards that preclude harm by their own terms and, therefore, the provision should be deleted.
- "Temporal Consistency" (Page S-4, Item 6 (d)) - This provision should be clarified to provide that temporal consistency is satisfied for point sources when the credit is generated and used within the same 12 month period. This request is consistent with the annual basis for the TMDL and WLAs.
- "Accountability" Provisions (Page S-5, Item 8) - Much of this section is redundant of the previous seven items in Appendix S. However, a number of the items are worded slightly differently than those prior items. This may lead to confusion and further complicate implementation. We suggest deleting all sub-elements that are addressed elsewhere in the document.

Response

Thank you for your comments. Facilities generating credits for sale need to be in compliance with existing environmental laws and regulations. This is consistent with EPA's Trading Policy.

Comment ID 0472.1.001.001

Author Name: Fults Brent

Organization: Chesapeake Bay Nutrient Land Trust, LLC

Following many years of experience in the wetland and stream private mitigation banking field, EarthSource Solutions, Inc. created the Chesapeake Bay Nutrient Land Trust, LLC (CBNLT) in 2006 as a private market-based entity with the

purpose of generating and transferring nonpoint nutrient offsets ("Offsets") to compensate for nutrient inputs into the Chesapeake Bay and its Virginia tributaries. CBNLT has worked closely with the Virginia Department of Environmental Quality (DEQ) and Virginia Department of Conservation and Recreation (DCR) to develop private facilities that create nonpoint nutrient offsets that can be traded to point sources (under DEQ's program) and developers who cannot meet phosphorous requirements found in Virginia's stormwater permits and regulations (under DCR's program). [FN 1]

CBNLT is thus in a position to provide real world insights and perspective on the impact of the TMDL and Virginia WIP on private market based trading and how private entrepreneurial trading can aid in meeting the water quality needs of the Chesapeake Bay and its tributaries.

It is important to note that the Offsets created under the Virginia program meet the expectations found in Appendix S of the TMDL. Nonpoint nutrient Offsets created by CBNLT provide:

Nutrient Reductions Exceeding "Baseline" Requirements - Offsets represent nutrient reductions in excess of those otherwise required by, or funded under, state or federal law or by tributary strategy plans, and provide an incentive for baseline to be achieved so that Offsets can be created.

Pre-Implemented Benefits - Offsets are state verified on-the-ground nutrient reductions that are in place well in advance of the land disturbing activity that will need the Offset occurring. Large nutrient reductions are created well in advance of their use as Offsets.

Protection of Local Water Quality - Offsets may not be used in contravention of local nutrient water quality requirements. In addition, six percent of each transaction fee goes to DCR or a locality for local water quality enhancement programs. As long as local water quality is protected, Offsets may be used in the same HUC or adjacent HUC just as wetland mitigation credits can be used in Virginia. If no Offset facility is in either HUC, Offsets may be used from the same River Tributary.

Accounting for Attenuation - Offsets are based on the reduction in delivered load to the Bay rather than streamside reductions. This also provides local water quality benefits and eliminates the need for a trading ratio. A trading ratio is also not needed due to the conservative nature of the reduction calculations.

Perpetual Protection - Stormwater Offsets must be protected in perpetuity. Offsets for point sources must be protected for the duration of the point source's need.

Financial Assurance - Offsets are financially assured by the Offset provider until such time as the land conversion has been deemed to be established.

Verified and Enforceable Reductions - Two state agencies must certify the nutrient reductions before they are available for transfer, both agencies have the ability to inspect Offset facilities and require compliance, annual reports of Offset facility compliance is provided, and Offsets are incorporated into permit requirements.

Phosphorous and Nitrogen Benefits - Virginia's stormwater program only regulates phosphorous, but both phosphorous and the associated Offset facility's ratio of nitrogen are retired.

Tracking of Transactions - Similar to the wetland and stream banking systems, Offset facilities provide ledgers documenting transactions and available Offsets.

Private Investment with Public Returns - No state or federal money is needed for Offset creation but their use provides economic benefits to developers, state and local tax bases, and environmental benefits beyond just nutrient reductions.

TMDL and VIRGINIA WIP COMMENTS

TMDL Appendix S

As noted above CBNLT's Offsets meet EPA's expectations for a tradable credit. However, CBNLT's experience in Virginia has shown that there are road blocks to the actual use of the Offsets. One of the more significant road blocks is local government-administered in lieu fee programs, pro rata share and similar programs. Virginia localities thus have the ability to create programs to allow developers to "achieve" stormwater nutrient requirements through payments rather than actual controls. However, the fees are being accumulated and don't always appear to be utilized for nutrient reductions, let alone nutrient reductions that are equivalent to those needed to address the associated impacts. These programs have not qualified under a certification program that meets the needs of the TMDL as offsets have, and also operate in a subsidized environment supported by tax dollars and voluntary payments. The time lag (some localities assert that they have the right to accumulate funds for twelve years before using them) between fee collection and utilization for nutrient reductions means a temporal loss of nutrient reductions as well.

Appendix S should specifically disallow the use of trading mechanisms that do not meet the same high standards imposed upon the private market for the generation and use of credits. Included in this should be a specific statement that Offsets must be certified and represent actual in the ground nutrient reductions at the time of need and that programs that accept funding for some future nutrient reductions may not be used. EPA should provide a clear endorsement of DEQ/DCR certified private facilities, such as those developed by CBNLT, and assert that they should be used prior to other, less reliable sources of nutrient reductions.

[FN 1] These facilities are the first of their kind certified in Virginia by both DEQ and DCR and include the Wildwood Farm in Appomattox County (with annual phosphorous reductions of 101 pounds and 376 pounds of nitrogen) and the Cranston Mill Project in James City County (with annual reductions of 752 pounds of phosphorous and 1,655 pounds of nitrogen).

Response

Thank you for your comment. Similar to a credit exchange, a private offset could potentially buy and sell credits that are utilized in conjunction with the Chesapeake Bay TMDL. EPA and the Chesapeake Bay jurisdictions would be interested in receiving further information and having further discussions about a private offset approach.

Comment ID 0472.1.001.003

Author Name: Fults Brent

Organization: Chesapeake Bay Nutrient Land Trust, LLC

Although environmental credit markets have been around for some time, nutrient Offsets are an innovative and novel approach. Rather than encouraging the use of innovative methods of nutrient reduction, there has been a lack of clear endorsement and support of the use of Offsets by state and local governments. This lack of clear support creates a level of unfamiliarity and potential reluctance that permit issuing authorities, landowners and the development community may have toward the use of Offsets.

As the federal government and the Bay jurisdictions strive to achieve the water quality goals for the Chesapeake Bay, the active participation of a private nonpoint nutrient Offset market will be essential. The implemented nutrient reductions and resulting Offsets will provide landowners with additional stewardship and income opportunities while encouraging land use alternatives that will immediately contribute to improved water quality of the Bay and its tributaries.

Neither the Virginia WIP nor the TMDL (Appendix S) address the failure of local programs to provide equivalent nutrient reductions contemporaneously with the land disturbing impact. As noted above, there are a variety of mechanisms by which the Virginia WIP should be significantly improved to promote, rather than hinder, the development of cost effective entrepreneurial solutions.

If you have any questions, please feel free to contact Brent Fults or Scott Reed of CBNLT at (804) 222- 5114 or Shannon Varner at Troutman Sanders LLP at (804) 697-1331.

Response

Thank you for your comment. Similar to a credit exchange, a private offset could potentially buy and sell credits that are utilized in conjunction with the Chesapeake Bay TMDL. EPA and the Chesapeake Bay jurisdictions would be interested in receiving further information and having further discussions about a private offset approach.

Author Name: Rountree Glynn

Organization: National Association of Home Builders (NAHB)

d. Comments on Appendix S. Offsetting New or Increased Loadings of Nitrogen, Phosphorus and Sediment to the Chesapeake Bay Watershed.

i. Page S-2, section II, 3, Offsets Baseline - Farmers have made it clear that if they must meet the TMDL baseline, it disadvantages those farms that have voluntarily installed BMPs to improve water quality. In addition, they say that once they meet the TMDL baseline requirements, they will have used most all of the inexpensive measures to improve water quality, and further measures will increase the cost of their credits to be sold. EPA should allow credit for farms towards

meeting the TMDL baseline from existing BMPs on the farm that were installed prior to the TMDL. Further, farmers should be allowed to sell credits prior to meeting the baseline if they show a credible plan to achieve and verify meeting the TMDL baseline after selling credits. Without such flexibility provisions, the generation of credits for sale from agricultural operations will be constrained.

ii. Page S-2, Section III.1., Authority - Since the federal Construction General Permit will be revised in 2011, EPA should consider supplying language for inclusion in the new permit that endorses the concept of water quality credit trading to encourage states to consider trading to lower their costs of water quality improvement measures.

iii. Page S-3, Section 2.(b), Offsets Baseline (for credit generators) - this section contains the term "geographic scale." Does this term refer to the geographic region where the credits from a source can be bought?

iv. Page S-4, 7.(b) - This section discusses estimating the pollutant loading from nonpoint sources and discharges from unpermitted sources. This estimate must account for the airborne deposition of NO_x from the emissions from Southeast Asia, Mexico, Canada, and other foreign nations. NO_x deposited into the Chesapeake Bay watershed from sources outside the scope of the TMDL will continue to increase for the foreseeable future. Domestic permitted sources must not be penalized by being forced under the TMDL to make additional pollutant reductions to account for the actions of offshore, unregulated air emissions that deposit NO_x into the Chesapeake Bay watershed.

v. Page S-4, 7.(c) - Given the economic situation of the states, the additional burden on the states on the new TMDL requirements, and the existing permit backlogs in the states, it is not practical, and certainly not a good use of rare resources, to reopen state permits to incorporate offset transactions. The overhead costs of any trading program will increase the price of credits, shutting some sources out of the credit market simply because they will not be able to afford the credits or the credits are unavailable at any price. There is no environmental value gained by adding offset transactions to permits when such information will be found on the website of the entity responsible for selling trading credits. Adding to the trading program's overhead cost by requiring permits to incorporate the offset transaction is a bad idea.

vi. Page S-5, 8(c) - Home builders will be disadvantaged if the offset or credit purchased cannot be sold again during the term of the credit. As we understand it, credits are normally of multi-year duration, perhaps 3-5 years, much longer than required for the majority of homebuilders, who need only nine months to build a home. At a minimum, EPA should consider adding a provision for those with short-duration permits providing that, at the termination of their NPDES permit, they can sell the remainder of their credits to another source.

Organization: National Wildlife Federation Action Fund

The Chesapeake Bay community depends on clean water for health, livelihoods and economic security.

Unfortunately, pollution is killing the Chesapeake and hundreds of other rivers and creeks in the region. All this pollution gets collected into the bay, which is no better shape today than it was 25 years ago.

You now have the unique opportunity to do something about it, and the time has come to put strong, enforceable water safety standards in place to protect homes, support the economy and ensure that streams and rivers are healthy today and for our children's future.

I urge you to develop a strong pollution diet in the state that holds everyone accountable for the pollution that is harming our wildlife and damaging the local economy. It is imperative that these plans address all sources of pollution and demonstrates how reductions will be gained. Citizens across the state and the region need your help to keep our water clean and protected.

Response

EPA notes commenter's support for the Chesapeake Bay TMDL.

60.3 - SUPPORTS NYS DEC (COMMENT -0389)

Comment ID 0364-cp.001.001

Author Name: Hazlitt K.

Organization:

As a supporter of the family farms within New York's Chesapeake Bay watershed area, I ask that the Environmental Protection Agency (EPA) revise New York's Chesapeake Bay Total Maximum Daily Load (TMDL) allocation to a realistic and attainable standard and accept the NYS Department of Environmental Conservation's (NYS DEC) Watershed Implementation Plan (WIP) which is an aggressive and realistic plan to protect water quality in New York's portion of the Bay watershed.

Clean water is a priority of New York farmers, who have worked for many years to protect the state's water resources under the most progressive water quality standards in the country. The EPA should revise New York's Chesapeake Bay TMDL allocation to more adequately reflect NY's environmental achievements, be more proportionate in accordance with science, account for NY's decreasing environmental footprint over the past decade and reflect that NY's water quality chemistry already meets Bay specifications for high water quality as required by EPA's TMDL. New York's state-wide environmental program achievements, as well as its unique landscape, growing conditions and seasonality - which differ from other five Bay watershed states - should all be accounted for in any Chesapeake Bay Program TMDL.

EPA should also adopt the model refinements recommended by the NYS DEC in their draft Phase I Watershed Implementation Plan to restore the Chesapeake Bay and its watershed. The strategy presented in NYS DEC's WIP is an aggressive, achievable, credible, stakeholder driven plan which provides adequate assurances on NY's ability to achieve stated nutrient reductions. These requested model refinements reflect the environmental protection accomplishments New York State has already attained and truthfully represents the practices of environmental stewardship currently employed on New York's family farms.

New York's farm communities in the Bay watershed have serious concerns that U.S. Environmental Protection Agency Region 3 (USEPA R3) has not accurately accounted for all pollutant reduction factors which are distinct and unique to New York. Unlike other Bay watershed states, New York's small portion of the Chesapeake Bay watershed is characterized by low population growth, low intensity agriculture, forest and high water quality. This is significant because the brunt of any nutrient load allocation requirement will fall squarely on our small family farms in the Bay watershed region in the absence of any other significant industry or population centers to satisfy USEPA R3 pollutant reduction targets.

Since 2004, the NYS DEC, in partnership with the New York State Department of Agriculture and Markets, has been implementing a practical, programmatic, state-wide approach to nutrient and sediment reduction which has resulted in marked improvements to the Susquehanna River Basin region and, thereby, the Chesapeake Bay watershed. These existing state water quality and agricultural environmental management programs have established practices and standards which exceed federal minimum requirements and pre-date any EPA mandate.

For these reasons, please revise New York's Chesapeake Bay Total Maximum Daily Load (TMDL) allocation to a realistic and adopt the model refinements recommended by NYS DEC in their Draft Phase I Watershed Implementation Plan.

Response

During the public comment period, EPA received hundreds of these letters as part of a mass mailing campaign. EPA's notes all the commenter's support for NYS DEC's watershed implementation plan. With regards to comments that relate to New York's allocations, please refer to response to comment 0080-cp.001.002. With regards to EPA's WIP backstop rationale, please refer to response to comment 0067.1.001.007 and Section 8 of the TMDL report.

Organization: Chesapeake Bay Foundation (CBF)

I support clean water in the Chesapeake Bay and in my community of Kensington, Maryland. With the development of our state's first Watershed Implementation Plan, the EPA has a unique opportunity to ensure the establishment of effective programs to save the Chesapeake Bay for generations to come. However, the plan lacks implementation details for meeting the plan's goals. I urge you, as the EPA Administrator, to require the state of Maryland to improve its plan by ensuring the necessary specific measures are articulate and implemented to clean the bay's water by 2020.

The Chesapeake Bay is one of our country's most treasured waterways. I'm sure you agree with this and your vigorous action will determine to a large degree whether we succeed in saving this treasure or passing on to our children an opportunity lost, a treasure ill spent.

I know your challenges are many and difficult, but please make restoring the Chesapeake Bay one of your highest

priorities. I would appreciate your views on this challenge and those actions planned to save the Chesapeake Bay.

Response

EPA notes the commenter's support for protecting the Chesapeake Bay. Please refer to Section 8 of the final TMDL which outlines EPA's evaluation of the jurisdictions' watershed implementation plans.

Progress has been painfully slow to finally clean up the Chesapeake Bay and its tributaries.

The EPA must require the state to detail how it intends to implement the plan.

Response

Please refer to Section 8 of the final TMDL which outlines EPA's evaluation of the jurisdictions' watershed implementation plans.

60.4 - USE OF EPA'S AUTHORITY TO IMPROVE MD'S WIP

Comment ID 0767.001.001

Author Name: Campaign Mass

Organization: Chesapeake Bay Foundation (CBF)

Please accept the enclosed letters in support of a strong, effective Watershed Implementation Plan (WIP) being developed by the state of Maryland. The Chesapeake Bay Foundation and other groups have been working diligently to educate the citizens of Maryland about the importance of and opportunity presented by the WIP. The enclosed letters demonstrate that Marylanders are concerned about water quality and want to see your agency hold a firm line by enforcing the Total Maximum Daily Load and the WIP allocations.

Thank you for this opportunity to provide comments. We look forward to seeing a comprehensive, detailed and enforceable final product.

Response

Thank you for your comments and support for EPA's Chesapeake Bay TMDL.

Please see the response to comment 0067.1.001.009 and Section 8 of the TMDL report for EPA's rational and methodology for evaluating and backstopping the jurisdictions' WIPs.

For discussion of accountability and possible federal actions, please see the response to comment 0110.001.005.

Shawn Garvin, Administrator for EPA's Mid-Atlantic Region (Region 3), is firmly committed to establishing a scientifically robust and legally defensible Bay TMDL by December 30, 2010. The TMDL establishes the loadings necessary to allow the Bay to meet applicable water quality standards and restore designated uses.

I urge you to enforce Clean Water Act standards and hold Maryland and Virginia accountable for cleaning up the Chesapeake Bay. If my state does not meet its requirements for a clean-up plan, EPA should take the following actions:

- Improve pollution standards from point sources;
- Rewrite or deny pollution discharge permits; and/or
- Assume responsibility for Maryland and Virginia's Water.

State's like Maryland and Virginia need to play their part in cleaning up the Bay. Please use EPA to help make that happen.

We are looking forward to your response.

I have been watching with both interest and dismay the progress or lack of it we have had in cleaning up the Chesapeake. For too long clean up efforts have been faltering for lack of any real teeth to clean up regulations. Now that there is a real chance of EPA enforceable clean up, it is more important than ever that The EPA keep on top of efforts by the states involved including Maryland. Well meaning promises by the state aren't enough. Maryland needs to spell out not just what it wants to accomplish but what it is going to do to make it happen. Specifically how it will address funding; gaps and legislative changes that will be required to make this all happen

Please use your position as EPA Administrator to have Maryland improve it's draft plan so that the 2020 goals will be reached. Perhaps I won't see it in my lifetime, but restoring the Chesapeake to the vitality it had when the country was founded would be a wonder to behold. The Bay is not just a part of Maryland Virginia and Delaware. It is part of the United States, every bit as important as the Rockies, the Gulf of Mexico or Puget Sound. It is the heart of our coastal ecosystem and the source of bounty that is found up and down the eastern seaboard. Nature will accomplish wonders if given the chance, but first we need to make that possible. Right now, you are someone who can make that happen perhaps more than anyone else. You will have our support in this process.

I am a big supporter of a clean environment, especially clean water in Maryland and my community. As you may know

Maryland has labored to clean our waters but the results of significant quality has been dragging. Presently, with the Watershed Implementation Plan, the EPA has the prime window to bring about greater accountability to clean up our waterways sooner rather than later.

Sure Maryland has "passed" quality standards from the EPA, but we Maryland citizens need more teeth in this proposal to improve the situation. The EPA needs to mandate details on the plan of execution and monitor them as they are rolled out.

I am asking you with the gift and privilege of the position you hold to improve the draft plan to ensure the best quality for our waters by 2020.

You know we already have the technology, we just need a comprehensive plan that will ensure excellent execution and make all citizens of Maryland proud and even boastful of our waterways - for this generation and the ones to come.

I am very concerned about the Chesapeake Bay and its tributaries. The Bay is heavily polluted and unless something is done soon, the Bay will die.

The State's first Watershed Implementation Plan has been developed. The EPA must put pressure on Maryland to say how it intends to work this plan. This is a golden opportunity to use your position in the EPA to see that this state will implement the necessary measures to save the Chesapeake and its tributaries.

Clean water is good for the fish, the crabs and us!

Clean water is important to me, especially in the Chesapeake Bay and in my community. Progress to clean our waters has been halting until now, with the development of the state's first Watershed Implementation Plan. The EPA has a huge opportunity to ensure the establishment of effective programs, incentives and penalties that will finally clean-up the Chesapeake Bay and its tributaries.

Citizens of MD need assurance that this W.I.P. will come to fruition. The EPA must require the state to detail how it intends to implement the plan. For example, the state must address the "funding gaps" and "new regulatory/legislative changes" necessary to meet plan goals.

I ask you to use your position as EPA Administrator to push Maryland to improve its draft plan ensuring all the necessary measures will be in place to achieve clean water by 2020. We know what the problems are. We have the technology to address the problem. We just need a strong, enforceable plan.

We are at the tipping point and your actions will determine to a very large degree whether we succeed in restoring clean water in the Bay or whether the polluted Bay kills all the fish.

I support clear water in the Chesapeake Bay and in my community. Maryland has worked hard to clean our waters but progress is very slow. Now with the development of the state's first Watershed Implementation Plan, the EPA has the opportunity of a lifetime to ensure the establishment of effective programs, incentive and penalties to finally clean up the Chesapeake Bay and its tributaries.

Although Maryland received a passing grade on its plan from the EPA, citizens need assurance Maryland's proposal will become a reality. The EPA must require the state to detail how it intends to implement the plan. For example, the state must address the "finding gaps" and "new regulatory/legislative changes" necessary to meet plan goals.

I ask you to use your position as EPA Administrator to push Maryland to improve its draft plan ensuring necessary measures will be in place by 2020 to achieve clean water.

We know what the problems are and how to address them with the proper technology. We need strong plan to make it happen.

Your actions will determine whether we succeed in restoring clean water in the Bay. I want the Bay to be clean and there for generations to come.
