Author Name: Hughes Robert

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

EPCAMR would like to be represented on the WIP workgroup in the near future, if you are looking for additional input from another organization that has already demonstrated the commitment to help protect and restore the Chesapeake Bay. We would hope to think that we are a leader in the environmental restoration of AMD impacted watersheds in Eastern PA and throughout the Chesapeake Bay Watershed.

Response

See response to Comment No. 0034-cp.001.001

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

EPCAMR had been involved with many of the Conservation Districts in the development of their Chesapeake Bay Tributary Strategies and would like to continue to do so in the future implementation of the other phases. We will keep in touch with our Conservation District Chesapeake Bay Technicians within our Region to provide updates to their County Implementation Tributary Strategies.

Author Name: Bond Arthur

Organization: City of Frostburg, Maryland

In Frostburg' region, we are within a few miles of the Pennsylvania border, and about 25 miles from Mineral County, West Virginia. Both of these States have not been as forthcoming with appropriate measures in comparison with Maryland in the Phase I WIP per EPA feedback. In addition, Maryland has voluntarily moved its target dates up five

years. If the neighboring States are not required to keep pace with Maryland, a development imbalance will be seen where Maryland communities will be at a major disadvantage with regard to cost of building any new structure. While this advantage would theoretically not be permanent, any advantage that lasts for several years would change development patterns and lead to stagnation or even disinvestment in Maryland, particularly given the weak economy and pattern of population loss in our region which make markets more difficult with respect to justifying capital expenditures, including 'green' factories, home building, or redevelopment projects in our urbanized areas.

Response

EPA and the state partners have agreed to implementing all needed controls by 2025. AS a show of leadership, Maryland has voluntarily set state specific more aggressive deadlines. EPA applauds this action.

Comment ID 0285.1.001.002

Author Name: Rebecca Sutton and Craig Cox

Organization: Environmental Working Group

The EPA's draft Chesapeake Bay TMDL (EPA-R03-OW-2010-0736) indicates that draft versions of all state plans contain "some" (Maryland, Washington DC) or "serious" deficiencies (all other states). All the plans lack "sufficient reasonable assurance that pollution controls identified could actually be implemented to achieve the nitrogen, phosphorus and sediment reduction targets by 2017 or 2025." The backstop measures outlined by the EPA to compensate for shortcomings in the state WIPs all include "additional adjustments to agriculture nonpoint sources as necessary to exactly meet nitrogen, phosphorus and sediment allocations."

Economic Impact of Implementation

Comments:

A study by the Hampton Roads Planning District Commission (HRPDC), conducted on behalf of the City and the other Hampton Roads localities, was performed to develop a preliminary cost estimate for implementing the storm water pollution reductions for the Bay TMDL. The cost estimate was based on the following assumptions, however does not include land acquisition or easements for the construction of BMPs on private property:

- Urban acreage data that was included in Bay model
- Cost per acre treated by various structural BMPs based on a study performed by the Center for Watershed Protection
- Treating 19% of urban land with BMPs, which was the average maximum amount of practical application of BMPs across Hampton Roads
- Collecting, storing, and reusing storm water to meet the pollutant reductions that cannot be met with BMPs

Virginia WIP Requirements: Should the EPA and Virginia agree and proceed with the nutrient credit exchange program as outlined in the Draft WIP, the estimated cost per year for the City would be \$15M for the installation and retrofit of BMPs alone. This estimate does not account for storm water system maintenance nor flood reduction projects. The estimated cost includes treatment of 19% of urban land with storm water BMPs in addition to requiring the agriculture or wastewater sector to make additional reductions. However, the reductions made to agriculture or wastewater are two orders of magnitude cheaper per pound of phosphorus than requiring those reductions to be made in traditional storm water retrofits or BMP installation (i.e. \$100/lb for agriculture and \$200/lb wastewater compared to \$15,000(or more)/lb for storm water).

EPA Backstop Requirements: Should the EPA impose the backstops or treatment of 50% of urban land in the Virginia TMDL, the City would likely be required to implement BMPs on all municipally owned lands and condemn significant private property for additional BMPs. The City would spend \$15M on BMPs described above and another \$84M per year on storm water storage and reuse; bringing the total annual cost to Norfolk residents at \$99M per year.

The revenue generated by the storm water utility for the City in FY10 was \$11.1M and is estimated to be \$10.8 M in FY11. These funds are used for storm water system repairs and upgrades, operation and maintenance of storm water pump stations, flood reduction, and also water quality improvement. In order to meet the requirements outlined above, the City will have to increase the storm water revenue 2 to 10 times the existing rates. In light of the economic

recession, it would be detrimental to Norfolk resident to increase their rates at this magnitude.

Recommendations: The City of Norfolk recommends that the EPA consider extending the timeframe as outlined above to give the Commonwealth of Virginia time to strengthen the WIP to avoid the EPA proposed backstops.

Response

EPA reminds the commenter that there is a legal deadline of December 31, 2010 to have the TMDL established, which does not allow for more time to strengthen WIPs. For a detailed response on WIP backstops, please see the response to comment 0067.1.001.009 and section 8 of the TMDL.

Author Name: Williams Shannon

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

IV. Has EPA Considered Implementation Issues of Each of the Bay Jurisdictions' WIP's?

A. The WIP's prepared by New York, Pennsylvania, Delaware, and West Virginia may represent what those states are actually capable of doing and not promises that more can be achieved.

1. Has EPA considered that the WIP's from the various states may have been written from different points of view and that a WIP provides no assurance that the actions promised will be achieved?

2. If the states do not have sufficient regulatory authority to satisfy EPA, what regulatory authority can EPA assert to assure that the WIP's, as written, can be implemented?

3. If the states do not have sufficient resources, financial or other, what resources can EPA provide to assure that the WIP's as written can be implemented?

Response

EPA disagrees with the commenter's assertion that the WIPs do not provide assurance that the proposed actions of each jurisdiction will not achieve the allocations of the TMDL. EPA acknowledges that each jurisdiction's WIP may differ with respect to implementation strategies in order to meet the allocations under the TMDL; however, each jurisdiction was required to provide reasonable assurance that strategies proposed in the WIP to meet the allocations could be achieved and maintained. For those jurisdictions that did not meet EPA's expectations as described in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction or meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans, EPA applied backstop allocations. EPA's evaluation of the final WIP for each jurisdiction can be found in Section 8 of the final TMDL report.

See response to Comment No. 0394.001.013 regarding EPA's regulatory authority for the Chesapeake Bay TMDL.

See Comment No. 0038.1.001.024 for sources of funding that are available for Chesapeake Watershed restoration initiatives.

Organization: Environmental Defense Fund (EDF)

In closing, we also wish to emphasize the vital importance of economics, cooperation, partnership, and resources in achieving the clean water success we all seek. The ultimate goal of the TMDL - to restore water quality to the Chesapeake Bay - must go hand-in-hand with economic viability of the communities and sectors that call the Bay watershed home. EDF fully recognizes the need and authority of the TMDL to include backstop measures, but at the same time we strongly encourage EPA to continue to seek, support, and advance innovative, collaborative, and cost-effective practices and strategies that will foster both clean water and economic sustainability. We believe this can best be accomplished by working with states to devise adequate Watershed Implementation Plans that promote such practices and strategies, ensure all sectors shoulder their fair share of the reductions, and also provide reasonable assurances, thus avoiding the need for backstop measures.

Response

EPA has worked side-by-side with its jurisdiction partners in developing the TMDL. EPA has also provided extensive hands-on assistance to the states and the District in the development of their Watershed Implementation Plans. Through the Chesapeake Bay Program committees, principally the Water Quality Goal Implementation Committee (WQGIT), as well as other stakeholder meetings, EPA has closely worked with the jurisdictions on all aspects of the TMDL. A list of meetings of the WQGIT and other meetings involving EPA and the jurisdictions are included in Appendix C of the final TMDL report.

In addition, in the time from the draft WIPs to the final WIP, EPA has worked closely with the states in identifying the deficiencies in the WIPs and bringing those issues to resolutions. Fortunately, from these efforts, the final state WIPs are much improved from the drafts. As a result, EPA has removed or reduced the backstop allocations.

20.1 - NEW YORK

Comment ID 0103.1.001.009

Organization: Tioga County Landowners Group

To continue to promote clean water conservation in the Upper Susquehanna Watershed the USC districts use a

multiple barrier approach to address nonpoint source issues. This approach addresses water quality issues at the source, across the landscape, focusing on the stream corridor, and is promoted programmatically through research, outreach and training.

The USC integrates 3 major focus areas: Wetlands, Streams and Agriculture.

Under the Umbrella of the Agricultural Team, which includes partners from NRCS, DEC, Ag and Markets, and major universities, the SWCDs promote several programs that include:

- Voluntary incentives through the Agricultural Environmental Management Program (AEM)
- Regulation through permitting of Concentrated Animal Feeding Operations (CAFO)
- Funding for implementation through the Agricultural Nonpoint Source Abatement & Control Grant Program (AGNP), and USDA Farm Bill Programs
- Support of "wall to wall" buffers through Graze-NY
- Commitment to proper nutrient management through rigorous conservation planner certification process
- Regular training for SWCD and NRCS Employees, and SWCD's Board of Directors
- Environmentally and Agronomically-sound guidelines from the Cornell University

This approach in a watershed with 70 percent forest cover, low intensity agriculture on a sufficient land base, and a decreasing population, leave little room for additional source reductions and place a disproportionately heavy burden on agricultural resources in NY.

Response

The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community or on any one sector such as agriculture. EPA allowed and encouraged jurisdictions to develop a Watershed Implementation Plan that meets the TMDL allocations in the manner most feasible for that jurisdiction. If a jurisdiction is unable to meet the targeted allocations or provide the justification on how it will meet those allocations then EPA must ensure that the TMDL allocations will be met with or without regard to cost as referenced in the response to Comment No. 0139.1.001.017. Furthermore, in EPA's professional judgement, the loadings allocated to New York is equitable. Please see response to comment # 0080-cp.001.002.

New York

Overall

New York has adopted a hostile posture toward TMDL process, noting that the "submission of this draft Phase I WIP should not be interpreted as New York's acceptance of these draft allocations.... New York has repeatedly expressed serious concerns over the fundamental fairness of these allocations..." For transparency of information, New York discloses a fair amount of specific data to establish a baseline for comparing future progress. For strength of program, the pollution control programs and authorities that are listed in New York's WIP sound promising, and the WIP boasts of being stronger than federal requirements. However, the draft WIP does not provide enough information to determine whether the strength on paper actually translates into strength in substance.

In addition, New York is highly critical of the model and the fairness of allocations. It points out that while the state constitutes 10 percent of the land area in the watershed, it receives less than 5 percent of the total nitrogen. In contrast, Maryland constitutes approximately 14 percent of the total Bay watershed but has received more than 20 percent of the nitrogen allocation. However, while not proportional to the land area, the allocations are roughly proportional to each state's actual contribution of nitrogen: New York contributes 6 percent and Maryland contributes 20 percent of the total nitrogen to the Bay.

The draft WIP would lower the sediment discharges to a level that is 16 percent below the target allocation. However, the draft WIP still permits nitrogen and phosphorus discharges to be 15 percent and 14 percent, respectively, more than the level allowed by the target allocation.[FN 17]

New York's final Phase I WIP should provide greater detail about the NPDES permitting, enforcement, and compliance program, particularly if the state intends to rely on increased enforcement as its main contingency plan if existing compliance rates and programs fail to achieve the needed reductions. The final WIP should also provide more information about the participation and compliance rates with voluntary programs for nonpoint sources of pollution.

NPDES Permitting

In the draft WIP, New York provides solid baseline information, such as statistics on the number of CAFOs and wastewater facilities, but fails to provide a snapshot of the universe of all NPDES-regulated facilities and the number of which have up-to-date NPDES permits. The draft WIP does not say when the New York's NPDES permitting program will be in compliance with the pollutant allocations in the Bay TMDL. Moreover, New York failed to establish deadlines, timelines, or qualitative goals for updating and reissuing expired and administratively continued NPDES permits. For

example, the state could commit to reissuing and updating a certain number of permits per month for a certain program and could include this target as one of its two-year milestones.

Enforcement of NPDES Permits

The draft WIP includes some information by which to judge the enforcement of NPDES permits. For example, it cites an inspection rate of 50 percent for CAFOs and a total penalty collection of \$11 million for CAFO penalties, as well as 2000 staff trained for construction site inspections.[FN 18] However, this information is incomplete. In the final WIP, New York should include a table or other graphic that clearly lays out its enforcement activities per sector. This information should include: the number of physical, on-site inspections conducted per sector; the number of violations and penalty actions or the total amount of penalties assessed; information on major facilities that are in significant non-compliance; and the level of enforcement resources.

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

The New York WIP does not discuss inspection rates or existing or needed resources to regularly monitor implementation of best management practices. In the final WIP, New York should include this information because it is crucial to providing the necessary reasonable assurances that nonpoint sources will achieve their allocation of pollutant reductions.

Contingencies

New York is relying heavily on increased enforcement and compliance activities as its contingencies. It already has the authority to conduct these activities as primary pollutant control activities. If greater enforcement is the primary contingency, however, New York should provide more detailed enforcement information to demonstrate how this contingency will be effective.

Concentrated Animal Feeding Operations

The strength of New York's CAFO program is that, together with the Agriculture Environmental Management program, 95 percent of dairies in the Bay watershed are covered, significantly more than the federal CAFO Program alone. For example, the state program covers all farms with as few as 200 cows, while the federal program only covers some farms with more than 700 cows.[FN 19] In addition, New York's CAFO program is in the process of being updated to be consistent with the new federal regulations but does not state when it will be complete. The final WIP should provide the final date for the completion of CAFO program updates and should indicate what if any changes will be made and how those changes will contribute to decreases in pollutant discharges. It should also detail how and with what funds additional staff will be hired. New York should also provide a timeline or set of goals for updating, renewing, or reissuing existing permits that contain both the Bay TMDL allocations and the federal regulations.

Stormwater

The stormwater section lists guidance for stormwater inspections and for local delegated authorities but fails to provide specific information about how the guidance, laws, and regulations will be applied to achieve reductions in pollutants from stormwater. The section refers to the state manuals but does not explain the applicable standards or otherwise

demonstrate how stormwater management will be improved.

In the final WIP, New York should take the next step beyond simply listing its authorities and include specific details about how it intends to apply these authorities.

Air Deposition

The draft WIP includes a discussion of state authorities to address air deposition of nitrogen, including the adoption of year-round NO_x limits from power plants and other stationary sources and California's low-emission-vehicle standards. The WIP does not indicate whether these authorities are sufficient to achieve the necessary pollutant reductions. The final WIP should include a more detailed analysis of the gaps in New York's air program, including what additional legislative authorities may be needed to achieve greater reductions from air sources and what funding or personnel resources are needed for this sector and how these gaps may be filled.

Comment ID 0191.1.001.007

Author Name: Smith Robert

Organization: Farm Credit East, ACA

We urge you to adopt the model refinements recommended by the New York State Department of Environmental Conservation in their Draft Phase I Watershed Implementation Plan. These model refinements reflect the environmental accomplishments that New York State farmers have already attained, and represent a more realistic and attainable objective for water quality improvement all stakeholders in the watershed seek to achieve.

Response

EPA worked closely with New York as it developed its final Phase I WIP and the associated allocations in the final TMDL. In response to New York's concerns regarding the fairness of how EPA distributed the Baywide allocations to jurisdictions, EPA increased New York's nitrogen and phosphorus allocations and approved New York's exchange of some phosphorus for nitrogen. New York still did not meet its target allocations, however, despite these increased allocations and nutrient exchanges and despite

the fact that NY's final input deck achieved significant additional reductions in both the agricultural and wastewater sectors compared to the draft WIP. EPA has closed the gap with an aggregate WLA backstop that further reduced New York's wastewater load, which is further described in Section 8 of the final TMDL.

New York's final Phase I WIP showed significant improvement in the agriculture and stormwater sectors, and there are no backstop actions against these sectors applied to New York in the final TMDL.

It should be noted that New York did not propose model refinements in its final Phase I WIP.

New York State has put forth a concerted effort to devise a draft Watershed Implementation Plan that sets forth goals to achieve realistic and attainable results, yet still fell short of the EPA's desired reductions. Due to the already low pollutant levels in New York, these required reductions cannot be met, and, therefore, the extreme expense associated with the mandates will be fruitless. Rather than imposing a penalty for the great strides that have been achieved, the successes that have been accomplished in New York should be held as a model for other jurisdictions in the Chesapeake Bay Watershed.

Response

Author Name: Wells Wayne

Organization: Cameron Committee for a Safe Environment (CCSE)

I live in Cameron NY on a tributary to the Canisteo River in the upper Chesapeake Bay watershed and downstream from the Dickson waste disposal "farm" Corp. The Dicksons use about 1,000 acres in Steuben county in three towns under the names Leo Dickson & Sons Inc. and Dickson Environmental Services Inc. Since 1986, when the Dicksons began using farm land for the disposal of industrial sludges, our community has seen a degradation (at times severe) of our air and water quality.

NYDEC permits land application of wastes for the Dicksons. The Dickson Corp. is the largest private bio-solid land applicator in NY state and from the inception of their sludge business, which began with the construction of a six million gallon lagoon, they have NOT been in compliance with good farming practices or NYDEC's own regulatory directives.

I organized neighbors under the Cameron Committee for a Safe Environment (CCSE) to force compliance of the Dickson operation to DEC regulations with limited success. Our documentation of Dickson violations culminated in the closing down of their lagoon in 1993 and led to a few token fines. Air and water pollution from their waste application practices that include the failure to use any set-back buffers from roadside ditches, continued with ongoing and new documentation being submitted to NYDEC region 8 as late as this Spring and Summer regarding severe field erosion.

I noted from the NYDEC WIP Draft document dated 9/1/10 pg.15 this statement: "....., must adhere to stringent setbacks for nutrient applications in farmlands adjacent to New York's waters, must control erosion on crop fields and must make nutrient applications in accordance with science-based nutrient management plans." Here the EPA might wish to see the Dickson Corp. annual reports showing phosphorous loadings. Further on the Draft reads: "It is these stringent

technical standards and the CAFO program's proven rate of implementation and enforcement that protects water quality. Professional management of waste at these facilities is critical to protection of water quality. That professional management is ensured by the New York CAFO permit program." the following under CAFO program highlights: "New York requires erosion control to "tolerable Soil Loss" on all CAFO crop land," and the stand alone statement: "High level of regulatory oversight" ending "CAFO program highlights" from NY state Draft WIP. These statements imply a nonexistent reality with the past history of dealings and observations of the Dickson Corp. & NYDEC regulatory enforcement since 1986 to the present. The pattern of violations by the Dickson Corp. have ranged from the sloppy to willful disregard of DEC health and safety provisions in handling and applying of bio-solid wastes and municipal sewer sludges let alone no visible efforts to date for controlling erosion through "best farming practices" in spite of New York's Agricultural Environmental Management (AEM) or Co-Operative Extension programs.

It might be interesting to the Commission that the period 1995-2006 the Dickson Corp. had received \$797,619.00 in farm subsidies including conservation subsidies, over double any other local farm operation as a way to gage the scale of their business relative to surrounding farm operations.

Relevant to the issue of cleanup efforts for the Chesapeake Bay is the past unwillingness of the NYDEC or effective impacts from County Co-operative Extension and AEM programs to bring bad actors such as the Dicksons into compliance with the aims of preventing ongoing erosion and runoff that is responsible for excessive phosphorous and other contaminant containing sediments from flowing into the streams and rivers each time we get heavy rains or snow melt during Spring runoff. This in spite of the CCSEs repeated efforts to bring this to the attention of DEC with credible documentation for 24years.

Response

EPA will hold each jurisdiction accountable for implementing the practices and programs as identified in its final Phase I WIP and provide sufficient reasonable assurance that nonpoint source reductions will be achieved and maintained through credible and "enforceable or otherwise binding" strategies.

In order to ensure reasonable assurance, EPA is committing to enhanced oversight actions in those jurisdictions whose final Phase I WIP did not fully meet EPA's expectations. As a result of this enhanced oversight, EPA will consider future backstops and may take additional federal actions consistent with its December 29, 2009 letter should the jurisdictions not demonstrate sufficient progress in their Phase II WIPs. EPA also is committed to maintaining its ongoing oversight for the Chesapeake Bay jurisdictions, with the goal of ensuring that the jurisdictions successfully implement their final Phase I WIPs and 2-year milestone commitments. EPA is prepared to take necessary federal actions – such as permit objections, conditioning of federal funds, and targeted compliance and enforcement actions – should these goals not be met.

Organization: Cornell Law School Water Law Clinic

Local communities in New York are willing to go beyond existing regulatory and nonregulatory water protection efforts. In its evaluation of New York's draft Phase 1 WIP, EPA points out the need for more information on how enhancements to current water quality programs will be implemented.[FN 12] Responding to this, we point out that EPA should recognize the contribution of these local initiatives in its TMDL implementation strategy for New York and, more practically, capitalize on these local initiatives by directing grant resources towards enhancing their capacity. The following sections describe these initiatives and our related recommendations in greater detail.

A. Road Drainage in Rural Areas

The extensive network of rural roads and highways in the New York portion of the watershed makes roadside ditches a major pollutant pathway. New York municipalities have approached this challenge as an opportunity to abate nutrient and sediment loading in stormwater runoff in innovative ways.[FN 13] For example, although it is not a regulated MS4, the Town of Danby voluntarily adopted a stormwater ordinance that incorporates New York State's Phase II Stormwater regulations to address erosion and sedimentation. Additionally, the Town created a special task force to explore the development of an enhanced drainage management scheme to reduce pollutant loading in stormwater runoff-this scheme could serve as a model for similar headwater communities.

Working with the Cornell Law School Water Law Clinic, the neighboring towns of Caroline and Newfield, the Tompkins County Soil and Water Conservation District and the Upper Susquehanna Coalition, Danby proposes to develop and implement practical drainage management practices and regulations that will retard nutrient and sediment delivery to local water resources and the Chesapeake Bay while minimizing financial hardship. In targeting pollution sources that are unique to the hilly and flood-prone landscape of rural New York, the enhanced drainage management scheme will focus on: (1) road ditching practices, especially those on the region's many unpaved town roads, logging roads, and other access and back roads; (2) impervious surfaces; and (3) stormwater controls that focus on retaining the natural features of the watershed hydrology.

In evaluating New York's draft Phase I WIP, EPA observes that the state could "consider more controls on state and county roads to reduce loads from impervious surfaces outside MS4 communities." [FN 14] Innovative and aggressive efforts such as the Town of Danby's proposed enhanced drainage management scheme directly respond to this need.

Recommendation:

- Although roads and ditches play a central role in pollutant transport and delivery, they are often neglected in conventional stormwater management programs. To help New York fill this gap, EPA should provide support to local initiatives such as the enhanced drainage management scheme proposed by the Town of Danby in its final Bay TMDL implementation strategy.

B. Urban Stormwater Management New York communities are also willing to do more to reduce pollutant loading from urban land, using both enhanced regulations and additional incentive-based methods. As an example, the Otsego County Soil and Water Conservation District and the Cornell Law School Water Law Clinic are currently working on a model stormwater ordinance for the City of Oneonta's consideration. The ordinance is intended to create a comprehensive green infrastructure program that would control runoff from the city's impervious surfaces through a combination of targeted stormwater projects, regulatory requirements for both new and existing development, and retrofit incentives.

To retrofit its public infrastructure, Oneonta is prepared to consider forming an interdepartmental task force that would site a stormwater retrofit demonstration project, write new specifications for future street reconstruction and other projects, and estimate annual spending increases for green infrastructure construction and maintenance. As incentives for green infrastructure such as green roofs and urban gardens, Oneonta is also prepared to consider property tax abatements, grants, or cost-share agreements.

Additionally, Oneonta is prepared to consider regulations that would limit runoff from new development, require rooftop or rain barrel retention for all buildings, require landscaping or permeable pavement on commercial and multi-family residential complex driveways and parking lots, as well as vacant lots, and charge a stormwater fee upon non-compliance. These are "strong, unqualified, enforceable performance standards" that go beyond "referencing a manual," as EPA has said in its evaluation of New York's draft Phase I WIP.[FN 15] A model urban green infrastructure program such as that being pursued by the City of Oneonta can be replicated in other areas of the watershed to reduce nitrogen loading from urban land.

Recommendation:

- Because reducing pollutant loading from urban land is an important gap-filling strategy for New York, Chesapeake Bay Program resources should be directed towards promoting the program.

[FN 12] Supra note 12.

[FN 13] See WIP I at 44.

[FN 14] Supra note 12 at 2.

[FN 15] See supra note 8 at 2.

Response

EPA commends New York for coming up with implementation strategies to reduce pollutant loadings from stormwater and urban

lands. The WIPs are part of the accountability framework outlined in the Chesapeake Bay Protection and Restoration Executive Order 13508 and EPA does not have authority to draft the WIPs on behalf of the jurisdictions or mandate specific details of the WIPs developed by each jurisdiction. The WIP helps ensure implementation of the Chesapeake Bay TMDL but is not an approvable part of the TMDL; therefore, EPA cannot require jurisdictions to implement practices that are outside of EPA's regulatory authority. EPA encourages New York to replicate programs such as those referenced in this comment to meet its wasteload allocations under the Chesapeake Bay TMDL.

Successful implementation of the Bay TMDL will also require enhancement of legal understanding among community decision-makers, especially in rural areas where it may be difficult to gain access to useful information. To fill this gap, the Cornell Law School's Water Law Clinic is pursuing a project, called "Follow the Water," to compile and explain the legal framework surrounding water quantity and quality issues and to facilitate information exchange amongst local communities using an online blog.

By presenting the legal framework of federal, state, and local water law in a layperson-accessible format, the blog will provide local governments the legal tools they need to amend or strengthen their stormwater regulations and also to protect local wetlands as required by the Clean Water Act and the New York State Articles of Environmental Conservation, which provide for stricter wetland protections than does the Clean Water Act itself. Additionally, the blog will allow communities to share their programs, thereby helping other local governments enhance their own stormwater regulations, local wetland ordinances, stream corridor ordinances, and floodplain protective measures.

While the main focus of the Bay TMDL is water quality, the high risk of flash flooding in the New York portion of the watershed requires a strategy that also accounts for water quantity challenges, because the volume and energy of such floods can cause heavy loads of sediment and other pollutants to move quickly into streams. One avenue is for local communities to enact permit systems and other regulations to prevent and mitigate the impacts of flooding on local water resources. To promote this, the Clinic is working to explore the authority of local governments to regulate land use and development in flood plains by discussing existing approaches and considering new ones. We will also provide an online forum for communities to share successful implementation strategies, to express concerns and problems, and to exchange water policy information.

Recognizing that education is a critical tool in the protection of water resources at the local level, the Clinic also seeks to strengthen understanding of water issues by individual community members. Following programs such as Project WET, which demonstrates the effectiveness of strengthening community understanding of water issues through high schools, the Clinic is developing a curriculum for high school students. The curriculum addresses water pollution and protection issues within their legal framework. This complements other work with communities by the Clinic that is designed to strengthen capacities to protect water resources at the local level.

Response

EPA agrees that education and public outreach is a useful tool in water quality initiatives and implementation of the Chesapeake Bay TMDL.

Through concerted and coordinated efforts, New York State devised a draft WIP to meet the EPA mandate using the existing Tributary Strategy as the springboard to achieve realistic and attainable results for nutrient and sediment reductions. However, this fell short of the EPA's desired reductions. Rather than impose penalty for New York's achievements, the EPA should use New York as a models for other Bay states.

3. The Department of Environmental Conservation developed a reasonable WIP for BMP implementation that considers budget limitations for NY. The draft WIP is based on realistic estimates of technical and financial support that may be available for ag BMPs through 2025.

Response

EPA had an expectation for all states that their WIPs identify existing tools or recommend new tools (like funding) to implement the needed controls to achieve the loads allocated to the states. EPA found major deficiencies in the NY plan because it did not identify adequate tools to achieve the allocations. For example, a fundamental need of the plan is to identify controls that will achieve the loads for that states established by EPA. Not only did the draft NY plan did not achieve this basic requirement, the draft NY plan had point source controls that were much less than any other state in the watershed. While the final plan is improved, some deficiencies exist. EPAs determination on the final NY plan can be found in Section 8.

Comment ID 0466.1.001.008

Author Name: Suarez Julie

Organization: New York Farm Bureau (NYFB)

It is critical that when discussing nutrient management planning, EPA consider geographic and climatic differences within the watershed. This is particularly true when considering restrictions on winter spreading and the establishment of cover crops. There is a difference, for example, in the number of growing degree days in Maryland and New York. This creates a situation where New York farms would feel a greater impact on their operations because of restricted winter manure spreading. It also means New York farms have a more limited time between harvest and winter weather in which to plant cover crops. Rather than establish specific BMPs in regulations, each state should have the flexibility to focus on the installation of BMPs that are geographically and climatically practical and appropriate.

For this reason, New York Farm Bureau strongly opposes the banning of winter manure spreading. Small farms cannot

afford the immense capital cost of installing manure storages. It is much more cost effective for both farms and taxpayers to instead utilize science-based nutrient management planning to identify appropriate, low-risk fields for winter manure spreading.

Response

On May 12 2010, the EPA published guidance for federal land management in the Chesapeake Bay watershed under Section 502 of the Chesapeake Bay Executive Order. EPA's objective in developing the guidance is to provide the information that will allow federal agencies to lead by their example. The guidance provides information and data on appropriate proven and cost-effective tools and practices for implementation on federal lands and at federal facilities. EPA's 502 technical guidance addresses these concerns. EPA asserts that the winter application of manure is a waste disposal method. Continued winter spreading will not meet the objectives of optimizing yields and protect streams, rivers, ponds, and groundwater. Furthermore, the application of manure on cover crops negates the nutrient removal benefit derived from their application according to the Chesapeake Bay Program as it relates to nutrient reductions calculated by the Watershed Model. Applying manure to land where there are no growing crops (only residue) is not a long term solution to manure management. A study done in New York, by Lewis and Makarewicz (2009), reported significant decreases in winter concentrations of TP, soluble P, TKN, and NO₃-N following cessation of winter dairy manure application to cropland.

Comment ID 0515.1.001.015

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

Like the TMDL, the New York draft WIP-I does not identify any funding sources for carrying it out (perhaps the NYS-DEC should "be bold" in its final WIP-I and call on federal government to provide at least 80% of the cost of restoring the Bay in line with the Chesapeake Bay Executive Council's 2005 financing proposal (discussed below) as well as President Obama's declaration of the Bay as a "national treasure"?). Neither the TMDL nor the WIPs can self-implement.

We support NYS-DEC's call for modeling corrections and improvements as outlined in the New York draft WIP-I, and we call on the EPA to expressly and fully address each and every comment and criticism by NYS-DEC of the Bay watershed modeling and the TMDL process followed by the EPA.

Nevertheless, we are concerned that the New York draft WIP-I which, as observed in our October 29, 2010 letter (on-line Comment Docket Comment Attachment #145.1), has not yet entered a public comment period, "unlevels the playing field" and sacrifices the economic vitality of our Binghamton-Johnson City Joint Sewage Treatment Facilities' service area by requiring significantly enhanced denitrification of us that is not required by NYS-DEC of other significant New York WWTPs in Bay Watershed, so we support the EPA's criticism of the New York draft WIP-I to the extent that the EPA objects to the NYS-DEC's proposed assignment of widely varying nitrogen discharge limits to WWTPs and, instead, calls on New York to maintain a "level playing field". In the absence of specific climate or operational differences, or disproportionate local contribution to degradation of the Bay, all New York significant WWTPs of 0.5

MGD or larger should be regulated to the same uniform standard so as not to impose an inequitable financial burden on certain "target" communities (for example, those served by larger wastewater treatment facilities) without requiring similar participation by the same sectors in other Bay watershed communities. Nevertheless, the EPA should not blindly require NYS-DEC to force a "one size fits all" set of requirements uniformly on all Bay watershed territories within NY's jurisdiction (i.e., certain all-rural counties can better participate/contribute as to agriculture/open-space BMPs, while counties with urban lands can contribute via WWTPs/MS4s/CSOs), so we do support that some flexibility should be afforded to state governments for good cause to vary the specifics of their implementation plans based on differences in the characteristics of communities and counties, as long as the New York WIP and NYS-DEC administration and/or enforcement of an EPA-mandated TMDL are not carried-out in a way that places an excessive burden on some sectors and/or communities without fairly distributing the responsibility for meeting the goals to be achieved. To do otherwise creates financial and practical disincentives for industries and residents alike to locate or remain in the more stringently-regulated communities and, conversely, incentivizes siting decisions by industries into less stringently-regulated communities where, for example, their wastewater discharges would not be as well-treated to the high water quality standards necessary to meet either the TMDL goal or the Bay's needs.

We also believe that the NYS-DEC has unrealistic expectations for what our Facilities' denitrification upgrade - contracted by the Facilities' Owners to meet an average monthly maximum 6 mg/L effluent TN standard - will produce. Our "real world" experience shows us that meeting the contracted-for standard (which is what the Permit requires) is not without significant challenges, especially given seasonal variations in influent temperature as outlined above.

Because the draft WIP-I has not been opened for public comment yet, nor has a corresponding SEQR process begun, the EPA is - in essence - requiring New York to violate its own environmental protection laws by compressing the time for development and submission of the WIP-I to the EPA before the TMDL is finalized.

EPA's commentary on New York's draft WIP-I to the effect that "reasonable assurance" is lacking for the performance and effectiveness of New York's WIP-I efforts rings hollow. New York's exemplary environmental stewardship and non-impaired WQ at the Pennsylvania border should be given full consideration. New York's historical performance and "good deeds" with respect to environmental matters should count for far more than the mere words contained in a draft document. The NYS-DEC has consistently pursued high WQ standards and - as we know from first-hand experience - has not hesitated to pursue criminal complaints, consent orders, and other enforcement means to preserve and protect our local WQ. As mentioned above, the NYS-DEC has taken the lead in updating its stormwater management "toolbox" and MS4 regulations, including tough new mandated engineering requirements in the planning, implementation and operation stages. In sum, New York's overall course of conduct with respect to the Bay watershed and other areas of the state should afford the EPA more than adequate assurance that New York will continue to meet its WQ obligations to the Bay watershed.

Response

Please refer to response to comment 0228.1.001.002. EPA's evaluation of the final WIP can be found in Section 8 of the final TMDL report.

Comment ID 0600-cp.001.001

Author Name: Herrala G.

Organization:

New York's farm communities in the Bay watershed have serious concerns that U.S. Environmental Protection Agency Region 3 (USEPA R3) has not accurately accounted for all pollutant reduction factors which are distinct and unique to New York. Unlike other Bay watershed states, New York's small portion of the Chesapeake Bay watershed is characterized by low population growth, low intensity agriculture, forest and high water quality. This is significant because the brunt of any nutrient load allocation requirement will fall squarely on our small family farms in the Bay watershed region in the absence of any other significant industry or population centers to satisfy USEPA R3 pollutant reduction targets.

Since 2004, the NYS DEC, in partnership with the New York State Department of Agriculture and Markets, has been implementing a practical, programmatic, state-wide approach to nutrient and sediment reduction which has resulted in marked improvements to the Susquehanna River Basin region and, thereby, the Chesapeake Bay watershed. These existing state water quality and agricultural environmental management programs have established practices and standards which exceed federal minimum requirements and pre-date any EPA mandate.

For these reasons, please revise New York's Chesapeake Bay Total Maximum Daily Load (TMDL) allocation to a realistic and adopt the model refinements recommended by NYS DEC in their Draft Phase I Watershed Implementation Plan.

Response

EPA worked closely with New York as it developed its final Phase I WIP and the associated allocations in the final TMDL. In response to New York's concerns regarding the fairness of how EPA distributed the Baywide allocations to jurisdictions, EPA worked closely with New York as it developed its final Phase I WIP and the associated allocations in the final TMDL. In response to New York's concerns regarding the fairness of how EPA distributed the Baywide allocations to jurisdictions, EPA increased New York's nitrogen and phosphorus allocations and approved New York's exchange of some phosphorus for nitrogen. New York still did not meet its target allocations, however, despite these increased allocations and nutrient exchanges and despite the fact that NY's final input deck achieved significant additional reductions in both the agricultural and wastewater sectors compared to the draft WIP. EPA has closed the gap with an aggregate WLA backstop that further reduced New York's wastewater load, which is further described in Section 8 of the final TMDL.

New York's final Phase I WIP showed significant improvement in the agriculture sector, and there are no backstop actions against the agricultural sector applied to New York in the final TMDL.

It should be noted that New York did not propose model refinements in its final Phase I WIP.

Comments from the Chesapeake Bay Foundation on New York's Draft Watershed Implementation Plan November 4, 2010

On behalf of the Chesapeake Bay Foundation's (CBF) more than 200,000 members please this letter as formal comment on the Chesapeake Bay Nitrogen, Phosphorus and Sediment Maximum Daily Loads, New York Draft Phase 1 Watershed Implementation Plan (WIP) prepared by the New York State Department of Environmental Conservation (DEC). Also, incorporate by reference the comments submitted by the Chesapeake Bay Foundation, Cho Clean Water Coalition, and Rebecca Hanmer on the Chesapeake Bay TMDL, Docket no. E R03-OW-2010-0736.

We very much appreciate the dedication of the many state agency staff that contributed to t draft WIP. We further thank the state for the opportunity to comment upon this critical wo Unfortunately, the draft WIP falls far short, not only of achieving the necessary load alloc, for nitrogen, phosphorus, and sediment called for in the draft Chesapeake Bay Total Maxin Daily Load (TMDL), but also in providing the necessary reasonable assurance that the prol policies, and other necessary actions will be put in place by 2025.

As you know, the process of developing the Bay-wide TMDL actually began over a decade with a series of federal judicial consent decrees and settlement agreements over impaired listings for many watershed states . See American Canoe v. EPA, 54 F. Supp. 2d 621 (E.D. 1999). On June 28, 2000, the governors of Virginia, Maryland, and Pennsylvania, the chai the Chesapeake Bay Commission, and the Mayor of the District of Columbia responded to various decrees and agreements by signing, with the EPA Administrator, Carol Browner, the Chesapeake 2000 agreement which, among other things, committed to reduce nitrogen, phosphorus, and sediment sufficiently to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. In the fall of that same year, Governor Pataki of

New York a formal agreement to work with the other jurisdictions to "achieve the nutrient and sediment reduction targets . . . to achieve the goals of a clean Chesapeake Bay by 2010."

In December 2003, the EPA, New York and the other Bay jurisdictions agreed to the nitrogen phosphorus and sediment allocations that became the basis for "tributary strategies," designed to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. New York its own tributary strategy in 2006. [FN1] There, New York observed that "to meet Bay restoration goals, a substantial amount of nutrient reduction from New York is necessary." (p. 18) They noted the waste load and load allocations assigned by the Chesapeake Bay Program and believed that its tributary strategy was a practical means to meet those allocations. (p. 17) However, the Bay was not de-listed and the failure to achieve that goal triggered the need to develop the TMDL - a process in which New York has been a full participant.

New York has raised concerns about the fairness of the TMDL allocation process. We find these concerns to be unjustified. The TMDL load allocations were equitably and fairly distributed to the Bay jurisdictions, based on the following 3 principles, paraphrased here: 1) the allocated loads should result in attainment of all applicable tidal water quality standards; 2) major basins that contribute the most to the water quality problems must do the most to resolve those problems; and 3) all tracked and reported reductions are credited toward achieving the assigned loads.

In its WIP, DEC complains that "...New York makes up about 10% of the total Bay watershed and receives less than 5% of the total nitrogen allocation to the states. Whereas, Maryland, which makes up about 14% of the total Bay watershed, receives more than 20% of the available nitrogen allocation." (p. 5) But, when you look at the reductions that must be achieved, New York is doing disproportionately less than most other jurisdictions. Using the same comparison of New York and Maryland, New York is responsible for roughly 4% of nitrogen load reductions from a 2009 baseline, whereas Maryland needs to reduce its loads by almost 18%, even though, on a proportional and total load basis, Maryland made greater progress reducing loads from 1985 until the present. In addition, if one looks at reductions needed on a "per acre" basis - NY ranks 6 out of the 7 bay jurisdictions i.e., reductions equivalent to 0.6 lbs N/per acre compared for example with PA and DE who need to achieve reductions of 2.05 and 2.71 lbs/per acre, respectively.

DEC has also argued that the necessary pollution reductions are unachievable for New York. We disagree. Taking nitrogen reductions as an example, New York has to reduce nitrogen pollution by roughly 2.3 million pounds from 2009 levels. Modeling scenarios that simulated the maximum rate of implementation of pollution reduction practices in New York would result in an additional 2 million pounds of N reductions. Hence, what NY is being asked to do, does not equate to doing every practice on every acre of farmland. Furthermore, cleaning up New York's waters, many of which are also degraded for nutrients and/or sediments, will improve local economies by enhancing recreational opportunities associated with fishing, swimming, etc.

As described in DEC's most recent Watershed Inventory/Priority Waters List reports for the Susquehanna and Chemung river basins, many of the streams, rivers and lakes are currently degraded due to agricultural activities. [FN2] In the Chemung River Basin, sediment and nutrient-related impacts, primarily from agricultural activities, are affecting about one-third of the basin river miles. For the Susquehanna River basin, the impacts are fewer; however, roughly one-third of the rivers and streams in the basin have not been assessed. The list of waterways affected by agriculture includes, but is not limited to:

- Madison County: Payne Brook and tributaries, Lebanon Reservoir, Ostelic River and tributaries
- Broome County: Whitney Point Lake, tributaries to lower Susquehanna River

- Chemung County: Lower/Mainstem Chemung River, Seeley Creek
- Steuben : Cohocton River, Five Mile Creek, Twelve Mile Creek.

Many others waterways are also impacted by silt and sediment erosion. However, only a few of these impacted segments are officially listed on the state's Section 303(d) list as impaired.

Reasons for this are twofold, first, as noted above many streams and rivers have not been assessed, and second, the subjective method of listing that DEC employs . By its own admi "best professional judgment" is used in determining whether waterbodies that violate disso oxygen standards should be listed as impaired. [FN3] This approach is overly subjective. The Environmental Protection Agency in their guidance on this issue recommends the states clc articulate their decision rules regarding listing and reasons for excluding data. [FN4] We believ York's listing process is flawed, and, in fact, violates the Clean Water Act.

To restore local rivers and streams and, ultimately, the Chesapeake Bay, we strongly encou the state to provide the necessary details in their WIP for how they will achieve the necess reductions by 2025, consistent with EPA's letters to the Principals' Staff Committee of September 11, 2008, November 4, 2009, and April 2, 2010. New York's responsibility to develop an adequate WIP that meets the Bay TMDL allocations and provides reasonable assurances of required pollution reductions is founded on the firm requirements of federal I

The Clean Water Act (CWA or Act) [FN5] provides the basis on which the draft WIP must be evaluated. Enacted in 1972 to compel the restoration of the nation's waters, [FN6] the CWA reqi the states to establish water quality standards and to take the necessary actions, including tl by upstream states, to ensure that the waters meet those standards, thereby achieving CWA goals. [FN7] If a state does not promulgate water quality standards or falls short of CWA requirements in doing so, EPA will set the standards for the state. [FN8] The CWA prescribes tlof technology-based effluent limitations for most point sources discharges [FN9] and, if those measures do not achieve water quality standards, the Act requires the use of water quality- controls under Section 303(d). [FN10]

The draft WIP forms part of the CWA's § 303(d) TMDL program, which requires identific and listing of all impaired water bodies within a state's borders. For each listed segment, S 303 and implementing regulations require the state to establish a TMDL for specified pollutants. [FN11] A TMDL is the maximum amount of a pollutant -- from background, point at nonpoint sources, together with a margin of safety -- that the water body can receive and st attain water quality standards. [FN12] These requirements apply to both point and nonpoint sour pollution. [FN13] When triggered by CWA requirements, the states and EPA are required to establish a TMDL, as courts have recognized. [FN14]

Once a TMDL is established and approved by EPA, the affected states must adequately implement it to ensure water quality goals are attained. Thus, CWA § 303(e)(1) requires each state to have a continuing planning process that results in implementation plans for all navigable waters within state boundaries, which include effluent limitations and compliance schedules as required, § 303(d) TMDLs for pollutants, and "adequate implementation, including schedules of compliance, for revised or new water quality standards," including those of downstream states. [FN15] Resort to a TMDL is the CWA's "backup" strategy for achieving water quality standards; it is invoked when point source permits and best management practices (BMPs) for non-point sources (NPS) have not succeeded. [FN16] Accordingly, EPA may only approve a state-submitted implementation plan that provides assurances it will succeed in "implement[ing] applicable water quality standards." [FN17]

What constitutes reasonable assurances will vary depending on the water body and the pollution sources at issue. [FN18] In the case of TMDLs for waters impaired only by point sources, National Pollutant Discharge Elimination System permitting may be sufficient to provide reasonable assurance that the TMDL's waste load allocations will be achieved. For waters impaired by both point and nonpoint sources, a TMDL may not allocate WLAs based on an assumption that NPS load reductions will occur unless the TMDL provides reasonable assurances that NPS control measures will achieve expected load reductions. [FN19] The bottom line is clear, however: To carry out CWA's command to ensure water quality standards are attained, EPA must be able to determine that a plan's claimed load allocations are not based on excessively optimistic hopes concerning the amount of NPS pollutant reductions that will occur. "If the reductions embodied in load allocations are not fully achieved because of a failure to fully implement needed NPS controls, the collective reductions from point and NPS will not result in attainment of the water quality standards." [FN20]

The current draft WIP from New York does not satisfy the requirements of the Clean Water Act. For one, it fails to achieve the necessary allocations for nitrogen, phosphorus and sediment and two, it fails to provide the necessary reasonable assurance that the required reductions will be achieved.

We sincerely hope that the final WIP submitted to EPA is sufficient, so as to avoid the need, EPA to invoke the "backstop" provisions in its proposed TMDL.

Organization: Southern Tier East Regional Planning Development Board (STEPDB)

Southern Tier East Regional Planning Development Board (STERPDB) recognizes the importance of a healthy and thriving Chesapeake Bay and commends the efforts to restoring the Bay's ecosystem. However, we feel that the EPA's draft TMDL is inequitable, unattainable, and threatens to be punitive to our State and our local economies. We support the position of the New York State Department of Environmental Conservation (NYS DEC) and its water quality partners, and their assessment as put forward in the draft Watershed Implementation Plan.

NYSDEC and other Statewide Programs

Many of the State-wide and regional programs to support the Bay TMDL program are described in the draft New York Phase I Watershed Implementation Plan (NY WIP) submitted in September 2010 by the New York Department of Environmental Conservation (NYSDEC) to support the Bay TMDL program. Just a few of these programs are listed below. Please refer to the proposed NY WIP for more details on these programs.

1. Dishwasher Detergent and Nutrient Runoff Law

In keeping with its long standing practice of being proactive and a leader on environmental issues which affect the State and its regional neighbors, the New York Legislature, during its 2010 session, passed the "Dishwasher Detergent and Nutrient Runoff Law" [FN3]. This law updated New York's existing ban on phosphorus in most detergents, by expanding the prohibition to dishwasher detergent which was not in common usage when the first ban was passed in the early 1970s. Studies have shown that dishwasher detergents can account for 9 to 34% of total phosphorus in municipal wastewater. It also banned, with few exceptions, the use of phosphorus containing lawn fertilizers in New York beginning on January 1, 2012. Lawn fertilizer typically contains up to 3% phosphorus and can account for up to 50% of the soluble phosphorus in stormwater runoff from lawn areas [FN4].

2. 2008 Revision of Wastewater Treatment Plant Discharge SPDES Permits

Twenty-eight "Bay Significant" wastewater treatment plant have been identified in the Draft Bay TMDL. Twenty six of these are municipal wastewater treatment facilities and two are agricultural-related industrial facilities. In 2008 NYSDEC began issuing SPDES permit modifications to these WWTPs that require maintenance of current nutrient removal performance by including nutrient Action Levels based on recent effluent data. These modified SPDES Permits also include a schedule of compliance requiring the implementation of nutrient removal optimization with a goal of achieving effluent levels of 12mg/L nitrogen and 2.0 mg/L of phosphorus. Finally, these permit revisions also require the submitting of reports with the results of an engineering analysis of feasibility and costs of greater levels of treatment. A conceptual design which would allow nutrient on effluent level to fall to 5.0 mg/L total Nitrogen (Nt) and 0.5 mg/L total Phosphorus (Pt). The intent of the engineering evaluation is to gather reliable facility specific data, including costs, to help NYSDEC identify appropriate site-specific remedies and priorities of subsequent capital investment in such significant infrastructure.

3. New York Has a Strong CAFO SPDES Permitting Program Which Is Working

New York State is now into the third five-year cycle of the State Pollution Discharge Elimination System (SPDES) permit for concentrated animal feeding operations (CAFOs). The New York permitting program applies to both medium and large CAFOs. As required in the most recent (2009) State (ECL) version of this permit [FN5]:

Medium CAFOs newly authorized under this ECL General Permit must: (1) have all nonstructural practices identified in the CNMP fully implemented, unless the Agricultural Environmental Management (AEM) certified planner and the owner and operator determine that a structural practice not yet scheduled to be installed is required in order for the nonstructural practice to be fully operational, (2) be in compliance with the implementation schedule requirements in Part III.C. of the ECL General Permit and (3) be appropriately operating and maintaining all practices implemented prior to obtaining permit coverage.

Large CAFOs newly authorized under this ECL General Permit will need to have a fully implemented CNMP prior to obtaining permit coverage.

In 2005 a Senior Extension Associate with PRODAIRY in the Cornell University Department of Animal Science and others described the successes of the New York CAFO SPDES permitting program to that point in time:

Implementing this aggressive permitting program has been challenging, but it has proceeded exceedingly well. Participation of large CAFOs in the permitting process is believed to be 100 percent. The vast majority of medium and large CAFOs have developed a Comprehensive Nutrient Management Plan (CNMP), and many have implemented dozens of structural and managerial practices with numerous more changes scheduled through 2009 and beyond. Reports indicate that farm inspections by personnel from the Department of Environmental Conservation (DEC) find that most operations are making good progress, with some experiencing a few minor, mainly technical violations. Dozens of private and public sector planners regularly attend training sessions to keep up to date on the latest developments in CAFO planning, science, and policy. The annual Northeast Region Certified Crop Advisor Training held in December and the annual Water Quality Symposium in March offer numerous hours of beginner and advanced CNMP training, including updates on new research, tools for planning, and environmental related sessions. A strong partnership has developed between the New York State Departments of Agriculture and Markets and Environmental Conservation, the U.S. Department of Agriculture Natural Resources Conservation Service (NRCS), Cornell University and Cornell Cooperative Extension (CCE), the New York State Soil and Water Conservation Committee, and soil and water conservation districts (SWCDs). This partnership fosters communication links among the organizations so that multiple priorities and perspectives can be balanced. [FN6]

4. Local Water Quality Improvement Efforts

In addition to the above State-wide efforts, a number of local entities have contributed to the ongoing efforts to reduce nutrient and sediment discharges to the Bay watershed over the last twenty-five years, which are discussed throughout these comments.

a. NY Soil & Water Conservation Districts and Farm Bureau Programs

The New York Farm Bureau is a non-governmental, volunteer organization financed and controlled by member families for the purpose of solving economic and public policy issues challenging the agricultural industry. For over 65 years, New York State's 58 County Soil & Water Conservation Districts have been providing assistance to landowners, organizations, businesses and local government in the management of natural resources. Established under State law as local government subdivisions, Districts have the unique ability to work on both public and private lands to implement conservation programs that address local needs, while advancing state and federal objectives for protecting natural

resources.

Because of their proven ability to identify potential concerns, and implement solutions that serve to correct and prevent problems, Districts are the local go-to agency for an expanding range of issues. Districts are taking a proactive approach to meeting growing community needs, along with an increased workload resulting from new state and federal requirements, by broadening their programs and technical services. In addition to expanding assistance in traditional focus areas such as agriculture, Districts are diversifying into emerging issues including:

- stream and riparian area restoration
- storm water management
- watershed management
- wetland protection and mitigation
- drinking water protection
- habitat protection and enhancement
- emergency action planning
- flood protection and emergency response
- forest management and urban forestry
- onsite wastewater systems
- open space and farmland protection

Within the 16 County SWCD located in the Bay Watershed, well over 40 million dollars has been invested in our Ag Communities, Stormwater Management, Stream Stabilization, and Wetland Restoration since 1985.

b. The Chemung County Stormwater Coalition

This stormwater Coalition was formed in 2002 to address the Phase II Construction Permit requirements for the MS4's in Chemung County. Its Stormwater Team has been includes a NYS licensed engineer, an environmental educator, and an erosion/sediment control technician that serves the municipalities of Chemung County. The MS4s in Chemung County include the City of Elmira, the Town of Elmira, the Town of Southport, the Town of Big Flats, the Chemung County Department of Public Works, the Town of Horseheads, the Town of Horseheads, the Town of Millport, the Village of Elmira Heights, the Village of Wellsburg, and the Town of Ashland. The mission of the Coalition is to protect and improve water quality and natural resources in Chemung County with the involvement of citizens and agencies through planning, education, coordination, funding, project implementation and advocating for our water resources through a Stormwater Management Program. For each of the last 3 years, the eighteen municipalities within Chemung County have supported the Stormwater Team, each paying a portion of the \$300,000.00 per year budget for the Coalition. Between this and other funding, well over a million dollars has been spent on Stormwater over the past three years.

c. Upper Susquehanna River Coalition

The mission of the Coalition is to protect and improve water quality and natural resources in the Upper Susquehanna River Basin with the involvement of citizens and agencies through planning, education, coordination, funding, project implementation and advocating for our water resources. The USC integrates 3 major focus areas: Wetlands, Streams and Agriculture. To continue to promote clean water conservation in the Upper Susquehanna Watershed, the USC

districts use a multiple barrier approach to address nonpoint source issues. This approach addresses water quality issues at the source, across the landscape, focusing on the stream corridor, and is promoted programmatically through research, outreach and training.

d. Efforts at Municipal Wastewater and Water System Operations within the New York Portion of the Bay watershed

A number of municipal wastewater and water systems within the New York State portion of the Bay watershed have taken voluntary actions with the objective of reducing their nutrients levels discharged to the Chesapeake Bay watershed. Some of these are briefly described in Appendix A. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0746.1]

Similarly the TMDL should not identify which WWTPs have to do what the draft NY WIP calls "Beyond Phase I" phosphorous or nitrogen reductions.

Response

New York still had a nitrogen and phosphorus gap in its final Phase I WIP submission. Therefore, EPA was required to place a wastewater treatment plant gross WLA backstop in the final TMDL to close the gap. However, implementation of the TMDL/WLA backstop will be deferred until after the Phase 2 WIP is completed. In the interim, existing State permits which require treatment optimization, engineering evaluations to improve nutrient removal, and the implementation, within 18 months of permit effective date, of the recommendations from the engineering evaluations, will govern. EPA does not identify which facilities may require additional treatment controls in the final TMDL.

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

The attachment to NY's draft WIP, entitled A Nonpoint Component to the New York CB WIP - Suggestions for Agricultural and Wetland Best Management Practice Implementation to Reduce Nutrients and Sediment Load (2010), Must be Considered an Integral Part of the Draft WIP But Its Implementation Limited to Voluntary Actions

These "suggestions" represent realistic and achievable agriculture related N/P/Sediment reductions practices that are expected to achieve the levels of reduction forecasted by NYSDEC in the draft WIP. The BMPs discussed in this document represent the likely maximum practical N/P/Sediment reduction from the remaining farms in the watershed. They were intended, however, to continue to be implemented as voluntary actions with participation encouraged by educational outreaching and the incentive of partial matching funds.

Response

This attachment was not included in New York's submitted final Phase I WIP. Because this attachment was not submitted as part of the final Phase I WIP, it is not being considered by EPA.

Organization: Otsego County, New York

New York State's working group, consisting of the New York State Department of Environmental Conservation, New York State Department of Agriculture and Markets, individual Soil and Water Conservation Districts from across the southern tier, the Upper Susquehanna Coalition and Cornell University, has submitted a Watershed Implementation Plan (WIP) that is rooted in science, an understanding of the trends in agriculture, demographics, land-use and climate in New York, is reasonable, realistic and based on available funds; and

WHEREAS, the EPA rejected the WIP as grossly deficient and proposes such 'backstop' measures as a ban on winter spreading of manure, CAFO style regulations for all animal operations, significant expansion of Municipal Separate Storm Sewer System (MS4) regulations to small communities, significant retrofitting of infrastructure for existing MS4 communities and the purchase, installation and maintenance state-of-the-art technology for municipal Waste Water Treatment Plants;

Comment ID 0771.001.005

Author Name: Bertoni John

Organization: Village of Endicott, New York

New York State has put forth a concerted effort to devise a draft Watershed Implementation Plan that sets forth goals to achieve realistic and attainable results, yet still has fallen short of the EPA's desired reductions. Due to the already low pollutant levels in New York, these required reductions cannot be met, and therefore, the extreme expense associated with the mandates will be fruitless. Rather than imposing a penalty for the great strides that have been achieved, the successes that have been accomplished in New York should be held as a model for other jurisdictions in the Chesapeake Bay Watershed.

The restoration of the Chesapeake Bay requires the participation of all partners and jurisdictions located in the Bay watershed. In order to move forward in confidence, the TMDL load allocations need to be viewed as equitable and affordable by all parties involved.

Therefore, in regard to the establishment of the Chesapeake Bay TMDL in New York State, The Village of Endicott stands by the assessment of the NYS Department of Environmental Conservation and its water quality partners as set forth in the draft Watershed Implementation Plan. Furthermore, we urge the EPA to work with New York to develop a plan that will restore the Bay in a manner that is not an unbearable burden on New York State communities.

Organization: Quail's Nest Industries

Pennsylvania's WIP needs to include better mechanisms to account for the use of non-cost share, voluntary BMPs by forest landowners and harvesters.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0067.1.001.016

Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

While it is not perfect, we support in principle the Pennsylvania WIP as the only plan on the table that has a chance of ultimate success.

We support a watershed implementation approach that fairly distributes responsibilities, and where all contribute to the solution - a plan that incorporates actions that are reasonable and cost-effective. We believe that the Pennsylvania WIP is generally on the right track.

Response

Thank you for your comment supporting Pennsylvania's WIP. While EPA agrees that there were some good elements in Pennsylvania's WIP, there were some elements that did not meet the expectations outlined in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction or meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. Where EPA determined that a jurisdiction did not meet its target allocations or did not provide adequate reasonable assurance, EPA calculated that jurisdiction's draft backstop allocations by relying on the adequate portion(s) of the jurisdiction's draft Phase I WIP, where possible, and supplementing any remaining shortfall or insufficient amount of reasonable assurance with its allocation adjustments and determinations of reasonable assurance to achieve the necessary reductions. Although a number of backstop options existed, EPA primarily relied on decreasing the WLAs to the point sources. EPA did that because point sources are the pollutant discharging source sector for which the CWA gives EPA the clearest authority to ensure implementation of needed controls.

That being said, PA and EPA worked hard to improve the Pa WIP. Fortunately the final WIP is much improved and therefore, EPA has chosen to reduce or remove the backstops that were in the draft TMDL. The final assessment of the state WIP and EPAs backstop decisions can be found in Section 8.

Comment ID 0070.1.001.001

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

As the Executive Director of the Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR) for the last 13 years, who has spent the majority of his time working in the Chesapeake Bay Watershed on abandoned mine reclamation, watershed restoration, environmental education, environmental action projects, stream restoration, and abandoned mine drainage remediation projects, in partnership with a myriad of organizations from the Federal, State, County, and local grassroots level, I would like to respectfully submit comments on the Pennsylvania Department of Environmental Protection's Draft Chesapeake Bay Watershed Implementation Plan (draft WIP).

EPCAMR works to provide technical and administrative support to the Conservation Districts, coordinate reclamation activities, establish a public education outreach program within the schools, and to rejuvenate local watershed groups, primarily in those areas where streams are adversely affected by abandoned mine siltation and abandoned mine drainage. EPCAMR works together with nearly 75 local groups to inform and educate the public and to organize environmental interests relative to the purpose and value of specific reclamation, remining, and remediation techniques being proposed for sites in their local community.

I am a lifelong resident of the Wyoming Valley, and am particularly knowledgeable about the past mining impacts on the water quality of the Susquehanna River and its tributaries, having an extensive background in anthracite mining geology, aquatic biology, history, and underground hydrogeology of this area. As the Executive Director of EPCAMR, I have had the opportunity for many years to Chair the PA DEP's 319 Non-Point Source (NPS) Liaison Resource Extraction Workgroup Subcommittee that updated the PA DEP and US EPA Region III on project successes, outreach efforts, new innovative treatment technologies, implementation plans, watershed assessments, and networking opportunities that were convened on a yearly basis. I am also a member of the PA DEP's Mining Reclamation Advisory Board, as an Alternate Member appointed by the State Conservation Commission and have been a technical advisor and Ad Hoc Reclamation Committee member to the full MRAB for over a decade. I also sit on the Susquehanna River Basin Commission's Water Quality Advisory Committee and have done so for many years. A majority of EPCAMR's workload has been contained within the Susquehanna River Basin, and therefore, the Chesapeake Bay Watershed. EPCAMR Staff have assisted County Conservation Districts over the years to develop their Chesapeake Bay Tributary Implementation Strategies as well, providing statistical analyses of GIS data on stream segment impairments by cause and assisting with making recommendations on how to implement best management practices (BMPs) for those impairments, be it AMD treatment, land reclamation, agricultural impacts, stormwater runoff, streambank erosion, and riparian buffer establishment.

EPCAMR is aware that Pennsylvania's draft WIP was prepared to address the EPA's expectations for the Chesapeake

Bay Total Maximum Daily Load (TMDL), scheduled for publication in December 2010. EPCAMR has reviewed many TMDL Reports for watersheds in our region and provided water quality data, field reconnaissance support, GIS Mapping assistance to staff biologists of the Susquehanna River Basin Commission, and recommendations to the PA DEP Section 319 NPS Program water pollution biologists on stream segments previously impacted by AMD for removal from the Federal List of Impaired Waters due to our analyses of water quality improvements and aquatic insect population improvements over time, as well as due to the increase in the number of AMD remediation treatment systems that were constructed to reduce the loading rates of common metals (iron, aluminum, and manganese) found in AMD to our impaired watersheds.

EPCAMR understands that the US EPA directed the states to develop a Phase 2 WIP which will further subdivide the loads by local area (county). We also understand that these will NOT be regulatory allocations to each of the counties. Rather, they are to inform local implementers (e.g. municipal elected officials and planning agency personnel, county conservation districts and planning commissions) and organizations like ours, or community watershed organizations, of the nutrient, metal, and sediment loads generated by their geographical area so we can help implement or plan appropriate actions to reduce the loads. Local implementation efforts should focus on compliance with existing rules and regulations, as well as seeking opportunities for additional management actions from EPA's standpoint. Community groups are not trying to disobey or break current or existing rules and regulations, their watersheds, rivers, and streams, are already in non-compliance, from the standpoint that they do not have clean water available to them for a multitude of uses that others enjoy across the Commonwealth in healthier watersheds with minimal impacts.

AMD is "abandoned" mine drainage. Communities are not trying to force compliance on anyone; groups like ours are trying to develop landowner relationships and agreements to allow for the construction and remediation of AMD on parcels of their properties where the discharges emanate from, for the betterment of the entire community and watershed. However, they need some protections and compensation for the perpetual loss of the use of those particular parcels for them to get on board with our recommended implementation projects. The Commonwealth of PA would be very hard pressed to force a single landowner where an AMD discharge comes to the surface and flows across their land into compliance, when the underground mine water complexes, from which the water flows could be miles away in all directions, and take in many additional landowners on the surface. That is why voluntary cooperation by landowners is of the utmost importance to our partnerships with local community groups and municipalities.

Community awareness of the problems and the potential solutions to the impacts left by past mining practices is needed in our region. Most elementary aged school children do not even know what water pollution is. Sure they know that the streams are orange, red, and yellow, and have been told anecdotal stories by their parents or grandparents about the dangers of hanging around the local streams because of the mining impacts, but what they do not know is that they can become a part of the solution to cleaning up and restoring their own watersheds. EPCAMR has made it a point in our environmental education and outreach efforts to take school aged children and their teachers in our underserved, more impoverished, and underrepresented school districts to the streams within their local watersheds to teach them about historical mining impacts, water quality, fishery biology, stream ecology, and community volunteerism. This is where the focus should be. I've been in the schools for over a decade and you would be shocked to find that most elementary aged students do not even know the name of the Susquehanna River or their home watersheds in which they live. None of them have even heard of the Chesapeake Bay. Therefore, EPCAMR believes that a place-based Environmental Education component should be involved in the WIP, not just loading reductions. We need increases in awareness of the problem in the communities where we want to treat the water.

EPCAMR is currently working with the SRBC to develop an Anthracite Region AMD Remediation Strategy. EPCAMR and the SRBC are in the process of developing a strategy to assist in the cost-effective restoration efforts for AMD areas by identifying watersheds where reclamation activities would result in the greatest water quality improvements. We would like to seek additional funding to develop a comprehensive Mine Pool Evaluation of the Northern and Eastern Middle Anthracite Coal Fields. By June of 2011, EPCAMR will be reporting on and completing a comprehensive underground mine pool evaluation report for the Southern and Western Middle Anthracite Coal Fields, based on best available mapping and water quality resources available. The anticipated evaluation would dovetail with the proposed remediation strategy as SRBC would be able to assess the potential for augmenting low flows during droughts and for the possible use of small-scale hydroelectric power production at selected sites to provide revenues that would help to offset treatment costs and reduce waste allocation loads. Tom Clark, AMD Coordinator for the SRBC is working side by side with EPCAMR on these two complimentary efforts and is continuing to seek additional funds to complete the work plans.

EPCAMR would like to be more actively involved with the Phase 2 WIP Implementation in partnership with the US EPA from December 2010 until 2017 and learn about the details on how it will be phased into the communities and the watersheds impacted. This involvement by EPCAMR is contingent upon being able to secure additional funding to support our full-time staff of two to continue providing the expertise and community support that we have been doing since 1997 in the NorthCentral and NorthEastern parts of PA impacted by past mining. While it's formidable that the US EPA has looked ahead towards the second stage of implementation that will extend from 2018 to 2025, when controls will be implemented to reduce loads from the interim to final target levels. EPCAMR does not have the ability to see that far into the future.

EPCAMR wants to believe that Pennsylvania is committed to protecting and enhancing our streams and watersheds and that the efforts here at home will in turn help in further restoring the Chesapeake Bay by 2025. There is no doubt in my mind that over the years, significant progress has been made to reduce nitrogen and phosphorus pollution of the local waters in the Pennsylvania watershed. EPCAMR believes that more attention needs to be paid to metal allocation loads in the tributaries of the Chesapeake Bay Watershed where the AMD impacts are. EPCAMR realizes that it is a difficult concept to understand when it comes to relating AMD to the Chesapeake Bay, but all you have to do is look at the legacy sediments and coal silt that is located behind every dam on the Susquehanna River from here to Maryland to realize that if those dams were not in place, that the coal fines, silt, acidity levels, and metals contamination would be much greater at the mouth of the Bay. In all of the Tributary Strategies developed by EPCAMR and our supporting Conservation Districts, many recommendations were made to implement strategies to remediate AMD problems in the tributaries, but not many were followed through on due to lack of funding and or lack of prioritization. More needs to be

done.

Response

See response to Comment No. 0302.1.001.008 regarding Phase II WIPs.

The pollutants of concern for the Chesapeake Bay TMDL are nutrients – nitrogen and phosphorous – and sediment. If Bay segments are impaired for other pollutants, EPA expects that jurisdictions will develop separate TMDLs to address those pollutants.

See response to Comment No. 0230.1.001.054 regarding management plans for dams located along the Susquehanna River.

In the Anthracite Region, we cannot thank some of our regional co-generation facilities enough for the great job they do in reclaiming abandoned mine lands. These private companies are not obstacles, they should be considered one of the greatest assets we have in our region. Let us not forget that much of this work has been completed at no cost to the state or taxpayers. The backlog of reclamation needed for the nearly 190,000 acres of abandoned mine lands left unreclaimed in PA and over 5,500 miles of streams impacted by AMD is projected to cost more than \$3,000,000,000 in PA, and that only includes the Priority 1 and Priority 2 Sites. There are still nearly 11 Million Tons of CFB-ash has being beneficially used at abandoned mine sites throughout PA. Over 2 Billion Tons of waste coal has been burned as an alternative energy fuel source in PA.

Approximately 4500 acres of waste coal piles have been reclaimed in the last 20 years. PA DEP estimates that it costs around \$20,000 to clean up just one acre of abandoned mine lands. This estimate does not include the elimination of AMD that has detrimentally impacted our streams and rivers. For example, in the Wyoming Valley, Luzerne County, PA, hundreds of acres of abandoned culm banks have literally disappeared. The once dirty, ominous, abandoned mine land features that have dominated the landscape for nearly eight decades and blocked the beautiful view of the Susquehanna River from the East side of the Valley from the West, have been reclaimed utilizing coal ash for abandoned mine reclamation. People can travel the local highways and Interstate I-81 and now see clear cross the Wyoming Valley. Northampton Generating Supply Company, separated the culm, hauled it away, brought back the ash, compacted in lifts on the same site in which it came from, filled the mine voids, and reclaimed the site. It was a win-win situation. In the land beneath these culm banks, there's economic and environmental value.

Within the culm banks, there is energy to be recycled, and in the continued removal of these eyesores, EPCAMR sees great satisfaction in the reclaimed aesthetic look for Northeastern PA and across the State of PA as a whole. We should concentrate our efforts on reclamation of these undeveloped acres for social, economic, as well as environmental uses. Expanding and reconnecting our communities separated by mountains of culm, creation of open space areas, wildlife habitat enhancement, water quality improvements, improving the areas quality of life, recreational opportunities, stream

restoration, and economic development of these abandoned mine lands should be of the utmost importance.

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

Resource extraction activities and abandoned mine lands (AML) have the potential to release sediment into nearby surface waters. EPCAMR firmly believes that abandoned mine drainage (AMD) from AML can impair the ability of streams to assimilate these nutrients effectively. My reason for repeating some of the information in the draft TMDL WIP Report is so that the general public interested in the abandoned mine issues can hone in directly on parts of the draft that could potentially impact their local watersheds, so I apologize for some redundancy, however, in this case I think it is warranted.

Reclamation methods include PA DEP's primary efforts to improve water quality through reclamation of abandoned mine lands (for abandoned mining) and through the National Pollution Discharge Elimination System (NPDES) permit program (for active mining). EPCAMR currently receives the majority of its funding for projects designed to achieve water quality benefits from the US EPA Section 319 Grant Program and Pennsylvania's Growing Greener Program. Federal funding is from the Department of the Interior's Office of Surface Mining (OSM) for reclamation and mine drainage treatment through the Appalachian Clean Streams Initiative and through Watershed Cooperative Agreements have also been a part of EPCAMR's historical funding streams to work with community groups to design, build, construct, operate and maintain AMD treatment systems within the Chesapeake Bay Watershed.

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

The primary concept employed by the mining program in dealing with sediment issues is prevention. The permitting process provides the framework for the necessary measures, typically collection ditches and sedimentation ponds, to have effective controls. Standard BMPs are employed on most permits. Coal mining permits and large noncoal permits typically include site-specific engineered Erosion and Sedimentation control plans.

There are about 1,750 permitted mine sites in Pennsylvania in the Bay watershed. Each of these permits include Best Management Practices for prevention of erosion and sedimentation. These permits also include revegetation plans to stabilize the post-mining reclamation area. There are about 475 mining sites in the Bay watershed for which there are NPDES permits. These permits include effluent limits for suspended solid and/or settleable solids. These measures prevent contributions of sediment in the watershed.

The point of planning and permitting is to prevent increased sediment loads as the level of earth disturbance increases. Mine sites and oil and gas development sites are subject to permitting which minimizes their impact on loads. In the case of coal mining, most new mine permits include some re-mining where AML is reclaimed in the course of mining. While the potential impact of the earth disturbance for mining is temporary, the overall improvement (i.e. the reclamation of AML) is permanent.

Funding/Staffing

DEP BAMR, which administers the program to address the Commonwealth's abandoned mine reclamation program, has established a comprehensive plan for abandoned mine reclamation to prioritize and guide reclamation efforts for throughout the Commonwealth to make the best use of valuable funds

(http://www.portal.state.pa.us/portal/server.pt/community/pennsylvania%27s_comprehensive_plan_for_abandoned_mine_reclamation/13964). In developing and implementing a comprehensive plan for abandoned mine reclamation, the resources (both human and financial) of the participants must be coordinated to insure cost-effective results.

EPCAMR and WPCAMR assisted in the development of the PA Comprehensive Plan for Abandoned Mine Reclamation. EPCAMR and WPCAMR have served as the local liaison for the Commonwealth of PA for more than 20 years in WPCAMR's case, and for more than 14 years, in the case of my organization. I was previously employed by the PA DEP Bureau of Abandoned Mine Reclamation's Wilkes-Barre Office in the Northeast Region as a Science Intern in 1993 and as a Hydrogeological Intern for the Hawk Run District Mining Office in Western PA, now the Moshannon District Mining Office, in 1994 and 1995, prior to graduating from Penn-State.

The following set of principles guides this decision making process:

- Partnerships between DEP, EPCAMR, WPCAMR, watershed associations, local governments, environmental groups, other state agencies, federal agencies, & other groups organized to reclaim abandoned mine lands are essential to achieving reclamation & abating acid mine drainage in an efficient & effective manner.
- Partnerships between AML interests and active mine operators are important and essential in reclaiming abandoned mine lands.
- Preferential consideration for the development of AML reclamation or AMD abatement projects will be given to watersheds or areas for which there is an approved rehabilitation plan.
- Preferential consideration for the use of designated reclamation monies will be given to projects that have obtained other sources or means to partially fund the project or to projects that need the funds to match other sources of funds.
- Preferential consideration for the use of available monies from federal and other sources will be given to projects where there are institutional arrangements for any necessary long-term operation and maintenance costs.
- Preferential consideration for the use of available monies from federal and other sources will be given to projects that have the greatest worth.

-Preferential consideration for the development of AML projects will be given to AML problems that impact people over those that impact property.

-No plan is an absolute; occasional deviations are to be expected.

Since 2000, new approaches to mine reclamation and mine drainage remediation have been explored and projects funded to address problems in innovative ways. EPCAMR has been an instrumental partner in the development of these new approaches. EPCAMR co-coordinates State-wide Conferences on Abandoned Mine Reclamation with its' sister organization, WPCAMR, and a Planning Committee made up of State-wide regional non-profits, State representatives, Foundation representatives, and Colleges and Universities to network and exchange ideas on these new approaches and innovative AMD Treatment technologies. See our websites at (www.epcamr.org, www.amrclearinghouse.org and www.treatminewater.com).

These include: Awards of grants for: (1) proposals with economic development or industrial application as their primary goal and which rely on recycled mine water and/or a site that has been made suitable for the location of a facility through the elimination of existing Priority 1 or 2 hazards; and (2) new and innovative mine drainage treatment technologies that provide waters of higher purity that may be needed by a particular industry at costs below conventional treatment in common use today or that reduce the costs of water treatment below those of conventional lime treatment plants.

Projects using water from mine pools in an innovative fashion, such as the Shannopin Deep Mine Pool (in southwestern Pennsylvania), the Barnes & Tucker Deep Mine Pool (the Susquehanna River Basin into the Upper West Branch Susquehanna River), EPCAMR's Mine Pool Mapping Project and Groundwater Modeling for the Western & Southern Anthracite Coal Fields) and the Wadesville Deep Mine Pool (Exelon Generation in Schuylkill County) have also been funded.

Current and Future Reclamation Efforts in the Watershed

EPCAMR agrees that while numerous remediation projects have already been completed and others are underway, it will take decades at current funding levels until the entire problem areas in the Chesapeake Bay watershed are addressed. EPCAMR thinks that Pennsylvania should place an even higher priority on efforts throughout the entire Chesapeake Bay watershed, particularly in the Anthracite Coal Region. If the Chesapeake Bay Tributary Strategy is to be effective, than funding needs to be provided to projects in the tributaries. In addition to the problems associated with the water quality itself, tremendous amounts of recreation and tourism dollars have been lost in the watershed due to the mining impacts. EPCAMR feels that additional funding should be provided to community groups under the State's Set-Aside Program to conduct the necessary watershed assessments to make them eligible for the Title IV Funding that is currently being held in an interest bearing account while a re-prioritization of the criteria to become eligible for the funding is finalized.

EPCAMR supports the PA DEP in developing a stormwater NPDES General Permit (GP) for mining activities. The intent of this permit should be to manage stormwater from mine sites where the hydrologic impact is limited to surface water. The GP requires the use of BMPs to manage stormwater to prevent sedimentation. It is anticipated that this GP will be finalized during the summer of 2010. However, again, it must be stated that the encouragement of infiltration into stormwater detention basins that are unlined on abandoned mine lands only encourage surface infiltration of runoff into the deeper mine pool complexes and local underground groundwater reservoirs. The PA DEP should consider looking into the underground effects of infiltration of stormwater runoff from abandoned mine sites (<http://www.stormwaterresourcesformunicipalities.com/>).

Organization: Eastern PA Coalition for Abandoned Mine Reclamation (EPCAMR)

In 2009, the Department published the draft Riparian Forest Buffer Guidance, Commonwealth of Pennsylvania, Department of Environmental Protection, Document # 395-5600-001 (2009), as amended and updated. The guidance lists various design, construction, and maintenance standards for developing a riparian forest buffer.

If initial WIP results indicate that a change in this approach is warranted, these funds can be targeted to specific locations and to specific BMPs. PA DEP could also target the specific BMPs identified by EPA Region III as their most critical for Bay model loadings. One of the five BMPs, which track closely to those that have been given priority in the effort, is: riparian buffers. Riparian buffers can still be implemented and planted along many of our rivers and streams in the Coal Region to reduce the overall sedimentation loads to the watershed and can be mapped by EPCAMR based on our RAMLIS GIS tool in relation to those abandoned mine lands that are adjacent to rivers and streams and have problem areas where sedimentation is prevalent and continues to downcut, undercut, and erode the culm banks.

A good example would be along the Lackawanna River in Lackawanna County, where acres of culm banks lay along the streambank of the Lackawanna River and during storm events and flooding events, slough off into the River and the sediments are carried downstream. Increased volume of stormwater runoff results in an increase in the frequency of bank full or near bank full flow conditions in stream channels. The increased presence of high flow conditions in riparian sections has a detrimental effect on stream shaping, including stream channel and overall stream morphology. Stream bank erosion is greatly accelerated. As banks are eroded and undercut and as stream channels are gouged and

straightened, meanders, pools, riffles, and other essential elements of habitat are lost or greatly diminished.

Laws, Regulations, Funding, Staffing and Technical Capacity

EPCAMR supports the increase in funding to support and fund the Pennsylvania Department of Environmental Protection, Department of Agriculture, County Conservation Districts, organizations such as ours, and Critical Programs such as Growing Greener and Clean Water Act, Section 319 so as to assure robust levels of personnel to provide outreach, technical assistance and cost-share funding in the implementation of necessary BMPs and to assure, where applicable, compliance inspections and enforcement of all existing regulations are being adhered to. EPCAMR works to reclaim abandoned mine land and watersheds impacted by abandoned mine drainage throughout the North Central Bituminous Region and Anthracite Coal Region of Northeastern PA, in partnership with our sponsoring Conservation Districts. Conservation Districts sustain, protect and restore the natural resources for the Commonwealth of Pennsylvania. EPCAMR supports Conservation Districts within the EPCAMR Region who are seeking dedicated sources of funding to provide 50% cost share for basic staff positions and cost-of-living increases to meet their goals. One possible source of dedicated funding for all Conservation Districts is through a severance tax in Pennsylvania for extraction of oil and gas deposits. Although Pennsylvania has never initiated a severance tax, many other states in the country have established this type of tax to fund various budgetary items. For instance, Oklahoma has a gross production tax on oil, a small portion of which is earmarked for natural resource protection. Wyoming has a severance tax that subsidizes their state's general fund, thus indirectly partially funding Conservation District activities.

EPCAMR also supports a portion of any severance tax for the Environmental Stewardship Fund, which has funded many "Growing Greener" grant projects that EPCAMR has been awarded in the past or where EPCAMR has been a partner. Funding for our organization and our sister organization (WPCAMR) is also vital to continue the reclamation of abandoned mine lands, remediation of streams and rivers impacted by abandoned mine drainage (AMD), and to further the economic redevelopment potential of the reuse of underground abandoned mine pools throughout PA. Only \$6 Million is anticipated to be allocated state-wide in the most recent round of Growing Greener for watershed restoration projects. EPCAMR firmly believes that a small, predictable portion of any state mandated severance tax should be allocated directly to the Conservation District Fund to help all Conservation Districts across the state maintain their environmental protection programs. Using a natural gas severance tax of 5% on the value of the natural gas at the wellhead, plus 4.7 cents per 1,000 cubic feet of natural gas taken from the ground, \$178.6 million would be generated in the 2010-2011 fiscal year and increase to \$475.6 million by 2014-2015. We recommend 3% of the severance tax, or approximately \$5.358 million in the 2010-2011 fiscal year, be dedicated to the Conservation District Fund. By the 2014-2015 fiscal year as the severance tax revenue grows, approximately \$14.3 million would be generated for the Conservation District Fund. Obviously this type of dedicated funding would resolve many of the financial challenges our Conservation Districts collectively face on a daily basis.

EPCAMR is also in need of additional administrative funds that can be found through grant funds under the Environmental Stewardship Fund. We are in a position as a regional non-profit environmental organization, founded by Eastern PA Conservation Districts and other reclamation related partners and watershed groups that has been providing technical assistance, grant writing assistance, project coordination, project management, grant administration, Geographic Information System mapping assistance, research on AMD Treatment technologies, innovative AMD Treatment Design and Construction, environmental education, and the continued building of diverse partnerships and leveraged funds to reclaim our Commonwealth's abandoned mines and watersheds impacted by AMD. For more nearly 15 years, EPCAMR has been providing support to our Conservation Districts, watershed organizations, and local

governments within the EPCAMR Region on abandoned mine reclamation issues, environmental education, and watershed improvement projects.

It is undisputed that EPCAMR and Conservation Districts provide much needed services to Commonwealth citizens to help them identify and resolve critical natural resource concerns. EPCAMR and Conservation Districts deliver essential services that protect our soil, water and air for a reasonable cost. Since there is a direct link between the removal of natural resources and natural resource protection activities, it makes sense to consider advocating a portion of a severance tax for natural resource protection activities. A severance tax, a portion of which would be dedicated to the Conservation District Fund and to the Environmental Stewardship Fund should be enacted. We do not underestimate the power on a local level of other regional non-profits, nor do we claim that we are the only organizations that can provide some assistance to the PA DEP and the US EPA. We just want to make the Commonwealth and the US EPA Region III know that our organization would like to have an integral relationship in the protection and restoration of the Chesapeake Bay Watershed and that we have been supporting such efforts for nearly 15 years. We do not have all the answers either, but we are part of the solution.

Urban and Rural Reforestation

The two additional DCNR-based programs that promote reforestation of urban and rural parts of the Bay Watershed, TreeVitalize could be promoted more widely to our community groups and watershed associations in the mining impacted areas to assist with the replanting of riparian buffers along our rivers and streams where culm banks are a part of the landscape in the urban and rural settings. This program is not often promoted to these organizations. The Scranton-Wilkes-Barre Area, Pottsville, Shamokin, Mt. Carmel, Hazleton Area, are all urban communities that this Program could be expanded into. EPCAMR would be willing to promote it within these communities to our partners.

Riparian Forest Buffer Initiative

EPCAMR in the past had played an important role in implementing small riparian forest buffers along stream channels that had been recently reclaimed through the construction of rip rap channels to control overland flows off of the reclaimed mine sites. In 2005, Plymouth Township, Luzerne County, we were able to plant willow sheens, native shrubs, viburnum, and other wetland plants donated by the Octoraro Nursery in partnership with the Chesapeake Bay Foundation, Alliance for the Chesapeake Bay, and the Plymouth Township Planning Commission along a 1500' section of an unnamed tributary to the Susquehanna River that we called Sickler Run, locally. It is anticipated that more of these riparian buffer projects can be completed to add to the Stream ReLeaf, or Riparian Forest Buffer database in years to come.

Appalachian Regional Reforestation Initiative

The Appalachian Regional Reforestation Initiative (ARRI), a federal partnership program that supports planting trees for water quality, is a coalition of citizens, non-profit groups, the federal Office of Surface Mining (OSM), and states who are dedicated to restoring forests on coal mined lands in the Eastern United States. GIS analysis indicates that there are 120,000 acres of abandoned mine lands within the Upper Susquehanna--Lackawanna River Basins. These lands represent a great opportunity to expand forest cover within the Bay watershed while reintroducing native trees to the region. The restoration has already begun. EPCAMR, SRBC, Earth Conservancy, and the Lackawanna River Corridor already have existing relationships with many landowners, community watershed organizations, regional non-profits,

and coal operators in this Region. EPCAMR is also already an ARRI partner and has signed its Statement of Mutual Intent. EPCAMR is very supportive of The American Chestnut Foundation and its mission to help restore the American Chestnut propagation back into our landscape, including on abandoned mine lands.

Many of the forested acres are managed with best management practices are not currently recognized or counted in the Chesapeake Bay model either and should be added to the mix. EPCAMR believes that every tree planted on an abandoned mine site, be it by the private coal mining industry, or volunteers, or through ARRI should be counted for consideration as an innovative approach to sequester carbon. Trees are growing on these sites over the years as a part of the reclamation plan and are providing additional root zones to fixate nitrogen and to trap CO₂. Some of the Pennsylvania Game Commission's 1.04 million acres of forestland in the Bay watershed, are all well-managed and follow multiple best management practices, and do include some abandoned mine lands that can fall under the ARRI Initiative. Even reclamation mixes of grasses, legumes, and other ground-cover vegetation plant species are reducing the runoff from abandoned mine sites following the reclamation phase of mining. Vegetated reclamation sites should also be included in the Chesapeake Bay Model under number of reclaimed acres.

Remediation of Acid Mine Drainage Sites

EPCAMR agrees that remediation of abandoned mine drainage (AMD) sites in forested areas represents an opportunity for increased biological activity and algal uptake of nutrients and should be accounted for as reductions to the forest load in the Chesapeake Bay model. A study completed by Stroud Water Research Center showed that "despite near-neutral pH in the AMD-impacted stream (Lorberry Creek), iron hydroxide deposition interferes with normal periphyton colonization and enzyme activities". Rattling Run, an Exceptional Value stream in the Anthracite region, had chlorophyll-a levels nearly fifteen times greater than Lorberry Creek. Stroud also stated that the "most important implication of these findings is that, although water chemistry in a stream might be technically within a range that can sustain aquatic life (i.e. circumneutral pH and low dissolved metals concentrations), metal deposition on substrata clearly inhibits microbial colonization and severely limits phosphorus availability to aquatic bacteria, fungi, and algae." EPCAMR has numerous other project locations within the Anthracite Region that concur with the Stroud Water Research Center's example. For example, here in Luzerne County, many of the tributary streams impacted by AMD are circum-neutral with a pH of 6-6.5, are more alkaline than acidic, often have high sulfate concentrations, Total suspended solids, area large volume flows, and have heavy loadings of suspended iron that are severely coating the bottoms of the stream channels for miles until reaching the Susquehanna River. This iron hydroxide coating, prevents the aquatic populations from reproducing in these areas, leaving them with little biological diversity and stagnant. However, if additional AMD treatment systems are designed and constructed, the metal loadings can be reduced through the use of artificially constructed wetland systems, specifically constructed for the removal of the iron loadings that will reduce the overall iron loadings to the Susquehanna River and eventually the Chesapeake Bay. EPCAMR has even found several ways to recycle, harvest, dry, and re-use the iron hydroxide from these treatment systems to help fund its environmental education programs in the Region.

We've been doing this for nearly a decade. See our link at (<http://epcamr.org/storage/EnvEdBrochure2010.pdf>). EPCAMR has had the iron hydroxide tested for pigment quality and it is very high in a number of discharges within the Chesapeake Bay, upwards in the range of 92-98% pure iron oxide, once dried. EPCAMR makes its own wood stains for public recreational and trail projects, iron oxide chalk programs in schools, AMD Tie Dye Workshops, Art Shows with various regional Art Leagues, mixes its own paint, and has sold it to over 10 states to community groups interested in utilizing it for similar projects that we've initiated in PA. See our link (

http://epcamr.org/storage/iron_oxide_recovery_pamphlet2.pdf).

There are many uses for iron oxide in the United States and worldwide. The current markets for low-grade iron oxides in the United States alone is approximately 175,000 tons per year (1995 estimate; Hedin Environmental SBIR research), while the current world market for a similar grade product is approximately 850,000 tons per year. The typical revenue from this quality of material is approximately \$0.10 - 0.75/lb (Hoover Color; Bayferrox Corp). Higher value "specialty" iron oxide products are typically used in the animal vitamin supplement or cosmetics markets and have a higher associated economic value, as much as \$3.00 - 4.00/lb. EPCAMR has been able to sell the iron oxide that we process in-house in 5 gallon buckets collected by ourselves or seasonal interns and dried in a small soil oven, big enough to make 4 batches of cookies for \$5.00/oz. and it still does not cover the costs of our time to get it to the final form to get it to market. However, we are utilizing the iron oxide to support our educational programs and not for a profit. These load reductions in terms of pounds of iron oxide removed from the AMD treatment systems should also be included in the Chesapeake Bay Model.

EPCAMR totally agrees with the logic presented by the Stroud Water Research Center that the nutrients (especially phosphorus) being transported to Chesapeake Bay associated with metal hydroxide-based sediments, to which dissolved phosphorus has a strong affinity, could be reduced through remediation of the mined site and restoration of aquatic life to the stream. Similarly, even though the nitrogen species do not have the same affinity for sediments as the dissolved phosphorus, nitrogen uptake within the watershed by the benthic algae would decrease that available to be delivered to Chesapeake Bay. EPCAMR agrees that these reductions should be credited to the forested areas because the load was probably attributed to forest in the original modeling as the calibration gages are downstream of primarily forested sites.

However, EPCAMR does feel that not only should there be an emphasis on the restoration of the publicly owned lands, but in the urban environments, where the larger number of communities and population centers are being directly affected by the AMD pollution problem. Funding spent in these areas where there is a much higher incidence of local traffic by the local community would not only benefit them in achieving a higher quality of life, but it could lead to an increase in personal property values, increased recreational opportunities like swimming and fishing, economic redevelopment opportunities, conversion of abandoned mine lands into recreational spaces like trails constructed by the Earth Conservancy and others, an increase in water quality and improved aquatic stream health, and an increase in the number of visits to their local places as opposed to having to drive much further to State Parks and State Game Land areas during economic hard times.

EPCAMR Staff worked and participated with The American Chestnut Foundation, the Pennsylvania Game Commission, OSM's Patrick Angel, other OSM staff, volunteers from the OSM/VISTA Appalachian Coal Country Watershed Team, Schuylkill County Conservation District, and the Schuylkill Headwaters Association community volunteers to plant the 2,500 trees on an abandoned mine land site in Schuylkill County in 2009 in partnership with a local Anthracite Coal Company Operator. The ACCWT is a national team of AmeriCorps VISTA volunteers supported by the Corporation for National Service, the Office of Surface Mining, and local sponsors, such as EPCAMR and the Anthracite Heritage Alliance. They are providing much needed additional on the ground support to groups like EPCAMR, Schuylkill Headwaters Association, Schuylkill County Conservation District, and other community groups. See more details on the ACCWT Team on (www.accwt.org).

Local townships have only recently started to implement the three-year pump and haul program that is required by their Act 537 Plans, some of which were approved more than ten years ago. I do not understand why it has taken this long for enforcement to begin. I feel there needs to be more regulatory action against those who fail to follow through with the contents of their Act 537 Plan in a timely manner. There needs to be more accountability from the elected township officials who fail to realize the importance of their job.

Response

Thank you for your comment. Please see the response to comment number 0110.001.005. EPA also notes, with respect to substantive comments regarding individual jurisdictions' Phase I WIPs, that the WIPs submitted by each jurisdiction are part of the accountability framework outlined in the Chesapeake Bay Protection and Restoration Executive Order 13508. The WIPs help ensure implementation of the Chesapeake Bay Total Maximum Daily Load (TMDL) but are not an approvable part of the TMDL. Because this public comment period is specific to EPA's Chesapeake Bay TMDL, specific comments on each jurisdiction's WIP should be directed to the appropriate jurisdiction for consideration. EPA has forwarded this comment to the appropriate jurisdiction for consideration as part of its WIP.

We ask EPA to carefully evaluate all WIPs to assure they provide measurable and effective mechanisms to reduce nutrients flowing into the Bay to desired limits within the time frames established. And they should provide detailed alternatives to address contingencies, if expected progress in one or more areas does not occur. These measures should be particularly strong and amendable in the cases of where the greatest problems are being observed, such as non-point sources such as storm water from suburban sprawl and pollutants from agriculture. Effective deadlines with real consequences for failing to meet them are also necessary.

Pennsylvania

Overall

The Pennsylvania draft WIP is characteristic of nearly all the states' submissions. It includes a detailed recitation of the state's programs to control pollutants, but fails to provide specific numbers on the effectiveness and scope of these programs. The transparency of information is uneven across the major sectors, and the strength of its programs is average. The draft WIP does not explain how each requirement or incentive strategy will result in the reduction of a specific amount of pollutants so that the states will meet their allocations under the Bay TMDL. Without such specific details, or an explanation of what additional programs the state intends to implement, the WIP is no more meaningful to the EPA or the public than a visit to the state's website. Because Pennsylvania did not provide such essential details, it is difficult to determine the effectiveness of existing programs. EPA itself considers the WIP to be "very weak compared to the amount of N, P, and sediment [that Pennsylvania] must reduce." [FN 20]

The draft WIP would lower the sediment discharges to a level that meets the target allocation. However, the draft WIP still permits the nitrogen and phosphorus discharges to be 4 and 16 percent, respectively, more than the level allowed by the target allocations. In its final Phase I WIP, Pennsylvania must explain precisely how it intends to meet these reduction targets by strengthening its permitting and enforcement programs and making additional commitments to monitor and verify voluntary pollution management practices.

NPDES Permitting

Pennsylvania includes some baseline information, including the number of CAFOs and stormwater dischargers that have NPDES permits, but overall the draft WIP fails to provide a snapshot of the universe of all NPDES-regulated facilities and the number of which have up-to-date NPDES permits. The draft WIP does not say when the state's NPDES permitting program will be in compliance with the pollutant allocations in the Bay TMDL.

Similarly, Pennsylvania failed to establish deadlines, timelines, or qualitative goals for updating and reissuing expired and administratively continued NPDES permits. For example, the state could commit to reissuing and updating a certain number of permits per month for a certain program and could include this target as one of its two-year milestones. Bay states should identify institutional milestones, such as goals for hiring more permit program staff by a certain time or establishing and maintaining a database of NPDES permit holders, to ensure that the existing NPDES permitting program better regulates and monitors pollutant discharges.

Enforcement of NPDES Permits

The draft WIP provides general information on how enforcement for stormwater is prioritized. According to the WIP, in 2008 DEP and conservation districts conducted over 10,000 compliance inspections in the stormwater program, but it is unclear whether these inspections were physical, on-site inspections or simply reviews of self-submitted paperwork. They investigated 1,439 citizen complaints and collected \$135,000 in penalties, a token amount.[FN 21] The WIP also notes an increased focus on agriculture and stormwater compliance, but the efforts sound mostly cooperative and voluntary rather than deterrent in nature.

In the final WIP, Pennsylvania should provide the following information for all of the NPDES sectors: number of inspections; number of facilities in significant noncompliance and the reasons why; and number and types of enforcement actions taken and penalties assessed. The WIP should also discuss local governments' enforcement authorities and activities, enforcement resources, and major facilities in significant noncompliance.

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

The Pennsylvania WIP briefly explains that it has a targeted watershed approach to monitor and ensure proper implementation of agriculture BMPs, but fails to provide adequate detail about how these watersheds are identified and more importantly how Pennsylvania will ensure proper implementation.

The draft WIP does provide, for some voluntary programs such as the Growing Greener Watershed Protection Grant Program and the Pennsylvania Agricultural Conservation Easement Purchase Program, the past funding levels and current budgets. For example, the Growing Greener Program gave \$12.6 million statewide for the grant period ending in April 2010 and will give \$6 million for the current grant period. However, the draft WIP does not allocate a specific portion to monitoring and verification activities. In the final WIP, Pennsylvania should conduct a more thorough gap analysis to better identify how existing programs can be used to maximize pollutant reductions, what new programs may be needed, and what staffing and funding are necessary to ensure successful reductions from nonpoint sources.

Contingencies

Pennsylvania's draft WIP speaks only in generalities about what contingencies would be implemented if primary pollutant controls fail to produce the necessary reductions. In the final WIP, Pennsylvania should ensure that its contingencies are clearly identified. They must be coordinated with specific failures, have timely implementation deadlines, and be effective. The WIP must identify what, if any, additional legal authority is needed to implement these contingencies and ensure that the enactment of these authorities is not an excuse for delay.

Concentrated Animal Feeding Operations

According to the draft WIP, Pennsylvania has 317 permitted CAFOs within its portion of the Bay watershed but does not provide an estimate of the universe of CAFOs that require but do not have permits.[FN 22] A recent estimate by EPA indicates that Pennsylvania has roughly 480 CAFOs in the entire state, 334 of which have permits and 146 of which do not.[FN 23] Pennsylvania's CAFO permitting program is in the review process and changes, if any, will be made after its current General Permit expires on September 30, 2011. The WIP does not include any discussion of the specific regulatory revisions that may be needed to comply with the new federal regulations. The WIP is honest in stating that the DEP staff for the CAFO program are "insufficient to ensure compliance" and that "there is no expectation that

additional state funds for staff resources will become available in the near term." [FN 24] At present, the WIP indicates that the CAFO program has startlingly few staff resources: 1.2 staff positions at the Department of the Environment's central office and another 6 staff positions in regional offices for inspection, compliance, and permitting activities. [FN 25] This low number, 7.6 total staff positions for 480 CAFOs across the state, does not inspire confidence that Pennsylvania's program is or can be effective.

Pennsylvania's final WIP should disclose what regulatory changes are likely to occur as a result of updating the CAFO regulations, including whether or not the CAFO regulations should be expanded to include more AFOs. It should also specify the details of CAFO inspection, setting a physical, onsite inspection rate of at least 20 percent annually.

Stormwater

Pennsylvania's stormwater section is primarily an inventory of existing laws and regulations with no additional description of how these tools will be used to achieve pollutant reductions. EPA notes that the existing programs have "questionable enforceability and accountability." The WIP also does not disclose the extent of authority delegated to local governments that administer the stormwater program.

The WIP does well in recognizing that the permit fees are insufficient to implement the stormwater program but does not propose a timeline for seeking an increase in those fees. In the final WIP, Pennsylvania should explicitly state how it will improve its stormwater program to achieve the allocations in the Bay TMDL.

Air Deposition

Pennsylvania plans to rely on reductions from implementation and enforcement of Clean Air Act requirements, specifically by reducing pollution from sources such as kilns and glass manufacturers, and switching to renewable energy sources. Pennsylvania's final WIP should further detail its state air pollution programs that can be used to reduce air deposition of nitrogen and specific actions that demonstrate how the state will use these other authorities, as it did with the kilns and glass manufacturers. Pennsylvania should also ensure that it has the staff and financial resources to conduct an effective air program, and, if not, propose how it will obtain these resources.

The greatest potential for roadways to generate sediment is when roadway maintenance and improvement projects are conducted. By complying with PADEP's existing regulatory program for construction activities and with PennDOT's policies contained in the Drainage Manual and by designing projects consistent with the standards contained in approved Act 167 plans, the potential generation of sediment from these activities is addressed.

Response

EPA agrees that roadway construction activities can and often do contribute notable sediment loads to receiving waters. A great deal more effort is needed to ensure that discharges from construction activities comply with the Clean Water Act, and all relevant federal, state and local regulations.

PMAA recognizes the difficulty in achieving timely compliance from the non-point source sectors. We encourage EPA and the states to work together to develop methodologies for these sectors that will merge both voluntary and mandatory requirements to allow reductions to be met in a scheduled timeframe. These methodologies should be delineated to the fullest extent possible in the final WIP submission of each state and the final TMDL from EPA.

In particular, EPA should recognize the existing statutory and regulatory authority that DEP has through the Pennsylvania Clean Streams Law. This compliance tool seems to be totally overlooked by EPA in their comments to the Pennsylvania WIP. EPA should work with DEP so that all inspection, compliance, and/or enforcement options available under this Act are fully incorporated in the WIP, including specific provisions for the successful implementation of activities that ensure compliance from all non-point source sectors.

Organization:

My comments mainly have to do with Wastewater Treatment Plants. The Municipal Planning Code of PA calls for all land uses in each municipality, unless there is a cooperative agreement through joint or regional planning efforts. Many of the municipal zoning ordinances allow for higher density development (scattered throughout the landscape) if public sewer is provided. Instead of planning for and maintaining sewage infrastructure near urban areas at a reasonable growth rate, the municipalities within our state continue to react with Act 537 plans or sewer modules for applicants with sewage "needs" for new development, while ignoring actual failing systems that need more immediate attention. If we do not address the zoning ordinances that are currently on the books, the property owners will continue to have expectations of public infrastructure to accommodate their land development plans.

A viable approach to stormwater management that recognizes Pennsylvania's unique governmental structure is imperative.

Pennsylvania has a local governmental structure that is not like many states, and any approach that is aimed at addressing local sources of nutrients and sediments must be cognizant of, and be framed to work within, that governmental structure.

Urban and stormwater is a case in point.

EPA has criticized the Pennsylvania WIP for failure to expand the so-called MS4 program to seek stormwater control via imposition of limitations and requirements in NPDES permits issued to municipalities and municipal authorities that operate storm sewer systems. EPA's fixation on the MS4 program, to the exclusion of other approaches, demonstrates a fundamental misunderstanding of what such storm sewer system operators can and cannot do.

In many if not most cases, stormwater systems are not operated by units of general government, but rather by municipal authorities. Such authorities have limited powers to finance, construe and implement infrastructure projects,

but they do not possess general police powers, land use control authority, or other legal tools to regulate the sources of nutrients or sediment that may become entrained in and flow as part of stormwater entering their sewer lines. Moreover, under the Pennsylvania Constitution Article III, §31, municipal authorities do not have general taxation powers, and can only establish fees and charges to pay for services provided by the infrastructure they operate.

Recognizing this situation, Pennsylvania's approach to addressing stormwater must proceed in a different direction, combining the authorities contained in different programs to work on the ultimate problem. For this reason, the Pennsylvania WIP relies on the combination of (i) county-adopted watershed stormwater management plans prepared under the Pennsylvania Stormwater Management Act; (ii) statutory-mandates that municipalities adopt and administer ordinances that implement those watershed stormwater management plans; and (iii) the state level Ch. 102 erosion and sedimentation control permitting program, including its mandates for post-construction stormwater management plans. In our view, this is the only viable approach given Pennsylvania's governmental structure - and EPA's apparent insistence (despite the law) to drive use of the MS4 program is akin to assuming that the hammer in hand is the only tool in the tool box, and therefore must be used to drive a screw. EPA needs to take its blinders off, and stop just looking at the Clean Water Act as if it were the only tool kit. The Pennsylvania WIP points to other tool kits, and in many cases those tools are the only ones that hold real promise of achieving effective results.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. See Section 8 of the TMDL for discussion. EPA is establishing the Chesapeake Bay TMDL in order to attain water quality standards in the Bay pursuant to its authority under the Clean Water Act (CWA). That CWA authority includes the NPDES program. EPA has no authority under Pennsylvania regulations or state laws to ensure compliance with TMDL reductions. Since PADEP did not provide sufficient reasonable assurance in the draft WIP document that its reductions will be met using its approach, EPA identified additional reasonable assurance for stormwater pursuant to its authority under the CWA and more specifically, identified additional authority under the NPDES permit program, such as those issued to MS4s. While PA has many viable state programs, not all of them have been robustly implemented. For example, PA's Stormwater Management Act (Act 167) is a cornerstone of PA's stormwater program. Although many counties have adopted Act 167 Watershed Plans, the necessary ordinances that are required to implement the plans have not yet been adopted by all municipalities within that county. Likewise, while PA has just adopted revised regulations (25 PA Code Chapter 102), the programs to implement that authority are just developing. Finally, EPA inspections in PA have revealed some inconsistencies in state enforcement and regulatory compliance. While PA provided improved implementation actions and detail in its final WIP, especially for the agriculture program, EPA has determined that PA did not provide sufficient assurance regarding implementation of its stormwater programs. As a result, EPA included stormwater allocations for PA based on backstop assumptions about tighter controls on federally permitted point sources of pollution in the final TMDL. See Section 8 of the TMDL for a more detailed discussion.

3. EPA provided inadequate administrative and technical assistance in development of Pennsylvania's WIP.

Throughout the past several months, DEP and Pennsylvania stakeholders have been meeting in an active and earnest effort to devise its WIP. Critical to Pennsylvania's ability to make reasoned decisions on proposals for programs to be incorporated in the WIP was the ability of stakeholders to analyze the impacts of various proposals in the Model.

Contrary to what stakeholders were led to believe, EPA has been made little effort so far to provide the type of technical assistance needed to perform this analysis in a timely or meaningful way. Stakeholders have been virtually making blind guesses in predicting the mix of feasible best management practices that will have the greatest environmental returns in EPA's Chesapeake Bay Model. And the period of turnaround for measuring the Model's effects of stakeholders' blind guesses has been unsatisfactorily slow. Pennsylvania and the Bay states continue to be largely left in the dark in their effort to devise an environmentally sound and economically viable implementation plan through analysis of the Model.

4. EPA has provided no meaningful guidance or constructive feedback in response to proposals offered in the course of WIP development.

EPA has provided little meaningful or concrete feedback to more specific measures for pollution control within Pennsylvania's agricultural sectors that DEP has proactively proposed and offered for consideration. And what little feedback DEP has received has been predominantly negative, and largely devoid of practical or feasible recommendations to address EPA's concerns.

Response

EPA has worked side-by-side with its jurisdiction partners in developing the TMDL. EPA assigned a jurisdictional lead to each jurisdiction as a main point of contact. EPA has provided extensive hands-on assistance to the states and the District in the development of their Watershed Implementation Plans through a number of face-to-face meetings as well as Chesapeake Bay Program committees such as the Water Quality Goal Implementation Committee (WQGIT), as well other stakeholder meetings and webinars. EPA has worked closely with each jurisdiction to provide constructive feedback on the draft Phase I WIPs up to the final document submission. Evidence of the communications is reflected in the improvements seen in the final submissions for each jurisdiction. A list of meetings involving EPA and the jurisdictions are included in Appendix C of the final TMDL report.

Author Name: William Neilson John Bell and

Organization: Pennsylvania Farm Bureau

7. EPA's preoccupation with legal compliance of farms is misplaced and will not efficiently manage limited financial resources.

EPA seems to be unduly insisting that aggressive regulatory and enforcement measures to invoke legal compliance by all Pennsylvania farms be a major component of Pennsylvania's WIP. While we are not advocating that Pennsylvania farms be operated in a manner that does not achieve baseline compliance, we have significant concerns over the extreme focus EPA is giving to this facet of the WIP and the detrimental effects that this focus will have in diverting state and federal resources from proven programs of nutrient and sediment reduction on farms.

EPA has not offered any meaningful analysis of the effect of full achievement of legal compliance on farms will have in attaining nutrient and sediment reduction in the Chesapeake Bay. Our analysis of the Chesapeake Bay Model's measured effect of full legal compliance by all Pennsylvania farms would indicate that full compliance would only attain modest reduction in nitrogen, phosphorus and sediment pollution.

Response

The comments seems to make the point that full compliance with existing state regulations on farms is not sufficient to have significant improvement in the nitrogen, phosphorous and sediment loads. If this is the case, it would seem clear that more controls would be needed. EPA has left it to the states to determine how those controls will be achieved, but EPA insists that the plan demonstrate that those controls have a high level of assurance that the controls will be installed.

Comment ID 0432.1.001.014

Author Name: William Neilson John Bell and

Organization: Pennsylvania Farm Bureau

While we do have concerns with DEP's most recent proposals to ramp up investigation and regulatory enforcement activities in Pennsylvania's agricultural sector, we are troubled by the extreme degree of disapproval expressed by EPA in response. In the abstract, the focus of DEP's plan to direct more financial and administrative resources to those stream areas considered to be most seriously impacted from agricultural activity seems to make basic sense. In its response, EPA failed to offer any constructive suggestions to address its criticism of DEP's approach.

Response

See response to Comment No. 0432.1.001.010. Also, fortunately, the extended discussions between EPA and the states have paid off. That is, the final state WIPs are much improved from the draft WIPs. Therefore, EPA has chosen to reduce or remove the backstop allocations that were in the draft.

Comment ID 0432.1.001.018

Author Name: William Neilson John Bell and

Organization: Pennsylvania Farm Bureau

Pennsylvania's proposed WIP is the product of a reasonable and good-faith effort made jointly by the Commonwealth and Pennsylvania's public and sectors to devise a meaningful and effective game plan for future nutrient and sediment reduction in the Bay watershed. Especially given the severe time constraints to develop and submit the Phase 1 WIP and the serious lack of guidance or meaningful assistance provided by federal officials in its development, we believe Pennsylvania's WIP will effectively move Pennsylvania toward the nutrient and sediment reduction goals that EPA would like to see accomplished by 2025. And we and other stakeholders who assisted in the WIPs development sincerely believe that it can be fully implemented without bankrupting public coffers and farm families.

Response

Organization: The Harrisburg Authority, Harrisburg, Pennsylvania

The WIP fails to identify the specific activities that will be implemented to reduce nutrient and sediment loading from the agricultural sector. What exactly will be done to assure agricultural compliance? Section 8, which addresses Agricultural, is largely a recitation of existing practices that have proven to be unsuccessful. Also, the cost to Pennsylvania and the cost to each sector is not identified to implement the WIP. Any discussion of costs should include a discussion of funding sources and needs, which is missing from the WIP.

The draft WIP claims that Pennsylvania is "making progress" toward its assigned loading reductions. What steps is the Department taking to ensure that EPA approves the draft WIP and abandons its efforts to implement the "backstop allocation" approach?

Does the Department intend to mandate more stringent discharge limitations in NPDES permits (i.e., limit of technology) even if EPA retains the "backstop allocation" approach in the final Chesapeake Bay TMDL?

Page 7 New Technology and Nutrient Trading

The Department is correct that failures in manure management result in greater discharges to the Bay and that regional digesters, some of which could be co-located at existing point source sites, would reduce nitrogen and phosphorus if appropriate BNR or ENR technology is applied. It should be noted, however, that the nutrient removal technology in regional digesters is likely the same as that required of every point source that chooses to meet its cap load through treatment. Further, DEP must assure that the regional digester projects have a source of funding that is independent from funding sources that might be available to the point sources. If separate funding is not implemented, then point sources and regional digesters will compete for the same pool of money.

The Department is advocating the use of advanced technologies to meet the Commonwealth's loading reductions. The Department needs to discuss possible funding of these technologies with Pennsylvania's legislature, EPA, and other federal sources?

Page 49 Current programs and capacity

If it is correct as stated that it is unlawful under the Clean Streams Law to discharge pollutants to surface or groundwater except as allowed by regulation, then the DEP's enforcement for agricultural operations must be lacking. This conclusion is obvious given the large proportions of nitrogen, phosphorus and sediment coming from this sector. Until DEP assures that this sector is in full compliance with the Clean Stream Law, other sectors should not be tasked with meeting tighter standards than those set forth in the CBTS.

Page 64 Staffing Considerations - Regulatory Programs

The Department asserts that: "Pennsylvania's strength in the environmental regulation of agriculture is the laws and regulations currently in place." However, the draft WIP states that Pennsylvania cannot ensure compliance with these laws or regulations because of staffing issues. Such a position is unacceptable, as compliance is a concern raised by EPA in its September 27, 2010 comment letter to the Department regarding the draft WIP ("...there appears to be a high-level of non-compliance with existing state programs for farm conservation and nutrient management plans" (see p.3). Pennsylvania must ensure that it has adequate resources to address the regulation of non-point sources, such as agriculture.

Page 97 Onsite Wastewater

There is little likelihood that significant reductions in nitrogen discharged from on lot disposal systems will be achieved even if extensive efforts are made to replace existing systems with ones believed to be capable of nitrogen reduction due to relatively low groundwater temperatures in much of the Pennsylvania and due to the lack of operations and maintenance that will be practiced. The only significant solution to reduction of nitrogen discharge from OLDS will be through their abandonment in favor of connection to public sewers. Currently an offset of 25 pounds per year of nitrogen is provided to certain qualifying OLDS when connected to a public sewer. This, alone, is not sufficient to cause public sewer systems to seek to construct new sewer systems. If reduction in this segment is required, then incentives should be implemented.

8. We support the State focusing on the Core 4 practices while exploring alternative technologies. Alternative technologies must remain an option to consider - not a requirement on new and expansion projects. EPA must recognize the tremendous cost associated with some of the technologies and the difficulties in obtaining financing to cash flow the project.

9. We support the State and USDA-NRCS expanding the projects and practices that can be covered to gain on overall improvement to water quality.

Response

Nutrient and sediment loads from agriculture, across the watershed, have been reduced, but not enough to achieve the reduction goals to restore water quality in the Chesapeake Bay. In addition, voluntary efforts, over the past 25 years, have not incentivized the widespread adoption of conservation practices across the agricultural landscape. Farmers who were willing to implement

conservation practices on their lands under this voluntary system, for the most part, have done so. Hence, the nutrient and sediment reductions attributed to conservation practices on agricultural lands to date. According to a recent NRCS study, cultivated cropland represents only about 10 percent of the land base in the Chesapeake Bay watershed. With the current level of conservation treatment, cultivated cropland delivers a disproportionate amount of sediment and nutrients to rivers and streams and ultimately to the Bay. Of the total loads delivered to rivers and streams from all sources, cultivated cropland is the source for 25 percent of the sediment, 27.5 percent of the phosphorus, and 32 percent of the nitrogen. There is significant room for improvement in reducing the amount of nutrients and sediments from agricultural lands. The goal with the TMDL is to improve federal, state and local regulatory frameworks to provide new types of incentives for the adoption of these cost-effective BMPs to further reduce the pollutants running off of agricultural lands. Pa.'s revised WIP outlines using a targeted watershed approach to implement conservation planning and practices in those agricultural watersheds having the greatest impact to the Bay.

Pennsylvania will shortly submit a Final Phase 1 Chesapeake Watershed Implementation Plan (WIP) that will provide the necessary reasonable assurance, separate and apart from the TMDL, that the Commonwealth's nutrient and sediment allocations for the Chesapeake Bay will be met. This WIP is being developed with the input of over 150 stakeholders and reflects an equitable cost-effective approach to meeting Pennsylvania's allocations.

- Pennsylvania is concerned with any mandatory requirement for a precision feed management program for dairy operations of any size.

Response

The recommendations and concerns of the commenter are very relevant to the implementation of the TMDL, but beyond the scope of the TMDL itself. It is important that EPA distinguish that the TMDL is required by law to establish the loadings necessary to meet water quality standards, but does not establish the specific BMPs to implement the allocations. The draft TMDL did include backstop allocations that included stringent load levels for agriculture. Since the Pa WIP is much improved the backsto allocations

have been reduced or removed. Please see section 8 for a full description of EPA assessment of the state WIPs and final allocations.

Pennsylvania remains a committed partner in the restoration of the Chesapeake Bay. Given the appropriate flexibility, time, and tools, Pennsylvania is confident that we can help develop a WIP that will make sense to Pennsylvania stakeholders and restore Pennsylvania's local waters and the Chesapeake Bay. The Final Chesapeake Bay TMDL should be consistent with Pennsylvania's final WIP submission and provide gross WLAs and gross LAs for each major basin in the state.

Comment 1. Wastewater Facilities.

According to the draft WIP, a Compliance Plan for Industrial Waste Dischargers to the Chesapeake Bay was developed in January 2010 after holding three voluntary meetings with the 30 existing significant industrial dischargers. The plan for these existing facilities was to keep them at their current load plus a 10 percent margin for future growth. The draft WIP also includes 183 significant domestic wastewater facilities. The 183 significant domestic wastewater facilities and 30 industrial facilities are expected to comply by 2017.

Significant point sources are defined as domestic wastewater treatment plants (WWTPs) with a design flow of 0.4 million gallons per day (mgd) or greater or industrial discharges with greater than either 75 lbs/day of Total Nitrogen (TN) or 25 lbs/day Total Phosphorus (TP).

We are concerned that the list of significant dischargers has been prematurely determined to be complete or final leaving other existing significant dischargers with insufficient wasteload allocations (WLAs).

As described in the draft WIP, nutrient loadings can be associated with many sources (e.g., deposition, storm water, air pollution control devices, landfills, etc.). Therefore, to ensure the equitable distribution of waste load allocations, we suggest that the DEP collect monitoring data from all major industrial point sources to better ensure the list of significant

point sources is complete.

We recommend including a reserve of WLAs in the WIP to provide some flexibility in the event that other existing significant point sources are identified as the TMDL is implemented in Phases II and III.

As indicated by the DEP in the draft WIP, the short timeframe allotted for development of the WIP did not allow for full analysis of all the comments provided by the workgroups, and the DEP plans to continue to work with these groups, and all interested individuals, on further analysis of ideas and suggestions. RRI Energy looks forward to working with the DEP.

Comment 3. Industrial Storm Water.

As indicated in the draft WIP, an up-to-date list of industrial stormwater permitted facilities and associated outfall locations was prepared in April 2010 and was used to complete the industrial stormwater analysis. For consistency with other TMDLs developed in Pennsylvania, each outfall was considered to have an estimated drainage area of 1 acre.

The up-to-date list appears to have been developed using only NPDES General Permits. The list of industrial stormwater permitted facilities fails to include stormwater outfalls that are included in individual NPDES permits and as identified in stormwater Module 12 of NPDES applications. As a result, the number of permits and associated drainage acreage are significantly under estimated.

As one example, Clearfield County was identified as having 25 Permits consisting of 36 drainage acres. As detailed in Shawville's 2005 NPDES Renewal Application, five stormwater outfalls with a total drainage area of 121.4 acres are present at the station. This is more than the drainage area identified for the entire County. In addition, the drainage area for each Shawville stormwater outfall is substantially larger than the 1 acre estimated drainage area used for each outfall in the draft WIP. Any WLA derived from this data for stormwater discharges at Shawville or other facilities would result in a WLA that would be impossible to meet with any technology and would require elimination of the stormwater discharge or purchase of credits.

Comment 4. Significant Industrial Waste Discharges.

The Shawville Generating Station is identified as an insignificant point source in Appendix Q-1 and Q-2 of the draft Bay TMDL and does not have a sufficient waste load allocation (WLA) for existing discharges.

Organization: Capital Region Council of Governments TMDL Work Group

COMMENTS TO DRAFT PENNSYLVANIA WATERSHED IMPLEMENTATION PLAN ON BEHALF OF THE CAPITAL REGION COUNCIL OF GOVERNMENTS TMDL WORK GROUP

p.3 The draft WIP asserts that Pennsylvania is "making progress" toward its assigned loading reductions. Yet, EPA has deemed the draft WIP to be insufficient. What steps are or should the Department take to ensure that EPA approves the WIP and abandons its efforts to implement its "backstop allocation" approach as set forth in the draft Chesapeake Bay TMDL?

p.4 The Department is advocating the use of advanced technologies to meet the Commonwealth's loading reductions. Has the Department discussed possible funding of these technologies with Pennsylvania's legislature, EPA or other federal sources?

p.5-6 The Department's Compliance Plan regarding non-point source reduction did not meet EPA's "reasonable assurance" evaluation. Setting aside the legal issues regarding EPA's "reasonable assurance" standard, what does the Department need to do to ensure that it provides EPA with "reasonable assurance" that the non-point source sector will meet its loading reduction obligations?

p.9 Does the Department agree with EPA's apparent interpretation that: (1) EPA has sufficient legal authority to develop the Chesapeake Bay TMDL; and (2) Pennsylvania, with no impaired streams feeding into the Chesapeake Bay, must nonetheless comply with the requirements of the Chesapeake Bay TMDL?

p.15 Did EPA provide the Department with sufficient time to develop its Phase I WIP?

p.16 Does the Department intend to mandate more stringent discharge limitations in municipal wastewater treatment plant permits (i.e., limit of technology) even if EPA insists on retaining the "backstop allocation" approach in the final Chesapeake Bay TMDL?

p.50 In EPA's September 27, 2010 comment document to the Department regarding the draft WIP, EPA suggested that Pennsylvania's Trading Program is not totally satisfactory. How does the Department intend on addressing EPA's concerns and how will this impact the Department's trading program and its strategy on accounting for future growth in the Commonwealth? Moreover, it is critical that DEP obtain the most current delivery ratio data from EPA and incorporate such information into its WIP because trading will be affected by the delivery ratios used in the WIP.

p.52 Does the Department agree with EPA that the limit of technology for nitrogen and phosphorus is 3 mg/l and 0.1 mg/l, respectively?

p.59 The Department has sufficient regulatory authority under the Clean Streams Law to ensure that the non-point source sector meets its loading reduction obligations under the Chesapeake Bay TMDL and the Department should conclusively state that it will use this authority to ensure that the non-point source reductions in the Chesapeake Bay TMDL are met.

p.60 Pennsylvania should further explain how its regulations on Erosion and Sedimentation Control, specifically its new Chapter 102 regulations, which become effective on November 19, 2010, will be used to address the loading reduction requirements of the Chesapeake Bay TMDL.

p.61 Will the Department take legal action under 25 Pa. Code § 91.36 to ensure that all regulatory requirements for nutrient management for manure storage and land application is undertaken?

p.64 In its draft WIP, the Department asserts that: "Pennsylvania's strength in the environmental regulation of agriculture is the laws and regulations currently in place." However, to subsequently concede that Pennsylvania cannot ensure compliance with these laws or regulations because of staffing issues is unacceptable, as compliance is a concern raised by EPA in its September 27, 2010 comment letter to the Department regarding the draft WIP (" ... there appears to be a high-level of non-compliance with existing state programs for farm conservation and nutrient management plans" (see p.3) and "Pennsylvania mentioned that its biggest challenge was ensuring compliance with existing regulations...EPA needs more detail on how many farms can be reached, by how many staff, within what timeframe and the resulting nutrient and sediment reductions." (see p.4).)

p.72 The Department must engage EPA regarding the implementation of BMPs between versions 4.3 and 5.3 of EPA's Chesapeake Bay Watershed Model.

p.128 The Department's discussion on legacy sediment is a good first step in addressing the source of nutrients which the Department asserts, that "stream corridor erosion from breached millpond reservoirs - is a substantial source of suspended (i.e., fine grained) sediments and nutrients within the Chesapeake Bay Watershed." How do the Department and EPA intend to address this issue in the context of the Chesapeake Bay TMDL?

Organization: Lancaster County Clean Water Consortium

The Lancaster County Clean Water Consortium ("LCCWC") believes that the Pennsylvania Watershed Implementation Plan could be significantly strengthened by emphasizing solution-oriented approaches to the underlying TMDL causes.

The LCCWC offers the following specific examples to strengthen DEP's Watershed Implementation Plan. The first example is a solution-oriented MS4's example of a watershed overlay, holistic MS4 approach and could serve as the pilot project to demonstrate its TMDL pollutant reduction results .

The Lancaster County Clean Water Consortium proposes to facilitate county-wide compliance with new federal regulations for water quality in the Chesapeake Bay by establishing a resource organization known as the Lancaster County Clean Water Consortium . The Consortium, organized in 2010, will serve Lancaster stakeholders by proactively initiating compliance with stringent pollution reduction standards proposed in the Pennsylvania Chesapeake Watershed Implementation Plan. The goal of the Consortium is to enable the cooperative implementation of water quality and quantity projects between federal, state, and local governments, watershed associations, watershed residents, and community stakeholders.

To encourage the utilization of the most cost-effective proven and/or emerging technologies, the Consortium is in the process of securing funds to obtain technical assistance in 2011 to: "

Develop a coordinated, watershed overlay Municipal Separate Storm Sewer System (MS4) which will support the Model Stormwater Ordinance under development by the Lancaster County Planning Commission and design a pilot stream bank restoration project that will take into consideration the impact of point-source outfalls and surrounding land uses; "

Provide detailed cost estimates to assist in the evaluation, the selection, and the funding of a variety of agricultural best management practices and nutrient reduction techniques .

Solutions: Projects and People

Lancaster County has been identified as one of the top three contributors of agricultural pollutants in the Chesapeake Bay. While early introduction of agricultural best management practices have accomplished some reductions in nitrogen, phosphorous and sediment loads, much remains to be done.

The success of the Lancaster County's approach will depend on the ability to implement the commitments and achieve the required nutrient and sediment reductions described in the Commonwealth's Watershed Implementation Plan (WIP). If the goals of the state WIP are not achievable, the repercussions of USEPA consequences will affect all source

sectors in the county (and state), especially within the agricultural sector. Lancaster County consists of a unique farming community that includes a preponderance of small farms beleaguered by marginal operating economics. A successful program must be carefully crafted to encourage participation without undue economic hardship, and must also address how to involve the large numbers of independent farms in order to provide the information, leadership, education, and training necessary for successfully implementing nutrient load-reducing practices. There are also unique considerations that apply to plain-sect farmers; some programs may have varying rates of success within the distinct local communities that dominate each of the county's watershed basins. The Chesapeake Bay Program, through data collection and modeling, has generated a considerable amount of information related to efficiencies and costs of implementing agricultural management practices, but Pennsylvania is a state where one-size does not fit all. The far-reaching implications of the WIP necessitate a close examination of the agricultural strategies that are best for Pennsylvania and Lancaster County. This makes "the Development of a Tool to Estimate the Costs to Meet the Nutrient and Sediment Reduction Goals" critical for the state and the county to preserve the county's water quality goals. In other words, identifying and implementing the programs and practices that give the best nutrient and sediment reduction for the dollars spent is essential for success.

In anticipation of more stringent EPA regulations, Lancaster County must proactively evaluate the best combination of agricultural management practices, storm water management systems, point source, and legacy sediment stream restoration projects to maximize the TDML reductions in a cost effective manner. With the information gathered in the three programs proposed for funding year 2011, the Consortium will be able to help municipalities, landowners, and watershed groups prioritize their implementation projects and help them secure funds. This model of jurisdiction (County) wide cost evaluation and coordinate stormwater protocols Consortium model is replicable in any County and the base costs for project implementation will be of use in other parts of the Chesapeake Bay Watershed and Pennsylvania for many years.

The Foundation plans to support the ongoing operations of the Consortium through: "

Annual financial contributions from 5 classes of members:

- o Municipalities & Authorities;
- o Non-profits (e.g. Lancaster Farmland Trust, Watershed Alliances, Trout Unlimited Chapters);
- o Agriculture (landowners and charitable contributions from agri-business);
- o Business (local corporations & developers);
- o Individuals that share a commitment to environmental stewardship and clean water initiatives."

Administration fees from planning grants and project implementation grants." Sponsorship from individuals and firms." Contributions from developers and landowners to offset MS4 or water quality impacts.

Solutions: Funding

Nutrient and sediment reduction in the Chesapeake Bay is a priority for DEP funding. This proposal will result in the information necessary to meet Lancaster County's assigned goals as well as for all other impacted counties within the Commonwealth. The relative costs of agricultural nutrient control practices and the programs that will be needed to implement them need to be better understood in order to set priorities for efficient allocation of public funding and promote overall pollution reduction cost-effectiveness. On one hand, it is important that investigations into the identification of "preferred programs and practices" involve an independent assessment of the programs and practices tentatively identified in the Commonwealth's draft WIP. It is also important to take a fresh look into new, emerging, and innovative ideas drawn from a broad knowledge base comprising the latest findings of academic experts, governmental

agencies, farmers, and practitioners engaged in the research, management, and operations of the state and County farming community. Again, this makes funding of the "Methods and Costs to Reduce Loads", "Identification of Technology and Innovative BMPs", and "Recommendations for Preferred Agricultural Programs" critical needs for immediate funding. Work on these projects will supply necessary information to make cost-effective decisions about designing and funding preferred programs that will provide the leadership necessary to achieve required water quality goals.

In addition to meeting the financial priorities of the Commonwealth and DEP, this proposal could save hundreds of thousands of dollars of public and private funds by eliminating the need for redundant studies, project plans and cost estimates. Lancaster County's progress toward reaching TMDLs for nutrient and sediment reduction will be enhanced through the coordinated efforts of the Consortium. By combining plans and strategies on a watershed basis, the Consortium will maximize every dollar spent on water quality projects. The limited grant preparation and administration capacity of County stakeholders will be supplemented by the Consortium staff and the deliverables will streamline and enhance quality proposals that are more likely able to secure coordinated multi-source funding. Our efforts will supplement the activities of the Lancaster County Conservation District and the Lancaster County Planning Commission by focusing on the Chesapeake Bay Nutrient Reduction programs, projects and milestone reporting.

The implementation of coordinated watershed restoration strategies and innovative demonstration projects will provide Lancaster County's urban, suburban and rural communities with a better quality of life as nutrient and sediment loadings are reduced in the county's rivers and streams via non-point municipal and agricultural run-off as well as sewage treatment plants and other point sources. The countywide WIPs will also demonstrate where and how the county can absorb more population growth while still keeping county waters clean for drinking, fishing and swimming.

The success of the Lancaster County's approach will depend on the ability to implement the commitments and achieve the required nutrient and sediment reductions described in the Commonwealth's Watershed Implementation Plan (WIP). If the goals of the state WIP are not achievable, the repercussions of USEPA consequences will affect all source sectors in the county (and state), especially within the agricultural sector. Lancaster County consists of a unique farming community that includes a preponderance of small farms beleaguered by marginal operating economics. A successful program must be carefully crafted to encourage participation without undue economic hardship, and must also address how to involve the large numbers of independent farms in order to provide the information, leadership, education, and training necessary for successfully implementing nutrient load-reducing practices. There are also unique considerations that apply to plain-sect farmers; some programs may have varying rates of success within the distinct local communities that dominate each of the county's watershed basins. The Chesapeake Bay Program, through data collection and modeling, has generated a considerable amount of information related to efficiencies and costs of implementing agricultural management practices, but Pennsylvania is a state where one-size does not fit all. The far-reaching implications of the WIP necessitate a close examination of the agricultural strategies that are best for Pennsylvania and Lancaster County. This makes funding for "the Development of a Tool to Estimate the Costs to Meet the Nutrient and Sediment Reduction Goals" critical for the state and the county to preserve the county's water quality goals. In other words, identifying and implementing the programs and practices that give us the best nutrient and sediment reduction for the dollars spent is essential for success.

MS4 Watershed Overlay Permit

Scope of Work To provide assurance that across Lancaster County, the most cost-effective and environmentally

sound implementation projects are undertaken, the Consortium would like to complete a pilot project analysis to integrate:

- MS4s
- BMP Installation
- Point Source discharges
- Legacy sediment - nutrient and stormwater credits

Coordinated MS4 Protocol and Little Chiques Creek Pilot Project Analysis - Develop a watershed or county-wide coordinated protocol with specific tools to assist Lancaster County municipalities in meeting MS4 requirements. This will include a template for addressing applicable TMDLs in addition to the six Minimum Control Measures (MCMs) required as part of PAG-13. Also included will be an evaluation of alternatives that may exceed the MCM requirements but would require individual permit approval. Alternative measures may be more cost effective with greater water quality benefits. Some of these alternative measures may involve regional coordination and multi-municipal efforts.

Approximately 40 miles of stream segments of Little Chiques will be analyzed including Main Stern, Brubaker and Back Run. Seven (7) representative reaches would be selected to obtain field data such as geo probes, nutrient analysis, storm water management - storage volume. One (1) location would include data intensive for credit trading purpose for nutrients and stormwater. The Mount Joy Borough and Mount Joy Borough Authority are committed to repairing the stream banks along the Little Chiques Creek in the borough park. An unusual aspect of this proposed project area is that part of the stormwater flows impacting the stream come from an industrial park in the Donegal Region Urban Growth Area. This development has a master-planned, integrated storm water system that serves over 400 acres of businesses that provide more than 3,000 jobs.

Objective: Develop stormwater permit protocols that are consistent with a new model Stormwater Ordinance developed by the Lancaster County Planning Commission.

Objective: Provide spatial and depth data. Useful for assessments in effort to reduce field work. Data can be used in rough estimate calculations for items 1-3 above.

Objective: Establish riparian buffers and restore disturbed areas along the Susquehanna river, Conestoga River, and smaller waterways.

Objective: Provide guidance to municipalities and watershed groups to support the requirement for comprehensive watershed analysis on all watershed areas prior to funding request for streambank projects.

1. Deliverable - MS4 watershed overlay compliance protocol for Lancaster County Municipalities

AG-13 Compliance - Multi-Municipal agreements to cooperatively meet MCM responsibilities more efficiently

- Public Outreach and Education
- Public Involvement
- Illicit Discharge Detection and Elimination
- Construction Site Runoff
- Post Construction Stormwater Management

-Pollution Prevention/ Good Housekeeping

Strategies to implement existing and develop new Watershed Implementation Plans (WIPs) to meet TMDL requirements

Individual Permit Alternatives

Develop watershed- based stormwater management/ water quality strategies

-Incorporate Act 167 plans, WIPs

-Multi-municipal coordination

Plan and implement Regional Stormwater Management/ Water Quality Facilities Develop framework for applying stormwater offsets to new development sites Develop incentives for participation in regional efforts identify long-term maintenance needs and responsibilities (including inspections) Negotiation with DEP/ EPA regarding application of alternative strategies Establish reliable protocol so that municipalities can be confident of compliance through alternative measures

2 . Deliverable: Comprehensive Report with Data for Pilot Project Report including:

-Mapping - LIDAR photography & Video -aerial logging photography

-Field Assessment: Ground Truthing, Photo documentation "

-Data collection (nitrogen, phosphorus, sediment)

-Determine locations of point source discharges

-Identify Restoration opportunities - Regional SWM, Wetlands, buffers, etc

-Integration of the two other studies - Resolution 215 (Program I) and the MS4 Protocols (Program III)

Summary-

The landowner and municipalities of Lancaster County will make better progress toward reaching TMDL for nutrient and sediment reduction through the coordinated efforts of the Consortium. By combining plans and strategies on a watershed basis, the Consortium will maximize every dollar spent on water quality projects. Resources will be concentrated to better deliver quality proposals and secure coordinated funding. Our efforts will build on the prior activities of the Lancaster County Conservation District and the Lancaster County Planning Commission by focusing on the Chesapeake Bay Nutrient Reduction programs and implementation projects.

The members of the Consortium recognize that stormwater runoff is best considered a valuable and reusable resource; not a waste that must be quickly moved away.

Stormwater can be effectively managed through properly constructed and maintained best management practices (BMPs) which remove pollutants, facilitate ground water recharge, provide base flow for surface waters, and protect and maintain the stability and environmental integrity of our ground and surface water resources. Managing increases of stormwater runoff to minimize pollutant loading includes reducing or avoiding the generation of new or increased sources of these pollutants as well as restoring and protecting the natural systems that are able to remove pollutants . These objectives can be accomplished through various BMPs such as stream buffers, vegetated systems, infiltration, and the reuse, recycle or collection of stormwater . Although stormwater runoff cannot be eliminated, the effects of

excess stormwater on our citizens and land and water resources are minimized through better management and treatment. Source: Growing Together, LIMC Comprehensive Plan

The Consortium is dedicated to utilizing the best, affordable technologies in a holistic Chesapeake Bay watershed approach. We wish to use existing plans but seek to streamline the permitting process for municipalities, farmers, and developers. Our focus will be to provide guidance and an awareness of the opportunities, not to obstruct the EPA process. Our intended service to our constituents is to clearly deliver what are the best and most cost-effective methods for accomplishing compliance with the forthcoming TMDL regulations.

II. TMDL Efficiency Tool

Scope of Work - The mission of the Consortium is to undertake a variety of efforts to develop a proactive, cohesive countywide strategy to restore the County's waterways and facilitate compliance with looming federal and state regulations intended to clean up the Chesapeake Bay.

A. Objective/Work Element - Estimate the cost to meet the agricultural source nutrient reduction goals of the Chesapeake Bay Program and agricultural allocations as defined in the State WIP, including but not limited to determining a cost per unit removed (nitrogen, phosphorus, or sediment) for best management practices that are considered or recommended. A panel of Academic Experts and consultants (experienced in development of the Chesapeake Bay model), will participate to obtain and confirm input data for the development of an assessment tool. Cost data, nutrient removal efficiencies, and implementation aspects will be checked or areas of concern identified. These data will be used to build a "reference" cost analysis, then will be refined based on the Pennsylvania-specific information our team will gather as we execute work elements B, C, and D.

1. Deliverable -Data management tool for composite scenario costing of the agricultural non-point-source portions for on-site pollution-reduction practices. This tool will utilize data collected and evaluated in elements B and C. In turn, the tool is in part utilized in the identification and evaluation of priority practices in element D.

2. Deliverable -Technical Memorandum outlining the following -baseline cost of compliance for the agricultural sector, evaluation of BMP cost and effectiveness ranges, and cost of WIP compliance for the Commonwealth's agricultural sector.

B. Objective/Work Element - Identify methods (including their costs) employed in other states to reduce loads from agricultural sources and make findings as to their applicability and impact to the agricultural community of this Commonwealth, particularly Lancaster County.

1. Deliverable-Conduct surveys and prepare technical report on other state WIP programs that will draw on readily available Chesapeake Bay Program and state-prepared documents, 2010 Draft WIP and 2010-2011 milestones, new technologies being demonstrated in other states (from Work Element C), and nutrient trading programs in other states; relative to the potential impact on future Lancaster County watershed allocations. A Technical Memorandum will be prepared to describe effective agricultural management practices employed outside the state.

C. Objective/Work Element - Evaluate the potential of new technology and innovative best management practices generally to address nutrient loads from agricultural sources. As part of the evaluation, the relative cost compared with

established technologies, practices and pro-grams will be developed . A panel of Academic Experts and an Agricultural Work Group will be used to identify and list technologies and innovative BMPs, including those established and those not widely established in the Commonwealth . The short listing process will consider any programs not otherwise selected, but currently being emphasized as part of the Chesapeake Bay Program or the Draft WIP as key initiatives for achieving the Commonwealth's nutrient reduction goals. The "short list" of promising and key initiative options will then be subjected to a planning-level evaluation based on demonstration site visits, data from manufacturers, published literature, or previous studies to the extent achievable within the timeframe of this study. Results will be summarized, with a focus on highlighting technologies or innovative BMPs with the potential to become a more significant component of the Lancaster County's watershed nutrient reduction strategy.

1 . Deliverable - A weighted set of screening criteria ; planning-level budgetary capital cost estimates ; 20-year life cycle cost estimates, cost effectiveness ratios (cost per pound of nutrient removed), "transactional" cost estimates (the cost of education, outreach and technical support to promote the technology or practice) and potential impact of the technology or practice on meeting overall nutrient removal goals. A Technical Memorandum will be prepared to summarize new technologies or innovative BMPs with potential to become a more significant component of the state's and county's nutrient reduction strategy.

D. Objective: Make recommendations for preferred programs for the agricultural community that overcome structural obstacles, encourage participation, accelerate bringing agricultural lands to baseline, facilitate the application of cost-effective technology and innovative best management practices and stimulate the generation of nutrient credits that are valued by point sources.

1 .Deliverable: Recommendations that set criteria for and identify preferred programs based on the costs and benefits, training and technical support requirements, regulatory and other obstacles, and relative incentives. A Technical Memorandum will be prepared to summarize: existing and innovative programs that are effective and are relevant to PA farm baseline requirements and information gathered, potential load reductions from meeting baseline compared to reductions needed to meet WIP requirements, and impact on availability for nutrient trading and will provide a list of preferred programs and basis for the list.

RE : Comments regarding Pennsylvania's draft Chesapeake Watershed Implementation Plan (WIP); September 2010

Dear Department of Environmental Protection:

The Chesapeake Bay Foundation (CBF), and its more than 200,000 members, thank the Department of Environmental Protection (DEP) for developing and implementing a thorough and open stakeholder process for constructing the Watershed Implementation Plan (WIP). We look forward to a finalized WIP that includes the Best Management Practices (BMPs) necessary to meet the reduced requirements, but also includes the implementation capacity to assure that all BMPs are put "on the ground." It must equitably require nutrient and sediment reductions from across all sectors. The WIP must outline the mechanisms, allocate programmatic and financial resources to meet the goals, to provide reasonable assurance that the WIP can be implemented, and to restore Pennsylvania's waters and the Chesapeake Bay.

As you know, the process of developing the Bay-wide Total Maximum Daily Load (TMDL) actually began over a decade ago with a series of federal judicial court decrees and settlement agreements over impaired water listings for many watershed states. See *American Littoral Society v. EPA*, Case No. 96-489 (E.D. April 9, 1997); *American Canoe v. EPA*, 54 F. Supp. 2d 621 (E.D. Va. 1999). On 28, 2000, the governors of Virginia, Maryland, and Pennsylvania, the chair of Chesapeake Bay Commission, and the Mayor of the District of Columbia responded to the various decrees and agreements by signing, with the EPA Administrator, Carol Browner, the Chesapeake 2000 Agreement which, among other things, committed to reduce nitrogen, phosphorus, and sediment sufficiently to remove the Bay and its tidal tributaries from the impaired waters lists by 2010.

In December 2003, the EPA, Pennsylvania, and the other Bay jurisdictions agreed to the nitrogen, phosphorus and sediment allocations that became the basis for "tributary strategies," designed to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. Pennsylvania completed their plan in 2004. [FN1] The failure to achieve the goal triggered the need to develop the Bay TMDL - a process in which Pennsylvania has been a full and cooperative participant.

Consistent with EPA's letters to the Principals' Staff Committee of September 11, 2008, November 4, 2009, and April 2, 2010, we strongly encourage the state to provide the necessary details in their WIP for how they will achieve the necessary reductions.

While Pennsylvania has made significant progress on some specific BMPs, the Commonwealth has demonstrated an inability to deliver on core programmatic items that are critical to meeting our water quality goals. This WIP is Pennsylvania's final opportunity to create a strategy for implementing the TMDL that is built by Pennsylvanians, for Pennsylvania, and utilizes the details and efficiencies that are specific to the Commonwealth. CBF urges you to consider the following recommendations to construct a credible strategy to accomplish the necessary reductions. Otherwise, the Federal Government will use its Clean Water Act authorities to attempt to accomplish those reductions in Pennsylvania. The outcomes of that approach will be far more difficult and less efficient for the Commonwealth and its citizens.

EPA's assessment of the Pennsylvania WIP was not good. The agency cited numerous "significant deficiencies" that if not corrected would result in EPA invoking under existing Clean Water Act authority several "backstop" measures.

[FN2]

A central criticism by EPA was the conclusion that Pennsylvania did not develop a credible and justifiable plan to reduce pollution from farms and urban and suburban developments. Without meaningful reductions from these sectors, Pennsylvania will not achieve the pollution reductions required by the TMDL.

The ramifications of failure, and the implementation of the "backstop" measures and the other consequences, detailed in EPA's December 29, 2009 letter to the Bay states, threaten to profoundly impact Pennsylvania communities, farmers and businesses in many significant ways.

In order to avoid EPA imposing the TMDL "backstops" and the other consequences, we strongly encourage DEP to fully integrate our comments and suggestions into the draft Phase I WIP.

Also, we incorporate by reference the comments submitted by CBF and the Choose Clean Water Coalition and Donald Boesch, et al. to Administrator Jacl on November 8, 2010, Docket no. EPA-R03-OW-2010-0736.

Key Recommended Improvements

Detailed in our comments herein are numerous recommendations for improve the draft WIP, particularly as it pertains to the reasonable assurance EPA summary, we believe that the draft WIP should incorporate the following:

Agriculture

- Describe a strategic plan containing binding commitments for the state reasonably achieves agriculture's load allocation within the TMDL's limit and which includes sufficient contingencies if specific program elements cannot be implemented.
- Inform all producers of regulatory and TMDL-related requirements.
- Implement outreach, financial assistance, and enforcement activities to assure widespread compliance.
- Identify overall funding need, and remaining funding gaps that must be filled by the Commonwealth.
- Pursue core conservation measures first on farms that have not yet participated; "the basics" provide cost effective nutrient reductions.
- Integrate state efforts on alternative manure technologies with compliance efforts on small and medium farms, especially dairies.
- Invest state and federal funds in forested buffers of at least 35 feet; narrower or grass buffers should not be a subsidized priority.
- Maximize landowners' use of CREP for buffers to stretch other limited cost share programs farther.
- Advocate to restore and grow the REAP tax credit program.
- Advocate to restore and rebuild conservation district capacity.
- Develop a comprehensive methodology to track voluntary BMPs that reduce nutrient and sediment loads, as well activities (by all sectors) that increase nutrient and sediment loads.
- Commit to timeline for establishing criteria for TMDL level compliance and "Safe Harbor."
- Commit to timeline for establishing a plan for achieving phosphorus balance over the long term and that is sufficiently protective of water quality.
- Strengthen the private sector's role in providing planning and design services to producers.
- Coordinate efforts effectively to ensure all cooperating agencies and organizations are working on goals that are consistent with the WIP.

Urban/Suburban Stormwater

- Abandon the proposed MS4 methodology in favor of the approach employed in the Christina River Basin Watershed Stormwater Source TMDL.
- Revise permit requirements so as to incorporate no net increase provis for new or expanded discharges of construction, post-construction stormwater runoff.
- Revise Act 167 to fully incorporate stormwater-related LA and WLA allocations and reduction goals and practices.
- Revise Pennsylvania's Stormwater Best Management Practices Manual as to incorporate the small storm hydrology management approach.
- Develop and advocate for innovative, but scientifically justifiable, approaches to address and fund stormwater retrofits and impervious surface reductions in existing urban and suburban areas, including the examination of an offsets program.
- Develop a meaningful MS4 permitting program which requires the adoption of low impact development (LID) requirements, tree and urban/suburban woodland protection ordinances, and retrofitting programs, amongst other improvements.
- Advocate for a ban on the sale of phosphorus-based fertilizers intende use by homeowners, except under certain conditions.

Resource Extraction

- Develop a process to track and quantify the impact of land-based Marl Shale-related drilling activities (e.g., pads, roads, clearing of forest, etc incorporate into the WIP.
- Revise permit requirements to incorporate no net increase provisions new or expanded discharges of construction, post-construction storm, runoff from extractive industries, including Marcellus Shale.

Onsite Wastewater

- Close the septic system "loop hole" regarding no net increases in pollutant loads from new or expanded sewage discharges and institute an offsets program.

Sector Specific Comments

Throughout various sections of the draft WIP, numerous aspects of DEP's programs, permits, and methodologies for incorporation into the TMDL and VVIP are presented. This presentation approach makes it difficult to provide meaningful comment via a sequential approach. Therefore, for ease of presentation we provide our comments below on a per sector basis and not sequentially as presented in the draft WIP.

However, in general, the issues and concerns we raised in our August 12, 2010 letter to the Pennsylvania WIP team members remain (Attachment A). [Comment Letter contains additional information in the form of an attachment. See original comment letter EPA-R03-OW-2010-0736-0732.1.] Specific comments for each sector are below.

Agriculture

CBF supports DEP's commitment to reducing pollution from agriculture in ways that strengthen the sector overall, and helping individual producers maintain or regain profitability in the process. A robust agricultural sector in Pennsylvania is critical to PA watersheds and the Bay. That developed land is the only sector still increasing pollution loads underscores

the fact that farms and forests are much preferable to development, especially the highly land-consumptive growth that has occurred in the region over the past several decades.

DEP and other Pennsylvania agencies and partners have developed and pursued creative approaches to achieving agricultural nutrient reductions to augment ongoing efforts. These initiatives include nutrient credit trading, state enhancements to CREP, innovative manure technologies, REAP transferrable tax credits, ARRA and PENNVEST nonpoint source projects, county assessments of voluntary BMIPs, and others. We are hopeful that a new tracking program for voluntary BMPs will reveal more progress made by producers that has not yet been credited to the agricultural community.

Nevertheless, PA farms continue to generate substantial nutrient and sediment loads, and sufficiently reducing this sector's loads is the most critical aspect of Pennsylvania's WIP. The final WIP must clearly outline a strategic plan for agriculture that includes specific commitments of technical and financial resources with measurable goals and timelines. The draft WIP for agriculture not contain sufficient detail to provide reasonable assurance to EPA that necessary agricultural reductions will be achieved, nor did it give PA policymakers a clear roadmap for funding and program needs. The Chesapeake Bay Foundation agrees with EPA's assessment of serious deficiencies and we provide the following recommendations to correct these deficiencies.

Achieve widespread compliance with state and federal requirements in a timely fashion

The final WIP Agricultural Compliance Plan must identify the process, resources and timelines necessary to inform and assist producers who do not have required plans and BMPs.

Pennsylvania has a solid foundation upon which to work with small and medium sized farms that are not required to have certified nutrient management plans or Concentrated Animal Feeding Operation permits. DEP deserves much credit for efforts to revise Chapter 102 regulations on erosion and sedimentation control and the Field Application of Manure Supplement to the Manure Management Manual. Once the latter is completed, producers will have clearer guidance on required planning and implementation measures for both sediment and nutrient control, setting a "level playing field" for the majority of producers and giving an excellent context for gaining additional nutrient reductions from farms that may have considerable work yet to do.

The draft WIP relies heavily on new BMPs derived from farms developing and implementing required Erosion and Sediment Control Plans and Manure or Nutrient Management Plans. CBF supports this approach as fair and cost effective. It will focus pre-2017 efforts on implementing "core BMPs" (nutrient management planning, cover crops, riparian buffers, no-till or low-till cultivation) on farms that previously had not established necessary conservation practices versus enhanced BMPs on farms already achieving high standards.

However, regulations mean little if compliance with those regulations continues to lag. Pennsylvania has required conservation and manure plans for almost years, and many farmers are still unaware of these regulations. Indeed, a large number of PA farmers are unfamiliar with these requirements for the very reasons that EPA has criticized PA's draft WIP: DEP has never led, and has still neither described nor committed to, a comprehensive and proactive compliance effort. The failure of the Commonwealth, through DEP, the Department of Agriculture, Conservation Districts, and others to clearly educate and inform the agriculture sector about compliance has left the Commonwealth's farms vulnerable under state laws to administrative enforcement and citizen action.

While Pennsylvania has no comprehensive database on farm plans, discussions with county and state conservation agency staff suggest that at least half of Pennsylvania farms do not have required erosion control or manure management plans, and the number could be much higher. Recent inspections by EPA in the Watson Run watershed in Lancaster County found that only three of the twenty four farms in the watershed had conservation plans. [FN3] A comprehensive assessment of farming practices in the Chesapeake Bay watershed found that about 26% of cultivated cropland acres across the watershed still need additional erosion control practices and about 81% of these acres require additional nutrient management practices. [FN4] Past and current DEP regulatory programs do not appear to be a significant factor in planning decisions for most producers.

The updated requirements for these plans, coupled with the expectations of the TMDL, will require a comprehensive outreach, education and enforcement strategy that details the steps DEP and partners will take to assure that the approximately 40,000 farms in the Chesapeake Bay watershed develop or update these plans and are on implementation schedules for meeting necessary standards for water quality. The final WIP must move beyond what appears to be largely a recitation of existing programs with modest funding and staffing enhancements.

Implementation of the revised Manure Management Manual will lead to significant nutrient reductions, but possibly not sufficient to meet the TMDL goals. If the Manure Management Manual does not yield the performance needed, then DEP must require a higher level, such as certified nutrient management plans on all farms producing livestock.

The draft WIP acknowledges that staff resources are insufficient to assure compliance, but does not provide any meaningful solutions to address this shortage. It proposes to support four new staff positions, that "once fully trained, are expected to result in an increase of 450 agricultural inspections annually, well as 50 stormwater inspections and 100 compliance actions per year. [FN5] At rate, it would take 89 years after their training to reach all of the approximately 40,000 farms in the watershed. The final WIP needs to provide a strategy for either reaching these 40,000 farms with existing resources as soon as possible or securing new resources for this purpose.

The final WIP must commit to ensuring that sufficient resources for technical financial assistance will be available so that necessary plans will be developed for the estimated 18,000 livestock farms in the Chesapeake Bay watershed by 2018 and all remaining crop farms by 2018. We provide the following analysis on the necessary staffing resources for planning and outreach. Whether or not the final WIP uses a similar analysis, it must describe in detail how Pennsylvania will provide assurance that needed conservation and manure/nutrient management plans will be done on a timeline that is consistent with TMDL milestones.

Staffing Needs for Compliance Outreach and Assurance - An Analysis

About 2,000 livestock operations already have Nutrient Management Plans, the remaining 16,000 farms require Manure Management Plans. The Lower Susquehanna Watershed should see the most emphasis initially, because it contributes both the greatest nutrient and sediment loads to the Chesapeake and has greater staff resources. The Lower Susquehanna Watershed contains about 21,000 farms, approximately 10,000 of which have livestock.

Some farms will require only verification that they have current Erosion and Sediment Control or Conservation Plans and Manure Management Plans that are being implemented on schedule. Other farms will require only modest updates to their plans to address water quality concerns. A third set of farms will require more assistance in developing and

implementing plans where none currently exist. Anecdotal information suggests that about approximately one third of are in each of the three above groups. We estimate that an average (across t various situations described above) of 2.5 days of technical assistance staff ti per farm are needed to develop a basic Erosion and Sediment Control plan Manure Management Plan in the case of livestock operations.

CBF's assessment of technical resources assumes that agency and private sector employees must reach about 5,000 farms each year, so that developing the necessary plans for all farms in the Chesapeake Bay watershed is achieved within eight years. Eight years to develop the needed plans would provide the framework to establish 60% of the necessary BMPs by 2017 as required by EPA. One staff person (with vacations, holidays, sick time, and training time) could assist about 90 farms annually. This would require 56 full-time staff people, working exclusively on planning assistance to farms in the Chesapeake Bay watershed.

An alternative approach would be to shift priorities of existing staff, with some sacrifices to other programs or priorities. An estimate of the needs under this approach includes:

- 62 Chesapeake Bay Technicians in Conservation Districts, that could spend about 2/3 of their time (140 days/year) on outreach and plan development, with an average of 2.5 days per farm. At this rate, they could develop 34130 plans annually.
- About 50 Nutrient Management Technicians, Erosion and Sediment Control Technicians and other Conservation District staff, that could spend 10% of their time, or about 21 days/year to develop 420 plans per year.
- USDA Natural Resources Conservation Service assistance with approximately 500 plans per year through various programs, such as the Environmental Quality Incentives Program and the Conservation Stewardship Program.
- Eight Department of Environmental Protection regional staff encouraging the most problematic farms to develop the necessary plans immediately, through the private sector if Conservation District staff unavailable. They could reach about 50 farms per year per person, or about 400 total plans per year.
- The private sector's development of an additional 250 plans in the initial year, and more in the future. This sector must play a significant role in plan development and implementation, and their ranks would likely expand with demand, as farms see stronger regulatory requirements or nutrient credit trading opportunities.
- Farms in geographic proximity could be grouped together (possi with Conservation District assistance) to obtain lower cost bids f planning.
- Additional funding from EPA could support private sector plan development.
- Farms that pollute Pennsylvania's waters should be required to develop and implement the necessary plans immediately, and m will need to rely on private sector planners, or face enforcement actions.

According to these estimates of combined technical resources of the public a private sector, about 5,000 farms in the Chesapeake Bay Watershed would h plans each year. Initial efforts should be targeted to livestock operations curr lacking plans. All livestock operations in the Lower Susquehanna watershed should have plans by the third year, and by the fifth year in the rest of the watershed. By the eighth year, all Chesapeake Bay Watershed farms should an Erosion and Sediment Control plan with a Manure Management Plan whe needed, although some may need adjustments. We propose the following timeframe for plan development:

[Please see page 123 of the Docket ID #EPA-R03-OW-2010-0736-0732 for the table]

Once farms develop the necessary erosion and sediment control and manure management plans, additional work will

be needed to ensure that plans are being implemented, soil erosion is limited to "T" over a rotation, animal concentration areas are correctly managed, buffers are established and maintained, cover crops are planted early enough each year, and other practices are successfully established and maintained. Plan development is just the first step in the process.

Enforcement

The draft WIP describes the planned "Targeted Watershed Approach" which will guide the department's compliance and enforcement efforts. This approach has many advantages, particularly given limited staffing resources. CBF recommends, however, that the final WIP include a compliance and enforcement strategy that extends beyond targeted watersheds and response to complaints. The final WIP needs to outline a process that will result in all farms complying with state and federal requirements on a timeline consistent with the TMDL.

Thus, in addition to DEP's efforts in targeted watersheds, the initiative should focus enforcement on farms with obvious and serious water quality problems first. Complaint-driven enforcement of environmental regulations is inadequate because it drives regulatory action to the farms where there are observant neighbors, not necessarily where the greatest pollution risks exist. Throughout the watershed, there are farms that have not participated in voluntary technical and financial assistance, and some of these operations contribute to serious water quality problems. Many of these problems - such as direct barnyard runoff and unmanaged Animal Concentration Areas (ACA's) near streams - are clearly evident from public roadways. Publicized enforcement on these farms would serve as an incentive to many others to quickly develop the plans and establish the conservation practices needed on their farms to avoid similar regulatory action. EPA's recent enforcement action on a facility in Manheim, PA illustrates this approach. [FN6] Many voices from within agriculture have supported fair but firm enforcement of the state's Clean Streams Law focused on bad actors first.

CBF supports an emphasis on targeting ag-impaired streams as described in DEP's draft Agricultural Water Quality Initiative. [FN7] But we believe that a targeted watershed approach alone will not be sufficient to ensure adequate compliance throughout Pennsylvania's Chesapeake Bay watershed. We believe a multipronged approach would be most successful, comprised of:

- Inspections of farms in targeted watersheds
- Enforcement on farms with significant pollution problems, regardless of location or broader watershed impairment, especially where the operator has failed to take corrective actions in the past a timely manner
- Randomized compliance visits to a small percentage of farms through Pennsylvania each year

Close coordination with conservation districts on these efforts will be necessary. The WIP should describe programmatic options DEP will pursue to encourage and enable individual conservation districts to take a more active role in compliance assurance (versus providing only technical assistance to producers).

Addressing the Funding Gap

A significant challenge not resolved in the draft WIP is how PA will commit to level of resources, particularly for agricultural financial assistance, that is on par with the need. While the federal government has increased conservation funding through Farm Bill programs, farmer demand for financial assistance consistently and substantially exceeds available

funding. On average, about two-thirds of Pennsylvania farmers' applications for Natural Resources Conservation Service (NRCS) financial assistance programs have remained unfunded in recent year. About 2000 Environmental Quality Incentives Program applications were unfunded last year, due to funding shortfalls. [FN8] While the state faces his financial constraints, this does not relieve the state of its obligations under the Clean Water Act. Pennsylvania policymakers did not make sufficient investment in agricultural nonpoint source programs during times of surplus; these were legislative and executive choices that make the current situation all the more difficult. The WIP must describe how this historic funding gap that continues this day will be corrected.

The final WIP should specify the level of financial and technical assistance needed and what funding streams will be secured, leveraged or appropriated and at, levels. The final WIP must estimate the total expenditure (public and private) necessary for planning and for implementing all the remaining BMPs that will be required to get all farms into compliance and to achieve agriculture's portion of the TMDL. This analysis would logically assume shared contributions from the federal government, the state, and producers themselves. PA's earlier tributary strategy estimated that need at roughly \$215 million dollars per year, for at least seven years. Unfortunately total annual spending on agricultural BMPs never came close to this figure. The final WIP needs to identify the approximate funding need now through at least 2017. Without a clear funding requirement spelled out in the WIP coupled with specific funding streams meeting that level, a key element of reasonable assurance will not be satisfied.

Indeed, the draft WIP reviews past and current expenditures but fails to mention imminent shortfalls and reductions and what steps will be taken to replace lost funding. For example, the draft WIP's section on Growing Greener does not mention that the current round of this foundational funding program is coming to an end just as the Bay TMDL is getting underway nor does it recommend any new funding. The section on the REAP tax credit program states that the program was cut in half with no discussion of restoring or increasing funding for the program.

Funding for County Conservation Districts and Core Conservation

While CBF supports DEP's efforts to fund alternative technologies and manure-to-energy systems, we are concerned that this focus may distract the DEP from ensuring that "the basics" are tended to first, meaning cover crops, buffers, fencing, barnyard treatments, and other BMPs needed for soil and nutrient plan implementation. It is from these practices that PA will derive the lion's share of reductions at the lowest cost. The draft WIP relies heavily on Conservation Districts for delivery of core conservation practices, and places additional responsibilities on staff, without providing additional resources. The final WIP should estimate the additional staffing and resources for the conservation districts to implement the additional outreach, compliance and technical assistance necessary for implementation of the Agricultural portion of the Bay TMDL and provide the necessary increase in future budgets beginning in the 2011-2012 budget. The Pennsylvania Association of Conservation District's budget request for Fiscal Year 2010/2011 of \$10 million is a minimum of the annual allocation needed to provide the staff resources needed to meet the expanding requirements in the draft WIP. [FN9]

Restoring Funds to the Resource Enhancement and Protection (REAP) tax credit program

This efficient and over-subscribed tax credit program has established a tremendous track record of matching tax credits with private resources to accomplish conservation goals. In spite of its effectiveness at supporting conservation and leveraging private funds, the allocation to REAP has been cut in half.

While most state programs have seen cuts in the last two budgets, the final must reconcile this reality with the imperatives of the TMDL. Seeing the great need for agricultural financial assistance, in April of 2008 the PA Fair Share C Water Coalition called on the General Assembly and Governor Rendell to invest \$50 million annually in agricultural assistance (split between \$35 million in RI and \$15 million in new cost share grants). [FN10]

While committing Pennsylvania to \$50 million in new funding in 2011 may not be realistic for the final WIP, it needs to describe a strategy of "scaling up" state funding for agricultural BMPs between now and 2017. CBF recommends that allocation for the Resource Enhancement and Protection (REAP) tax credit program be restored to at least \$10 million in FY 2010-11 and increased by \$1 million per year thereafter until unmet demand for financial assistance comes into line with available funding from all sources, and milestones for BMP implementation are being consistently met. It is critical that the Commonwealth maintain consistent funds for the program so that producers can make investments in new BMPs with greater confidence that tax credits will be available when they need them.

Total Maximum Daily Load Compliance and Nutrient Credit Trading

While producers may partially or fully reach TMDL compliance with Nutrient Manure Management Plans and Erosion and Sediment Control plans, it is currently unclear how close compliance with state regulations will bring a farm to TMDL compliance. The final WIP should establish, or commit Pennsylvania to establishing within six months or less, the criteria all farms must meet to achieve compliance with the Bay TMDL as well as adequate protection for local water quality. These criteria would constitute "baseline" after which an operation can generate offset or trading credits. DEP should consider establishing these criteria in such a way that enables producers to select from a suite of options based on the type of operation and relevant local conditions.

Clearly specifying criteria for TMDL compliance will be important for planners providing technical assistance to producers. To the greatest extent possible, planners and producers should design Manure Management Plans and Erosion and Sediment Control Plans, and their associated conservation practices, in order to maximize nutrient and sediment reductions. Individual plans designed only to meet state and federal regulatory requirements could be insufficient to cumulatively reduce nutrient and sediment pollution under the TMDL. For example, a farm with contour strips and manure application setbacks from streams may satisfy regulatory requirements, but the addition or substitution of no-till practices, cover crops and riparian buffers may be needed to address water quality goals. Planners will provide a better service to producers if they include these practices at the outset (some of which may be optional for state regulatory compliance) so that farms are not faced with multiple plan revisions at a later date.

Moreover, clear guidance on TMDL compliance for farms will enable DEP to establish standards for "safe harbor" for producers, which we recommend be completed within one year of the final Phase 1 WIP. With safe harbor, producers who achieve an established level of environmental performance and/or BMP implementation would be protected from further requirements for a set period of time, such as three to five years.

Pennsylvania's current trading policy system of utilizing a subwatershed tradeable load cap does not meet EPA's trading policy guidelines. The following problems preclude Pennsylvania's trading program from effectively meeting the reduction goals.

First, the lack of a requirement to meet TMDL compliance prior to trading would likely preclude credit generators in Pennsylvania from participating in multi-state trading, which represents potentially a very profitable scenario for

generators.

Second, there is no strategy, resources, or clearly stated requirement for NPS credit generators to come into TMDL compliance after they have reached the current threshold for trading. Moreover, when some operations in a subwatershed have utilized the available credits under the cap - there is no plan for obtaining the additional reductions from the remaining operations. Will regulatory authority be utilized? Will resources be made available?

Third, there will be problems of inequity if some farms, achieving the same level of compliance, are allowed to trade, and others are not (because the tradeable load cap has been reached in that subwatershed). A related issue is that after tradeable load cap has been met, farms may have to implement more expensive BMPs, at their own expense, after selling more inexpensive credits to buyers. Again, will regulatory authority be used? Will resources be made available?

Phosphorus Management

The current Phosphorus Index allows phosphorus to accumulate in some soil beyond crop needs, and therefore will not adequately protect water quality in the long term. Therefore, the WIP must outline a strategy to revise phosphorus management standards that will be implemented over time to address the problem of excessive phosphorus accumulation. Elements of this strategy may include:

- Revision of nutrient management planning requirements to prevent water saturation of soil phosphorus, such as by reducing the P Index scores where P may not be applied or may be applied at reduced rates, within one year
- A limit on P application to the rate needed for crop production, based on soil tests and realistic yields, over a specific timeline. For example, the standards could be implemented by 2017 for Concentrated Animal Operations (CAOs) and Concentrated Animal Feeding Operations (CAFO) and for all farms by 2025.
- Development of new strategies to correct the regional imbalance of phosphorus that results in a heavy influx of this mineral that is a finite natural resource. Pennsylvania must reduce the flow of phosphorus in livestock feeds into the region, and/or develop new strategies to cost-effectively transfer it to locations that need it.

Concentrated Animal Feeding Operations

The proposed plan includes working with EPA Region 3 to improve the CAFO program. The Chesapeake Bay Foundation strongly recommends that the program designate AFOs with discharges as CAFOs, as specified in the federal CAFO rule. The farms should have an opportunity within a reasonable timeframe to correct the discharges before designation. The goal should be to remove the discharges, rather than expand the number of farms under the CAFO program.

Farms' efforts to prevent CAFO designation would be a valuable tool to address problems such as: livestock directly depositing manure in streams, stormwater flowing from manure management facilities, and other sources of stream degradation. CAFO designation would provide a regulatory tool to address some of the most significant sources of pollution to the Commonwealth's waters.

In Pennsylvania, requiring farms to eliminate discharges or face enforcement proceedings as CAFOs is likely to be a more effective tool to improve water quality than lowering the threshold of animal numbers to include more farms as CAFOs.

USDA Technical Service Provider Program

The Commonwealth should work with the USDA NRCS to develop a broader, more flexible TSP to enable greater private sector delivery of critical conservation programs such as the Environmental Quality Incentives Program (EQIP) and the Chesapeake Bay Watershed Initiative (CBWI). Pennsylvania's private sector agricultural groups should be enabled to play a greater role in providing the critical technical assistance necessary to implement the federal agriculture program dollars.

Improved tracking of all BMPs

DEP does not effectively track nor, therefore, report and model most Best Management Practices (BMPs) that are privately funded and not part of an organized program. Thus, many of these key BMPs are dramatically under-reported. Pennsylvania must incorporate Census of Agriculture data, satellite images (such as for cover crops), and other broad data collection methods with efforts to assure that practices are established according to standards and are being correctly maintained.

--Identifying untracked BMPs could "open the door" to education and outreach on necessary compliance efforts. People trying to assess the untracked BMPs may also provide information about requirements facing farms and refer them to sources of technical and financial assistance.

--Identified farms with superb conservation efforts could be provided information about nutrient credit trading opportunities.

At the same time, Pennsylvania's efforts to better track voluntary Best Management Practices must also track activities from agriculture and all other sectors that increase nutrient and/or sediment loads, such as new and expanded livestock operations. For example, the explosive growth in gas development the Marcellus Shale formation has resulted in loss of forest acreage in northern tier counties. In another example, Amtrak has been clear cutting trees along mile stretch of the Susquehanna River for electric line maintenance, with no for reforestation. [FN11] These losses directly offset gains for two modeled BMPs tree planting and riparian forested buffers - and must be accounted for in the model.

Innovative Technologies

The draft WIP promotes regional digesters and other technologies, without detailing how they will be financially viable, the fate of nutrients, and how they may be structured and managed. The Chesapeake Bay Foundation supports development of innovative technologies that hold potential for significant, cost-effective nutrient reductions, but also recommends strong emphasis on "tried true" cost-effective nutrient reduction methods, with testing of promising innovations. Moreover, the need for alternative uses for excess manure is most urgent for small dairies with high animal density. DEP's program for innovative technologies should focus research and assistance to this sector.

Conservation Reserve Enhancement Program (CREP) as the First Choice for Building Buffers

As the WIP states, Pennsylvania leads the nation in CREP enrollment, bringing with it substantial water quality benefits. With a broad CREP partnership and continued robust resources available through CREP for future enrollment, PA has a terrific base upon which to achieve further implementation of additional riparian forested buffer acreage. Indeed, the

WIP should stress the important CREP to PA's buffer goals for agriculture (as well as non-agricultural landown and propose new strategies to boost enrollment . Instead, the WIP recites statistics about the program with little attention to its future. The benefits c CREP and CREP buffers are many:

- CREP provides substantial non-state funding to implement riparian forested buffers to meet PA's milestone goals and financially benefit landowners.
- Riparian Forested Buffers, once successfully established after three to four years of careful management, require significantly less maintenance for proper BMP effectiveness compared to many other BMPs. Indeed, forested buffers continue to provide benefits for decades or longer . Many other agricultural BMPs have lifespans of only 5-15 years.
- Riparian Forested Buffers provide significant habitat value and local water quality and stream ecosystem services in addition to nutrient reductions to the Bay."
- Plentiful CREP resources can be used for many pasture-related agricultural BMPs, such as stabilized crossings and alternative livestock watering systems, thus freeing up limited cost share funding of other programs like EQIP, literally stretching financial assistance funding to serve more farmers and deliver more practices.
- CREP typically pays at least 100% of project installation costs, designed and implemented by experienced professionals . CREP typically yields profits of \$2000-\$4000 or more per acre over a 15-year contract, with an opportunity to re-enroll for an additional contract another \$2000-\$4000 or more per acre. In addition, CREP pays for post-planting care of buffers that is critical to their success.
- Forested riparian buffers provide greater opportunities for nutrient credit trading or carbon credit trading.
- Research from the Stroud Water Research Center has documented that forested streams may reduce 2-8 times more nitrogen than same-width grass buffers via in-stream processes. [FN12]
- Buffer maintenance is often more difficult for narrow than wider buffers. Streams with actively moving banks may undercut fence posts . Fences nearer to streams often catch more flood debris .

Wherever Pennsylvania fails to get pollution reductions from a particular site forested buffers can provide (all paid for by CREP at a profit to landowner), ti will need to be additional reductions from other practices for which funding i limited. The alternative methods/practices needed to reach the required reductions might present more challenges to farm management than adopting forested buffers.

Thus, the WIP should identify specific programmatic opportunities that DEP partners can pursue to maximize CREP's contribution to Pennsylvania's nutri reduction efforts. These may include:

- DEP should continue to give a clear preference to the establishment of foot wide forested buffers over grass buffers.
- DEP should continue to offer its conditional cost-share reimbursement the Riparian Forest Buffer Practice (CP-22) to ensure that enrollments continue to meet future milestones for buffers.
- DEP should convene the Pennsylvania CREP Partnership to discuss opti for accelerating enrollment in CREP for buffers and commit to implementing the best options in the Phase II WIP.
- FSA and NRCS, with input from other partners, should consider modifications to EQIP and CBWI that incentivize the use of CREP instea other Farm Bill funds for the construction of buffers and associated practices for livestock operations. For example, EQIP ranking criteria c give preference to proposed projects that include CREP buffers.

Much speculation has been made about farmers' unwillingness to enroll in a program that requires 35-foot minimum buffers. While buffer width is certai barrier for some producers, our experience suggests that many will adopt bu and enroll in CREP when a clear vision of how forested buffers can play a vali profitable role in meeting pressing needs

facing PA agriculture.

To illustrate, CBF's initial proposal to PENNVEST for ARRA funds included 120 farms asking for \$28 million for various agricultural BMPs. Eligibility for these funds required: 1) a Chapter 102 compliant conservation plan 2) elimination of runoff from ACA's or barnyards 3) elimination of milk house wastewater poll and 4) 35' forested buffers on all areas of all streams (including existing buffE counted and use of CREP for new buffers). Out of 120 farms, only two declin due to the buffer requirement. Our final proposal included 45 farms for \$14 million, and all agreed to the above terms including buffers of at least 35 feet.

Coordination among All Organizations and Agencies

The effort to assure that all farms in the Chesapeake Bay watershed are developing and implementing the necessary conservation and manure management plans will require collaboration among all parties working with farmers, not just conservation districts and DEP. The WIP should recommend roles and an on-going planning process bringing together DEP, USDA Natural Resources Conservation Service, Penn State Cooperative Extension, Pennsylvania Department of Agriculture, State Conservation Commission, PennAg Industries. Association, Pennsylvania Farm Bureau, Pennsylvania Association for Sustainable Agriculture, Chesapeake Bay Foundation, PennFuture, private sector technical assistance providers, agribusinesses, and many other public agencies, agricultural and conservation organizations. A coordinated effort could advance innovative approaches that have not been employed in the past; for example :

- Conservation plans developed by NRCS to enable a farm's participation in cost-share programs should address all water quality problems on the farm and ensure that the farm will meet TMDL requirements.
- Agricultural lenders should be verifying that their clients are implementing the necessary plans, to reduce the financial risks of farms with serious pollution problems.
- Insurance providers could verify the implementation of plans, as a way to reduce their liability.
- When Penn State University's PaOneStop program to develop conservation plans is finalized, technologically-savvy youth could help farmers develop a conservation plan.
- The Food Alliance is now partnering with the PA Association for Sustainable Agriculture to deliver third-party certification of farms, food packers, and other agricultural entities that meet environmental and other standards.
- Milk inspectors could inform farms of their requirements, as a way to ensure that the farms remain in production and, in some cases, produce higher quality milk, such as when cows are no longer standing in mudd animal concentration areas that contribute runoff to local streams.
- Municipal governments could ensure that farms are meeting all state i federal requirements, such as when farms need building permits. An e better approach would be a comprehensive strategy to ensure that all farms are meeting requirements, such as that used by Warwick Towns Lancaster County.
- Farms with the most significant pollution problems should be required immediately develop plans, regardless of whether conservation distric other public sector technical service providers are available. They coull linked with private sector conservation and nutrient management plar to develop plans quickly, at the farm's expense.
- County tax offices could verify that farms receiving preferential tax assessments under the Clean and Green program have and are followi the required soil erosion control and manure management plans- .

The Chesapeake Bay TMDL and state WIP will require public and private ent and thousands of Pennsylvania citizens, to make changes - some large and s small - in how they conduct their lives, properties, and businesses. DEP nee lead

and coordinate this effort so that everyone is pulling together.

Urban/Suburban Stormwater

In the draft WIP, DEP provides an excellent summary of existing stormwater-related programs, staffing, regulations, and permit structure. However, we have numerous concerns regarding the sufficiency of these and as well as the solution for urban/suburban pollutant loads that are relied upon by DEP.

Projected reductions represent a reduced rate of increased load, not a true step toward achieving cap loads.

DEP's proposed approach to addressing loads from the urban/suburban sector relies almost exclusively on efforts that minimize the increase in loads from land conversion activities. The approaches in the draft WIP offer little or no solution to addressing existing loads from previously developed urban/suburban land.

For example, consider a new residential development in a green field setting that must acquire a Chapter 102 permit. In this case, the reduction in pollutant loads via the new erosion and sedimentation control standards in Chapter 102 represent a decrease in the net increase in load during construction. As a result, no progress towards meeting the TMDL caps has been made but simply a reduction in the rate in which loads have increased, albeit temporarily in this case.

A similar argument can be made for the post-construction scenario. DEP's approach relies heavily on Pennsylvania's Stormwater Management Act 167. The Act 167 plans have traditionally focused on developing a plan that minimizes the impact of new sources of stormwater rate and, recently, volume on a watershed or county-basis. While in recent years such planning efforts have in some cases identified stormwater retrofit opportunities to address existing stormwater concerns, there is no requirement or reasonable assurance that such projects will be implemented. More discussion of the sufficiency of the current Act 167 program and requirements is provided below.

Finally, DEP contends that achieving the control guidance and guidelines for a 2-year 24 hour storm, as detailed in DEP's stormwater BMP Manual [FN13] results in a no net increase in pollutant loads. However, the control guidance only suggests a planning requirement of reducing post-construction loads by 85 percent reduction in post-development total suspended solids (TSS) and total phosphorus loads and a 50 percent reduction in post-development solute (as nitrate nitrogen). Furthermore, some studies have indicated that the 2-year 24 hour design storm may cause excessive erosive streambank flows to receiving streams. Under either scenario, this does not equate to a no net increase. These concerns are explained further under the Urban/Suburban Stormwater, Accounting for Growth section of our comments.

Methodology for Developing Current Loads : MS4 Runoff

We have and continue to contend that the MS4 Sector Methodology (page 34 of draft WIP) is fundamentally flawed by being non-reflective of real world conditions and contrary to the purpose and intent of the federal MS4 program.

Essentially, using the approach described in the draft WIP would be equating publicly owned roads as equivalent of the MS4 drainage network. Under this methodology, the land area contributing to the MS4 would not be calculated part of the load. For instance, in a residential development in which the downspouts are connected to the stormwater system

or drain to the system overland flow, DEP's methodology ignores the loads associated from these contributing areas and instead pretends that only the streets generate and contribute point source pollutant loads to the MS4 system. As the adage goes possession is nine tenths of the law and it is simply scientifically unjustifiable contend that those areas contributing to the MS4 should not be considered a part of the MS4, despite Pennsylvania's unique local governmental framework and inability to require retrofits or new stormwater BMPs on grandfathered private land.

The reasons why the proposed approach is scientifically questionable are cle< brief, however, this methodology threatens to significantly under-represent pollution load from MS4 service areas. In turn, it will result in inappropriat depressed responsibilities for load reductions from MS4 sources areas.

Interestingly, by employing such a limited definition of the MS4 area, DEP ha MS4 communities in a very difficult position to achieve assigned TMDL WLA c loads. The approach would actually severely limit the suite of potential load reduction BMPs available to MS4s to those that are only applicable on or alongside roadways--street sweeping, catch basin inserts, and vegetated swa to name a few. If pollutant load reductions are not achieved or maintained such BMPs, MS4 communities may be faced with being out of compliance wiiththe TMDL WLAs and with limited options to address it.

In 2007, EPA issued a document that examines how TMDLs with storm water sources were created in 17 watersheds. [FN14] None of the methodologies appro in these 17 examples appears to be in any way similar to Pennsylvania's methodology.

In our research, we have not found another instance where EPA has approve use of this type of an approach for the calculation of MS4 loads and associated load reductions as part of a TMDL; we believe that is because its use or approval would effectively undermine MS4 permitting programs across the country.

However, we understand and appreciate the unique difficulties Pennsylvania's fragmented local governmental system present in instituting an MS4 program, particularly a program which achieves quantifiable reductions in stormwater load. These issues are especially evident in the context of a TMDL.

Adopt the Christina River Basin Watershed Stormwater Source TMDL as the MS4 Load Methodology in the draft WIP

An interesting and appropriate solution to this problem may be the methodology employed in The Christina River Basin Watershed Stormwater Source TMDL (2006), [FN15] which included all or parts of MS4 communities in Pennsylvania, Delaware, and Maryland.

The Christina TMDL acknowledges that for the actual waste load allocation (WILA) neither "the PA nor the DE MS4 permits identify the boundaries of the stormwater collection system contributing areas within each municipality. Therefore, it is not possible to assign a WLA specific to the storm sewer collection areas within each MS4 municipality. Because these systems have not yet been delineated, the TMDL includes nonpoint source loadings in the WLA portion of the TMDL. It is anticipated that the state's stormwater program will revise the WLA into the appropriate WLA and load allocation (LA) as part of the stormwater permit reissuance; however, the overall reductions in the TMDL will not change."

The Christina TMDL MS4 WLA methodology could be employed as the stormwater load calculation approach in the

phase 1 WIP with the requirement that all new and reissued MS4 permits contain requirements for delineating the drainage areas of each outfall within the MS4 in order to more precisely determine the WLA versus LA loads within each urbanized area.

In summary, we strongly believe that DEP's proposed MS4 methodology is inconsistent with the MS4 permitting program and real world conditions. We recognize, however, Pennsylvania's unique local governmental structure and the difficulty it presents in dealing with this issue. To that end, we believe the approach employed in the Christina TMDL represents the most readily employable and justifiable solution and strongly urge DEP to undertake this alternative.

We have provided our position in a letter dated August 12, 2010 letter to EPA Region 3 Water Protection Division Director, Jon Capacasa. This letter can be found in Attachment B. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1]

Methodology for Developing Current Loads: Industrial Stormwater

The narrative describing how industrial stormwater loads were derived should be expanded to include several key areas currently not discussed.

For instance, the area loads per land use in EPA's Chesapeake Bay Model do not contain an explicit industrial land use category. Given such, it is imperative that DEP present what the employed pollutant load (lbs/ac/yr) was in the industrial sector.

Secondly, DEP states that for consistency with other Pennsylvania TMDLs, a drainage area per outfall was assumed. No information pertaining to how that assumption was derived in this or in previous TMDLs is presented in the draft WIP.

Methodology for Developing Current Loads: Construction Stormwater

The description of the method employed to calculate loads from construction activities is difficult to fully comprehend.

Under the approach, DEP assumes that the 10 year average rate of construction acreage will represent future activity, at least until 2025, it would appear to be reasonable to occur in perpetuity as eventually all developable land will be developed. To rectify this issue, it may be necessary for DEP to determine the remaining developable land per county and subtract that value by the 10 year average acres to determine the remaining number of years the average rate of construction can continue within the county. Clearly, Pennsylvania's woeful record of land use planning makes such an analysis difficult.

Another issue is if construction activity increases above the 10 year average. If this were to occur, it would represent a load not accounted for in the model could result in exceeding the cap loads assigned to the sector and the overall TMDL. To avoid such a circumstance will require careful accounting by DEP raises several difficult questions if such an event occurred. For instance, would DEP cease approving construction permits if the 10 year average for the county would be exceeded by the approval? Or, would DEP require that all construction sites that represent acreage above the 10 year average have a "no net increase" of pollutant loads provision in their NPDES permits?

DEP states that for construction acres they employed the average loading rate's associated with high intensity urban

land. However, an open construction site, even with erosion and sedimentation controls, is fundamentally different than an urban site under post-development conditions. Simply stated, a construction site often has little or no vegetation or other soil stabilization; thus, rain events can easily mobilize soil particles of all sizes. A high intensity urban landscape is highly impervious and although that also causes water quality concerns, it typically does not represent excessive erosion of the developed land. A study by U.S. Geological Survey concluded that managed construction sites can contribute 1.6 times more sediment load on a per acre basis than developed urban lands. [FN16].

The use of the high intensity urban land load called into question further given, that the Bay Model includes a Pennsylvania land use category for construction. The barren/construction land use category indicates a nitrogen load (lbs/acre) of 27.7, a phosphorus load of 3.86, and a sediment load of 3.64 (t/acre). The high intensity urban pervious and impervious loads employed by the Bay Model are notably less than these values.

Finally, it is unclear whether DEP has considered under the construction source sector Oil and Gas extraction activities (i.e., pads and infrastructure) as part of the construction category. Given the magnitude of the industry and the amount that may be under construction for the foreseeable future, it would appear to be a vital oversight if such activities were not appropriately accounted for.

Methodology for Developing Current Loads: Urban/Suburban Runoff-Non MS4

DEP states that the non-MS4 load was determined by subtracting out regulated point source and other "developed" land loads from the total urban/suburban load. While the total non-MS4 load can be obtained from such an analysis, under this approach a more nuanced and comprehensive understanding of the urban/suburban load is not obtained.

A more accurate approach to determining the non-MS4 load would be to determine the urban/suburban load based on land use intensity (e.g., high or low) and the proportion of pervious and impervious fractions. Under this approach developed land totals could be determined for each county and further segmented based on the level of intensity. Based on observational data or by professional judgment, the impervious to pervious fractions per land intensity, would be calculated.

MS4 Program (sufficiency and compliance)

The current state of the MS4 program is widely acknowledged as being ineffective and largely ineffectual in achieving quantifiable reductions in stormwater-related pollution from urbanized areas. Difficulties with funding and oversight, Pennsylvania's governmental framework, and the limited nature of the Six Minimum Control Measures, amongst other factors, have restricted the program's overall effectiveness. Compliance issues that have resulted in nearly 100 municipalities recently being cited by EPA for failure to adhere to the permit requirements further illustrates the difficulties the program has encountered.

To that end, we find it perplexing that in the draft WIP DEP presents the MS4 permit as being highly effective and efficient and achieving quantifiable and sustainable reductions in stormwater pollutant load. While improvements in the permit may yield such, we do not believe that in its current or recently proposed form it can be a reliable approach to mitigating this source sector. This proposed change significantly reduces the reasonable assurance that the non-point source stormwater load will be reduced.

We recommend that DEP fully incorporated into Pennsylvania's MS4 permit those draining to the Bay watershed the recommendations we detail in our 2010 letter to DEP Stormwater Planning and Management Chief, Barry New. A copy of that letter can be found in Attachment C. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1]

Pennsylvania's Stormwater Management Act 167

When passed in 1978, Act 167 was a unique and progressive step towards stormwater management. But, in many ways, the Act has outlasted its usefulness and needs to be updated to reflect today's regulatory realities. VA updates that require preventing new sources of stormwater pollution and addressing problems from existing development, Act 167 could once again serve as the framework for planning and implementing stormwater management relevant to the challenges of today.

In the draft WIP, Pennsylvania accurately notes the required nature of Act 167 planning and adoption of local ordinances. However, the reality of the program is such that it is considered a voluntary planning program not undertaken by counties or local governments without cost-share funding from DEP. As a result, the development and updating of such plans has been in some cases extremely protracted. More importantly, information presented by DEP indicates that in some cases municipal adoption of Act 167 ordinances has been woefully inadequate.

DEP data indicates that of 2,566 municipalities in the Commonwealth, as of 2008 only 911 had at least one approved Act 167 plan. This equates to roughly only 36 percent of local governments. Of those, approximately 359 have failed to adhere to the Act and have past-due enactments. [FN17]

Act 167 could be used as the fundamental tool to achieve compliance with the stormwater-related requirements of the Chesapeake Bay TMDL, as well as local TMDLs. But in order for it to function in such a fashion, the Act should be revised so that requirements for such plans and ordinances explicitly and quantitatively integrate achieving and maintaining TMDL WLA and LA allocations for stormwater.

Funding assistance for Act 167 planning, which has been eliminated in recent Pennsylvania budgets, must be restored.

Accounting for Growth

Whether within or outside an MS4, new rural, suburban, and urban growth threatens to outstrip nutrient and sediment load reductions achieved from other sources. Given that new greenfield development rarely, if ever, occurs in isolation and often causes a "train" of development and services that follow, the cumulative impacts of these development patterns far outweigh the impacts per site basis.

In the draft WIP, DEP states that a no net increase in pollutant loads is achieved by managing for the 2-year 24 hour storm event. Under this option, it was conventional thinking that if flows were held below the two-year level that erosion would be minimized. However, some research has indicated that this criterion frequently does not protect channels from downstream erosion and actually exacerbate erosion since banks are exposed to a longer duration of erosive bankfull and sub-bankfull events. [FNs 18,19,20,21] And, as development continues within a watershed that is managed under 2-year 24 hour storm event criteria; the bankfull event that causes streambed and bank erosion actually can decrease below the 2-year threshold. [FN19] If such is the case, then a no net increase is not achieved due to erosive flows causing

increased sediment and phosphorus load downstream.

Furthermore, in section 3.5 of DEP's stormwater BMP Manual [FN22] a control guideline for total water quality of an 85 percent reduction in post-development total suspended solids (TSS) and total phosphorus loads and a 50 percent reduction in post-development solute (as nitrate nitrogen) is recommended, not required. Under such a design approach, each new development which meets the control guidance and guidelines established in the Manual represents an allowable 15 percent increase in TSS and total phosphorus load and a 50 percent increase in nitrate nitrogen load. This does not equate to a net increase. In actuality, it represents a decrease in the increase of pollutant loads from new development.

To ameliorate this significant deficiency, we strongly recommend Pennsylvania's draft WIP include an offsets provision similar to that described in Chapter 3 of Maryland's draft WIP. [FN23] Under Maryland's proposed approach future loads from development would use different degrees of offsets in three different types of places. Areas with high loads per capita would need to offset loads to a higher degree than areas with low loads per capita. A third category would fall in between. Areas with sewer service and higher density of homes and jobs, served by state-of-the-art sewage treatment, will tend to have lower per capita loads.

Areas with low density development on well and septic systems would tend to have higher per capita loads. Regardless of whether a modified version of Maryland's approach is acceptable, it is imperative that given the sprawling trend of land development in Pennsylvania over the last several decades, that a full cost accounting and offsetting of new stormwater loads be fully negated through a program which addresses postconstruction stormwater management loads. Such a program should also abandon the "meadow or better" baseline condition to a more appropriate for the watershed baseline-forest.

Lawn Fertilizer -A lawn fertilizer restriction law should be enacted

The draft WIP only briefly mentions the potential consideration the development of an Urban Nutrient Management program. The precise nature of such a program is undefined.

Recent research has indicated that turf cover ranges from 2.1 to 3.8 million acres, or 5.3 percent to 9.5 percent of total Bay watershed area. Approximately 75 percent of current turf cover is potentially devoted to home lawns. In Pennsylvania, lawns cover an estimated 1,059,015 acres-most of which occurs in south-central part of the Commonwealth. [FN24] Although precise data on management techniques does not exist, the potential implications to local Bay water quality is large and should be a primary focus.

Although numerous programs attempting to limit the impact of fertilizers on water quality have been developed and implemented across the United States recent decades, given the size and magnitude of the Bay effort in Pennsylvania the most readily implementable approach could be to simply limit the sale of phosphorus-based lawn fertilizer in the Commonwealth.

A recent study released by Virginia Tech supports the concept of prohibitions fertilizer applications, with exemptions for nutrient deficient soils or new seedings, as one of the most effective approaches to address this issue with the Bay watershed. Researchers at Virginia Tech estimated that a potential 25 to percent reduction in total phosphorus loading to stormwater could result within several years of the prohibition. The study also concluded that the prohibition achieved an

estimated 10 to 20 percent reduction in total nitrogen loads to stormwater run off. [FN25]

Given the clear benefit such an approach would yield at relatively low cost, through legislation Pennsylvania should enact a lawn fertilizer restriction law which would ban the sale of all fertilizers designed for turf lands that contain phosphorus and those that contain less than 25 percent slow release nitrogen. Further, by law, prohibit the application of fertilizer that contains nitrogen to lands more than once a year unless required by a valid soil test. Applications fertilizers should be allowed for new seedings on construction and reconstruction sites and for areas where soil test indicate a nutrient deficiency. A multi-year citizen education program will need to accompany the effort so as to ensure homeowner compliance.

Alternatively, the passage of a local municipal ordinance which affectively achieves the same outcome could be an explicit requirement of all reissued new MS4 permits could be considered. However, this approach may prove unwieldy to manage and code enforcement officers within the municipalities many of which are already dealing with numerous issues, may not be willing serve as an enforcement agency.

Establish a Series of Comprehensive Stormwater Pollution Planning and BMP Demonstrations

While moving forward with permits that meet the pollution reduction requirements of the Federal MS4 program and the Chesapeake Bay and local TMDLs, the draft WIP should propose a series of demonstrations to implement full scale on-ground installation of new and retrofitted stormwater practices designed to quantitatively achieve WLAs for stormwater pollutant loads within currently suburbanized/urbanized areas. The demonstrations should be sufficiently detailed so as to identify "critical sources areas" of stormwater load within the pertinent area and the most cost-effective solutions available to address these areas. Such an effort will provide valuable lessons learned as to how local implementation can occur and be integrated comprehensively into latter phases of the WIPs.

Develop a Stormwater Pollutant Offset Program for Existing Developed Areas

In some areas, it may make sense to achieve load reductions through an offset: program to be consistent with local targets and the cap allocation in the TMDL. A program that is designed at the appropriate spatial scale (e.g., county or watershed) that allows local governments to purchase pollution, but not volume or rate, offsets in lieu of on-the-ground practices should be considered. Such an effort, however, should not relinquish local entities from not achieving an appropriate baseline and threshold prior to being able to offset remaining loads.

Funding

Although DEP has risen NPDES permit fees recently and that will offer the program more funds towards technical review by staff, a significant deficiency in funds going towards implementation of stormwater-related planning and projects has and continues to exist.

A sustainable source of funding would not only facilitate Act 167 planning but also support local implementation of new and the retrofitting of existing stormwater practices and initiatives. Through legislation, regulation, or policy establish the framework for the creation and operation of local Authorities, Utilities, or Management Districts and/or other sustainable funding sources that enable entities to collect fees and generate revenues dedicated to planning, constructing, monitoring, maintaining, improving, expanding, operating, inspecting and repairing public and private stormwater

management infrastructure.

In addition, in order to facilitate the redevelopment and reduction of impervious surfaces in existing urban corridors, we recommend a law establishing a state incentive program for such activities. Incentives could include tax reductions/credits, density bonuses, parking waivers, fee reductions, and rapid project approval. Some local governments already provide a mix of incentives for certain actions. Incentives should only apply to projects that are either in US census-designated urbanized areas, consistent with the local comprehensive plans, include specific sound land use elements, such as supporting higher density, compact development, transit-oriented design, multiple uses, increased open space/buffers/tree canopy, and onsite capture and water reuse.

Forests

Methodology for Developing Current Loads: Forest

Section 4.7.3 of the draft TMDL and page 114 of the draft WIP presents a detailed description of the forested load within the watershed. In particular, the narrative describes the proportion of the forest load that can be attributed to atmospheric deposition, harvesting, and background conditions.

In the draft WIP, DEP contends that the Bay Model is "fundamentally flawed" because of the assumptions it uses in estimating pollutant loads from harvested acres. While DEP's arguments regarding the fact that most harvested areas have some level of BMP implementation and that such sites are rarely completely denuded of vegetation, we believe an additional factor should be considered when estimating the potential pollutant load from harvested forest land—slope length.

If harvesting of forest acres occurs on landscapes that are moderately to steeply sloped or in areas with long slope lengths, the pollutant load potential in such areas is higher than those in less sloped areas. In such instances, the presence of vegetative debris could easily be overwhelmed. As a result, it is important to understand the spatial specifics of the location of the harvesting activities, along with any BMPs that may be employed.

Accounting for Growth

In DEP's analysis of the current forest-land cover in the state and subsequent presentation of loss and gain information (page 117), it is interesting and important to note that while the overall forest cover acreage has remained relatively consistent since 1989, the loss of forest land and the pollutant removal efficiency they provide (overland flow interception and in-stream processing) has been largely concentrated in the central and south-central portions of PA's Bay watershed. These areas also have the highest pollutant delivery ratios and therefore represent a critical loss of pollutant removal capability. To that end, programs, initiatives, and regulations which protect and restore rural, suburban, and urban tree canopy cover should be prioritized to these areas.

Gap Analysis

As noted above, because forest losses since 1989 appear to have been concentrated in areas with the highest delivery ratios, emphasis should be on these locations. DEP states that 10 communities are partaking in an effort to analyze and possibly enhance urban tree canopy but those communities are not listed.

In addition, we believe DEP should consider requiring the adoption of a tree and woodland protection ordinance as part of an MS4 permit. Ordinances of this type provide a basic level of protection to existing tree canopies and remaining woodlands in urbanized areas. When used in conjunction with programs that enhance canopy cover, such as TreeVitalize, they can provide a quantifiable and stable source of pollutant reductions from the urbanized landscape. Numerous communities across the nation have adopted such ordinances and several models exist. A basic construct can be found at:

<http://conservationtools.org/tools/general/show/37> and
http://www.scenic.org/tree/model_ordinance

We commend DEP for their emphasis and exceedance of the 2010 forested riparian buffer goal of 3,300 miles. As one of the most cost-effective BMPs, forested buffers offer numerous ecological benefits and can be applied ubiquitously regardless of adjacent land use. Emphasis should continue on expanding the amount of forested buffers within the watershed via incentive and regulatory-based efforts, such as the new Chapter 102 requirements in HQ/EV watersheds.

Resource Extraction

Resource extraction activities provide a notable proportion of the total pollutant load from Pennsylvania, particularly in the Susquehanna River Basin. And according to the tables presented in page 23 through 28 or the B2 tables in Appendix 4, resource extraction is capped at 2009 levels.

Although the traditional mining common in the past is not expected to increase dramatically in the coming years, the oil and gas development industry related Marcellus Shale drilling represents a potentially significant new source of pollutant loads from extraction-based activities. We believe that this activity represents an unaccounted for new source that must be incorporated into the Bay Model and given cap loads for construction and post-construction stormwater loads, as other sectors have. To neglect this new source may render Pennsylvania unable to achieve TMDL cap loads, despite full implementation BMPs, and therefore unfairly shifts the burden of reductions to accommodate industry to other source sectors, like agriculture.

Similar to the construction permits for erosion and sedimentation control, the permit structure does not call for a net increase in pollutant loads. As such even well managed sites fully compliant with permit requirements can result in incremental increases in pollutant loads to local receiving waters and the Bay. Whether it's the BAT limits for sediment in coal mining-related permits or the narrative standards for oil and gas activities, each new permit represents a potential increase in pollutant load that must be accurately accounted for and offset.

Wastewater

CBF has and continues to fully support the implementation of the Point Source Allocation Strategy of 2007 which sets equitable nutrient limits via NPDES discharge permits for significant and non-significant sewage treatment facilities. Based on our analysis of the draft WIP, a few issues did emerge however. The aspects pertaining to the data presented in Table B2 and on page 23 through 28 are detailed in our Miscellaneous comments section. In addition to those,

Accounting for discharges less than 0.002 mgd may be necessary

As noted by EPA in recent wastewater WIP meetings, although it is very unlikely that discharges less than 0.002 have or will have a notable impact on Pennsylvania's ability to achieve the TMDL load caps, establishing a system of documentation of these dischargers so provide an accurate tracking and accounting mechanism of these systems currently and overtime.

An accounting system would likely require the coordination of local Sewage Enforcement Officers and DEP staff so as to properly account for existing and newly built systems. The system should be established so that it can recognize when or if such systems may interfere with the Commonwealth's ability to achieve and/or maintain the cap loads established in the TMDL. In the event that this were to occur, a mechanism to incorporate nutrient limits and the no net increase sewage discharge policy will be necessary. Although unlikely, at least in the near term, developing the details regarding such a safeguard should be committed to in the Phase 1 WIP and finalized in a subsequent Phase.

Onsite Wastewater

Regardless of whether the septic system load represents roughly 4 or 30 percent of the nitrogen load delivered to the Bay from Pennsylvania, DEP's proposed approach for this sector is inappropriate.

Close Septic System No Net Increase Loop Hole

New or expanded discharges from sewage treatment plants must achieve a no net increase in pollutant loads according to DEP policy; yet, septic systems do not have to achieve this standard and are essentially given a free ride in terms of addressing the pollutant load from these systems.

For instance, a new residential development that can either hook up to an existing sewer line may be required to pay the local authority a fee to offset increase nutrient loads or provide offsets in the form of credits. Alternatively, the development could build a "package" plant to provide sewage treatment if conditions were appropriate. In this case, the no net increase provision applies and credits or appropriate treatment such as spray irrigation would need to be obtained or employed. However, if septic systems are to be employed as the sewage treatment technology the developer and those that live there have no obligation to address nutrient loads from the systems. Such a situation may result in incentivizing septic systems over other treatment options.

To ameliorate this issue, DEP should close the loop hole available for septic systems and require new or reconstructed septic systems to also achieve a no net increase in nutrient loads. We concur, however, with DEP that reliable and affordable technology that addresses nitrogen loads from septic systems are available on the marketplace. Yet, other options to address future and existii loads from this source are available.

To address such loads, we propose the creation of a fixed price offset requirement for new or reconstructed septic systems. Under such a requirer the EPA load assumptions per system per household would be used to calculate the total anticipated load over the course of the expected lifespan of the syst (e.g., 30 years) and a fixed price per pound of nutrient (e.g., \$5/lbs.) would b applied to determine the total cost of offsets required for the system. The c the offset would simply be added to the total cost of construction or reconstruction. Funds generated by the offsets would go into a newly established revolving fund that would assure that BIVIPs would be implement completely offset loads from the

systems. Individual homeowners, develop or contractors would not have to seek out and acquire individual contracts for offsets under this system. They would simply pay a onetime fee into an established fund.

Miscellaneous Suggestions

Throughout the document, summarizations of and citations for reports, articles and data are not presented as there are no footnotes or bibliography as part the draft WIP.

For instance, in the conclusion of the Executive Summary DEP cites the result the Susquehanna River Basin Commission's (SRBC) monitoring stations for the period of 1985-2008. No citation to the dataset(s) or to any of SRBC's report given. In many other occasions reports are cited or discussed in the text but not included in a bibliography. For instance, on page 10 several reports are noted (Smith et al. 1992 ; Kemp et al. 2000; Dennison et al. 1993 ; Kemp et al. and Gallegos 2001). On page 115 a report by "Edwards and Willard" is discus but no information pertaining to it, such as year or title is given. Similarly, on page 129 there is a reference for a 2008 Walter and Merritts paper but again there is no footnote or bibliography detailing common information such as the title of the paper or publisher.

In each of these cases, the lack of appropriate referencing of the cited documents makes it difficult to obtain and review the information cited by DEP. The final WIP should correct this issue throughout the document. PA may be required to defend its WIP in court and a complete administrative record is imperative

DEP does not present a map or other information regarding of the four maior basins/watersheds discussed in the draft WIP.

The draft WIP relies heavily on presenting the loads and subsequent Load Allocations (LA) and Wasteload Allocations (WLA) for the Susquehanna and Potomac River Basins along with the Eastern and Western Shore Watersheds. Yet, there is no presentation of geographical boundaries of these watersheds. There is also no discussion regarding the size of each watershed (e.g., square miles) or the general land use (past, present, and predicted future)--all of which are vitally important in the examination of the assigned WLAs and LAS. It also is important for citizens and the regulated community to comprehend precisely in which basin/watershed they lay for regulatory and programmatic considerations.

DEP should address the oversight by including such information in the final WIP.

DEP should present the area loads per land use along with the best management practice (BMP) efficiencies in an additional Appendix.

Although this information is available from the EPA Chesapeake Bay Program, it can be difficult and time-consuming to locate. Reviewers of the draft WIP who do not have the time seek this information but do have an interest in it, would benefit from its presentation in the draft WIP.

The Susquehanna River trend data presents an incomplete summary of SRBC's monitoring study results and should be expanded upon to reflect a holistic analysis of the data.

SRBC's report [FN26] presents the most recent summary of the water quality monitoring trends within key locations of the Basin. Although the data indicate improvement, particularly in total nitrogen load reductions, context is important.

When one is orders of magnitude above a sustainable load (i.e., loads need to achieve the TMDL), a decrease from the long term mean load doesn't really validate significant progress.

Several parameters (particularly several phosphorus species) have rather large errors/uncertainty reported for the 2008 value. In many cases, if one considers that the true value is within the range then there is little or no statistical reduction and, in some cases, possibly an increase in load. Even with the error/uncertainty around a 2008 value, several phosphorus species, particularly the dissolved and dissolved orthophosphorus, are notably higher than in previous years. Total phosphorus is within the mean or slightly higher in 3 of 6 sites; thus indicating no real trend. Exceptions are the Conestoga and Mari sites.

Nitrogen and associated species appear to have decreased in 2008 versus the long-term mean, while flow remained at or very near the average for most sites. Errors/uncertainty around nitrogen species are not very large and when considered do indicate a true reduction in most cases.

Sediment fate and transport is complex, a year's worth or several years' worth reductions may not necessarily reflect a decrease at the edge-of-stream. Reporting on the fine and sand sediment fractions of sediment, along with total suspended sediment, would yield additional insight into the sediment issue.

In short, the data does appear to indicate that, generally, 2008 nitrogen load is a decrease from the long-term mean. However, the analysis does not put this decrease into the perspective that given the significant amount of work required to reach TMDL cap loads, this represents a small fraction of the overall necessary reductions. Furthermore, even if the reported reductions hold, the rate of reduction is still relatively slow and would not be expected to achieve a TMD in a timely manner. Additionally, the phosphorus data is concerning and could have a dramatic effect on local water quality as well as the Bay. Why the reversal to an upward trend in phosphorus (continuation of the "banana" plots) [FN27], particularly the dissolved and ortho fractions, is speculative but important.

The "Pennsylvania 2009 Nutrient and Sediment Loads . . ." are notably different than those presented in EPA's draft TMDL.

On page 13 of the draft WIP, the sector loads from the phase 5.3 watershed model are presented as numerical values. However, when converted to percentage of total load, these percentages are vastly different than those in Table 4.1 and 4.2 of the draft TMDL (page 4-6), except for agriculture. For instance, in the draft WIP on page 13 the urban/developed load is stated to deliver 6,704,000 lbs of TN/yr. This represents 6 percent of the total load of 106,413,000 lbs of TN/yr. In table 4.1 of the TMDL, "stormwater" is credited for 33 percent of the total load. Septic systems are documented with delivering 3,290,000 lbs/yr in the draft WIP, which is approximately 4 percent of the total load. The draft TMDL assigns septic systems a current load of 30% of the nitrogen. Similar discrepancies can be found for the other source sectors.

The "Projected Sector Loads ..." and tables in Appendix 4, are fundamentally different and therefore cannot be appropriately examined.

The "Projected Sector Loads" tables presented in page 23 through 28 of the draft WIP attempt to summarize pollutant load data for each basin/watershed along with percent of total, reductions, total allocation, LAs and WLAs. In numerous,

instances, these numbers are vastly different than those in Appendix 4.

For example, the Susquehanna CAFO nitrogen data on page 23 indicates that no information regarding 2009 loads is available but that a WLA of 870,000 is set. The nitrogen B2 table indicates that the 2009 CAFO load is 1,222,439 lbs/yr. In the same table, the MS4 load is presented as 805,923 lbs/yr with a 2025 cap load of 542,475 lbs/yr. In the table on page 23, the 2009 MS4 load is presented as the B2 2025 cap load of roughly 542,000 lbs/yr. This table also presents this as the final WLA; therefore indicating no load reductions called for from MS4. Similar discrepancies are present for each basin/watershed in each of the pollutant tables in Appendix 4.

Interestingly, no WLA reductions are called for from the construction, mining, and industrial stormwater sectors under the data presented in pages 23 through 28. According to the tables in Appendix 4, this is not the case. If this is accurate, however, it represents a disturbing lack of responsibility by these sectors and a disproportionate shouldering of the reduction burden to others, such as agriculture. It also apparently establishes an equability issue in that it that DEP appears to be proposing that construction activities which cumulatively do not cause an exceedance of the WLA will have a lesser set of erosion and sedimentation control requirements than those that would. Presumably, a permitted construction activity which would result in the construction WLA exceeded would need either be denied a permit or required to achieve a no net increase offset. Whereas, construction loads that would not cause the WLA exceeded would have no such requirements.

Curiously, the total nitrogen point source data for the Potomac Basin indicates that an additional 335,000 lbs/yr of nitrogen compared to the 2009 load is allocated. The B2 data for this sector does not appear to support the increase presented in the table on page 23; yet, if it is correct, it appears to violate the "net increase" requirement for new or expanded loads from sewage treatment facilities.

The Point Source total sediment load data for the Eastern Shore watershed in "Pennsylvania 2009 Nutrient and Sediment Loads ..." tables indicates a disproportional sediment load.

On page 28 of the draft WIP, the 2009 and WLA Eastern Shore Watershed point source sediment load is presented as 52,300 million lbs/yr. Comparatively, the Susquehanna Basin is cited as having a point source sediment load of 16.1 million lbs/yr; 0.36 million lbs/yr for the Potomac, and 0.0 million lbs/yr for the West Shore. The TSS data presented for point sources of all types in Table B2 does not support this information.

The Point Source total sediment load data in Table B2 indicates a notable sediment load from this sector, contrary to previous information and the underpinnings of the Point Source Allocation Strategy developed under the Tributary Strategy.

Divergent from the data presented in page 23 through 28, TSS data in Table B2 indicates a notable load of sediment from point sources. For instance, in the Susquehanna Basin the 2009 significant municipal wastewater load is presented as 19,344,917 lbs/yr. This presumes the subtotal title is incorrect in reference to nitrogen and that the table title is correct. Although this is substantially less the load attributed to agriculture and urban/suburban stormwater, it nonetheless represents a load that was not considered under the Point Source Allocation Strategy. Notably, Table B2 does not call for any reductions below the 2009 while other sectors must reduce loads substantially. For instance, agriculture is tasked with reducing sediment by 166,600,699 lbs/yr by 2025. This disproportionately shifts the burden of achieving TSS reductions to the other sectors.

Given the magnitude of the point source sediment load and the lack of consideration of such loads in the permitting process previously developed, it appears necessary to re-examine the Point Source Allocation Strategy to include TSS limits and reductions in existing and future NPDES permits.

Conclusion

The TMDL is real. The ramifications of failure are real.

We appreciate DEP's candor and acknowledgement that improvements to their first draft of the WIP are necessary. We encourage EPA and DEP to continue to develop mechanisms and funding to strengthen the WIP, with special emphasis on achieving reasonable assurance. Achieving non-point source compliance and quantifiable stormwater improvements for our communities, supporting our County Conservation Districts, and providing funding for nonpoint source improvements are key elements of the WIP

Pennsylvania must ensure that all stakeholders work together to ensure that the necessary components of funding, staffing, technical assistance, enforcement, and regulations-are sufficient enough to achieve our pollution reduction goals.

We believe that the recommendations we have made would meet and exceed the thresholds for reasonable assurance established by EPA and encourage DEP to undertake serious consideration of them.

[The document submitted was partially illegible along the right margin. The text below have been reproduced to the greatest extent possible. See EPA-R03-OW-2010-0736-0732 for a copy of this document.]

Watershed Implementation Team Members

Dear Watershed Implementation Plan Team Member:

I want to personally thank each of you for the time, effort, and resources you and you organizations have committed to the Watershed Implementation Plan (WIP) process. The Chesapeake Bay Foundation (CBF) also acknowledges and thanks the Department of Environmental Protection (DEP) for developing and implementing a thorough and open stakeholder process for constructing the WIPs.

In order to construct a WIP that not only contains proposed BMPs to meet the modeled reduction requirements, but includes the implementation capacity to assure that those BMPs are put "on the ground", we have prepared a look at the 2008-2009 implementation progress to compare with the current milestone commitments. This is instructive in seeing where we have the resources or capability to succeed, and where we must placed increased emphasis.

Methodology

As you know, Two years ago the federal and state governments determined that shorter-term milestones would improve accountability, accelerate pollution reductions, and increase the likelihood of meeting pollution reduction targets for the Chesapeake Bay and its Tidal Tributaries. The jurisdictions announced their first milestones in May 2009 and laid out plans to meet these commitments over the three years between January 1, 2009 and December 31, 2011. A copy of Pennsylvania's first milestone commitment is provided as Enclosure A for your convenience. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1]

For comparison, we have obtained from EPA Pennsylvania's reported BMP implementation levels from the 2008 and 2009 bay model runs (v. 4.3). This information and the milestone commitment levels for the pertinent BMPs are presented as Enclosure B. Additionally, we calculated the percentage of the three year milestone which has been achieved in the first year. While not every BMP would be on a linear trajectory, this does give some indication of whether we are progressing at a rate that will result in PA meeting our 2011 milestone commitments.

As you evaluate and comment on the draft Phase I WIP, we ask that you consider enclosed information and comments that we believe are critical creating a Plan the meet the requirements of the TMDL and avoid Pennsylvania being faced with a "Backstop WIP" from EPA or other consequences from the EPA letter.

Results

While assessing the practices and implementation numbers in Enclosure B, several things are apparent. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1] The first is that we are doing very well in some areas and lag substantially in others. The second interesting observation is that the areas where is doing well can be grouped into three categories:

1. Practices that have broad acceptance and are part of accepted, profitable practice, such as poultry phytase, cover crops and no-till farming.
2. Practices that are supported by robust federal programs, such as animal waste systems and forest buffers.
3. Practices that are required by regulatory programs with oversight capacity such as wastewater treatment plant upgrades.

A third notable observation is that is that, due to inadequate tracking of BMPs in-state with private resources, PA is dramatically under-reporting some BMPs, such as cover crops and no-till acres. Numerous other BMPs are also likely under-represented to lesser extent.

The fourth item, and the one of great concern with respect to crafting the WIP, is that the areas where we are dramatically behind on BMP implementation are those where we have acknowledged inadequacies in programs or funding. Nutrient management and Conservation Plan targets in the milestone are far behind schedule. These plans set up the implementation demand for many other BMPs in future years. The gap in this area is largely the result of a lack of compliance, outreach and technical assistance. Our state budgets have not addressed the funding and staffing needs of the County Conservation Districts, who are the front line for doing this work. Another gap is the lack of progress on addressing stormwater runoff from our urban/suburban centers. As discussed by the Stormwater WIP team, PA continues to struggle with developing a clear strategy and has yet to commit the necessary resources to implement improvements in this area.

Wastewater Treatment

Pennsylvania's strategy [FN28] with regard to permitting for wastewater treatment facilities appears to be on track. For all phase 1 facilities, cap loads based on concentrations of 1.0 mg/l TN and 0.8 mg/l TP at design annual average daily flow have been placed in permits and will become effective on 10/01/2010. Permits for phase 2 facilities will be effective 10/01/2011; and phase 3 facilities on 10/01/2012. Permit limits will be achieved through capital upgrades, nutrient trading, or combinations of both.

We continue to support DEP's wastewater treatment strategy as the most cost-effective and equitable approach towards achieving this sector's cap load allocation; however, we remain concerned that financing through grants and loans remains limited, particularly in comparison to Maryland and Virginia. Given the current economic conditions, prioritizing existing statewide water infrastructure funding towards projects with the Bay watershed that facilitate achieving this sector's cap load should be explicitly integrated into the decisionmaking criteria of PENNVEST and other state financing sources.

Agriculture

Pennsylvania's progress on the Ag milestones has been a mixed bag. As noted earlier we are on or ahead of implementation schedule for a number of key BMPs, including buffers, cover crops, and no-till. We also know that we

are substantially underreporting some BMPs, including cover crops and no-till. According to recent estimates from evaluations in Bradford and Lancaster counties, we are under-reporting by as much as 40 to 80 percent.

The problematic issue for the agricultural sector is the degree to which we are behind in developing nutrient management plans and conservation plans. This reality is consistent with the compliance problem facing PA's agricultural sector, as an estimated 50-60% of farms do not have the required conservation plan, consistent with PA Chapter 102, and manure management plan. These plans serve as the conservation and compliance road maps for farms and drive the future implementation of many BMPs.

The grave concern about PA's performance in these areas is threefold:

1. It translates to a continued problem with compliance, leaving water quality unaddressed, and farms subject to enforcement.
2. It may lead to greater difficulties in meeting the implementation goals for other BMPs in future years.
3. Our ability to meet these targets is predicated on the availability of technical assistance.

The technical assistance necessary to develop conservation plans and nutrient management & manure management plans has primarily come from the USDA NRCS and our County Conservation Districts. State funding for conservation districts has been steadily declining, not increasing as will be necessary to reverse the current trend. NRCS staffing has also been declining, while their project funding has increased - creating a growing bottleneck. Further, preparation of these plans by private sector agricultural consultants has been hampered by the substantial reduction of the Resource Enhancement And Protection (REAP) tax credit, the lack a robust, streamlined Technical Service Provider (TSP) scenario with USDA, and the lack of compliance outreach and enforcement.

The Phase I WIP must address the issues of compliance, an increase in technical assistance availability, and resource availability. CBF recommends that the WIP T and the Commonwealth consider incorporating the following concepts in the WIP:

--Develop an Agricultural Compliance Plan which identifies the process, resources and timelines necessary to achieve compliance with state and federal requirements. Enclosure C is a copy of CBF's comments on PA D draft Ag. Water Quality Initiative. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1]

--Increase funding for the Resource Enhancement And Protection (REAP) credit to \$20 million per year. This efficient and over subscribed tax credit program has established a tremendous track record of matching tax credits private resources to achieve conservation goals.

--The Commonwealth should work with the USDA NRCS to develop a broader, more flexible TSP to enable greater private sector delivery of critical conservation programs such as EQIP and CBWI. PA's private agricultural groups should be enabled to play a greater role in providing the critical technical assistance necessary to implement the federal agriculture program dollars.

--Increase the state funding to County Conservation Districts. The WIP should estimate the additional staffing and resources for the conservation districts to implement the additional outreach, compliance and technical assistance

necessary for implementation of the Agricultural portion of the B, TMDL and provide the necessary increase in future budgets beginning in the 2011-2012 budget.

--Improve Phosphorus Management. The current Phosphorus Index allows phosphorus to accumulate in some soils, and therefore does not adequately protect water quality. Nutrient management planning requirements should be revised to prevent over-saturation of soil phosphorus, such as by incorporating Saturation into the P Index, without losing the protection that the P Index provides to steep slopes and areas near streams.

--Develop a system for tracking all BMPs. As noted above, we do not effectively track nor, therefore, report and model most BMPs that are privately funded and not part of an organized program. CBF agrees with many other partners that we are dramatically under-reporting numerous key BMPs and accurately tracking those BMPs is critical.

Stormwater

Pennsylvania's decentralized and fragmented local governmental system presents a particular conundrum in addressing pollutant loads from urban and suburban runoff evidenced by the extensive discussions within the stormwater WIP workgroup, achieving and maintaining the necessary reductions from this sector under our current framework is unlikely, if not impossible, and certainly very costly.

In order to circumvent such challenges, we believe that the following recommendations should be undertaken by DEP and, where appropriate, the legislature:

--Employ a scientifically justifiable and accurate methodology to determine the MS4 pollutant load. Pennsylvania's currently-proposed methodology equates the publicly owned roads with the MS4 drainage network. Under this methodology, the land area contributing to the MS4 would not be calculated as part of the load. This approach is inadequate and scientifically unjustifiable and, if implemented, could result in other sectors shouldering the burden for a large percentage of the urban stormwater load. And, as noted in EPA's July 9, 2010 letter to DEP, the methodology is inconsistent with the Clean Water Act and MS4 permitting program. However, we understand and appreciate the unique difficulties Pennsylvania's fragmented local governmental system present in instituting an MS4 program, particularly a program which achieves quantifiable reductions in stormwater load. These issues are especially evident in the context of a TMDL. We recommend that DEP consider employing the methodology used in The Christina River Basin Watershed Stormwater Source TMDL (2006), [FN 29] which included all or parts of MS4 communities in Pennsylvania, Delaware, and Maryland. The Christina TMDL MS4 WLA methodology could be employed as the stormwater load calculation approach in the Phase I WIP with the requirement that all new and reissued MS4 permits contain requirements for delineating the drainage areas of each outfall within the MS4 in order to more precisely determine the WLA versus LA loads within each urbanized area.

--Revise Act 167 requirements to explicitly and quantitatively integrate achieving and maintaining TMDL WLA and LA allocations for stormwater. When passed in 1978, Act 167 was a unique and progressive step towards better stormwater management. But, in many ways, the Act has outlasted its usefulness and needs to be updated to reflect today's regulatory realities. With updates that require preventing new sources of stormwater pollution and addressing problems from existing development, Act 167 could once again serve as the framework for planning and implementing stormwater management relevant to the challenges of today. As a result, Act 167 could be used as the fundamental tool to achieve compliance with the stormwater-related requirements of the Chesapeake Bay TMDL, as well as local TMDLs.

- Prioritize passage of House Bill 1390, commonly referred to as the Integrated Water Resources Act. HB 1390 would set a framework for a more consistent, coordinated, and comprehensive county-based approach to stormwater management in the Commonwealth.
- Establish a sustainable source of funding to support local implementation of new and the retrofitting of existing stormwater practices and initiatives. Through legislation, regulation, or policy establish the framework for the creation and operation of local Authorities, Utilities, or Management Districts and/or create sustainable funding sources that enable entities to collect fees and generate revenues dedicated to planning, constructing, monitoring, maintaining, improving, expanding, operating, inspecting and repairing public and private stormwater management infrastructure.
- Establish through regulation or policy a pollution offset program for all or increased permitted discharges. President Obama's Executive Order on the Chesapeake Bay Foundation's settlement agreement with EPA commits: requires that states must offset all new nitrogen, phosphorus and sediment by reducing them from another source, including new or increased permitted discharges. This requirement includes new or increased permitted discharge from construction and post-construction stormwater. It should be noted that this is not an endorsement of the concept of offsetting volume from new development which is entirely different.
- Through legislation, consider a statewide lawn fertilizer restriction. By ban the sale of all fertilizers designed for turf lands that contain phosphorus those that contain less than 25 percent slow release nitrogen. Further, by law prohibit the application of fertilizer that contains nitrogen to turf lands more than once a year unless required by a valid soil test. Citizen education programs be needed to ensure homeowner compliance with the once-a-year nitrogen application rate. Alternatively, the passage of a local municipal ordinance which effectively achieves the same outcome could be an explicit requirement of a reissued and new MS4 permits could be considered.
- Create by law a state incentive program for the redevelopment and reduction of impervious surfaces in existing urban corridors. Incentive: could include tax reductions/credits, density bonuses, parking waivers, fee reductions, and rapid project approval. Some local governments already provide a mix of incentives for certain actions. Incentives should only apply to projects that are either in US census-designated urbanized, consistent with the local comprehensive plans, and include specific sound land use elements, such as supporting higher density, compact development, transit-oriented design, mixed uses, increased open space/buffers/tree canopy, and onsite capture and reuse.
- Close the "no net increase" sewage treatment loophole for new septic systems. Unlike new or expanded sources of sewage discharges, under current Pennsylvania policy septic systems are not required to acquire offsets for nitrogen loads. Through regulation or policy, all new or rehabilitated septic systems should be required to either install nutrient-reduction technology or purchase offsets equivalent for the expected life of the system.
- Establish a series of urban stormwater pollution reduction demonstrations. While moving forward with permits that meet the pollution reduction requirements of the Federal MS4 program and the Chesapeake Bay and local TMDLs, prioritize and implement a series of demonstrations to implement on-ground installation of new and retrofitted stormwater practices designed to quantitatively reduce stormwater pollutant loads within currently suburbanized/urbanized areas. The demonstrations should be sufficiently detailed so as to identify "critical sources areas" of stormwater load within the pertinent area and the most cost-effective solutions available to address these areas. Such an effort will provide valuable lessons learned as to how local implementation can occur and be integrated comprehensively into latter phases of the WIPs.
- Develop a stormwater pollutant offset program for existing developed areas. In some areas, it may make sense to achieve load reductions through an offset program to be consistent with local targets and the cap allocation in the TMDL. A program that is designed at the appropriate spatial scale (e.g., county) that allows local governments to purchase pollution offsets in lieu of on-the-ground practices should be considered. Such an effort, however, should not relinquish local entities from not achieving an appropriate baseline and threshold prior to being able to offset remaining loads.

Conclusions

CBF strongly supports the milestone approach to restoring the Chesapeake Bay. The use of short-term targets should, in theory, provide for greater accountability and accelerate pollution reductions and more responsive adaptive management. While Pennsylvania has made significant, accelerated progress on some specific BMPs, the Commonwealth has demonstrated an inability to deliver on core programmatic items that are critical to achieving the milestone and the longer term goals of TMDL implementation. The new WIP must contain programmatic and resource commitments necessary meet all the milestone commitments and to accelerate nutrient pollution reductions.

The WIP is Pennsylvania's final opportunity to create a strategy for implementing the TMDL that is built by PA, for PA, and utilizes the details and efficiencies that are specific to the Commonwealth. Integration of the necessary resources and implementation strategies to achieve the reduction goals is critical to the success of the WIP and its acceptability to EPA. CBF urges you to consider the recommendations contained in this letter and to develop similar recommendations for consideration by the WIP Teams and the Commonwealth. If we do not construct a strategy that that is credible for accomplishing the necessary reductions, the Federal Government will use the authorities and digression at its disposal to attempt to accomplish those reductions in Pennsylvania. The outcomes of that approach will be for more difficult and less efficient for the stakeholders and the Commonwealth.

I urge you to consider the recommendations enclosed, the ramifications of inaction insufficient action, and the opportunities that we have to create a strategy that cre clean water for the Chesapeake watershed and the rivers and streams of Pennsylvania.

Enclosure A : Pennsylvania's First Milestone Commitment

Chesapeake Bay Foundation's Comments for Pennsylvania's Proposed Chesapeake Bay Agricultural Water Quality Initiative

The Chesapeake Bay Foundation agrees with the goals of "Pennsylvania's Proposed Chesapeake Agricultural Water Quality Initiative." We applaud the objectives of nutrient and sediment reduction on all farms within the Chesapeake Bay watershed, while maintaining the economic viability of farms and meeting federal and state laws and Chesapeake Bay legal requirements.

We consider it appropriate that the initiative focus in part on education and outreach to meet existing regulatory requirements for Erosion and Sediment Control and Manure Management, along with technical assistance to meet these requirements, especially for farms that have been outside of the realm of the Nutrient Management and Concentrated Animal Feeding Operation (CAFO) program. We also believe that compliance assurance coupled with targeted enforcement actions are needed operations that are not taking the necessary steps to comply with these requirements, and that enforcement actions will serve as an incentive to encourage other farms to comply with these regulations to reduce nutrient and sediment pollution to Pennsylvania's waters.

The Chesapeake Bay Foundation recommends the following changes to strengthen the initiative:

1. Targeted Watersheds

The targeted watershed approach must be complemented with a broad and robust compliance outreach effort throughout the Chesapeake Bay watershed. The focus on small watersheds is very limiting, especially since Pennsylvania has approximately 5,500 miles of streams impaired by agricultural pollution alone. Focusing on a small number of watersheds at any given time will limit DEP's ability to restore all impaired streams and the Chesapeake Bay in a timely fashion. The effort within the prioritized watersheds should not eclipse the effort throughout the watershed.

Also, there are DEP, Conservation District, and other relevant staff located throughout the Chesapeake Bay watershed, including those in small watersheds not in the initial prioritization efforts for outreach, education and enforcement are essential. A targeted watershed focus without complimentary outreach to farms throughout the watershed could allow these staff, as well as the farmers in those areas, to be complacent and not take the necessary steps to improve water quality.

2. Total Maximum Daily Load Compliance

All Manure Management Plans and Erosion and Sediment Control Plans, and their associated conservation practices, should be developed so that they will be adequate given expectations for agriculture's portion of local and Chesapeake Bay Total Maximum Daily Loads (TMDLs). Individual plans satisfying only state and federal regulatory requirements could be insufficient to reduce nutrient and sediment pollution to meet the TMDL. This would require further outreach and effort to refine plans and encourage adoption of additional conservation measures, adding to the work load of agency staff. It would also impose significant hardship for farmers who could be required to develop multiple plans in succession.

The Manure Management Plans and Erosion and Sediment Control Plans should address all measures needed to meet both water quality goals and regulatory requirements. For example, a farm with contour strips and manure application

setbacks from streams may satisfy regulatory requirements, but the addition or substitution of no-till cultivation, cover crops and riparian buffers may be needed to address water quality goals. The plans should include these practices so that farms are not faced with the further challenges at a later date to establish additional practices.

3. Concentrated Animal Feeding Operations

The proposed plan includes working with EPA Region 3 to improve the CAFO program. The Chesapeake Bay Foundation strongly recommends that the program designate livestock operations with discharges as CAFOs, as specified in the federal CAFO rule. The farms should have an opportunity (within 60 days) to correct the discharges before designation. The goal should be to remove the discharges, rather than expand the number of farms under the CAFO program.

Farms' efforts to prevent CAFO designation would be a valuable tool to address problems such as: livestock directly depositing manure in streams, stormwater flowing from manure management facilities, and other sources of stream degradation. CAFO designation would provide a regulatory tool to address some of the most significant sources of pollution to the Commonwealth's waters.

In Pennsylvania, requiring farms to eliminate discharges or face regulation as CAFOs is likely to be a more effective tool to improve water quality than lowering the threshold of animal numbers to include more farms as CAFOs.

4. Enforcement

The proposed initiative lacks necessary details on the "tiered compliance process." For example, it does not specify the timeframe provided to farms to comply with requirements. It provides for enforcement discretion that is not detailed. "Escalated enforcement" is not defined. There are no timelines for ensuring that all farms will have the necessary plans developed and implemented.

The initiative should focus enforcement on the most problematic farms first. Complaint-driven enforcement of environmental regulations is inadequate because it drives regulatory action to the farms where there are observant neighbors, not necessarily where the greatest pollution risks exist. Throughout the watershed, there are farms that have not participated in voluntary technical and financial assistance, and some of these operations contribute to serious water quality problems. Publicized enforcement on these farms would serve as an incentive to many others to quickly develop the plans and establish the conservation practices needed on their farms to avoid similar regulatory action.

5. Details needed

Most importantly, the proposed Chesapeake Bay Agricultural Water Quality Initiative is lacking some of the most important details to assess the potential effectiveness. Achieving the Initiative goals will require a substantial revision of existing Conservation District and DEP staff job descriptions and/or expectations to prioritize a significant increase in outreach and compliance. The plan should specifically address how this technical assistance and enforcement will occur. The draft begs many questions:

- What is the timeline? How many farms will have plans developed each year? When will the plans be implemented?
- How and when will farms be notified of the requirements?

- What type of outreach and educational activities will be conducted?
- Who will conduct these outreach and educational activities?
- What will be the specific roles and responsibilities of Conservation District and DEP staff?
- How will other partners, such as the USDA Natural Resources Conservation Service, Penn Cooperative Extension, Pennsylvania Department of Agriculture, PennAg Industries Assoc Pennsylvania Farm Bureau, Chesapeake Bay Foundation, private sector technical assistance providers, and other public agencies, agricultural and conservation organizations collaborate

Recommended strategy for reaching compliance throughout Chesapeake Watershed

The outreach, education and enforcement requirements to meet the Chesapeake Bay Agriculture Water Quality Initiative are immense, but they are achievable goals with a concerted effort. The Chesapeake Bay Foundation provides the following estimates as a framework to ensure that every farm across the Chesapeake Bay watershed develops and implements the necessary plans.

According to the Census of Agriculture, Pennsylvania's portion of the Chesapeake Bay waters includes approximately 40,000 farms needing Erosion and Sediment Control Plans, and about livestock operations needing Manure Management Plans. About 2,000 already have Nutrient Management Plans, so the remaining 16,000 require Manure Management Plans. The Lower Susquehanna Watershed should see the most emphasis initially, because this area contributes the greatest nutrient and sediment loads to the Chesapeake Bay and has greater staff resources. Lower Susquehanna Watershed contains about 21,000 farms, approximately 10,000 of which are livestock.

Some farms will require only verification that they have current Erosion and Sediment Control Conservation Plans and Manure Management Plans that are being implemented on schedule. Some farms will require only modest updates to their plans to address water quality concerns. A third of farms will require far more assistance in developing and implementing plans where none currently exist. Anecdotal information suggests that about approximately one third of farms are in each of the three above groups. We estimate that an average of two days of technical assistance staff time per farm are needed to develop a basic Erosion and Sediment Control plan with a Manure Management Plan in the case of livestock operations.

CBF's assessment of technical resources estimates that reaching about 5,000 farms each year is possible, so that developing the necessary plans for all farms in the Chesapeake Bay watershed is an achievable goal within eight years. These estimates include:

- 49 Chesapeake Bay Technicians in Conservation Districts, that could spend about 2/3 of the time (140 days/year) on outreach and plan development, with an average of two days per farm. They could develop 3430 plans annually.
- About 40 Nutrient Management Technicians, Erosion and Sediment Control Technicians and other Conservation District staff, that could spend 10% of their time, or about 21 days/year to develop 420 plans per year.
- USDA Natural Resources Conservation Service assistance with approximately 500 plans per year through various programs, such as the Environmental Quality Incentives Program and the Conservation Stewardship Program.
- Eight Department of Environmental Protection regional staff encouraging the most problematic farms to develop the necessary plans immediately, through the private sector if Conservation District staff unavailable. They could reach about 50 farms per year per person, or about 400 total plans per year.
- The private sector's development of an additional 250 plans in the initial year, and more in the future. These people must play a significant role in plan development and implementation, and their ranks would likely expand with demand,

as farms see stronger regulatory requirements or nutrient credit trading opportunities.

--Farms in geographic proximity could be grouped together (possibly with Conservation District assistance) to obtain lower cost bids for planning.

--Additional funding from EPA could support private sector plan development.

--Farms that pollute Pennsylvania's waters should develop the necessary plans immediately, and many will need to rely on private sector planners, or face enforcement actions.

According to these estimates of combined technical resources of the public and private sector, about 5,000 farms in the Chesapeake Bay Watershed would have plans each year. Initial efforts should be targeted to livestock operations currently lacking plans. All livestock operations in the Lower Susquehanna watershed should have plans by the third year, and by the fifth year in the rest of the watershed. By the eighth year, all Chesapeake Bay Watershed farms should have an Erosion and Sediment Control plan with a Manure Management Plan when needed, although some may need adjustments.

Timeframe for plan development:

[See EPA-R03-OW-2010-0736-0732 for the figure.]

Once plans are developed, we recommend the following timeframe for implementation and establishment of the necessary conservation practices.

--Manure application rates, setbacks, management of temporary storage areas, and winter application criteria will be applied according to Manure Management Plan immediately after plan development.

--Livestock management near streams should be addressed within three months of plan development (when required in plan). People should be encouraged to participate in the Conservation Reserve Enhancement Program (CREP) when possible. Public funds should be used when buffers of at least 35 feet are included. Flexible fencing without public funds is an option for a quick remedy when needed.

--Structural changes such as animal concentration areas or manure storages must be completed within three years of plan development.

--Cover crops, no-till cultivation, and other in-field practices should be established during the crop year when possible, but at a maximum, within two years when crop rotations and equipment purchases cause delays.

The Chesapeake Bay Foundation recognizes that this strategy is ambitious, but can be achieved (concerted effort). It will require significant outreach and technical assistance, combined with the enforcement of cases where there are verified pollution problems. These enforcement cases will encourage many people to seek the necessary assistance, rather than relying solely on time-consuming public agency assistance. Since requirements for Erosion and Sediment Control Plans and Manure Management Plans have been required for over 30 years, although now undergoing major revisions, farms that are able to receive assistance from public agencies should not be exempt from the requirements, nor should they be expected to seek help from the private sector.

[The document submitted was partially illegible along the right margin. The text below has been reproduced to the greatest extent possible. See EPA-R03-OW-2010-0736-0732 for a copy of this document.]

Dear Mr. Capacasa:

As you know, CBF is one of the members of the Chesapeake Water Implementation Plan (WIP) Urban-Suburban-Rural Workgroup in Pennsylvania such, we have been participating in the discussions regarding the development WIP for the State. The purpose of this letter is to thank EPA for its detailed letter Pennsylvania DEP dated 9 July 2010 regarding DEP's proposed MS4 methodol part Pennsylvania's stormwater WIP.

However, we remain concerned given that EPA did not explicitly prohibit DEF employing the proposed methodology or indicate what, if any, ramifications may o this or a similarly inaccurate methodology were employed. The letter also d appear to fully indicate the details of what an acceptable methodology is; for ins the two MS4 methodology options set forward by EPA to the Bay states.

It should be noted that we continue formally express our opposition to using the recent methodology proposed by DEP to determine the boundaries of the MS4 s areas in assessing the current load from MS4s. In its most recent correspon regarding this methodology [FN30] Pennsylvania states:

For Pennsylvania, there are no GIS/spatial data that delineate the actual boundaries of the MS4 service areas. In discussions with Barry Newman, DEP Chief of Stormwater Planning and Management, it was decided to define the MS4 service areas based on the area of roadway within each MS4 municipality that lies within the urbanized area boundary. Urbanized area extent will be derived from the US Census 2000 (2009 corrected version) Urbanized Areas data. PennDOT and the Pennsylvania Turnpike Commission maintain MS4 permits for their roadways within the Urbanized Area portions of the State. The area of their respective roadways lying within the MS4 urbanized areas will define the boundaries of these MS4 service areas. [FN31]

Essentially, by using this approach Pennsylvania would be equating the publicly owned roads with the MS4 drainage network . Under this methodology, the land area contributing to the MS4 would not be calculated as part of the load. This approach is inadequate and we believe scientifically unjustifiable.

The reasons why the proposed approach is scientifically questionable are numerous and we will not detail them herein. In brief, however, this methodology threatens to significantly under-represent the pollution load from MS4 service areas. In turn, it will result in inappropriately depressed responsibilities for load reductions from MS4 sources areas. Additionally, by employing such a limited definition of the MS4 area, DEP would be confining the suite of potential load reduction BMPs available to MS4s to those that are only applicable on or alongside roadways.

EPA has issued a document that examines how TMDLs with storm water sources were created. [FN32] It is important

to note that EPA has included a disclaimer in this document clarifying that it is not intended to serve as a substitute for the CWA regulations and does not impose legally binding requirements on EPA or states. Having said that, none of the methodologies approved in these 17 examples appears to be similar to Pennsylvania's methodology.

In our research, we have not found another instance where EPA has approved the use of this type of an approach for the calculation of MS4 loads and associated load reductions as part of a TMDL; its use or approval in this case would effectively undermine MS4 permitting programs across the country. Our analysis indicated that in general the methodologies used in past efforts have been similar to the two EPA has repeatedly proposed to Pennsylvania as follows:

--Provide a map of the MS4 service areas including facilities like DOT roads and highways, state and federal institutions with the Chesapeake Bay drainage. EPA will use area-weighted averages to assume all loads from all land uses within the service area are part of the waste target load.

--EPA will use area-weight averages to estimate current loads from urban land uses within MS4 jurisdictions, using jurisdiction boundaries originally submitted by the states in September 2008. [FN33]

We find these two approaches reasonable and scientifically reliable. However understand and appreciate the unique difficulties Pennsylvania's fragmented governmental system present in instituting an MS4 program, particularly a program which achieves quantifiable reductions in stormwater load. These issues are especially evident in the context of a TMDL.

In 2006, an interesting and appropriate solution may be the methodology employed in The Christina River Basin Watershed Stormwater Source TMDL (2006) [FN34], which included all or parts of MS4 communities in Pennsylvania, Delaware, and Maryland. The Christina TMDL acknowledges that for the actual wasteload allocation in neither "the PA nor the DE MS4 permits identify the boundaries of the stormwater collection system contributing areas within each municipality. Therefore, it is possible to assign a WLA specific to the storm sewer collection areas within each municipality. Because these systems have not yet been delineated, the TMDL in nonpoint source loadings in the WLA portion of the TMDL. It is anticipated that the state's stormwater program will revise the WLA into the appropriate WLA and allocation (LA) as part of the stormwater permit reissuance; however, the load reductions in the TMDL will not change."

The Christina TMDL MS4 WLA methodology could be employed as the stormwater calculation approach in the phase 1 WIP with the requirement that all new and revised MS4 permits contain requirements for delineating the drainage areas of each within the MS4 in order to more precisely determine the WLA versus LA loads each urbanized area.

Finally, as you know, our settlement agreement [FN35] with EPA says that the Agency "expand the universe of MS4s" through new rulemaking. Specifically, the agreement states:

Pg. 7 - WHEREAS, on April 21, 2010, EPA issued for public notice comment a draft NPDES permit for the Municipal Separate Storm Sewer System (MS4) of the District of Columbia:

Pg. 16 - III.C.9.c. By July 31, 2010, EPA will issue an "MS4 Storm Permitting Approach for the Chesapeake Bay Watershed" that will identify key regulatory and water quality performance expectations EPA will consider when reviewing new or reissued draft state MS4 permits.

Pg. - III. D.12 - 12. By September 30, 2011, EPA will propose a regulation under section 402(P) of the Clean Water Act to expand the universe of regulated stormwater discharges and to control, at a minimum, stormwater discharges from newly developed and redeveloped sites. As part of that rulemaking, EPA will also propose revisions to its stormwater

regulations under the Clean Water Act to more effectively achieve the objectives the Chesapeake Bay TMDL. In developing the proposed rule, EPA will consider the following elements related to stormwater discharges both nationally and in the Bay watershed: (1) additional requirements to address stormwater from newly developed and redeveloped sites; (2) requiring development and implementation of retrofit plans by MS4s to reduce loads from existing stormwater discharges; and (3) expanding the definition of regulated MS4s. EPA will take final action on the regulation by November 19, 2012.

It would seem entirely inconsistent with this objective, set out in the settlement of our lawsuit against the Agency, for PA to be taking an action that would substantially shrink the universe of MS4 coverage, geographically, as it pertains to PA's stormwater WIP.

We are very aware and supportive of the time, money and effort being put forth by the EPA, the states and the other stakeholders in this endeavor. We also appreciate that EPA has reiterated several times that it has high expectations for the states to provide accurate information in its WIPs.

At this stage, it is crucial to ensure that all resources are being used efficiently and in a scientifically justifiable manner to ensure a WIP and TMDL that will produce the results are all seeking. CBF therefore strongly advocates using of one the EPA-recommended methodologies be employed to determine current load from MS4s in Pennsylvania.

In conclusion, we ask that EPA clearly state to DEP in formal format that not only is the proposed methodology scientifically indefensible, adversely precedent-setting, and in contravention to regulation and law, but that will it not be acceptable in Pennsylvania's WIP. Furthermore, such a statement by EPA should make clear that if DEP employs the proposed or a similarly unacceptable methodology, EPA will reserve the right to impose consequences that include, but are not limited to, those detailed in EPA's 29 December 2009 letter to the Bay states (i.e., the "consequences letter").

[FN30] This is the second methodology presented by Pennsylvania. The first proposal was that the MS4 service area would be calculated as 1% of the urban land within each of the relevant MS4 urban area boundaries, as defined by EPA. Once the MS4 service area is defined, EPA will estimate the load based on area-weighted averages to all loads from all land uses within the service area are part of the aggregated waste target load. The service area is described here refers to the 1% of the urban land within the relevant MS4 urban area boundary. Response

PA's Final WIP improved its commitments to implementing its stormwater program. The WIP provides a strong description of Chapter 102 regulations and what they can enforce and regulate for no net change in stormwater runoff. EPA continues to

communicate with PADEP and is keeping close oversight of its stormwater permits and program. As you know, EPA has clearly articulated its interpretation of NPDES MS4 stormwater requirements and made specific comments regarding PADEP's interpretation of those requirements for MS4 systems and the proposed use in the context of the Chesapeake Bay WIP stormwater methodology. (See letter to John Hines, PADEP dated July 9, 2010; Letter to Glenn Rider, PADEP dated September 10, 2010; Email from Jon Capacasa to Hines and Rider, PADEP dated October 15, 2010; Letter to Glenn Rider PADEP dated November 18, 2010). While PA provided greater detail in its final WIP, EPA has determined that PA did not provide sufficient assurance regarding implementation of its stormwater programs. As a result, EPA included stormwater allocations for PA based on backstop assumptions about tighter controls on federally permitted point sources of pollution. In the final TMDL. See Section 8 of the TMDL for a more detailed discussion. As part of that ongoing oversight EPA affirms its reservation of authority to take additional contingency actions including, but not limited to, those detailed in EPA's 29 December 2009 letter to the Bay states.

20.3 - VIRGINIA

Comment ID 0034-cp.001.001

Author Name: Comment Anonymous

Organization:

I expect Virginia's clean-up plan to assure success, through issuance of a step-by-step plan that prescribes mandates, funding, and deadlines. The draft clean-up plan fails to provide these assurances. In particular, the plan must:

- a) Call for additional pollution reductions from sewage treatment plants on the lower James River basin;
- b) Commit to real mandates and incentives to reduce polluted runoff from farms and cities; and
- c) Define specific two-year actions to achieve actual pollution reductions over the next 15 years to finally heal our rivers and the Bay.

Response

The Watershed Implementation Plans (WIPs) submitted by each State/Commonwealth/District of Columbia (D.C.) are part of the accountability framework outlined in the Chesapeake Bay Protection and Restoration Executive Order 13508. The WIPs help ensure implementation of the Chesapeake Bay Total Maximum Daily Load (TMDL) but are not an approvable part of the TMDL. Because this public comment period is specific to EPA's Chesapeake Bay TMDL, specific comments on each State/Commonwealth/D.C. WIP should be directed to the appropriate State/Commonwealth/D.C. agency for consideration. EPA has forwarded this comment to the appropriate agency for consideration as part of its WIP.

As a Virginia resident, I would hope that the state would come up with more stringent/effective measures to curb/reduce Chesapeake Bay pollution from runoff and other sources. I live on a manmade lake in Northern Virginia that drains its overflow water into the Chesapeake Bay, along with all the storm drains in our area. Every year, I have seen algal blooms in the lake that are caused by the myriad fertilizers and other runoff (including avian feces from our local Canada goose flock) that go into the lake from the houses, driveways, and lawns surrounding it. It is humbling to know that these same fertilizers and runoff that cause these blooms go from the lake into the Chesapeake Bay, where they end up mixing with other fertilizers to create eutrophic zones within the Bay that harm water quality and suck dissolved oxygen from the water (killing underwater grasses and aquatic organisms like mussels, oysters, and crabs). When I think that the state's planned allocation for nitrogen and phosphorus for the James River does not meet the target required to declare it healthy, I wonder if the same things that happen on my lake will happen here, too (Summary Virginia WIP Evaluation 9/24/2010, 1). By not creating a clearer, more specific plan for cleaning up the Bay and reducing water pollution (as opposed to only saying that "The state will consider broader incentives and other mechanisms for nutrient management plans"-what does this mean? Considering is not doing), the Bay will continue to suffer thanks to the pollutants brought to it by the James, my lake, and other bodies of water in the watershed (Summary Virginia WIP Evaluation 9/24/2010, 1).

The state also has to create real and clear incentives to begin cleaning pollutants out of Virginia waters. According to the EPA's review of the Virginia Watershed Implementation Plan (WIP), the WIP does not "include legislative and regulatory changes that would support high implementation rates" (Summary Virginia WIP Evaluation 9/24/2010, 1) This means that the state does not provide any ways that would get polluters to begin reducing their pollution at high levels. This means that the state is going to have to spend more money on reducing pollution rather than getting polluters to do the footwork. It would cost less for the state to get dischargers to work proactively to lessen runoff or discharge as opposed to retroactively working to clean up the aftermath. This is a state led by fiscal conservatives-would they not desire to reduce pollution by spending the least amount of state funds?

I would hope that the state of Virginia would take these thoughts into account when redrafting/amending the current Virginia WIP. The Bay is possibly our greatest saltwater resource, and it would be a shame to lose its wealth of aquatic species and the income it brings to countless Virginians because we could not come up with specific and definitive measures to protect it.

I will begin by stating that after reading the EPA Draft TMDL and the Virginia WIP and listening to Ann Jennings' lecture, I agree that the primary roadblock to achieving the pollution reduction quantities in the TMDL and to implementing the plans mentioned in the WIP is the lack of specifications and actual implementation strategies. Though these documents

purport to give such specifications, they remain extremely vague on how those numbers should be achieved and how those strategies should be put into practice. Without these specifications, these documents leave too much room for error and for wasted time. Though the EPA Draft TMDL is extremely imprecise, I find the WIP's indistinctness to be extremely problematic.

The most important thing the EPA needs to consider in the discussion on the Virginia WIP is specific goals and guidelines for reaching those goals. It is not enough just to promise the citizens of Virginia who have legal rights to clean water in both federal statutes and Virginia's own constitution without creating a system in which these goals can actually be reached.

Response

With such specificity, EPA believes we have accountability. This is precisely the improvement that EPA sought, and obtained, with the final state WIP.

Organization: University of Richmond Environmental Law and Policy

Virginia's plan to reduce pollution relies heavily on an expanded nutrient credit exchange program (WIP p. 5). The issue with this solution is accountability. It seems that if a firm has enough money, they may buy credits from other firms and (as long as they continue to meet the minimum pollution reduction numbers) continue to pollute. There are a few problems with this plan. First of all, if certain firms are polluting heavily, areas of high concentrations of pollution will develop and as they move downstream and into the Bay, they will adversely affect the ecosystem. Also, this cap and trade system does not produce any incentives for firms to further reduce their pollution outputs or to develop intuitive ways to lessen the cost of reducing their pollution.

It comes down to the fact that the Commonwealth of Virginia needs to take a stronger stance on reducing pollution in the Chesapeake Bay, not only for future generations, but for today's population- those who rely on the Bay and its tributaries for livelihood, recreation, and more.

The Watershed Implementation Plans (WIP) should also be revised by the EPA to be more effective. Instead of making vague references such as "authorities will be considered..."(pg 78) and "the board could mandate..." (pg 89), the EPA should include very specific mandates and goals for companies to fulfill. A WIP that includes these examples in them makes it seem as if it is more of a suggestion than the law that they must obey. The EPA should instead write what WILL happen to achieve less pollution from point and non point sources and also include what authorizes will oversee this and what actions will be done. Laying out a specific groundwork will help the Chesapeake Bay clean up faster.

Response

In VA's WIP, the biggest plan the state seems to have for addressing the need for better pollution control is an expansion of its current Nutrient Credit Exchange Program. The state supports such an expansion without evaluating the effectiveness of the current program in actually reducing the pollution it is supposed to be reducing, or discussing issues with accountability and having valid measurements authoritatively tracked through this exchange program. The document's argument for an expansion would be better supported if comments on market limits within trading region and the nutrient being traded were gone over, to prove the systems produces valid results and will do its best in preventing the hot spots that arise under most credit exchanges. The state's new plan is also concerning because its diagram (p.4-5) shows that under the current program only two sectors are buying credits, with four selling, and the new diagram shows now four sectors buying credits, with the addition of on-site systems and agriculture able to not just sell but also buy permits. It seems alarming the state feels agriculture, one of the major contributors to nitrogen/phosphorus pollution, should now be able to buy credits that would allow some farms to not reduce but just buy their way out of the problem. Plus, with the addition of these new sectors into the program, there will be an increased need for monitoring /authoritative oversight, and we don't know whether those same sectors from will even be able to reduce enough to feasibly meet the demand for the increased amount of credits expected to be bought. One of the benefits VA WIP gives for this program (p.6) is that it allows for "the citizens of the Commonwealth to determine the priority for what nutrient reduction actions need to be taken and by when." How this is a benefit seems a bit fuzzy, since the general Commonwealth population is not highly educated on such a specialized issue as the scientific and/or policy background of pollution into the Bay, or the severity of the current situation and effects it is having on their health, certain economic sectors, and their range of recreational activities.

Besides the shortcomings with Virginia's main plan of expanding trade credits, the overall wording and tone of the document lacks a commitment to making productive change. In listing the guiding principles of the WIP (p. 2), a principle given is "credit past progress," meaning dwelling on the past successes in clean-up when considering the need to a large amount of future clean-up; a principle reflecting the rather whining sentiments of the preface that said we cannot forget the \$8 billion of taxpayer's dollars already invested in the effort. Putting this in as a guiding principle shows Virginia's hesitance to accept that more drastic legislation and regulation is necessary and recognize the need to completely focus on future actions. Along the same lines, the Background and Approach paragraphs (p. 3) suggest that cost will be the number one factor in determining which pollution abatement methods are employed, going so far as to imply cost will trump benefit analysis in decision making. Virginia's wariness towards setting out definitive action is expressed through saying the entire WIP contains only "broad" strategies (p. 2), in context a 'loose plan,' the fact it doesn't present any new plan, just tweaking of old regulations with a few minor additions, as indicated by the lack of incremental deadlines, unclear set levels, and "consider revisions" and "explore feasibility" phrases under the source

sector paragraphs. For the James River, which should be of most concern to us Richmond residents, the plan pushes for the river to not have to meet standards set out by the EPA since the river was already placed under chlorophyll restrictions in 2005. Instead the plan thinks considering any sort of regulation for the James should be put completely on hold until a detailed three year study is conducted to determine 'more accurate' scientific readings of the effects of pollution on the James, rather than the measurements provided by the EPA model, and to analyze the economic costs to industry. All of this means a longer delay on clean water, and Virginia putting off its responsibility to the Bay that has provided for it since colonization.

One of the major issues that I have with the Virginia WIP is that it focuses heavily on Nutrient Credit Exchange, which will inevitably lead to "hot spots" where pollution is concentrated in one area causing maximum damage. By allowing for hot spots to occur the plan will solve problems in some areas, but could cause even greater damage in others. Another concern is the use of vague language, meant to provide flexibility to industries, which does not establish clear guidelines of when certain things need to be done. For example when discussing the techniques the agriculture industry should implement the goal of 2017 is laid down, but smaller steps before that are absent. These smaller steps would help to ensure that the goal is met on time by everyone, which is ultimately the goal.

In the Draft WIP wastewater is a point of focus but shows much reliance on trading programs such as Nutrient Credit Exchange, there is no major focus on creating whole new regulations. New regulations in the VA WIP may be the only solution due to our lack of progress in the past. The WIP lacks a description of how VA will organize to purchase or sell credits for wastewater and agricultural runoff within a set time period. Although the VA WIP shows concern for Agricultural runoff it does not specify any regulations dealing with onsite inspections or audits to verify that farms are

using proper techniques and implemented BMP's. The VA WIP must incorporate specific tactics for farms, allowing each farm to be closely inspected multiple times each year. Since, agricultural runoff has such an impact on the Bay, TMDL's and the VA WIP must specify audits of farmland. The VA WIP and the draft TMDL show room for improvement in regards to the Bay, but we still need to work on the specifics and imply entirely new regulations to see progress.

My biggest concern is that the VA WIP has no implementation plans. An effective WIP should contain a plan or sequence of action(s) to achieve a reduction in pollution. The preamble of the VA WIP on p. 2 says the WIP contains plans that provide "board strategies proposed to meet those allocations." It seems to me that the VA WIP is setting itself up for failure by failing to identify specific actions to achieve reduction. The WIP contains many proposals for agriculture, waste water, septic and urban storm water but no method of action. For example page 13 of the VA WIP where agricultural practices are addressed it states "it is the expectation of this plan that these practices will be widely implemented on agricultural lands." The VA WIP expects that its proposals are "widely implemented" but never explains how. I think that if Virginia has been working over the past several decades on improving health of the Chesapeake Bay and has invested billions of dollars water quality it has should care enough to put forth a better WIP that works to carry out its goals. It is time for Virginia to take responsibility, take action, and actually follow through with legislation or mandates to implement its strategies.

In regards to agriculture I think the VA WIP should put more weight on agricultural land management practices in reducing runoff rather than in relying on expanding the nutrient management credit program. One of the plans for agriculture on page 13 of WIP is to "implement nutrient management plans on most crop and hay acres". However, the WIP provides little details of what constitutes nutrient management. I think the WIP should place a much greater emphasis and provide greater detail on this strategy. In my opinion mandating farmers to adopt certain practices to prevent of runoff from their fields seems to be a more straightforward method that will result in immediate pollution reductions that I think the Bay needs.

Under section 5.1 (current programmes and capacities) it's mentioned that nutrient credits can be traded within the same river basin. However, this does not take into account the relative natural and anthropogenic filtration systems along the river. For example, If a point source pollutes at a high level in the river, after which the river passes through a riparian zone when nitrates are filtered out, the impact upon the river is not so great as if a point source polluted below that riparian zone, as few pollutants would reach the bay in the former scenario. If credits can be exchanged, and the lower course polluter can therefore pollute more this will negatively affect the pollution entering the bay, even if the same amount enters the river.

Under section 5.4 (Strategy to fill gaps) the WIP references discharges by homeowners. In the Northern section of Richmond, the relevant watershed is the Chickohominy River, and a relatively recent study by Dr Don Forsyth into attitudes about the watershed in the area revealed that most homeowners are unaware of the impacts they have on the river, despite considering themselves environmentalists. This particular river segment has high pollution levels that definitely affect the swimmability, yet the section of the WIP is vague as to how it will achieve reductions in single household pollution, and how it will interact with homeowners to achieve reductions.

Non-point sources such as agriculture (or ones that fall into a strange, grey area between point and non-point sources) need more specified attention in the WIP because of their ambiguous nature and their significant contribution to the state's water pollution.

Another aspect of Virginia's WIP that needs a serious overhaul is the mention of investment in research and development, specifically regarding the harmful, excess nutrients in wastewater, a significant source of pollution. The WIP states that "new technologies and management procedures will need to be explored to address these types of effects from the greater emphasis on removing nutrients from wastewater" (VA WIP, p. 50), however it does not provide any further information about this. As with the aforementioned agricultural pollution and the WIP in general, this discussion needs to be more specific. Perhaps the WIP could designate a specific committee for research and development or set feasible, "technology goals" that must be met by designated time increments. At the very least, the WIP should give more attention to research and development and what part they will play in reducing the water pollution in Virginia.

The EPA should most specifically revise issues concerning the TMDL with regards to more stringent point source regulations.

Response

Virginia did not submit a draft WIP that met its TMDL allocation for phosphorous and nitrogen. Because Virginia did not meet the nutrient allocations, nor did Virginia submit a WIP consistent with EPA's April 2010 "Guide for EPA's Evaluation of Phase I Watershed Implementation Plans." EPA was required to assign backstop allocations to Virginia in the draft TMDL so that its allocations would be met. The backstop allocations in the draft TMDL focused on point sources where EPA has federal authority, including NPDES-permitted wastewater treatment plants.

EPA has reconsidered its approach to federal backstop allocations as proposed in the draft TMDL. This is in large part due to the improved final Phase I WIPs and informative public comments on this issue. The final TMDL places much greater emphasis on jurisdictions' final Phase I WIPs and less emphasis on backstops in deriving the loading allocations for all sectors. Please see Section 8 of the final TMDL for the final Phase I WIP evaluations and the backstop allocations for each jurisdiction.

Although the regulation of non-point sources would be even more important to the commonwealth it is understandable that this type of regulation is even more difficult than point source reduction. Most importantly the state of Virginia in their WIP must at least meet EPA guidelines. Currently the state supports a reduction in Nitrogen levels in the James that is almost 3 million tons higher than what the EPA has mandated.

While not a Virginian I still have a vested interest in the water quality of the James as a tributary to the Chesapeake Bay. I was born and raised in Annapolis Maryland and use the Bay regularly, from being a part of my highschool rowing team, to simple recreation on the water, to a love for Bay shellfish. All of these activities are put in jeopardy by the hazardous conditions of the Bay. As an intern for Anne Arundel County's recreational waters program this summer I

have firsthand knowledge of the terrible quality to the water lately.

Organization: Coastal Canoeists

Coastal Canoeists (coastals.org) supports clean water in the Chesapeake Bay and all its tributaries. As members of a recreational canoe and kayak club based in Virginia, the quality of Chesapeake Bay waters is particularly important to us. We also support measures that protect the scenic quality of the waters we paddle and their ability to sustain wildlife.

To that end, we have asked that livestock fencing be a required practice, and that 35 foot forested buffers be established and maintained on all perennial streams, including those later developed. We also support mandating effective Best Management Practices for all farms receiving manure or sludge.

We would like to prohibit new construction on the 100 year floodplain or within 100 feet of a perennial stream or within 25 feet of an intermittent stream. These measures would protect property investment as well as water quality.

Not only is clear clean water more enjoyable to paddle in, it is also more healthy. Paddlers can swim or flip and roll and there have been many cases of infections coming from water contact that could be minimized if the Chesapeake Bay TMDL is actually put in place.

With Virginia's proposed WIP, this passing of burdens from generation to generation will only continue to occur. The WIP draft fails to provide step-by-step details on how the program is accurately going to clean up the bay and limit the amount of chemicals in the bay and local rivers and streams. The majority of the draft seems to stress the lack of money available for funding this project. However, what the state fails to understand is that without cleaning up our bays, there will be an even greater economic burden on local businesses and companies that flourish from the bay. Along with this, the state feels that they have made "great" decreases in the pollution levels in the bay, which they claim are not far from the proposed levels the EPA is striving for. If there has been such a BIG decrease in pollution levels, then why is the watershed still green and brown? Instead of focusing on the economic standpoint, the state should want to clean up the bay for the community as a whole. As an undergraduate at the University of Richmond, I know that I deserve the right to swim in the James River without having to worry about getting sick. I also believe the animals that actually live in the water deserve the right to live in an environment free from pollutants.

One of the basic principles of soil erosion science states that as the percentage of soil organic matter increases the amount of runoff from rainfall is reduced.[FN 2] Farming practices that increase the percentage of soil organic matter of the soils should be included as an agricultural best management practice.

"Maintaining good soil organic matter levels helps keep topsoil in place. A soil with more organic matter usually has better tilth and less surface crusting. This means that more water is able to infiltrate into the soil instead of running off the field, taking soil with it. When you build up organic matter, you help control erosion by making it easier for rainfall to enter the soil." Source: Sustainable Agriculture Research and Education organization (Reducing Soil Erosion, Chapter 13, sare.org)

The prescribed burning of indigenous grasses would remove a source of soil organic matter and be detrimental to soil organic content as compared to pasture that is not burned.

The deer population in Virginia today is estimated to be nearly twice the number of the deer population at the time settlement of Jamestown.[FN 6]

The WIP plan proposes to increase the wildlife habitat regardless of the environmental health impairments to the population that reside in the region. These health impairments would include threats from wildlife diseases such as Lyme disease, West Nile virus and chronic wasting disease. In Virginia the incidence of Lyme disease has increased from 55 in 1993 to 886 in 2008.[FN 7] The incidence of Lyme disease has increased 1500% in Virginia during a 13 year period.

Increasing wildlife habitat for migratory birds would be an environmental health impairment to horses and humans due to the risk of West Nile virus.

Migratory birds are also a factor in the spread of Avian Influenza which is a threat to commercial poultry operations and human health.

Deer/vehicle collisions and wildfire threats from wildlife habitat are additional impairments to the public safety of our communities. In 2009 the two fatalities occurred on public highways within the Shenandoah Valley in which a deer/vehicle collision was a contributing factor to the accident.

BMPs such as grass buffers and filter strips include recommendations to conduct a prescribed burn on regular intervals. Prescribed burning of indigenous grasses introduces an additional safety impairment of uncontrolled wildfires to our communities.

Wildfire risk assessment specific to the Shenandoah Valley should be completed due to the unrestricted conversion of farm land to wildlife habitat.

The plan relies on an excessive amount of agricultural land retirement to achieve nutrient reduction objectives.

Unlimited Reduction of Farm Land

Implementation of a variety of Best Management Practices (BMPs) will convert a significant amount of existing farm

land to forest land and wildlife habitat. The following is a partial list of farm land conversion to nonfarm uses:

- 1) Retirement of 5% of Agricultural Land (e.g. Conservation Reserve Programs)
- 2) Conversion of 5% of highly erodible agricultural land to forest
- 3) Conversion of farm land to establish riparian forest buffers
- 4) Conversion of farm land to establish riparian grass buffers
- 5) Retirement of farm land attributed to the nutrient trading program

Additional loss of farm land is anticipated due to land being purchased for urban development. Unrestrained conversion of farm land to nonfarm use may be accelerated due to the proposed nutrient trading program.

This plan states that a 35' grass or forest buffer will be implemented on 95% of the waterways in crop and hay lands. Livestock will be excluded from 95% of the perennial waterways. There is no cap or limit of the total amount of farm land that would be converted to nonfarm use. The total amount of farm land conversion to wildlife habitat is unlimited. Financial incentives of nutrient trading may influence landowners to retire an excessive amount of farm land that would result in an impairment of domestic food security. Additional farm land reduction is expected from farms lost to urban development.

By the year 2025 a total of 60% of all pasture land will be subject to prescribed grazing practices. The practice of controlled grazing may be very beneficial to the economic sustainability of farm operations as compared to continuous grazing practices.

However the enforcement of minimum pasture heights during adverse weather conditions would require livestock to be removed from pasture areas. If cattle would need to be removed from a specific grazing area this would be create an economic adversity to the livestock producer. This would in effect regulate the number of days on pasture in a growing season. If additional pasture is not available, livestock would need to be placed in a confined feeding operation or liquidated.

The typical 180 day grazing season in Rockingham County, Virginia has been cut in half this year due to drought conditions according to the extension service as reported by Daily News Record on October 23, 2010.

The recommended standards for prescribed grazing need to ensure that livestock producers can maintain economic viability.

Virginia

Overall

Overall Virginia expresses great resistance, if not outright hostility, to the Bay TMDL. Throughout the development of the Bay TMDL, Governor McDonnell has repeated his concerns about the cost, legality, allocations, and timeline for action. This attitude is reflected in the draft WIP. The WIP relies heavily on an expanded nutrient trading program to achieve its pollutant reductions under the Bay TMDL, but the plan fails to specify what laws, regulations, funding, and other resources are needed to ensure that the trading program is functional and effective and results in actual pollutant reductions rather than simply paper trades.

The draft WIP would lower sediment pollution to a level that is 12 percent below the target allocation. However, it still permits nitrogen and phosphorous allocations discharges to be 6 percent and 7 percent, respectively, more than the level allowed by the target allocation.

For transparency of information, the draft WIP does not disclose much of the crucial information. For strength of its programs, relying on an expanded trading program fails to inspire confidence that pollutant allocations will in fact be met. In its final WIP, Virginia should provide more details regarding how its nitrogen and phosphorus allocations will be met by all sectors through the trading program. Water quality trading raises serious concerns about creating hotspots of pollutants and establishing accountability to ensure that trades result in actual pollutant discharge reductions rather than paper trades. The Virginia Department of Environmental Quality should provide legislative guidance to enable the Virginia General Assembly to expand the state trading program, including appropriate geographic and temporal limitations and the establishment of baselines for the trading program. Virginia should also detail back-up pollutant control measures that will also achieve the Bay TMDL in case the nutrient trading program is not expanded to include all sources of nitrogen, phosphorus, and sediment.

NPDES Permitting

In the draft WIP, Virginia includes some information regarding the number of wastewater facilities and stormwater dischargers but fails to provide a snapshot of the universe of all NPDES-regulated facilities and the number of which have up-to-date NPDES permits. Virginia also failed to establish deadlines, timelines, or qualitative goals for updating and reissuing expired and administratively continued NPDES permits. The draft WIP does not address gaps, if any, in personnel levels and how the gaps might be filled.

Enforcement of NPDES Permits

Virginia's draft WIP does not provide any internal assessment of the effectiveness of its program, nor does it provide sufficient information to judge the strength of its enforcement program. The final WIP should include: the number of physical, on-site inspections conducted per sector; the number of violations and penalty actions or the total amount of penalties assessed; information on major facilities that are in significant non-compliance; and the level of enforcement resources.

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

The Virginia WIP does not discuss inspection rates or the existing or needed resources to regularly monitor implementation of best management practices. This information is crucial to providing the necessary reasonable assurances that nonpoint sources will achieve their allocation of pollutant reductions. Moreover, Virginia intends to include nonpoint sources in an expanded trading program, which highlights the importance monitoring and verifying implementation of voluntary practices in order to accurately get credit for those practices. In the final WIP, Virginia must include this information.

Contingencies

The draft WIP speaks only in generalities about what contingencies would be implemented if primary pollutant controls fail to produce the necessary reductions. For Virginia, a thorough discussion of contingencies is particularly important because the state plans to expand its nutrient trading program for pollutant reductions. If the nutrient trading does not work or causes significant delays, Virginia will need to implement its contingencies.

In the final WIP, Virginia should ensure that its contingencies are clearly identified. They must be coordinated with specific failures, have timely implementation deadlines, be effective, and legal authority must exist for their implementation.

Concentrated Animal Feeding Operations

According to the draft WIP, Virginia's new CAFO regulations became effective on March 3, 2010, and the Virginia Department of Environmental Quality is "in the process" of modifying the CAFO permit program. The final WIP should provide a final or at least estimated date of when all CAFO permits will be in compliance with both the new regulations and the Bay TMDL. The draft WIP also fails to disclose gaps related to funding and personnel needed to establish and maintain an effective CAFO NPDES permitting program.

Stormwater

Virginia's stormwater section fails to include much of the basic information needed to evaluate its stormwater programs. The section does not include permitting information or the scope of authority and enforcement activities conducted by local governments with delegated authority. The section fails to disclose information about available and needed resources and how the state will obtain these resources.

Air Deposition

Virginia's draft WIP generally does not include a discussion of controlling sources of air deposition of nitrogen in the state, with the exception of the James River Basin. There, the draft WIP simply acknowledges the need to reduce atmospheric deposition of nitrogen without specifying how it will be achieved. The final WIP should include a list of Virginia's state air authorities and specific details on how these authorities will be applied to achieve the nitrogen allocations. These details must include the level of enforcement, personnel, and financial resources dedicated to the state's air program, the gaps in these resources, and how and when the gaps may be filled.

Virginia, however, has determined in its WIP (September 2010) at pages 14-15 that the chlorophyll standard is faulty and that "additional scientific study is needed to provide a more precise and scientifically defensible basis for setting final nutrient allocations." We agree with this finding and determination by Virginia, and we also support Virginia's "Four Part James River Strategy" at pages 15-17 of the WIP to address these major technical problems. We strongly support the WIP with regard to its wastewater elements at pages 11- 12 (Source Sector Strategy for Wastewater), at pages 14-17 (James River), and pages 38-50 (Section 5: Wastewater).

The TMDL is supposed to be a partnership between the states and federal government. An element of this partnership

is the responsibility of each of the Bay jurisdictions to develop a Watershed Implementation Plan. These plans are supposed to be a roadmap to clean water, outlining the steps that the state will take to have in place all cleanup activities by 2025. Unfortunately, Virginia's draft Watershed Implementation Plan is not a roadmap. Instead, the state has submitted a document that outlines where we are at in our cleanup efforts and where we want to go, but no direction on how to get there.

To begin, it is important to note that we believe in the need for a plan that is crafted by Virginia in order to have confidence that the plan will be successfully carried out. Unfortunately, we cannot turn a blind eye to the fact that the Virginia plan is far too weak to be a stand-alone document. Specifically, we have identified deficiencies in each of the pollution sectors that we believe need to be addressed.

Two-year Benchmarks

It is disconcerting that Virginia has chosen to view the draft WIP in the totality of the next 15 years rather than the two-year benchmarks that have been agreed upon by the partner states within the watershed, the District of Columbia and the federal government. These two-year milestones provide a mechanism for Virginia to review its progress on meeting the pollution reduction targets. Virginia needs to use this tool to provide transparency and a system of checks on our progress.

Nutrient Credit Trading Program

The foremost glaring concern when reading the Virginia WIP is the Commonwealth's over reliance on an expansion of the nutrient credit trading program. From our analysis of the state's strategy it would appear that the state believes massive pollution reductions can be made through this program, however, there are multiple problems with this strategy which the state has not addressed.

The state has not identified a legislative proposal for what form the expanded nutrient credit program should take on. We feel that the current proposal to conduct a study on the feasibility of expanding the existing program, paired with no criteria of what that expanded program will look like is a recipe for delay and inaction. It is up to the McDonnell administration and the state regulatory agencies to provide detailed recommendations and guidance what Virginia's expanded trading regime will look like. This guidance is currently lacking in the WIP.

Nutrient trading should not be expanded. Developing a program to do so will delay the implementation of proven methods to cut pollution. An expanded nutrient trading program would be confusing to polluters and expensive and cumbersome to administer. Local officials already complain of confusion in regulations, and cutbacks in staffing at Virginia's natural resources agencies make it unlikely that useful rules can be developed, reviewed, and implemented efficiently.

As currently described, there are no regulatory drivers to ensure that pollution credits will be purchased from the various sectors. Furthermore, there is no timeline for when we can expect to see this program take effect and on what schedule different sectors will begin to participate.

As with many other areas within the WIP, this section lacks specificity. We do not know to what level different sectors and communities will be expected to participate in the program, nor how they will go about participating.

James River Strategy

The Virginia Chapter-Sierra Club begins with the premise that all of Virginia's rivers, lakes and streams should be clean and safe for the plants and species that call it home, and for the citizens who rely on them for drinking water and recreation. The Virginia WIP, and the McDonnell Administration, has asserted that the James River could become too clean. This is an affront to the principle of people deserving access to clean water, and could be considered a violation of Article XI of the Virginia Constitution.

Author Name: Tolbert J.R.

Organization: Virginia Chapter-Sierra Club

The initial reaction when reading the Watershed Implementation Plan is that Virginia has shown a real commitment to reducing pollution from the agriculture sector in the draft strategy. Upon further review, several problems become apparent with the draft strategy.

- Voluntary Nature of the Best Management Practices (BMP) Program - The draft Virginia WIP relies largely on the voluntary implementation of agricultural best management practices with little increase in the transparency or auditing of their implementation. Based upon the Commonwealth's own arguments this is a flawed approach. The administration has claimed that not all BMPs are given credit, yet there is no proposal to ensure better tracking of implementation.

- Funding for Agriculture BMPs - The draft strategy assumes tens of millions of additional funding for BMP cost-share programs, but makes no proposals on how to provide increased funding. It is incumbent on Virginia to provide a strategy for meeting the funding required through the ramp-up period. As evidenced by the funding cuts to cost-share programs in the 2010 General Assembly session, it is our recommendation that this funding should come from a dedicated source.

Handling Manure Loads - The state should be commended for referencing the potential for a poultry litter to energy project. We would encourage the state to establish a pilot program with James Madison University or another public educational institution to develop this technology and turn what is currently a financial drain on Virginia's farmers into an economic engine and coup for clean water.

In addition to the recommendations made above the Virginia Chapter believes the following steps should be taken to reduce nutrient loads from the agriculture sector:

- Require that all cows and other livestock are fenced out of Virginia's streams by 2017. No new unfenced pastures should be allowed to go forward beginning January 1, 2011.

- Prohibit additions of manure, phosphorus-containing fertilizer, or sludge to soils with phosphorus saturation greater than 20 percent, or to soils that are highly erodible or otherwise hydrologically unsuitable for land application.

- Nutrient management and soil conservation plans should be in place on all farms over 500 acres by 2014; and on all

farms over 250 acres by 2017; and on all farms over 50 acres by 2020; and on all commercial farms by 2025. The Commonwealth should develop and establish a nutrient analysis and fertilizer application education and certification program that should apply to all purchasers of more than 50 pounds of fertilizer.

- All perennial streams should have established at least a 35 foot forested or appropriate vegetative buffer. Farming practices that overwhelm this buffer with sediment or nutrients, so that it can not function as an ecosystem, should be prohibited. This should be a priority use of federal and state conservation funds. These buffers should be on all lands including those later developed.

Stormwater

While Virginia has made significant progress in reducing pollution from agriculture and wastewater facilities the same cannot be said for stormwater. Recent reports show that efforts to clean the Chesapeake Bay and its tributaries are losing ground specifically because increased stormwater pollution is offsetting progress being made from point sources, agriculture and other sources.[FN1]

Unfortunately, the Virginia WIP assumes that stormwater reductions will meet the E3 standard (Everything, Everywhere by Everyone) which is simply not possible without significant improvement to Virginia's plan. We believe that the Virginia allocation cannot be met without strengthening the proposed stormwater regulations and adopting them immediately on January 1, 2011.

In addition to the recommendations made above the Virginia Chapter-Sierra Club believes that the following steps should be taken to reduce nutrient loads from stormwater:

- Prohibit new construction in 100 year floodplains or within 100 feet of a perennial stream, or within 25 feet of an intermittent stream.
- Virginia should implement the Department of Conservation and Recreation stormwater program as it stood September 2009, before various changes were made to weaken and delay the program.
- Require that all MS4 and other stormwater permits incorporate the local wasteload allocations as defined in the TMDL.

Wastewater

Virginia has seen significant load reductions from improvements to wastewater treatment plants throughout the Chesapeake Bay watershed. The state should be commended for its progress in this area. It is our belief that this area represents a model for the other sectors since water quality improvement in this area can be traced directly to the mandate that load reductions be achieved from wastewater treatment plants.

Unfortunately, the Virginia WIP does not do enough to capitalize on this proven pollution reduction method. As stated earlier, we believe that Virginia should retrofit treatment plants in the James River Basin to the levels of 4 mg/L total nitrogen and .3 mg/L total phosphorus.

Furthermore, there is concern over the pump-out requirement for onsite septic systems. The plan lacks clarity on how 100% pump-outs will be achieved. We would recommend that the Commonwealth include a plan for accounting for total pump-outs. Specifically, we believe that homeowners should mail back a certificate provided by the contractor to the local municipality so that local governments can track those homes which have met this requirement and those that have not. In addition to the recommendations made above the Virginia Chapter-Sierra Club believes that the following action should be taken to reduce nutrient loads from wastewater and onsite septic systems:

- Ensure adequate ongoing funding to Virginia's Water Quality Improvement Fund to continue the ability of wastewater treatment plants to install best available control technology. Virginia must close the gap for smaller point source dischargers, specifically on wastewater treatment plants (less than 500,000 gallons per day capacity).

Comment ID 0213.1.001.002

Author Name: Daley Edwin

Organization: Hopewell Regional Wastewater Treatment Facility (HRWTF), Virginia

HRWTF Supports Virginia's WIP: The Commonwealth of Virginia's Watershed Implementation Plan provides a reasonable and cost effective approach to meeting the goals of the Chesapeake Bay and in particular the James River. It provides sustainability and stability for communities like Hopewell through its systemic approach and development of expanded trading programs. EPA's TMDL is not required to consider cost in development of its TMDL, however, before the TMDL can be achieved, costs must be considered in the implementation process. HRWTF believes that Virginia's WIP provides that cost consideration and EPA has no right to disapprove this plan.

Comment ID 0213.1.001.008

Author Name: Daley Edwin

Organization: Hopewell Regional Wastewater Treatment Facility (HRWTF), Virginia

Disapproval of Virginia's WIP and Proposed Backstop Allocations Affect Trading:

Virginia's WIP proposed the expansion of the nutrient trading program to include point and nonpoint trading scenarios. This would greatly enhance opportunities to creatively meet the Bay tributary allocations in as quick and cost effective manner as possible. However, disapproval of Virginia's WIP discourages the State from developing the legislation and regulation necessary to make this happen.

Imposition of the proposed backstop allocations are an impediment to trading by reducing POTW allocations available for trading. POTWs can no longer exceed limitations and credits to sell when they are being forced to treat to the limit of technology.

The second phase of HRWTF's two phase plan, which is estimated to cost \$35 million would reduce total nitrogen by 3 mg/l and would still require the purchase of nitrogen credits to meet the current nitrogen allocation. If the current draft of the TMDL is adopted, there will be little if any credits available and certainly not enough credits to meet HRWTF's needs at the proposed backstop allocation.

Author Name: Cuffee-Glenn Selena

Organization: City of Suffolk, Virginia

The City of Suffolk's MS4 operates under a general Phase II MS4 permit issued by the Virginia Department of Conservation and Recreation. As a small locality in the Tidewater Region of Virginia, we have concerns with the proposed implementation of EPA's "Pollution Diet" and the possible impacts to our community. While we understand and agree that the health of the Chesapeake Bay should be of concern to everyone, and must be addressed, we are concerned with many of the approaches proposed by the EPA. We are apprehensive with regard to the tools being used to both determine the load allocations, and to monitor the diet. We all know most diets prove unsuccessful because they are impossible to stick with; either the diet is too onerous or the results do not come quickly enough. Like the EPA, we are committed to a successful diet. However, in order to be successful, we respectfully request that the criteria to meet the milestones be obtainable for a small community like Suffolk, and affordable for our citizens. Additionally, the schedule established should be realistic in allowing time for the desired results.

No response required.

Comment ID 0220.1.001.001

Author Name: Emory B.

Organization: billememory.com

I grew up on the south side of the James River between Boshers's Dam and William's Dam. When I was a child, the James was a mess, abused by Richmond, ignored by the Federal Government (this was a long time ago, before the Federal water pollution efforts of the 1970's). There were signs posted on the Southside advising citizens to stay out of the water for health reasons.

Look at Richmond now! The city boasts a nationally recognized river parks system. Environmental improvement has fostered economic development.

I have been following the Chesapeake Bay draft TMDL process with interest. I wanted to provide you with some citizen feedback regarding Virginia's response, the draft Watershed Implementation Plan (WIP).

I attended two of the public education sessions the EPA, the VA DEQ and the VA DCR held in October. From these I gather that Virginians support fishable and swimmable waters. Additionally, Virginians realize that arriving at that condition will not be easy.

The EPA has come up with a list of what they call "Federal backstops" to put into place if Virginia's WIP does not provide assurance that the nutrient loadings specified in the Chesapeake Bay TMDL are attained.

This Federal intervention will not be necessary with the exercise of your strong leadership before the upcoming General Assembly and your involvement with the final editing of Virginia's WIP.

I live in a region that has done little to help with the health of Virginia's waters. In Thomas Jefferson Planning District Commission legislative packet, in years past we have urged the General Assembly not to consider extending the "Bay Act" here!

Make the extension of the Bay Act your first legislative priority and so state in the WIP. Turn your gaze to non-Tidewater communities located in the Chesapeake Bay watershed, the 104 units of local government cited in the HJR 622 study (November, 2001). Welcome them to the honor and responsibility of being in the Bay watershed, extend the geographic reach of the Chesapeake Bay Preservation Act.

Create a State program that tracks and rewards farmers when they install best management practices on their farms. The external cost of dumping tons of nutrients into the waters of Virginia must be dealt with. It is not good business to destroy Virginia's aquaculture and Virginia's riverine recreational and tourism resources.

Encourage localities to implement storm-water utility fees based on permeability.

Please consider leading our localities and citizens. Make it clear to the people in the Bay watershed why you are asking them, in these difficult economic times, to step up.

At the education sessions I heard reference to many citizen ideas that came out of the "SAG" process (stakeholders advisory group meetings?) The commenter lamented that these proposals had not been included in the WIP. Where are those proposals? Promote specific actions in the WIP.

The economic impact of Federal backstops on citizens will be intense. But, with your leadership, the backstops can be avoided.

Ask Virginians to sacrifice. Direct the DCR to write a Watershed Implementation Plan that will get Virginia into the EPA's end-zone of "reasonable assurance".

We are about the same age. I know you remember Nixon going to China. President Nixon, flaws aside, was a pretty amazing President. Mr. Nixon started the EPA as well.

Please consider being the Governor of the Commonwealth of Virginia, the leader who makes plain the way for the other states and DC to reach this attainable goal of an actionable "pollution diet" for the Chesapeake Bay.

As called for in Virginia Code before you and I were born:

Virginia's 1950 State Water Control Law.

62.1-44.2. Short title; purpose.

The short title of this chapter is the State Water Control Law. It is the policy of the Commonwealth of Virginia and the purpose of this law to: (1) protect existing high quality state waters and restore all other state waters to such condition of quality that any such waters will permit all reasonable public uses and will support the propagation and growth of all aquatic life, including game fish, which might reasonably be expected to inhabit them; (2) safeguard the clean waters of the Commonwealth from pollution; (3) prevent any increase in pollution; (4) reduce existing pollution; (5) promote and encourage the reclamation and reuse of wastewater in a manner protective of the environment and public health; and (6) promote water resource conservation, management and distribution, and encourage water consumption reduction in order to provide for the health, safety, and welfare of the present and future citizens of the Commonwealth.

Response

Comment ID 0226.1.001.006

Author Name: Harris, Jr. Cecil

Organization: Hanover Courthouse, Hanover County, Virginia

In the interim, we are proponents of technology based alternatives employed under the principles of MEP (Maximum Extent Practicable) and adaptive management to demonstrate compliance with what we believe to be solid Clean Water Act principles. We appreciate and support Virginia's inclusion of an expanded trading program as a local implementation option. Virginia has a nationally recognized point-point trading program that currently includes domestic and industrial wastewater treatment plants. We believe that expansion of Virginia's trading program is one way to provide flexibility to help make attainment more feasible.

Response

EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Comment ID 0228.1.001.002

Organization: Wetland Studies and Solutions, Inc.

I am optimistic that, with modification, the draft WIP proposed by the Commonwealth could easily become the most cost-effective and equitable solution to the TMDL problem that is acceptable to the EPA. This WIP would benefit the citizens of the Commonwealth by cleaning the Bay and local rivers and streams in the most affordable way possible.

Response

It is EPA's preference that the jurisdiction WIPs are used to meet the allocations. However, the WIPs need to meet the expectations outlined in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction and meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. Where WIPs do not meet these criteria, backstop allocations may need to be applied. EPA's evaluation of the final WIP for each jurisdiction can be found in Section 8 of the final TMDL report. Also please see response to comment # 0431.1.001.004.

The following seven Action Items (and associated Sector Allocations outlined in Exhibit 1) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] can improve the draft WIP and achieve the TMDL allocations for Virginia at a lower total cost to society as summarized in Table 1, below (See Section III., Table 6, for calculations and data sources):

1. Upgrade All Significant Discharger Wastewater Treatment Plants
2. Establish Urban Fertilizer Regulations
3. Expand 5-Year On-Site Pump Out Requirement
4. Improve Erosion and Sediment Control Training and Specifications
5. Establish a "Nutrient Trading Fund"
6. Allow New Construction with On-Site Sewage Disposal to Exceed NSF/ANSI Standards or Contribute to the Nutrient Trading Fund
7. Allow Development Exceeding the Allowable WIP Loads to Contribute to the Nutrient Trading Fund

Table 1: Urban Sector Cost Comparison of Draft WIP, EPA Backstop, and Proposed WIP Modification.

The arguments against further upgrades to WWTPs include:

- a) "They" have already spent a lot of money to upgrade their plants and it is unfair to ask for more; and
- b) "They" have already done more than their fair share of load reductions since 1985.

However, Pogo [FN14] once said, "we have met the enemy and he is us," and that wisdom applies in this case as well. The arguments above are inappropriate because, again, "they" are not WWTP operators; "they" are rate payers, the urban/suburban dwellers who ultimately pay for these plants, but who also pay for urban stormwater upgrades through fees or taxes. The WIP needs to compare the cost-effectiveness of upgrading WWTPs [FN15] to other options faced by the same people: the rate payers, not the WWTP operators.

[FN 14] Walter Kelly, Earth Day Poster, 1970.

[FN 15] To concentrations of TN = 3.0 mg/L and TP = 0.10 mg/L from today's levels (since costs increase dramatically as treatment levels tighten).

Organization: Wetland Studies and Solutions, Inc.

The SAG voiced support for implementing Urban Nutrient Management, which proposes to reduce the pollutants running off urban surfaces by regulating how those nutrients may be applied to urban surfaces in the first place. (See Exhibit 5, Effects of Fertilizer Management Practices on Urban Runoff Water Quality [FN17]. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1]) Governor McDonnell has also voiced his support for urban nutrient management, noting that he was the patron of legislation to ban phosphorus in detergents in the Commonwealth as an incredibly cost-effective nutrient management strategy. However, the draft WIP only noted that urban nutrient management regulations would be "considered" and "investigated."

As shown in Charts 1 and 2, below, the potential reductions achievable through urban nutrient management are significant; proper implementation of nutrient management has the potential to save at least 125,000 lb/year TP and 465,000 lb/yr TN at an insignificant cost (less than \$10/year [FN18] for a quarter-acre lot). In fact, in some markets, this could be a no-cost reduction [FN19].

[FN 17] 17 Daniels, W., Goatley, M., Maguire, R., Sample, D., 2010. Effects of Fertilizer Management Practices on Urban Runoff Water Quality. Virginia Polytechnic Institute and State University and Occoquan Watershed Monitoring Lab.

[FN 18] Based on conversations with industry experts and cost comparisons at retail stores in July, 2010. Assuming the approximate cost of straight urea fertilizer is \$0.80/pound applied and poly- or sulfur-coated urea fertilizer is \$2.30 to \$2.70/pound applied (an expensive Slow Release Nitrogen Source), with 1 lb/slow release Nitrogen per 1000 sf/year used and no extra cost for including Phosphorus in the fertilizer.

[FN 19] A comparison of Fairway Formula GreenView fertilizer at Merrifield Garden Center in Gainesville, Virginia, on 11/2/ 2010, showed three formulas (29-2-10 Fall fertilizer; 30-0-12 Fall fertilizer with 3/5ths SRN; and 31-0-0 Late Fall fertilizer with 9/10ths SRN) each priced at \$39.99 for an amount covering 5,000 square feet.

The discussion below presents specific modifications to the Draft WIP that achieve the EPA load allocation goals in a more cost-effective manner than that Draft WIP proposal (a summary of the proposed load allocations and the actions required to achieve the allocations for the Proposed WIP Modification is presented in Exhibit 1) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] . Table 7 provides a cost analysis comparison for the Draft WIP, EPA backstop, and the Proposed WIP Modification.

Table 7: Urban Sector Cost Comparison of Draft WIP, EPA backstop, and Proposed WIP Modification [Please see page 15 of the original letter (Docket ID 0228.1.001.015).] [FN28-35]

The analysis in Table 7, above, shows that the most cost-effective plan for the Commonwealth, in terms of both the total cost and the per-capita cost, is the Proposed WIP Modification presented in Exhibit 1. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1]

In addition to providing the lowest cost for tax- and rate-payers in the Commonwealth, the Proposed WIP Modification also provides for a high level of reasonable assurance as described in the sections below.

[FN 28] Includes Wastewater, On-site and Urban sectors.

[FN 29] See Exhibit 2 for sector cost estimates. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1]

[FN 30] 6,001,681 people in the Chesapeake Bay portion of Virginia. Calculated from 2009 US Census estimate (<http://www.census.gov>; last accessed 7/6/2010), using Chesapeake Bay Watershed boundary GIS information (<ftp://chesapeakebay.net>) and the ESRI Virginia County dataset. Where only a portion of a county falls within the watershed, the county population in the watershed is determined by calculating the population of the county (based on the 2009 US Census estimate) times the percent of the county area within the Chesapeake Bay Watershed.

[FN 31] The proposed WIP modification requires reductions from the Urban sector of 161,194 lb/yr TP and 760,018 lb/yr TN below 2009 levels (see Exhibit 1) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] . Urban nutrient management regulations have the potential to reduce loads by 124,863 lb/yr TP and 466,287 lb/yr TN, leaving 36,331 lb/yr TP and 293,731 lb/yr TN to be removed by retrofits. At an estimated cost of \$33,500 \$/lb/yr TP and \$6,000 \$/lb/yr TN, the total cost to perform urban retrofits is $[36,631 \times \$33,500 \text{ (TP)}] + [293,731 \times \$6,000 \text{ (TN)}] = \$3.0 \text{ Billion}$.

[FN 32] EPA, in their 2009 report titled, "The Next Generation of Tools and Actions to Restore Water Quality in the Chesapeake Bay," estimates the cost of "...retrofits in existing MS4s at about \$7.9 billion per year." This equates \$462/capita/yr, which is comparable to the Draft WIP and indicates that the high cost of urban retrofits has been anticipated by EPA for some time.

[FN 33] US EPA, 2009. The Next Generation of Tools and Actions to Restore Water Quality in the Chesapeake Bay, A Draft Report Fulfilling Section 202a of Executive Order 13508 (Page 23). U.S. Environmental Protection Agency, Chesapeake Bay Program Office, Annapolis, MD. (Page 23.)

[FN 34] Total Urban sector cost was calculated by multiplying the yearly per-capita cost by the 2009 U.S. Census estimate (<http://www.census.gov>; last accessed 7/6/2010) population for Virginia within the Bay watershed (6,001,681). The resulting value was then multiplied by 15 years to achieve the total sector cost. Calculations based on 2009 US Census estimate (<http://www.census.gov>; last accessed 7/6/2010), using Chesapeake Bay Watershed boundary GIS information (<ftp://chesapeakebay.net>) and the ESRI Virginia County dataset. Where only a portion of a county falls within the watershed, the county population in the watershed is determined by calculating the population of the county (based on the 2009 US Census estimate) times the percent of the county area within the Chesapeake Bay Watershed.

[FN 35] Annual per-capita cost was calculated by dividing 7.9 Billion by the Bay-wide watershed population of 17,102,170 (2009 U.S. Census estimate; <http://www.census.gov>; last accessed 7/6/2010). Calculations based on 2009 US Census estimate (<http://www.census.gov>; last accessed 7/6/2010), using Chesapeake Bay Watershed boundary GIS information (<ftp://chesapeakebay.net>) and the ESRI County dataset. Where only a portion of a county falls within the watershed, the county population in the watershed is determined by calculating the population of the county (based on the 2009 US Census estimate) times the percent of the county area within the Chesapeake Bay Watershed.

A. Action Items Required to Achieve the Proposed WIP Modification

1. Upgrade All Significant Discharger Wastewater Treatment Plants

As previously stated, WWTP upgrades are the most cost-effective method of removing nutrients on a cost-per-pound basis (compared with nutrient removal options in other sectors) and provide a very high level of reasonable assurance.

This makes upgrading significant discharger wastewater treatment plants to a proposed Tier 4 [FN36] level of treatment (Limits of Technology; TN = 3 mg/l; TP = 0.10 mg/l) a very practical option for the Commonwealth. In addition, an implementation schedule should be established under the next applicable General Permit to allow the necessary plant upgrades to be sequenced over the next 15 years [FN37] so that, by 2025, every WWTP upgrade has been completed or funded with construction commenced without running into permit compliance issues.

[FN 36] As defined by the Chesapeake Bay Program, "Nutrient Reduction Technology Cost Estimations for Point Sources in the Chesapeake Bay Watershed," November 2002.

[FN 37] Rather than the immediate 5-year life of the current General Permit.

4. Improve Erosion and Sediment Control Training and Specifications

Training and minor specification improvements can more than double the effectiveness of current regulations. This could be facilitated by forming an advisory group to determine the cumulative benefit of minor improvements to training requirements and specifications contained in Virginia's Erosion and Sediment (E&S) Control program. The TMDL model documentation estimates that E&S controls have 40% removal efficiency [FN40]; however, the report titled, "Performance of Current Sediment Control Measures in Maryland" by the Metropolitan Washington Council of Governments and the Occoquan Watershed Monitoring Laboratory (MWCOC Report) indicates that, with proper installation and maintenance, E&S controls can provide over 90% efficiency [FN41], as shown in Chart 6, below:

Chart 6. Effect of Erosion and Sediment Control Measures on Suspended Sediment Concentrations [Please see page 18 of the original letter (Docket ID 0228.1.001.020).]

Minor changes which should be examined by the advisory group include:

a) Updating the requirements for Responsible Land Disturbance.

The advisory group should consider requiring Responsible Land Disturbance (RLDs) to first pass Virginia Department of Conservation and Recreation's (DCR's) Basic Erosion and Sediment Control class [FN42] (discussed below) or be a Professional Engineer (which is currently an option). Anecdotal evidence suggests that E&S controls could achieve much higher efficiencies if installed, inspected, and maintained properly. Therefore, it is critical that most, if not all, land-disturbing professionals be trained in proper E&S control. Currently, professionals (who are not already licensed

Professional Engineers) are only required to pass an online test to be certified as a RLD, which does not provide the necessary level of training to properly implement and inspect E&S controls.

b) Privatizing the DCR's E&S training classes, which will allow the RLD requirement discussed above to be practicably implemented.

Currently, DCR offers three levels of training and instruction for E&S professionals:

- Basic Erosion and Sediment Control in Virginia (16 hours, \$80 course fee);
- Erosion and Sediment Control in Virginia for Inspectors (8 hours, \$50 course fee); and
- Erosion and Sediment Control in Virginia for Plan Reviewers (16 hours, \$80 course fee).

Eight Basic and Inspector classes and three Plan Reviewer classes were held in 2010; certification tests are offered only twice per year at four locations around the Commonwealth. These schedules present hurdles to professional wishing to become certified, especially those from smaller firms who may not have substantial travel budgets available for training.

To facilitate increased class attendance and certification:

- DCR's Basic Erosion and Sediment Control in Virginia class should be privatized to the point that it can be taught by a professional who both holds Plan Inspector certification and has been an active professional in the E&S field for at least one year; and
- Certification tests (subsequent to attending the corresponding class) should be conducted online to increase the number of professionals taking the test while reducing the costs associated with travelling to the test site.

c) Increasing sediment trap size.

The advisory group should consider the effect of increasing the required capacity of sediment-trapping facilities to 202 cy/ac (1.5" watershed-inches) of sediment storage in lieu of the current 134 cy/ac (1" watershed-inch) design standard and requiring that 68 cy/ac (0.5" watershed-inch) of that volume be wet storage. This capacity would allow the facility to capture approximately 1" of runoff on top of the wet storage volume before producing any outflow. The advisory group should consider the cost of such facilities against the potential nutrient and sediment removal. (It should be noted that the Fairfax County Public Facilities Manual already requires 202 cy/ac of capacity for sediment-trapping facilities within Resource Protection Areas.)

The MWCOG Report indicates that "it is important to establish and maintain a generous storage capacity" in sediment traps and basins. The MWCOG Report also notes that, "the presence of standing water has several evident benefits" to sediment removal but that, "the presence of standing water reduces the effective storage capacity." Chart 7 [FN43], below, indicates that the efficiency of sediment-trapping facilities increased from 45.6% to 65.1% when all storms were captured. Therefore, if facilities are sized to capture more storms, their efficiency should also increase.

Additionally, the advisory group should consider the benefit of permitting sediment traps to control drainage from only one acre, rather than three as is currently allowed under Minimum Standard #6. (Fairfax County has required this for many years.)

Chart 7. Instantaneous Removal Efficiency of Sediment Trapping Facilities [Please see page 20 of the original letter (Docket ID 0228.1.001.020).]

Increasing the size of sediment-trapping facilities also increases their detention time. As shown in Chart 8 [FN44], below, detention time has a large affect on effluent sediment; 6 hours of detention removes approximately 65% of sediments, while 24 hours of detention removes approximately 75% and 48 hours of detention removes approximately 90% of sediments.

Chart 8. Removal Rate Versus Pollutant Removal for Sediment Trapping Facilities [Please see page 21 of the original letter (Docket ID 0228.1.001.020).]

d) Considering the use of skimmers for sediment basin outfalls.

Skimmers (such as the Faircloth Skimmer; see Exhibit 7, Faircloth Skimmers) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] rise and fall with water levels in sediment basins, thereby removing the cleanest water during the dewatering process, unlike typical static dewatering risers which also remove sediment-laden water from lower in the water column. The advisory group should examine the effect that skimmers may have on reducing effluent sediment from sediment-trapping facilities.

e) Reducing unstabilized soil.

Consider requiring temporary soil stabilization for any sites that will remain dormant for longer than 7 days (rather than 30 as is currently required) and permanent soil stabilization for any sites that will remain dormant for longer than 60 days (rather than one year as is currently required).

The MWCOG Report indicates that, "temporary vegetative stabilization is the single most important factor in reducing downstream suspended sediment (providing a six-fold reduction)." Additionally, "extra efforts need to be made to reestablish vegetative areas that have failed or been damaged by construction equipment or activities."

Chart 6 [FN45], above, indicates that erosion control measures have the potential to reduce downstream sediment loads by 83%, while sediment-trapping measures increase that by only an additional 9%. Therefore, it is imperative that temporary or permanent stabilization be applied rapidly rather than relying on sedimenttrapping facilities to re-capture sediment after it has mobilized.

The four considerations above should help construction sites increase their efficiency from 40% to 80% (conservatively), thereby reducing their percentage of the Commonwealth's sediment "pie" from 2.8% to 1.4% (a 50% reduction) [FN46]. Additionally, TP will be similarly reduced from construction sites (from 1.3% to 0.7%) [FN47] because it is typically bound to the soil.

[FN 40] Chesapeake Bay Model Phase 5 Documentation, Chapter 9 Sediment Simulation (downloaded on October 25, 2010, at: <ftp://ftp.chesapeakebay.net/modeling/P5Documentation/SECTION%209.pdf>).

[FN 41] 283 mg/l (after erosion and sediment controls) divided by 4,145 mg/l (uncontrolled) = 93.1% removal , as

shown in Chart 6, below:

[FN 42] This requirement should include a two-year grandfathering period to allow sufficient time to train existing RLDs.

6. Allow New Construction with On-Site Sewage Disposal to Exceed NSF/ANSI Standards or Contribute to the Nutrient Trading Fund

New construction utilizing on-site sewage disposal should:

- a) Provide a wastewater treatment system that meets or exceeds NSF/ANSI standard 245 (which includes a 50% reduction of effluent nitrogen) in conjunction with a shallow-placed drip system if determined to be acceptable by the Virginia Department of Health (VDH) for site conditions; or
- b) Enter into an agreement with DCR that requires the septic field owner to pay quarterly to DCR's "Nutrient Trading Fund" an amount equal to the average sewer bill (during occupancy of the structure with said field) in that river watershed as established annually by the Virginia Board of Soil and Water Conservation.

Response

Thank you for your comment. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

In the TMDL, EPA has attempted to identify and promote options for the jurisdictions to accommodate growth while meeting the

TMDL allocations. Offsets and trading use free market approaches to allow new and existing dischargers to meet their allocations by paying for pollutant reductions at another location. These approaches have been implemented in several Bay jurisdictions, including Virginia. Virginia is also seeking to expand its program to make offsets available to a wider range of dischargers. EPA supports this program expansion and believes the success of the program expansion, particularly for stormwater and on-site or septic systems, depends on the State's success in creating greater demand for load reductions from these sectors. Creating additional pressure on sectors that have not traditionally felt a demand to decrease their loadings will stimulate market activity in this area.

7. Allow Development Exceeding the Allowable WIP Loads to Contribute to the Nutrient Trading Fund Development that does not meet the WIP load requirements [FN52] with onsite stormwater facilities or other offset mechanisms should pay a fee to the Nutrient Trading Fund described in Action Item #5, above. This will facilitate installing the most cost-effective, nutrient-reducing measures.

[FN 52] For new development, no net increase in TN and TP loads from stormwater above 2025 average nutrient loads per acre from previous uses, and for redevelopment, 20% load reduction.

The Action Items listed above outline Proposed WIP Modifications which achieve the EPA load allocation goals in a more cost-effective manner than the draft WIP or the EPA backstop. It should be noted that the Proposed WIP Modifications will achieve the EPA load allocation goals at the Commonwealth scale; however, localities and source sectors in some riversheds may need to trade with others to meet the allocations at the local and rivershed level; therefore, maintaining the NTE as proposed is critical.

In conclusion, I would like to again thank you for the opportunity to comment on Virginia's draft WIP. I believe the draft WIP proposed by the Commonwealth could easily be modified into a cost-effective and equitable solution to Virginia's portion of the Bay pollution problem by following the Proposed Sector Allocations and Action Items laid out in Exhibit 1. I. The TMDL does not acknowledge and accept Virginia's proposal to revise the chlorophyll standards and improve the modeling framework

Appendix 2 of Virginia's WIP contains a Draft James River Chlorophyll-a study plan. HRSD concurs with and supports the need for the stated tasks. Successful completion of this study plan is considered essential to address the stated deficiencies of the standard and the associated modeling framework that are referenced in these comments. EPA has ignored the importance or implications of this study in the Chesapeake Bay TMDL. The existing allocations listed in the EPA TMDL for the James River based on chlorophyll-a (23.48 mpy TN, and 2.340 mpy TP) should be replaced with allocations consistent with Tributary Strategies. EPA's TMDL should include the chlorophyll-a study in the TMDL. However, EPA must clearly state the level of unreliability that exists with the present chlorophyll-a standard and the modeling results in the TMDL document.

EPA's Draft TMDL Backstop Actions on the Virginia Draft Phase I Watershed Implementation Plan (WIP)

UOSA believes that the Virginia draft WIP is based on solid guidance principles such as equity and cost effectiveness. The Virginia Phase I WIP also provides the regulatory stability point sources need to continue reducing nutrients loads to the Bay. Virginia (via its Water Quality Improvement Fund) and publicly owned treatment works (POTWs) have made and continue to make large investments in capital projects to reduce the inputs of nutrients to the Bay. Capital projects design and construction need to be based on firm long term water quality treatment goals. Continuously changing water quality goals will result in wasted public funds during one of the worst economic recessions in the Commonwealth and the nation and it also defies fiduciary responsibility.

Organization: City of Poquoson, Virginia

The size of the Chesapeake Bay watershed, combined with the program's aggressive schedule, limits regulators' ability to consider localized conditions. This creates unrealistic requirements in terms of what land Poquoson controls and can treat, and what "on the ground" treatment practices are feasible.

Response

Thank you for your comment. EPA and the state partners have agreed to ensure that all pollution control measures needed to fully restore the Bay and its tidal rivers are in place by 2025, with 60 percent of the actions completed by 2017. With each successive WIP in Phase II and Phase III, it is expected that each jurisdiction will work with its local partners to refine the allocations in the Phase I to a finer scale. EPA encourages Poquoson to continue to work with the Commonwealth of Virginia and participate in the Phase II WIP development process.

Comment ID 0246.1.001.001

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

We agree with EPA that Virginia's Draft Watershed Implementation Plan (WIP) is grossly inadequate and fails to provide reasonable assurances that the state will meet its pollution reduction goals under the EPA's Chesapeake Bay Total Maximum Daily Load (TMDL). Unfortunately, Virginia has simply repackaged its existing, under-performing programs instead of using the WIP as an opportunity to launch new ideas and better management goals. Ideally, Virginia will develop a WIP that sets out an effective plan and commits the resources needed to achieve its waste load allocations set out in the TMDL. We urge Virginia to remedy the problems in its WIP, maintain control of the clean-up plan, and clean up local waterways and bays in the process but in a way that works for Virginians. However, Given the inadequacies of Virginia's draft WIP, and in the event that Virginia fails to significantly improve its WIP, we have no choice but to support EPA's proposed backstops in the draft TMDL and encourage EPA to follow through with the proposed backstops.

Comment ID 0246.1.001.003

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

Shenandoah Riverkeeper has been heavily engaged in assessing and addressing the agricultural pollution in the Valley. Over approximately the last four years, Shenandoah Riverkeeper has conducted an extensive survey of animal feeding operations (AFOs), primarily dairies and poultry farms, but also beef cattle operations, among others. Our work revealed a number of problematic practices, including many that we consider direct stream discharges and large sources of pollution. The existence of these problematic practices confirms EPA's conclusion that Virginia's WIP will be insufficient to restore the Bay in the absence of significant programmatic changes. Current state and federal programs, both mandatory and voluntary, do not sufficiently address the pollution that we have documented and described in these comments. Addressing these sources of pollution and meeting the TMDL's waste load allocations would require a significant upgrade of Virginia's existing programs.

Although Virginia has enjoyed some success statewide with the voluntary implementation of best management practices, our survey and stream analysis reveal that these steps have occurred only in certain sectors, while failing to take hold on a wide scale in others. Furthermore, there are large areas of the state where cultural practices and farm economics seem to have prevented significant improvement at all. We base this not only on our own visual survey, but also on stream pollutant monitoring results. Unfortunately, the WIP proposes largely a continuation of the efforts that have failed to date.

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

Virginia submitted its WIP to EPA and to the public for comment on September 24, 2010. In comments on the WIP, EPA concluded that Virginia's WIP has "serious deficiencies" with respect to improving existing programs to achieve the additional pollution reductions needed to restore the Bay. In so finding, EPA noted that, "[t]he WIP does not include mechanisms that would support [the] high implementation rates" of various pollution control practices that the WIP relies on.[FN 5] Furthermore, EPA does not have reason to believe that Virginia can achieve the "high implementation rates" without "legislative and regulatory changes . . . [such as the] proposals presented to Virginia's WIP Stakeholder Advisory Group." [FN 6] Finally, Virginia's WIP failed to provide reasonable assurances that the programs proposed would be adequately funded.[FN 7]

After outlining the deficiencies in Virginia's draft WIP, EPA offered suggestions for how Virginia could improve its plan. With respect to pollution from agriculture, EPA first suggested that Virginia expand its Nutrient Management Plan (NMP) requirements to require more best management practices (BMPs).[FN 8] In order to correct the disconnect between Virginia's BMP implementation goals and the efficacy of the programs relied on in the WIP, EPA suggested that Virginia expand its regulation of AFOs in order to ensure that enough farms actually install those BMPs.[FN 9] EPA further suggested that Virginia lower the threshold of the CAFO permit to include smaller AFOs and specified that the scope of the program be designed to cover small dairies.[FN 10] Furthermore, to satisfy EPA, Virginia's "WIP should include any program-building milestones such as studies, legislative proposals, or cost-share program enhancements that are expected to occur." [FN 11] Lastly, to remedy the lack of assurances regarding Virginia's funding for its WIP, EPA suggested that Virginia's WIP include "a strategy and schedule for addressing program funding and staffing gaps." B. Shenandoah Riverkeeper's Evaluation of the WIP

We agree with the EPA that Virginia's WIP fails to provide any reasonable assurances that Virginia's pollution control efforts will occur and that the state will stay within its waste load allocations under the Bay TMDL. Virginia's WIP is little more than a repackaging of its existing programs, which have proved ineffective in addressing urban stormwater and agricultural runoff. As EPA noted, Virginia fails to propose programs that are likely to translate into the necessary pollution reductions. Virginia offers neither concrete incentive programs nor does it pledge to increase regulation. Without additional funds and better program staffing, Virginia provides no reason to expect this trend to change.

1. Examination of the Deficiencies in the WIP's Agriculture Provisions

The WIP indicates that Virginia will achieve its waste load allocations for agriculture by implementing a menu of BMPs on a very high percentage of the state's farms. The WIP, however, does not dedicate meaningful funding or propose any significant new regulatory programs to actually achieve these high implementation rates. Indeed, the WIP proposes a continuation of current programs, which have proven inadequate to control agricultural pollution, particularly in the areas of heavy animal agriculture like the Shenandoah Valley.

Virginia's current method of managing agricultural pollution relies on voluntary programs and three kinds of mandatory permitting programs. The voluntary programs include cost sharing and tax credits. Both programs compensate a farmer for implementing a specific BMP up to a percent of the cost or a fixed maximum.[FN15] As outlined fully in the TMDL, these voluntary incentive programs have not been adequate to address agricultural pollution.

Virginia's current permitting programs consist of a general Virginia Pollution Abatement (VPA) permit, a VPA permit specific to poultry, and a Virginia Pollution Elimination System (VPDES) permit for CAFOs. The minimum thresholds for regulation are as follows: the VPA general permit applies to operations consisting of more than 200 dairy cattle, 750 swine, or 3,000 sheep/lambs; the VPA poultry permit applies to farms with more than 20,000 chickens or 11,000 turkeys; and the VPDES permit applies to large CAFOs, which are defined as having more than 700 dairy cows, 2500 swine, or 55,000 turkeys. The fundamental problem is that these high program thresholds mean that the great majority of Virginia's farms escape regulatory oversight, and that the VPA program (which covers more farms than the VPDES program) does not comprehensively address all types of pollution caused by a feeding operation.

There are several reasons why the existing permit regime does not adequately address agricultural pollution. First, the VPA program does not have high compliance rates across all farming sectors. In a recent survey, EPA found that only ten percent of all dairy farms comply with the VPA program.[FN 16] This means that even the waste management and application practices are not being enforced on ninety percent of dairy farms. Second, only thirty-three farms of any kind in Virginia's Shenandoah Valley have registered with DEQ under the VPA general permit.[FN 17] VPA's poor coverage of AFOs in Virginia is further highlighted by the fact that the average farm size in the Valley is equal to 100 dairy cows, or half of the minimum VPA permit threshold.[FN 18] This figure looks especially small when compared with the estimated 27,000 cattle farms in Virginia.[FN 19] Third, only the VPDES permit requires BMPs that go beyond nutrient management and application. Most significantly, this is the only program that deals with contact between production areas and surface waters, one of the most important areas for future pollution reductions. There are only about thirty permitted CAFOs in Virginia.[FN 20] Thus, few farms are required to implement these additional BMPs.

Virginia's voluntary programs have also proven unsuccessful in generating high percentage levels of BMP implementation. Participation in voluntary programs in the Valley is very low. In fact, Shenandoah Riverkeeper's evaluation of the records reveal only 177 farms have participated in the stream exclusion program.[FN 21] Relative to the number of farms in the valley or in Virginia and the variety of BMPs, this indicates low levels of participation. The deeply impaired state of nearly every stream in the Shenandoah Valley provides additional commonsense evidence to support this conclusion given that over 97% of non-forested land is in agriculture. Given the high levels of pollution from agriculture in Virginia, the current programs, both mandatory and voluntary, are not effective.[FN 22]

To meet the waste load allocations in the TMDL, Virginia relies on very high levels of BMP implementation. However, as EPA recognized, Virginia intends to attain these implementation levels through its voluntary and permitting programs.[FN 23] Yet Virginia provides no reason to believe that these programs will be more successful in the future than they have been previously. The WIP provides no details as to how it will expand the coverage of these programs and fails to commit any meaningful funding to implement them.[FN 24] Critically, the WIP fails to describe how Virginia would meet the staff requirements for technical assistance to execute and monitor the incentive-based programs.[FN 25] Virginia does indicate that it might amend its VPA and VPDES regulations to make certain BMPs requirements for getting a permit.[FN 26] However, Virginia does not specify when the regulations will be changed or if all permitted entities will be subject to this requirement.[FN 27] Even if these regulations are amended, they still will fail to cover a large number of farms in the state.

We would strongly prefer to see Virginia develop an adequate WIP, and thereby allow the state to maintain control over how it will achieve its share of restoring the Bay. The state's failure to commit to a real implementation plan left EPA no choice but to propose the backstops outlined in the TMDL. This choice is a step backward for Bay restoration, and also a missed opportunity to work cooperatively with Virginia's farmers to reduce water pollution. If Virginia fails to amend its WIP and provide reasonable assurances that it will meet its waste load allocations, then Shenandoah Riverkeeper supports the EPA in applying those backstops.

2. Nutrient Management Unaddressed by the WIP

There are several other issues that neither the TMDL nor the WIP address that are currently, or soon will be, significant risks for both local water quality and the health of the Bay.

One current issue that neither document deals with is the growing intensity of animal feeding in the Valley, and the fundamental problem of excess manure and other waste. Neither document addresses either how to facilitate restructuring of the industry in an economically and sustainable way, or how to dispose of the tremendous amounts of waste produced by chicken, dairy, and beef operations. Although none of these are explicit in the WIP, in discussions about Bay restoration and agriculture, the McDonnell administration has put forth three clear assertions that fail to capture the reality on the ground. The first assertion is that most of the agricultural pollution problems can be attributed to "bad actors." The second assertion is that these bad actors can be addressed by the Agricultural Stewardship Act. The third assertion is that our voluntary programs are working and if we just continue them we'll get to our Bay restoration goals.

Shenandoah Riverkeeper addresses each of these assertions in some way in these comments but we also feel that it is important to provide some general context. We assert that now is the time for Virginia to recognize there are severe agricultural pollution problems originating in the Shenandoah Valley. The problems are not a reflection on the land stewardship of Virginia's farmers, but simply arise from the complexities of an evolving agricultural society rooted in practices established over generations. The environmentally problematic practices developed when agriculture was much less intense, when arable land was plentiful, and when there was little emphasis on how farming affects water quality and public water resources.

These polluting farming practices have not adapted to changing circumstances over time, and have become more damaging as agriculture has intensified. Over the past several decades, the number of animals per acre and the amount of fertilizer applied to crops have both steadily increased. Meanwhile, families have grown, farms have been divided, and farming products have been commoditized and devalued through a consolidation and vertical market integration of meat, eggs and milk. Families now have to survive off much less land, while receiving comparatively less money for the same product.

Unfortunately, many farmers believe the type of changes needed to protect water quality will be detrimental to their livelihood. However, it is clear that two things are needed to restore the Bay and protect the Shenandoah River. First, we need more than small, incremental changes in how our farms interact with groundwater and surface water. Significant restructuring of some farms will be required, which cannot happen without significant support from the state and federal governments. Neither the inadequate funding of the state's WIP or EPA's increased regulations addresses this need. Second, we must find alternative markets for the huge amounts of manure generated in the Valley, so that this manure is no longer a burden on the watershed. It is estimated by industry that nearly 2 billion pounds of feed, mostly corn and soy are shipped into the Valley annually for use as poultry livestock feed. The importation of feed represents an overwhelming nutrient input in the Valley. This is the kind of imbalance that is created when you add five major poultry integrators and 700 confined poultry operations on top of an already mature agricultural industry of dairy and cattle. Ultimately the nutrients which are not exported (carried) out of the valley as meat either accumulates in the soils or is carried by our rivers into the Chesapeake Bay. Buffers and nutrient management will not undo the basic net importation of nutrients, and therefore they won't solve the fact that the amount of nutrients generated in waste far exceeds the agronomic uptake of all the crops grown here. Both Virginia and EPA fail to address any possible alternative uses of manure, such as energy.

The WIP also fails to address the use of phosphorus site index (P Index), which is an inadequate method of managing nutrient application. In this regard, Riverkeeper endorses the Chesapeake Bay Foundation's position, wherein they argued that: phosphorus site index. . . is not sufficiently protective of water quality. While the P Index is a valuable tool

in identifying regions at high risk for phosphorus loss, soil scientists that developed the P Index state in no uncertain terms that the P Index is not an adequate tool to address regional imbalances in manure. They strongly recommend that all producers be encouraged to apply manure at rates designed to meet plant uptake requirements and avoid over-application of phosphorus. They note that continued reliance on the P Index in areas where manure is produced in excess of crop needs is not sustainable in the long term, and will lead to an eventual build up of soil phosphorus to levels where no further phosphorus can be applied.[FN 28] As a result, the Chesapeake Bay Foundation and the Riverkeeper ask that "the Virginia Nutrient Management Standards and Criteria be modified to phase out the use of the P Index . . . by 2017 for biosolids application and poultry litter, and by 2025 for other livestock." Figure 3: Streambank destroyed by cattle resulting in erosion of bank and sediment destroying instream life. [Please see page 9 of original document (Docket ID .0246.1).]

Virginia's WIP includes livestock stream exclusion as one of the primary BMPs to be implemented to achieve agricultural pollution reductions. In the WIP, Virginia sets the goal of 95 percent implementation of this BMP by 2025 to achieve the TMDL's pollution reduction goals. [FN 30] However, the WIP does not explain how the state will achieve such a high rate of implementation with this BMP. Indeed, the state is already behind in working towards this goal. The Chesapeake Bay Foundation calculated that Virginia only achieved thirteen percent of the goal for stream fencing during 2009, the first year of the Chesapeake Bay Program's three-year "milestone" reporting period.[FN 31]

Virginia proposes improving the permit requirements for both AFOs and CAFOs by including livestock stream exclusion as a clear requirement. Currently, CAFOs must "design, construct, and maintain" the production area in a way that "contain[s] all manure, litter, and process wastewater including the runoff and the direct precipitation." [FN 32] Virginia plans to clarify this requirement by adding stream exclusion as a requirement of the NMP that must be prepared and implemented by all CAFOs.[FN 33] This requirement would only apply first to permitted CAFOs, which constitute a small portion of the state's farms. Virginia also intends to extend this requirement to AFOs that are required to comply with the VPA general permit.[FN 34] Changing the requirements of the AFO General Permit to include livestock stream exclusion will only affect farms with more than 300 animal units, or about 200 dairy cattle.[FN 35] Although this is an important step, it will leave many small dairies and most grazing operations unaddressed.

In order to achieve ninety-five percent implementation of this BMP by 2025, Virginia states that all farms with twenty or more cattle will need to engage in this practice.[FN 36] Therefore, to reach farms with twenty or more cattle and less than 200 cattle, which is the lower limit for VPA permit application, Virginia will have to rely on voluntary programs. According to the 2007 Agricultural Census, in Virginia there are 666 dairy farms that will need to use the voluntary program.[FN 37] However, voluntary programs for this practice have been available for decades and yet have generated only low levels of implementation.[FN 38] The WIP commits no new funding for these programs and does not provide a strategy for improving their implementation. Therefore, Virginia has not provided reasonable assurances that it will improve its incentive programs to generate the necessary levels of implementation with this best practice in order to actually reduce pollution in the Bay.

Comment ID 0246.1.001.012

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

Despite the prevalence of poor practices in the Valley, no portion of the Virginia WIP directly references or seeks to limit the practice of streamside feeding and concentration or proper manure management for winter cattle feeding areas and supplemental dairy feeding areas. Although the WIP attempts to address stream intrusion, it neglects to address streamside feeding and concentration. Fencing the animals out of the stream, while allowing them to be concentrated near the stream, is self-defeating.

Vegetated buffers are only a partial solution to this practice, but they are the only portion of the WIP that even tangentially addresses the effects of streamside feeding and concentration. Buffers establish a minimum distance between livestock concentration and streams, while also performing important filtering functions. The WIP only targets vegetated buffers on crop and hay fields.[FN 39] Buffers are only required at permitted AFOs and CAFOs with respect to manure application; this requirement only applies to the few CAFOs and AFOs that are regulated in the state of Virginia,[FN 40] leaving most farms uncovered. In this case, none of the current programs or the WIPs proposed changes address livestock concentrations near streams at dairies and other AFOs.

Eventually, all confinement and concentration areas need to implement both effective nutrient capture systems and must be physically covered to eliminate environmental exposure. Even though the complexity and cost of implementing the necessary changes will not be insignificant, there are huge benefits to be reaped in the form of water quality improvements. Thus, the Commonwealth should immediately launch a new effort to help farmers with this important task. In the meantime, the Commonwealth should prohibit animal concentration near streams to establish a physical separation and allow nutrients and sediment to be absorbed agronomically. Virginia could address this issue by adding a new requirement to VPA and VPDES permits stipulating that animals not be concentrated near stream channels, including intermittent channels. Additionally, Virginia should lower the animal unit level for VPA permits or use effective incentive programs to increase implementation of any or all of these practices.

[FN 39] 9 VA. ADMIN. CODE § 25-191-50; 9 VA. ADMIN. CODE § 25-192-70.

Comment ID 0246.1.001.015

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

Virginia's Draft WIP is inadequate with respect to manure storage because it does not offer any improvement on the programs that are currently in place. Virginia aims to have ninety-five percent of all "concentrated livestock and poultry operations" implement manure management systems by 2025.[FN 41] Because "concentrated livestock and poultry operations" is not well defined in the WIP or in a statute, the scope of Virginia's goal is hard to assess. Nonetheless, Virginia's strategy for achieving this high level of implementation does not provide EPA with reasonable assurances. As discussed fully above, the current program has major gaps, which the WIP does not adequately close.

Figure 8: Water lagoon completely full in winter, evidence of previous overflows right next to stream. [Please see page 13 of original letter (Docket ID .0246.1).]

Waste management systems are currently required of permitted CAFOs and AFOs, but is presently not well enforced, a flaw that the WIP fails to remedy. CAFOs with a VPDES permit as well as AFOs with either a general or poultry VPA permit are required to address manure storage and application as part of their NMPs.[FN 42] More specifically, all three kinds of permits require that the permitted farm maintain adequate manure storage to "accommodate periods when the ground is ice covered, snow covered or saturated, periods when land applications of nutrients should not occur due to limited or nonexistent crop nutrient uptake." [FN 43] Virginia's draft WIP calls for "better accounting for practices already required," but provides no details, and therefore no reasonable assurances, as to how these requirements will be better enforced. [FN 44] Virginia does not indicate whether or not it will hire more inspectors or improve its inspection schedule in order to achieve this part of its goal. Again, as with many aspects of the WIP, Virginia does not identify funding or any other mechanism to provide reasonable assurances that improvements will actually occur.[FN 45]

Virginia also fails to provide reasonable assurances that it will attain high implementation rates of manure management systems at currently unregulated farms. The Draft WIP states that, "Animal Waste Management Systems may be installed and managed . . ." [FN 46] By using optional language Virginia fails to establish any real new requirements for the farms like the ones that Shenandoah Riverkeeper has observed. Likewise, Virginia's Draft WIP explains that, "[f]ull achievement may not be accomplished without establishing new expectations for farms below current permit thresholds." [FN 47] Although Virginia notes that improvement with respect to this bad practice is unlikely without lowering the permitting threshold, Virginia fails to actually reduce the threshold. Therefore, the manure storage section of the WIP constitutes a failure on the part of Virginia to lay out real enforcement, funding, staffing, or other programmatic commitments needed to get the job done. This failure is consistent with EPA's conclusion that Virginia's Draft WIP "did not identify programs to sufficiently reduce pollution to meet TMDL allocations and provide assurance the programs could be implemented." Comment ID 0246.1.001.017

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

Virginia's Draft WIP plans to increase the use of grass buffers around perennial surface waters. The scope of this requirement leaves important small and intermittent waters unprotected from particularly harmful activities. Farming directly through small and intermittent waters leads to directly dumping chemicals, nitrogen, phosphorous, and sediment into the waters, which then feeds into the Chesapeake Bay. It should be noted that the normal flow regimes of these small intermittent streams coincide exactly with the periods where farm inputs are greatest, which is during the winter and spring. While small intermittent streams are often overlooked and disregarded, they deserve attention because they act as headwaters that will inevitably carry substantial pollutants downstream to larger tributaries.

Furthermore, Virginia's Draft WIP provisions on buffers do not provide reasonable assurances that ninety-five percent of all farms will comply with its new requirement. Because adding a new requirement will only affect permitted farms, and many farms do not require a permit, Virginia has not proven that it can attain the stated level of compliance. Virginia has not indicated that it will expand the scope of its agricultural permits or that it will develop effective incentives to cover unpermitted farms.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0253.1.001.017

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

Henrico County adopts the WIP comments submitted VAMWA and VAMSA on Virginia's WIP, and incorporates those comments by reference as if fully set forth herein. Additionally, the County will defend vigorously any claim of waiver due to failure to submit comments to the WIP on the basis that insufficient time was given to adequately respond.

The County appreciates Virginia's efforts to incorporate flexibility and cost effectiveness into the draft WIP; however, the James River basin urban runoff sector allocations in the draft WIP would impose massive financial costs on the County's MS4 system in an effort to reduce phosphorus loads below the larger backstop phosphorus allocation proposed by EPA (an average 54% percent phosphorus reduction). Even at the EPA allocation, Henrico County would still have to expend an estimated \$848 million to \$1.25 billion over the implementation period, plus the cost of land acquisition, to achieve the backstop sector allocation.

Henrico County supports Virginia's expansion of its nutrient trading program in the WIP. However, the draft WIP's reliance on the availability of credits from the point source and agriculture sectors to assist the MS4s in attaining their sector allocations may be misplaced. There is no assurance that the credits will be generated when and where needed. The credits would be generated from excess flow capacity and, therefore, would be available to the MS4s on a temporary basis. The reductions that would be required of urban runoff with the draft WIP allocations are so great that the demand for credits could exceed the supply, thus driving up their cost and limiting their availability to the Localities, particularly if the Localities are forced to compete with private developers for the credits. The effect of this plan will result in the involuntary redistribution of the resources of the sector that contributes least to pollution in the Bay, urban stormwater runoff, to that sector that contributes the greatest amount of pollution, agriculture.

Both the Virginia WIP and EPA "backstop" allocations for the urban runoff sector are beyond a level that is practicable of attainment. It is impossible to predict the full extent of the socio-economic consequences of attempting to undertake an effort of this magnitude because such an undertaking has never been tried before. However, we can state with confidence that there is no assurance that the load reductions that would be required to achieve the backstop allocations can be accomplished by EPA's 2025 deadline, and that, on a pound-for-pound basis, the cost would be totally out of portion to any water quality benefit. It is estimated that it would cost the County approximately \$848 million to \$1.25 billion to reduce phosphorus loads to the levels needed to comply with the backstop allocations. See CDM Technical Memorandum [Comment Letter contains additional information in the form of an attachment. See original comment letter 0253.2].

Further, this cost estimate does not reflect the added cost of acquiring the land needed for the installation of BMPs and on-going maintenance of the BMPs. Id. Henrico County owns or controls very little of the impervious land area that would have to be treated to achieve the backstop phosphorus allocation. The remaining reductions would have to be achieved with retrofits on private land. Since the County cannot force private land owners to retrofit in the absence of redevelopment requiring local land use approvals, the County would have to negotiate for the purchase of the land needed for the easements or acquire the land by condemnation. Land acquisition is an expensive and time consuming process that will add greatly to the cost and time required to achieve the reductions.

Henrico County encourages Virginia to respond to EPA's backstop allocations by revising its WIP to include the

additional commitments needed to demonstrate to EPA that the Commonwealth can achieve the draft WIP allocations for the agriculture and onsite septic systems sectors. Such a demonstration would remove the backstop allocations and allow Virginia to distribute a portion of the allocations now assigned to the agriculture.

The County recognizes the need to assign some portion of the additional allocations to the point source sector to accommodate long-term growth and to generate credits. However, as explained above, the allocations in the draft WIP placed too much reliance on credits to offset the consequences of the small allocations to the urban runoff sector and did not reflect a cost-effective and equitable distribution among the two sectors.

Comment ID 0259.1.001.001

Author Name: Jackson Marjorie

Organization: The Elizabeth River Project

The Elizabeth River Project strongly supports Virginia's development and implementation of a TMDL Watershed Implementation Plan for nitrogen, phosphorous, and sediment. This may be the most promising step yet for both Virginia and the US EPA toward reducing nutrients, the top challenge for restoring the Chesapeake Bay. This plan is especially critical for our home river, the Elizabeth and its Lafayette branch, which exhibit some of the highest nutrient levels in the Chesapeake Bay. Each summer, a massive algal bloom starts in the Lafayette River and spreads into the lower bay. In some cases these blooms have led to fish kills.

In regard to specific elements of your draft plan, we are encouraged by your intent to reduce nutrients and many good ideas included in the draft plan.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0259.1.001.002

Author Name: Jackson Marjorie

Organization: The Elizabeth River Project

We also have several significant concerns:

- Our review indicates the need throughout for a clearer commitment to the plan. The language indicates Virginia will

"consider" and "explore" many promising strategies. To achieve the significant improvements in water quality that are imperative for restoring the Chesapeake Bay, the plan needs to identify many more of these strategies that definitely will be put into action, and provide more details of how and when each such strategy will be carried out.

- We are highly concerned that the plan acknowledges that Virginia does not expect to meet EPA's requirements for 2025 nitrogen and phosphorous allocations in the James River, which includes the Elizabeth sub-watershed. EPA's draft allocation is 23.480 million pounds/year for nitrogen and your plan anticipates a load of 26.790 million pounds per year (p.7). For phosphorous, the EPA draft allocation is 2.3 million pounds/year for the James, while your plan anticipates a load of 2.690 million pounds/year for the James. Much restoration is underway with a high degree of community commitment to restore the James and its Elizabeth River sub-watershed. You indicate being able to meet the EPA allocations in other tributaries. The James/Elizabeth system should be no different.

We provide further discussion of these issues and stand by to help in any way that would be useful to you.

NEED FOR STRONGER COMMITMENTS

1) We are encouraged that Virginia is considering a list of potential monitoring and control measures to reduce urban sources of nutrients (p. 78, 79), including:

- considering requiring reporting for lawn care companies,
- considering nutrient management plans for municipalities/counties and golf courses,
- investigating sales restrictions on do-it-yourself fertilizers such as a possible ban on phosphorous and requiring fertilizers to include a significant percentage of slow-release nitrogen and time-release restrictions for sale of fertilizers,
- considering prohibiting nitrogen in de-icers, and
- considering requiring proper storage and disposal of fertilizers by retailers.

that the final implementation plan indicate a significant number of these strategies that Virginia is committed to carrying out, and provide more details for how they will be implemented including a timeline.

2) We support the list of "contingency" actions that your plan says could be implemented if allocations are not met through other strategies (p. 79, 80). In fact, your contingency wording should be strengthened from "could be employed if allocations are not met," to "will be employed if allocations are not met."

3) The plan relies heavily on meeting nutrient reductions for urban stormwater using the Virginia Nutrient Credit Exchange Program. However, the plan does not provide enough detail to determine if trading between wastewater and urban stormwater would be effective. We recommend strengthening the plan to provide specific details of how the Nutrient Credit Exchange System would work for stormwater and wastewater credit exchanges in an urban environment. This information should include how credits would be established and traded.

NEED FOR STRONGER JAMES/ELIZABETH RIVER FOCUS

4) As indicated, we are highly concerned that the proposed plan acknowledges that Virginia does not expect to meet EPA's requirements for 2025 nitrogen and phosphorous allocations in the James River, which includes the Elizabeth sub-watershed. The massive algal blooms in the lower bay emphasize the need for significant reductions in nitrogen and phosphorus. We recommend a more aggressive strategy that would enable the James and the Elizabeth to meet

the required allocations and would be eager to use our consensus-building experience to help develop approaches that might obtain broad stakeholder support.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0288.1.001.005

Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

VAMWA supports the embodiment of the Virginia approach to POTW wasteload allocations from Virginia law and regulations into its WIP, and urges EPA to accept this element of Virginia's WIP. The wasteload allocations ("WLAs") found in Virginia's Draft WIP are derived primarily from Virginia's Water Quality Management Planning ("WQMP") Regulation (9VAC25-720), Virginia's Chesapeake Bay Watershed General Permit Regulation (9VAC25-820), and "all SWCB-approved amendments" to those regulations. VAMWA supports an approach that recognizes the need for this regulatory stability.[FN5]

[FN5] VAMWA has consistently advocated regulatory stability throughout this process. For example, VAMWA provided recommendations on regulatory stability to the Chesapeake Bay Wastewater Treatment Working Group on June 9, 2009 (attached hereto as Appendix 3) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A3]. See also December 11, 2008 Memorandum from VAMWA/MAMWA Chesapeake Bay Team to CBP Water Quality Steering Committee (Representation of VA and MD POTW Loads in Model Scenarios) (attached hereto as Appendix 4) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A4].

Response

Virginia did not submit a draft WIP that met its TMDL allocation for phosphorous and nitrogen. Because Virginia did not meet the nutrient allocations, nor did Virginia submit a WIP consistent with EPA's April 2010 "Guide for EPA's Evaluation of Phase I Watershed Implementation Plans." EPA was required to assign backstop allocations to Virginia in the draft TMDL so that its allocations would be met. The backstop allocations focus on sources where EPA has federal authority, including NPDES-permitted wastewater treatment plants. This action is consistent with EPA's December 29, 2009, letter sent to each jurisdiction within the Chesapeake Bay watershed.

EPA has reconsidered its approach to federal backstop allocations as proposed in the draft TMDL. This is in large part due to the improved final Phase I WIPs and informative public comments on this issue. The final TMDL places much greater emphasis on jurisdictions' final Phase I WIPs and less emphasis on backstops in deriving the loading allocations for all sectors. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for

developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

H. The TMDL does not acknowledge and accept Virginia's proposal to revise the chlorophyll standards and improve the modeling framework

Appendix 2 of Virginia's WIP contains a Draft James River Chlorophyll-a study plan. VAMWA concurs with and supports the need for the stated tasks. Successful completion of this study plan is considered essential to address the stated deficiencies of the standard and the associated modeling framework that are referenced in these comments. EPA has ignored the importance or implications of this study in the Chesapeake Bay TMDL. The existing allocations listed in the EPA TMDL for the James River based on chlorophyll-a (23.48 mpy TN, and 2.340 mpy TP) should be replaced with allocations consistent with Tributary Strategies. EPA's TMDL should include the chlorophyll-a study in the TMDL. However, EPA must clearly state the level of unreliability that exists with the present chlorophyll-a standard and the modeling results in the TMDL document.

Comment ID 0293.1.001.004

Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

VAMSA appreciates and supports the more flexible approach evident in the WIP as to Urban Stormwater, including crediting non-structural BMPs such as urban nutrient management, fertilizer restrictions, restrictions on improper waste disposal, street sweeping, and expanded trading program, all of which are listed at pages 78-79. Nevertheless, VAMSA has similar concerns with the WIP regarding the overall level of effort and associated costs.

From a local governmental perspective, it is imperative that the final TMDL and WIP retain flexibility for reasonable decision-making and implementation approaches and mechanisms at the local level that take into account cost considerations, reasonableness of rates for taxes/fees to implement the TMDL, and other relevant considerations.

Response

See response to Comment No. 0034-cp.001.001

Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

EPA's Decision to Reject Virginia's Expanded Trading Option Is Unreasonable

Virginia's WIP includes provisions for expansion of its existing nutrient trading program to include agriculture, urban stormwater, and other sectors. In addition, Virginia's Draft WIP (unlike EPA's Draft TMDL) does not include mandatory retrofits/restoration of impervious area. Taken together, these two aspects of Virginia's plan would give affected parties the flexibility to incorporate cost effectiveness into management decisions. Unfortunately, EPA has largely ignored cost considerations in developing the TMDL. In fact, EPA has acknowledged in recent public meetings that the TMDL does not consider affordability or cost-effectiveness. Unlike EPA, local governments (including MS4 owners) have a responsibility to their citizens to seek cost-effective solutions. By ignoring cost, EPA's disapproval of Virginia's WIP essentially conflicts with the public interest in efficient and affordable regulations. EPA's acceptance of Virginia's intent to consider trading program expansion would help address this major shortcoming of the TMDL, though attainability of the TMDL remains a major question.

Response

Thank you for your comment. EPA is aware that meeting TMDL allocations will involve local governments, which already manage a significant workload. EPA is working to identify means of providing technical support to local governments to reduce the burden of planning for the TMDL and implementing measures associated with the TMDL. EPA supports Virginia's proposed expansion of its Nutrient Credit Exchange as long as the appropriate accountability exists. EPA has worked closely with Virginia to ensure that if the proposed expansion of the exchange program is delayed or unsuccessful in meeting the state's TMDL allocations, contingency plans are in place and able to be implemented.

Organization: Virginia Department of Transportation (VDOT)

According to table 8-4 on page 8-6 of the draft TMDL, the Virginia WIP fails to meet the total N allocation by 16% and the P allocation by 22% for the James River. However, the Virginia WIP does meet the 60% target reduction by 2017. VDOT supports the Virginia WIP's proposal to evaluate the chlorophyll standard and then re-assess what, if any, actions may be necessary beginning in 2017 to meet the final target allocation. This approach is supported by studies

that have documented that the James River has less impact on the water quality of the main stem of the Chesapeake Bay than other rivers in the Bay watershed. Again, VDOT supports the proposed Virginia WIP approach to complete a "chlorophyll standards review and amend standards if necessary prior to the scheduled revision of the TMDL in 2017".

A second source sector targeted in both the Draft WIP and the Draft TMDL is urban and suburban stormwater. Stormwater runoff from existing development is regulated through municipal separate storm sewer system (MS4) permits. Fairfax County holds a Phase 1 MS4 permit. While the Draft WIP lacks clarity on what the exact requirements would be for urban and suburban stormwater, EPA's Draft TMDL defines an aggressive backstop allocation.

It is not at all clear how, or even if, these stringent standards can be met using current stormwater management practices, especially given that most soils in urban areas are highly compacted and will not support infiltration practices. We have seen several estimates for implementation of retrofits for existing impervious cover. One estimated a cost of an additional \$90 million per year, while more detailed analyses have indicated the costs to be more in the range of \$250 to well over \$300 million per year, which is similar to an EPA estimate for urban retrofits. It is important to understand that, using the \$250 million estimate, the tax rate increase an average homeowner will see is over 10%, or more than \$600/year, none of which includes operations. This also does not include costs associated with operating and maintaining all of the new stormwater management facilities that will be required.

- The development community bears a disproportionate burden under the draft WIP. Urban/suburban stormwater accounts for 8.7% of the flow of nitrogen and 13.7% of the flow of phosphorus into the Bay. Under the WIP submitted to EPA, urban/suburban stormwater nitrogen flows are to be reduced by 43% and phosphorus flows reduced by 68.3%. By comparison, agriculture, which accounts for 37.0% and 45.5% of nitrogen and phosphorus flow, respectively, into

the Bay is expected to reduce flows of nitrogen and phosphorus by 25% and 30% respectively, while wastewater, responsible 30.4% and 25.1% of nitrogen and phosphorus flow, respectively, is expected to increase flows of nitrogen and phosphorus into the Bay. These are not the allocations that were recommended by the Stakeholders Advisory Group (SAG) and we do not believe that they should be included in the WIP.

- The WIP contains the goal that "allocations for newly developed land will be set at a level that results in no increase above 2025 average nutrient loads per acre from previous uses; unless offsets are obtained in the event on-site controls will not fully achieve allowable loads." This goal will likely result in a phosphorus standard lower than the one proposed by the Kaine Administration in 2009 and possibly even lower standards for individual tributaries. Nitrogen standards are likely to be equally stringent. Such standards are likely to be economically unfeasible and, being based on modeling that is flawed, also likely to be unnecessary.

Organization: Lynnhaven River NOW

A TMDL is only as strong as its implementation plan. Without a strong implementation effort, it is fundamentally an academic process and a waste of time and taxpayer money. The Watershed Implementation Plan that Virginia has presented is basically "business as usual". It proposes that the state continue to do things exactly as they have been done in the past with a very low priority being given to water quality improvements. This has not worked and it will not work now. To continue business as usual will produce the same results we have now---thousands of miles of impaired waterways throughout the state and a very sick Chesapeake Bay.

We have had success with the TMDL process for bacteria reduction in the Lynnhaven River in Virginia Beach because

the implementation of the bacteria TMDL and cleaning up the river was made a highest priority by the city and a real commitment of funds, attention and collaborative effort has been made to reach that goal. I expect no less of a commitment from the state to clean up all of our waterways and the Chesapeake Bay. It must be a highest priority and a real commitment of funds, attention and collaborative effort needs to be made if the goals established by the Chesapeake Bay TMDL are going to be met.

While some progress has been made in reducing pollution from agriculture and wastewater treatment plants, runoff from stormwater in urban and suburban areas has continued to rise and, without a significant change, will continue to rise further. Progress has been made on reducing pollution from wastewater treatment facilities because funds have been allocated for upgrades to old plants and this work has been prioritized. The same commitment could work for urban and suburban stormwater. However, the proposed Watershed Implementation Plan lacks any specifics on how to achieve these reductions. Real reductions from this area will not occur without robust requirements on both redevelopment and greenfield development as well as funding to assist local governments with stormwater system upgrades.

Organization:

o The draft WIP as worded has the unintended consequence of requiring reductions in phosphorus that exceed the unreasonable levels required under the suspended regulations previously adopted by the Kaine Administration. The

WIP should be revised to provide for a much more reasonable phosphorus standard for new development that is close to the current standard in place.

o The 20% pollutant reduction requirement for redevelopment projects is excessive. It will encourage sprawl by unnecessarily increasing the cost of urban redevelopment projects.

- Virginia should quickly file suit against the EPA in early 2011 to block or delay implementation of the draft TMDL and the effective date of Virginia's WIP if EPA fails to delay adoption of the TMDL or fails to allow for a WIP that addresses Virginia's concerns and those outlined in your comments.

Virginia's WIP was developed through a collaborative process, and we support the TN and TP allocations set forth in the WIP as originally submitted by the Virginia Department of Environmental Quality ("DEQ") on September 3. We believe DEQ erred in its TSS allocations, which were predicated on an across-the-board TSS concentration target of 30 mg/l for industrial and municipal dischargers. However, we understand that DEQ plans to correct this error to reflect appropriate and defensible industrial TSS allocations in the next iteration of the WIP. The revised version will adjust the industrial TSS allocations based on site-specific constraints at industrial facilities as substantiated in individual industrial VPDES permit proceedings. We support the process and the product that the DEQ is working to develop.

When assembling the WIP, Virginia's Secretary of Natural Resources convened a stakeholder advisory group ("SAG"), consisting of representatives of all affected stakeholders. The SAG reviewed and provided feedback on the model inputs, outputs and the feasibility of achieving a host of practices across Virginia's Bay watershed. Members reviewed and advised on sector pollutant load reductions and the sector allocations that would be used to meet the interim and final goals established by EPA (for nitrogen and phosphorus, but not for TSS). Through this collaborative process, Virginia obtained input from affected sources, including valuable technical expertise on the workings of the model and the impacts and achievability of various allocation proposals.

The WIP drew upon two core aspects of Virginia's regulatory program: (1) the WGP, which serves as a vehicle for implementing the regulatory nutrient allocations assigned to significant industrial and municipal dischargers; and (2) the Exchange, which facilitates implementation of these allocations by and among facilities in the most cost-effective manner.

Support for Virginia's Watershed Implementation Plan and the James River Approach

We support the approach that the VA DEQ proposes in its Watershed Implementation Plan (WIP) for the James River due to its unique qualities and chlorophyll criteria. This approach proposed in the WIP uses, as a foundation, the successful point and non point source control plans already developed by localities and municipalities in the basin. The significant reduction of nutrient allocations proposed by EPA for the James River is unfounded and fails to recognize or consider the significant progress to-date and future nutrient reductions plans that have been made in good faith in the basin. We believe the adaptive management approach proposed by VA DEQ for the James River to achieve the 2017 goals is appropriate and that EPA should approve this portion of VA DEQ's WIP as originally submitted. To utilize the allocations that EPA has proposed is contrary to the pursuit and use of sound science upon which EPA professes to

base its approach to protecting the environment.

Urban retrofits are an appropriate, but costly stormwater treatment strategy. Urban retrofits should be balanced with other aggressive stormwater treatment strategies focused on agricultural land. Stormwater BMPs on agriculture land are much more cost effective per pound of nutrient removed than urban retrofit BMPs. The current Bay TMDL and Virginia WIP require too much urban retrofits and too little agricultural BMPs.

Response

Through the state WIPs, EPA has deferred to the states to make the initial assessment on which sectors to seek what level of controls. While the draft WIPs were largely deficient, EPA finds the final WIPs are much improved. Therefore, in the final TMDL,

EPA has chosen to reduce or remove the backstop allocations. As a result the allocations in the final TMDL are much more aligned with the loadings in the state WIPs. EPA's final decisions on the WIPs and backstop allocations can be found in section 8.

Regarding implementation strategies that should be considered, see response to Comment No. 0044.1.001.004.

Comment ID 0434.1.001.008

Author Name: Pryor Wayne

Organization: Virginia Farm Bureau Federation

I. The Virginia WIP Appropriately Builds Upon the Significant Reductions Achieved to Date by Agribusiness and Other Stakeholders to Achieve Bay Water Quality Goals.

The VA Farm Bureau's members (farmers, foresters, etc.) are committed to environmental stewardship. Clean water and good soil are fundamental to our success. We have been doing our part, and will continue to do so in order to help create a healthy Chesapeake Bay and local waters.

As a result of this commitment, agriculture has met 52% of the reduction goals established in Virginia's Tributary Strategies for Nitrogen and 50% for Phosphorus and Sediment—all through a voluntary, incentive based program in Virginia. According to the Virginia Department of Forestry, 83% of logging jobs already use the proper combination of best management practices.

Virginia's Chesapeake Bay program has provided the impetus for VA Farm Bureau members to implement measures to address nitrogen, phosphorus and sediment discharges. Virginia's agricultural community has responded to these incentives.

o Virginia has put over \$80 million into Agricultural Best Management Practice (Ag BMP) Cost-Share program since 2006. Farmers have matched this spending with \$0.60 of every dollar, and are lined up at the door to do more. Every year, there are more farmers interested in participating than there are funds to be distributed.

o Even without cost-share funding, agriculture is taking action. Virginia farmers fence cattle from streams, practice conservation tillage, test soils before applying fertilizer, and install buffers along waterways -- without federal or state funds -- and without being "counted" by EPA.

o Virginia has enacted the most far-reaching "bad actor" statute in the watershed to address agricultural contamination. Its "Agricultural Stewardship Act" was enacted in 1996 and became fully effective in 1997. See Va. Code §§ 3.2-400 et seq. Between April 1, 2009 and March 31, 2010, 100 inquiries were made through this program, resulting in 51 investigations and 21 cases that prompted needed improvements in agricultural operations.

The cooperative program that Virginia has established is working. Progress is being made. EPA's intervention at this point in the process will only cause friction, finger-pointing and litigation. Instead of progress we will have gridlock.

VIII. Conclusion

The VA Farm Bureau is committed to doing its part to ensure the restoration of the Chesapeake Bay. Virginia's September 3, 2010 WIP provides a sensible approach for achieving the nutrient and sediment reduction goals set by EPA. The TMDL proposed by EPA, however, lacks legal and technical support, and undermines the progress that has been made by the agricultural community through the regulatory and non-regulatory programs already established in Virginia. Building upon these programs will lead to greater reductions by the agricultural community. Additionally, allowing opportunities for trading and other incentive-based programs will ensure a continued partnership to achieve reductions.

Comments Regarding the Commonwealth of Virginia Draft Chesapeake Bay TMDL Phase I Watershed Implementation Plan

The City of Norfolk (City) appreciates the opportunity to review the Virginia Draft Phase I Watershed Implementation Plan (WIP), released in September 2010, and submit comments. As a coastal community, receiving direct benefit of a cleaner Chesapeake Bay, the City has always been a leader in storm water management in the Commonwealth of Virginia and supports the goals of the Chesapeake Bay (Bay) Total Maximum Daily Load (TMDL) and WIP process.

The City recognizes Virginia's efforts to incorporate flexibility and cost effectiveness into the development of the Draft WIP. We support a WIP that ensures adaptability and fairness within and between source sectors in achieving pollutant loading reductions within the Commonwealth.

The City has reviewed both the Draft TMDL developed by the Environmental Protection Agency (EPA) and the Draft WIP developed in conjunction with and response to the TDML. The City has reservations about the WIP and the potential implications it may mean to our residents. While we have also commented through our membership in the Hampton Roads Planning District Commission and Virginia Municipal Storm Water Association, we wish to submit additional comments of particular concern for the City.

The City understands the pressures and influence that the EPA has placed on the WIP development process; however, we believe a more fair and balanced approach must be taken to address contributions of each watershed to the pollutant loads. Because the James River discharges at the mouth of the Bay, it contributes the least amount of pollutants to the Bay. We find that implementing the Draft WIP as proposed would place substantial financial burdens on City residents with minimal improvement to water quality. Therefore, outlined below are comments reflecting specific concerns and recommendations associated with the Draft WIP.

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

Realign Allocations

Should the EPA backstop pollutant allocations not come into play, the City encourages Virginia to assign a significant portion of the additional allocations of nutrients and sediment in the James River basin to the urban runoff sector. However, as explained above, the allocations in the Draft WIP placed too much reliance on credits to offset the consequences of the small allocations to the urban runoff sector and did not reflect a cost-effective and equitable distribution among the sectors.

The City would like to take this time to thank you for the opportunity to submit these comments associated with the Draft WIP. We recognize that the state is attempting to develop the WIP to allow for flexibility and cost effectiveness throughout the source sectors. We feel that the state is making great strides to improve water quality in the Bay watershed.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0435.1.001.021

Author Name: Lentz Kristen

Organization: Department of Public Works, City of Norfolk, Virginia

First, the Hampton Roads Localities encourage Virginia to respond to EPA's backstop allocations by revising its WIP to include the additional commitments needed to demonstrate to EPA that the Commonwealth can achieve the draft WIP allocations for the agriculture and onsite septic systems sectors. Such a demonstration would remove the backstop allocations and allow Virginia to distribute a portion of the allocations now assigned to the agriculture sectors to the urban runoff and point source sectors. Should the backstop allocations be removed, it is important that Virginia assign a significant portion of the additional allocations to the urban runoff sector. The Hampton Roads Localities recognize the need to assign some portion of the additional allocations to the point source sector to accommodate long-term growth and to generate credits. However, as explained above, we believe the allocations in the WIP placed too much reliance on credits to offset the consequences of the small allocations to the urban runoff sector and did not reflect a cost-effective and equitable distribution among the two sectors.

As we explain in our comments on the TMDL, time is a more critical factor for the urban runoff sector than it is for any other source sector receiving allocations in the TMDL. This is because the cost of retrofitting existing development is directly related to the Localities' ability to impose retrofit requirements in land use approvals for re-development rather than having to acquire easements for the retrofits and installing the retrofits independent of re-development. The Localities expect that they will be receiving new MS4 permits within the next two years and that these permits will contain conditions based on the Bay TMDLs. Therefore, it is critical that the State include the largest urban runoff sector allocations possible in the final WIP. This will afford the Localities' a greater opportunity to comply with their permits cost-effectively through retrofits required at the time of redevelopment.

Second, we encourage the State to emphasize in its final WIP the critical importance of federal and state grant funding

to assist the localities in achieving the load reductions called for in the final TMDL. As is evident from the cost estimates summarized above, local governments simply do not have the financial resources to implement their responsibilities under the TMDL. This is particularly true in the case of the urban runoff sector where the cost-per-pound of nutrients and sediment removed is far greater than any other source sector and where grant funding for storm water programs has been non-existent. In the absence of significant federal and state grant funding assistance, the urban runoff sector allocations are little more than a recipe for failure and will serve only to expose MS4s to federal enforcement. To protect MS4s, we also urge the State to make clear in its final WIP that the 2025 compliance deadline must be tied to the availability of significant federal and state grant funding for the urban runoff sector.

Finally, we encourage Virginia to take full advantage of the existing model capabilities to credit existing management practices that the State has not previously catalogued or reported to EPA. We also urge the State to formally request that EPA directly account for nutrient reductions attributable to filter feeders. It is apparent that EPA has made very little effort in the draft TMDL to incorporate additional, more cost-effective opportunities to achieve the basin-wide allocations. Crediting load reductions attributable to filter feeders such as oysters and menhaden and adopting an aggressive, targeted approach to reducing nitrogen loads from air deposition would reduce the need for other sectors to make more expensive nutrient reductions. Other cost-effective opportunities such as a federal commitment to funding the cost of installing wide-spread forested buffers should also be given serious consideration. Currently, neither the TMDL nor Virginia's WIP addresses any of these opportunities in a meaningful way. We urge the State to press EPA to remedy this deficiency when it establishes the final TMDL.

Organization: Excalibur Farms

As a second-generation farmer, I also have major concerns about an emphasis on specific "solutions" rather than results. Fencing all streambeds to totally exclude livestock is an example of a specific solution. On my family's farm, we have nine creeks which join to form Whetstone Run, a Rapidan River tributary. All but two of these creeks begin on our farm. We have over half of the farm in forest. The remainder (about 220 acres) is devoted to hay production and pasture for livestock (mostly sheep with a few brood cows). In our open land (about 220 acres), we have about 14,000 linear feet of streambed. Fencing this out (28,000 feet of fence at \$3/foot), adding the necessary number of stream crossings (about \$6000 each), burying 20,000 feet of water lines with power for heaters to supply waterers (about \$7/foot) could cost between \$250,000 and \$300,000. On-going maintenance of the streambed fencing would also be expensive: our streams flood frequently because we have allowed them to grow up with trees and brush per NRCS recommendations. We lost many miles of fence in a single flood in 1995, so this is not a theoretical concern.

In addition to this tremendous increase in expense, we would lose about 30-35 acres of pasture and hay acreage, so our farm income would be reduced. We could clear some forest to make up for the lost acreage, but that would in itself

add to the Bay pollution loads (according to your model).

We have already made a major investment in water quality-driven improvement. We stopped row-cropping years ago (sediment run-off from this hilly ground was significant). We converted from an all-cattle operation to mostly sheep. Sheep do not stand in creeks like cattle do. Sheep also are kinder to ground cover than cattle, so sediment runoff from a sheep operation is less than from a cattle operation. Working with the NRCS and CSWD, we have invested about \$100,000 in barnyard drainage, roof-water runoff control, animal walkways, fencing out buffer zones for our barnyard and woodlands, road drainage improvements, and a manure composter. We got on a state-approved nutrient management plan. Beyond the money invested, family members put in over 1000 hours of engineering, fencing, regulatory research, and construction management time to lower costs. Fortunately, grants and tax credits covered a portion of the work, but nowhere near all. We were frustrated by the lack of data (no one tested the water before or after all this work); however, we made the investment because we believed that it would be necessary to continue farming in the face of increasing environmental concerns and ultimately regulations. It will take us years to pay for this, but we did have reason to believe that these BMPs were going to make us better neighbors and citizens.

The one thing that we could do to contribute more is get rid of the last few cows and concentrate entirely on sheep. Unfortunately, we face poorly-conceived “one-approach-fits-all-farms” regulations in these WIPs such as this fencing mandate that could cost us up to 3 times what we have voluntarily invested already. Worse, this investment would not contribute anything to the Bay cleanup because sheep don’t like getting their feet wet anyway. We are straining to pay for what we have done for the Bay already--farm input prices have soared while farm product prices have not, thanks to imports from places where water quality and feed sources are not a concern.

Response

First, thank you for your efforts to improve the environment. Agreed that the solutions need to be ‘home grown’ For this reason, EPA has sought to have the plan developed at the state level with dialogue among the many stakeholder. Furthermore, EPA is looking for the plan to be driven down to a maller scale (like county) in 2011 in phase 2 of the planning. So EPA would hope that as these plans continue to evolve that suggestions like the ones in your comment are discussed.

Organization: NAIOP (Commercial Real Estate Development Association) Northern Virginia Chapter

The proposed TMDL includes components which address existing development and efforts that can be undertake to mitigate their impact on the Bay. In Virginia, there simply is no legal authority to address some of the urban/suburban retrofits proposed in the EPA draft TMDL. Some of the backstops that would be imposed on existing properties, including state and local highways simply cannot be implemented - such as removing existing parking lots, installing stormwater controls on existing sites or requiring that rain gardens be added retroactively. Virginia has no authority to require existing property owners to make these changes and to suffer the expenses for doing so.

In addition, such controls are more expensive and are also less successful in pollutant reductions per dollar spent.

Wastewater treatment plant upgrades (which developers and citizens pay for through service charges) or many agricultural best management practices contained in the Virginia draft WIP are much more effective expenditures of scarce resources. Some of the proposals in the Virginia WIP are based on what is allowable under state law. This would include the proposed Agricultural BMPs which could be funded through a nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Organization: Chesapeake Bay Nutrient Land Trust, LLC

WIP Expansion of the Nutrient Exchange Program

The Virginia WIP fails to fully acknowledge or take advantage of existing authority for a private market based Offset program. Instead, the Virginia WIP calls for an expansion of the Nutrient Exchange Program without providing details for how that expansion will occur. Based on the limited information in the WIP, it appears that Virginia plans on a system that would rely heavily on excess capacity at sewage treatment plants being traded with multiple other sources. Point source nutrient reductions are not evaluated in the same manner as those resulting from permanent land use alterations and both the science and trading potential appear incompatible. Such a system would be a municipality driven, government subsidized trading system that does not promote land use changes but offers a limited approach using treatment systems reliant on technology to remove the pollutants. Offsets offer a 100% nutrient reduction, whereas a trading program under current water quality and stormwater programs allows a maximum 65% or 75% treatment efficiency for runoff.

The current state of wetland and stream banking in Virginia versus Maryland bears out this argument against a municipality driven trading system. Maryland has a very limited number of private wetland banks yet in Virginia, where governmental establishment and control of wetland and stream mitigation banks for commercial purposes is prohibited, the private market has flourished. CBNLT's experience in the Virginia nutrient market is also demonstrative of the negative impact that local government involvement in trading can have on private markets.

Virginia's WIP suggests that a legislatively authorized study will be pursued to determine the appropriate expansion of the Nutrient Exchange. The study should (i) include as a requirement the protection and promotion of private market based trading systems, (ii) acknowledge that trading between point sources and source such as stormwater that require permanent reductions is limited in potential due to concerns that point sources will not want to permanently give up their allocation.

Cost of implementation

The Virginia WIP anticipates significant federal funding, yet such funding seems unlikely. At the same time the Virginia WIP makes no mention of the cost effectiveness of a private trading program. As noted above, Offsets created by CBNLT are created at no expense to either state or federal agencies. Given these hard economic times, private solutions rather than more governmental subsidies should be vigorously pursued, yet the Virginia WIP fails to do so.

Missed opportunities for true reductions

The Virginia WIP should include an assessment of current stormwater BMP effectiveness with a special emphasis on whether BMPs have been installed as designed, whether BMPs are being adequately maintained, whether BMPs are actually functioning, and even where the BMP or manufactured devices are actually located. There is an over-reliance on expensive (in real dollars and per pound of reduction) on-site technological solutions with questionable monitoring, maintenance and reliability and with long term replacement needs and costs (meaning replacement may not occur). Many in ground technological systems such as Filterra and Contech systems require regular and long term maintenance and eventual replacement to maintain full nutrient removal capacity. It is questionable whether it is possible to document and ensure that these activities occur as needed. Many question the actual efficiency of these systems and the practicality of long term maintenance. These factors lead to serious questions as to whether expected nutrient reductions are actually occurring. The result is that we could be counting reductions that aren't actually taking place.

The Virginia WIP should provide for increased enforcement with Offsets as a compliance tool

The Virginia WIP should include more emphasis on enforcement of existing requirements. CBNLT is aware of a variety of compliance issues for which Offsets could be part of a compliance package. These examples range from development activities with no water quality consideration in their SWPPP to improperly constructed nutrient management facilities. Offsets are valuable for making up for the temporal loss of nutrients and for longer term solutions to offending site nutrient management deficiencies. Offsets could be made a clear item in the enforcement tool box, particularly with the priority given to stormwater in EPA's National Enforcement Initiatives and its Chesapeake Bay Compliance and Enforcement Strategy.

Local stream impacts

Section 7.2 of the Virginia WIP creates an inappropriate impression that the use of Offsets can have a negative impact on local stream water quality. Virginia state statute (Va Code § 10.1-603.8:1) authorizing nonpoint nutrient Offsets for stormwater permitting already requires an examination of local stream impacts as does guidance developed by DCR. In addition, the Virginia WIP should also note that nutrients at a development site that are accounted for through an Offset rather than an on-site control have very little to no impact on most receiving streams. The true impact to local streams is from water quantity rather than nutrients. Under Virginia's program water quantity must be addressed on-site and, except for some local government programs, cannot be managed off-site.

D) Virginia's overall approach in the Draft WIP

In Virginia's September 3, 2010 cover letter to EPA, Secretary Domenech highlights the state's ongoing efforts to improve water quality in the Bay over the past two decades, recognized the severe economic conditions currently faced by Virginians, and the high cost of implementation of the draft WIP. He further promotes a system built upon flexibility and cost-effectiveness to meet these goals. We concur.

Our industry supports Virginia's approach in the Draft WIP to utilize adaptive management, nutrient trading, and flexibility in meeting goals. Implementing the WIP and the Bay TMDL will be costly. In order to best balance the needs of a growing economy with water quality, we support a) adequate and reliable cost-share and technical assistance for agribusinesses, b) providing flexibility and certainty, c) balancing water quality reductions with economic impacts to industries, d) a trading program that allows for all economic sectors to participate, and e) utilizing adaptive management based upon economic conditions, future advancements in practices and technologies, and true water quality data. Virginia's draft WIP sets the course for such actions.

In general, if EPA is requesting additional detail be provided by the Commonwealth on current programs, we encourage the state to work with EPA to determine the types of information necessary to meet their expectations. Adding additional explanation of current programs will clearly prove that Virginia, through statute, regulations, inspections, and voluntary programs, has taken great strides in meeting water quality goals, and through full utilization of these programs, can make even more progress in the decade to come.

E) Agriculture Sector Section of the Virginia Draft WIP

Fully Utilizing Existing Programs, Adding Details, and Increasing Staff

As already stated, state officials should continue working with EPA staff to add details regarding current permitting, regulatory, inspection, and voluntary programs to the draft WIP. Further, we support utilizing current programs, statutes, and regulations to their fullest extent, explaining areas where additional staffing, resources, and funding are necessary, and working to address these shortfalls over time. We urge the state to continue efforts to get full credit for all actions taken resulting from regulatory or permitted actions, as specified in the SB 346 Study Report (November, 2010).

If provided with adequate funding and staffing, the Agricultural Stewardship Act (ASA) can be utilized to ensure compliance with water quality laws and serve as an enforcement tool that EPA is demanding. We encourage the State to include information on expanded staffing and utilization of the ASA program in the re-draft of the WIP.

Ag BMP Cost-Share Funding Is Critical

We continue to support adequate and dedicated funding for cost-share assistance and technical assistance provided through the Virginia Agriculture Best Management Practices Cost-Share program and Soil and Water Conservation Districts. The draft WIP should be amended to reflect a formula utilized to determine Cost-Share and Technical

Assistance funding needs, based upon state, federal, and farmer share of costs. We are gravely concerned about including unrealistic BMP implementation goals without any guarantee that government cost-share and technical assistance will be available in the future. Just as the state and farmers will be held to an expectation by the federal government to meet funding goals, so should the federal government. If TMDL goals are not met due to lack of available and adequate funding, the industry should not be left to deal with consequences.

Accounting of Voluntary Best Management Practices

We applaud the state's inclusion of plans to address the inherent problems with the current system of tracking and verifying agricultural best management practices (Ag BMPs) within the Chesapeake Bay Model. We continue to work in earnest with state officials to implement the terms of SB 346 (Hanger) which will set the state on a course towards tracking and accounting for voluntary best management practice implementation. As envisioned in the WIP, it is critical that regulatory practices already mandated, such as those associated with the Poultry Waste Management Act, biosolids regulations, the Agricultural Stewardship Act compliance, and the Chesapeake Bay Preservation Act, for example, be accounted for fully within the Bay Model. Adequate staffing will be crucial to begin implementing this critical program as a means to account for the significant conservation practices already implemented by agriculture already.

Resource Management Plan (Conservation Plan) Approach

As advocated by industry representatives during the WIP development process, utilizing Resource Management Plans (Conservation Plans) will achieve Bay improvements in an economically sensible, scientifically based manner. Specifically, a resource management plan should constitute a suite of Best Management Practices (BMPs) most appropriate for each farm. Each farming operation is unique with respect to its conservation needs. Each varies in its potential to affect water quality. A Resource Management Plan which addresses nutrient management, soil conservation, riparian management, and stream protection as needed, is the most effective means of determining the appropriate BMPs for any given farm. We will continue to work with state officials to further develop this program to ensure that it is effectively and fairly utilized by the State in meeting Bay goals.

Other Specific Questions and Concerns on Agriculture Section

- Gap Analysis (page 57) - It is not clear which table is referenced in the first paragraph; this should be clarified or deleted.
- Nutrient Management Plans (page 62) - There are two dates listed as goals; 2020 for 95% implementation and 2017 for increases in NMP plan writers. Shouldn't these be consistent? There should be further discussion on phase-in plans with impacted stakeholders.
- Conservation Tillage and Soil Conservation Plans (pages 62-63) - Industry representatives have raised concerns regarding the equitability of focusing conservation efforts on large farms initially (phase-in proposals), and as such, further discussions with impacted stakeholders must occur.
- Livestock Stream Exclusion (page 63) - The basis for expectations for farms with a certain number of cows needs further discussion with impacted stakeholders. The section should also be amended to reflect the need for more flexible standards in fencing types, buffer restrictions, and grazing rules.
- Container Nursery and Greenhouse Runoff and Leachate Collection and Reuse (page 65) - This specific practice is not currently established as a BMP by DCR, or to our knowledge, credited in the Bay model. Until discussions with impacted industries occur and such a BMP is created, it should not be included in the WIP. The specifics of this practice have not been fully vetted with the impacted industry and there remain many questions from industry, particularly landlocked, small, and retail/distribution operations as to adoption, affordability, and feasibility of this practice.
- Contingencies (page 66) - Further discussion with impacted stakeholders regarding contingency plans must occur.

The provisions regarding potential mandates of BMPs for land-use taxation has never been vetted with agribusiness industry representatives.

F) Urban/Suburban Sector Section of the Virginia Draft WIP (Turfgrass industry specific)

Urban Nutrient Management

The draft WIP envisions greater restrictions on nutrients in turf and lawn care fertilizer products. Members of the fertilizer, lawn care, golf, and green industries have identified that certain provisions of the draft WIP may be feasible to implement provided they are approached in a cost-effective manner for impacted industries. Below, we outline amendments and additions to the draft WIP we suggest to specific sections in order to achieve this goal.

Stormwater BMP Cost-Share Program (page 78) - We applaud the state's inclusion of plans to create a stormwater BMP Cost-Share Program and encourage including items such as urban nutrient management, proper fertilizer applications, and incentives for utilizing more efficient nutrient products in this program. In the current economic conditions, without adequate cost-share funding goals, such as Nutrient Management for golf courses, may be unattainable.

Use of Voluntary Water Quality Agreements with DCR (page 78) - The industry appreciates recognition of this important voluntary program in collecting data from willing participants within the lawn care industry. We urge the state to also expand the funding and resources provided to this program so that additional companies may participate. There is a willingness from the industry to expand the use of this program; however it is currently limited due to resources and staffing.

Nutrient Management Plans on Golf Courses (page 78) - Adequate time must be given to allow for plan writers to be certified in the Urban Nutrient Management program and for plans to be written. Further, cost-share assistance will be critical in helping some golf courses, both public and private, meet this goal.

Sales Restrictions on Do-It-Yourself Non-Agricultural Lawn and Turf fertilizers: Slow Release Nitrogen (page 78) - We encourage state officials to work with the industry in assessing this goal over the next several years, as technology, practices, and products are constantly changing in this area.

Sales Restrictions on Do-It-Yourself Non-Agricultural Lawn and Turf fertilizers: Time of Year Restrictions (page 78) - Due to climate and grass type differences across the Commonwealth, and the various nutrient needs based upon these differences, the industry urges the state to base any restrictions on no applications to frozen ground, as established in DCR's Nutrient Management Standards & Criteria.

Sales Restrictions on Do-It-Yourself Non-Agricultural Lawn and Turf fertilizers: Ban Phosphorus (page 79) - The wording of this section should be changed to reflect that it is actually a restriction on the phosphorus content of certain fertilizer products, not a ban on all use of the products in all situations. There are circumstances, recognized by the exemptions outlined in the draft WIP, where application of phosphorus may be necessary for home lawns and turfgrass. Further, the industry urges the state to also provide an exemption in the WIP for biosolids and products with naturally occurring phosphorus. This would parallel other states that have enacted similar restrictions on phosphorus use.

Ban on Nitrogen Containing Deicers (page 79) - If a ban on utilizing nitrogen containing deicers were to occur, adequate

time (several years) to allow for retailers with the product to clear their inventory must be allowed.

Proper Storage and Disposal of Non-Agricultural Fertilizers by Retailers (page 79) While a "good housekeeping" practice, it may be impractical and difficult to implement. In addition, the Bay Model does not give credit for this "practice" and as such, it should be removed from the WIP.

Generally speaking, the draft WIP should, but does not, clearly present:

- o Current baseline loading across all Virginia Chesapeake Bays basins;
- o Load reductions required for each of the Virginia Chesapeake Bay basins to achieve allocations;
- o Best Management Practice (BMP) Implementation levels or management actions required for all source sectors to achieve allocations by Virginia Chesapeake Bay basin;
- o Detail primary assumptions regarding management actions to be taken by source sector to achieve allocation load reductions;
- o Timeline of what management actions will/should be taken to achieve the estimated load reductions in first 7 years through 2015, within the next 3 years (through 2020), and the subsequent 5 years (through 2025);

- o Tracking and reporting system to track the status of implementation of management actions, or projections of load reductions due to implementation of management actions, or actual measurements/assessment of the water quality in the Bay and the contributing basins;
- o Provide a complete Appendix detailing all Virginia Chesapeake Bay Watershed Model segment characteristics;
- o Provide a complete Appendix identifying all Significant and Non-significant dischargers (Public and Private) along with all pertinent information;
- o Provide a complete Appendix identifying all individual Virginia Pollutant Elimination System (VPDES) permit holders for industrial stormwater dischargers along with all pertinent data.

Watershed and Sector Inequities

The draft Virginia WIP proposes no waste water treatment plant improvements beyond the current permitted requirements. This situation is vastly different than the other reduction requirements being placed on the remaining sectors. This lack of additional removal requirements on the wastewater sector is not cost-effective and it places a larger financial burden on the remaining source sectors. Not only has this lack of action towards the wastewater sector resulted in an inequity between the sectors, but additionally it has resulted in inequity in allocations between the watersheds. This is evident within the table provided below which depicts the projected delivered per capita wastewater load by watershed.

[Please see table on page 5 of the original letter (Docket ID EPA-R03-OW-2010-0736-0519)] [FN2]

Wastewater treatment plant upgrades are the most cost-effective method of removing nutrients on a cost-per-pound basis while providing a very high level of reasonable assurance.

Another inequity exists in that there are no reductions from estimated present loads for industrial VPDES permitted stormwater. The significance of this, besides the issue of equity, is that the Commonwealth of Virginia must deduct the industrial waste load allocation (WLAs) for facilities within the permitted Municipal Separate Storm Sewer System (MS4s) from the composite MS4 WLA. As a result, the differential MS4 load will be even higher since the estimated current Industrial stormwater loads are at much higher levels than the Everything, Everybody, Everywhere (E3) source sector allocations. WSM model assumptions are additionally called into questions as these industrial loads do not appear to match what the WSM loads per acre are, and are generally higher than the "no BMP loads" in the model.

[FN2] Allocations are based on 8/4 model run #4 corrected, personal email conversation, Russ Perkinson, VADCR, 09/13/2010 and U.S. Census Bureau, Population Division, 2009 Population Estimate, obtained from <http://www.census.gov/popest/files/COEST-2009-ALLDATA.csv> on 9/2010.

As a further modeling issue with respect to the draft WIP, the combined sewer system (CSS) numbers submitted in the Virginia Department of Environmental Quality (VADEQ) watershed model input deck did not reflect any reduction associated with taking the stormwater component of CSS down to E3. Again, this impacts the MS4 WLA allocation negatively.

Reliance on Stormwater Retrofits

The over-reliance on stormwater retrofits suggested throughout the WIP is problematic for several reasons, specifically costs and physical limitations which prevent the BMP conversions. Additionally, modeling scenario decisions have further influenced how the E3 definitions are comparable on a source sector basis. Given the extreme pressure and apparent intended reliance on stormwater point source discharges (MS4s and construction activities); it is misleading to the public to exclude them from the No-Action Point Sources category. Instead, it appears that they are lumped in the No-Action Nonpoint Source Practices. These discharges should have been identified in the No-Action Point Sources and include due to the fact that BMPs have been, and continue to be, implemented for both urban and non-urban stormwater discharges.

It appears that there is an apple to oranges comparison between No-Action Point Sources and No-Action Nonpoint Source Practices. There is treatment on both urban practices as well as other practices. If it is assumed that there are

no practices on nonpoint sources, how can it be assumed that there are practices on point sources? The assumption of no nonpoint nutrient and sediment control practices in place is false. Some forms of control have been implemented to some extent in all sectors since the early 1900's.

The decision to allow wastewater treatment to expand to design capacity (which, in Maryland, for instance, is 30 percent higher than 2020 projected flows) for E3 scenario will place the squeeze on both urban and agricultural nonpoint sources. Nobody has suggested a logically parallel decision for urban nonpoint sources: increase 2020 projected urban acres by 30% to full build-out based on existing zoning, or something along those lines.

A portion of the urban discharge pollutant load comes directly from failed collection systems of the point source dischargers. It is unrealistic to assume that all discharges from point sources are discharged through the outfall. The fact that point source discharges have inflow and infiltration programs is confirmation that these systems are not isolated from the surrounding environment. The repair and upgrade of collection systems while expanding the treatment plants could be more economically feasible than trying to meet an E3 scenario of retrofitting all pre-2006 urban acres with a suite of practices.

In general, the definition for E3 is not realistic. The E3 Scenario was never designed, nor intended, to represent an implementation scenario; it was nothing more than a construct of theory with best professional guess removal efficiencies for urban stormwater removals. As part of the deliberations of the E3 levels by the CBP Urban Stormwater Workgroup, there was a deliberate acknowledgement that highly urbanized areas would not be able to achieve high levels of retrofits due to physical limitations.

Such limitations are coming to light as local governments are undertaking watershed studies. Arlington County, Virginia is in the process of developing such plans and has hired the Center for Watershed Protection to develop retrofit plans. The first one completed in a 1000 acre subwatershed with 30 to 35 percent impervious cover and mostly residential land use identified only 40 potential retrofits locations that collectively would treat less than 10 percent of the impervious cover.[FN3] These realities are clearly in conflict with the stormwater retrofit backstops imposed by the USEPA.

The Northern Virginia Regional Commission staff urges the Commonwealth of Virginia and the USEPA to remove from consideration the setting of stormwater BMP implementation levels at the E3 level

[FN3] Personal Email Communication, Jason Papacosma, Arlington County Dept. of Environmental Services, 10/04/2010

At this extremely late point in time, EPA has unilaterally changed the computer model it uses to judge the adequacy of Virginia's actions. Virginia, however, has determined in its WIP (September 2010) at pages 14-15 that the chlorophyll standard is faulty and that "additional scientific study is needed to provide a more precise and scientifically defensible basis for setting final nutrient allocations." We agree with this finding and determination by Virginia, and we also support Virginia's "Four Part James River Strategy" at pages 15-17 of the WIP to address these major technical problems. We strongly support the WIP with regard to its wastewater elements at pages 11-12 (Source Sector Strategy for Wastewater), at pages 14-17 (James River), and pages 38-50 (Section 5: Wastewater).

In addition, as the Chesapeake Bay Program has long ago determined, the James River does not influence of mid-Bay water quality and any regulation of James River nutrient discharges should occur only for local water quality protection. Locally, the applicable water quality standard is chlorophyll standard adopted by Virginia in 2005 and approved by EPA. However, the appropriateness of that standard is in question in part due to EPA's unilateral changes to the computer model it uses to judge the adequacy of Virginia's actions. In fact, Virginia has determined in its WIP (September 2010) at pages 14-15 that the chlorophyll standard is faulty and that "additional scientific study is needed to provide a more precise and scientifically defensible basis for setting final nutrient allocations." We agree with this finding and determination by Virginia, and we also support Virginia's "Four Part James River Strategy" at pages 15-17 of the WIP to

Dear Governor McDonnell,

Please submit revisions to your Chesapeake Bay TMDL WIP that are in line with what the scientists on your staff recommend and not the policy makers. The environment is where we all live and it is past time that these issues are removed from the political realm and addressed in a way to benefit everyone and not just VAMWA and industry. Please use your leadership to quell the scare tactics of crying wolf by HRSD's Ted Henifin and James City County's Jim Kennedy that sensible steps to ensure the stewardship of the environment (a core responsibility of the Commonwealth) are outlandishly and prohibitively expensive. It is your responsibility to educate Virginians that your job is to lead us in the development of the Commonwealth's plan that works for ALL Virginians in concert with EPA's guidelines, not to scare people that the EPA backstops have no alternative. The sensible steps we need to take are never going to get less expensive and since we have already missed the previous Ches. Bay goal, it is critically important that we redouble our efforts. DEQ staff has worked very hard and had general support for the development of Total Nitrogen and Total Phosphorus wasteload allocations for the river systems and the watershed general permit. I encourage you to support them and to assist and mentor their counterparts at DCR to develop the no-discharge piece of the plan such that the WIP may be revised unhindered by political pressure. It is the right thing to do for the good of all the people of the Commonwealth.

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). We object to the waste inherent in EPA's proposed override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Response

It is EPA's preference that the jurisdiction WIPs are used to meet the allocations. However, the WIPs need to meet the expectations outlined in the accountability framework outlined in its September 11, 2008, letter to the Chesapeake Bay Program's Principal Staff Committee (PSC) and further developed in letters sent by EPA to the jurisdictions on November 4, 2009, and December 29, 2009 as well as the eight elements outlined in EPA's April 2010 "Guide for EPA's Evaluation of Phase I Watershed Implementation Plans."

Where WIPs do not meet these criteria, backstop allocations may need to be applied. Where EPA determined that a jurisdiction did not meet its target allocations or did not provide adequate reasonable assurance, EPA calculated that jurisdiction's draft backstop allocations by relying on the adequate portion(s) of the jurisdiction's draft Phase I WIP, where possible, and supplementing any remaining shortfall or insufficient amount of reasonable assurance with its allocation adjustments and determinations of reasonable assurance to achieve the necessary reductions. Although a number of backstop options existed, EPA primarily relied on decreasing the Wasteload Allocations to the point sources. EPA did that because point sources are the pollutant discharging source sector for which the CWA gives EPA the clearest authority to ensure implementation of needed controls. EPA's evaluation of the final WIP for each jurisdiction can be found in Section 8 of the final TMDL report. Also, please see response to comment # 0431.1.001.004.

Organization: Virginia Sanitation Authority, City of Alexandria

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that local governments have made to implement those requirements including incurring significant public debt (typically with 20 to 30 year repayment terms) and constructing major new facilities (typically built to last 20 to 30 years). As an organization with a demonstrable commitment to clean water, we object to the waste inherent in EPA's threatened override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Organization: James River Association (JRA)

JRA has found substantial concerns with Virginia's Draft WIP and therefore encourages EPA to remain steadfast in its efforts to hold states accountable for addressing deficiencies in their WIPs and implement backstop actions if required. JRA's comment letter to the Commonwealth of Virginia regarding concerns, suggestions and recommendations for Virginia's Draft WIP is attached to this letter as Exhibit 1. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0614.1] Of particular concern are the failure to meet the James River allocations for nitrogen and phosphorus, lack of detail for achieving agricultural pollution reductions, over reliance on an expanded nutrient trading program and unrealistic goals for pollution reductions from existing urban areas and septic systems. JRA also has a special interest in Virginia's proposal to review the James River chlorophyll standards. JRA urges EPA to use its legal authority and technical expertise to ensure that the final Virginia WIP appropriately addresses these concerns and provides a cost-effective plan that achieves a fully healthy James River.

Response

See response to Comment No. 0262-cp.001.002. For the James River comment, please see response to comment # 0293.1.001.017.

Comment ID 0614.1.001.007

Author Name: Street William

Organization: James River Association (JRA)

The Draft WIP Does Not Meet James River Pollution Limits - One of JRA's greatest concerns with the Draft WIP is that it fails to meet the pollution limit that is needed to achieve Virginia's water quality standards for the James River. Virginia's WIP states that it will only meet 60% of the needed pollution reductions even though those standards are attainable through available technology and a similar level of effort that is being implemented in other basins.

Instead of meeting the current James River algae standards, the draft Virginia WIP proposes to review the standards and potentially change them before any additional reductions are planned. While JRA recognizes that the James River algae standard will be reviewed as part of Virginia's 2011 triennial review of all water quality standards, JRA maintains that it is inappropriate to compromise the requirement of the TMDL and WIP of meeting water quality standards based on possible future actions. The Draft WIP should be revised to include actions necessary to fully meet the James River allocation by 2025. Not only will this better meet federal and state requirements, it also will maximize the planning time for the additional actions. After the re-assessment of the algae standards, if some reductions are not necessary to achieve water quality standards, they can more easily be eliminated than added at that time.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. In its final WIP Virginia committed to require WWTP upgrades in the James River Basin along with other sectors sufficient to achieve 100% of the James River Basin waste load allocations. (WLAs). See Section 8 of the TMDL for further discussion. EPA agrees with the that the Bay TMDL allocations are for attaining the current water quality standards (WQS) as required by the Clean Water Act (CWA). The TMDL is required to use the current chlorophyll-a criteria as the basis for James River allocations. If Virginia does modify their WQS for the James River in the future, Virginia is required by the CWA to submit those modifications to EPA for review and approval or disapproval before becoming effective. For a discussion of the James River in the final Virginia WIP and final TMDL, see Comment No. 0293.1.001.017 and Section 8 of the final TMDL report.

Many Actions in the Draft WIP Are Unclear - Although specific programs and policies and even draft legislation were developed and proposed by the state agencies, the draft WIP removed nearly all references to specific policy actions that would be proposed. This calls into question how the needed actions will be achieved and undermines the credibility of the plan and the assurance that the plan will be implemented sufficiently to achieve water quality standards. We

recognize that the plan itself cannot commit to certain actions if they require legislative approval, but the plan can and should provide a clear picture of what mechanisms will be pursued.

Urban - The pollution reductions proposed in the Draft WIP for existing urban areas are set at the absolute highest levels that are technically feasible. It is widely understood that pollution reductions from retrofitting existing urban areas are the most expensive to achieve and that implementation at this level is unrealistic. Even though the Draft WIP states that the expanded nutrient trading program will be utilized to achieve these reductions in a cost effective manner, placing this level of burden solely on local governments rather than across all sectors makes the plan inequitable and therefore subject to challenge. Additionally, given the difficult financial position of most local governments, the practicality of relying so heavily on them is questionable.

JRA supports including the following elements in the final WIP:

--Set the waste load allocation for existing urban areas at least at Tier 2 level reductions or Tier 3 levels if needed to achieve particular basin allocations.

--Set a corresponding performance standard for each urban area based on applying the appropriate Tier 2 or Tier 3 level reductions to its specific land covers. This will provide flexibility to the locality in selecting the pollution reducing BMP's. This performance standard should be implemented through the MS4 permit for the urban area.

--Utilize the Clean Water Act "residual authority" to establish a permit mechanism for all urban areas that will be subject to a Phase II WIP allocations.

--Establish urban fertilizer regulations that ban the sale of phosphorus fertilizers except in starter fertilizers and organic-based fertilizers, and require slow release nitrogen formulations or the equivalent.

--As state in the Draft WIP, require new development to keep pollution loads below the allowable 2025 average nutrient loads per acre from previous land uses, so future development does not increase nutrient loads. This standard should be implemented through the state stormwater regulations due to be completed by December 2011.

--Require at least 20% reduction in pollution loads from redevelopment projects with greater requirements for larger and less pervious sites that have the capability to achieve greater reductions with more advanced treatment practices.

--Strengthen erosion and sediment controls on construction sites by requiring all "responsible land disturbers" to be trained or be a Professional Engineer and improving the timing of disturbed area seeding/stabilizing and sediment trap sizing.

Subject: Public Comments to Virginia's Draft Phase I Watershed Implementation Plan (WIP)

Dear Secretary Domenech,

I would first like to commend you, your staff, state agencies and the Stakeholder Advisory Group in preparing what appears to be a practical, common sense based response to the federal EPA mandate that all participating states prepare a Draft Phase I Watershed Implementation Plan by September 1, 2010. The preamble contained in the introduction to this document speaks volumes to the level of sensitivity that Governor McDonnell's administration has acknowledged with great concern regarding the enormous potential economic impact that this initiative will likely impose on the people of the Commonwealth of Virginia.

In response to the issuance of the Public Review Draft of the subject WIP and on behalf of myself and several concerned rural residents of Rockingham County who have endorsed this document, I would like to respectfully offer comments specifically addressing the proposed provisions relating to Onsite/Septic systems as a contributing source of nutrients to the watershed. In the interest of brevity, I will limit my rather general comments to the bullet points outlining source sector strategies on page 12 of the document as opposed to the more detailed discussions in Section 8 on page 81.

Implement amendments to Virginia Department of Health regulations for alternative systems (currently under revision).

Emergency regulations recently adopted relating to alternative systems are evidence of the unanticipated consequences of a "hasty" regulatory move toward the more complex and technologically sophisticated alternative onsite systems that were perceived to be more effective at protecting the environment than the time proven conventional onsite septic systems. While these systems are highly effective at reducing nitrogen loss, they only do so when they are functioning as designed, installed and commissioned.

Consider revisions to the Code of Virginia to require all new and replacement systems in the Chesapeake Bay watershed to utilize either: (1) "shallow-placed" systems capable of reducing nitrogen loss (2) denitrification technology to reduce nitrogen loss.

OR

Consider requirements for additional nitrogen reducing technologies in certain defined sensitive areas.

Given the complex design of alternative systems and potential ramifications of a failure of any number of components, it might behoove the Commonwealth to re-review the site specific conditions that typically drive us toward a decision to mandate an alternative system in lieu of a conventional system which may not be as effective at reducing nitrogen loss on a daily basis, but is potentially more effective at consistently discharging a relatively high quality low BOD effluent in the long run due to the inherent reliability of such systems. Perhaps the decision between a conventional and alternative system should consider and more heavily weigh the environmental sensitivity of the site regarding relative proximity to impaired streams and not just the raw soils analysis data and drainage test results. It baffles me as to how some 50 year old conventional systems with relatively small drain fields can continue to provide excellent sub-soil drainage while the same locations would not pass a percolation test imposing today's standards. Could it be that we have gone too far with the standards? A decision to mandate an alternative design should be a last resort action. Conventional systems have many design advantages that are overlooked by those that would advocate alternative systems simply because of the superior nutrient removal efficiency of the alternative system.

- Alternative systems consume energy for blowers and pumps. The generation of that energy produces nitrogen in the form of nitrous oxide which eventually ends up in the bay. One third of the nitrogen in the bay comes from air sources. The power generation also produces carbon which is suspected of causing climate change. The conventional system has a zero carbon footprint.
- Alternative systems depend on the reliability of the electrical system and all electrical components that make up the system. The conventional system relies on gravity which is among the most reliable forms of renewable energy on the planet.
- Alternative systems are much more expensive than conventional systems. On-site systems are indigenous to the most rural areas of Virginia, the very same areas that frequently fall into a lower socio-economic environment where median incomes are typically lower than in those developed areas where public utilities services exist in abundance. Forcing the more expensive alternative system on these Virginians unfairly places a higher per capita bay cleanup cost on those that can least afford it. This in itself will be the greatest challenge in implementing a WIP that incorporates stringent standards unilaterally on the rural community without regard for system size, potential environmental impact and other factors.

Having stated the concern of a perceived tendency to more often than not and perhaps unnecessarily mandating the more complex and costly system(s), I fully support the development and implementation of regulations that address the need to insure ongoing knowledgeable operation and maintenance of these complex systems once they are determined to be necessary, commissioned and turned over to the property owner. However, I would also point out that conventional systems can be prone to the same potential pit fall of failing if the owner of same is not knowledgeable of certain basic operating and lifestyle guidelines when living with any onsite system. A wise rule of thumb here is "An ounce of prevention is worth a pound of cure." I would therefore highly support as part of the WIP more public education on how to care for an onsite system. Those of us that are intimately familiar with how to keep a conventional system functioning trouble free for years know that the following guidelines are critical:

- Don't hydraulically overload the system. Conserve water and thus influent flow. Excess hydraulic loading will wash

solids into the drain field causing damage.

- Don't organically overload the system. Avoid putting food waste down the kitchen sink and abide by the design of the system relative to persons served.
- Don't chemically shock load the system. Avoid heavily chlorinated household cleaners and sanitizing soaps favoring more organic options that will not upset the bio-mass in the septic tank. Biodegradable cleaning products and plain soap.
- Don't overload the system with solids such as paper and hygiene products.
- Do promote healthy bio activity in the system. While there are commercially available products available, an occasional dose of sour milk will also work.
- Last but not least, pump the system once every 5 years to remove excess solids.

Consider revisions to the Code of Virginia to encourage the use of community onsite systems.

Encouraging the use of community onsite systems will almost invariably result in the installation of more alternative systems which have already been discussed at length in regard to advantages and disadvantages. While one might suspect that amendments to the Virginia Department of Health Regulations requiring the assignment of licensed or certified operators to these systems would address most concerns about who will be responsible for community systems, it is highly likely that the locality may end up taking over operation in some cases. A system that is not owned by an individual entity but perhaps by a home owners association or other organization which may or may not be diligent in it's duties could become a liability to others. That being the case, promotion of community systems could become an unfunded mandate on the locality and thus the tax payers supporting that locality. This would be inherently unfair to the tax payers and for that reason, I would oppose same without including provisions to establish either sanitary districts or authorities where those contributing flow to the community system would be fully burdened with costs. Again the challenge will be the economics, as these systems may or may not be affordable to many of the rural residents of Virginia that might have these systems imposed on them in the lower income communities.

Expand the Nutrient Credit Exchange Program to include onsite systems and allow offsets of new septic loads or participation in offsetting increased nitrogen loads from additional onsite systems from other areas within the Chesapeake Bay Watershed

In general this is a good idea. Perhaps a pool or bank of credits could be reserved for assisting certain rural residents that would otherwise not be able to afford upgrades. These credits could be funded by grants or could be offered at a discount rate based on a needs analysis on a case by case basis. Perhaps a system similar to the program that provides funding for septic system pump outs in sensitive areas could be incorporated.

Explore the feasibility of establishing tax credits or other financial incentives for upgrade/replacement of existing conventional systems with nitrogen reducing systems.

Notwithstanding previous comments regarding the apparent trend to advocate alternative systems, I believe any free market based approach to encouraging a particular desired behavior is always better than a government mandated approach. Hence, if it is the opinion of the majority of stakeholders in this WIP that we want to encourage more alternative systems before they have actually proven their worthiness to improve upon the environmental impacts of onsite systems in general, than I would support the use of a tax credit or other financial incentive. However, let's keep in mind that "Cash for Clunkers" was not exactly an overwhelming success in doing anything more than wasting a lot of

tax payer dollars and increasing the deficit. Such a program extended to the world of existing onsite systems could be an equally ineffective endeavor.

Explore the use of grants or other methods to defray expenses on low and moderate income households.

Explore the use of "Betterment Loans" for repairs to existing systems.

As stated previously, anything we impose on the users of onsite systems is going to potentially have a significant negative economic impact on many of those that can least afford it and will unfairly burden those Virginians with a disproportionate share of the economic responsibility for addressing the Chesapeake Bay watershed. I would therefore fully support any methodology to reduce this burden as much as possible.

I would point out that onsite systems are:

- Necessary in rural areas of the Commonwealth as it is simply not feasible or economically practical to consider expanding public service in rural counties beyond what the private sector market based development activity can justify.
- Provide safe, effective treatment of typical low organic loading from single family homes and small businesses.
- Reduce the potential for phosphorus loss unlike centralized treatment plants.
- Provide a valuable source of recharge for the aquifers that rural residents rely upon for well water supplies.

If there is any one common thread that weaves through many of the issues surrounding the subject of nutrient contributions from onsite systems and how best to address those issues, it is the economic impact to a specific sector of the public; i.e. those that must reside or do business in the rural areas of the Commonwealth. Hence, the final argument that I would make regarding how best to manage the situation is that one size or one set of solutions does not fit all circumstances. Therefore, the WIP must be flexible in how it approaches the various different circumstances. The concept of targeting the more environmentally sensitive areas with the more stringent requirements is a good start because at least it minimizes the sheer number of people that are adversely impacted. However, the WIP needs to go farther in addressing for example the difference in the magnitude of the source. As an example, the small two bedroom 1000 square foot single family dwelling contributes less volume flow than the sprawling six bedroom 6000 square foot gentleman's farm mansion while both might sit side by side out in the country. Would it be fair to look at both systems through the same prism, the same set of standards that blindly mandate an alternative system with the same effluent concentration guidelines? Or would it not make more sense to allow a lower cost system with perhaps a more relaxed effluent standard for the small unit than the larger unit thus imposing the higher cost system and higher standard of treatment on the property owner that is in the better economic position to absorb the majority of the net impact of the regulation?

In closing I offer one final comment on a broader note. Challenging the motive, methodology and timing of what appears to be a Federal EPA fast track plan that has the potential to seriously impact the financial well being of 17 million Americans living through the worst economy in a generation and 88,000 farms struggling to remain competitive is a noble effort on the part of the Commonwealth's leadership. Even slowing this process down will help all of us that find ourselves in the unenviable position of living and working within the 64,000 square mile watershed that is ground zero in the cross hairs of big government. Therefore, I would urge the current administration to do everything in it's power to minimize the impacts and delay the actions that this initiative might impose on the citizens of Virginia in hope that it will not impede an economic recovery. Without economic recovery and the necessary tax revenues to properly implement

the proposed plan with adequate federal and state funding, we are sure to fail again and do nothing to help the health and well being of the Chesapeake Bay and those that rely on this body of water for their livelihood.

Author Name: Lynch I.

Organization:

SUBJECT: The Virginia Watershed Implementation Plan (WIP) for the Chesapeake Bay Total Maximum Daily Load (TMDL)

Dear Sir or Madam:

(1). The U. S. President's May 12, 2009, Chesapeake Executive Order (EO) 13508, Action Plan FY 2011, includes only a brief section on implementation and accountability efforts. The September 9, 2009, Federal Leadership Committee (FLC) also failed to explicitly (clearly, plainly express, or state transparently) define accountability instructions, goals, and/or their time-frames. The public needs more definite accountability instructions from the President and the FLC.

(2). The "Arc News" magazine, Fall 2010 article, "Chesapeake Bay Restoration Made Transparent to Public: Program Builds Web-Based Accountability Tool" stated that the success of the Maryland's Stat Web-based reporting and accountability (transparency) computer tools [established at the May 2009, Maryland Executive Council meeting] influenced the Chesapeake Bay Program (CBP) [federal government] implementation and accountability efforts to form a Chesapeake Stat team to create a similar computer tool. The Chesapeake Stat is built, in part, on the Arc GIS Server, and Arc GIS API for Flex. The Office of Inspector General (OIG) and auditors (federal, state, and/or local) have not reviewed either computer tool (state, and/or federal) to determine whether either is inclusive (comprehensive, having a broad understanding, precise, beyond reproach and disgrace) or not. There is no assurance whether this computer tool protects the public's interest, money, and/or communities. The public definitely needs the OIG and auditors to determine if this computer tool is:

- (a). as transparent and accountable as it is so glamorously advertised.
- (b). as transparent as the title of the magazine article leads the public to believe.
- (c). if it is all-that inclusive, and precise.

(3). The "WIP" to clean-up the Chesapeake Bay is relatively sound. The plan however does not have very-much independent over-sight of the "WIP". This lack of independent over-sight is also very-evident in many other expensive federal long-term projects. Lack of independent over-sight is the norm in the three (3) governments (local, state, and/or federal). The OIG and/or auditors are not mentioned in the plan as over-seers before, during, and/or after any critical-intervals to determine if the three (3) governments (federal, state and/or local) are complying with the plan. The lack of

having a strong presence (close-oversight) of the OIG and/or auditors in the "WIP" is of great concern. The public does not need the OIG and auditors as a last-minute (in-a-rush, hasty, and/or knee-jerk) adjustment (late addition, addendum, and/or amendment) to the "WIP". The public needs the OIG and auditors mentioned up-front and right-now in the "WIP". Why are the OIG and/or auditors not mentioned as a key-integral part in the "WIP"?

(4). There are medical (health) consequences when clean-water for recreation, drinking and other purposes is not available. Can citizens sue if not having clean-water is linked to their medical problems?

(5). Lack of money will undoubtedly be a factor for the three (3) governments (local, state and/or federal) not being able to comply with the plan. At what point, will there be monetary-consequences (penalties and/or fines) for not being able to comply? What will be the monetary consequences to each government for their failures? Will one state be able to blame another state for their state not being able to comply with "EPA" because of cross-pollution, cross-contamination, cross-dilution cross-spillage and/or residual pollution?

(6). Enforcing the "WIP" is a matter that will definitely need the "Federal Court" system to resolve. The citizens will need "Equal Access to Justice Act" (EAJA) money and lawyers to enforce their rights and concerns. Why is this not in the "WIP"?

(7). Documenting, cataloging, and storing (preserving detail) the four (4) Science, Technology, Engineering, and Mathematics (STEM) teams [the first (1st) STEM team] procedures, notes, findings, unknowns, ambiguous-detail, possible-outcomes, solutions, and reports will play a vital-role in finishing the "WIP" before the EPA due date. Guidelines for improved-science (new discoveries) and improved-monitoring data have not been addressed in the "WIP". Passing on leads about problems and delimas to other OIG and/or auditors is essential in multi-level and multiple-jurisdictions' inspections and audits. Who will be the overseer (OIG and/or auditor) for the three (3) governments (local, state, and federal) overseeing the four (4) STEM teams documentation? How will the three (3) overseers (local, state, and federal) use each other's "YEARLY" OIG and/or audit reports so as to follow-up on leads from each other's "YEARLY" reports?

(8). The "WIP" that will be presented at the 2012 year session of the Virginia General Assembly (legislative branch) did not and perhaps will not outline accountability (transparency), and over-sight (OIG and auditors). Useful and accurate bookkeeping and accounting records have not been adequately-explained in-detail (in layman's terms and/or in Plain-English) in the "WIP". This will be a problem as numerous audit findings and consulting reports have heavily-criticized many of the three (3) governments (local, state, and federal) expensive long-term projects. What entity at a higher/independent level will oversee the "WEEKLY" and/or "MONTHLY" bookkeeping and accounting reports of these three (3) governments (local, state, and federal)?

(9). STEM team (the first (1st) STEM team) records' and reports' transparency (highly-visible and/or in plain-sight at all times), bookkeeping, and accounting records' transparency to the public has historically been a problem. At what intervals ("WEEKLY" and/or "MONTHLY") will these three (3) governments (local, state, and federal) be mandated to present these records and reports on a timely basis to the public? And what will be the definition of timely?

(10). A second (2nd) STEM team of independent commercial and government scientist, technologist, engineers, and mathematicians (STEM) team needs to accompany (go-along with, and/or augment) the auditors, and OIG (6 independent overseers) to offer additional help (assist, provide written expert-opinions, and affirm/deny others' solutions

to the development and implementation of the "WIP") is definitely needed to provide constant reviews of the numerous-volumes of paperwork that will be prepared and filed during this arduous and lengthy experimental, developmental, and operational process. Guidelines for improved-science (new discoveries) and improved-monitoring data have not been addressed in the "WIP". Not having (leaving-out, omitting, and/or failing to include) these six (6) independent overseers in the over-sight process would be a wholesale-mistake, require multiple-trials and create unnecessary-errors. The aforementioned needed corrections to the "WIP" will cost millions of dollars. If these aforementioned corrections are not implemented, the cost to the taxpayers will be in the billions of additional dollars to correct these avoidable errors and mistakes.

(11). The public needs as definite as possible an assurance (guarantee, make certain, and/or make completely sure) that protection and restoration of water-quality is at the top of the list of the "WIP" goals. A high expectation but within reason no-holes-barred (at-all-cost) approach should be adhered to as closely as possible. The public will definitely need "YEARLY" public comment periods.

(12). The U. S. President's EO 13508, Action Plan FY 2011, and the FLC covers six (6) states (Delaware, Maryland, New York, Pennsylvania, West Virginia, and Virginia) and the District of Columbia (DC) [seven (7) governments]. The FLC did not (failed to) address over-sight collaboration (working together on scientific efforts) among the six (6) overseers [the four (4) STEM teams, OIG, and auditors] of the six (6) states and DC [seven (7) governments].

Response

The President's Chesapeake Bay Protection and Restoration Executive Order 13508 calls for the federal government to lead a renewed effort to restore and protect the Chesapeake Bay and its watershed. To bring the full weight of the federal government to address the Bay's challenges, the Executive Order established the Federal Leadership committee which is chaired by the Administrator of the EPA. EPA's Chesapeake Bay nitrogen, phosphorus and sediment TMDL is a part of an overall strategy in setting measurable goals for improving the water quality in the Bay and providing accountability to ensure that those goals are met. EPA and this TMDL do not have the authority to instruct or change the President's Executive Order.

While EPA appreciates the commenter's concerns and interest in Maryland's Web-Based Accountability Tool and the commenter's desire for independent oversight for a more accurate and transparent tool, EPA has no authority over the Office of Inspector General and has no authority to direct the OIG's decisions to audit or evaluate EPA or State activities. The Office of Inspector General is an independent office within EPA that helps the Agency protect the environment in a more efficient and cost effective manner. For more information about the OIG and their mission and to contact the OIG, please see their website located at http://www.epa.gov/oig/about_epa_oig.htm. For these same reasons, it would be inappropriate for Maryland WIP's to include activities for the OIG.

With regards to a citizen's right to sue, this TMDL does not take away or add any right for any citizen to litigate as allowed under the laws within the United States. In addition, This TMDL does not provide EPA or States' any more or any less enforcement authority as allowed by the CWA. EPA and States will not be enforcing State WIPs. Rather States will be implementing their WIPs by providing, among other things, NPDES permits effluent limits consistent with the WLAs and the TMDL, as appropriate. State and federal agencies will continue to use their enforcement authority under the CWA to ensure compliance with those permits. Regarding comments directed at funding, please refer to response to comment 0038.1.001.024.

Regarding comments about the Equal Access to Justice Act" (EAJA), this Act provides for the award of attorney fees and other expenses to eligible individuals and organizations that are parties to litigation against the government and prevails in its litigation against the government. A Jurisdiction WIPs are implementation plans to reduce nitrogen, phosphorus and sediment loads as outlined by the TMDL, not a plan for providing funds to award to attorney fees to those who litigate against the TMDL or the WIP.

EPA is documenting and storing all activities related to the development of Chesapeake Bay TMDL. WIPs are jurisdiction watershed implementation plans that identify programs to reduce pollutant loadings to meet the TMDL allocations. Jurisdictions are responsible for the development of the WIPs and any documentation as required by State and federal law. With regards to comments directed at State WIP activities, please refer to response to comment 0034-cp.001.001. EPA does not agree with the commenter that auditors or the OIG is needed to in order to effectively implement the TMDL. EPA and the Jurisdictions have developed an accountability framework which includes the WIPs with a goal of installing all controls necessary to achieve the Bay's water quality standards by 2025. Please refer to Section 8 of the TMDL for more information regarding the WIPs.

We all want clean water for Virginia and the other areas of the Chesapeake Bay watershed. Unfortunately, Virginia's draft Watershed Implementation Plan fails to take the necessary steps to clean Virginia's rivers, lakes and streams that flow into the Chesapeake Bay. Virginia's cleanup plan should be strengthened to assure success, with a step-by-step procedure which includes mandates, funding and deadlines. The plan should include:

- Additional pollution reductions from sewage treatment plants on the lower James River Basin;
- Real mandates and incentives to reduce polluted runoff from cities and farms; and
- Specific two-year actions to achieve actual pollution reductions over the next 15 years in order to have all actions in place by 2025.

- Additional pollution reductions from sewage treatment plants on the lower James River Basin;
- Real mandates and incentives to reduce polluted runoff from cities and farms; and
- Specific two-year actions to achieve actual pollution reductions over the next 15 years in order to have all actions in place by 2025.

Organization:

We all want clean water for Virginia and the other areas of the Chesapeake Bay watershed. Unfortunately Virginia's draft Watershed Implementation Plan fails to take the necessary steps to clean Virginia's rivers, lakes and streams that flow into the Chesapeake Bay. Virginia's cleanup plan should be strengthened to assure success, with a step-by-step procedure which includes mandates, funding and deadlines. The plan should include:

- Additional pollution reductions from sewage treatment plants on the lower James River Basin;
- Real mandates and incentives to reduce polluted runoff from cities and farms; and
- Specific two-year actions to achieve actual pollution reductions over the next 15 years in order to have all actions in place by 2025.

Comments on Chesapeake Bay TMDL Phase 1 Watershed Implementation Plan prepared by the Commonwealth of Virginia

Dear Sir/Madam:

On behalf of the Chesapeake Bay Foundation's (CBF's) 89,000 members in Virginia, please accept this letter as formal comment on the Chesapeake Bay TMDL Phase 1 Watershed Implementation Plan (draft WIP) prepared by the Commonwealth of Virginia and submitted to the U.S. Environmental Protection Agency (EPA) on September 3, 2010. [FN1] We very much appreciate the dedication of the many state agency staff that contributed to the draft WIP. We further thank the Commonwealth for the opportunity to comment upon this critical work.

Unfortunately, CBF finds that the draft WIP falls far short of providing assurance that actions will be taken by 2025 to achieve the reductions in nitrogen (TN), phosphorus (TP), and sediment pollution called for in the Chesapeake Bay Total Maximum Daily Load (Bay TMDL). [FN2] Promising ideas in the draft WIP are overshadowed by the failure to attain the TMDL allocations in the James River basin and a critical lack of "reasonable assurance," that is, the details, commitments, and accountability needed to cut pollution, particularly nonpoint source (NPS) pollution. Considering the long history of the Bay clean-up effort, the constructive exchange of ideas within the Stakeholder Advisory Group (SAG) over the last year, and the many ambitious new concepts for delivering pollution reductions put forward in earlier versions of the WIP, the draft WIP as submitted to EPA is a significant disappointment.

As has been voiced by EPA and diverse state interests since the release of the draft WIP, CBF concurs that a solution by Virginia for Virginia is best. There is no question that this approach allows a deeper chest of tools and more flexibility in how to achieve the Bay TMDL than is afforded outside entities.

With that belief in mind, herein, CBF provides specific comments to facilitate improvements to the draft WIP. In Section I we describe requirements under the law for Virginia's creation of a WIP that meets TMDL allocations with a high level of reasonable assurance and in Section II we demonstrate that the draft WIP does not approach providing reasonable assurance. Section III provides a summary of our recommended revisions to the draft WIP, and the attached Exhibit 1 provides a detailed evaluation of the draft WIP and specific recommendations on how to create a final WIP that meets TMDL goals. Our recommendations are focused on reducing TN and TP pollution, so the terms "nutrient pollution" and "pollution" used hereinafter refer to these pollutants. In Section IV we offer a revised set of pollution allocations, which only deviate from the pollution allocations envisioned in the Commonwealth's August 24, 2010 "discussion draft" by requiring additional reductions from the wastewater source sector. [FN3] Section V highlights the economic benefits of clean water, and the attached Exhibit 2 extensively documents this fact.[Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1] And lastly, Section VI closes the comments by discussing the economic benefits of clean water and the current state of affairs that justify a new approach to cleaning the Bay and its rivers.

We believe a final WIP that incorporates our recommendations can achieve our revised pollution allocations, and will be achievable, accountable, and give Virginia assurance that the Bay TMDL will be met. Submittal of such a final WIP by the Commonwealth will allow the McDonnell Administration to do something seven previous Governors have failed to do: once and for all to meet their obligation under the Virginia Constitution, state as well as federal law, and multiple agreements to protect the Bay and its rivers from pollution. CBF has, and will continue, to hold EPA to this same high standard when evaluating the draft Bay TMDL. We hereby incorporate by reference the written comments of CBF, the Choose Clean Water Coalition, and Rebecca Hanmer on the Bay TMDL submitted to EPA under Docket no. EPA-R03-OW-2010- 0736.

In the event that the Administration does not take this last opportunity seriously, and .again submits a WIP that fails to

provide reasonable assurance, we firmly stand behind EPA's proposal to approve a "backstop" TMDL, use its "residual authority" to establish more stringent requirements for NPS, and take other appropriate actions to ensure the Bay is finally put on a more certain path toward restoration. It is EPA's duty under the Clean Water Act to protect our waters if Virginia fails to do so.

The Commonwealth and the other six Bay jurisdictions have made important progress reducing pollution. However, the evidence is clear that our mostly voluntary efforts to cut the pollution running off the lands that house and feed our growing population have not, and will not, finish the job. Our recommendations are specifically intended to help solve the growing problem of NPS pollution.

We now have before us a once-in-a-lifetime opportunity to move beyond 30 years of obligations and vital, yet partial, progress to once and for all protect the Bay and its rivers, and in turn, safeguard the hundreds of thousands of jobs and tens of billions in annual economic activity these waters increasingly struggle to sustain. Our efforts today will prevent another generation of the Bay region's children from inheriting our mess .

I. The Clean Water Act and Virginia Law Require that Virginia Adopt an Adequate Watershed Implementation Plan that Meets Bay TMDL Allocations and Provides Reasonable Assurances that Necessary Pollution Reductions Will be Achieved.

Virginia's responsibility to develop an adequate WIP that meets the Bay TMDL allocations and provides reasonable assurances of required pollution reductions is founded, contrary to suggestions in the draft WIP, [FN4] on the firm requirements of both state and federal law .

A. Under the Clean Water Act, TMDLs Must Be Established at Levels Meeting Water Quality Standards and Be Adequately Implemented.

The Clean Water Act (CWA) [FN5] and implementing regulations provide the basis on which the draft WIP must be evaluated. Enacted in 1972 to compel the restoration of the nation's waters [FN 6] the CWA requires the states to establish water quality standards for the waters within their boundaries and to take the necessary actions to ensure that the waters meet those standards, thereby achieving CWA's goals . If a state does not promulgate water quality standards or falls short of CWA requirements in doing so, EPA will set the standards for the state. [FN7] The CWA prescribes the use of technology-based effluent limitations for most point source discharges [FN 8], and if those measures do not achieve water quality standards, CWA requires the use of water quality-based controls under Section 303(d). [FN9]

The draft WIP forms part of the CWA's § 303(d) TMDL program, which requires identification and listing of all impaired water bodies within a state's borders. For each impaired water body, Section 303 and implementing regulations require the state to establish a TMDL for specified pollutants. [FN10] A TMDL is the maximum amount of a pollutant--from background, point and nonpoint sources, together with a margin of safety--that the water body can receive and still attain water quality standards. [FN11] These requirements apply to both point and nonpoint sources of pollution. [FN12] When triggered by CWA requirements, the states and EPA are required to establish a TMDL, as courts have recognized. [FN13]

Once a TMDL is established and approved by EPA, the state must adequately implement it to ensure water quality

goals are attained. Thus, CWA § 303(e)(1) requires each state to have a continuing planning process that results in implementation plans for all navigable waters within state boundaries, which include effluent limitations and compliance schedules as required, §303(d) TMDLs for pollutants, and "adequate implementation, including schedules of compliance, for revised or new water quality standards." [FN14] Resorting to a TMDL is the CWA's "backup" strategy for achieving water quality standards; it is invoked when point source permits and best management practices (BMPs) for NPS have not succeeded. [FN15] Accordingly, EPA may only approve a state-submitted implementation plan that provides assurances it will succeed in "implement [ing] applicable water quality standards." [FN16]

What constitutes reasonable assurances will vary depending on the water body and the pollution sources at issue. [FN17] In the case of TMDLs for waters impaired only by point sources., National Pollutant Discharge Elimination System (NPDES) permitting may be sufficient to provide reasonable assurance that the TMDL's waste load allocations (WLAs) will be achieved. For waters impaired by both point and nonpoint sources, a TMDL may not allocate WLAs based on an assumption that NPS load reductions will occur unless the TMDL provides reasonable assurances that NPS control measures will achieve expected load reductions. [FN18] The bottom line is clear, however: to carry out CWA's command to ensure water quality standards are attained, EPA must be able to determine that a plan's claimed load allocations are not based on excessively optimistic hopes concerning the amount of NPS pollutant reductions that will occur. "If the reductions embodied in load allocations are not fully achieved because of a failure to fully implement needed NPS controls, the collective reductions from point and NPS will not result in attainment of the water quality standards." [FN 19]

B. Under Virginia Law, TMDLs Must Be Established at Levels Meeting Water Quality Standards and Be Adequately Implemented.

The requirement that Virginia adopt an adequate plan to implement a TMDL for impaired waters has been part of the law of the Commonwealth for many years. In fact, even before the enactment of the CWA, the Commonwealth was committed to both protecting and restoring state ...waters. The Constitution of Virginia proclaims, "To the end that the people have . . .pure water it shall be the policy of the Commonwealth . . . to protect its . . . waters from pollution, impairment, or destruction, for the benefit, enjoyment, and general welfare of the people of the Commonwealth." [FN 20] In 1950, the General Assembly first enacted Virginia's State Water Control Law (SWCL), [FN 21] which reaffirms the Commonwealth's obligation to protect high-quality state waters and to restore "all other state waters to such condition of quality that any such water will permit all reasonable public uses and will support the propagation and growth of all aquatic life including game fish, which might reasonably be expected to inhabit them." [FN 22]

Building on these foundational laws, Virginia adopted the requirements of the CWA §303(d) program, along with other measures to protect water quality. [FN 23] Thus, the General Assembly mandated that the State Water Control Board (Board) prepare CWA § 303(d) reports that identify state waters impaired by nutrients, sediments, and other pollutants and determine the impairments' causes among point and NPS. [FN 24] The Board is specifically required to "develop and implement a plan to achieve fully supporting status" -- defined as "meeting the fishable and swimmable goals of the CWA" -- for impaired waters . [FN 25] The implementation plans must state the date of expected completion, measurable goals, necessary corrective actions, the associated costs, benefits, the and environmental impacts of addressing impairment, and expeditious development and implementation of total maximum daily loads. [FN 26]

These statutes leave no doubt that the CWA governs Virginia's implementation plan including the draft WIP at issue. Indeed, it commands the Board to "develop and implement pursuant to a schedule total maximum daily loads of

pollutants that may enter the water for each impaired water body as required by the Clean Water Act." [FN 27] Accordingly, the adequacy of draft WIP at issue here must be measured against the CWA requirements, including the requirements of meeting the Bay TMDL's allocations and providing reasonable assurances of pollutant load reductions.

C. EPA Is Required by CWA §§ 303(d) and 117(g) to Issue the Bay TMDL and Proceed with the TMDL Process.

EPA is authorized to issue the Bay TMDL and proceed with the Bay TMDL process as a result of the Bay waters' § 303(d) listing, the failure of Virginia and other Bay states to prepare required TMDLs, and CWA § 117(g) .

The long history of and incomplete progress in restoring the Bay are well documented. Over the course of the last 25 and more years, the Bay jurisdictions and the federal government have committed and re-committed themselves to the goal of restoring the waters of the Chesapeake Bay and tidal tributaries . See, e.g., 1983 Chesapeake Bay Agreement (agreement by the governors of Maryland, Virginia, and Pennsylvania, the District of Columbia mayor, the chairman of the Chesapeake Bay Commission, and the EPA Administrator to form the Chesapeake Bay Executive Council to implement plans for protecting Bay water quality) ; 1987 Chesapeake Bay Agreement (agreement by same parties to a 40 percent reduction in point source nutrient pollution and development of a Bay-wide implementation strategy by 2000) and 1991 reevaluation (agreement requiring quantification of the original reduction goals, including "tributary nutrient load allocation") ; 1992 amendment of 1987 Agreement (agreement requiring implementation of tributary-specific strategies to meet Bay water quality goals).

The Chesapeake 2000 agreement commenced a new stage in Bay restoration . The region's jurisdictions, together with the EPA Administrator and the Chesapeake Bay Commission chairman, agreed to implement revised tributary strategies by 2002 and to reduce nutrient and sediment pollution sufficiently to remove the Bay and tidal tributaries from the § 303(d) list by 2010. In 2003, EPA and its watershed partners established nutrient and sediment cap loads on the basis of Bay water quality model projections and allocated those loads among the major river basins as implemented by the tributary strategies. In and around 2004, Virginia, Maryland, and Pennsylvania all passed legislation to create the Chesapeake Bay Commission to assist state legislatures in responding to problems relating to the Bay. [FN 28] In 2004, as well, Virginia and the other six Bay jurisdictions developed what became known as the Chesapeake Bay Tributary Strategies which outlined river basin-specific implementation activities to reduce nutrients and sediment from point and NPS . The tributary strategies led to WLAs and LAs for the river basins that were set at levels very close to those recently stated in the Bay TMDL. In 2005, Virginia, Maryland, and Pennsylvania completed their Tributary Strategies for each major river basin. [FN 29] In 2007, EPA and the Bay jurisdictions reevaluated the tributary strategy nutrient and sediment cap loads and found that sufficient progress had not been made.

While each of these endeavors may have yielded some benefits, they did not lead to removal of the Bay and tidal tributaries from Maryland or Virginia's list of impaired water. [FN 30] Bay waters were included on Virginia's 1998 § 303(d) list, giving rise to the Commonwealth's obligation under the CWA obligation to prepare a TMDL for those waters . Virginia never prepared such a TMDL. Instead, it requested that EPA do so [FN 31] in accordance with a schedule established in a consent decree resolving the American Canoe Assn, et al. v. EPA litigation. [FN 32] Propelled by American Canoe, other consent decrees, memoranda of understanding, and settlement agreements, [FN 33] EPA commenced the process of preparing the TMDL, pursuant to CWA §§ 117(g) and 303(d), and current case law. Section 117(g) directs the EPA Administrator in coordination with the Chesapeake Executive Council to "ensure that management plans are developed and implementation is begun by signatories to the Chesapeake Bay agreement, to achieve and maintain . . .the nutrient goals of the Chesapeake Bay Agreement for the quantity of nitrogen and

phosphorus entering the Chesapeake Bay and its watershed. .." [FN 34] The Bay TMDL, which sets sediments and Bay nutrient target loadings, is such a management plan.

In view of the decisions of Virginia and other Bay states not to establish TMDLs for impaired Bay waters as required by CWA 303(d), the fact that the impaired Bay waters constitute a multi-state system impaired by pollutant loadings from seven jurisdictions, and that EPA acts pursuant to the consensus direction of the Chesapeake Executive Council's Principals Staff Committee, EPA's decision to proceed with the TMDL is fully authorized. [FN 35] Indeed, that decision embodies the directive in Executive Order 13508 that EPA "make full use of its authorities the CWA." [FN 36] [FN 37]

D. Virginia Is Required to Adopt an Adequate WIP that Meets the Bay TMDL Allocations and Provides Reasonable Assurances.

The requirement that Virginia adopt an adequate WIP that implements the Bay TMDL meets the Bay TMDL allocations, and includes reasonable assurances of point and nonpoint source pollution reductions is a crucial aspect of the Bay TMDL and its "accountability framework."

The WIP is intended to fulfill several crucial components of the Bay TMDL framework.[FN 38] Virginia is expected to meet, but not exceed, the Bay TMDL's total nutrient and sediment allocations to the Commonwealth and its basins, and to sub-allocate those limits among point and nonpoint source sectors and individual permitted sources within the area draining to each of the applicable § 303(d) segments in Virginia . Further, the WIP is expected to identify specific actions and controls to be 60 percent implemented by 2017 and 100 percent implemented by 2025. Specifically, the WIP must provide information concerning interim and final nutrient and sediment target loads; current loading baselines and program capacity (including current legal, regulatory, programmatic, financial, staffing, and technical capacity to deliver the target loads) ; ways growth will be addressed; gaps in program capacity ; Virginia's commitment and strategies for filling; the gaps; tracking and reporting protocols; contingencies for slow or incomplete implementation; and detailed targets or schedules. [FN 39] Note that the EPA WIP guidance sets a standard that is very similar to that required for TMDL implementation plans in Virginia law. [FN 40] [FN 41]

The WIP, as a CWA implementation plan, is required to provide reasonable assurances that its allocations, including NPS allocations, will be achieved. The draft WIP asserts there is "some uncertainty" regarding the meaning of the term "reasonable assurance," and it suggests that the draft WIP's cursory references to "existing authority," "means of implementation," and to seeking "additional authority" will be sufficient to meet that requirement . EPA has issued a plethora of guidance on the subject that both confirms that reasonable assurances are the binding, enforceable, and/or incentive based tools that are included in an implementation plan to demonstrate that water quality goals will be attained and makes it clear that there is no "uncertainty" in this term that could justify any failure on Virginia's part to comply. For example, in 1991, EPA explained:

"Assurances may include the application or utilization of local ordinances, grant conditions, or other enforcement authorities. For example, it may be appropriate to provide that a permit may be reopened for a WLA which requires more stringent limits because attainment of nonpoint source load allocation was not demonstrated . . . State nonpoint source management programs may include, as appropriate, nonregulatory or regulatory programs for enforcement, technical assistance, financial assistance, education, training, technology transfer, and demonstration projects. [FN 42] The TMDL is established so that the statutorily-required water quality standards are achieved, reasonable assurances must be given that the nonpoint source load allocations will be achieved. [FN43]

EPA's 1997 TMDL guidance, "New Policies for Establishing and Implementing Total Maximum Daily Loads (TMDLs)" further states, "It is now time to move towards the next stage of our strategy to achieve water quality standards--to make sure that TMDLs are established for all listed waters, and that the load allocations established by TMDLs are implemented by point and nonpoint sources alike." [FN 44] The guidance continued by explaining that "reasonable assurance that the nonpoint source load allocations established in TMDLs (for waters impaired solely or primarily by nonpoint sources) will in fact be achieved. These assurances may be non-regulatory, regulatory, or incentive-based, consistent with applicable laws and programs." [FN45] To the same effect is EPA's 2002 document, "Guidelines for Reviewing TMDLs under Existing Regulations issued in 1991" which states for waters that are impaired by both point and nonpoint sources, "reasonable assurances that nonpoint source control measures will achieve expected load reductions [are required] in order for the TMDL to be approvable." [FN46]

EPA has repeatedly clarified its expectations concerning "reasonable assurances ." By letter dated September 11, 2008, EPA provided the Chair of the Chesapeake Bay Program's Principals' Staff Committee with information about how EPA intends for the Bay TMDL to allocate nutrient and sediment loads and provide accountability for basin-wide reductions to meet water quality standards. This letter also included, in "Enclosure A," detailed information concerning what the states were expected to provide by way of the reasonable assurance implementation framework for the Bay TMDL.

EPA offered a similar explanation in 2009, as the Bay TMDL process gathered momentum: [FN47]

"When EPA establishes or approves a TMDL that allocates loads to both point and nonpoint sources, it determines whether there is a 'reasonable assurance' that the nonpoint source load allocation will, in fact, be achieved and water quality standards be attained. EPA does this to be sure that the load allocations are not based on too generous assumptions regarding the amount of nonpoint source pollutant reductions that will occur. If the reductions embodied in load allocations are not fully achieved because of a failure to fully implement needed nonpoint pollution controls, the collective reductions from point and nonpoint sources will not result in attainment of the water quality standards." [FN 48]

Accordingly, the WIP will not be accepted by EPA as meeting applicable water quality standards unless the proposals it makes to reduce pollution loadings from nonpoint sources are clear and transparent, specific in their manner of effectuation, and enforceable through legislation, regulation, enforceable agreements, and appropriate and/or verifiable incentive programs. As shown below, Virginia's current draft WIP falls far short of this requirement.

II. Virginia's Draft WIP Does Not Meet the Bay TMDL Allocations or Include Reasonable Assurances Showing that Necessary NPS Pollution Reductions Will Be Achieved.

The draft WIP does not conform to the requirements of the CWA. Most obviously, its nutrient allocations exceed the limits stated in the Bay TMDL for the James River that are necessary to meet the current chlorophyll a standard.

Equally important, the draft WIP does not provide reasonable assurances that the NPS reductions on which it relies to meet the Bay TMDL's allocations will be achieved . The draft WIP indicates the Commonwealth will "consider" or "explore" significantly expansion of a number of programs and practices that would be critical to achieving the reductions promised by the document, yet the document has not persuasively-or, in some cases, at all-explained how

the expansions will be accomplished. Thus, the draft WIP relies to a significant degree on a barely-described proposal for a greatly enlarged nutrient credit exchange (NCE) as a way of meeting the nutrient and sediment reductions that are required by the TMDL. Indeed, the draft WIP repeatedly claims that the significant reductions promised for the urban runoff and on-site septic sectors "can be attained through expansion of the Virginia Nutrient Credit Exchange (NCE) program." [FN 49] Although the program apparently would rely on nutrient credit purchases by the urban runoff and onsite septic system sectors, [FN 50] nothing in the draft WIP describes what mechanism-whether regulatory or other-would create a demand for such credits. This issue is further discussed in Section III.

The WIP is strikingly devoid of necessary details concerning the how and when of possible changes in Virginia's regulatory and legislative frameworks that would be required to meet the reasonable assurances standard with respect to claimed nutrient reductions. A few of the many examples of this problem include the draft WIP's references to the onsite wastewater sector (noting the need to "consider revisions" to the Code of Virginia concerning new and replacement systems and requirements for additional nitrogen-reduction technologies) [FN 51] and the urban runoff sector (noting the need to "consider controls" on non-agricultural lawn and turf fertilizers). [FN 52] The lack of specificity is all the more disappointing given that the SAG members and agency staff put forward many thoughtful proposals to meet these gaps.

For other proposed reductions, the draft WIP asserts it will rely almost exclusively on voluntary measures, without enforcement or verification strategies, clear incentives, or regulatory drivers that could persuasively indicate the measures will be adopted and NPS reductions made. This strategy is especially striking in the context of the draft WIP's proposal to require 100 percent BMP implementation for urban runoff and onsite wastewater sectors and vastly increased agricultural BMP usage-yet these increases would be accomplished without mandates and without any detailed or plausible commitment on the part of the Commonwealth to increase available funding. [FN 53] As discussed throughout these comments, our position is that voluntary means will not suffice to meet the reasonable assurance requirement.

The deficiencies in the draft WIP cannot be excused by reference to any special provisions of Virginia law concerning implementation costs, as the draft WIP seems to suggest. As shown above, Virginia law requires conformity to the Section 303(d) program. Moreover, the Code section that prescribes implementation plans to address impaired waters provides no support for any idea that costs would justify delay in the development of an adequate implementation plan. [FN 54]

Further, the draft "target loads" provided by EPA in November 2009 and the draft TMDL allocations released in July 2010 do not differ significantly from those published in the tributary strategies in 2005. [FN 55] The Commonwealth has been in regular contact with EPA since 2005 participated actively in Chesapeake Bay Program committees (including the Principals Staff Committee, Executive Committee, and Water Quality Implementation Team), was a party to the decision for EPA to pursue a Bay TMDL in 2007, and worked closely with EPA over the last year to establish the draft WIP. Based on these facts we resolutely reject the WIP's suggestion [FN 56] that the allocations were unexpected or in any way impede the Commonwealth's ability to develop a final WIP that meets the Bay TMDL.

As part of the draft Bay TMDL, EPA included its review of draft WIP-based applicable laws and regulations and the detailed EPA WIP guidance and concluded that the draft was "seriously deficient." [FN 57] The draft WIP's numerous failures to provide reasonable assurances of nonpoint source reductions prevent EPA --- and prevent the Commonwealth --- from ascertaining whether the WIP will be able to meet water quality standards. The draft WIP

cannot be approved in these circumstances . Thus, we concur with EPA's conclusion that the draft WIP is "seriously deficient." It neither meets the Bay TMDL's allocations nor the requirements of CWA § 303(c) requiring reasonable assurances for NPS pollution reductions . CBF respectfully urges the Commonwealth to amend the draft WIP, in the manner detailed below, to address these deficiencies.

III. CBF Specific Recommendations for Improving the Draft WIP.

In the attached Exhibit 1, CBF provides a number of recommended revisions to the "Accounting for Growth," "Strategy to Fill Gaps," and "Contingencies" sections of the draft WIP to address its two principal shortcomings discussed in the previous section: (1) it does not present sufficient pollution reductions to meet the TMDL allocations for TN and TP in the James River in 2017 or 2025, and (2) it lacks binding commitments to provide the program capacity needed to give reasonable assurance that reductions in NPS pollution will be achieved and pollution from future growth will be prevented.

Recommendations to alleviate the key deficiencies in the draft WIP are provided for the four largest pollution source sectors: wastewater treatment plants (WWTPs), agriculture, urban runoff, and onsite wastewater systems (onsite systems). Comments and recommendations are not provided for the forest and resource extraction sectors. Table 1 provides a brief summary of our recommendations described in more detail in Exhibit 1. Many of these recommendations were provided to the McDonnell Administration in a July 20, 2010 letter. [FN 58] In addition, we include two brief additional sections that address the proposed expansion of the NCE and the use of two-year milestones to help meet TMDL goals. We also include some supplemental ideas for the WWTP sector if our specific recommendations prove untenable. Each recommendation includes (i) identification of the shortcomings in the draft WIP the revision will help address, (ii) a description of the revision, including the deadline for major actions, (iii) rough estimate of reductions in delivered TN and TP, if amendable to quantification without scenario builder or Bay modeling, and (iv) details of existing and new program capacity needed to implement the revision.

In narrowing down our list of recommendations, CBF focused on those that appeared realistic and achievable, are the most cost effective, attain better equity for citizens across river basins, and deliver additive benefits for local streams and communities. Some additional benefits could include nutrient reductions to streams that are scheduled to be subject to freshwater nutrient criteria beginning in 2013, recharge of groundwater sources, and assistance meeting other local water quality priorities (bacteria TMDLs, flood control, Municipal Separate Storm Sewer [MS4] permit requirements, etc.). [FN59]

Lastly, these recommendations are not presented as the only means to improve the draft WIP. There are surely many other ways to improve the draft WIP, some of which were discussed during the SAG meetings. Thus, these recommendations and the projected pollution reductions are not absolute by any means. Our intent in providing them is to broadly illustrate the wide range of options available to the Commonwealth for developing a final WIP that meets the Bay TMDL.

Table 1: Summary of CBF Recommendations [Please see page 12 of the original comment letter (Docket ID 0732.001)]

IV. Revised Pollution Allocations Consistent With CBF Recommendations.

CBF proposes a revised set of TN and TP allocations for 2017 and 2025. Our suggested allocations only differ from the

allocations put forward by the August 24, 2010 discussion document by reducing allocations for the WWTP sector in accordance with our recommendations. We call for significant pollution reductions from the James River basin, with some further effort spread across the remaining river basins. We did not include any lower NPS allocations than those proposed in August 2010 because we believe implementation of the types of recommendations we put forward can meet these goals. Reductions in NPS pollution beyond these levels would require more aggressive actions. Since they were created without use of the Bay watershed model or scenario building tool, these projected reductions are not presented as absolute, and are presented to illustrate potential options. Tables 2 provides the 2025 pollution allocations included in the draft WIP, those put forward in the August 24, 2010 discussion document, and our proposed revised allocations. Table 3 shows the anticipated 2017 progress under these same three allocation schemes.

Our recommendations result in a reduction in allocations to WWTPs by 5,257,769 pounds per year TN and 652,685 pounds per year TP. These reductions help:

- Overcome the TN pollution reduction shortfall in meeting the 2017 goals and 2025 TMDL allocations, and nearly overcome the TP reduction shortfall in meeting the 2017 and 2025 goals.
- Allow the allocations for the agriculture, urban runoff, and onsite system sectors to be increased consistent with the levels of treatment envisioned in the discussion document.

TN is reduced almost 1,000,000 pounds per year below the 2025 allocation in this analysis. This is because lower allocations were necessary to help meet the James River-specific allocations intended to meet the chlorophyll a criteria in the lower James.

Exhibit 1 provides more detail and perspective about our reasoning for focusing on the WWTP sector and the James River basin, how we arrived at these estimates, and how they and other options can replace and/or augment our recommended actions to fully achieve the 2017 and 2025 goals for both TN and TP.

Table 2: Revised Virginia Chesapeake Bay TMDL Allocations [Million Pounds/Year] [Please see page 15 of the original comment letter (Docket ID 0732.001)]

Table 3: Revised Virginia Chesapeake Bay TMDL Allocations-2017 Target [Million Pounds/Year] [Please see page 15 of the original comment letter (Docket ID 0732.001)]

Since the majority of the cut in allocations is taken from WWTPs in the James River basin, in Table 4 and 5 below we illustrate whether our recommendations similarly help meet the goals in the James. For both TN and TP, our suggestions help meet the 2017 goals and nearly meet the 2025 goals.

Table 4: Revised James River Basin TMDL Allocations [Million Pounds/Year] [Please see page 15 of the original comment letter (Docket ID 0732.001)]

Table 5: Revised James River Basin TMDL Allocations-2017 Target [Million Pounds/Year] [Please see page 15 of the original comment letter (Docket ID 0732.001)]

In sum, we believe the proposed revised allocations are equitable, realistic, and attainable, and our recommendations

can assist in meeting them through 2025.

V. The Value of the Bay and Clean Waterways Across Virginia.

The draft WIP and this comment have thus far discussed new actions, and potentially new costs, to deliver additional pollution reductions to the Bay and its rivers. There has been considerable discussion by the McDonnell Administration, stakeholders, and in the media about how much it will cost the state, businesses, and the people of Virginia to implement the WIP.

To put these costs in proper context, one must consider the other side of the equation—that clean water improves economic opportunities for all Virginians, through increased benefits to vital sectors of the economy that rely on our waterways and decreased burdens on businesses and citizens impacted by water pollution. In Exhibit 2, we provide extensive documentation on eight categories of benefits or avoided costs that demonstrate the value of the Bay and clean waters across Virginia. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0732.1] Here are several striking highlights of the exhibit to consider:

- Based on a 1989 study by the University of Maryland, an expert panel set the value of the Bay at over \$1 trillion, with an annual economic benefit of \$33 to \$60 billion.[FNs 60, 61, 62, 63]
- A 2008 National Oceanic and Atmospheric Administration (NOAA) report said that commercial seafood industry in Maryland and Virginia contributed \$2 billion in sales and more than 41,000 jobs to the local economy.[FN 64]
- Our crab report from 2008 calculated that between 1998 and 2006 crabbing-related jobs in Maryland and Virginia declined 40 percent, from 11,246 to 6,760. [FN 65]
- Our 2010 oyster report states that the decline of the Bay oyster over the last 30 years has meant a loss of more than \$4 billion for Maryland and Virginia. [FN 66]
- A recent study in Hampton, Virginia found that resident and non-resident boaters were responsible for \$55 million in economic impact and 698 jobs to this city.[FN 67]
- A study by the Brookings Institute projected a 10 percent increase in property values for homes near a proposed \$26 billion Great Lakes restoration project.[FN 68]
- Threats from sewage and bacteria forced Maryland and Virginia to close or restrict shellfish harvesting in 223,864 acres of the Bay and its rivers in 2008, eight percent of the total shellfish beds. [FN 69]
- An EPA study of drinking water protection concluded that for every \$1 spent on source water protection, an average of \$27 is saved in water treatment costs.[FN 70]
- A study by the University of Virginia concluded that over a five year period implementation of agricultural BMPs in line with the Virginia tributary strategies would create nearly 12,000 jobs and that every \$1 spent to implement BMPs generates \$1.56 in economic activity. [FN 71]

When discussing the James River Strategy, the draft WIP states that the Commonwealth will be conducting a cost-benefit study to help inform the Phase 2 WIP process.[FN 72] We urge the state to reflect upon the information in this section and consider the jobs, economic benefits, and foregone costs associated with clean water when preparing the final WIP and conducting future cost-benefit analysis to support WIP execution.

VI. Conclusions.

CBF believes firmly that the draft WIP falls far short of meeting Virginia's obligations under its Constitution and state laws, and does not allow EPA to meet its own obligations under the Clean Water Act to create a Bay TMDL package that provides reasonable assurance that water quality standards will be achieved and maintained in the Chesapeake Bay and its rivers. We further believe that by creating a final WIP that includes the types of recommendations we describe that Virginia can chart its own course for meeting the Bay TMDL—something the majority of Virginians prefer.

There is no question that creating a WIP that provides reasonable assurance that the Bay TMDL will be met is not an easy task. If it were, we would have completed the work years ago. However, based on our respect for the skills and experience of the agency staff charged with composing the final WIP, we have high expectations that a much improved document will be submitted to EPA on November 29. Nonetheless, if the McDonnell Administration fails to improve the WIP, CBF supports EPA's proposal to shift more pollution reduction responsibilities to regulated point sources via the backstop TMDL, use its residual authority to address NPS pollution, and to assume a more direct role in the protection of our waters.

This is our generation's chance to make our mark and finish the job. We need to take it. It is far past time for all of us to make a real commitment to cleaning up the Bay and its 100,000 streams so we can stop passing on our pollution to the creek across the street, to our neighbors, to the businesses downstream, and ultimately, to our children.

Thank you again for the opportunity to comment on this critically important work for the people of Virginia. If you have any questions regarding these comments, please feel free to contact me at 804/780-1392 or at mgerel@cbf.org.

Sincerely,

Mike Gerel

Virginia Senior Scientist

EXHIBIT 1:

DETAILED RECOMMENDATIONS FOR THE COMMONWEALTH OF VIRIGNIA CHESAPEAKE BAY TMDL PHASE 1 WATERSHED IMPLEMENTATION PLAN [FN 1]

I. Wastewater Treatment Plants

Background

Virginia has made significant progress over the last five years reducing nutrient pollution from 125 of the state's largest

municipal and industrial WWTPs. These "significant dischargers" represent about 95 percent of the WWTP flow to the Bay from Virginia. Virginia adopted revisions to the Water Quality Management Planning Regulations (WQMPs) in 2005 that established enforceable annual TN and TP load limits (or "caps" for these large plants. [FN 2] "Technology regulations" also adopted in 2005 set annual nutrient concentration limits for new and existing plants that exceed specified flow capacities. [FN 3] In 2005 the General Assembly established the NCE to allow the exchange of nutrient credits between plants to help reduce costs and accelerate achievement of the caps and subsequent nutrient reduction goals. [FN 4] A Watershed General Permit (WGP) was developed in 2006 to implement these new programs and establish a 2011 deadline for meeting the caps. [FN 5] In addition, \$1.5 billion in state monies from the Water Quality Improvement Fund (WQIF) and Virginia Resources Authority (VRA) as well as federal assistance from the State Revolving Load Fund (SRLF) were provided over this period to help pay for plant upgrades. [FN 6] Finally, to address future growth, the NCE law and a revision to that law in 2009, require a complete offset of any nutrient pollution from existing significant dischargers that expand and new plants that exceed 1,000 gallons per day (GPD). [FN 7]

The new programs put in place over the last five years represent a substantial increase in program capacity. According to the Virginia Department of Environmental Quality (DEQ), these new efforts have specifically supported 44 plant upgrades and 46 nutrient exchange contracts, which are projected to deliver enough nutrient pollution reductions to meet the 2011 wastewater caps. [FN 8] [FN 9] In total, these efforts are estimated to provide pollution reductions to the Bay of about 6,600,000 pounds TN and 580,000 pounds TP.[FN 10] Note that using these same programs, up to 60 additional plant upgrades could take place after 2011 to help maintain the cap into the future.[FN 11]

Draft WIP

The draft WIP sets the 2005 nutrient caps in the WQMP as the WLAs for this sector. In other words, no additional pollution reductions beyond the existing caps are required of any existing WWTP through 2025.

In trying to meet the TMDL allocations while forgoing additional reductions from WWTP, allocations for other sectors were set based on an "E3" level of treatment, or "everything, everywhere, by everyone," for urban and septic source sectors. This level of treatment was included in materials for the SAG as a theoretical maximum amount of reductions that are possible, not as a level of effort that was realistic to expect from any source sector. EPA guidance was explicit that if a WIP relies on implementation approaching or beyond E3 levels that "EPA expects the Bay jurisdiction to provide documentation supporting the achievement of such an extraordinary level of effort." [FN 12] Although the WIP proposed E3 level of treatment for these sectors, the required documentation was not provided. Further discussion of the proposal to use E3 levels of treatment for the urban runoff and septic source sectors are provided later in this document.

Despite the inclusion of these completely unrealistic implementation levels for urban NPS sectors, the James River basin still failed to meet the 2025 TMDL allocations for TN by 3,300,000 pounds per year (lbs/year) and for TP by 350,000 pounds per year (lbs/year). The draft WIP addresses this shortfall by indicating that a poorly-described expansion of the NCE and/or a potential future revision of the chlorophyll a standard for the lower James River will allow the TMDL allocation to ultimately be met. CBF is on record with our opposition to the Commonwealth's unjustified presumptions that the chlorophyll a standard will be loosened and the TMDL allocations for the James River will be increased. [FN 13] The current chlorophyll a standard is the standard until it is formally changed via the Administrative Process Act-and the TMDL and WIP must be written to meet the current standard. We will plan to participate actively in public elements of the James River Chlorophyll Study or water quality standard revision process should either move

forward.

Some strong programs are in place to address future growth in this sector. However, there are some gaps related to smaller facilities that need to be addressed. Offsets are currently not required for existing plants with a design flow less than 40,000 GPD that are expanding, but will still be under 40,000 GPD. Also not addressed are new municipal WWTPs under 1,000 GPD and industrial plants below 40,000 GPD. The draft WIP mentions both of these deficiencies, but does not commit to actions to address them.

Overall, the Commonwealth's recent success cutting pollution by this sector and the decision to forgo further reductions from this sector and seek E3 reductions from other sectors, leads us to draw three broad conclusions. We discuss these observations in detail below as they help form the basis for our recommendations for how to improve the draft WIP.

First and foremost, the draft WIP must be revised in such a manner to ensure that the TMDL allocations for the James River basin are met. The CWA prevents EPA from approving a TMDL that does not meet water quality standards.

Second, additional pollution reductions from this sector are feasible, reasonable, and cost-effective. These pollution reductions are absolutely critical to help erase the shortfall in the James River basin and help alleviate the lack of reasonable assurance in all basins for other source sectors. Our basis for this position is as follows:

Wastewater has the strongest nutrient pollution reduction program capacity in place compared to the other sectors.

Wastewater is the largest source of nutrient pollution to the James River, contributing half of the nitrogen and a third of the phosphorus pollution. Further, the wastewater flow to the James represents nearly half of the wastewater flow from Virginia to the Bay watershed.

In parts of the Lower James River, chlorophyll a levels are highest during low flow conditions when wastewater discharges play a larger role compared to normal or high flow conditions. Given the large influence that wastewater flows have on the river during these times, further nutrient reductions from WWTP discharges must be part of the solution for meeting the spring/summer chlorophyll a standards in the tidal fresh and lower estuarine segments of this river.

Pursuing further reductions from WWTPs that discharge to the lower James supports the dual goal of helping to meet the chlorophyll a standards in the lower river and to meet the dissolved oxygen and water clarity standards in the James and Bay main stem.

WWTP remain one of the most cost effective nutrient pollution controls available. DEQ recently reported cost for the recent plant upgrades averaged \$6 per pound TN and \$15 per pound TP. [FN 14] There is little question that many of the same citizens-the ratepayers-that are helping to pay for wastewater upgrades, will also end up helping to pay for measures to address the existing urban runoff and septic source sectors. Maximizing cost efficiency for these ratepayers should be paramount.

The level of treatment required in the James River basin is less than what is being required of wastewater dischargers in other Virginia basins. For example, the annual average concentration limits used to set the caps in the WQMP in

2005 for plants in the James and York River basins (6.0-12.7 mg/L TN and 0.5-1.0 mg/L TP), were higher than the more stringent state-of-the-art (SOA) limits used for the Potomac, Rappahannock, and Eastern Shore basins (3.0-4.0 mg/L TN and 0.3 mg/L TP). Further, a provision in the Technology Regulation allows plants to operate above their "concentration base" if it is not necessary to meet their cap.[FN 15] Therefore, the "effective" performance base for plants that discharge to the Lower James River in Hampton Roads ranges from better than biological nutrient removal (BNR, 5.0-8.0 mg/L TN) to less than secondary treatment (20.5 mg/L TN) for TN and BNR or less (1.0-1.5 mg/L TP) for TP. Thus, many of these plants could upgrade to provide anywhere from BNR to SOA treatment to provide additional pollution reductions and establish equitable requirements for plants across river basins.

As of 2009, WWTPs in Virginia that discharge to the Bay watershed were using only 65 percent of their design capacity to set the caps in the WQMP in 2005.[FN 16] This large excess capacity has allowed plants to operate far above their concentration base. These design flows were calculated in 2004 during one of the largest land development booms in Virginia's history. Therefore, it is fair to question whether this capacity truly represents that which is realistically needed by communities for expected economic development in the near future.

Third, the same approach used to deliver pollution reductions from the wastewater sector should be used as a blueprint for achieving more assured reductions from the NPS sectors. The accomplishments of this sector provide clear evidence that significant pollution reductions result when reasonable assurance is provided, in this case, through strong mandates, including a reasonable compliance schedule; significant public funding; and market-based incentive programs. These same steps are necessary if existing NPS reductions are to be realized.

Recommendations

Based on our conclusions above, we offer five specific recommendations for revisions to the draft WIP with respect to WWTP wasteload allocations. These actions are intended to provide significant additional pollution reductions to help achieve the spring/summer chlorophyll a standards in both lower James segments, assist with achieving TMDL goals in the James for both 2017 and 2025, and provide additional reductions to assist in providing a higher level of reasonable assurance that revised pollution allocations in Section IV for the entire Virginia Bay watershed can be met. Additional feasible options for achieving more pollution reductions from large WWTPs are provided at the end of the first recommendation. As noted previously, our recommendations are not the only means to improve the draft WIP; the list of recommendations we present are intended to show the wide range of options available to the Commonwealth to meet the TMDL goals.

(1) Require phased upgrade of 11 large plants in the Lower James River by 2025.

The Commonwealth should require that eleven of the largest municipal WWTPs that discharge to the Lower James River between Chesterfield County and the mouth of the James River upgrade to achieve a 5.0 mg/L TN and 0.3 mg/L TP by 2025.[FN 17] We used a step-wise approach to select WWTPs for upgrade. First we focused on several larger municipal plants that have WLAs based on TN concentrations that exceed BNR treatment for TN (several even approached secondary treatment). This strategy would bring the performance of these very large municipal WWTPs more in line with the performance required of comparable plants in the other river basins. Then we selected municipal WWTPs that have a design flow of 20 MGD or more. We also looked to balance reductions from WWTPs that discharge to both the tidal fresh and lower estuary of the James. And lastly, we took into consideration whether plants had very recently completed an upgrade and deferred those plants for further upgrades until 2025.

Note that this analysis focuses on what plants are authorized to discharge in the WGP and WQMP, in other words, their TN/TP concentration basis and design flow used to set their WLAs in 2005, the most current information available to the public. The best way to approximate potential future reductions in delivered pollution was to only include reductions from installation of new technology that improves upon the TN/TP concentration basis. The current significant excess flow capacity-and the higher TN/TP concentrations it can allow-precludes using current flow and performance to draw meaningful conclusions about what additional pollution reductions may be available in the future. Therefore, this recommendation focuses on what could be discharged under an individual WWTP permit, not what the plants are choosing to discharge today.

Also be aware that we do not have access to the Bay model or scenario builder, so the pollution reductions projected here are estimates. They are solely intended to illustrate that options are available between the approach taken in the draft WIP of not pursuing any further WWTP upgrades through 2025, and the EPA backstop that seeks upgrades by all significant WWTPs that discharge to the Bay to 4.0 mg/L TN and 0.3 mg/L TP. Further, use of the NCE, exchange of TN and TP allocations, and other strategies may allow some of the proposed upgrades to be unnecessary. The absolute bottom line is that for the final WIP to be acceptable it must include a mix of upgrades and other strategies that meet the TMDL allocations.

To first allow a full accounting of new reductions that can be anticipated, Table 1 describes the two Lower James River plant upgrades that are already funded and scheduled to come on-line by 2013 that improve upon the TN/TP concentration performance. It is our understanding based on discussions with DEQ staff that these reductions are not yet counted by EPA as progress through 2009. It is our further understanding that these projected reductions have been considered by the Commonwealth when it states that the overall 2011 goal for WWTPs will be met.

Table 1-Lower James River WWTP Upgrades Anticipated Through 2013 [Please see Exhibit 1, page 6 of the original comment letter (Docket ID 0732.001)]

Table 2 summarizes the additional upgrades recommended to further improve upon performance through 2025.

Table 2-Proposed Lower James River WWTP Upgrades Through 2025 [Please see Exhibit 1, page 6 of the original comment letter (Docket ID 0732.001)]

We estimate that upgrading these eleven significant WWTPs by 2025 can achieve the basin-wide TMDL allocations for the James in 2017 and 2025 and the revised Virginia Bay watershed-wide allocations called out in Section IV. However, there are an array of strategies to achieve further reductions from WWTPs. The following strategies may also be workable:

Require upgrades to significant WWTPs that discharge to the lower James River such that all plants achieve 4.0 mg/L TN and 0.5 mg/L TP. This would require 14 plants to upgrade their TN treatment and seven plants to improve TP performance. Reductions in pollution delivered to the Bay could be reduced by approximately 5,253,000 lbs TN and 245,126 lbs TP.

Mandate upgrades such that all significant WWTPs watershed-wide achieve 4.0 mg/L TN and 0.3 mg/L TP. This approach would be consistent with the proposed EPA back-stop action for WWTPs.

Require upgrades such that all significant WWTPs watershed-wide achieve 3.0 mg/L TN and 0.3 mg/L TP.

Require upgrades of significant WWTP plants to 3.0-4.0 mg/L TN and 0.3 mg/L TP that serve Phase 1 MS4 communities or both Phase 1 and 2 MS4 communities.

Require upgrades of plants in the York River basin from 6.0 mg/L TN and 0.5 mg/L TP to at least 5.0 mg/L TN and 0.3 mg/L TP to achieve nutrient treatment more consistent with WWTPs in the other river basins.

The existing Virginia Pollutant Discharge Elimination Program (VPDES) and NCE program are in place to help facilitate these recommended upgrades. However, regulatory changes and significant funding will be needed to accomplish these recommendations. Existing funding for WWTP upgrades is already \$130 million in arrears, so existing past funding allocations are not available to support new programs.[FN 18]

The new WLAs necessitated by these upgrades would need to be included in the next WGP due by January 1, 2012 and in the WQMP.[FN 19] We recognize that meeting this requirement might be logistically challenging for some WWTPs. However, to advance the type of pragmatic upgrade schedule listed above to help meet these new WLAs in light of the existing regulatory guidelines regarding compliance within the VPDES permit cycle, Virginia could propose the development of a permit for only those WWTPs subject to a chlorophyll a standard, subject to public notice and comment and followed by a judicially enforceable agreement, that includes a binding compliance schedule that will meet the requirements set forth in the new Bay TMDL by 2025.

Obtaining consistent financial assistance from the legislature to pay for mandated upgrades through 2025 is absolutely critical. General Fund appropriations, bond authority, and other options are needed. A high cost-share percentage (at least 60 percent) will also be vital to ensure an equitable cost-sharing between state and locality budgets. The Commonwealth could consider prioritizing funding to WWTP projects that are upgrading nutrient treatment capabilities or expanding to take smaller plants, onsite systems, or other pollution sources (landfills, for example) off line, over projects that are only expanding capacity to support future development. WWTP pollution reductions are supported by strong existing program capacity (in terms of regulatory mechanisms, staffing, and tracking), are some of the most cost-effective available, are supported by millions of rate payers, and create well-paying construction and engineering jobs. While year-by-year funding of nearly \$1 billion via the General Fund and bond packages has carried the program since the late 1990s, pursuing a consistent funding source would provide better surety to local WWTPs that are asked to carry increased pollution reduction responsibilities.

The NCE also has the potential to help accomplish these reductions faster and at lesser costs. A full discussion of an expanded NCE is provided later in this section.

(2) Retire five percent of existing "nutrient credits" currently tied to excess capacity in WLAs for WWTPs in the James River Basin by 2011.

Virginia should permanently retire five percent of the existing "nutrient credits" tied to the currently unused flow capacity from all 27 municipal WWTPs in the James River basin. This action will provide an immediate reduction in authorized delivered nutrient pollution by 572,000 lbs/yr TN and 50,000 lbs/yr TP. Again, focusing reductions on the James Basin can further help ensure adequate reductions are provided to meet the chlorophyll a standard. Other options include

retiring five percent of the nutrient credits tied to excess flow watershed-wide (delivering pollution reductions of approximately 1,940,000 lbs TN and 177,000 lbs TP) or retiring ten percent of the nutrient credits tied to excess flow Virginia Bay watershed-wide (approximately 948,000 lbs TN and 88,000 lbs TP).

CBF is aware that WWTP capacity is a significant local tool used to attract economic development, and the prospect of pulling back existing WLAs may not appear immediately attractive, or even fair. Keep in mind that should this capacity- or additional capacity-be needed by localities in the future as the economy recovers, the NCE was specifically created to help accommodate future WWTP pollution loads. Any expansions to the NCE, including additional authorities and mandates to compel buying and selling, are likely to be complete by the time the retired capacity is needed.

Revisions to the next WGP and WQMP would be necessary to achieve these reductions. Any permanent reductions in design flow, and resultant reduction in WLAs, provides pollution reductions at no new costs to the Commonwealth. Using new funding sources to pay for WWTP upgrades and forestalling use of these existing nutrient credits now, is akin to borrowing money from a friend to pay a debt when you have sufficient money in your bank account to pay the debt. If the Commonwealth is serious about pursuing the most cost-effective solutions, immediately retiring a modest amount of existing nutrient credits is a useful approach.

(3) Require upgrades by the largest existing non-significant municipal WWTPs by 2025.

The Commonwealth should require upgrades of existing non-significant WWTPs that discharge greater than or equal to 200,000 GPD to achieve to BNR. This would require 37 plants to achieve 8.0 mg/L TN and 1.0 mg/L TP by 2025. These plants are all above the fall line, as plants below the fall line that discharge more than 100,000 GPD already must meet more stringent treatment standards. A plant that treats this volume of wastewater is not small; it supports approximately 2,000 households. We believe it is more than appropriate to ask these large non-significant plants to upgrade some time in the next 15 years. Further, this action will benefit the Bay, and will also help comply with existing and planned mandates to improve water quality in local streams. For example, nutrient criteria for freshwater streams are scheduled to be promulgated by 2013 for wadeable streams and 2014 for non-wadeable streams. [FN 20]

Table 4 below describes the plants that should upgrade and a rough estimate of nutrient pollution reductions that can be realized through the upgrades.

Table 4-Upgrades by Largest Non-significant Dischargers [Please see Exhibit 1, page 9 of the original comment letter (Docket ID 0732.001)]

Amendments to the WQMP and Technology Regulation would be necessary to achieve these reductions. Further, a consistent source of financial assistance from the legislature to pay for mandated upgrades through 2025 is essential. A high cost-share percentage (at least 75 percent, if not more) will be needed, as most of these plants are operated by small towns.

(4) Install infrastructure to reuse two percent of municipal WWTP flow by 2017.

The state should create statewide incentives via the Code to facilitate the installation of infrastructure and nutrient management plan (NMP) implementation to support reuse of least two percent of Virginia Bay watershed-wide municipal flow. Based on a total municipal WWTP flow of 585 MGD and annual average concentration limits of 5.0 mg/L

TN and 0.5 mg/L TP, reuse of 11.7 MGD could generate pollution reductions of 178,000 lbs/yr TN and 17,800 lbs/yr TP.

Wastewater reuse is particularly important in areas of the state that are vulnerable to drought conditions. Wastewater could be directed for irrigation of golf courses, recreational fields, and open spaces, as well as use for cooling water or other industrial uses. Any reuse as irrigation must be applied in accordance with NMP requirements to ensure zero discharge of nutrients to ground or surface waters. Any nutrients discharged in excess of NMPs or that pass through an industrial process must be removed from the reduction created.

As costs to install and maintain pipes and pump stations to relocate reuse water can be a considerable barrier, changes to the Code would be required to authorize grants, low interest loans, business tax credits, and/or the authority for localities to offer their own tax credits, fee waivers, or other incentives to compel interest. Efforts to pursue this level of reuse should be pursued immediately, perhaps through targeted incentives and outreach to golf courses.

(5) Require offsets of new nutrient pollution from small municipal and industrial WWTPs.

The Commonwealth should require nutrient pollution offsets from new municipal WWTPs that discharge less than 1,000 GPD (usually single-family homes) and new industrials that discharge less than 40,000 GPD. This action will help ensure that the aggregate load from new and expanding residential development and industry will not erase progress elsewhere. Amendment of the nutrient NCE law would be required to accommodate this new requirement. It may be appropriate to create an in-lieu fee component of the trading program to collect a standard fee to mitigate the smaller pollutant loads generated by these sources, as well as on-site septic loadings discussed later in this section. An expanded NCE is discussed later in this section.

Conclusion

EPA's "backstop" allocations include upgrades to 4.0 mg/L TN and 0.3 mg/L TP by all 39 municipal and industrial WWTPs in the James River basin. Virginia has the flexibility to pursue the modified approach outlined in the preceding section that we believe provides additional pollution reductions that are feasible, equitable, and cost-effective. Types of actions recommended in this section may be preferable to the region-wide approaches available to EPA.

II. Agriculture

Background

Over the past few decades, Virginia farmers have made significant progress in reducing nonpoint source pollution from agriculture by installing BMPs. One of the most promising aspects of on-farm conservation in Virginia has been the success of federal and state cost-share programs in driving BMP implementation. Farmers have consistently demonstrated the willingness to invest their own resources to install BMPs when cost-share funding is available. Despite historic levels of funding for the federal cost-share programs in Virginia, there is still a backlog of applications. Additionally, there are many farmers who choose not to participate in cost-share programs but who do install BMPs using their own financial resources.

Also, Virginia has a strong history of collaboration amongst stakeholders to develop innovative projects that include demonstrating new technologies, as well as projects designed to accelerate BMP implementation in targeted

watersheds and in targeted communities. These efforts are delivering additional financial and technical resources to farmers and demonstrating innovative technologies and practices such as: demonstration of an on-farm portable pyrolysis unit that converts poultry litter to bio-oil, delivery of on-farm technical assistance and private funding resources to the Old Order Mennonite communities for BMP implementation; and delivery of technical assistance and equipment to help farmers better utilize fertilizer and avoid over-application.

However, despite these efforts, Virginia still has a long way to go to reduce nutrient and sediment runoff from agriculture to acceptable levels. The draft agriculture scoping scenario 2008 implementation levels presented to the agriculture work group on July 8, 2010, illustrates that for practices considered high priority, implementation levels as of 2008 are far below the proposed goals. [FN 21] Although this estimate currently does not include data on voluntary BMPs (i.e. paid for without federal or state cost-share information), the data on BMP implementation using cost-share funds indicates agriculture still has a long way to go. For example, forest or grass buffers of at least 35 feet or more have been installed on just nine percent of cropland, 16 percent of pasture acreage, and zero percent of hay acreage.

While CBF supports the effort currently underway, as directed by 2010 Senate Bill 346 and Code amendments to 2.2-220.3, to establish a program for tracking BMPs installed without cost-share funding, even when these voluntary practices are enumerated, it is likely that the data will reflect we have a way to go towards meeting agriculture nutrient and sediment reduction goals.

A recently released draft report from the U.S. Department of Agriculture (USDA) assessing the effects of conservation on cultivated cropland in the Chesapeake Bay watershed (USDA 2010 Report) further illustrates that existing programs have not made near enough progress in protecting water quality. [FN 22] This report considered all conservation practices currently implemented, including practices implemented voluntarily, without federal or state cost-share assistance. The report found that 81 percent of harvested cropland in the Bay watershed lacks some or all conservation measures necessary to reduce nutrient and sediment loss to tolerable levels. The report also found that 81 percent of harvested cropland failed to meet nutrient management planning goals for rate, timing, and placement of fertilizer application. Lack of NMP development and implementation, and subsequent excessive loss of fertilizer nutrients, costs Virginia farmers millions of dollars in lost revenue every year. While soil erosion control practices are widespread, 26 percent of crop land still has excessive sediment loss from fields and requires additional erosion control practices. Existing programs have also failed to protect lands most vulnerable to nutrient and sediment loss-47 percent of land in the watershed is considered highly vulnerable to pollution and is classified as "critically undertreated." While existing programs have made some progress, it is unreasonable to expect they will achieve necessary agricultural nutrient reduction goals.

Draft WIP

The draft WIP proposes ambitious goals for widespread implementation of BMPs on farms. For example, the draft WIP proposes 90 percent implementation levels for riparian buffers on cropland, pasture, and hay acreage by 2025. Implementation of NMPs on cropland is anticipated to increase from 51 percent to 95 percent, and no-till farming is projected to increase from 55 percent to 90 percent by 2025.

The agricultural sector section of the draft WIP relies almost exclusively on existing programs and authorities in addition to a new "expectation" that farmers will widely adopt BMPs, without any concrete drivers proposed to accomplish these ambitious goals. There are no estimates of cost-share funding needed to achieve the proposed reduction, nor is there a

plan to secure the funding. The draft WIP also lacks new program capacity--the proposed rules, regulations, permits, or other enforceable, binding measures--to achieve the proposed pollution reduction goals. There is also no schedule for implementation, including no two-year milestone goals.

Recommendations

Below we recommend eight specific revisions to the agriculture section of the draft WIP that will help provide a high level of reasonable assurance that the revised pollution allocations for the agricultural sector in Section IV will be met. Note that these allocations are set based on a Level 3 level of effort included in the August 24, 2010 SAG discussion draft.

(1) Develop financial incentives to support enhanced agricultural BMP implementation by 2011.

The availability of cost-share funding is a critical component for the agricultural community to achieve BMP implementation goals. As such, the WIP should include an estimate of the total cost to fund the Virginia Agricultural BMP Cost-Share Program to levels sufficient to ensure adequate cost-share is available for implementation of the practices proposed in the WIP. Also, the WIP should include a plan for securing these funds including legislative proposals.

According to the 2009 report prepared by the Virginia Department of Conservation and Recreation (DCR) [FN 23] (based on the tributary strategy BMP implementation goals), annual funding needs for the Virginia Agricultural Cost-Share Program over the next 15 years total \$1,123,000,000, statewide. Of this total, eight percent will support Soil and Water Conservation District (SWCD) technical assistance, 55 percent will support agricultural BMPs in the Chesapeake Bay basin, and 37 percent will support BMPs in the Southern Rivers. Funding estimates for agriculture BMPs in the Chesapeake Bay watershed total approximately \$620 million and are listed by year in Table 3.

Table 3--Chesapeake Bay Watershed Ag BMP Cost-share Funding Projected Needs [Please see Exhibit 1, page 13 of the original comment letter (Docket ID 0732.001)]

These funding levels include the funding needed to accomplish levels of reduction from nutrient management planning and implementation on 90 percent of cropland and hayland in the Chesapeake Bay watershed. This level of implementation reflects what would be accomplished if NMPs were developed and implemented on all farms that apply fertilizer or manure to more than 100 acres.

In addition to traditional cost-share, CBF recommends an expansion of the Virginia tax credit program to include transferable tax credits similar to the Pennsylvania Resource Enhancement Program (REAP). [FN 24] Producers often owe few, if any, state taxes. The REAP program allows farmers to sell tax credits to other tax payers, similar in concept to the Virginia conservation easement tax credit program outlined in the Virginia Land Conservation Incentives Act of 1999. [FN 25] This would require new legislation. CBF recommends capping the proposed transferable tax credit program at \$10 million per year.

CBF also supports the promising idea in the draft WIP to consider amending §58.1-3231 to require certain BMPs to be used on land enrolled in local use value assessment and taxation programs. These practices should include: implementation of soil conservation and nutrient management plans, establishment of 35-foot or greater permanent

grass or riparian buffers, livestock stream exclusion, and if applicable, appropriate barnyard management.

(2) Expand regulatory drivers for BMP implementation in existing programs through 2025.

Currently, the only water-quality related regulatory drivers governing Virginia agriculture apply to:

Confined animal feeding operations (CAFOs) with more than 200 animal units of poultry or 300 animal units of livestock and liquid manure systems (Virginia Pollution Abatement Permit Regulation [FN 26]);

Fields receiving biosolids (Biosolids Use Regulations [FN 27]); and

Farms in regions covered by the Chesapeake Bay Preservation Act (CBPA) Regulations. [FN 28]

We recommend the following changes to these existing regulatory programs to provide additional program capacity to deliver nutrient pollution reductions.

(a) Virginia Pollution Abatement Permit for Livestock Animal Feeding Operations

According to the 2007 National Agricultural Statistics Survey, there are over 1,100 dairies operating in Virginia and only 80 of them are currently covered by Virginia Pollution Abatement (VPA) permits for animal feeding operations.[FN 29] We recommend expanding coverage to facilities with herd sizes greater than 100 animals by 2017 (which would cover approximately 34 percent of Virginia dairies), and 50 animals by 2025 (covering approximately 55 percent of Virginia dairies). Developing a general permit for smaller facilities would require legislative change to the existing code (Chapter 32, Virginia Pollution Abatement Permit Regulation).

Expanded VPA coverage for smaller dairies will address barnyard management issues, as well as ensure manure is land-applied appropriately. The importance of manure management is illustrated by the USDA 2010 Report that found that 70 percent of the acreage categorized as having the lowest level of conservation treatment for nitrogen management receives manure as fertilizer. In contrast, less than six percent of the acreage categorized as having a high level of nitrogen management receives manure. The USDA 2010 Report further states that the most critical conservation concern in the region is nitrogen loss through subsurface pathways, most of which eventually discharges to surface waters, and that about 65 percent of cropped acres require additional nutrient management to address excessive levels of nitrogen loss to groundwater. Ensuring dairy manure is land-applied appropriately is critical for protecting local and regional surface and ground water quality.

(b) Biosolids Use Regulation

Over 50 percent of the biosolids land-applied in Virginia are imported from out-of-state facilities.[FN 30] By 2017, Virginia should eliminate the use of phosphorus index (P index) for fields receiving biosolids. Instead, biosolids should be required to be land-applied according to soil test nutrient recommendations. Also, require the same setback for riparian areas as required for poultry litter (100 feet with no permanent vegetative buffer, and 35 feet with a permanent vegetative buffer). [FN 31] In addition, eliminate land-application of biosolids in December, January, and February and eliminate application to saturated, frozen, or snow-covered ground. The 2017 deadline will allow for municipal wastewater treatment facilities to install waste-to-energy facilities that convert excess biosolids to renewable energy.

Changes to the biosolids regulations could be made administratively, without legislation.

(c) CBPA

Require all agricultural land uses in counties covered by the CBPA (not just agricultural land in the resource protection and/or management areas) to comply with a minimum buffer requirement of 35 feet, and minimum conservation standards including development and implementation of soil conservation plans and Virginia certified NMPs. Currently, agricultural land in the resource protection area in production prior to passage of the CBPA does not have to comply with the buffer requirements. Also, the buffer requirements need to be updated with research conducted over the last two decades that indicates that a 35-foot buffer is the minimum buffer width necessary for sediment and nutrient reduction to surface waters. [FN 32] Last, we recommend that DCR support local governments in efforts to enforce provisions of the CBPA by dedicating staff to conduct random inspections using the same inspection protocols currently in place for the Virginia Agricultural Cost-Share Program. Violations should be reported to local governments for enforcement. Chesapeake Bay Act compliance measures should ensure that local governments are enforcing agricultural provisions of the CBPA.

(d) Virginia Nutrient Management Standards and Criteria

The USDA 2010 Report previously mentioned illustrates the importance of development and implementation of NMPs on cropland, and the lack of widespread implementation of plan recommendations (NMPs are either not developed or improperly implemented on more than 81 percent of cropland in the Bay watershed). This represents a two-fold loss for both water quality and farm profits. Proper implementation of NMP regulations avoids over-application of fertilizer, and prevents nutrient pollution.

As such, Virginia should place a strong emphasis on NMP development and implementation, requiring implementation on farms with more than 100 acres that receive nutrients by March 1, 2015. With respect to cropland, this would cover almost 90 percent of Virginia's harvested cropland and affect just over 5,000 Virginia farmers, many of whom already are implementing certified nutrient management and soil erosion control plans to various degrees. Further, DCR and NRCS should work together to ensure that Virginia certified nutrient management planners understand that NMPs are living documents that will likely require revision on an annual, if not semi-annual, basis. Regular communication with their clients is essential to ensure that the plan is up-to-date and to address problems with implementation. This can be accomplished via training and scheduling cost-share payment reimbursement to planners that is tied to regular plan updating and consultation with farmers through the lifespan of the plan.

Additionally, CBF is also concerned that the phosphorus site index (P Index) is not sufficiently protective of water quality. While the P Index is a valuable tool in identifying regions at high risk for phosphorus loss, soil scientists that developed the P Index state in no uncertain terms that the P Index is not an adequate tool to address regional imbalances in manure.³³ They strongly recommend that all producers be encouraged to apply manure at rates designed to meet plant uptake requirements and avoid over-application of phosphorus. They note that continued reliance on the P Index in areas where manure is produced in excess of crop needs is not sustainable in the long term, and will lead to an eventual build up of soil phosphorus to levels where no further phosphorus can be applied.

In light of that, CBF recommends that the Virginia Nutrient Management Standards and Criteria be modified to phase out the use of the P Index to justify over-application of phosphorus (beyond soil test recommendations) by 2017 for

biosolids application and poultry litter, and by 2025 for other livestock. [FN 34] In the interim, plans developed for soils with high phosphorus should include a long-term strategy and proposed implementation timeline for reducing soil phosphorus to levels that protect water quality and allow for application of phosphorus at rates recommended by soil test results.

Soil scientists also recommend that state P Indices be correlated with local water quality requirements. [FN 35] As such, the Virginia P Index should be recalibrated to take into account pollution reduction goals for P proposed in the Virginia Bay TMDL. Specifically, the minimum criteria for edge-of-field P runoff and leachate should be that nutrient concentrations in receiving waters not cause water quality impairment (algae, aquatic habitat, etc.). The tool should also identify those fields or situations where even with the best conservation, no additional P should be applied.

CBF is also concerned that threshold pre-screening procedures used in Virginia allow for application of phosphorus to soils already at risk for increased phosphorus loss to surface waters (for example, fields close to streams), without the benefit of running the P index to identify critical source areas where more intensive management is appropriate. Research indicates that risk for phosphorus loss in surface runoff and leaching begins to increase in soils that exceed a 20 to 30 percent degree of phosphorus saturation (DPS) threshold. [FN 36] As such, CBF recommends that the P index should be used to determine phosphorus application rates for all soils that test greater than 20 percent DPS and for fields located within 150 feet of surface waters.

CBF also recommends that the Virginia Nutrient Management Standards and Criteria regulations be modified to include requirements to prevent erosion from exceeding the soil erosion tolerance level ("T"). The USDA 2010 Report emphasizes that "nutrient management practices need to be paired with erosion control practices to obtain net reductions in soluble nutrients." As such, NRCS is currently considering the addition to the NRCS Nutrient Management Code of general requirements that soil erosion rates not exceed the tolerance factor (Code 590) standard. [FN 37] This approach makes sense because soil fertility, nutrient availability, and phosphorus transport are all directly related to soil erosion.

In addition, because nutrient transport to surface waters is strongly correlated with the distance from the field to surface water, we recommend that the Virginia Nutrient Management Standards and Criteria also include a requirement for riparian buffers of at least 35-feet in width that complies with NRCS standards for grass buffers or forested buffers (NRCS 391 Riparian Forest Buffer or NRCS Code 390 Riparian Herbaceous Cover Standard). Research has established that a 35-foot buffer is the minimum width necessary to provide surface runoff remediation. [FN 38] Forested buffers are particularly valuable and increase in-stream nitrogen processing by two-to-eight fold increase over contiguous riparian areas with grass buffers. [FN 39] A mandatory buffer will effectively act as a setback for all forms of applied fertilizer. This would level the playing field for poultry litter, which has a mandatory 35 feet application setback from a stream if a permanent, vegetated buffer is established, or 100 feet otherwise. As such, it is appropriate to require fertilizer application setbacks as well as the establishment and maintenance of buffer areas to provide remediation of surface water runoff from fields receiving nutrients as an integral part of nutrient management planning in Virginia.

(3) Require livestock stream exclusion by 2017.

The proposed adoption rate of livestock stream exclusion on 95 percent of Virginia's pastures proposed in the draft WIP is unrealistic without a regulatory driver. State code should be revised to require the following:

Require livestock stream exclusion by 2017 when local TMDL implementation plans for bacteria, general benthic, sediment, nitrogen, or phosphorus list livestock as a causative factor in the impairment, and where livestock stream exclusion is required to achieve water quality goals; and

Require livestock stream exclusion for farms with herd sizes greater than 20 cows between 2017 and 2025. This would apply to approximately 42 percent of cattle farms and result in exclusion of 94 percent of Virginia's cattle from streams.

Note that DCR distributed a draft piece of legislation to SAG members in August 2010 that included livestock exclusion requirements, but it was not included as part of the draft WIP.

(4) Create a safe harbor provision for Virginia farms by 2011.

The draft WIP proposes that a "resource management plan," as defined by NRCS, will be deemed to be in compliance with the draft WIP and any associated law or regulation. First, it should be noted that this language does not suggest that compliance with the draft WIP is associated with implementation of the plan. The current language suggests that merely having a plan constitutes compliance. Further, it is also important to note that NRCS does not have a definition for the term "resource management plan."

While NRCS does have a number of definitions for various types of conservation plans, CBF has a concern that these lack the performance standards necessary for ensuring nutrient and sediment reductions. For example, the most basic conservation plan is simply a record of the farmer's decision and is required for all NRCS-funded practices. Any farmer who has received cost-share funding from NRCS has a conservation plan on file. The basic NRCS conservation plan could be written for one field out of twenty fields associated with the farm, and include a description of one BMP that the farmer has agreed to implement, out of a number of BMPs that might be recommended and necessary to protect water quality. Clearly, obtaining a conservation plan does not provide any assurance that appropriate BMPs are being implemented.

NRCS does offer more far-reaching conservation planning services, however, widespread implementation of more comprehensive conservation plans (such as a resource management system) can take several days (or longer) to develop for a whole farm, and would require a significant investment in staff.

While comprehensive conservation planning should be encouraged, given the logistics of developing plans for over 40,000 farms in Virginia, the more simplified approach outlined below will accomplish the dual goals of providing performance-based farm-specific planning tools and Bay TMDL compliance.

Agricultural producers in compliance with all the applicable planning and scheduled implementation requirements of the following could be deemed to be in compliance with the WIP:

Applicable federal and state permits and laws;

Implementation of a soil conservation plan that meets NRCS criteria that reduces soil erosion to at or below the soil loss tolerance level (T), as defined by NRCS, for each field on the farm;

For crop, hay, or pasture land receiving nutrients, implementation of a NMP written by a certified Virginia nutrient

management planner. When manure or poultry litter nutrients are used, this must include manure storage necessary to ensure appropriate timing of manure application as specified in the NMP;

Establishment of a winter cover crop, either for production (Virginia Agricultural Cost-share practice SL-8H) or soil erosion protection and nutrient removal (Virginia Agricultural Cost-share practice SL-8 and SL-8B);

Creating a permanent 35-foot vegetated (either grass or forest) riparian buffer that meets NRCS practice standards (NRCS 391 Riparian Forest Buffer or NRCS Code 390 Riparian Herbaceous Cover Standard);

Livestock stream exclusion;

Properly protected barnyards that employ BMPs necessary to prevent manure and runoff from confinement areas from entering streams and waterways.

In order for this safe harbor provision to be applicable, the state will need to develop some means of verifying that these BMPs are being properly implemented and maintained.

Note that it is important to clarify that implementing these provisions will secure producers with a safe harbor for Bay TMDL compliance only-there may also be local stream TMDLs that need to be addressed and as such, local governments may need to pass additional ordinances as may be necessary to protect local water quality.

(5) Expand enforcement of existing and proposed programs by 2011.

The Commonwealth should immediately expand enforcement of the existing agricultural programs described below in order to realize new pollution reductions.

(a) Animal Feeding Operations (AFOs) that discharge manure to surface waters are in violation of state law. [FN 40] DEQ has existing authority to address facilities violating this rule. Virginia should evaluate whether existing staff levels are sufficient to accomplish this goal. Staffing may need to be increased by two or three persons in high-density production areas of the Commonwealth, primarily the Shenandoah Valley. Increased enforcement of Virginia regulations will mean it will be less likely for EPA to intervene and expand coverage of the EPA Concentrated Animal Feeding Operations (CAFO) Final rule [FN 41] to smaller facilities. It is in the dairy industry's best interest to ensure Virginia takes control of correcting these problem facilities, as EPA has no flexibility with respect to CAFO rule enforcement, whereas Virginia has the option to allow for a case-by-case determination of the implementation schedule for corrective actions.

(b) Enforcement of proposed NMP recommendations, livestock exclusion, and CBPA agricultural requirements should be conducted by DCR staff using the random spot-check approach currently used to verify Virginia Agricultural Cost-Share Program BMP implementation. This would assist local governments in enforcing agricultural provisions of the Bay Act and help to ensure enforcement is uniform across the region.

(c) Agricultural producers participating in environmental stewardship programs that include third party verification (using protocols approved by DCR) should be given the lowest priority for inspections.

(d) The Virginia Agricultural Stewardship Act (ASA) is currently under-utilized and under-staffed. With only one staff person, and investigation of complaints only when they are reported by the public, the ASA fails to achieve its potential. Specific limitations of the ASA include:

The ASA is complaint driven and thus relies on members of the community to "turn in" their neighbor. Given the risk to an individual's standing in the community and fear of repercussions, understandably, people are reluctant to file a complaint, even where there are egregious water quality problems;

The ASA is not designed to handle issues such as over-application of manure because it is difficult to "prove" water pollution, even when it is clear that manure is being handled inappropriately; and

Timelines for complying with a corrective action plan are too lenient-up to 18 months, with a possible six month (or longer) extension from the Commissioner.

The program is not sufficiently staffed or effectively utilized as a compliance measure, or as a deterrent. As such, CBF recommends the following changes to the ASA:

Rather than requiring a report on a violation and a subsequent investigation, an ASA violation should be triggered automatically for failure to implement practices outlined in local TMDL implementation plans, failure to install riparian buffers of 35 feet or more, and for failure to implement NMP or livestock stream exclusion requirements;

Staff levels should be increased;

Timeline for implementation of the corrective action plan should be shortened, especially for egregious water quality problems and repeat offenders;

A fine structure should be established in Code, rather than being left to the Commissioner's discretion;

A specific timeline for Virginia Department of Agriculture and Consumer Services (VDACS) investigations should be established to ensure that violations are addressed in a timely manner; and

Owners of land rented to farmers should be held equally responsible for a violation and for ensuring the problem is addressed.

Note that farmers complying with the previously recommended Safe Harbor provisions would be exempt from additional requirements to meet Bay TMDL goals, but may have to implement practices necessary to protect local water quality. As such, they would not be exempt from ASA violations.

(6) Develop alternatives to land application of manures.

Hand in hand with expansion of existing regulatory programs and phasing out the over-application of manure phosphorus, we recommend that the Virginia WIP propose a strategy for increasing alternatives to land application, including clean technologies that convert manure to saleable fertilizer and/or renewable energy. With respect to manure-to-energy technologies, Virginia should pursue technologies that avoid simply transferring excess nutrients

from water to air pollution. The fate of nitrogen associated with manure-to-energy technologies is particularly of interest, as nitrous oxide emissions often associated with converting manure or poultry litter to energy via thermochemical conversion technologies can also cause water pollution, as well as ozone formation. It is also important to consider that these approaches may require a public investment-- particularly for dairy manure, which is not economically feasible to transport over long distances.

(7) Reduce ammonia emissions from animal feeding operations.

Virginia's WIP should also focus on reducing ammonia emissions from animal feeding operations. Recent research indicates that the total ammonia emission rate for broilers including losses in-house, during storage, and following land application, is 0.07 pounds of TN per bird.⁴² Virginia produces approximately 241 million broilers each year (not including turkeys and laying hens), which could potentially release almost 17 million pounds of TN to the atmosphere. Once in the atmosphere, ammonia is subject to both wet and dry deposition and has been demonstrated to be a significant source of nitrogen pollution in coastal rivers and estuaries. [FN 43] Existing BMPs that reduce the loss of ammonia from poultry production should be fully utilized--particularly the use of poultry litter amendments at rates recommended for maximum ammonia gas reduction. Additionally, increasing implementation of ammonia-control technologies and BMPs, including improved house design, feed management, and other approaches that reduce emissions and/or capture ammonia, should also be considered.

(8) Offsets for new growth.

For existing CAFOs, Virginia should assign a WLA for loads from (i) CAFO production areas, assuming standard BMPs are in place, and (ii) land-application areas, assuming a NMP is in place. Purchase of nutrient offsets should be required for any discharge from a CAFO in violation of a permit (i.e. runoff from a field where manure was applied inappropriately according to the NMP, where manure was applied without an NMP, or an unpermitted point source discharge from a production area).

For new and expanding CAFOs, complete offset for all loads from production areas and land application should be required. In other words, these operations do not get a "free" allocation for any discharge from properly managed production areas and NMP lands. However, because the aggregate loading from animal agriculture is not expected to grow significantly in the future, we support the concept of reserving "allocations" from any existing animal agricultural operations/acreage that are taken out of production for future use as offsets by existing CAFOs that expand, or new CAFOs that come on-line.

With respect to new or expanded loadings from other agricultural operations that may grow, such as turf farms or nurseries, DCR should develop an assessment by 2017 to determine whether growth is occurring in non-permitted agricultural operations and whether an offset requirement needs to be established. Alternatives to purchasing offsets could be the installation of BMPs necessary to reduce nutrient and sediment runoff to baseline pre-development levels.

Conclusion

Full implementation of these recommendations will provide the level of reasonable assurance needed to achieve pollution reductions from this source sector in the revised pollution allocations based on a Level 3 level of effort included in Section IV. These recommendations recognize the agricultural community's desire for clear expectations and

commitment to widespread adoption of basic BMPs in a manner that avoids a one-size-fits-all approach.

Absent adoption of these recommendations or other similar approaches that will provide assurance that agricultural sector goals will be met, CBF recommends lowering the pollution reduction expectations for the agricultural sector, and increasing pollution reduction expectations for the WWTP source sector.

III. Stormwater

Background

Virginia has developed numerous programs to address discharges of runoff from urban and suburban lands and industry (collectively "urban runoff") to surface waters. The Virginia Erosion and Sediment Control Law, Erosion and Sediment Control Regulations, and Erosion and Sediment Control Certification Regulations arose beginning in the 1970s to control the discharge of pollution from active land-disturbing activities. [FN 44] [FN 45] [FN 46] The pollutants of concern in urban runoff include sediment, nutrients, and other pollutants, as well as, the peak flow rate, volume, and timing of runoff. The Virginia Stormwater Management Act, Virginia Stormwater Management Permit Regulations (VSMP), and the CBPA and Regulations came about in the 1990s to control the discharge of these same pollutants from active and finished private development (or "post-construction" activities), municipal separate storm sewer systems (MS4s), and industrial activities.[FN 47] [FN 48] [FN 49] [FN 50] Virginia issues VPDES individual or general permits to these categories of discharges. Urban runoff from private active and post-construction activities are covered under the five-year Construction General Permit, discharges from MS4s are covered by individual permits (larger "Phase 1" communities") or a five-year general permit (smaller "Phase 2" communities), and industrial releases are covered by a five-year general permit. [FN 51] [FN 52] [FN 53] Lastly, the Code provides some authority under local planning, subdivision, and zoning programs to take actions that impact urban runoff.

Despite the program capacity already in place to address this pollution source sector, urban runoff has become a principle reason that thousands of river miles across the state and the entire Bay remain polluted. Statewide, 1,570 stream miles are impaired because of urban runoff. [FN 54] Many urban and suburban streams are falling apart, subject to hazardous flooding, clogged by sediment and trash, and/or are largely devoid of native aquatic life. These streams help make up the 100,000 streams that feed the Bay. Urban runoff is responsible for ten percent of the TN, 17 percent of the phosphorus, and 15 percent of the sediment that pollutes the Bay and its rivers. [FN 55] [FN 56] Reports from EPA and the U.S. Geological Survey have concluded that efforts to clean the Bay are losing ground specifically because progress reducing pollution from other source sectors is being offset by increased urban runoff pollution. [FN 57] [FN 58] While the existing program capacity, proactive dischargers, and new technologies helped reduce pollution from individual sites since between 1985 and 2005, the sheer pace at which farms and forests were converted to development has caused the "aggregate" pollutant loading over this same period to increase by 16 percent. [FN 59] It is this total pollutant loading that fuels impairment of the Bay; thus the Bay is facing significant problems moving forward if this pollution source sector is not arrested.[FN 60]

Draft WIP

The draft WIP proposes extremely aggressive allocations for this pollution source sector. As noted earlier, the Commonwealth calculated reductions for each pollution source sector from "E3" treatment and two levels of greatly enhanced treatment that are less stringent than E3.61 For urban runoff, Level 2 called for retrofit of 20-25 percent of

impervious surfaces and 20 percent of pervious surfaces, while Level 3 included retrofit of 40-50 percent of impervious and 20 percent of pervious. [FN 62] E3 would involve retrofit of 100 percent of existing urban lands. The urban runoff allocations for the James, Rappahannock, and York River basins are set at "E3." Specifically, for TN, the James and Rappahannock were set based on E3, and for TP, the James and York were set based on E3. The urban allocations for TN in the Potomac and York and for TP in the Rappahannock are also aggressive, set to be more stringent than Level 3 ("Level 3+"). The remaining three basin/pollutant combinations are set at Level 3.

As discussed at the outset of this section, it is clear that Virginia's existing urban runoff programs have so far been incapable of arresting stormwater's growing impact on the Bay. With that said, these programs are in no way sufficient to achieve the E3 level of treatment posited in the draft WIP. Frankly, we find it unlikely that any combination of mandates, funding, and incentives could provide reasonable assurance for achieving E3 levels of implementation from this sector. The shear cost, legal barriers, and logistics involved make E3 completely unrealistic at the basin-level.

We also feel strongly that existing programs cannot provide reasonable assurance that a level of increased BMP implementation can be achieved that will deliver reductions in pollution from this sector. Outdated provisions in the state erosion and sediment control, CBPA, and urban runoff programs, and the lack of numeric pollution reduction requirements and deadlines to meet water quality standards in existing VPDES permits issued to Phase 1 and 2 MS4 communities, private development industry supports our position. Further, there are no public funding programs in place to provide the financial assistance needed to retrofit existing urbanized lands. A growing number of proactive communities that have adopted local stormwater fees are ahead of the game, but they do not begin to collect monies to cover the cost to meet existing or proposed retrofit goals. [FN 63] The draft WIP does not commit to any new program capacity to address these deficiencies, instead indicating the Commonwealth will "consider" or "investigate" a list of new authorities, regulations, and funding mechanisms to meet the proposed allocations. While the draft WIP did describe in general some potentially viable strategies to fill gaps, none were fleshed out with details and analysis that demonstrates a strong obligation to pursue them. Any thought that additional reductions from this sector can be realized through the NCE, without first establishing mandates that urban runoff dischargers improve their performance by a deadline, is unrealistic. Further discussion of an expanded NCE is included later in this section.

Some new programs may be on the horizon to address future growth from this sector. A proposed revision to the VSMP regulations for discharges of post-construction stormwater from private development created over a nearly a four-year period were finalized at the close of the Kaine Administration in 2009. In short, these regulations would have required new development to achieve the average treated predevelopment pollution loading from the farm and forest lands it replaced (equated to a TP criterion of 0.28 pounds/acre/year). The regulations were subsequently suspended in January 2010 and are being reevaluated by the Commonwealth to address concerns that they were technically flawed and too costly to developers. [FN 64] However, the draft WIP includes this very same requirement as the "Tier 1 load balancing approach" stating that new development will be held to a post-development load that "produces a no net increase from the average forest, cropland, pasture, and hay loads after treatment with the suite of agriculture and forest BMPs as previously identified in this WIP." [FN 65] In fact, based on Virginia's own chosen source sector allocations, the draft WIP anticipates a TP criterion of 0.26 pounds/acre/year, which is more stringent than the criterion in the suspended regulations. [FN 66] While CBF strongly supported this approach through the development of the proposed post-construction regulations, we are unsure whether to take this provision seriously based on the McDonnell Administration's support of the suspension of the regulations. These regulations must actually be promulgated for the Commonwealth to claim this program as a means to provide reasonable assurance that the requirements of the TMDL will be met.

The Commonwealth's Tier 2 load-balancing approach in the draft WIP "will allow for an accounting of existing programs and practices on the ground that are currently either inadequately tracked or not tracked at all." [FN 67] Assuming that this means that Virginia will improve enforcement and tracking of pollution reductions obtained from existing programs, CBF strongly supports this action.

Lastly, CBF supports the Commonwealth's plan to require federal facilities to manage existing and new stormwater discharges consistent with Presidential Executive Order 13508, the Energy Independence and Security Act of 2007, and the Clean Water Act. [FN 68] [FN 69]

Recommendations

In the forthcoming pages CBF offers seven specific revisions to the draft WIP that will help provide a high level of reasonable assurance that the revised pollution allocations for the urban runoff sector in Section IV can be met. Note that these allocations are set based on a Level 2 effort included in the August 24, 2010 SAG discussion draft.

(1) Establish a new state program to fund the retrofit of existing developed lands by 2011.

The Commonwealth and every state, locality, homeowners association (HOA), and commercial development in the nation, is facing the significant challenge of how to pay for capital projects and ongoing maintenance programs to address the pollution discharged by the existing urban and suburban landscape. Further complicating this task is that many lands were developed prior to any requirements to address the quantity and quality of stormwater. Also, the HOAs that own many urban runoff practices on private lands are loosely organized and have very little funding options, short of association fees that usually only cover routine maintenance, if that.

Potential actions, generally called "urban retrofits," could include the upgrade and repair of existing flood control infrastructure, upgrade of stormwater BMPs, disconnection or replacement of impervious surfaces, installation of practices for water reuse, and restoration and protection of urban streams. The retrofit concept is not defined in the draft WIP and is viewed differently across stormwater practitioners and regulators. For the Virginia WIP, we suggest defining the "retrofit of an acre of urban land" as the installation and maintenance of actions that reduce nutrient pollution to the maximum extent practicable from that acre of land.

These types of efforts, particularly the "core" public works needs, are already ongoing, planned, or needed in most urbanized areas of the state in order to comply with TMDLs on local waterways, meet MS4 or Combined Sewer Overflow (CSO) Long-Term Control (LTCP) requirements, prevent hazardous flooding and property damage after heavy rains, protect drinking water supplies, and to generally improve the livability of their communities. Bay TMDL or not, these actions will, and must, take place eventually. In many cases, full implementation of work that is already mandated or locally essential for local rivers, creeks, and streams should be more than enough to protect the Bay downstream. Where Bay requirements necessitate actions beyond those that are locally driven, the NCE and other incentives can be used to reduce the costs of this work. However, we reject the premise that most local and Bay-related urban runoff infrastructure improvement needs can be avoided by an expansion of the NCE.

There is no question that there will be significant costs to address this problem. History has proven that the cost of public infrastructure projects only increases with time. For example, communities that chose to pursue full or partial separation of old CSO systems 20 years ago surely saved hundreds of millions of dollars, compared to cities that are

pursuing CSO work today. The tributary strategy listed the costs to meet requirements for the urban sector at \$7.5 billion. [FN 70] Note that this also includes costs for the installation of stormwater BMPs for new development activities that will be absorbed by developers and builders, and skews high in our opinion because lower cost non-structural practices that reduce stormwater volume were not fully considered in the estimate. Regardless, it could cost billions to retrofit and maintain urban lands in a manner that protects local waters and the Bay.

Thus, the Commonwealth must immediately pursue (i) an appropriate mechanism to deliver funding and incentives to the localities, homeowners, and private lands that pursue retrofits on existing developed lands, and (ii) a dependable source of funding to cover capital and maintenance costs for these retrofits.

We suggest a revision to the Code that creates an urban retrofit funding program to distribute monies. This program should only fund a relatively short list of proven practices that "capture" runoff on-site through infiltration, evapotranspiration, and reuse, thereby reducing pollution and augmenting and protecting existing drinking water sources. Eligible "green infrastructure" practices could include urban tree cover, rainwater harvesting and reuse systems, disconnection of impervious surfaces, pervious pavement installation (green alleys, sidewalks), rain gardens, swales, bioretention, green roofs, and targeted pond and filtration retrofits that support improved infiltration. New installation of stormwater ponds for storage, paved channels, and other infrastructure specifically designed for flood control that have limited ability to reduce nutrients or protect drinking water should not be included. The program should include both a cost-share component for localities and HOAs (similar to that in place now for WWTP upgrades and agricultural BMPs) and a tax credit component for existing commercial and industrial landowners.

Such a program should use a sliding-scale to determine cost-share amounts, with a higher percentage provided for those that pursue projects the soonest, those that are closest to waterways, and/or those that would provide the greatest pollution reductions. Eligibility requirements should also apply, including provision of a specified match (obtained via stormwater fee or other sources) by localities or HOAs and maximum utilization of "non-structural" practices (indicated in existing MS4 and industrial stormwater permits) by commercial and industrial lands.

Such an innovative fund will be of little use if it not adequately funded. Therefore, the Commonwealth must make a real, long-term commitment to address this problem now, before the costs ascend further. A consistent source of funding via an appropriate tax or fee is best to assist with long-term planning by potential fund users, while budget-to-budget allocations to the General Fund, the approach used for WWTP and agricultural funding, is a workable, but less desirable option. Additionally, CBF believes strongly that the federal government must play a significant role in funding this work, perhaps mimicking the approach used to fund thousands of WWTP upgrades nationwide after passage of the CWA. Further, CBF has spent more than a year actively supporting the Chesapeake Clean Water Act, which would provide \$2.5 billion for these types of stormwater retrofits Bay watershed-wide. [FN 71] Whether through this proposed law, targeted allocations to states from EPA via the State Revolving Loan Fund (SRLF), or another funding instrument, we are committed to working with the U.S. Congress and EPA to dramatically increase funding for stormwater retrofits.

Three law changes and new permits would be needed to support this program. The new urban retrofit fit would need to be created within the WQIF, Virginia Clean Water Revolving Loan Program, or as a new section of code. To facilitate this new program, and ensure access to stormwater funding that may be available through the federal SRLF in the future, the code would need to be changed to allow funding of stormwater projects under the Virginia Clean Water Revolving Loan Program (VCWRLF). As currently written the VCWRLF is limited to financing only WWTP, agricultural, Brownfields, and land conservation projects. [FN 72] Also, the existing NCE provisions in the code would need to be

amended to properly integrate urban runoff to help meet Bay-related goals in a manner that protects local water quality. And lastly, VDPEs regulations and/or permits that cover existing developed lands would need to be amended to include a specific retrofit mandate, as discussed further in the next recommendation.

Funding the control of stormwater pollution from existing developed lands will not be cheap. But the Commonwealth can begin to heal its urban streams, ensure existing urban lands do their part to clean the Bay, and save billions of dollars in the long-term by facing up to the problem now and establishing a strong and sustainable program for completing this important work.

(2) Establish aggressive, yet feasible, retrofit mandates in MS4 permits by 2012.

The Commonwealth should revise and reissue by 2012 the currently administratively continued individual MS4 permits for the 11 Phase 1 communities and revise the existing general MS4 permit for Phase 2 communities to include binding retrofit requirements. The permits should mandate a Level 2 level of treatment of MS4 acreage by 2025. This is the same level of treatment proposed by the Commonwealth in the August 24, 2010 discussion draft. This would require retrofit of 25 percent of high intensity impervious land (1.6 percent per year), 20 percent of low intensity land (1.3 percent per year), 10 percent of high intensity pervious land (0.67 percent per year), and 10 percent (0.67 percent per year) of low intensity pervious land. Note that we suspect that if implemented, urban turf fertilization restrictions recommended below will assist with achievement of the pervious lands goals.

Employing the NCE to assist compliance can be appropriate, provided trading is used to meet a binding limit included in the permit and trading does not result in local water quality impairments. If limits are set at such a stringent level that the limits can only realistically be achieved through acquisition of credits, there must be a demonstration by the discharger and/or the Commonwealth in developing the program that adequate credits are available to meet the need. Requiring confirmation up front that credits are available and under an exchange contract during the permit renewal process, similar to the permitting approach for wetlands mitigation, is a potential means to provide surety that anticipated reductions will be achieved. In regions where a comprehensive watershed plan is in place, equivalent reductions within the same watershed that meet other mandates and goals of the Bay TMDL, should be allowed. Lastly, the total nutrient reductions to meet these mandates over the 15-year WIP period should be used to set WLAs for each MS4 community, and these WLAs should be included in the Phase 1 individual permit or in a registration list (or equivalent) for the Phase 2 general permit.

(3) Restrict the sale and application of fertilizer to turfgrass statewide beginning in 2012.

Turf coverage in the Bay watershed ranges from 2.1 to 3.8 million acres, or 5.3 percent to 9.5 percent of total Bay watershed area, and roughly 75 percent of this turf cover is potentially devoted to home lawns. [FN 73] This same study estimated that turf acreage in Virginia, which stood at 1,100,000 acres in 2001, has grown faster than population or impervious cover in the last three decades, with an annual growth rate of 8.6 percent. [FN 74] As of 2004, 62 percent of turf acreage in Virginia was home lawns. [FN 75] Turf grass is now the largest crop grown in the Bay watershed, and even represents the single largest irrigated crop in the U.S. [FN 76] [FN 77] Between July 1, 2008 and June 30, 2009, fertilizer for non-agricultural use represented 41 percent by weight of that sold in the Commonwealth. [FN 78] The remaining 59 percent is applied to agricultural lands. We estimate that non-agricultural fertilizers represent approximately nine percent of the TN and ten percent of the TP applied as fertilizer in Virginia. [FN 79] A significant amount of fertilizer is applied by homeowners who do not have expertise in nutrient management planning or turf

management. All told, the misapplication of these fertilizer nutrients to urban lawns can result in significant pollution to waterways in urban areas.

Thankfully, there are some common-sense, cost-effective approaches to improving management of turf fertilizer that minimizes pollution, assists compliance with local TMDLs, MS4 permits, and ordinances, and helps maintain healthy grass cover.

(a) Contract application of TN and TP to turfgrass.

About 20 percent of turf lands in Virginia (about 200,000 acres) receive fertilizer from private contract applicators.[FN 80]Currently about 10 percent of these acres are enrolled in a voluntary DCR program that promotes NMP practices. [FN 81] VDACS is currently in the process of revising its regulations and recommending Code revisions for the contract application of fertilizer to turfgrass. [FN 82] Below we describe our suggestions for revising these regulations. A more detailed explanation of these recommendations was included in written comments submitted to VDACS in October 2010. [FN 83]

Training. CBF supports VDACS proposal in the revised regulations to require contract applicators to receive training and certification to ensure that nutrients are applied in accordance with provisions for turfgrass in the Virginia Nutrient Management Standards and Criteria.

Reporting. As currently proposed by VDACS, accounting of nutrient management acres will rely on the voluntary program managed by DCR. We strongly recommend mandatory annual reporting to the state that includes TN and TP applied, total acreage receiving these nutrients (by county or city), and total acreage receiving these nutrients in accordance with nutrient management criteria requirements. This type of basic, aggregate data is already collected by applicators and its submission to VDACS once a year will not be overly burdensome or elicit business privacy concerns. Voluntary reporting is inappropriate for a regulatory program, particularly one that is assisting with implementation of the Bay TMDL, MS4 permits, and other local water quality directives. Collection of this data will also allow Virginia and localities to get proper credit under the Bay TMDL and other TMDLs for urban runoff. A proper accounting of these actions has the potential to reduce the need for more expensive urban retrofits and address the concerns raised in the draft WIP and amongst stakeholders that on-the-ground BMPs are not being adequately counted. Simply put, Virginia and EPA cannot obtain an accurate count of actions if they are not efficiently reported.

Enforcement. Contract applicators that fail to comply with nutrient management requirements should face significant financial disincentives, including a substantial fine as well as loss of license and individual applicator certification. Fines for failure to comply should at least double the estimated cost of complying (i.e. the cost of training courses for staff).

Labeling. Labeling of lawn fertilizer sold in Virginia should have clear language advising consumers on how to use the product appropriately to achieve desired results and avoid pollution of surface waters. The currently proposed language is insufficient. Specifically, CBF recommends the inclusion of language compatible with Florida's labeling requirements for fertilizer sold at retail. The Florida law states that the following language shall appear conspicuously on bags of fertilizer sold at retail:

"Do not apply near water, storm drains or drainage ditches. Do not apply if heavy rain is expected. Apply this product only to your lawn/garden, and sweep any product that lands on the driveway, sidewalk, or street, back onto your

lawn/garden."

Given that we do expect frozen soils in Virginia and know that some homeowners do use fertilizer as a de-icer, we would recommend that the second sentence be modified to read:

"Do not apply to frozen or saturated ground, or if heavy rain is expected Do not use this product as a de-icer."

A final version of the VDACS regulations consistent with these ideas, and appropriate Code changes, are needed to accomplish these recommendations.

(b) Sale and application of TP fertilizer for lawn maintenance.

A recent report by Virginia Tech researchers evaluated several management approaches to reducing TN and TP runoff from fertilized urban acreage.[FN 84] The reports' key conclusions were that the implementation of a wide range of fertilizer management practices and policies could significantly reduce runoff of TN and TP, and that by carefully restricting application rates, TN loss in urban runoff from well-managed turfgrass will be minimal. The authors recommended a range of approaches that are estimated to reduce annual TN and TP pollution to surface waters in Virginia by 454,646 and 123,655 pounds, respectively.

Based on the results of this and other studies, the existence of similar programs in at least ten other states already, CBF supports a new program to restrict the sale and application of lawn fertilizer that includes the following components that are consistent with the Virginia Tech study: [FN 85]

Establish point-of-sale restriction on lawn fertilizer that contains TP for lawn maintenance. Most well-established home lawns and landscapes will not be soil phosphorus limited, but exceptions would be needed for "new ground" seedings, active construction sites, or critical renovation areas in home lawns where soil test validates an actual phosphorus deficiency. Requirements for signage and point-of-sale education should also be included.

Establish a point-of-sale requirement for lawn fertilizer that it must contain at least 25 percent slow-release TN. Guidance should be provided regarding the benefits of one-time and annual applications. Many manufacturers already combine quick and slow release sources of TN to take advantage of both strengths. The quick release source provides quick green-up but is at a sufficiently low rate to prevent salt injury or reduce the potential for leaching. The slow release source is available to provide a greening response for a longer duration.

Prohibit contract applicators from applying TP to established lawns without a soil test and require compliance with strict annual and one-time TN application in accordance with Virginia Nutrient Management Standards and Regulations for turfgrass management.

Bar application of fertilizer on sidewalks, driveways, or other paved surfaces.

Establish appropriate seasonal application restrictions to prevent application to frozen ground.

Create appropriate exemptions for organic sources of TN in fertilizer.

Implementation of this recommendation would require passage of a new statewide law. An appropriate phase-in period through 2012 would be appropriate for the TP provisions, and perhaps a longer period for the slow-release TN requirement. Take note that DCR distributed a draft piece of legislation to SAG members in August 2010 that included very similar requirements, but it was not included part of the draft WIP.

(4) Make several improvements to the Virginia Erosion and Sediment Control Program.

The Commonwealth should pursue two common-sense improvements to Virginia's Erosion and Sediment Control programs that have the potential to deliver reductions in nutrient and sediment pollution.

First, Virginia should require that sites be at least temporarily stabilized within three days of site disturbance, rather than seven days as currently allowed by the Erosion and Sediment Control regulations. Shortening the time sites may remain destabilized will reduce the chance that sudden rain events will wash sediment, nutrient, and high runoff volumes from the sites. Virginia should also expeditiously revise the regulations and associated guidance to ensure they are consistent with the federal effluent limitations guidelines (ELGs) for the construction and development industry when they are finalized.[FN 86]

Next, nutrient management on active construction sites should be consistent with DCR's "Technical Bulletin No. 4-- Nutrient Management for Development Sites." [FN 87] This bulletin advocates application of 50 percent of the TN that is presently recommended in the 1992 Virginia Erosion & Sediment Control Handbook for permanent vegetative stabilization on construction sites. Based on more recent nutrient management science, the recommended amount of TN is excessive. This could provide significant TN reductions through 2025.

In order to achieve these pollution reductions, revision and reissuance of the Construction General Permit and revision of state regulations will be necessary. We suggest that this action take place as soon as the currently suspended ELGs are finalized by EPA.

(5) Initiate an intensive education campaign on citizen education to reduce stormwater pollution.

The Commonwealth should promptly begin a statewide media campaign to educate citizens about steps they can take to reduce urban runoff. The campaign should use television and other new media that maximizes reach into the community. The focus should be on simple actions that reduce urban runoff, protect drinking water, and save people money. Such a campaign has the potential to provide immediate reductions in pollution from changes in citizen behavior, and future reductions indirectly by building citizen support for water quality programs. Table 4 suggests ten actions to consider for such a campaign.

Table 4--Ten Things Citizens Can Do to Prevent Stormwater Pollution and Save Money

1. Limit use of fertilizer.
2. Use native plants.
3. Pick up trash.
4. Keep water away from pavement.
5. Compost yard waste.
6. Never dump anything down the drain.
7. Perform environmentally-friendly car care.

8. Pick up after your pet.
9. Drive less.
10. Become active in your community.

(6) Require no net increase in post development pollution loads from new development by 2012.

Virginia should promulgate new regulations for post-construction stormwater that at least provide a no net increase in TN and TP loadings from the average predevelopment conditions to ensure that all nutrient loads from new development are fully offset. The draft WIP indicates a willingness to finalize these regulations. Moving toward 2025, the state should require that new development achieve a no net increase from the forested condition, either on-site or through acquisition of offsets.

(7) Establish regulations and incentives that promote redevelopment and sound land use.

The Commonwealth should take the following steps to reduce pollution from existing and future developments. Virginia should promulgate the new regulations for post-construction stormwater that require a 20 percent reduction in TN and TP from redeveloped lands. The draft WIP indicates a willingness to finalize these regulations.

Studies indicate that high density development provides less stormwater pollution per capita than low density greenfield development.[FN 88] [FN 89] [FN 90] We suggest that Virginia create incentives for redevelopment of existing urban corridors and projects in planned growth areas that include specific sound land use elements, such as supporting higher density, compact development, transit-oriented design, multiple uses, and/or increased open space, buffers, or tree canopy areas that are permanently protected. Incentives could include tax reductions, density bonuses, parking waivers, fee reductions, and rapid project approval. Some local governments already provide a mix of incentives for certain actions. Incentives should only apply to projects that are in approved urban development areas (UDAs), are compliant with the CBPA (if applicable), and are consistent with the local comprehensive plans.

Conclusions

CBF concludes that full implementation of these recommendations will provide the level of reasonable assurance needed to achieve pollution reductions from this source sector in the revised pollution allocations based on Level 2 included in Section IV.

IV. Onsite Wastewater Systems

Background

Conventional on-site sewage systems and alternative onsite septic systems (AOSS) are installed in Virginia. AOSS systems overcome drainfield area and other site limitations that preclude the use of conventional systems. Approximately 536,200 systems are located in the Virginia Bay watershed, with 11,000 new systems added each year (10 percent are AOSS). The Code, the Sewage Handling and Disposal Regulations, and Emergency Regulations for Alternative Onsite Systems govern these systems. [FN 91] [FN 92] [FN 93] EPA and the Commonwealth assume these systems retain all TP onsite. The Code provides authority for the Virginia Department of Health (VDH) to set TN limits on AOSS, but not for conventional systems. The existing AOSS regulations require large systems (greater than 1,000

GPD) to meet a five mg/TN limit. It has been VDH's policy for years to require compliance with the drinking water standard of ten mg/L nitrate-N in groundwater for all systems using mass drainfields (greater than 1,200 GPD). Note that dilution, not necessarily treatment, may be used to meet these TN limits. VDH does not administer funding programs for conventional or AOSS systems, although the code authorizes a betterment loan program to repair and or upgrade existing systems. The CWRLF, WQIF, and other programs sometimes provide grant funds for upgrades.

Even though programs are in place to address TN from new large AOSS, the sheer number of new conventional systems-many using 100-year old technology-will result in the total TN pollution from this source sector to continue to increase with growth. While onsite systems in Virginia only provide about four percent of TN load to the Bay, clusters of outdated or failing systems can pollute groundwater used for drinking water and nearby surface waters, such as poorly flushing creeks, embayments, and coves. The draft WIP indicated that, "VDH is beginning to see an increase in the number of applications for larger onsite systems in the Chesapeake Bay Watershed, but it is difficult to determine the trend." [FN 94] It is reasonable to conclude that the advent of new AOSS technologies that overcome conditions that ruled out conventional systems is driving this trend.

Draft WIP

The onsite system source sector portion of the draft WIP provides a well-written and direct overview of the challenges faced by this sector. Like stormwater, the draft WIP proposes a TN allocation based on an E3 level of treatment for this sector in the James River basin. The remaining TN allocations are at Level 2, which is the same level of treatment in the August 24, 2010 discussion draft. TP allocations are not provided to this sector.

The draft WIP acknowledges that existing onsite programs will not be able to reduce TN discharges to the Bay. Similar to our stormwater comments, there is absolutely no way that an E3 level of treatment can be achieved in the James River basin. Further, while the allocations were set based on Level 2 treatment and the draft WIP describes the new program capacity prescribed in the scoping scenario as necessary to meet Level 2 (installation of TN removal, septic pump outs), like the other NPS sectors, there was no commitment to pursue necessary new program capacity needed to support the effort. However, the draft WIP does indicate that new pending regulations for AOSS will propose the inclusion of TN limits for small AOSS systems (less than 1,000, mostly single family homes), elimination of the dilution option for compliance by large systems, and more stringent design standards for placement in sensitive areas. Lastly, there is no commitment to pursue new funding to upgrade existing systems, nor is there a specific pledge to instate offset requirements to address pollution from new systems. Taken in total, the existing programs and draft WIP do not provide reasonable assurance that the proposed allocations can be met.

Recommendations

We offer the following six specific revisions to the draft WIP that will help provide a high level of reasonable assurance that the revised pollution allocations for the onsite sector in Section IV can be met. Note that these revised allocations are set based on a Level 2 level of effort included in the August 24, 2010 discussion draft.

(1) Require existing septic systems within sensitive areas to install best available technology for TN or offset equivalent load by 2025.

The Commonwealth should require all existing conventional or alternative onsite systems in sensitive areas to install

best available technology (BAT) for TN or offset an equivalent load for the design life of the system. Single family home systems that hook up to an existing WWTP or a community onsite system that achieves BAT would also meet this mandate. "Sensitive areas" should be defined as onsite systems whose effluent dispersal components are within 100 feet of the ordinary high water mark of surface waters, open channel MS4s, sink holes, or public or private sources, including wells, springs, and reservoirs. This 100-foot boundary is consistent with new EPA guidance for onsite systems on federal lands that calls for a 100-foot setback for system components from these waters. [FN 95] Even a properly operating onsite system can discharge TN that far exceeds secondary levels of treatment. Thus, systems operating in sensitive areas can result in a locally-significant direct discharges. Also, dilution should no longer be used for compliance with TN limits. Improved performance in these areas will help protect drinking water sources, shellfish waters, and help meet local bacteria TMDLs and other mandates, as well as help reduce pollution to the Bay downstream. This recommendation is consistent with the new proposed regulations for AOSS; however, this approach extends the more stringent requirements to all systems in sensitive areas.

Specific Code changes would be required to allow VDH to mandate TN treatment for conventional systems and allow system owners to access an appropriate offset program. Changes to the Sewage Handling and Disposal Regulations would also be needed. Lastly new grant, loan, and incentive programs are warranted to achieve this recommendation. A 15-year implementation schedule based on system size and risk is recommended to phase in this requirement.

(2) Require installation of BAT for all new and replacement septic systems within 1,000 feet of sensitive areas by 2012.

Virginia should require that all new and replacement onsite systems within 1,000 feet of sensitive areas achieve at least a BAT for TN or offset an equivalent load for the design life of the system. This is also consistent with recent EPA guidance and new law in Maryland. [FN 96] [FN 97] The BMP proposed by VDH in the draft WIP that employs a denitrification system with a shallow placed, pressure dosed dispersal system is one way to accomplish this level of treatment. As noted in the previous recommendation, specific Code and regulation changes will be needed to allow TN treatment standards for conventional systems and access to offsets by developers.

(3) Improve enforcement of the existing CBPA septic pump out provisions immediately, and expand those provisions Virginia Bay watershed-wide by 2025.

The Commonwealth must ensure that the septic system provisions of the CBPA are fully enforced to maximize capture of nutrients. The CBPA regulations require that septic systems in the Resource Protection Areas be pumped out at least every five years, or alternatively, install sediment trapping systems approved by VDH. Further, a five-year pump-out requirement should be required of all systems in the Virginia Bay watershed by 2025. A new law and regulations would be required to expand the pump-out requirement.

(4) Prohibit new onsite systems in sensitive areas by 2012.

The state should prohibit the placement of any onsite system components in sensitive areas as defined in the first recommendation. This action will prevent TN inputs, and even TP inputs, as phosphorus could be released if the systems discharge to hydric soils or soils that are already saturated with phosphorus. This would require a Code and regulation changes.

(5) Establish a financial assistance program for system improvements by 2012.

The Commonwealth should create a tax credit program to assist system owners in complying with the first recommendation for this source sector. Appropriation of funding to support the existing betterment loan program should also be considered to assist with costs borne by the system owner. A Code change would be necessary to support this new program.

(6) Require offsets from all new systems through an in-lieu fee approach.

All nutrient pollution from new onsite systems should be offset. Adequate funds should be collected to offset the load for the life of the system. To ease compliance with this standard, we suggest establishing an in-lieu fee program that allows landowners who are newly required to upgrade their systems the option to pay into a fund. Funds should be available for use by localities for nutrient reduction projects. Such a fund is discussed further in the NCE section below.

Conclusions

CBF concludes that full implementation of these recommendations will provide the level of reasonable assurance needed to achieve pollution reductions from the onsite sector in the revised pollution allocations based on Level 2 included in Section IV.

V. Expanded Nutrient Credit Exchange

Background

Market-based pollution trading programs have been established or are under development across the nation. Pollution trading in the United States began with the Acid Rain Program established in 1990 to reduce the atmospheric emission of sulfur dioxide and nitrogen oxides primarily from coal-fired power plants. [FN 98] This program has been hailed as a success by EPA, industry, and others. Owing to the success in the air arena, as many as 70 water quality trading programs are underway or being explored across the country. [FN 99] [FN 100] Most of these programs have used "point source-to-point source" credit trading approaches or were specifically limited in participants or geographic scale. Newer programs operating in Connecticut to protect the Long Island Sound and in Pennsylvania and Virginia for the Bay are the farthest along in setting up programs that allow "point source to NPS" trades, support offset of pollution from future growth, and/or are focused on large coastal watersheds. A study by the Water Resource Institute in 2010 concluded that a Bay-wide nutrient trading program could help reduce nutrient pollution in the Bay in the most cost-effective and timely manner. [FN 101]

Virginia established the NCE in 2005 and created a permitting mechanism for the program in 2006.[FN 102] [FN 103] This program allows point-to-point and NPS credit exchange for compliance, offsets to address growth, and "bubbling" or sharing of WLAs by WWTPs that are part of the same sewerage authority. In 2010, the code was amended to require offset of any nutrient pollution from new small WWTPs that discharge more than 1,000 GPD.[FN 104] Also in 2009, a provision was added to allow compliance with stormwater requirements at §10.1-603.4 through the use of offsets.[FN 105] The ability to use offsets was expanded to allow compliance with MS4 permits and TMDLs in 2010.[FN 106]

As noted in the WWTP sector section, the existing NCE has supported 46 point-to-point source nutrient contracts, which are projected to help accelerate pollution reductions at lesser cost. To our knowledge, no point source-to-NPS

trades have taken place so far. Several private nutrient banks hold NPS offsets for sale, but the current excess capacity held by point sources and the lack of appropriate regulatory drivers for potential buyers has precluded a market for these offsets to date.

CBF supported the legislation that created the NCE programs described above. Our focus during development of the enabling legislation was to ensure that the program operated at an appropriate scale and with sufficient rules to meet the following broad goals: (i) ensure delivery of actual reduction in pollution loads to the Bay and its rivers, (ii) help offset pollution from future growth, (iii) protect local water quality and meet local mandates, and (iv) include realistic expectations and deadlines for the ability of the approach to solve water quality programs. Our conclusion after five years of operation is that the NCE is working as designed for point-to-point source trades, with some minor legislative changes it can facilitate offset of new growth, and lastly, with firm regulatory drivers, may eventually sustain a viable NPS trading component.

Draft WIP

The draft WIP proposes a significant expansion of the NCE. This program expansion is only vaguely described, short of indicating that it will reduce reliance on implementation of sector-specific BMPs, allow agriculture and onsite systems to purchase credits to achieve compliance, and that allocations--very aggressive allocations--for urban runoff and onsite systems can be attained through the expanded NCE. The draft WIP does not include any analysis of credit supply and demand, projected offset needs, the cost of credits, or any other data to prove that this approach can be sufficient to meet the pollution allocations. Further, the document fails to even mention the types of new legislative authority or regulatory changes that are needed to launch an expanded program. In fact, the draft WIP is explicit that, "The specific details of an expanded nutrient credit exchange will be developed through the legislative and regulatory processes of the Commonwealth." [FN 107]

While the NCE was recognized as an important tool in the draft worksheets, scoping scenarios, and draft plans presented to the SAG, the wholesale use of the NCE proposed in the draft WIP appears to have been added late in the process. As presented, this approach raises significant concerns. Three problems undermine the potential success of an expanded program:

1. The lack of any regulatory mandate or other driver to compel the presumptive users of this expanded approach--the urban runoff or onsite sectors--to purchase credits. There would be no reason for an MS4 or homeowner to purchase credits unless they are required to improve their performance by a set amount by a set date.
2. The Commonwealth has a mixed record maintaining a firm cap in program participants. Maintaining pollution caps is absolutely critical to a successful market-based trading program. If participants believe it is more efficient to invest in efforts to seek an increased cap, rather than investing in credits, the program will not work. Requests for additional WLAs were before the General Assembly in the past, yet did not become law. To date at least two administrative requests for additional nutrient WLAs were rejected by the State Water Control Board.[FN 108] However, in April 2009, the Board approved a request for additional pollution allocations by Merck.[FN 109] And unfortunately, in September 2010, the Board overturned its previous denial (in April 2009) by approving a settlement which increased the WLAs of the Frederick-Winchester Service Authority's Opequon WWTP. [FN 110] We fear some will argue that these decisions establish a precedent that caps are not firm.

3. There is no evidence presented in the draft WIP to support the premise that WWTPs would be willing to permanently give up via sale the amount of nutrient allocations that appear to be necessary to support an expanded effort. Excess wastewater capacity is "gold" to localities, and it seems unlikely that significant credit exchanges, even between WWTPs and MS4s that serve the same community, would be acceptable to local elected officials.

The draft WIP states in regard to filter feeders, such as oysters, that "Virginia is committed to increasing the population of these natural filters and believes credit for filter feeder restoration and the associated nutrient removal should be recognized in implementing the James River TMDL." The concept of integrating oyster restoration into nutrient trading programs has been evaluated by Virginia Commonwealth University and Virginia Tech and there has been growing support for this concept amongst stakeholders.[FN 111]

CBF is a leader in promoting native oyster restoration and oyster aquaculture, and is actively involved in the protection of menhaden and other filter feeders. However, at this time, for the following reasons, we oppose allowing oysters or other filter feeders placed instream to be used to generate nutrient offsets to assist permitted sources with attainment of water quality standards:

Right now CBF can only support offset approaches that prevent or reduce pollution from entering surface waters, not those that will treat it after it has been released. Once in surface waters, TN and TP can cause ecological effects (algal blooms, dead zones, harm aquatic life) and it will be very difficult, if not impossible, to ensure that those effects will be adequately mitigated by oysters or other instream treatment options, particularly if they are not in the same geographic location.

Nitrogen removal efficiency of oysters is very site specific. Consequently, we cannot be certain that their removal efficiencies will be the same at different locations and under different conditions. For example, if oysters are placed in polluted water, or exposed to algal blooms or other stressors, and they cease feeding or do not feed as efficiently, they may not remove as much pollution as anticipated.

We will, however, strongly support oysters as an adjunct to, not a replacement for, the reduction of pollution from land-based sources. Additionally, use of oysters and other filter feeders "off-stream" in constructed water bodies to provide additional treatment of WWTP discharges or runoff before it reaches waterways may be a potential option in the future.

Finally, the draft WIP recognizes the ability of the existing NCE to offset new loads from the largest WWTPs and introduces the concept of establishing a perpetual funding source for offsets that could have great promise as a way to truly offset loads from developed lands. While not committing to pursue new program capacity, the draft WIP identifies some workable solutions to fill gaps in the existing NCE program by requiring small WWTPs and onsite systems to purchase offsets.

Recommendations

(1) Establish firm mandates for regulated parties expected to participate in the NCE program by 2012.

The Commonwealth should expeditiously establish more stringent nutrient limits and deadlines for compliance for the dischargers that are envisioned to participate in the expanded NCE. MS4s, onsite systems, and potentially, the largest non-significant dischargers would be subject to new mandates. Further, the state should work with the State Water

Control Board to ensure that WLAs in place for significant WWTP plants are not increased to accommodate future plant capacity needs. As discussed earlier in this section, without a firm regulatory driver, there is nothing to compel source sectors to participate in any market-based trading programs.

(2) Create an in-lieu fee offset program for small dischargers by 2012.

To comply with retrofit or offset requirements placed on smaller dischargers, such as those from small WWTPs (less than 1,000 GPD) or onsite systems used for single family homes, Virginia should create an appropriate program to accept in-lieu fee payments to address delivered nutrient pollution for the working life of the system. The concept of establishing a fund that would set, collect, and manage these in-lieu payments such that needed "perpetual" reductions are provided is a good idea that should be explored further. Such funds could be provided to localities to pay for less intensive actions whose cost can reasonably be expected to be covered by the funds expected to be collected. Septic pump outs, buffers and tree plantings, urban BMP maintenance, and urban nutrient management may be options.

(3) Establish different offset ratios for different types of development.

Maryland's draft WIP introduced the use of different ratios for different types of development. New development of "greenfield" areas will be required to provide more offsets than development in existing or planned growth corridors. Such an approach can help encourage the types of high density development in growth areas that studies show are better for water quality. Virginia should consider building at least a modest version of this approach into the expanded NCE, perhaps requiring additional offsets for new development of forests and fewer offsets for new development in UDAs or projects that achieve specific land-use principles. Care should be taken to ensure that the "net" offsets across all new development still compensate for new pollution loads.

VI. Two-Year Milestones

Background

EPA provided detailed guidance to the Bay jurisdictions about the content of the WIP and two-year milestones. "EPA expects the Watershed Implementation Plans and two-year milestones will contain greater source sector and geographic load reduction specificity, more rigorous assurance that load reductions will be achieved, and more detailed and transparent reporting to the public than past Bay restoration efforts [emphasis added]." [FN 112] Further, EPA's April 2, 2010 follow-up guidance provides a series of questions to aid in WIP development. One question reads, "Does the Bay jurisdiction indicate how nutrient and sediment loads, by major basin, are expected to decrease over time so that EPA can assess future two-year milestones?" [FN 113] The clear intent here is to avoid the mistake made in the past of waiting until deadlines are upon us before assessing progress (determining in 2007 that the 2010 goal would not be met for example). EPA is looking for step-wise plans and targets that will assist with adaptive management and tracking progress by the jurisdictions and EPA during the 15-year life of the WIP.

Draft WIP

Unfortunately, the draft WIP does not comply with these requirements. It does not project the loads by basin and source sector or actions that will be pursued during each two-year period through 2025. The draft WIP indicates that, "Assessing compliance with two-year milestones will be based upon total loadings, not by compliance with individual

source sector allocations." [FN 114] However, the draft WIP contradicts this stated approach by also stating that, "Another component of this adaptive management approach is a requirement to develop two year milestones that provide specificity regarding pollutant control measures to be implemented within each two year period and to support maximum accountability [emphasis added]." [FN 115] Based on the failure to provide any breakdown of two-year plans in the draft WIP, our presumption is that total loadings will be used to assess progress every two years.

Recommendations

The Commonwealth should describe in the final WIP the approximate pollution reduction milestones by source sector for each two-year period and list the anticipated actions it will take to help meet each milestone goal. Greater specificity should be provided for near-term efforts, with more general types of actions appropriate for longer-term efforts. This information is essential to meet EPA's and stakeholders requests for more accurate and transparent tracking of BMPs and pollution reduction progress.

In closing, what is distinctly missing from EPA's Draft TMDL is any appreciation for the major commitments very recently made by EPA and Virginia (the State's adoption and EPA's approval of the Virginia Regulations in 2005 and 2007) and the major financial commitments that have made to implement those requirements including constructing major new facilities (typically built to last 20 to 30 years). As an organization with a demonstrable commitment to clean water, we object to the waste inherent in EPA's threatened override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

West Virginia

Overall

For transparency of information, West Virginia disclosed a significant amount of specific information related to its current programs and capacities but, similar to the other draft WIPs, failed to commit to specific actions to achieve pollutant allocations under the Bay TMDL. This lack of specific actions makes it difficult to have confidence that the state will achieve its pollution reduction requirements. For the strength of its programs, West Virginia appears to rely on mostly voluntary programs to reduce pollutant discharges from its nonpoint sources but does not provide any information to assess the effectiveness of and compliance with these programs.

The draft WIP would lower phosphorus discharges to a level that is 6 percent below the target allocation. However, the draft WIP still permits nitrogen and sediment allocations to be 18 percent and 38 percent, respectively, more than the level allowed by the target allocation.[FN 26]

In its final WIP, West Virginia must commit to taking specific actions that will ensure achievement of the Bay TMDL and provide more compliance and participation information to ensure that nonpoint sources contribute to the nitrogen, phosphorous, and sediment reductions.

NPDES Permitting

West Virginia disclosed a good deal of information regarding the number of facilities with permits but failed to disclose other permitting information, such as the universe of facilities that require but do not yet have permits and the number of expired or administratively continued permits and when they will be updated. The draft WIP notes a personnel gap in all sectors but does not specify the gap or how or when that gap will be filled.

In the final WIP, West Virginia should include a more thorough capacity and gap analysis and establish goals for ensuring all facilities have the required and up-to-date permits that are consistent with the Bay TMDL.

Enforcement of NPDES Permits

The draft WIP does not contain much enforcement information, apart from noting that there are "regular" inspections of wastewater facilities and that the state is in the process of developing an enforcement protocol for stormwater discharges. Unlike other states, however, West Virginia does include data on the major facilities that are in significant non-compliance.

In the final WIP, West Virginia should include complete enforcement data, such as: the number of physical, onsite inspections per sector; the number of violations and penalty actions and the amount of penalties assessed during the

past year; a description of the enforcement activities by local governments with delegated authority; and a clearer picture of enforcement resources. One avenue for this disclosure is for the West Virginia Legislature to pass legislation requiring an annual report of enforcement activities, such as section 1-301(d) of the Maryland Environment Code.[FN 27]

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

The draft WIP relies on voluntary implementation of best management practices, which are funded by a combination of federal, state, and private monies. The draft WIP does not indicate how successful the voluntary implementation has been. In the final WIP, West Virginia should disclose the acreage currently under voluntary management or best practices and the method of ensuring compliance with funding terms. As a contingency, the state should consider transitioning some voluntary practices into mandatory practices.

Contingencies

The draft WIP does not discuss contingencies related to each sector, and the contingencies that are discussed lack evidence of serious commitment to implement should the primary controls fail or be delayed. The contingency for stormwater, for example, states that the West Virginia legislature "could enact statewide stormwater regulations that address water quality and water volume outside of MS4 areas." While regulating more areas for stormwater would certainly contribute to pollutant reductions, the WIP gives no indication when these regulations be enacted or what areas might qualify for additional regulation.

In the final WIP, West Virginia should include contingencies that cover each sector and should specify when and how these contingencies will be implemented.

Concentrated Animal Feeding Operations

The draft WIP notes that in 2010 West Virginia revised its CAFO regulations to match federal rules. According to EPA, however, the CAFO program has not yet been approved and "there are several issues that need to be addressed in order for EPA to approve." [FN 28] The draft WIP also admits that the universe of facilities that require CAFO permits cannot currently be determined, and that despite the cumulative impact of discharges from AFOs West Virginia does not intend to have universal CAFO designation.

The final WIP should provide an estimate for the date of EPA approval and the subsequent timeline for ensuring that all facilities receive permits that are consistent with the Bay TMDL. West Virginia should also provide more information regarding its CAFO compliance and enforcement program, including inspection frequency, compliance rates, enforcement activities and penalties, and any other relevant information.

Stormwater

The draft WIP includes, notably, specific future goals for active registrations under the permit (decreasing acreage under the construction stormwater general permit to 2025) and a brief discussion of how WV might achieve these goals. However, it does not include information about the authorities of local authorities to verify stormwater discharges and compliance with NPDES permits, nor does it include information regarding the personnel and funding gaps and how the

state will fill them.

In the final WIP, West Virginia should address these gaps and overall provide a more detailed review of its stormwater program and how it will substantively be used to meet the stormwater allocations in the Bay TMDL.

Air Deposition

The draft WIP does not include a discussion of authorities to reduce air deposition of nitrogen. In the final WIP, West Virginia should disclose a list of all major sources of pollutants that contribute to air deposition of nutrients in the Bay, a list of air pollution control authorities that the state plans to use to control air pollution, and an estimate of the funding and personnel gap and a plan with deadlines or commitments to fill that gap.

Organization:

4. Poor communication between US EPA and West Virginia officials in charge of the WIP was stated as a primary reason for confusion and many of the deficiencies in the plan. That is not the fault of the public here in West Virginia. We should not be held accountable for problems that exist between federal and state agencies, nor should we be made to suffer as a result of those problems.

Organization:

Poor communication and a full speed ahead mentality at US EPA are indicative of a draconian and arrogant federal program destined for failure. Instead, become partners with the good stewards of the land that make up the proud people of West Virginia. It is much easier to work with us to address these environmental challenges than it is to exert a heavy handed, top down approach that solves nothing. Show us that you are willing to meet us at the water's edge and work together to keep the water we send downstream the cleanest it has been in many many years. This will entail a cultural change at US EPA. One that will require you to begin to trust and understand the agricultural practices that we employ every day, on the land we love and where we raise our children.

Organization: Potomac Riverkeeper

Potomac Riverkeeper Inc (PRK) represents over 2500 members in the Potomac River watershed that support our efforts in protecting water quality in the Potomac 's rivers and streams through enforcement and community action. It is our responsibility to speak for the Potomac River and voice concerns that threaten clean water. PRK acknowledges the attempt of the West Virginia Watershed Implementation Team to develop a plan of action to address the nutrient loading reductions required by the EPA and the Chesapeake Bay Model. However, PRK strongly disagrees with the approach that West Virginia has taken. Specifically, the continued use of voluntary practices within the agricultural community, focusing on targeting Jefferson and Berkeley County agricultural community, requesting to exchange excess phosphorus for a reduction in nitrogen load, the use of nutrient trading as a key component for future offsets.

The agricultural voluntary practices may have had some progress in West Virginia, but many of the rivers and streams in the Potomac Watershed continue to suffer from excessive nutrients creating algae blooms that have significant ecological threats. USGS has found sections in the South Branch Potomac containing intersex fish along with the Shenandoah, the Potomac main stem and now intersex fish have been found in the Susquehanna [FN 1]. Many of these areas are rural landscapes with agriculture as the dominant land use. It is imperative that West Virginia not just concentrate on Jefferson and Berkeley County to satisfy the Bay TMDL nutrient reductions, but all counties in the Potomac Watershed. Focusing on the two Eastern Panhandle counties is unfair to the citizens and tourists that spend thousands of dollars to recreate on rivers like the South Branch Potomac, the Cacapon River, and Patterson Creek. These people and the aquatic species that thrive in the rivers require clean, pollution free water.

West Virginia's draft WIP is deficient in that it failed to commit to specific actions to achieve pollutant allocations under the Bay TMDL, relies on mostly voluntary programs to reduce pollutant discharges from its nonpoint sources, and does not provide any information to assess the effectiveness of and compliance with these programs. The draft WIP would lower phosphorus discharges to a level that is 6 percent below the target allocation. However, the draft WIP still permits nitrogen and sediment allocations to be 18 percent and 38 percent, respectively, more than the level allowed by the target allocation.

West Virginia must commit to taking specific actions that will ensure achievement of the Bay TMDL and provide more compliance and participation information to ensure that nonpoint sources contribute to the nitrogen, phosphorous, and sediment reductions. Additionally, each State has different processes for estimating waterbody impairment and therefore different TMDL development strategies. West Virginia has Biological Impairment TMDLs that looks at nutrients as a function of the impairment, but does not have caps for nitrogen or phosphorous and relies on the reduction of fecal coliform from point sources to reduce nutrients. West Virginia's process for evaluation impairment is the worst of all the States, and consequently, West Virginia is severely lagging behind others in the Potomac watershed. West Virginia needs to develop nutrient TMDLs that set caps for nitrogen and phosphorus for both point source and non-point sources.

Enforcement of NPDES Permits

The draft WIP does not contain much enforcement information, apart from noting that there are "regular" inspections of wastewater facilities and that the state is in the process of developing an enforcement protocol for stormwater discharges. For example, in Berkeley County, two waste water facilities have violated their NPDES permit for close to two years. Both facilities are operated by Berkeley County Public Service Sewer District and have received 16 to 18

"Notice of Violation" reports during State enforcement inspections. No action has been taken by West Virginia, and these two facilities continue to pollute the Opequon Creek.

It is also important to have complete accounting of all nutrient loads. The less significant WWTPs (40,000 gpd or less) need to have their flows measured and nutrient loads calculated in the final WIP.[FN 2]

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

West Virginias' approach to reducing nutrients from agriculture continues to use voluntary programs. Some progress has been made by using voluntary practices; however, the streams and rivers in the West Virginia Potomac Basin continue to be plagued by excessive nutrients and consistent algae blooms, year after year. Voluntary practices are not working. There needs to be a serious attempt in the WIP to control nutrients from farms through regulation. At the very minimum, Nutrient Management Plans need to be required for all farms and be publicly available. Dairy and Beef operations should be required to fence the animals out of the streams and a 40% target should be a two year milestone, not an overall target to be completed by 2025.

Sediment Loading

Sediment reductions are not covered in the West Virginia WIP. Possible sediment reductions should have been illustrated in the WIP even though the allocation number was not provided by EPA until last minute. In this regard, for the purposes of calculating possible sediment reductions in the WIP, the input deck West Virginia submitted to the Bay Model included an "extractive land use " designation that refers to surface mining activities. West Virginia proposed to equate the nutrient and sediment loading to a forest loading. Surface mining activities produce significant sediment and nutrient inputs to rivers and streams during rain events and are not in any way equal to a forest system.

Regulated Stormwater

Sediment and nutrient loadings from regulated stormwater activity is an important area that needs additional State and local support. There were no contingencies listed for these sections except the MS4. Similar to other permitted sections that are regulated by DEP, the WIP portrays the enforcement and compliance of permits are adequate and meet water quality standards, this is not true. There are as many as 631 construction stormwater permits that need to be monitored for BMP management to ensure turbid water does not reach our streams. This is not possible with only one DEP inspector. West Virginia needs to take sediment and nutrients from construction sites and MS4 sites more seriously by hiring more inspectors and working with local governments to provide support.

Non-Regulated Stormwater

The WIP identifies contingencies for this section and the State needs to considered some if not all of these for inclusion in the two-year milestones.

Comments from the Chesapeake Bay Foundation on West Virginia's Draft Watershed Implementation Plan
November 8, 2010

On behalf of the Chesapeake Bay Foundation's (CBF) more than 200,000 members please accept this letter as formal comment on West Virginia's Chesapeake Bay TMDL Watershed Implementation Plan, A Product of the West Virginia WIP Development Team. Also, we incorporate by reference the comments submitted by CBF, Boesch, et al., and the Choose Clean Water Coalition to Administrator Jackson on November 8, 2010, Docket no. EPA-R03-OW- 2010-0736.

We very much appreciate the dedication of the many state agency staff that contributed to the draft Watershed Implementation Plan (WIP). We further thank the state for the opportunity to comment upon this critical work. Unfortunately, the draft WIP falls short, not only of achieving the necessary load allocations for nitrogen and sediment called for in the draft Chesapeake Bay Total Maximum Daily Load (TMDL), but also in providing the necessary reasonable assurance that the programs, policies, and other necessary actions will be put in place by 2025.

As you know, the process of developing the Bay-wide TMDL actually began over a decade ago with a series of federal judicial consent decrees and settlement agreements over impaired water listings for many watershed states. See *American Canoe v. EPA*, 54 F. Supp. 2d 621 (E.D. Va. 1999). On June 28, 2000, the governors of Virginia, Maryland, and Pennsylvania, the chair of the Chesapeake Bay Commission, and the Mayor of the District of Columbia responded to the various decrees and agreements by signing, with the EPA Administrator, Carol Browner, the Chesapeake 2000 agreement which, among other things, committed to reduce nitrogen, phosphorus, and sediment sufficiently to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. In 2002, Governor Wise of West Virginia signed a formal agreement to work with the other jurisdictions to "achieve the nutrient and sediment reduction targets . . . to achieve the goals of a clean Chesapeake Bay by 2010."

In December 2003, the EPA, West Virginia and the other Bay jurisdictions agreed to the nitrogen, phosphorus, and sediment allocations that became the basis for "tributary strategies," designed to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. West Virginia issued its own tributary strategy in 2005. [FN1] In it, the state explicitly recognizes that failure to achieve the necessary load reductions would result in the development of the TMDL. (p. 11). Unfortunately, the Bay and many of its tidal waters were not de-listed, triggering the need to develop the Bay TMDL - a process in which West Virginia has been a full and cooperative participant.

In addition, many of West Virginia's waters within the Potomac watershed are listed as IML due to unhealthy benthic macroinvertebrate communities or high levels of fecal coliform bacteria. [FN2] Intensive agriculture (i.e., livestock waste) has been implicated as the source of bacteria in many of these streams [FN3] and also as a contributor to the impaired biological communities. [FN4] Practices that the state needs to implement to reduce the impairments to the waters are similar to those needed to reduce nitrogen, sediment and phosphorus loads to the Potomac River and Chesapeake Bay. [FN5] Cleaning up local waters will improve local economy by enhancing recreational opportunities associated with fishing, swimming, etc.

To restore local rivers and streams and, ultimately, the Chesapeake Bay, we strongly encourage the state to provide the necessary details in their WIP for how they will achieve the necessary reductions by 2025, consistent with EPA's correspondence to the Principals' Staff Commit September 11, 2008, November 4, 2009, and April 2, 2010. West Virginia's responsibility to develop an adequate WIP that meets the Bay TMDL allocations and provides reasonable assurances of required pollution reductions is founded on the firm requirements of federal law.

The Clean Water Act (CWA or Act) [FN6] provides the basis on which the draft WIP must be evaluated. Enacted in 1972 to compel the restoration of the nation's waters, [FN7] the CWA requires the states to establish water quality standards and to take the necessary actions, including that by upstream states, to ensure that the waters meet those standards, thereby achieving CWA goals. [FN8] If a state does not promulgate water quality standards or falls short of CWA requirements in doing so, EPA will set the standards for the state. [FN9] The CWA prescribes that of technology-based effluent limitations for most point source discharges [FN10] and, if those measures do not achieve water quality standards, the Act requires the use of water quality-based controls under Section 303(d). [FN11]

The draft WIP forms part of the CWA's § 303(d) TMDL program, which requires identification and listing of all impaired water bodies within a state's borders. For each listed segment, 303(d) and implementing regulations require the state to establish a TMDL for specified pollutants. [FN12] A TMDL is the maximum amount of a pollutant -- from background, point and nonpoint sources, together with a margin of safety -- that the water body can receive and still attain water quality standards. [FN13] When triggered by CWA requirements, the states and EPA are required to establish a TMDL,

as courts have recognized. [FN14]

Once a TMDL is established and approved by EPA, the affected states must adequately implement it to ensure water quality goals are attained. See *Sierra Club v Meiburg*, 296 F.3d 1021 (11th Cir. 2002). Thus, CWA § 303(e)(1) requires each state to have a continuing planning process that results in implementation plans for all navigable waters within state boundaries, which include effluent limitations and compliance schedules as required, § 303(d) TMDLs for pollutants, and "adequate implementation, including schedules of compliance, for revised or new water quality standards," including those of downstream states. [FN15] Resort to a TMDL is the CWA's "backup" strategy for achieving water quality standards; it is invoked when point source permits and best management practices (BMPs) for non-point sources (NPS) have not succeeded. [FN16] Accordingly, EPA may only approve a state-submitted implementation plan that provides assurances it will succeed in "implement[ing] applicable water quality standards." [FN17]

What constitutes reasonable assurances will vary depending on the water body and the pollution sources at issue. [FN18] For waters impaired by both point and nonpoint sources, a TMDL may not allocate WLAs based on an assumption that NPS load reductions will occur unless the TMDL provides reasonable assurances that NPS control measures will achieve expected load reductions. [FN19] The bottom line is clear: To carry out CWA's command to ensure water quality standards are attained, EPA must be able to determine that a plan's claimed load allocations are not based on excessively optimistic hopes concerning the amount of NPS pollutant reductions that will occur. "If the reductions embodied in load allocations are not fully achieved because of a failure to fully implement needed NPS controls, the collective reductions from point and NPS will not result in attainment of the water quality standards." [FN20]

The current draft WIP from West Virginia does not satisfy the requirements of the Clean Water Act. For one, it fails to achieve the necessary allocations for nitrogen and phosphorus and it fails to provide the necessary reasonable assurance that the required reductions will be achieved.

We agree with EPA's assessment of West Virginia's draft WIP. [FN21] Improvements should include more details on how loads from new development will be tracked and offset and specific information on permit limit requirements and compliance schedules for wastewater treatment plants. West Virginia should also strengthen the section dealing with achieving needed reductions from agriculture, which contributes the vast majority of the state's sediment, phosphorus and nitrogen loads to the Bay. The recent draft report by the U.S. Department of Agriculture highlights that although progress has been made in reducing sediment, nutrient and pesticide losses from farm fields through conservation practice implementation in the Chesapeake Bay region, a significant amount of conservation treatment remains to be done to reduce nonpoint agricultural sources of pollution. [FN22] West Virginia is relying heavily on existing conservation programs, but history has shown that the status quo is insufficient. The state must specify more details on how implementation will be accelerated through enforceable or otherwise binding measures.

We support the recommendation to revise the state's phosphorus index. We urge West Virginia to work with scientists in the other Bay jurisdictions to come up with a regional approach to protect water quality. We are pleased to learn that a poultry litter gasification system is currently being piloted and encourage West Virginia to work with the poultry industry to facilitate other waste-to-energy projects.

We sincerely hope that the final WIP submitted to EPA is sufficient, so as to avoid the need for EPA to invoke the

"backstop" provisions in its proposed TMDL.

20.5 - MARYLAND**Comment ID 0108.001.002**

Author Name: Kerstetter Donald

Organization: Trappe Landing Farm and Native Sanctuary

There are 4 actions that must be initiated now to begin to alleviate 60 years of unsustainable chemical farming and soil mismanagement. None of these are mentioned in Maryland's TMDL response. The first is the significant reduction in farm field fertilizer application rates, the second is the pyrolysis of farm animal manure, the third is a minimum 3 crop rotation plus mandatory winter cover crops and four is to end all corn subsidies including ethanol.

Maryland

Overall

Maryland's draft Phase I Watershed Implementation Plan (WIP) is an inventory of the state's pollutant control programs with no substantive commitment to implementing or bolstering specific programs. For transparency of information, Maryland discloses an average amount of information, which is somewhat surprising because much of the vital information already exists as part of its annual enforcement and compliance report. For the strength of its programs, Maryland lists a menu of pollutant control options that will enable the state to meet 130 percent of its TMDL load allocation but does not commit to any of those options. The options are not accompanied by funding commitments or deadlines for implementation.

The WIP was "expressly written to solicit public comments on a wide range of pollution control strategy options.... [T]he

options chosen to implement the needed reductions will be selected with the benefit of the public comments..." Public comment and input is undoubtedly valuable, but ultimately Maryland must make the tough decisions that protect the environment and lead to a restored Bay for present and future generations. By leaving the particulars open to debate, Maryland is likely to receive less focused and less helpful comments.

The draft WIP meets the nitrogen and phosphorus allocations and reduces the sediment pollution to a level that is 26 percent below the target allocation.[FN 12] Maryland's final Phase I WIP should include the permitting and enforcement information already contained in its annual compliance and enforcement report to establish its baseline capacity. The final Phase I WIP should also contain contingencies for slow or delayed implementation of primary pollutant controls.

NPDES Permitting

In the draft WIP, Maryland included some information about its permitting program, such as 526 Notices-of-Intent for facilities that are seeking coverage under the CAFO program, but failed to disclose information about existing facilities without permits, if any, or existing facilities with expired or administratively continued permits. Much of this information already exists in Maryland's FY 2009 Compliance and Enforcement Report, so MDE should collect this information and present it in the final WIP. Maryland also failed to establish deadlines, timelines, or qualitative goals for updating and reissuing expired and administratively continued NPDES permits.

Enforcement of NPDES Permits

Under section 1-301(d) of the Maryland Environment Code, MDE is required to publish a remarkable amount of information in its annual compliance and enforcement report.[FN 13] Earlier this year CPR published a report on MDE's NPDES program and recommended that the agency make public enforcement and compliance actions by local governments with delegated authority. MDE provides a helpful table, not included in its annual report, that breaks down inspection and enforcement data at the county, municipal, and state levels for the sediment and erosion control program. Appendix H of the WIP shows a wide range of permits-to-inspector ratios and more than 360 inspections per inspector.

Maryland's draft WIP does not provide any internal assessment of the effectiveness of its program, nor does it provide sufficient information to judge the strength of its enforcement program. Earlier this year, CPR conducted an evaluation of enforcement trends and found that MDE is significantly underfunded and its enforcement program is not designed to ensure compliance with NPDES permits and does not take advantage of citizen suits as additional enforcement assistance.[FN 14] For example, between 2000 and 2009, the overall workforce budget for the Water Management Administration declined nearly 25 percent, when adjusted for inflation, and coincided with a doubling of permits-in-effect. The average penalty obtained per enforcement action was striking low, roughly \$1,260.

Maryland's final WIP should explain how it intends to improve its enforcement program and address these issues as they relate to the Bay.

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

The draft WIP lists the different verification schedules for different federal and state funds. For example, inspectors conduct random spot checks of 10 percent of best management practices funded by the MACS program. The final WIP

should include information regarding participation and effectiveness of these nonpoint source pollutant control activities. In addition, the draft WIP does not cite dedicated funding for monitoring and verification. This information should be included in the final Phase I WIP.

Contingencies

Overall the draft WIP fails to discuss what contingencies Maryland will implement for slow or incomplete implementation. EPA's Expectations letter specified that the WIPs should contain specific plans to implement contingencies in the event of delayed adoption of new or revised legislation or regulations, inadequate compliance or participation rates, or adverse changes in land use or development rates.[FN 15]

In the final WIP, Maryland should ensure that its contingencies are clearly identified and are coordinated with specific failures, have timely implementation deadlines, are effective, and have legal authority to require implementation.

Concentrated Animal Feeding Operations

Maryland should be commended for having a CAFO NPDES program that is up-to-date with federal regulations, but it must now focus on issuing permits to all the facilities that qualify as CAFOs and work towards ensuring compliance with the permit terms. By not disclosing the total number of CAFO facilities, how many of those have permits and how many still need permits, and when all the facilities that require permits will have them, Maryland's draft WIP undermines the assurance that the NPDES program provides. In the final WIP, Maryland should provide a timeline or schedule for issuing CAFO NPDES permits.

The draft WIP also fails to disclose gaps related to funding and personnel needed to establish and maintain an effective CAFO NPDES permitting program. CAFO permits issued after the Bay TMDL is finalized must be consistent with the wasteload allocations in the TMDL.

Stormwater

The draft WIP includes a final copy of the Montgomery County final permit, which provides a useful insight into the county's delegated enforcement authority. For example, the county "shall conduct preventative maintenance of all stormwater management facilities at least on a triennial basis" and make annual reports of enforcement and compliance activities.[FN 16] If in fact local authorities have an inspection rate of 30 percent, this rate would exceed the rate recommended by EPA.

As with other sectors, however, the draft WIP does not disclose the estimated funding and personnel gap, if any, and does not explain how this gap will be filled to ensure that the state has and maintains an effective stormwater program.

Air Deposition

The draft WIP provides useful information regarding the air deposition of nitrogen by major river basin and lists the relevant state air programs that can be used to reduce pollutant loadings. As with other sectors, however, the draft WIP fails to explicitly state how these programs will be bolstered in order to achieve adequate load reductions. The draft WIP

gives no indication of whether MDE currently has adequate funding and personnel to run an effective air pollution prevention program and thus does not provide assurance that reductions from air deposition will occur.

- Although very difficult to measure as an option for load reductions, educational outreach for the public and elected officials is a vital component of achieving these reductions. Measures to provide effective outreach should be incorporated to the WIP. If these stakeholders better understand what needs to be done and why, it is more likely that measures will be put in place to achieve the targets.

Response

- The plan suggests the amount of additional capacity that would be needed to fully implement the options and achieve the target loads. However, no cost information is provided in the resource assessment. Local jurisdictions will not be able to adequately choose and commit to certain options without cost information and estimates of additional capacity needed in other areas as well. It is also critical to provide local jurisdictions with an estimate of the expected load

reductions from each option.

- Pg 2-2, 4th para: Please clarify in the text whether the 2-year milestones represent an acceleration of current capacity or just represent an acceleration of the EPA's schedule to get measures in place.
- Pg 207, 6th para: Depending on the number of septic systems to be replaced, upgrading to ENR standards may be cost prohibitive. Any upgrade to better treatment is a positive. Monies should be available for upgrades even if not to ENR.
- Pg 2-8, Staffing Capacity: The implementation of septic system upgrades is predominantly administered and managed through the local Health Departments. If an accelerated effort to upgrade septic systems is to be successful, capacity needs at the local Health Department level have to be considered. This is again an issue related to local funding capacities and resource allocation.
- Pg 2-13, 1st para: The text refers to changes in the NPDES Phase II permits. In addition, a statement is made regarding a funding strategy. Specifics regarding the changes and funding mechanisms should be provided as part of the Phase I WIP. This is an example of the critical details which the current draft lacks that are desperately needed by local jurisdictions.

Organization: Carroll County Government, Maryland

- Offsets for future loads are placed in three categories. The moderate per capita load category refers to areas served by state-of-the-art sewage treatment. If "state-of-the-art" sewage treatment means ENR, it will be difficult to achieve Smart Growth in these smaller communities without significant funding assistance to upgrade minor systems.
- Pg 3-3, Figure 3.1 & footnote: Figure 3.1 shows that 7.21 lb N/yr is generated per new HH on septic. The footnote says that 12.16 lbs N/yr is generated per new household on septic. The numbers do not appear to match. Please provide more description related to the differences between these two numbers to clarify why they are different.
- Pg 3-5, 2nd para & footnote: At quick reading, this paragraph seems to conflict with the footnote. The text reads that growth on sewer by 2020 is expected to exceed permitted WWTP capacity by about 40,000 households. The footnote indicates that sewer demand would be expected to exceed current permitted WWTP capacity by about 62,000 households. Please explain the difference between these two figures to eliminate the confusion.
- Pg 3-5, 1st para: The text references the need for septic system upgrades, stormwater retrofits, and WWTP upgrades as "must be part of the solution" activities. The text then states "but many will cost more per pound of nitrogen reduced than targeted options." This appears to be an excellent location for cost estimates and cost/benefit analysis. Suggest this section of the WIP be expanded to include a specific discussion regarding those items.
- Pg 3-6, bullet 3: One criterion guiding offset strategies is to ensure an adequate supply of offset generators. Please explain how an adequate supply will be achieved.
- Pg 3-6, last para: The text appears to suggest that target loads by sector might be increased so that there is room in the allocation for new growth as well. Please include text clarifying if this is the intent.

- Pg 3-8, 2nd para: To achieve a better picture of actual loads and reductions, incorporating local land use and septic data to the Bay model should be an option.
- Pg 3-8, 3rd para: Please clarify if jurisdictions or watersheds that already exceed the caps will still get an allocation for future growth.
- Pg 3-8, Bullets: It is not clear from the descriptive text which government agency or body will be responsible for requiring, implementing, tracking, and monitoring the bulleted items. Please explain and provide details.
- Pg 3-8, Bullets: Please include a note indicating if offsets will still be allowed in areas where the WWTPs exceed their caps.
- Pg 3-9, 3rd para: Please include a definition of "targeted areas" as it relates to septic system nitrogen updates and how these targeted areas are defined.
- Pg 3-9, Sect 3.4: The preliminary schedule to develop offset policies and procedures for septic systems and land development seems to be rather long given the 2017 and 2020 target dates and the length of time needed to get these measures in place on the ground.
- Pg 3-10, 2nd para: The text indicates that the BRF was instituted to fully fund the ENR upgrades to major WWTPs. If this is a commitment on the State's part and already included in the 2-year milestones, additional funding needs to be found or made available to ensure this measure/option can be fully implemented.
- Pg 3-10, 4th para: The text indicates that offsets are expected to primarily come from the agricultural sector. Some consideration should be given to what happens if the agricultural sector cannot meet its allocations and where that will be made up. If the agricultural sector does not meet its allocations, information should be included to identify how the offset program would work and how this would impact meeting the total allocation for a watershed.
- Pg 3-10, 2013: It seems a bit optimistic to believe offset policies, many of which may require legislative approval, can be in place in just two years.

Response

Comment ID 0200.1.001.014

Author Name: Devilbiss Thomas

Organization: Carroll County Government, Maryland

- Pg ES-10, 1st para: The text indicates that an 88 percent increase in capacity is needed to meet the Interim Target for nitrogen. It seems that, in order to determine this number, some background data and information must have been evaluated to identify current capacity and the gap in capacity. Please include the background information in the text of Element 4. It would also be helpful to include the figures from the Executive Summary in the text of Element 4 as well.
- It would be very helpful if the Bay model is made available to local jurisdictions. This would help local jurisdictions to monitor and track progress, and make adjustments at the local level. It would also help to customize data at the local level to provide results that are more indicative of progress for that jurisdiction by accounting for practices and capacity not otherwise individualized in the model. Understandably, the local data would need to be shared back at the State level to incorporate into regional and State monitoring.
- Pg 4-1, 1st bullet: It is not clear from the text how the current loads from the sector were estimated. Please explain

somewhere if the load estimate accounts for practices already in place in Carroll County that may not be elsewhere across the board.

- Pg 4-1, 2nd bullet: The text references "current programmatic capacity to reduce loads." It seems that information on specific policies, staffing, costs, programs, etc. must have been collected and evaluated to determine this capacity. This information should be included so that local jurisdictions understand exactly what is included in the "current capacity."
- Pg 4-1, 3rd bullet: Please describe in more detail how the future growth was estimated, what data was used to do so, and what the baselines and basic assumptions were. If current growth potential is not accounted for, some of the actions that might need to take place to reduce loads cannot be properly credited to the jurisdiction (such as downzoning or TDR).
- Pg 4-1, footnote: The State may desire to steer away from the controversy of being one to set variable reductions between sectors. However, if certain sectors clearly have more or less feasible capacity for reduction, this should be reflected in the percentages now.
- Pg 4-2, tables: It would be helpful to include some explanation of why the numbers are so different between the federal and local data. It seems that the estimates would be more relevant if local data is used, assuming it is more complete or detailed than the federal data. Please consider how local data may be able to be incorporated to the model in a useful manner that allows a better estimate of local impacts and reductions. As an alternative, the local jurisdictions could work closely with the State to refine the State data. We understand that the model is already very complicated, but the results and estimated reductions do have significant impacts on local jurisdictions and property owners.
- Pg 4-3, 2nd para: If we wait until Phase II or beyond to refine land use data, it may not be too late to adjust allocations between sectors, but it will be too late to adjust total reductions needed. Work should take place with the local jurisdictions to refine the land use data before the Bay TMDL and total reductions needed are set.
- Pg 4-3, 3rd para: The end of this paragraph seems to imply that converting farmland for development is beneficial in terms of load reductions. Yet, this is clearly not the goal. If this is not what was meant, please reword to clarify so that it is not misinterpreted.
- Pg 4-3, 6th para: What if, regardless of penalties, the funds just are not there to put all the measures in place needed to achieve the targets?
- Pg 4-4, 1st para: The figures presented here and in Table 4.2 raise several questions. Incorporating the answers to these questions will help local jurisdictions understand what is already assumed to be done versus what can be counted as a reduction because it wasn't included in the baseline data.
Does the baseline take into account practices currently in place?
Are there actual loads or estimated?
If estimated, couldn't the model identify a greater reduction than actually needed by a local jurisdiction if these practices were accounted for?
If the loads are actual, the baseline and the reductions should already reflect all practices currently in place, which theoretically would reduce the amount of reductions needed. If they are estimates, and all current practices are not accounted for, the additional reductions these practices would represent should be allowed to count toward the needed reductions.
- Pg 4-4, Table 4.2: Please clarify in the text whether the TMDL is set for delivered loads or EOS or both?
- Pg 4-5, 2nd para: Table 4.4 shows the percentage reductions needed by source sector. However, the WIP indicates that reductions will be spread out across the sectors in equal percentages. It seems that equal percentages are not necessarily the most effective way to distribute the allocations. It might be more useful to take the identified percentage reductions needed by sector, and then evaluate the feasibility and capacity of each to make those reductions, and then make some adjustments to reflect feasibilities.
- Pg 4-6, Key Assumptions: The first bullet states that point source loads do not account for the shortfall in ENR

upgrade funding. However, this is a critical factor in the feasibility of getting these measures in place by 2017.

Response

Comment ID 0200.1.001.015

Author Name: Devilbiss Thomas

Organization: Carroll County Government, Maryland

- The biggest question that remains for each Option/Action is on the anticipated cost and expected load reductions of each. This information is needed by local jurisdictions to effectively make decisions on the feasibility of certain commitments expected for the Phase 2 WIP.
- Pg 5-5, Point Sources, Activity 7: Upgrade of Large Minor WWTPs - The cost of upgrades to these systems, which can least afford the expense, seems questionable, and the O&M may be beyond the jurisdiction's expertise and budget.
- Pg 5-5, Urban Stormwater, Option 1: This requirement will be an extreme challenge to most jurisdictions. Retrofit costs can run up to \$20,000/impervious acre restored.
- Pg 5-5, Urban Stormwater, Options 2 & 3: Not feasible by any means in the timeframe designated.
- Pg 5-6, Urban Stormwater, Activity 4: MS4 Phase II - The proposed 20 percent level may not be achievable in the timeframe designated. There will be significant cost and resource issues with this item.
- Pg 5-7, Urban Stormwater, Activity 11: Urban Tree Canopy - It is difficult to reason where this option would provide any significant benefit to reductions in nitrogen loading.
- Pg 5-7, Septics, Activity 3: Septic hookup to ENR plants - The municipalities, which own and operate most of the public WWTPs in Carroll County, have already identified municipal annexation areas per the requirements of Article 66B to develop a Municipal Growth Element (MGE). Through the process of developing the MGE, the municipalities have identified areas that are expected to hook up to a public sewer system when the land is annexed to the municipality. Any other systems have either 1) not been planned for service and/or 2) will not be in an area developed densely enough to make the cost of extending services and hookups feasible.
- Pg 5-7, Septics, Activity 5: All systems within 1,000 feet of a stream - It would be helpful to clarify if this activity refers to all (including existing) septic systems or just new septic systems. This activity would be an extremely difficult task to implement and achieve (legally, technically, and financially).
- Pg 5-8, Best Farming Practices, Activities 1 & 2: Cover Crops - The program/practice is a critical component of the WIP. Are the options presented sustainable? Can the level of acres planted and the funds provided continue in perpetuity? Please clarify.
- Pg 5-8, Best Farming Practices, Activity 4: Soil Conservation & Water Quality Plans - How does a plan to do conservation practices generate specific loading reductions? Does this option, and loading reductions assigned, duplicate other practices? It appears many of the agricultural strategies are assigned reductions multiple times. Please clarify.
- Pg 5-10, Best Farming Practices, Activity 13: Stream Protection without Fencing - Does this practice truly achieve nutrient/sediment reductions? Please clarify.

- Pg 5-18, Air: The draft document indicates that roughly one third of the pollutant loads come from atmospheric deposition. If this is the case, it seems that more measures should be identified and added to address air quality. Additionally, if atmospheric deposition represents such a large percentage of the source, are the allocations to other source sectors reduced by the amount of each sector's NPS loads that are generated by air pollution?

Response

Comment ID 0200.1.001.016

Author Name: Devilbiss Thomas

Organization: Carroll County Government, Maryland

- The text indicates that data is reported through various State agencies and ultimately is filtered to BayStat. BayStat is then intended to be able to provide up-to-date data on the progress toward milestones. Local jurisdictions need to have access to at least view this data. It would be useful to add some description of how local jurisdictions can access, use, and interpret the data to identify progress on any given segment or sector.
- MDPProperty View is used for various aspects of tracking new development. However, in our experience that the database, and particularly the parcel lines on the tax maps to match a property account, have a high degree of inaccuracy. Carroll County recently completed a project to update and increase the accuracy of its parcel data/layer. Local jurisdictions should have the option to provide their own data to better reflect actual conditions on the ground at the local level.
- Pg 6-16, last para: With two-year milestones and with the 2017 and 2010 timeframes, the statewide land use layer should be updated much more frequently than every five years. Given the pace at which measures need to be in place and reductions able to be measured, the land use layer should be updated annually or on an ongoing basis. Local data should be incorporated as much as possible to reflect as many practices as possible that contribute to reductions.
- Pg 6-17, 1st para: The text indicates that local zoning is incorporated to the MDP Growth Simulation Model. It states that longer-term change adjustment is needed. Agreed. The WIP should include options to refine the growth model (as well as the Bay model) to more closely reflect on-the-ground conditions. Likely, this will result in many more land use categories, and therefore more impervious cover rates, loading rates, etc. However, this further refinement would be better able to capture changes in loading resulting from various land uses and BMPs. These adjustments would be able to credit local land use and programs to a great extent if these adjustments are also coordinated with local jurisdictions.
- Pg 6-17, 1st para: The growth model incorporates increases in septic tanks. This information must come from the local Health Department. It would be very helpful if the data was also made available to the local jurisdiction. As the septic tank regulation is a State function, the local jurisdictions and the State need to coordinate data for the monitoring of progress on the Bay and local TMDLs.
- Pg 6-17, 2nd para: The intent to collect more timely data on new development from local jurisdictions (through the annual report) will help keep data current and reflect local conditions. However, local jurisdictions would benefit greatly from detailed yet flexible guidance that spells out the kind of data that should be included. Guidance should be provided to jurisdictions in a timely manner so it can be incorporated in a reasonable timeframe.
- Pg 6-18, 1st para: A common reporting system to report implementation measures will help provide consistent data.

We request, however, that the local jurisdictions be involved in developing this reporting system so it can be incorporate data types and levels available at the local level. Access by locals to input the data will be more effective and efficient, but the data requested must be data that is actually available.

- Pg 6-19, flow chart: The chart does not include MDP and how the Growth Simulation Model fits in.

- The text provides a discussion on the WIP Phase II effort. Specific discussion is needed regarding the sub-allocation process by geographic area and sector. While no specific numbers are provided, the methodology to derive numbers is presented. The approach by the State seems reasonable and fair. Even if the load allocation was calculated equitably, reductions may not be able to be achieved as such, which will continue to be a significant issue for implementation.

Comment ID 0252.1.001.015

Author Name: Bond Arthur

Organization: City of Frostburg, Maryland

Frostburg has a history of mining impacts; our biggest challenges are acid mine drainage and the effects of combined sewers, which ironically tend to moderate the mine runoff. Other TMDL programs will be needed in the future to address other stressor substances. The City is concerned with another wave of enforcement that could overlap the Bay TMDL enforcement program. Our current and planned efforts reflected in a draft Comprehensive Plan update to be completed in 2011 include the following: continued focus on CSO 'elimination' projects; stepped up stormwater permitting process to ensure the new Environmental Site Design to the Maximum Extent Practical is required and that the measures are properly installed and maintained over time; updating the erosion and sediment control ordinance in conformance with new Maryland regulations and integrate our current Soil Conservation District partnership with new local capabilities to ensure proper review and enforcement of measures approved; and address a new stream restoration and vegetation

program along Sand Spring Run that could be planned with an integrated stream-side trail network over time. This latter builds on our partnership in the Savage River watershed with the Canaan Valley Institute to restore the site of the old original impoundment to restore proper stream flow and vegetation in Garrett County. Finally, our sanitary flows are sent to the Cumberland regional treatment plant that has been a point source focus in Maryland, recently completed by upgrade to ENR capability.

Response

EPA appreciates the concern of overlapping TMDLs and this is discussed in Section 2 of the final TMDL report. For watersheds and water bodies that have both local TMDLs and the Chesapeake Bay TMDL for nitrogen, phosphorous, and sediment, the more stringent of the TMDLs will apply. If Bay segments are impaired for other pollutants, EPA expects that jurisdictions will develop separate TMDLs to address those pollutants.

Comment ID 0255.1.001.004

Author Name: Gumm Gary

Organization: Washington Suburban Sanitary Commission (WSSC)

The Draft Bay TMDL incorporation of the Maryland WIP and the point source load allocations for major municipal wastewater treatment plant NPDES discharges directly impacts WSSC by assigning specific total annual nitrogen, total annual phosphorus, and sediment allocations that must be met by each facility. The specific allocations are shown in the Table contained in Section 9 of the Draft TMDL and the individual WWTPs are shown as follows:

Marlboro Meadows, Parkway, and Western Branch (p.9-32)

Damascus (p.9-33)

Seneca (p.9-34)

Blue Plains and Piscataway (p.9-36)

WSSC has been in direct contact with the Maryland Department of the Environment (MOE) on the inaccuracies in the assigned load allocations shown in Section 9 and we are commenting concurrently directly to MOE as there are also similar inaccuracies in Appendix B that was attached to the draft Maryland WIP submitted to EPA. It is our understanding that MOE will be providing EPA with the revisions to their Appendix B and requesting similar changes to Section 9 of the Draft Bay TMDL so that the two documents correctly show the load allocations that are consistent with the current NPDES permits for each facility.

Organization: Washington Suburban Sanitary Commission (WSSC)

Finally, WSSC is committed to proceeding with the upgrades to our WWTPS to meet the requirements of the Draft Bay TMDL as specified in the Maryland Watershed Implementation Plan. We are equally committed to providing the financial support necessary to realize those improvements and to providing an equitable share of the cost of the Blue Plains WWTP upgrade to ENR consistent with the funding formula for the Blue Plains users in the Intermunicipal Agreement that govern those commitments.

Response

Thank you for your comment. EPA's evaluation of the final Phase I WIPs can be found in Section 8 of the final TMDL report.

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

We would like to commend the State of Maryland for reaching out to local governments in the preparation of their WIP. In fact, their ongoing pilot projects in Caroline and Anne Arundel Counties, could serve as a model for state consultation with local governments. All of this becomes much more critical for the Phase 2 WIPs due in 2011. If TMDL loadings are allocated down to a county or sub-jurisdictional level, consultation with local governments before those decisions are made should be mandatory for all states.

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

MAMWA Opposes Maryland's Proposed Treatment of the Largest Minor Municipal Treatment Plants

In order to fill the gap between current programs (capacities) and the State's target loadings for nutrients and sediment, Maryland has raised the following potential gap-filling measure: "Evaluate the feasibility of upgrading five of the largest minor municipal WWTPs to ENR treatment by 2017." [FN12]

Although the State has not named particular plants that it is considering for potentially mandatory upgrades, it has suggested that it would select plants based upon "load capacity needs, community interest, technical feasibility and cost-effectiveness." The State estimates that the loading reduction associated with this option would be about 45,000 pounds per year of nitrogen. [FN13] The cost would be approximately \$58 million.[FN14]

Mandating upgrades for minor municipal WWTPs would be a significant departure from the current Point Source Strategy, which addresses non-significant (small) WWTPs as follows:

Non-significant wastewater treatment plants are those with design capacity of less than 500,000 gallons per day. Annual nutrient loads are based on design capacity or projected 2020 flow, whichever is less, and concentration of 18 mg/l total nitrogen and 3 mg/l total phosphorus. The 2020 projected flows were based on the county growth rates provided by the Maryland Department of Planning. Expanding non-significant facilities cannot exceed 6,100 lbs/year in nitrogen and 457 lbs/year in phosphorus. [FN15]

In other words, unless a facility is expanding, it is not required to achieve WLAs equivalent to ENR concentration levels.

Organization: Maryland Association of Municipal Wastewater Agencies, Inc. (MAMWA)

MAMWA Requests Representation at P-Index Discussions

The State has suggested that it will be "...convening a technical workshop, hosted by the University of Maryland's College of Agriculture and Natural Resources" to discuss "...relevant recent scientific advances, evaluation of the performance of the current P-Index, and evaluation of alternative approaches for revision of the P-Index." [FN18]

Although MAMWA can only comment broadly on this general concept of revising the P-index because the work to potentially revise the index has not begun, this is an important issue for MAMWA members who manage biosolids

under the EPA and State-approved method of land application. MAMWA requests the opportunity to participate in the technical workshop mentioned and believe the MAMWA membership can offer expertise with regard to the referenced issues.

In addition, MAMWA believes the WIP should include a strategy to promote and sustain biosolids land application, which is certainly environmentally beneficial as compared to the alternative of inorganic chemical fertilizer use for the following reasons:

- Biosolids-based nutrients are released more slowly because they are not as soluble as nutrients found in chemical fertilizers.
- Biosolids land application includes many safeguards including mandatory setbacks from water resources, soil conservation and soil erosion control practices, nutrient management requirements, and record keeping and reporting requirements. These safeguards exceed those required for chemical fertilizer or manure applications.
- Biosolids land application is carefully regulated at the federal and state level and subject to enforcement in the event of noncompliance.

Organization: Dorchester Soil Conservation District

The Dorchester Soil Conservation District has reviewed Maryland's Watershed Implementation Plan (WIP) and would like to make the following comments.

- There are many BMP's and workloads mentioned that are not currently feasible, due to technology and/or staffing. To be successful we need to have the staff trained and available in order to get the practice on the ground. In addition many of the new emerging technologies are not ready for wholesale use yet and seem to be viewed as ready to roll in the language of the WIP.

Organization: Advocates for Herring Bay (AHB)

The Advocates for Herring Bay (AHB) strongly support efforts by the State of Maryland to meet and maintain the limits established by the Environmental Protection Agency (EPA) on pollutant loads to the Chesapeake Bay. The measures outlined in the state's September 24, 2010 draft Watershed Implementation Plan (WIP) for the Chesapeake Bay Total Maximum Daily Load (TMDL) would, if implemented effectively, help us make progress toward those goals. What is unclear, however, is how the wide range of options in the draft plan will produce tangible results. To assist in that effort, we offer the following five recommendations for the final plan:

1. Provide Guidance on Funding for Engineering and Management Strategies

Maryland's draft plan correctly emphasizes the most cost-effective measures, such as accelerating the deployment of enhanced nutrient reduction technologies at major wastewater treatment plants and expanding the use of agricultural cover crops. AHB supports those measures as well as proposed investments in stormwater management, buffer restoration, and septic system upgrades in the Critical Area.

Implementing the WIP will require substantial financial resources. While state executive branch agencies cannot make monetary commitments on behalf of the state, they can help build a consensus for increasing the state's investment by providing estimates of the costs and benefits of what is being proposed, at least for the near term. As taxpayers, we urge our state and local governments to secure the necessary financing, starting in 2012. Specifically, we support setting firm funding targets for state and local initiatives (for example, for Bay Restoration Fund, the Chesapeake and Atlantic Coastal Bays Trust Fund, and local restoration funds); raising fees if necessary to actually meet those targets; and treating those proceeds as dedicated sources of funding that cannot be diverted to other governmental purposes.

2. Avoid Unintentionally Encouraging Growth in the Critical Area

We question the plan's unconditional support for connecting failing septic systems to waste water treatment plants, particularly in the Critical Area. Under the state's Smart Growth policies, development is directed to areas served by sewers. Thus, adding sewer capacity in the Critical Area could channel additional development to the same environmentally sensitive areas the state promises to protect and restore. In addition, areas with "antiquated lots," such as those that were subdivided in the 1920s at levels of density much higher than would be allowed today, would come under intense pressure for in-fill development because most pre-existing property rights were grandfathered under the 1984 Critical Area law.

Decisions about extending sewer service should be made on a case-by-case basis, based on a holistic assessment of the environmental impacts and benefits. In our view, new sewer connections should not be allowed in the Critical Area except in cases where the added capacity would have a negligible effect on the development potential and ecological integrity of the area being served. If sewer service extension is the only feasible way to address widespread failures, state or local governments should mitigate the ecological risks by purchasing development rights or attaching new restrictions on development in the Critical Area.

3. Develop Laws and Incentives for Preserving Existing Natural Filtration Systems

Natural filtration systems-streamside buffers, forests, and wetlands-are the most cost-effective methods for reducing the amount of pollution getting into our streams and waterways. While we are pleased that the state plans to spend funds to revitalize buffers and wetlands, we believe that more needs to be done to strengthen protections for existing habitats that are providing those ecological services at no cost to taxpayers. The final plan should include more proactive initiatives to protect existing filtration areas; possible strategies could include strictly enforced statewide performance standards for protecting all stream buffers from development impacts.

4. Develop Laws and Incentives for Minimizing Impacts of Growth

As noted in Chapter 3, existing land use policies fail to account for the pollution loads associated with different types of development, which exacerbates the adverse impacts of population growth. To address this shortcoming, the plan recommends statewide policies that would assign per-capita pollution loading factors to different types of development and require those with the highest environmental cost to be offset by certain mitigation measures.

We support adoption of land-use policies that incorporate per-capita loading factors. Without such incentives, the Bay will continue to suffer a "death by a thousand cuts." To be effective, however, these guidelines must be incorporated into state and local land-use laws. We urge the state to promptly enact the legislative changes needed to apply this approach statewide and to craft conforming ordinances for local governments.

Comment ID 0410.1.001.011

Author Name: Pujara Karuna

Organization: Maryland State Highway Administration (SHA)

Many of the controls that will be employed to comply with the TMDL and WIP will impact US Waters, involving permitting agencies such as the US Army Corps of Engineers, US Fish and Wildlife, US Marine Fisheries and the MDE Wetlands and Waterways division. SHA suggests that they must be recognized as partners in the WIP development process to ensure compliance within a relatively short implementation period.

Currently SHA experiences a 1 to 3 year timeframe in obtaining permits for stormwater, sediment control and nontidal wetlands impacts. We would also suggest that the permit process itself should be integrated into the implementation process in order to facilitate achievement of the desired goals. Success of the implementation plans depends upon the ability to get the proposed projects permitted, funded and constructed at a much faster rate. SHA has great experiences of partnership working with the regulators however, these hard to achieve goals will require new tools of the trade.

Response

EPA agrees that all State and federal agencies who oversee and have authority over the lands and water bodies that discharge into the Chesapeake Bay are important to the successful implementation of Chesapeake Bay TMDL. According to 40 CFR 122.44(d)(1)(vii)(B), the effluent limitations for an NPDES permit must be consistent with the assumptions and requirements of any available WLA. EPA expects that all NPDES permitting authorities will review the information provided by this TMDL and determine whether the effluent limit is appropriately expressed and is consistent with the TMDL. With that said, EPA also recognizes that permitting schedules and time frames may be an impediment to quickly achieving implementation.

EPA will measure each jurisdictions' progress toward reaching the TMDL's ultimate nutrient and sediment reduction goals against 2-year milestones by which the jurisdictions are expected to, with contingencies, identify and commit to implement specific pollutant-reduction controls and actions in each of their successive 2-year milestone periods. Expediting permit processes may be an important tool toward meeting the 2 year milestones.

Author Name: Pavlicek Jan

Organization: Kemira Water Solutions, Inc.

We, would like to take this opportunity to encourage EPA and the individual states affected by the Chesapeake Bay TMDL to amend the planned activity item in the Maryland Watershed Implementation Plan: Summary Table of Actions described as Poultry Litter Treatment. We respectfully request that Kemira Klasp™ litter amendment be accepted and included as BMP for mitigating ammonia and phosphorus from Poultry farms.

Kemira Klasp™ has been shown to be effective at reducing ammonia and binding phosphorous in University trials and numerous commercial applications.[FN1-3]. Attesting to this, is the fact that USDA/NRCS is currently providing cost

share assistance for this litter amendment via Natural Resources Conservation Service Conservation Practice Standard Amendments for treatment of agricultural waste Code 591. Also supporting this is the well established science that the iron III molecule effectively sequesters phosphorous as phosphate and is the preferred management practice throughout most the pollution management industry; iron III being the basis of the KLASP phosphate treatment chemistry.

By not endorsing KLASP the industry would be left with only one commercially available litter amendment (alum) to receive credit as a BMP for improving the Chesapeake Bay, EPA and would thereby also create an unfair competitive environment for this somewhat new but already well established product.

Additionally, a good number of poultry producers will be at a disadvantage as many will choose to continue using Klasp due its effectiveness on their farm compared to other BMP's.

In closing we strongly encourage you to include Klasp as an accepted BMP for mitigating ammonia and phosphorous on Chesapeake Bay poultry firms. Should you need more supporting data, please do not hesitate to contact us.

9. EPA and States Need to Make Sure Growth Policies Support Infill Development

The population of the COG region is forecast to increase 20 percent, or by about 1 million people, between 2010 and 2030. Most of this growth will occur as infill development in existing urban areas already served by municipal wastewater treatment. As the Maryland WIP notes in Section 3-1, having the growth occur in service areas for existing wastewater treatment plants produces much lower loads to offset than would allowing the growth to occur outside of sewered areas. As the Maryland WIP also notes, the increased wastewater plant load from new growth to 2030 can be accommodated within proposed plant allocations determined by 2010 design flows and various targets for enhanced nutrient removal implementation. It is also imperative that this growth capacity not be compromised by backstopping and other actions by EPA or the states that would reduce the current proposed WWTP allocations in response to the failure of other sectors to achieve their assigned reductions (ref. Section 10.1 Future Growth, & Section 7.2.4 Federal

EPA Actions, p. 7-11).

Recommendation #9: Provide Incentives to Encourage Growth in Existing Urban Areas

In concept, we support the growth and offset strategy that Maryland has outlined in its WIP (Section 3.2), which proposes to provide lower disincentives for growth in areas that are already more highly developed than in other areas. We urge Virginia to develop a system of incentives/disincentives that also seeks to direct growth to existing urban areas.

10. EPA and States Must Ensure that Efforts to Meet Bay Water Quality Standards are Consistent with Meeting Other Environmental Objectives

EPA and the states must recognize that at the local level addressing water quality requirements is only one of a number of equally compelling mandates and that, within the environmental arena, there are potential conflicts among these mandates. This is especially true when entities must meet mandates derived from EPA's own regulations (e.g., Clean Water Act, Safe Drinking Water Act, and Clean Air Act) and programs (e.g., Climate Change initiatives).

Example:

Many wastewater treatment technologies intended to implement ENR-level nutrient removal are by their very nature energy and chemical intensive processes - and hence tend to increase the net quantity of greenhouse gases. There are already many efforts underway by COG's local governments and wastewater utilities to find ways to minimize those energy needs and increase energy reuse; but it will take some time to evaluate and to implement such practices. These efforts are critical to the region not only for enhancing nutrient reduction costs/impacts, but also to help reduce the electricity generation needs in the region, to support regional efforts to comply with Clean Air Act regulations and reduce greenhouse gas emissions. (Note that COG's member governments also have made a voluntary commitment to reduce greenhouse gas emissions 20 percent below 2005 levels by 2025.)

Example:

The UOSA plant in Virginia serves multiple and simultaneous purposes by helping the region address water quality in the Occoquan Reservoir as well as downstream waters, and to help maintain water quality conditions within the Reservoir to protect and enhance its use as a drinking water source. Requiring higher levels of nitrogen reductions from the UOSA plant without accounting for both environmental and human health needs would pitch one environmental goal against another and risk failing to meet both objectives in a balanced manner.

Recommendation #10: Articulate Policies to Reconcile Competing Environmental Mandates

Consistent with the stated objectives of adaptive management and incorporating the best available science, EPA and the states should have clear policies and mechanisms in the TMDLs and the WIPs to allow for the reconciliation of such competing environmental mandates, and to avoid a one-size-fits-all approach when it is clearly not appropriate (ref. Section 10. TMDL Implementation & Adaptive Management, 10.5 Factoring in Effects from Continued Climate Change).

Response

EPA agrees that future growth is an essential component that must be considered by jurisdictions as part of their WIPs. EPA has included discussion of this issue in the TMDL. See Section 10 and Appendix S for more details. EPA reviewed the final WIPs for

each jurisdiction against EPA's expectations including those for growth, trading and offsets as outlined in its November 4, 2009, WIP expectations letter sent to each jurisdiction as well as the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. The results of the final WIP evaluations can be found in Section 8 of the final TMDL. Because the final WIPs are improved from the drafts, EPA has removed or reduced the backstop allocations for wastewater treatment plants except in New York. Regarding the commenter's proposals for policies for future growth and to reconcile competing environmental mandates, many are outside the scope of this TMDL. EPA will continue to provide oversight over implementation of the TMDL including these issues. .

Comment ID 0443.1.001.001

Author Name: Moore Shannon

Organization: Frederick County Government

Frederick County Government supports the goals to protect and restore the Chesapeake Bay and has contributed significant and sustained efforts voluntarily to this end. The County has concerns about the mechanisms proposed by the Maryland Department of the Environment in the Phase I Watershed Implementation Plan and provides the following comments:

1. The WIP incorrectly states on page 2-14 that Frederick County passed legislation to implement a stormwater utility fee.
2. Goals for Phosphorus reduction for the Urban Sector exceed the goals for Nitrogen reduction, yet most of the' goals in the WIP are stated in terms of Nitrogen. This makes quantifying the effort to meet these goals impossible.
3. Table C on page ES-12 indicates that the goals for the TMDL would be met for Urban Stormwater in 40 years, but that 3-4 times the current capacity would be needed to meet the goals by 2020. In reality, the capacity would have to be significantly increased beyond 3-4 times current levels due to increasing marginal costs and efforts to retrofit. The most cost effective restoration efforts occur first. These increases pose a financial hardship to Frederick County, and there are inadequate mechanisms available from outside sources to significantly help fund such an enormous effort.
4. Significant increases to the requirement to retrofit untreated urban impervious areas are considered to "close the gap" between the predicted and needed reductions. The permit currently requires an additional 10% every five years. Tripling or quadrupling this effort, as mentioned in the table on page ES- I 5, poses the following issues:
 - a. MDE held a meeting recently with Phase I MS4 municipalities to figure out how to credit retrofit projects, as there is currently no standard for water quality for retrofitting untreated urban impervious areas. Discussed were several options, including retrofitting WQ to the Maximum Extent Practicable, retrofitting to the 1" storm, retrofitting to the MD2007 stormwater regulations, and retrofitting to forested conditions; in an example where 0.6" of rainfall is the maximum extent practical for water quality due to site constraints, is the project treating a full acre of retrofit due to MEP requirements, 60% of an acre using the 1" requirement, or some other proportion of an acre? If we do not count the entire acre as treated, we will run out of acres to treat before we have hit 100% retrofit. If we do count the entire acre as

treated, then we may reach 100% retrofit before we have restored designated uses. This highlights the fact that the retrofit requirement does not tie directly to the nutrient reductions required to correct the designated use impairments; this requirement should be eliminated, and projects tracked according to their reductions of impairing substances using monitoring data and/or numbers accepted by the Chesapeake Bay TMDL model.

b. The retrofit requirement disregards the watershed assessments that are required by NPDES MS4 Phase I permits that actually look at the sources of designated use impairments and develop watershed restoration projects to correct the impairments; thus, there is no clear connection between the stormwater management facility retrofit requirement and the designated use impairment. The stormwater manager is encouraged to retrofit in areas with no impairment, and may under-restore areas with actual impairments in trying to meet this requirement. Again, it would make more sense to be held directly to the MS4 allocations in the TMDL than to have a secondary requirement that does not directly tie into the designated use impairment.

c. There are significant discrepancies between State, Bay Program and local estimates of urban impervious cover as noted on page 4-2. Should we be held to impervious area reductions, we should be able to use our own estimates, as they are based on the most accurate data available.

d. Stormwater retrofits are prohibitively expensive per acre, and the increased requirements would pose a significant hardship to Frederick County.

e. Other types of water quality restoration that would be more cost-effective than stormwater retrofitting are not permitted as substitutions/trades, though there are trading programs established between WWTPs and agriculture, for example. Frederick County has proposed a trading program for years but this has not been met with enthusiasm at MDE. We should also be able to trade with agriculture or with other BMPs that might be identified in the future. For example, if we were to pay for additional cover crops in the cover crop program, we would get credit for the reductions from the amount of the BMP we would pay for. Or we could look to get a partial restoration credit for land conservation activities (using a but-for option in a trading scenario) and track them through an established service like BayBank. Land conservation helps to protect and restore existing tracts of important green infrastructure, particularly in areas with local impairments.

f. Stormwater retrofitting is not the only water quality restoration that can occur in urban areas; for example, Frederick County is converting a significant area of the landscape to trees. This is a very effective mechanism for reductions from urban pollutants and should count under NPDES MS4 permit goals and not just under "natural filter" requirements, lest these programs be forced to compete with one another.

5. According to pages 2-10 and 5-23, "A key goal of the Bay restoration strategy will be to install stormwater controls (retrofits) and water quality improvement projects on land that was developed prior to the implementation of Maryland's Stormwater Management Law in 1985, and enhancing water quality for early BMPs implemented between 1985 and 2002."

There are several issues with this:

a. There is no recognition of the water quality benefit of practices installed prior to 1985, such as open section roads, and there is an unclear recognition of benefits from 1985-2002.

b. This requirement adds additional retrofit requirements to MS4 permits in addition to the 30-40% retrofit requirement discussed as a gap closure measure, as it effectively increases the number of untreated urban acres.

c. This requirement disregards the watershed assessments that are required by NPDES MS4 permits that actually look at the sources of designated use impairments and develop watershed restoration projects to correct the impairments; thus, there is no clear connection between the stormwater management facility retrofit requirement and the designated use impairment. The stormwater manager is encouraged to retrofit in areas with no impairment, and may under-restore areas with actual impairments in trying to meet this requirement. This encourages jurisdictions to meet the letter but not the spirit of the regulations.

6. If the strategies fall short of the 2017 goal, MDE proposes to "increase MS4 permit requirement for MD's largest counties and the State Highways Administration to require installation of stormwater controls on 40% or 50% of their impervious surface by 2017 in their jurisdictions that do not already have stormwater controls. The 2020 goal would increase to 60% or 70%, respectively, depending on the option selected

- Establish a Chesapeake Bay Watershed Restoration requirement in the NPDES municipal stormwater permits [note this is already written into draft NPDES MS4 permit];
- Require an implementation plan and schedule;
- Monitor and report compliance; and
- Continue to provide technical assistance, training, and outreach." (p. 5-23).

Issues:

a. It would be unrealistic to propose retrofitting 20% of a county's untreated urban impervious area in a three year period when Frederick County currently struggles to meet a 10% impervious area reduction in a five-year period, from both a financial and organizational perspective.

b. The bulleted goals are proposed in the current draft NPDES MS4 Phase I permits, which appears to be jumping ahead of schedule from the Phase I WIP.

7. 5.2.3 Natural Filters: As discussed above, when in urban areas, these types of projects should count towards the NPDES MS4 Phase I permit goals for restoration as a strategy for watershed restoration to restore designated use impairments. Furthermore, these types of projects could be eligible for trades with urban requirements when placed on non-urban lands that have met their minimum reductions for the Chesapeake Bay TMDL. DNR could administer such a program under the guise of trading ecosystem services.

8. Note that NPDES MS4 permits are listed in the document as both point and nonpoint source, and this should be made consistent. This is of particular importance to 6.1 Point Source: Tracking and Reporting because it is unclear if NPDES MS4 permits will be required to complete Discharge Monitoring Reports (DMR) and Monthly Operating Reports (MORs).

9. According to the WIP, "All stormwater retrofits and urban water quality improvement projects are being reported to Maryland BayStat. The data appear on spreadsheets that specify permit requirements, compliance status, nitrogen reduction benefits, and operating and capital expenditures toward meeting the 2-year milestones. BayStat reviews retrofit implementation and pollutant loads and considers proposed contingency actions. This information has been provided via electronic data tables or hard copies annually to MDE Stormwater program coordinators." Frederick County is not aware of this and to its knowledge, this is not the case. Frederick County is not required to report on N reductions so it is unclear how BayStat would be getting this information.

10. According to the WIP, "MDE's Science Services Administration Program ensures that the reported practices fit into EPA/Chesapeake Bay Program Model. Maryland's stormwater management practices will follow the Maryland Design Manual and includes Stormwater Ponds, Stormwater Infiltration, Stormwater Filtration, Open Channel Practices, Environmental Site Design (ESD) practices, Alternative Surfaces, etc." This list needs to be significantly expanded to take credit for all of the types of projects NPDES MS4 Phase I jurisdictions are counting towards urban retrofit requirement.

11. Frederick County would be negatively affected by Forest Conservation Act Enforcement recommendations, particularly the no net loss of forest requirements and the elimination of the fee in lieu program. The fee in lieu program is being used to target larger tracts of ecologically significant forest and areas with designated use impairments; this is not possible without the program. The county has also found that these fees often provide a greater opportunity for a net increase in forest acreage than the minimum requirement.

12. 5.2.3 Natural Filters "University of Maryland Extension at the Wye Research and Education Center will begin a project similar to Baltimore County's Rural Residential Stewardship Initiative for the Maryland Monocacy watershed expressly for water quality impacts. This project is based on the peer-to-peer education model and will feature a weekend workshop. Landowners will learn both afforestation and outreach techniques, and the workshop participants will be tasked with afforesting their own land and reaching out to others to do the same. The Natural Resource, Agriculture, and Engineering Service published a manual titled, "The Woods in Your Backyard" and this information will play an integral role in the work in the Monocacy." Frederick County is unfamiliar with this project at the Wye Center and sent an email to Jonathan Kays who runs the Woods in Your Backyard program; he is also not aware of this program. Frederick County submitted a grant with the Woods in Your Backyard program to the National Fish and Wildlife Foundation but it was not accepted.

13. The County is uncertain how we would implement "offsets" for new development without regulatory authority to require any action beyond current Stormwater Management and Forest Resource Ordinance regulations. Which types of agencies would be involved (Planning, Soil Conservation District, Permitting and Development Review, Public Works, Health department, other)? Would the offset requirement go into land use planning in some specific manner?

14. In general, the WIP indicates that the State will rely on local governments to participate in and support accounting of nutrient loads associated with growth. Additional coordination is not currently in place to track or report on these loads. Tools and support would be required to meet this objective.

15. Wetland banking is listed as a potential offset tool. Will the State continue to administer that, or will they expect the counties to? How would that work within an offset trading program?

16. For Wastewater Treatment Plants, the County should not have any difficulty complying with the new TMDL and WIP at this time. However, if there is a need to upgrade and increase the capacity of a wastewater treatment plant should arise, there may be total nitrogen and total phosphorus loading caps that would need to be met that may require BNR or ENR treatment at these WWTPs.

17. The Bay Model has numerous areas where it is known to be inadequate or inaccurate, particularly in the area of judging relative sediment contributions from land versus instream erosion, yet counties are being held to precise

standards for pollutant loading estimates. There is no flexibility for counties in the proposed allocations arising from this and other uncertainties. We echo the Maryland Association of Counties' (MACo's) concern that "The Chesapeake Bay Phase 5 Watershed Model continues to show improvements and refinements over previous versions, but ultimately the Model is still limited, being subject to inaccuracies and "best guess" estimates. Given that the Model is still imperfect but that State and county governments are being asked to undertake precise nutrient reduction tracking the Environmental Protection Agency (EPA) must commit to further refining the Model AND show some flexibility in allowing States and counties to present data and that may not be incorporated or accounted for by the Model. In short, the Model should not be a be-all and end-all for data measurement and analysis."

Frederick County also echoes the concerns of the Maryland Association of Counties on the following points:

- Local Flexibility to Meet the Goals
- Counties Need Many Quantifiable Nutrient Reduction Tools
- Bay Model Should Not Be Sole Determinant for Progress
- Counties Need Fiscal Support
- Counties Need Technical Support
- Use of Growth Offsets
- Nutrient Trading Must Be Clarified
- Separate the TMDL Targets From NPDES MS4 Permits Until Phase II WIP Completed
- Do Not Eliminate Forest Conservation Act Fee-In-Lieu Program

We appreciate the opportunity to address our concerns with the Draft Phase I Watershed Implementation Plan and express our commitment to the restoration of the Chesapeake Bay and its tributaries.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0443.2.001.004

Author Name: Moore Shannon

Organization: Frederick County Government

The County provides the following comments on the Executive Summary of the TMDL: p.6: "In their draft Phase I WIPs, the jurisdictions were expected to subdivide the Bay TMDL allocations among pollutant sources; evaluate their current legal, regulatory, programmatic and financial tools available to implement the allocations; identify and rectify potential shortfalls in attaining the allocations; describe mechanisms to track and report implementation activities; provide alternative approaches; and outline a schedule for implementation."

- MDE did not consult with those required to implement the WIPs during its construction; Frederick County is not able to guarantee at this time that we can meet the WIP, in fact, the opposite is expected due to resource constraints.

Overall, we feel the Phase I Maryland Implementation Plan (WIP) was a solid first draft of recommendations and strategies, but look forward to significantly more detail and specifics about how target goals will be met in the Phase II process. Given that a strong and enforceable WIP's are absolutely essential to the implementation of the Bay wide TMDL, we are hopeful that this increased level of detail will provide an accurate and geographically specific roadmap that will help our local waterways in the Baltimore Metropolitan become cleaner and healthier on their way to meet the Chesapeake Bay.

It should be noted that we support and reference the full suite of comments submitted by the Center for Progressive Reform (CPR) [Comment #0185] and the Choose Clean Water Coalition [Comment #0480] and those of the Waterkeepers (WK) of which the Baltimore Harbor Waterkeeper is a program of the Baltimore Water Alliance.

Author Name: Gaag Halle

Organization: Baltimore Water Alliance

As CPR explains, the WIP mainly inventories the state's existing pollutant control programs as "options" unaccompanied by programmatic or funding commitments or deadlines for implementation. The phase II WIP should detail the entity responsible and timeline, for specific practices and how much it is going to cost, and if possible note the funding source. Without specific, enforceable, time-sensitive implementation detail in the difficult areas, it is likely there will be less action and accountability. In this regard, we would like to highlight a comment in CPR's Maryland contingencies section: it reads: "In the final WIP, Maryland should ensure that its contingencies are clearly identified and are coordinated with specific failures, have timely implementation deadlines, are effective, and have legal authority to require implementation." This concept should be reflected in virtually every paragraph of the WIP.

As noted by others, the draft WIP was written with a different goal in mind: it states that it was "expressly written to solicit public comments on a wide range of pollution control strategy options.... [T]he options chosen to implement the

needed reductions will be selected with the benefit of the public comments...." Examination reveals that some of the options include an associated nutrient reduction amount, while others do not. Similar "options" have been proposed for the Bay clean-up in Tributary plans, and most everything in Maryland's WIP has been seen over and over again. In these regards, the WIP is not much of an improvement over the earlier Tributary Strategies which have failed to bring about meaningful water quality improvements.

We agree with CPR that opportunities for public comment are "valuable, but ultimately Maryland must make the tough decisions that protect the environment and lead to a restored Bay for present and future generations." Although the laundry list of options has some good things in it, it should not be up to the public to cherry pick the winning combination of activities from a long list. Maryland has erred "by leaving the particulars open to debate," and as a consequence "is likely to receive less focused and less helpful comments." Maryland has some of the best scientists, engineers, and watershed specialists in both the private and public sectors and we believe a more detailed suite of restoration/retro-fit options using the best available technologies and thinking can be created with the necessary detail on costs, timelines etc.

Additionally, as CPR points out, the "WIP does not explicitly commit to any of those options." Unfortunately, the options are not accompanied by "funding commitments or deadlines for implementation" which is exactly why past efforts have not yielded sufficient results. What is more, these "options" are proposed in a context in which Maryland has not committed sufficient resources to meet its own current regulatory requirements and does not specifically state that a "gap analysis" of key administrative or institutional milestones be completed by state and local jurisdictions to address known gaps in personnel for inspection and monitoring. Without sufficient resources and personnel, and a new 'mind set' around enforcement of regulatory requirements, no "options" will be sufficient.

We also want to highlight comments by the Waterkeeper "Inexplicably, the Maryland WIP omits vital information it has previously disclosed as part of its laudable annual enforcement and compliance report. For example, Maryland's draft WIP does not include the permitting and enforcement information already contained in its annual report to establish its baseline capacity. The final Phase I WIP should mine information from Maryland's annual report to resolve this problem.'

We are pleased that the "draft WIP meets the nitrogen and phosphorus allocations and reduces the sediment pollution to a level that is 26 percent below the target allocation." [FN 1] On the other hand, Baltimore Water Alliance has a particular concern about the way Maryland's Draft WIP deals with the issue of sediments. Section 5.1 states:

"The Chesapeake Bay TMDL requires both nutrient and sediment reductions. To begin developing options to reduce sediment loads the sediment reduction values from existing milestone practices were calculated. Maryland received draft sediment targets on August 13, 2010. Maryland is operating with the expectation, supported by EPA, that because of the close relationship between sediment and phosphorus loads, initial nonpoint sources strategies to achieve phosphorus goals will give a reasonable indication of whether the sediment goals are likely to be achieved. Consequently, limited attention is given to sediments in this draft of the Plan."

The assumption that sediments will be automatically addressed by dealing with non-point phosphorus loads is extremely environmentally significant. Yet the WIP does not describe a scientific basis for this assumption. The EPA should not accept this high impact assumption without an unimpeachable scientific justification.

NPDES Permitting/Enforcement of NPDES Permits

CPR points out that in the draft WIP "Maryland included some information about its permitting program . . . , but failed to disclose information about existing facilities without permits, if any, or existing facilities with expired or administratively continued permits. . . . Maryland also failed to establish deadlines, timelines, or qualitative goals for updating and reissuing expired and administratively continued NPDES permits."

The Baltimore Water Alliance is concerned that there has been prolonged and chronic failure to enforce lack of compliance with permitting goals, and needs assurances in the WIP that new, more stringent permits will be monitored and compliance issues enforced. As the Waterkeeper comments state: "Maryland has failed to issue permits; failed to reissue permits in a timely manner; failed to issue permits that conform with federal requirements including the requirement to have meaningful links to existing TMDLs; failed to inspect facilities as required by law; failed to fulfill its monitoring responsibilities; failed to effectively enforce the program; failed to seek adequate penalties; and failed to comply with public participation requirements. [FN 2]"

Thus, we endorse CPR's analysis and recommendation that "Maryland's final WIP should explain how it intends to improve its enforcement program and address these issues as they relate to the Bay."

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

We agree with CPR that "the final WIP should include information regarding participation and effectiveness of [best management practices funded by the MACS program.]" In addition we also concur that the final Phase I WIP must provide for dedicated funding for monitoring and verification.

Contingencies

CPR points out that overall "the draft WIP fails to discuss what contingencies Maryland will implement for slow or incomplete implementation." We agree with CPR that the final Maryland WIP should have timely implementation deadlines, and contain specific plans to implement clearly identified contingencies in the event of delayed adoption of new or revised legislation or regulations, inadequate compliance or participation rates, or adverse changes in land use or development rates. [FN 3] We believe it is essential that the WIP include detailed and strict contingencies for any source that fails to meet the TMDL limits and two-year milestones.

Stormwater

CPR correctly observed that the draft WIP "does not disclose the estimated funding and personnel gap, if any, and does not explain how this gap will be filled to ensure that the state has and maintains an effective stormwater program." This is especially true in Phase 1 MS4 jurisdictions. Maryland says its WIP supports the "reasonable assurance of implementation for Maryland's part of the TMDL." [FN 4] "This includes a demonstration that achieving load reductions required by the TMDL can reasonable be met, that is, current or anticipated resources and commitments are expected to be sufficient." [FN 5] However, the MD WIP says that locally administered programs will be analyzed in Phase II. [FN 6] If the Phase I WIP fails to analyze these Phase I MS4 jurisdictions and their capacity to achieve reductions, how can they provide any assurance that Maryland's implementation will be successful?

Baltimore city is one of the largest and oldest MS4 jurisdictions in the state of Maryland. The city was primarily built out before any stormwater management was in place, and has consistently failed to meet its current permit obligations. Without significant additional funding, it is virtually impossible they will be able to meet these enhanced mandates:

- 20% reduction in Nitrogen
- 34% reduction in Phosphorus
- 37% reduction in Total Suspended Solids [FN 7]

Baltimore City is attempting to legislate a local stormwater utility. However, a state-wide stormwater utility -- with rates determined and collected by the local jurisdictions -- would ensure that there would be a protected, reliable source of funds for costly retro-fitting, new green infrastructure, and neighborhood scaled best management practices. Moreover, a statewide mandate would ensure that all jurisdictions begin to tackle the specific run-off issue that is contributing the highest loads within their boundaries, and would ensure this burden is being felt by all citizens, not just in places where the political will is there to create local fees. We endorse Waterkeeper's assertion that MD should commit to passing this legislation in the phase I WIP.

AS a citizen living in Charles County for over half my life, I am concerned that there are better choices that could be made in protecting the Chesapeake Bay. You already know the importance of the Mattawoman Watershed. It would be way cheaper to determine how much and where protection is needed in this watershed, but the property and watch as nature works. Simplistic? Sometimes simple works, especially when mother nature is involved.

The MWS Society also points out three areas to focus on. I agree with this: Retrofitting untreated impervious surface, forest preservation, and Smart Growth. But for heavens sake, just buy the most sensitive stream valleys, wetlands, buffer zones...., focus construction away from the sensitive areas (build up Waldorf) and we will save millions.....

Baltimore, Maryland 21730

Re: Docket Number EPA-R03-OW-2010-0736

Dear Mr. Thorton;

I am a resident of Annapolis Maryland, living within the defined "Critical Area" and I am providing the comments below pursuant to the statement contained in the EPA website that "Comments are being accepted on the Draft Bay TMDL until November 8, 2010". I am aware that as part of the Bay TMDL process, the states within the Chesapeake Bay watershed must submit plans for reaching the pollution reduction targets established by the EPA's adopted TMDL.

In light of this dual requirement I have included my comments on the proposed Watershed Improvement Plan as submitted by Maryland in order to meet the EPA's requirements.

My comments are as follows;

1. Overall goal. I believe that the overall goal of establishing a "Total Maximum Daily Load" for the Bay is necessary and desirable as a public policy. I do not believe that limiting the TMDL levels to the three stated measurable criteria, (nitrogen, phosphorous and sediment) is sufficient. I recognize that these three are critical and accepted barometers of the Bay's health with some degree of reporting history however; the health of aquatic life in the bay is threatened by an ever growing influx of chemicals that are as potentially damaging as the three that the TMDL seeks to limit. I am referring to herbicides, pesticides, antibiotics and hormones being used throughout the watershed in the production of crops and livestock. If the proposed TMDL limits are met I believe that the health of all species in the Bay will still be at serious risk from these chemicals as will anyone that consumes them. I would encourage the EPA to begin a process by which these chemicals are prevented from entering the Bay's waters.

2. Timing. I applaud the EPA for establishing deadlines in a process that in the past has resulted in very little real progress, however given the complexity of what the EPA is attempting to achieve I cannot believe that the short time frame between the end of the "public comment" period (November 8, 2010) and the "final versions (of the states Phase 1 WIP) due on November 29, 2010" , is adequate to allow for meaningful review and study of any such comments

received, much less to act upon in revising the plans. I would strongly suggest extending the time allowed to the states to receive, review, and react to any comment received prior to the final TMDL being adopted, and their submission of "final versions" of their Phase 1 WIP.

3. Public Participation and Comment. The Draft WIP prepared by Maryland states that "The table of strategies presented.....will be selected with the benefit of the public comments received." I do not think that the format was sufficiently developed so that the "public" could make an informed judgment about what was being presented, and by definition provide comment that would have meaning for those individuals or entities that will adopt the "strategies" to be implemented under the Watershed Implementation Plans. There is no cost data whatsoever to be found in either document that would give the public some idea of how much each form of "strategy" costs per pound of targeted improvement. There is very little, if any, assessment of the marginal efficiency of investment in any of the proposed "strategies". How is the public to comment on the approaches if no clear presentation is provided on (a) what each approach might cost, and (b) what the rate of return (pounds removed) on the "public's" dollar invested might be. I would like to consider myself an informed participant and recognize that the documents were prepared for consumption by the general public, but I found them bewildering at best, and purposely obfuscatory at worst.

4. Assumptions. Chapter 3 of Maryland's Draft Phase 1 WIP contains the following assumption, "New development on septic tanks is assumed to be in the form of 2 acre lots that contribute non-point source loads of 3.15lbs TN per acre per year, served by septic systems discharging 12.16 pounds of TN per year." In W.G. Reay's comprehensive study of the impact of septic systems he determined the amount of Nitrogen loading to be 16.75 pounds per year. The amount was not based on lots as large as 2 acres, and they were in close proximity to tidal waters with a relatively shallow groundwater influence. The estimate was based on "conventional" septic system design and I can only assume the same for the WIP statement as it is not defined. In the January 2009 Bay Restoration Fund Advisory Committee Annual Status Report it says that 450 enhanced nutrient removal septic systems were installed utilizing Bay Restoration Grant Funding, and that this eliminated 6,849 pounds of nitrogen from the Bay watershed. On a per unit basis that would be 15.2lbs per dwelling, or more than the total amount estimated by the Maryland Department of Planning and very close to the same thing when adjusting the W.G. Reay results for larger lots and less proximity to high water tables. The figures provided in the January 2010 Annual Status report reflects the same per unit average reduction. Is it possible for these systems to be removing 100% of the estimated nitrogen load? Is the assumption in the WIP correct?

5. Assumptions. The January 2009 and 2010 Annual Status report noted above state that there are over 50,000 septic systems within the Maryland Chesapeake Bay Critical Area. The reports also state that annual replacements and/or upgrades are approximately 500 units a year with the rate of replacement matching funding provided by the Bay Restoration Grant (BRG) Fund. The "Summary Table of Actions" component of the draft WIP acknowledges this level of effort by stating that 535 systems are to be replaced using BRG funding and that 90 additional systems will be upgraded through the use of "surplus" funds after all priority applications have been addressed. The Phase 1 WIP calls for a 38% reduction in Nitrogen loads from septic systems. MDE estimates that there are 420,000 such systems in the state and 51,000 of them are located within the defined Critical Area. Would it be reasonable to say that if 38% of the OSD's in the state reached a total annual nitrogen load of less than 1lb per year the goal would be met? If so that would equate to nearly 160,000 systems, or more than three times the total number of OSD's in the Critical Area alone. The state does not have the money to embark on such a plan and the WIP really does not offer any alternative. Is a 38% reduction in Nitrogen Loading from septic systems a realistic assumption?

6. Assumptions. The EPA Draft TMDL and the Maryland Draft Phase 1 WIP both state that equitable solutions must be

reached based on stakeholder input. The Bay Restoration Grant Fund receives its money via a \$30 per wastewater system user or septic system owner. All funds (net of administrative expenses) collected from wastewater system users are applied to the upgrade of wastewater treatment plants. Septic system owners only receive 60% of the benefit of their contribution as the remaining 40% is diverted to subsidies for agriculture. I believe that 100% of the tax imposed on homeowners should be utilized to improve all OSD systems within the Critical Area prior to diverting any such funds for the benefit of private agricultural business interests.

7. Assumptions. The Maryland Draft WIP calls for reductions in pollutant loading from Urban regulated and Urban non-regulated areas. It is my understanding that the difference is between point and non-point source i.e. permitted and non-permitted sources of runoff. I believe that this is not a sufficiently defined or refined distinction. It lumps urban areas with combined sanitary and storm sewer systems which in many cases are nearly 100% impervious with little or no forms of storm water management with properties or buildings that have been constructed since the introduction of storm water regulations in the 1980's. I believe that at least one additional category of measurement needs to be added in order to correctly assess the impact of new projects.

8. Assumptions. The Maryland Draft WIP states that significant reductions in nitrogen (33%) and Phosphorous (38%) pollution were achieved while accommodating a 29% increase in population. There is no specific data in the draft WIP that indicates how this was achieved however a report prepared by Wetland Studies and Solutions Inc. , (WSSI) utilizing the Chesapeake Bay Watershed Model (5.3) states that "Nearly half (48.4%) of the agricultural TN load decrease from 1985 to 2009 is the result of land conversion of agricultural land to urban land. Approximately 60% of the TP and TSS load reductions result from land conversion rather than BMPs". I compared this data with information available from the US Census Bureau and the Maryland Department of Agriculture. I chose three western shore counties that have experienced significant population growth, (Anne Arundel, Montgomery and Prince George). Since 1997 these three Counties have seen an increase in population of nearly 200,000 while farm acreage has dropped from 164,963 acres to 133,862 a decline of nearly 18%. On the Eastern Shore Counties of Caroline, Dorchester and Talbot population has increased by approximately 6,500 while agricultural acreage has increased from 346,132 acres to 373,467 acres. A recent report released by the US Geological Survey states that water quality in the Choptank River (bounded by the above eastern shore counties) has worsened. Such data would seem to provide credibility to the WSSI report conclusion. If this is indeed the case, the underlying assumption on how water quality improvements have been achieved to date needs to be re-examined in light of this data. I would recommend that a much greater emphasis needs to be devoted to analyzing how agricultural lands can truly reduce the impact of their activities on the Bay Watershed and a greater percentage of the improvement in water quality achievement needs to be assigned to the agricultural sector.

9. Assumptions. The Maryland Phase 1 Draft WIP contains several references to a nutrient "Cap and Trade" program, (Section 3, Accounting for Growth). The process, means, pricing, and management of such a program are so vaguely stated that no reasonable conclusion can be reached regarding the validity of such a proposal. I would recommend deleting this recommendation in its entirety unless specific program terms are added so that its implications can clearly be understood.

10. Data collection. It is my understanding that many of the assumptions contained in the EPA's TMDL and the Maryland WIP are based on a computer model. Given the size of the watershed and the complexity of the analysis I cannot imagine any other means of attempting to create an overall plan for improving the Bay. I would strongly recommend that the number of data collection points be increased to validate the assumptions contained in the

computer model.

11. Realistic Goal Setting. The Maryland Phase 1 Draft WIP sets a goal of achieving 70% of the target reduction for regulated urban pollutant loads by 2017. This is exclusive of discharges from waste water treatment plants. The chart provided on page 6 of the Executive Summary indicates that a 1,000,000lb reduction in nitrogen pollution from regulated urban runoff is required for Maryland by 2020 and that 70% of that goal will be achieved by 2017. The most significant proposal for achieving that goal contained in the "Summary Table of Actions" is to require SHA and Counties to install storm water management controls at 30%, 40% or 50% of existing impervious surfaces without controls. I do not believe that it will be possible to identify and generate the necessary funding for any of these levels of retrofit much less design and install them by 2017. I think a more realistic analysis of actual pollutant sources and cost effective controls is required to meet the 2020 reduction targets much less those set for 2017.

As a resident who cherishes those days that I am fortunate enough to get out on the water, I applaud all those who truly seek to make it better, and I hope that you will accept the above in the hope that we can all achieve that goal.

Sincerely,

George Rathlev
1912 White Heron Road
Annapolis, Maryland 21409

Mattawoman Creek as a test case for assessing TMDL enforcement

As has often been noted, the Bay TMDL represents the largest and most complex attempt ever to implement the TMDL tool. This necessarily requires operating at a relatively coarse-grained spatial scale for the foreseeable future. Under such circumstances, an understanding the effectiveness of various enforcement strategies may be accelerated by examining these strategies at a smaller spatial scale, where more detailed modeling is feasible, and where a simpler matrix of land uses and pollution sources tests strategies with greater specificity. We believe that Mattawoman provides a compelling test case at a manageable spatial scale for examining the effectiveness of new approaches to enforcement, especially in regard to nonpoint sources, urban stormwater, and forest conservation, for the following reasons:

(i) Mattawoman represents a highly visible and charismatic Bay resource because of its outstanding qualities. For

example, it has for many years been an anadromous-fish spawning and nursery ground among the best, if not the best, in the Bay with a healthy and robust trophic structure in its freshwater-tidal fish community [Carmichael, 1992; Uphoff, 2005]. It also supports a vibrant recreational largemouth bass fishery [Groves, 2005; Penrod, 2010] that generates tens of millions of commerce annually [Fedler, 1989]. Over 100 bass tournaments are launched from its shores annually. Its intact forests harbor Important Bird Areas [Audubon, 2009], riparian biodiversity [DNR, 2005], and hotspots of avian and herpetological biodiversity [FWS, 2006].

(ii) Because agriculture is a less important contributor to pollution loads, the watershed epitomizes the issues of forest retention and urbanization, and provides an ideal test case for examining these issues. The Bay watershed loses to development about 100 acres of forest per day [CBP, 2010], and pollution from urbanization is increasing [CBP, 2007]. In the same vein, Mattawoman's majority-forested watershed is targeted for development by Charles County policies promoting urbanization of an area larger than Washington D.C., with 10,000 acres of forest-loss projected by 2030 [ACOE, 2003].

(iii) A GIS-supported model based on the Hydrologic Simulation Program Fortran code already exists for Mattawoman and may serve as a foundation for testing enforcement scenarios. The Army Corps of Engineers developed the model to study the impacts of projected urbanization [ACOE, 2003]. The model relies on unusually detailed calibration data from continuous monitoring stations operated by the Smithsonian Environmental Research Center [SERC, 2000].

(iv) Mattawoman is covered by Prince George's and Charles Counties' Phase-I MS4 permits (Municipal Separate Storm Sewer System), providing EPA with one of its key enforcement backstops. In addition, there is little headroom for nutrient reduction through improvements to wastewater treatment plants. Hence Mattawoman tests the ability to attain reductions through, for example, stronger requirements in, and enforcement of, county MS4 permits.

(v) Success in protecting as valued a resource as Mattawoman would bolster confidence in the commitment to restore the Bay using the Bay TMDL strategy. On the other hand, permitting its degradation-as is currently happening-undermines confidence in broader bay-wide efforts: a recent report finds a steep decline in fish abundance and species richness in the tidal estuary, and correlates the decline to watershed urbanization [Uphoff, 2009]. Consistent with these problems, usage of non-tidal waters by spawning anadromous fish was found also to have plummeted in the last decade. Are the strategies in the Bay TMDL able to reverse this trend?

(vi) Mattawoman enjoys broad support from resource agencies [Carmichael, 1992; ACOE, 2003; Groves, 2005; Uphoff, 2005; Uphoff, 2009; FWS, 2006; FWS, 2009].

It also receives wide public support [SGA, 2007; Sierra, 2007; Sierra, 2010; American Rivers, 2009; Audubon, 2009; SGACC, 2009; MBFN, 2010].

(vii) A past reluctance on the part of local county government to fully embrace Bay initiatives in general, and Mattawoman in particular, may be changing as Mattawoman concerns became a political issue in the recent Charles County election cycle; 80% of the board of commissioners have changed. Hence, here is place to demonstrate an ability to overcome past land-used decisions detrimental to water quality, a necessary ingredient of any strategy to restore the Bay in the face of increasing pollution from urbanization.

(viii) As documented below using Mattawoman as an example, the past approach of restoring the Bay by delegating authority to states and waiting does not work. Even now, it is disturbing that Maryland's draft Watershed Implementation Plan (WIP) fails to provide sufficient internal assessments of the effectiveness of its program, and fails to supply sufficient information to judge the strength of its enforcement program [FN 1] Even so, Maryland's WIP is among the better ones, and Mattawoman would provide an ideal place to test state resolve in a state with perhaps the strongest institutional heritage for Bay-restoration.

[FN 1] See appended comments to the Maryland Department of the Environment (MDE) on its draft WIP.

Response

Because Maryland submitted an improved WIP over the draft, EPA chose to reduce or remove the backstop allocations that were proposed in the draft TMDL. EPA will continue to provide ongoing oversight of Chesapeake Bay jurisdictions. This includes EPA's review of progress in Maryland's NPDES permit program and Nutrient Trading Program in 2011 to ensure consistency with EPA expectations. With each successive WIP in Phase II and Phase III, it is expected that each jurisdiction will work with its local partners to refine the allocations in the Phase I to a finer scale. EPA encourages local groups such as your's to reach out to Maryland to participate in the Phase II WIP development process.

Author Name: Long Jim

Organization: Mattawoman Watershed Society

We recommend that the following specific issues be reinforced in the WIP. We note where appropriate how employing Mattawoman as an example sharpens the need for resolve, specificity, and commitment.

Details must be supplied for how the options will be achieved by 2017 for retrofitting 30%, 40%, or 50% of untreated impervious surface in municipalities with a Phase I permit for a Municipal Separate Storm Sewer System (MS4) [WIP, 2010]. For example, Charles County, which is responsible for $\frac{3}{4}$ of Mattawoman's watershed, was required by its 2002 MS4 permit (a Phase I permit) to retrofit 10% of its untreated impervious surface every 5-year permit cycle. This pace is far below that necessary to achieve a 30% retrofit by 2017. Even so, Charles County is far behind schedule. While available figures appear inconsistent, please note that either 2607 acres or 765 acres are untreated, depending on the source.[FN 1] At the rate of 10% retrofit every five years, and allowing for a seven year period from the 2002 permit to the start of 2010, one would expect either ~365 acres or ~110 acres to have been treated, depending on which figure is used for the untreated impervious surface. In contrast, only 45 acres were treated as of July 2010 [WRE, 2010; MS4, 2010] far below the permit requirement. Thus it appears that enforcement strategies are inadequate.

Yet the strategies given in the WIP for ensuring compliance of impervious surface retrofits [WIP, 2010; p. 5-23] appear to be identical to the present inadequate strategies for enforcing compliance with existing MS4 permits. Therefore, much more detail describing enforcement steps is needed to assure that the past practice of overlooking deficient MS4 performance will be rectified.

Provide detail for how forest preservation goals will be attained. The WIP discusses an element to "[s]trengthen Maryland's Forest Conservation Act by requiring State and local programs be amended to require a 'no net loss of forest.'" We strongly endorse a strategy of retaining forest land, because forest contributes minimally to, and even reduces, nutrient and sediment loads, while paying dividends many times over by moderating stormwater discharge rates and amounts, enhancing stream baseflow, cooling stream water, providing habitat, increasing property values, and providing an aesthetic landscape. In addition, a forested landscape is a critical element for mitigating against the impacts of climate change [Palmer, 2007].

The forest preservation goal could be strengthened considerably by adding an element that identifies "intact forests" for protection. Protecting intact forest is much more effective and efficient than the present WIP proposal of planting trees for no net loss of forest because tree planting is most likely to target open-space lands that contribute less loading than the development replacing the original forest.

Furthermore, the WIP contains no quantitative analysis of how realistic is a goal of no net forest loss through mitigation. For example, the Army Corps projects that Mattawoman would lose 10,000 acres of forest in the next twenty years [ACOE, 2003]. The impacts of this cannot be mitigated, nor realistically "planted away." In addition, identifying 10,000 acres for mitigating tree-planting appears to be a major challenge. Without additional detail, this challenge calls into question the prognosis of this worthy WIP strategy.

Outline stronger standards for Smart Growth and limiting sprawl development as a means to improve water quality, that includes a re-evaluation of Priority Funding Areas. The "intact forest" element above dovetails with this idea. The governor's fully funding Program Open Space is another consistent and welcome strategy, as noted in the draft WIP, and can be means of protecting intact forest.

The WIP relies in part on the concept Priority Funding Areas (PFAs) and Comprehensive Plans as a component of Smart Growth. However, as the case of Mattawoman illustrates, these approaches require substantial strengthening if they are to be effective. For example, Charles County's Comprehensive Plan establishes a "development district" that is 30% larger than Washington D.C. As noted by DNR, "[p]rotection of this watershed appears to be in direct conflict with the location and size of the development district" [DNR, 1996]. We also note that such a large area, overlapping much of the watershed of one the Bay's most productive tributaries, is antithetical to Smart Growth.

An important specific means to strengthen the Smart Growth component would be to re-evaluate PFAs with respect their impacts to water quality. In fact, "[t]he statutory criteria for drawing PFAs are based on existing densities, infrastructure capacities, and municipal boundaries, not on careful plans that consider where future growth should occur. [Lewis, 2009; emphasis added]. Many PFAs were designated in haste and with minimal, or no, public input [Lewis, 2009]. In the case of Bryans Road, a one-stoplight town that drains to sensitive spawning reaches of Mattawoman and its tributaries, no public input was solicited before its designation as a PFA, but the public process required for subarea plans later revealed intense public opposition to the PFA designation.

Bryans Road is a PFA that appears to be extremely poorly cited for protecting the aquatic quality of Mattawoman Creek. Included within the PFA boundary are three noteworthy Mattawoman tributaries: (i) the heavily forested headwaters of one of Mattawoman's outstanding anadromous-fish spawning-tributaries [Powell, 2005]; (ii) the headwaters of another tributary that drains to head of tide [Powell, 2005]; and (iii) a globally rare Magnolia Bog wetland in the headwaters of

yet a third tributary [NatureServe, 2010]. Bryans Road is also adjacent to Chapman State Park, is within a Maryland Stronghold Watershed [DNR, 2008] and is surrounded by forested land that drains to especially sensitive spawning waters of Mattawoman Creek that include the state's most biodiverse herpetological site [DNR, 2005].

Listing Bryans Road as a PFA has impacts beyond the degradation of its local rich natural resources. Its listing was part of a strategy to cement Charles County's extremely large development district and to serve as a pretext for new highways that would open large areas to sprawl development (the proposed Cross County Connector and Western Waldorf Bypass). The Bryans Road PFA effectively replaces the Chapman's Landing development proposal that was circumvented in 1998 when the state and the Conservation Fund purchased what is now Chapman State Park. Note that the state's original Smart Growth initiative was motivated in no small part by the Chapman's Landing proposal, a disturbing irony given the evolution of plans for Bryans Road just one mile north. Hence, the example of Bryans Road shows how a re-evaluation of PFAs could limit sprawl development and support Smart Growth alternatives, such as investing in Waldorf, while enhancing the goals of the WIP.

It might be expected that the new WRE requirements for county Comprehensive Plans could be a tool to effect Smart Growth solutions to water pollution. The WRE is intended to link land use decisions to attaining TMDL reduction, for example, and is mentioned favorably in the draft WIP. However, for this to be the case, stronger state oversight is clearly needed: as the Charles County draft WRE shows, none of the three scenarios considered in the WRE comes close to meeting Mattawoman's TMDL out to 2030, as noted above.

In summary, as the above examples attest, Maryland's draft Phase I WIP, while representing a reasonable start and obvious effort, could easily break down if not substantially reinforced with more specificity for implementation. We have chosen three specific examples discussed in the WIP, namely retrofitting untreated impervious surface, forest preservation, and Smart Growth as a tool (in principle, a Maryland strength), to illustrate how the present assurances in the WIP need to be vastly improved to be convincing and successful.

[FN 1] According to Charles County's 2010 MS4 annual report, 2607 acres of impervious surface in the "development" district are untreated (p. 55). The figure is 765 acres, according to the draft Water Resources Element, which has not yet been submitted to the state in final form (Section 3.a).

Maryland should reallocate load reductions between point sources and nonpoint sources and develop a regulatory framework to ensure that nonpoint sources meet their reduction requirements.

The Draft Phase I Watershed Implementation Plan (WIP) does not adequately address how the proposed pollution reduction strategies are justified or cost effective. To justify the allocations of load reductions, the WIP must demonstrate that load reductions are commensurate with that source's environmental impact, will be imposed on sources with the capacity to achieve the reductions, and that the reductions are cost effective. Three facts found in the WIP indicate that the current slate of options considered do not meet this standard: (1) agriculture, unregulated urban stormwater, and other nonpoint sources comprise a significantly larger portion of the current pollutant load than urban stormwater[FN 1], (2) costly urban stormwater retrofits will be imposed on NPDES jurisdictions with insufficient amounts of state funding offered to help pay for these improvements and no consideration of whether these costs will be justified, and (3) the nonpoint source sector will be expected to achieve modest pollution reductions primarily through a series of state or federally-funded voluntary programs.

Section 319 of the Federal Clean Water Act directs the states to create and implement nonpoint source pollution programs to ensure that all navigable waters meet water quality standards. The statute also states that these programs should contain a regulatory and enforcement component. It is inequitable to force NPDES permit holders to achieve stringent reductions through expensive retrofits under threat of penalty while the nonpoint sector is only enticed with carrots funded by government. To be effective and fair, Maryland's nonpoint pollution control program must include a credible regulatory and enforcement component. The Water Quality Improvement Act, requiring nutrient management plans, was a good start. Maryland should leverage nutrient management plans to achieve more stringent reductions from agriculture. Plans should be monitored and enforced with the same stringency as MSA permits and the results quantified. If the management plans do not achieve the pollutant reductions necessary, the Department of Agriculture should make them more stringent. These are the cornerstones of a robust adaptive management strategy.

Finally, it is worth noting here that the Chesapeake Bay TMDL contemplates the states' nonpoint source programs stepping up to take pressure off of the NPDES permit holder community. Since the federal government lacks authority to regulate nonpoint sources but the states have ample authority to do so, EPA held out stringent "backstop" measures on point sources as an inducement for states to beef up their nonpoint source programs. Instead, the draft WIP does not meet this challenge and threatens to impose a heavy burden on local stormwater programs and wastewater treatment plants. Rockville disagrees with this strategy and urges Maryland to reexamine its implementation priorities.

[FN 1] See e.g. Maryland Watershed Implementation Plan 5-33, Figure 5.1. (showing that urban stormwater represents only 14% of nitrogen loads and the sum of all sources attributable to agricultural activity causes nearly 40% of loads).

Maryland must reform State law to support local stormwater utility fees and provide technical expertise to local

stormwater programs to help quickly develop and implement local funding sources.

As one of a minority of local jurisdictions implementing a stormwater utility fee in Maryland, Rockville can attest to the amount of effort, time, and planning required to create and manage local funding sources. Chapter Five of the WIP cites stormwater utility fees as a key source of funding for implementing the TMDL and Rockville agrees. Utility fees, in addition to increased State and Federal funding, will be an important component of these funds. Unfortunately, Maryland is unprepared to implement local stormwater fees statewide in time to meet 2017 interim goals. Legal uncertainty regarding the limits of authority, local political opposition, and technical impediments will prohibit most MS4 communities from adopting stormwater utilities in the near term. Therefore, if Maryland is to rely on local funding to restore the Chesapeake Bay, the State will need to act aggressively in reforming state law to require local utilities. In addition, we urge the State to provide technical assistance and funding to local programs to lower the technical barriers preventing the swift adoption of utility fees or other funding mechanisms.

The first major impediment to creating local stormwater utility fees is the lack of clear legal authority under State law. The current law authorizing a "system of charges" is vague, disputed, and provides inadequate authority for local programs to fund the requirements of the WIP. For example, the Maryland Department of Environment's Model Stormwater Utility Ordinance (2003) states that government owned properties may be assessed the stormwater utility fee. This guidance is contradicted by an opinion of the Maryland Office of Attorney General, which implies that stormwater fees cannot be assessed on government property.[FN 2] The lack of legal certainty concerning stormwater utilities as a fee for service prevents many communities from adopting or fully implementing utility fees.

Secondly, many local jurisdictions lack the capacity and political will to implement stormwater utilities in time to meet the 2017 interim goals. If local jurisdictions wait until an acute funding need exists to investigate stormwater utilities, the long period of time required to design, adopt, and implement a program will likely mean that the 2017 interim goals will not be met. Similarly, many smaller stormwater programs lack the capacity to gather and manage the data necessary to create a utility. The Maryland Department of Environment should act quickly to minimize this lag time by helping with the costly and difficult tasks of gathering impervious surface data and selecting a rate structure.

In summary, Rockville urges the Maryland to enact legislation that requires local jurisdictions to adopt stormwater utility fees and that clarifies the responsibility of government to pay for the stormwater pollution it generates. Without such legislation, many local jurisdictions will not implement stormwater utilities until it is too late to meet the interim deadlines proposed in the WIP.

Maryland should decrease the amount of stormwater retrofits required by 2017 to allow MS4 jurisdictions adequate time to conduct analyses of their potential retrofit opportunities and time to design and budget these projects.

Even where local stormwater programs have adequate funding sources to construct stormwater retrofits, these programs must have sufficient time to assess their retrofit opportunities and to plan projects. For example, the Little Pimmit Run Watershed Retrofit Plan in Arlington County, which assessed the retrofit opportunities in Arlington, Virginia, took nearly two years to complete. Most jurisdictions will need to complete a similar planning effort before retrofit work can begin. Retrofits without proper planning will be expensive and ineffective. Local programs should be given time to find the most cost effective and practical ways to reduce pollution loads.

Once programs identify retrofit opportunities, they need time to schedule the projects into their capital improvement budgets and to complete project design. Based on our experience, this process can take up to two years to complete. This would mean that the first retrofit projects might not begin until the fifth permit year. Furthermore, many local programs lack the capacity to manage the number of projects that would be required to achieve the interim goal of 20%. Based on these planning, process, and logistical constraints, local programs will likely fail to meet the 2017 interim goals as written.

The permitting process for building retrofits is another barrier to the rapid implementation of retrofit requirements. Maryland must streamline the waterway and wetland joint permitting process, in conjunction with the Army Corps of Engineers, since these permit approvals often take six to nine months from submittal of engineering plans.

Maryland should provide flexibility for urban and suburban stormwater programs to demonstrate pollution load reductions with other methods where stormwater retrofits are impractical.

Until MS4 jurisdictions can assess their retrofit opportunities, it is impossible to give reasonable assurance that pollutant reductions are feasible. The Maryland Department of Environment should allow local programs flexibility to use other pollution reducing technologies in lieu of stormwater retrofits where assessments show that retrofits cannot provide the necessary load reductions, or where more effective cost efficient opportunities exist. For example, many dense urban communities have limited space to install stormwater retrofits without incurring disproportionately high costs. Future NPDES permits should give credit towards the retrofit requirement for other activities such as stream restoration, street sweeping, and tree canopy improvement.

The WIP should clearly define how the amount of required stormwater retrofits will be calculated and provide flexibility for local programs to achieve maximum benefit from their retrofits.

Part of the stormwater retrofit planning process will require MS4 jurisdictions to assess their area of "pre-1985" impervious surface and then plan appropriate projects to achieve the required percent treated. Future WIPs must clearly spell out how these areas are calculated and how the area treated is quantified to avoid confusion and inadequate implementation. For example, there are numerous areas in Rockville that were developed pre-1985 with some form of stormwater management prior installed while there are post 1985 properties that have less management due to site constraints. The definition should address what retrofits will count towards meeting a retrofit requirement.

Such a definition is especially important considering the long range planning that will need to successfully complete all required retrofits. The sooner that program managers can enter their budget process with "concrete" requirements, the sooner funding will be made available to start retrofit projects.

Maryland should not prohibit urban communities from using fee-in-lieu for forest conservation.

On page ES-16, the WIP discusses potential amendments to the Forest Conservation Act that would prohibit local programs from collecting fee-in-lieu payments for projects not able to meet forest conservation requirements on site. Rockville supports the concept of no net loss of forest at a statewide level. In fact, our local tree reservation program is a model for other communities and has resulted in a 44% city-wide tree canopy. However, a prohibition of fee-in-lieu payments would have serious unintended consequences for our community. Rockville lacks the available private land to

create forest mitigation banks, meaning that developers would have to secure forestry easements outside of the City limits, essentially "exporting" and likely reducing Rockville's valuable urban tree canopy. The City removed the option to meet forest conservation off-site several years ago when there no longer was adequate forest planting space on City parkland. In addition, the City has not allowed developers to use existing forest on City parkland to meet their on-site forest conservation requirements since the City deems these forests as already preserved. Through the collection of fee in lieu, the City is able to plant between 400 and 600 street trees per year while maintaining and protecting our existing forest canopy. Removing this source of funding would jeopardize Rockville's street tree and forest maintenance programs.

Rockville's Forest and Tree Preservation Ordinance boasts some of the most stringent reforestation and afforestation standards in the state.[FN 3]Where these standards cannot be met on site, the City uses fees-in-lieu to plant and maintain trees within Rockville. Rockville lacks adequate space to create forest mitigation banks within its limits. Therefore, a strict application of a no net loss forest policy could actually decrease the number of trees in Rockville, thereby increasing the amount of urban stormwater discharged into the Potomac River and Chesapeake Bay. Maryland should continue to allow urban communities the flexibility to collect fee-in-lieu so they may implement successful local forest conservation strategies in the urban context and as a strategy to reduce urban stormwater runoff.

Comments on Maryland's Chesapeake Bay TMDL Watershed Implementation Plan

MDE and DNR are to be congratulated for such a comprehensive document. I am especially pleased that the approach now includes two-year milestones for implementation.

The Watershed Implementation Plan includes a large list of practices which can be used to meet the goals of the TMDL requirements for the Chesapeake, but does not prioritize the practices. If public input is to be used to develop the prioritization plan, more direction on cost effectiveness. If cost effectiveness is used to help prioritize then there needs to be some understanding of who pays and how. I believe that agricultural practices need to be supported with public money. Stormwater retrofits should be paid for with a fee based upon impervious area. New stormwater management should be paid for the development industry.

A major concern for recreational users such as fishermen is that there is no target reduction for sediment in the TMDL for the Chesapeake Bay watershed. As I understand it the WIP assumes that phosphorous reductions will get the necessary sediment reductions. A detailed look at this assumption will show that although it may be valid for agricultural sources it is without basis for urbanized and urbanizing areas. Stream instability is a major source of sediment delivery

to stream channels in these developed watersheds. Phosphorous reduction will most likely not be focused on this source of sediment.

A serious consequence of this omission will be the undervaluing of stream restoration as a strategy for restoration of the Chesapeake Bay watershed. Many small streams in the developed areas of Maryland suffer from significant instability and are major sediment sources. Since there is no specific target for reduction of sediment which can be a major and needed benefit of stream restoration there will be no incentive for this practice.

It seems that stream restoration is considered only for its ability to reduce nutrients and nutrient reduction is not well understood in streams. Work by Margaret Palmer and others is attempting to quantify nitrogen removal in the hyporheic zone of stream channels. This is one mechanism for nitrogen reduction in streams but not the only one. Nutrient processing by aquatic organisms in a healthy stream is a major factor which is not even considered much less estimated. The annual leaf and twig fall from riparian zones into stream systems is processed nearly quantitatively by macro and micro-invertebrates in healthy streams with diverse aquatic life. When streams become unstable and deliver excess sediment into their channels virtually all aquatic life can be eliminated, thus eliminating this form of nutrient processing. Under these conditions the allochthonous inputs to a stream system, rather than being incorporated into the food web, get transported downstream and taken up in anaerobic digestion. Thus, the secondary impact of an unstable stream channel is to increase nutrient delivery and cause additional problems such as increased biochemical oxygen demand and significant reductions of dissolved oxygen.

For these reasons it is important to have an understanding of the magnitude and impact of sediment from stream channel erosion. Without this understanding we are seriously underestimating the benefits of stream restoration. Research is needed to help quantify these impacts and thus the benefits of restoration. In the meantime I recommend that preliminary estimates of the volume of eroded sediment from stream channels be an important factor to evaluate in considering stream restoration as a process for inclusion in the WIP. A standard amount of sediment reduction cannot be used as a basis for evaluating stream restoration benefits because the amount will vary with the amount of sediment being generated by the stream being restored.

Stream restoration in urban and urbanizing areas should be included as an important practice for restoring the bay watershed and it should be coupled with stormwater retrofits in the drainage area of the stream being restored. The combination of stormwater retrofits effort along with stream channel restoration will maximize the benefits of nutrient AND SEDIMENT REDUCTION.

Thank you for the opportunity to comment on the Phase I WIP. I look forward to a continuing dialog as the development of the Phase II WIP is developed.

Organization:

We recommend that the Maryland WIP devote more attention to the small waste water treatment plants [WWTPs] that have a profound effect on certain rivers. For example, the Galena, Maryland plant is ranked low in Maryland's funding

and receives no grants, yet it is the source of half of the nutrients in the Sassafras river, and has a very direct discharge to the Bay. The Sassafras watershed has been identified in the Chesapeake Bay Program data and presentations as "hot" - ie -- a land area contributing more nutrients and needing greater emphasis since it has a greater affect on the main stem. A tiny amount of money, well placed in these and similar minor WWTPs could go far in improving certain critical ecosystems. But since the WWTP is small, it is ignored by the Maryland WIP, even though, relatively speaking, its upgrade could have a great beneficial impact.

Organization: Chesapeake Bay Foundation (CBF)

[The document submitted was partially illegible along the right margin. The text below has been reproduced to the greatest extent possible. See EPA-R03-OW-2010-0736-0732 for a copy of this document.]

Dear Secretaries Griffin, Hall, Hance, and Wilson:

In August 2010, the Chesapeake Bay Foundation (CBF) submitted a letter with recommended actions to be included in Maryland's Watershed Implementation). The overarching premise of each of our recommendations was to challenge Maryland beyond the status quo, as a WIP that contains largely the same practices and apps previous plans will not result in water quality improvements.

While CBF congratulates Maryland for outlining a suite of actions that, if fully implemented, could meet statewide allocation targets for nutrients and sediment, we remain concerned that Maryland's draft WIP does not discuss meaningful changes to current programs or funding mechanisms that would actually result in achievement of the targeted results. In short, the WIP does not provide reasonable assurance that it will achieve pollution requirements and improve water quality throughout the state of Maryland.

As you know, the process of developing the Bay-wide TMDL actually began over a year ago with a series of federal judicial consent decrees and settlement agreements that addressed the failure of the Bay jurisdictions to meet the Clean Water Act (CWA) requirement identifying all impaired waters within their respective boundaries and developing plans for those waters. In 1998, Maryland entered into a memorandum of understanding, Environmental Protection Agency (EPA) that required Maryland to complete listings of impaired waters and develop TMDLs for those waters within 10 years. Memorandum of Understanding between the State of Maryland and the U.S. Environmental Protection Agency. Pursuant to that agreement, EPA would complete the listings and TMDL development if Maryland did not.

On June 28, 2000, the governors of Virginia, Maryland, and Pennsylvania, the chair of the Chesapeake Bay Commission, and the Mayor of the District of Columbia responded to various decrees and agreements by signing, with then EPA Administrator

Carol the Chesapeake 2000 agreement which, among other things, committed to reduce nitrogen, phosphorus, and sediment sufficiently to remove the Bay and its tidal tributaries from the impaired waters lists by 2010.

In December 2003, EPA, Maryland, and the other Bay jurisdictions agreed to the nitrogen, phosphorus and sediment allocations that became the basis for "tributary strategies," designed to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. Maryland completed its Tributary Strategy in 2004 and an implementation plan in 2007. [FN1] The failure to achieve that goal triggered the need to develop the Bay TMDL - a process in which Maryland has been a full and cooperative participant.

Consistent with EPA's letters to the Principals' Staff Committee of September 11, 2008, November 4, 2009, and April 2, 2010, we strongly encourage the state to provide the necessary details in their WIP for how they will achieve the necessary reductions. EPA's assessment of Maryland's WIP shortcomings is correct in noting the lack of specifics on necessary changes to existing programs; unbalanced focus on point source reductions to meet 2017 reduction targets; and the need for "enforceable or otherwise binding commitments" to achieve agricultural and stormwater reductions. Attached hereto and incorporated herein by reference are EPA's assessments.

We have provided "CBF's Detailed Comments on Maryland's Draft WIP," dated November 8, 2010, as an attachment hereto . It is incorporated herein by reference. Without the bold actions enumerated in these Comments, Maryland will fail to provide reasonable assurance, will not meet its current Milestones, and will not make significant progress toward TMDL implementation.

In submitting these comments, we incorporate herein by reference the comments of the Choose Clean Water Coalition; those of Donald Boesch, et al.; and those of CBF, all of which were sent to Administrator Jackson in reference to Docket no. EPA-R03-OW-2010-0736.

1 . THE WIP NEEDS ENFORCEABLE AND BINDING COMMITMENTS TO INCREASE WATER QUALITY PROTECTIONS

The Draft Phase I WIP contains few commitments that would provide "reasonable assurances" that pollution reduction targets will be met. While the WIP contains options to expand agricultural best management practice implementation, increase stormwater retrofit requirements, increase advanced septic system technologies, and increase natural filters on private and public lands, there are no commitments for programs, developing new regulations, generating dedicated revenues, or creating other requirements that would ensure these actions are actually taken . Such options need to be backed with enforceable or binding commitments because voluntary implementation alone will not be sufficient to meet the extent of actions required to meet Maryland's nutrient pollution reduction goals under the Bay Total Maximum Load (TMDL) currently proposed by EPA.

It is imperative that Maryland include concrete commitments regarding the programmatic, statutory regulatory changes - including commitments to necessary funding - that will be necessary to provide "reasonable assurances" for the federal EPA, but can give stakeholders in Maryland the confidence sectors are being required to increase their actions in measurable and accountable ways. In order to substantially increase implementation of outlined activities, the State and Local governments, private individuals, and others in the private sector will have to increase their resources targeted to pollution. Below are several opportunities where reasonable assurances can be achieved through regulatory, or programmatic changes that are enforceable or otherwise binding commitments.

Increase the Bay Restoration Fund to Ensure ALL Major Wastewater Plants are Upgraded

Maryland's Bay Restoration Fund (BRF) has been a model of success by creating a dedicated fund from reductions. Since its creation in 2004, the modest fee on wastewater treatment and septic users has provided significant funding to upgrade the state's largest wastewater treatment facilities as well as fund septic upgrades and nonpoint pollution control with cover crops. Unfortunately, initial cost projections have been exceeded as wastewater treatment facilities go through engineering, design, and construction. It is estimated that the BRF will begin experiencing a structural deficit as early as 2012, short by more than 1 Million. [FN2]

The only solution that will ensure continuity in facility upgrades - and ensure both essential pollutant reductions and compliance with the existing upgrade schedule - is to increase the BRF fee. Increasing the current monthly fee from \$2.50 per Equivalent Dwelling Unit (EDU) to \$5.00 per EDU will provide the revenues to complete the task of upgrading all 67 major treatment facilities to Enhanced Nutrient Removal (ENR) technology while still meeting the existing upgrade schedule. Since the Draft WIP relies on nonpoint source reductions to meet its 2017 nutrient reductions, it is incumbent on the state to ensure that the funding will be in place to provide reasonable assurance of achievement of these reductions.

Stipulate Specific Performance Standards for Urban Stormwater Retrofits

Maryland's WIP lacks sufficient details regarding performance of stormwater retrofits and "restoration" activities in urban areas. Such retrofits and restoration of urban lands is the cornerstone of Maryland's WIP to reduce loads from existing development, yet there is no clear indication of what actions must be taken to "count" toward these load reduction goals. Maryland must better articulate the kinds of practices that would be acceptable to retrofit untreated urban and suburban lands, and ensure consistency with existing regulations that require Environmental Site Design (ESD) and lower impact technologies and approaches to meeting stormwater treatment requirements. For example, urban retrofits should focus on the installation of decentralized practices that maximize infiltration, filtration, evapotranspiration, or reuse as treatment methodologies, and must strive to treat at least the water quality volume from the contributing area.

Furthermore, Maryland must ensure that all retrofits, whether as part of the MS4 permits to meet load reduction requirements for the TMDL, or required under the Stormwater Management Act as a condition of redevelopment, be adequately designed, installed, inspected and maintained. The state needs to describe how they intend to track and enforce these requirements to meet the 2007 law and the MS4 provisions.

Require the Implementation of Local Stormwater Infrastructure Revenue Streams

The Draft WIP correctly identifies existing, unmanaged stormwater as a key target for retrofit in order to reduce nutrient and sediment pollution from the developed sector. The State has laid out three possible retrofit requirements for inclusion in the Phase I MS4 permits as they come up for revisions and modification : 30%, 40%, or 50%, and has asked for specific feedback. CBF supports inclusion of the 30% retrofit requirement - requiring MS4 jurisdictions to retrofit 30% of their currently untreated area during the permit term - consistent with the current Montgomery County MS4 permit. Achieving this level of retrofit within the five year permit term is an ambitious target. However, aggressive retrofits in our urban environments are necessary to restore stream health and reduce nutrient and sediment loads from developed areas.

A primary obstacle that the state must help to overcome is the lack of sufficient dedicated revenues to specifically

address the expensive needs associated with stormwater management and retrofits within existing urbanized areas. Most counties currently allocate minimal resources to meet basic stormwater program functions. Local jurisdictions need to develop and implement local stormwater infrastructure fees (based on the amount of impervious surfaces or similar mechanism) both to generate sufficient funds for infrastructure improvements and stormwater retrofits, as well as to fund ongoing inspections and maintenance of urban and suburban stormwater facilities. Much of the future TMDL implementation will fall on local governments; they therefore, must be prepared to pay for necessary upgrades, retrofits, and restoration work.

Unfortunately, current statutory authority which allows local governments to impose such fees has largely been unutilized. The State must require the creation of local infrastructure revenue streams. The time has come for the state to legislatively require local jurisdictions with stormwater responsibilities to create local stormwater infrastructure revenue streams through an impervious surface fee or similar assessment of a user fee. Such a state requirement would ensure all jurisdictions have resources to help meet stormwater management requirements, while ensuring modest parity among jurisdictions fearful of "going it alone." An additional "incentive" would be to directly tie State financial assistance - via grants, low interest loans, and technical assistance for stormwater infrastructure improvements, retrofits and related restoration work - to the establishment of a local stormwater revenue stream.

Develop a Nutrient Trading Policy for MS4 Permittees

The cost to reduce nitrogen and phosphorus from stormwater systems through retrofits is by far the expensive among all sectors. Recent analysis by the World Resources Institute indicates that nutrient trading could save MS4s hundreds of millions of dollars per year. [FN3] If MS4s could purchase nutrient credit portion of their waste load allocation, they could substantially reduce their compliance costs. The policy must be predicated on the protection and maintenance of local water quality and be constrained to segments if receiving waters are impaired, in order for MS4 permittees to participate in Maryland's Phase II (non-point source) trading programs.

Improve Stormwater Management from Smaller Jurisdictions and Active Construction Sites

Because untreated urban and suburban stormwater must be addressed in order to reduce pollution in existing developed areas, the draft WIP must detail the efforts Maryland will pursue to expand MS4 permit requirements in Phase II permits. Additionally, Maryland must expand the scope of the MS4 program to include smaller jurisdictions with populations of 5,000 - 10,000. Many of these communities lack stormwater management and may represent meaningful opportunities for restoration and retrofits. Adding a requirement in Phase II permits to retrofit 40% of untreated impervious acres by 2020 should also be included in the TIP.

In addition to expanding stormwater treatment to even smaller areas of existing development, Maryland must also make significant improvements in their existing General Construction Permit in order to reduce sediment and nutrient pollution from active construction sites. General Permit requirements need to include clear rules for phased site grading, and much more rapid site stabilization than the current 14-day stabilization, as requirements for buffers on all active construction sites. In this regard, mandatory sediment and nutrient control requirements would go a long way toward addressing a significant source of sediment and nutrient, Maryland's impaired waterways.

Improve Nutrient Management Planning and Implementation

The recent draft report by the U.S. Department of Agriculture highlights that although progress has been made on reducing sediment, nutrient, and pesticide losses from farm fields through conservation practice implementation in the Chesapeake Bay region, a significant amount of conservation management still needs to be done to reduce nonpoint agricultural sources of pollution. [FN4] Specifically, the report indicates that significant improvement is still needed in nutrient management (proper rate, form, timing, and method of application throughout the region). About 81 percent of the cultivated cropland acres require additional nutrient management to reduce the loss of nitrogen or phosphorus from fields. The most critical conservation concern in the report is loss of nitrogen through subsurface pathways, most of which eventually contribute to stream loads. This highlights not only the importance of cover crops, but also the need for Maryland to receive assistance to address the "bottleneck" for the development of comprehensive nutrient management plans for concentrated animal feeding operations. Maryland must devise a detailed strategy for achieving compliance and enforcement of these applicable state and federal regulations.

Require Cover Crops on Priority Acres to Achieve Annual Goal

Maryland is assuming substantial nitrogen reductions from the agricultural sector will come from planting cover crops on more than 300,000 acres each and every year. The Draft WIP outlines two scenarios for cover crop implementation - 355,000 or 500,000 acres annually - but includes no details of necessary programmatic or regulatory changes to achieve either. Without such details on enforceable or otherwise binding mechanisms, the draft WIP fails to provide the required reasonable assurance that the state can accomplish the outlined reductions from cover crops. In recent years, the Maryland Department of Agriculture (MDA) has increased per acre payment opportunities to incentivize early planting, planting of preferred grains, and cover crop planting after manure in order to maximize cover crop implementation. [FN5] However, this incentive-driven, voluntary program still struggles to increase participation to current 2-year Milestone levels of implementation (325,000 acres/year by 2011); therefore, the state needs to look beyond voluntary or purely incentive-driven programs.

Maryland must change its approach to implementing cover crops. Cover crops must be required on acres most at risk for nitrogen loss as a mechanism for raising rates of implementation and targeting limited cost-share dollars where the greatest environmental benefits can be gained. At a minimum, cover crops must be: required for fields after corn and on acres that have received manure. These scenarios currently are eligible for bonus payments under the cover crop program because they represent the best opportunity for residual nitrogen uptake by a winter crop which would likely otherwise be lost to the environment. Roughly 470,000 acres of corn were planted in 2009 [FN6] suggesting such a strategy of requiring cover crops on targeted high-risk acres could achieve annual implementation goals. Maryland's Water Quality Improvement Act and its implementing nutrient management regulations could be amended to require cover crops under specific circumstances, as an element of sound nutrient management. Only by amending the state law and regulations will Maryland have an enforceable mechanism to ensure that nutrient reductions could be counted on. Cost-share should remain available to these acres to help defray costs, but if necessary, per acre payments should be reduced to a level that would allow the state to offer financial assistance to all high risk acres.

Require Riparian Buffers Statewide

Buffering waterways is one of the most important ways to reduce nitrogen pollution of Maryland's rivers and streams. Maryland's Tributary Strategies recognize this by collectively calling for more than 93,000 acres of forested and grassed buffers on farm land, as well as fencing more than 11,000 acres of stream to prevent livestock access, and subsequently allow vegetation to reestablish and protect the streams. Unfortunately, progress on Maryland's first

Milestone goals for forested and grassed buffers does not reflect the importance of these practices; as of May 2010, the state had met only 8% of its forested buffer milestone (245 of 3,000 acres) and about 17% of its grassed buffer milestone (1,196 of 7,000 acres). [FN7]

Maryland should require buffers on ALL streams statewide, both on farms and developed land, and costshare funding to buffer implementation where they currently do not exist. Buffers provide long-term efficient nutrient reduction and stretch the benefits of limited cost-share dollars beyond a single year. Furthermore, buffers provide myriad environmental benefits including habitat, stream temperature (in forested buffers), nutrient removal (2-8 times the nitrogen removal) via in-stream processing (fore) [FN8] and carbon sequestration.

The state must maximize use of the Conservation Reserve Enhancement Program (CREP) and Maryland Agricultural Cost Share (MACS) Program to implement and maintain buffers on farm land, especially adjacent to impaired waterways and on highly erodible lands. An opportunity for achieving greater retention and restoration on developed lands would be upgrading the Forest Conservation Act (FCA) to a "no net loss" standard, by increasing mitigation requirements and targeting additional plantings to riparian areas. To achieve such a target, the FCA could be amended to allow a higher "credit" assignment to reforestation or afforestation of riparian areas than reforestation or afforestation that takes place away from streambeds. Fees-in-lieu collected through FCA mitigation should also be focused on replanting riparian forest areas as well.

Require Phosphorus-Based Management that Protects Water Quality

It is widely recognized that current use of the P-Index in Maryland is not adequately protective of water quality, especially in areas of high animal concentration, notably the lower Eastern Shore. As currently utilized, Maryland's P-Site Index allows for additional phosphorus to be applied to P-saturated soils. Phosphorus-based nutrient management must protect water quality, be reasonably simple to understand and implement, and balance manure use with crop removal.

A top priority must be placed upon the current WIP recommendation to reevaluate and revise the current P-Index to incorporate the best available science and more appropriately identify the risk for phosphorus movement from cropland. Reevaluation of the threshold that currently triggers required use of the 4R parallel necessary action. In Maryland, use of soil fertility values of 150 or greater may result in greater P losses from soils with lower soil test phosphorus levels [FN9]. Maryland should also work with the other states to determine an appropriate schedule under which the region can transition to a phosphorus-based management more sustainable approach. Ultimately, the goal must be to balance manure applications with crop removal on all farms in the Bay watershed.

2. THE WIP MUST BETTER ACCOUNT FOR AND LIMIT NUTRIENT LOADS FROM GROWTH

First reduce, and then require offsets for ALL remaining incremental increases in pollution

The use of a separate "Future Allocation" for accommodating new growth is contrary to the entire TMDL and WIP goal of reducing and capping pollution. Future Allocation transfers the burden of pollution reduction to other sectors and presupposes success. A separate Future Allocation also places infill and Smart Growth at an artificial disadvantage. The concept of Future Allocation must not be included in the WIP. All urban sources, both existing and new, need to be classified in a single sector and be held accountable for the nutrient reductions needed in the watershed. Furthermore, the methods for tracking the impact of growth must be uniform across local jurisdictions and publicly accessible in a

single location coordinated by the state.

In contrast, the inclusion of offsets, with forest as the baseline, for pollution loads associated with growth, is a positive element of the draft WIP. The draft WIP appropriately lays out a concept that differentiates between growth that occurs in higher density areas with low per capita load potential, versus growth that occurs in more remote, less dense areas where per capita pollution loads are higher, provided that high-per-capita loads are offset at a ratio of at least 2:1. Criteria for designating mid-per-capita areas, consistent with the criteria for designating Priority Funding Areas, are an additional necessary element. This model, combined with the 2007 Stormwater Management Act and implementing regulations which set different stormwater management standards for redevelopment versus green field development, will strengthen the state's foundation for smart growth.

However, the proposed policy is incomplete without concerted efforts to first prevent and minimize new pollution loads associated with growth, prior to considering and awarding offsets. Combined, new development and septic systems are projected to add 2.2 million pounds of nitrogen to Maryland's portion of the watershed by 2020 - a significant portion of Maryland's total projected "gap" in nutrient reductions. In this context, the WIP's use of offsets as the rimar means to control the impacts of growth is insufficient for the following reasons:

- offsets place little responsibility on local government to modify future land use plans to benefit water quality;
- offsets are not expected to be widely available in the near term;
- over the long term, offsets may become more attractive than on-site minimization and treatment of pollution, to the detriment of nutrient reduction efficiency and local environmental quality; and
- contingencies are not delineated for situations where offsets are unavailable.

The WIP needs to limit the use of offsets by prioritizing prevention and on-site load reduction as the primary way to address proposed new loads due to growth. After minimizing new loads, on-site treatment should be instituted to the maximum extent practicable. Only after this sequence of avoidance and minimization is exhausted, should offsets be allowed to be used. In addition to this offset "sequencing", the actions outlined below (and in the prior section on buffers) should be taken to ensure that new loads from growth are efficiently and effectively controlled.

Furthermore, Maryland must outline how offsets will be handled in the interim three years while it the offset program. During this interim, Maryland must effectively manage offsets from new loads ass ith growth in an enforceable manner.

Curtail the Use of Septic Systems for Large New Development

There are more than 430,000 septic systems in Maryland, and new traditional systems are added estimated 7 percent (3.6 million pounds per year) of the total nitrogen load in Maryland comes for systems. New septic systems are, collectively, a substantial annual new source that is currently not to be offset or otherwise mitigated, and most are not even required to use Best Available Technology ir nitrogen removal. Based on current growth trends, Maryland's Department of Planning (MDP) pr it 145,000 new septic systems will be added over the next 20 years, resulting in a 34-percent increase en loads from septic systems in Maryland. [FN10]

The State must commit to limiting new development on septic systems by legislatively prohibiting f septic systems to serve new major subdivisions. Major subdivisions belong in designated growth a re they can be served by centralized sewer. Any new major subdivisions to be built outside of central r service areas must utilize centralized collection and

treatment processes that improve nitrogen removal in traditional septic systems and include routine maintenance and operation by a trained, responsible, system should be sized to serve only the proposed project, and must be consistent with the local jurisdiction's approved master plan for water and sewerage. Maryland cannot continue to allow sprawl development of septic systems for a number of reasons, not the least of which is that it equates to an end-run around nitrogen source caps on wastewater treatment plants.

Cap Septics at 2010 Loads

Non-point source loads associated with a county's septic systems must be assigned an "allocation" or a cap based on the number of systems in service in 2010. County master plans for water and sewer describe how the county intends to maintain the allocation and operate a program to offset nitrogen loading in accordance with the state's guidance on trading and offsets. By tying this allocation to local water - planning, local jurisdictions will have a meaningful tracking mechanism as well as flexibility for when implemented. By establishing this effective "cap" any new septic system installed would have the same load, just as a new wastewater facility would have to.

Require All New Septic Systems to Utilize Nitrogen-Reducing Technology

Traditional septic systems rely largely on technology that is more than 100 years old. When improvements are made to homes, modern building codes must be considered, and systems must often be "upgraded" with more advanced standards for health and safety. Why, then, should Maryland continue to allow the routine replacement of failed septic systems with antiquated technology that pollutes surface and groundwater, and threatens public and environmental health? Maryland's WIP must include new requirements that any new onsite system and all replacement septic systems must be required to include nitrogen removal technology.

3. REVISIT AGRICULTURAL OPTIONS FOR NITROGEN REDUCTIONS

Focus "Gap Closers" on Practices with Known Nitrogen Removal Efficiencies

The Draft WIP suggests that even the "accelerated" Milestone rates of implementation of agricultural practices will result in a "source sector gap" of 1.4 million pounds of nitrogen, if outlined levels of implementation of cover crops and other practices are achieved annually. The draft WIP outlines a series of options that might be utilized to address this sizeable sector gap. Unfortunately, many of these options are largely untested and have no verified nitrogen removal efficiency data associated with them. Such a large pollution reduction gap would be better addressed through more aggressive implementation of practices with reliable nitrogen reduction efficiencies. Furthermore, the draft WIP lacks sufficient details on the gap-filling strategies, so there is no way to know if, as outlined, the strategies will meaningfully reduce nutrient pollution loads from the agricultural sector.

Generally speaking, the agricultural sector strategy needs to increase rates of implementation for most of the practices currently listed at, or slightly higher than, current 2-year milestone rates. It is precisely these practices - including fencing cattle from streams, planting buffers, building poultry litter storage facilities, and employing conservation tillage - that can be easily incorporated into current funding programs and farm operations. These practices meet multiple objectives on most operations, and have been undertaken routinely within Maryland, with known costs and outcomes.

Increasing rates of implementation will not be without challenges, most notably in technical and financial assistance.

The State should address these problems now by identifying and securing additional revenues and determining how to meet the statutory requirement to fully fund Soil Conservation Districts with technical personnel. One idea to provide additional financial resources would be to model a transferrable tax credit program in Maryland after Pennsylvania's successful Resource Enhancement and Protection (REAP) Program, which can incentivize private sector investments in agricultural conservation.

In order to accelerate implementation of some of these practices, Maryland must also look to the use of flexible standards. For example, it was clearly stated at the statewide WIP public meetings that farmers generally want to fence cattle from waterways because of the dual benefits of improved stream and livestock health. In many cases, minimal fencing is necessary to complete the job (2-strand wire versus USDA-recommended 5-strand fencing) and more modest fencing can be more attractive to farmers who rent the land they farm. CBF routinely works with farmers in central Maryland to implement such fencing projects, but these exclusions currently do not "count" toward nutrient reductions in the Bay model. Use of more flexible standards, only where appropriate, can be a cost-effective way of stretching limited cost-share funding and increasing implementation rates simultaneously.

Use of Innovation

Innovative approaches to meeting the challenges of nutrient reduction in our agricultural sector are ingredient of a successful WIP. One such innovative approach that is not currently included in the i is the conversion of marginal crop land to permanent vegetative cover. The benefits of permanent vel cover, including hay, pasture, and specialty crops such as orchard trees, vineyards, or perennial gra energy production, can not be over-stated. Covers such as hay or pasture grasses, require much lower inputs, and in the case of hay, could be highly valuable to Maryland's growing equine industry.

This kind of permanent cover can be undertaken as a whole-farm transition to a different farm syst, an opportunity for diversification on existing grain land, with hay or grasses grown on marginal land. supports the use of funds from the current cover crop program to support these kinds of transitions ient cover, as a related practice that has longer-term benefits for a farm.

We, the undersigned poultry producers, would like to take this opportunity to encourage EPA and the individual states affected by the Chesapeake Bay TMDL to consider amending the planned activity item in the Maryland Watershed Implementation Plan: Summary Table of Actions described as Poultry Litter Treatment We respectfully request that all commercially available Litter Amendments be accepted and included as BMP's for mitigating ammonia and Phosphorus from Poultry farms.

These amendments include: Klasp™ PLT™ and Poultry Guard™

These amendments have been proven to be effective and have been accepted by NRCS for EQIP cost share by several of the states affected by the TMDL. Scientific data is readily available and we, as producers, have utilized these amendments and found them to be effective at reducing ambient ammonia release and binding phosphorus in the litter.

Maryland: Conservation Practice Fact Sheet Recommendations for Poultry Acidifying Litter Amendments I[Code 591] - AMENDMENTS FOR THE TREATMENT OF AGRICULTURAL WASTE, October 2008.

Virginia: Fact Sheet - Conservation Practice Standard Amendments for Treatment of Agricultural Waste (Code 591)
Virginia Conservation Practice Standard 591 Amendments for Treatment of Agricultural Waste.

DELAWARE CONSERVATION PRACTICE STANDARD Amendments for Treatment of Agricultural Waste (Code 591).

Additionally, individual circumstances dictate we have the ability to use all of the tools available so that we may do our part in reducing agriculture's impact on the bay.

We strongly encourage you to add, include, or otherwise amend the Chesapeake Bay and state TMDL's so we may utilize these proven effective amendments.

I am a big supporter of clean water, in the Chesapeake Bay and in my community. For years Maryland has worked to clean our waters but progress has been painfully slow. Now, with the development of the state's first Watershed Implementation Plan, the EPA has the opportunity of a lifetime to ensure the establishment of effective programs, incentives and penalties to finally clean-up the Chesapeake Bay and its tributaries.

Although Maryland received a passing grade on its plan from the EPA, citizens need assurance Maryland's proposal will become a reality. The EPA must require the state to detail how it intends to implement the plan. For example, the state must address the "funding gaps" and "new regulatory/legislative changes" necessary to meet plan goals.

Dear Gov. O'Malley,

Thank you for your leadership in this unprecedented opportunity for clean water. Your draft clean-up plan was promising, and now I urge you to submit a strong final plan on Nov. 29th.

The final plan should include these strong proposals from the draft: revising the question of when farmers should put manure on their land, updating more waste water treatment plants, retrofitting up to half of covered surfaces in the largest counties, and requiring upgrades of stream-side septic systems throughout the state.

The plan should include more mandatory measures rather than continuing our over-reliance on the voluntary approach. For instance, the plan should require cover crops on fields where manure is applied, to help manage the 600 million pounds of chicken manure created annually in Maryland.

The plan should require enforceable limits on all sources of pollution, and it should provide details on how the state will fund, implement, and enforce every proposal.

20.6 - DISTRICT OF COLUMBIA

Comment ID 0185.1.001.015

Author Name: Steinzor Rena

Organization: Center for Progressive Reform (CPR)

District of Columbia

Overall

The District of Columbia is unique among Bay watershed jurisdictions because nearly all of its sources of pollutants are point sources and covered by National Pollutant Discharge Elimination System (NPDES) permits, administered by EPA Region 3. Nonpoint sources of pollutants contribute very little to water impairment. For transparency of information, the District of Columbia discloses an average amount of information. For strength of program, the Bay TMDL allocations should be written into the NPDES permits for the District's point sources.

The District's draft WIP would lower nitrogen and phosphorus discharges to a level that is 5 percent below the respective target allocations. However, the draft WIP still permits sediment discharges to be 26 percent more than allowed by the target allocation.[FN 10]

In the final Phase I WIP, the District should discuss in greater detail its pending stormwater permit, including the programs and elements that will reduce stormwater runoff and nutrient and sediment discharge.

NPDES Permitting

The draft WIP indicates that all facilities that require NPDES permits have them or are in the process of renewal.[FN 11] EPA Region 3 is the permitting authority for the District. DC Water, a semiautonomous regional entity, holds a combined permit for the Blue Plains Wastewater Treatment Facility and the District's combined sewer system. Upgrades to these systems are specified as permit conditions or as a result of consent decrees, and the draft WIP lays out a timeline for upgrades and the resulting pollutant reductions. If implemented as planned, the District's nitrogen and phosphorous targets will be met.

Enforcement of NPDES Permits

The draft WIP indicates that both major and minor facilities are inspected on an annual basis. EPA Region 3 has enforcement authority to ensure compliance with the permit conditions. However, the draft WIP does not disclose specific information related to enforcement and compliance efforts. In the final WIP, the District should disclose this information to substantiate its claims and should also explain its procedures for ensuring compliance.

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

This section does not apply to the District of Columbia, which will meet its Bay TMDL allocations through point sources.

Contingencies

Again, this section does not apply to the District because most of the pollutant sources are point sources that are subject to NPDES permits and mandatory consent decrees and other federal regulations with specific deadlines for compliance.

Concentrated Animal Feeding Operations

This section does not apply because the District does not have any CAFOs.

Stormwater

The District's 2004 MS4 permit expired in August 2009 but has been administratively extended, pending finalizing of the 2010 MS4 permit. The 2004 permit is missing numeric effluent limitations and has been subject to litigation, resulting in upgrades to the District's stormwater management plan and upgrades in the 2010 permit. The WIP specifically refrains from discussing the draft 2010 permit because it has not been issued. Because the District is relying solely on this permit to achieve its reductions for the stormwater section, the final WIP should discuss the permit in greater detail, addressing the legal tools, staffing resources, and financial resources needed to require the use of low-impact development and green infrastructure practices and estimates of pollutant reductions from using these practices.

Air Deposition

The District does not attribute any of its nitrogen loading to air deposition. Thus the draft WIP does not include this discussion.

[FN 10] U.S. E.P.A., "Summary: EPA Evaluation of District of Columbia Draft Watershed Implementation Plan" (Sept. 22, 2010) (on file with Yee Huang).

[FN 11] The draft WIP notes that the "District is not aware of additional sources that require (but lack) NPDES permits."

C. The reserve for growth should not be listed as separate WLAs in the Bay TMDL.

Table 1 in the Draft WIP distributed a portion of the WLAs assigned to Outfall 002 to a reserve for growth (see draft WIP, page 18, Table 4). Because this reserve could be construed to restrict DC Water's ability to use all of the WLAs distributed to Outfall 002 to serve the District's current flows to Blue Plains, DC Water has asked DDOE to include in the final WIP the WLAs now distributed to the reserve in one total distribution to Outfall 002. The District is already using all of its capacity in Blue Plains. Consequently, the District's current flows would have to be restricted if the approximately 13 MOD of capacity reflected in the reserve for growth in Table 4 of the Draft WIP was subtracted from the District's capacity allocation. Therefore, it is important to DC Water's ability to serve the District's current flows to Blue Plains that the Bay TMDL include the WLAs for Outfall 002 in one total distribution to Outfall 002. In other words, the final TMDL should not include a separate distribution reserved for growth.

The IMA flow allocations listed in Section B above for the Blue Plains user jurisdictions already include capacity for growth and under the provisions of the IMA, any additional allocation for the District would be obtained by off-loading flow from a Maryland or Virginia user because there are no plans to expand Blue Plains beyond 370 mgd IMA capacity.

Response

The Final WIP and input deck allow for a reserve to accommodate potential growth and/or additional flows that the District may contribute to Blue Plains. The WIP does specify that DC would negotiate with other partner under the Inter-jurisdictional Municipal Agreement (IMA) in the event additional flows are needed to accommodate growth at Blue Plains.

[The document submitted was partially illegible along the right margin. The text below has been reproduced to the greatest extent possible. See EPA-R03-OW-2010-0736-0732 for a copy of this document.]

Comments from the Chesapeake Bay Foundation on the District of Columbia's Draft Watershed Implementation Plan November 8, 2010

On behalf of the Chesapeake Bay Foundation's (CBF) more than 200,000 members please this letter as formal comment on Draft Chesapeake Bay TMDL Watershed Implementation District of Columbia Department of the Environment, September 1, 2010. Also, we incorpc by reference the comments submitted by CBF, Boesch, et al., and the Choose Clean Water Coalition to Administrator Jackson on November 8, 2010, Docket no. EPA-R03-OW-2010-0736.

We very much appreciate the dedication of the many District agency staff that contributed t draft Watershed Implementation Plan (WIP). We also appreciate and acknowledge efforts currently underway to upgrade the Blue Plains

Wastewater Treatment Plant and to implement Long-term Control Plan that will reduce pollution associated with combined sewer overflow. Unfortunately, the draft WIP falls short in achieving the necessary load allocations for sediment called for in the draft Chesapeake Bay Total Maximum Daily Load (TMDL) and providing reasonable assurance of achieving pollution reductions from urban stormwater runoff.

As you know, the process of developing the Bay-wide TMDL actually began over a decade with a series of federal judicial consent decrees and settlement agreements over impaired water listings for many watershed states. See *American Canoe v. EPA*, 54 F. Supp. 2d 621 (E.D. 1999); *Kingman Park Civic Ass'n v EPA*, 84 F.Supp. 2d 1, 2 (D.D.C. 1999). On June 28, 2002 the governors of Virginia, Maryland, and Pennsylvania, the chair of the Chesapeake Bay Commission, and the Mayor of the District of Columbia responded to the various decrees and agreements by signing, with the EPA Administrator, Carol Browner, the Chesapeake 2000 agreement which, among other things, committed to reduce nitrogen, phosphorus, and sediment sufficiently to remove the Bay and its tidal tributaries from the impaired waters lists by 2010.

In December 2003, the EPA, the District of Columbia, and the other Bay jurisdictions agreed to the nitrogen, phosphorus, and sediment allocations that became the basis for "tributary strategies," designed to remove the Bay and its tidal tributaries from the impaired waters list by 2010. The District of Columbia issued its own tributary strategy in 2004. [FN1] Unfortunately, the Bay and many of its tidal waters were not de-listed, triggering the need to develop the Bay TMDL - a process in which the District has been a full and cooperative participant.

To restore water quality in the Anacostia and Potomac Rivers, and, ultimately, the Chesapeake Bay, we strongly encourage the District to address the deficiencies EPA identified in the District's draft WIP [FN2] and provide the necessary details, consistent with EPA's correspondence to the Principals' Staff Committee of September 11, 2008, November 4, 2009, and April 2, 2010.

The District's responsibility to develop an adequate WIP that meets the Bay TMDL allocations and provides reasonable assurances of required pollution reductions is founded on the firm requirements of federal law.

The Clean Water Act (CWA or Act) [FN3] provides the basis on which the draft WIP must be evaluated. Enacted in 1972 to compel the restoration of the nation's waters, [FN4] the CWA requires the states to establish water quality standards and to take the necessary actions, including those by upstream states, to ensure that the waters meet those standards, thereby achieving CWA's goals. [FN5] If a state does not promulgate water quality standards or falls short of CWA requirements in doing so, EPA will set the standards for the state. [FN6] The CWA prescribes the use of technology-based effluent limitations for most point sources discharges [FN7] and, if those measures do not achieve water quality standards, the Act requires the use of water quality-based controls under Section 303(d). [FN8]

The draft WIP forms part of the CWA's § 303(d) TMDL program, which requires identification and listing of all impaired water bodies within a state's borders. For each listed segment, Section 303 and implementing regulations require the state to establish a TMDL for specified pollutants. [FN9] A TMDL is the maximum amount of a pollutant -- from background, point and nonpoint sources, together with a margin of safety -- that the water body can receive and still attain water quality standards. [FN10] When triggered by CWA requirements, the states and EPA are required to establish a TMDL, as courts have recognized. [FN11]

Once a TMDL is established and approved by EPA, the affected states must adequately implement it to ensure water

quality goals are attained. See *Sierra Club v Meiburg*, 296 F.3d 1021 (11th Cir. 2002). Thus, CWA § 303(e)(1) requires each state to have a continuing planning process that results in implementation plans for all navigable waters within state boundaries, which include effluent limitations and compliance schedules as required, § 303(d) TMDLs for pollutants, and "adequate implementation, including schedules of compliance, for revised or new water quality standards," including those of downstream states. [FN12] Resort to a TMDL is the CWA's "backup" strategy for achieving water quality standards; it is invoked when point s permits and best management practices (BMPs) for non-point sources (NPS) have not succeeded. [FN13] Accordingly, EPA may only approve a state-submitted implementation plan t provides assurances it will succeed in "implement [ing] applicable water quality standards." [FN14]

What constitutes reasonable assurances will vary depending on the water body and the poll sources at issue. [FN15] Most, if not all, of the pollution loads coming from the District fall under National Pollutant Discharge Elimination System permit which provides a foundation for providing reasonable assurance. The District, however, must ensure the final WIP achieve necessary pollution reductions and sets a timeline for achieving them by the 2017 and 2025 implementation deadlines.

20.7 - DELAWARE

Comment ID 0185.1.001.014

Author Name: Steinzor Rena

Organization: Center for Progressive Reform (CPR)

For the transparency of information evaluation, Delaware's draft WIP is well-organized and uses a consistent format for each sector that makes finding information easy. Delaware touches on each of the required elements but does not explicitly disclose all the information listed in EPA's guidance. For the strength of program evaluation, Delaware does not provide sufficient detail to verify its claims or provide assurance that its allocations will be achieved.

The draft WIP would lower sediment pollution to a level that is 20 percent below the target allocation. However, the draft WIP still permits nitrogen and phosphorous discharges to be 17 and 8 percent, respectively, more than the level allowed by the target allocation. [FN 6]

In the final Phase I WIP, Delaware should provide more detailed information on its NPDES permitting, enforcement, and compliance programs and make stronger commitments to implementing pollutant control measures in all sectors to achieve the Bay TMDL.

NPDES Permitting

For nearly every sector, the draft WIP states that 100 percent of facilities subject to NPDES permits have those permits but does not provide the specific number of facilities. This information also does not reveal which of these facilities have up-to-date permits and which have expired or administratively continued permits. The draft WIP does not contain any schedules or commitments for updating expired permits, nor does it disclose when all permits will be made consistent with the Bay TMDL.

In the final WIP, Delaware should not only point to programmatic needs but also to personnel and financial gaps and provide a plan for filling those gaps. For example, the wastewater section notes that current staff levels are "insufficient to keep up with permit issuance demands" but does not specify what additional staff are needed and how the state may acquire funds for new staff.

Enforcement of NPDES Permits

The draft WIP contains some information regarding inspections but not enough to determine whether Delaware is operating an effective, deterrence-based enforcement program in each sector. For example, the WIP states that "all of the major and half of the minor permitted wastewater facilities are inspected/audited on an annual basis." The WIP also states that compliance and participation rates are 100 percent for wastewater treatment plants and "[n]o additional regulatory or enforcement authorities are needed to meet these rates." However, the WIP fails to provide information to substantiate these claims, which if true are remarkable. Without providing additional details regarding the number of onsite inspections versus paperwork audits or the inspection protocol, assessing the enforcement program is difficult.

In the final WIP, Delaware should include complete enforcement data, including: the number of physical, onsite inspections per sector; the number of violations and penalty actions and the amount of penalties assessed during the past year; a description of the enforcement activities by local governments with delegated authority; and a detailed picture of enforcement resources. Collectively this information would allow a better understanding of how Delaware's NPDES permit enforcement program functions.

Monitoring and Verifying Voluntary Practices by Nonpoint Sources

The draft WIP provides some information regarding specific procedures and resources for assuring participation by unregulated nonpoint sources in actions to reduce pollutant discharges. The draft WIP also lists programs and their past and future funding levels. Programs such as the Agricultural Management Assistance Program and the Wetland Reserve Program are largely voluntary and provide cost-share assistance. These programs have very limited resources: 0.2 and 3.5 technical and staff positions, respectively, and annual budgets of \$60,000 and \$215,000. Moreover, the overall list of voluntary programs does not identify gaps in resources or how these gaps may be filled.

In the final WIP, Delaware should provide greater detail about actual participation rates and the method to ensure that pollutant control practices are in place, maintained, and functional. Delaware should also identify specific programmatic gaps and how they will be filled.

Contingencies

Compared to other states' submissions, the Delaware draft WIP contains fairly detailed contingencies. For example, wastewater facilities may be required to upgrade to higher levels of nutrient removal, up to the best available technology. However, the weakness in these contingencies is the lack of commitment to implement them; the draft WIP does not specify a timeline or cite resources for implementing these contingencies.

In the final WIP, Delaware should establish a timeline for identifying failures of primary controls and implementing contingencies. For example, Delaware could commit to periodic checks of the primary controls that coincide with the two-year milestones.

Concentrated Animal Feeding Operations

According to the draft WIP, Delaware's CAFO program was updated in Fall 2010 to be consistent with the new federal regulations. However, the draft WIP did not indicate if and when the relevant CAFO permits will be issued or updated to

be consistent with both the Bay TMDL and the updated regulations. Delaware should also provide more information regarding its CAFO compliance and enforcement program, including inspection frequency, compliance rates, and enforcement activities and penalties.

Stormwater

The draft WIP cites high permitting and inspection rates for portions of Delaware's stormwater program. However, the WIP fails to provide sufficient information to verify these rates, and EPA has expressed its skepticism of these rates.[FN 7] The WIP does not disclose the extent of a local government's delegated authority to conduct inspections, which is important information because stormwater permits are often administered by local authorities.[FN 8] The WIP identifies the need for more resources to administer an effective stormwater program but fails to specify quantified numbers or how Delaware will fill these needs.

In the final WIP, Delaware should provide more information to substantiate the high levels of permitting and should further specify needs to ensure that its stormwater program will meet the requirements of the Bay TMDL.

Air Deposition

Delaware's section on air does not discuss the state authorities available to control air emissions. However, the draft WIP states that there is "little left" in Delaware's regulatory arsenal to further reduce nitrogen pollution from regulated sources and that, even if more stringent controls were identified, Delaware would see little impact due to the location of sources and climatic patterns.[FN 9] As a result, Delaware would like to see EPA tighten federal rules under the Clean Air Act to reduce the air pollutants that reach the state from surrounding states. Because Delaware does not disclose information about its state air program, its claim that there is "little left" is difficult to evaluate. In the final WIP, Delaware should disclose more information that would allow a better evaluation of its program.

Comments from the Chesapeake Bay Foundation on Delaware's Draft Watershed Implementation Plan
October 29, 2010

First, we would like to sincerely commend and thank Delaware for being a willing and cooperative partner in the restoration of the Chesapeake Bay and its tidal rivers. Most notably, during the last several years of technical work on the Chesapeake Bay Total Maximum Daily Load (TMDL) and associated implementation plan, Delaware has consistently expressed a willingness to do its share. In a press release, dated May 29, 2009, Governor Markel and agency heads affirmed their commitment to accelerate cleanup of the Chesapeake Bay to achieve full implementation by 2025 and to increase government accountability. That said, we agree with the Environmental Protection Agency's (EPA) September 24, 2010, assessment of Delaware's draft Watershed Implementation Plan (WIP) and strongly encourage the state to address those identified deficiencies in their final plan.

Although Delaware represents only a small portion of the Bay watershed, it contains the headwaters of many eastern shore rivers and these areas have a relatively high impact on water quality in the Bay. Many of these rivers and streams are themselves impaired, so progress to restore the bay and its tributaries will also lead to improvements to Delaware's waterways. In fact, the state's integrated report suggests that TMDLs will be developed for many of these waterways by 2010. ([http://www.wr.dnrec .delaware.gov/Information/OtherInfo/Documents/2008%20Combined%20Watershed%20Report.pdf](http://www.wr.dnrec.delaware.gov/Information/OtherInfo/Documents/2008%20Combined%20Watershed%20Report.pdf)).

In addition, as indicated in Appendix F of Delaware's draft WIP, there are significant economic benefits associated with this region. Preliminary estimates indicate goods and services in the Delaware portion of the Chesapeake Bay watershed contribute over \$1 billion in annual economic activity, is directly/indirectly responsible for over 47,000 jobs, has an annual ecosystem value of natural goods and services of at least \$3.1 billion, and water supplies are worth at least \$50 million for treated drinking water and \$18 million for irrigation. Hence, protection and restoration of water quality in this area will serve to increase these economic benefits.

As you know, the process of developing the Bay-wide TMDL actually began over a decade ago with a series of federal judicial consent decrees and settlement agreements over impaired water listings for many watershed states, including Delaware. (*American Littoral Society v. EPA*, No . 96-330 (D. DE)). On June 28, 2000, the governors of Virginia, Maryland, and Pennsylvania, the chair of the Chesapeake Bay Commission, and the Mayor of the District of Columbia responded to the various decrees and agreements by signing, with the EPA Administrator, Carol Browner, the Chesapeake 2000 Agreement which, among other things, committed to reduce nitrogen, phosphorus, and sediment sufficiently to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. In the fall of that same year, Governor Tom Carper of Delaware signed a formal agreement to work with the other jurisdictions to "achieve the nutrient and sediment reduction targets . . .to achieve the goals o a clean Chesapeake Bay by 2010."

In December 2003, the EPA, Delaware and the other Bay jurisdictions agreed to the nitroge phosphorus and sediment allocations that became the basis for "tributary strategies," designed to remove the Bay and its tidal tributaries from the impaired waters lists by 2010. The failure to achieve that goal triggered the need to develop the Bay TMDL - a process

in which Delaware has been a full and cooperative participant.

Consistent with EPA's letters to the Principals' Staff Committee of September 11, 2008, November 4, 2009, and April 2, 2010, we strongly encourage the state to provide the necessary details in their WIP for how they will achieve the necessary reductions, particularly from agriculture, which contributes the vast majority of Delaware's sediment, phosphorus and nitrogen loads to the Bay. The recent draft report by the U.S. Department of Agriculture (USDA) highlights that although progress has been made on reducing sediment, nutrient, and pesticide losses from farm fields through conservation practice implementation in the Chesapeake Bay region, a significant amount of conservation treatment remains to be done to reduce nonpoint agricultural sources of pollution. (USDA October 2010. Assessment of the Effects of Conservation Practices on Cultivated Cropland in the Chesapeake Bay Region) Specifically, the report indicates that significant improvement is still needed in nutrient management (proper rate, form, timing, and method of application) throughout the region. About 81 percent of the cultivated cropland acres require additional nutrient management to reduce the loss of nitrogen or phosphorus from fields. The most critical conservation concern identified in the report is loss of nitrogen through subsurface loss pathways, most of which eventually contribute to surface water loads. These conclusions affirm EPA's recommendations that Delaware should consider revising their nutrient management plan (NMP) regulations and identify the resources necessary to increase their NMP and concentrated animal feeding operation inspection programs to ensure compliance with state regulations. See also Water Quality in the Delmarva Peninsula, 1999-2001, US Circular 1228.

We also encourage the state to improve its WIP with respect to addressing loads from new septic systems. According to the draft WIP, loads from this source are expected to increase however, there are no specifics about how these loads will be tracked and offset. We also concur with EPA's comments regarding the need for more specifics about how reductions from existing urban areas will be achieved.

We sincerely hope that the final WIP submitted to EPA achieves the TMDL allocations for nitrogen, phosphorus, and sediment and provides sufficient "reasonable assurance" so as to avoid the need for EPA to invoke the "backstop" provisions.

20.8 - WIP EVALUATION METHODOLOGY

Comment ID 0126.1.001.020

Author Name: Craun Ed

Organization: Augusta County Farm Bureau

Nitrogen, Phosphorus and Sediment are the impairments of the waterways that this plan is seeking to control. Yet the impairments of our local watersheds are based on the measurement of E. coli and benthic microinvertebrates. Direct measurement of the targeted goals would seem to be a more accurate method of evaluating the results of the planned

implementation practices.

Response

The Bay TMDL only addresses the restoration of aquatic life uses for the Bay and its tributaries via nitrogen, phosphorus and sediment pollutants. Sediment itself can degrade water clarity in the Bay and can contain other pollutants as well. For example, E. coli often clings to sediment. By reducing sediment there will be reductions in phosphorus deliveries to the Bay and possibly other pollutants such as E. coli. However, EPA is not providing allocations for E. coli or other additional pollutants in this TMDL.

Organization: Binghamton-Johnson City Joint Sewage Board

Not surprisingly, after the draft WIPs were submitted, the EPA stated that many of them were significantly flawed, in the agency's view. If, as the EPA asserts, many of the draft WIPs are significantly flawed, this raises serious questions about the efficacy and viability of WIPs as tools to fulfill the TMDL.

Response

The WIP submitted by each jurisdiction are part of the accountability framework outlined in the Chesapeake Bay Protection and Restoration Executive Order 13508. EPA reviewed the WIPs considering the accountability framework that has been developed for the Chesapeake Bay TMDL, and imposed backstop actions in the draft TMDL for each jurisdiction because they did not submit draft Phase I WIPs that met EPA's expectations outlined in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction or meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. EPA believes that the established accountability framework for the WIPs will ensure that the TMDL is implemented. Further information on the accountability framework can be found in Chapter 7 of the TMDL report.

In addition, the final state WIPs have provide to be much improved from the drafts. This condiered, EPA has chosen to reduce or remove the backstop allocations. EPAs final decision on these backstop allocations can be found in section 6 of the TMDL report.

Organization: Pennsylvania Department of Transportation

On page 8-8, EPA found the stormwater section of the PA WIP to meet few expectations. PennDOT disagrees with this conclusion. PADEP just revised its regulations that administer the NPDES stormwater program. The revisions include standards for volume control, rate control, and water quality. The revisions also include a retrofit element by requiring

that 20% of existing impervious surfaces for redevelopment projects be considered meadow when evaluating the volume standards. It is PennDOT's understanding that EPA reviewed these revisions to ensure consistency with the NPDES program and approved these revisions. In reviewing the PA WIP, EPA did not give sufficient credit to these existing regulatory practices.

Response

The revised PA Chapter 102 regulations were reviewed and commented upon by EPA. However, they were never formally approved by the Agency. At the time of the submittal of the draft WIP, the regulations referred to in the above comment did not exist—they did not become effective until November 19, 2010; therefore Pennsylvania, by their own admission, chose not to elaborate or include in their WIP document the specific requirements that the new regulation would necessitate. EPA requested that PADEP provide greater detail in their final Phase I WIP to explain the requirements of the revised Chapter 102 to provide greater reasonable assurance that proposed reductions can be achieved. PADEP included this in their final Phase I WIP. The evaluation of the final Phase I WIPs for each jurisdiction can be found in Section 8 of the final TMDL report.

I sincerely appreciate the opportunity to provide comments to you regarding the referenced draft WIP. I have had the honor of serving as a member of the Stakeholder Advisory Group (SAG) you developed for providing input to you and your staff during the development of the draft WIP. It is unfortunate that the WIP development process was condensed into such a short period of time due to EPA's decision to complete this WIP process by the end of the year despite their ±6 month delay in delivering the load allocations to the Commonwealth.

The result is that the public has been done a disservice because there was not sufficient time for a WIP to be developed that is cost effective and that equitably shares the costs of cleaning up the Bay across society, yet these two criteria were the foundation of agreement by the Commonwealth of Virginia's SAG.

Author Name: Bowman Cynthia

Organization: Cornell Law School Water Law Clinic

With reference to AEM in its evaluation of New York's Phase 1 WIP, however, EPA takes the view that "high implementation rates [are] unlikely if [the state] relies on voluntary programs." [FN 8] This statement is clearly inconsistent with EPA's acknowledgement that New York's CAFO and AEM programs cover 95% of the dairy farms in the New York portion of the Chesapeake Bay watershed and that more than 12,000 farms statewide are involved in AEM. EPA incorrectly assumes that AEM participation is entirely voluntary. AEM is not entirely voluntary. In fact, permits for CAFO operations require Comprehensive Nutrient Management Plans (CNMPs), and the CNMP training and certification program is managed through AEM. [FN 9]

[FN 8] U.S. ENVTL. PROTECTION AGENCY, SUMMARY: EPA EVALUATION OF NEW YORK DRAFT WATERSHED IMPLEMENTATION PLAN 1 (Sep. 24, 2010), http://www.epa.gov/reg3wapd/pdf/pdf_chesbay/WIPEVALUATIONS/NYWIPEvaluationSummary_9222010Final.pdf.

[FN 9] "CNMPs are the foundation for the New York State Department of Environmental Conservation's environmental

regulatory program to control potential water pollution from CAFOs under State General Permit GP-04-04, and are also a requirement for farms seeking federal or state cost-sharing to construct a manure storage structures." New York State Soil & Water Conservation Committee, Comprehensive Nutrient Management Plan (CNMP) Guidance for Planners, <http://www.agmkt.state.ny.us/SoilWater/aem/cnmp.html> (last visited Nov. 4, 2010).

Response

EPA's comment on NY's AEM program reflects the need for NY to demonstrate that there is reasonable assurance that BMPs are being implemented and maintained on these operations. Participation in the AEM program does not necessarily mean implementation of BMPs, which are necessary to meet the TMDL nutrient reduction goals. NY's CAFO program requires oversight by NYDEC including inspections and annual reporting on compliance with the CNMP and the implementation and maintenance of BMPs by the farm owner or operator. State programs that do not include compliance assurance and enforcement programs are considered voluntary.

Author Name: Lyskava Paul

Organization: Pennsylvania Forest Products Association

2. State Flexibility - States must be given as much flexibility as possible within their WIP to meet the TMDL. Specifically, Pennsylvania should only be required to meet its gross load allocation, without also meeting specific geographic and sector load allocations. The situation outlined in our first comment provides sufficient evidence for why this flexibility is necessary.

Response

It was EPA's intention to provide such flexibility to the upland states including Pennsylvania. However, since the draft and final plan did not fully meet EPA's expectations, EPA has included sector and individual allocations to sources. However, it is EPA's professional opinion that adequate flexibility still exists in that states can modify their WIPs when appropriate and EPA may modify the TMDL in 2011 and 2017 if necessary.

Comment ID 0418.1.001.012

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

As a result of the notable failure of most draft WIPs to address shortcomings in their 2 Year Milestones, in evaluating the revised Phase I WIPS, EPA must demand that Bay States identify specific measures and commit to accelerate progress toward meeting these goals.

Response

20.9 - GENERAL/MISCELLANEOUS

Comment ID 0035-cp.001.002

Author Name: Bowman Daniel

Organization:

I will only make one direct comment that might help the Bay. Ban the purchase of soil fertilizers by private citizens and the use of commercial fertilizers by services on privately owned land. Maybe make some concession for golf courses but require a significant reduction. The only group that should be allowed to use fertilizers are farmers and those need to have strict controls with monitoring of outflows.

Response

EPA appreciates your comment on implementation strategies that could be used to meet the Chesapeake Bay TMDL allocations. Each jurisdiction is responsible for developing a Watershed Implementation Plan (WIP) and identifying regulations, Best Management Practices (BMPs) or other implementation strategies within its WIP for meeting the pollution allocations under the TMDL. The WIP helps ensure implementation of the Chesapeake Bay TMDL but is not an approvable part of the TMDL; therefore, EPA cannot require jurisdictions to implement practices that are outside of EPA's regulatory authority in order to meet allocations under the TMDL. EPA currently does not have the authority to regulate the purchase or use of soil fertilizers by private citizens, golf courses, or farmers. Such regulations would need to be promulgated by the respective jurisdiction.

The green industry provides the products for the natural filtration: the use of plants as ground cover, trees, rain gardens, bioswales, green roofs and similar "green infrastructure" helps to manage stormwater runoff, and needs to be utilized in large and small solutions.

Response

Please refer to response to comment 0228.1.001.002. EPA's evaluation of the final WIP can be found in Section 8 of the final TMDL report.

Comment ID 0049-cp.001.004

Author Name: Sheppard Brandon

Organization: Weed Man of Winchester

In regards to the procedural manner in which the proposed TMDL are being presented to the states, namely Virginia, we are concerned that the Virginia's effort to meet, and in some instances surpass the proposed TMDL limits are not being given adequate recognition.

Additionally, the costs of implementation the proposed TMDL standards, beyond the levels proposed by Virginia, are prohibitively expensive for many rural communities and agricultural operations.

Response

It is EPA's preference that the jurisdiction WIPs are used to meet the allocations. However, the WIPs need to meet the expectations outlined in the accountability framework outlined in its September 11, 2008, letter to the Chesapeake Bay Program's Principal Staff Committee (PSC) and further developed in letters sent by EPA to the jurisdictions on November 4, 2009, and December 29, 2009 as

well as the eight elements outlined in EPA’s April 2010 “Guide for EPA’s Evaluation of Phase I Watershed Implementation Plans.” Where WIPs do not meet these criteria, backstop allocations may need to be applied. EPA’s evaluation of the final WIP for each jurisdiction can be found in Section 8 of the final TMDL report. EPA appreciates the significant cost pressures facing state and local governments given the current economic climate. Also please see response to comment # 0435.1.001.009.

The nutrient / sediment portion entering the Chesapeake Bay from sewage plants/ septic systems is primarily caused by humans utilizing flush toilets, urinals, garbage disposal units, etc. Fully 88% of the ammonia/ nitrogen from the human sewage source is from humans urinating in those fixtures. The solution is simple. Discontinue the use of flush/ drainage fixtures.

The definitive remedy is not to attempt "fix" the sewage but to stop creating the sewage. We have been developing and practicing such a mission for more than 30 years. With the utilization of waterless and vacuum micro-flush fixtures and on-site, aerated mineralization beds we have the capability of rescinding all sewage from domestic sources.

We have recently completed a larger system for a new nature center for the city of Baltimore, MD. Design load= 500 uses per day with near zero maintenance and zero sewage discharge. Please contact me for more details

Author Name: Goggin Brenna

Organization: Delaware Nature Society

The Society also believes stormwater runoff and other impacts from development represent a major source of pollution in the Chesapeake Bay watershed that is increasing. While stormwater BMP's have been effective in some areas, the

increase in development around the Bay have negated the BMP's workability. We strongly support performance standards in regulatory programs and allowing permitted entities to innovate in order to achieve or surpass these standards. The concept of predevelopment hydrology standards is an example of a performance based approach that has great potential for improving water quality.

Thank you for the opportunity to comment.

Response

EPA agrees that performance standards based on measurable environmental outcomes such as predevelopment hydrology are the preferred way to control and monitor stormwater discharges.

Comment ID 0134-cp.001.001

Author Name: Moretti S.

Organization:

I came here today to advocate for riparian buffer zones and wetlands as low cost, high impact water filtration systems.

I have noticed many areas throughout the Susquehanna River Basin where pasture or lawn stretches uninterrupted to waterways. Every area where runoff proceeds directly from pasture or lawn into the waterway becomes a wide open conduit for nutrients and sediment to enter the water. To compound the problem, these same areas often serve as habitat for ground nesting birds so the bird waste gets washed directly into the waterways with each rainfall. Controlling the bird populations is apt to have varying degrees of success, but an adequate riparian buffer zone, perhaps accompanied by edge-based wetland areas, would forevermore catch the runoff and filter it before it enters the waterway.

EPA could establish riparian buffer zones in areas where they are lacking through a five year, three step approach.

Step one: provide targeted educational outreach. Step two: offer encouragement or incentives to property owners along waterways. Since the various programs available now all require massive amounts of paperwork as well as the assistance of various experts, this step would need to address these obstacles by offering programs that are easy to understand and easy to implement. Step three would be to mandate riparian buffer zones throughout the Chesapeake Bay Watershed. The buffer zone could consist of an overgrown swath of vegetation, a section of forest or a perennial garden. The beauty of this program is that it is simple to oversee, since the only parameter is that there cannot be lawn or pasture alongside the waterway.

So as you consider testimony about sophisticated sewage filtration plants and other expensive measures, please remember that while those systems have their places the foundation of the solution should be built upon the most economical and effective surface water filtration systems available: riparian buffer zones and wetlands.

Author Name: Horn Charles

Organization: Headwaters Soil and Water Conservation District

Soil and Water Conservation Districts have built trusted relationships with landowners to implement these water quality best management practices. In 1992 only 0.13 miles of stream bank protection was installed in Augusta County. In 2010, 40.7 miles of stream bank protection was installed. This is a result of better awareness through education, flexible fencing programs, and greater acceptance by a young generation returning to manage the farm. We need to encourage this increased participation with adequate and reliable cost-share incentives and not regulation.

Response

EPA believes farmers across the Chesapeake Bay watershed have done a great job in reducing nutrient pollution from their lands over the past 25 years. However, after 25 years of efforts to restore the Bay, these voluntary efforts have not achieved the water quality goals needed to restore the living resources of the Chesapeake Bay. Through the TMDL, EPA seeks to create a level playing field in the agricultural community by ensuring that each Chesapeake Bay jurisdictions' WIP includes compliance assurance and enforcement response programs that address those farm operations that are discharging pollutants into the Bay and its tributaries.

To maintain our landowner relationships we believe the communication chain should be EPA to our established state agencies then to Districts for implementation.

Response

The strength of the Chesapeake Bay Program over the past 25 years and one of the reasons nutrients have been reduced to current levels is the unique partnership between federal, state and local governments and stakeholders. The Chesapeake Bay TMDL process has highlighted the need to improve upon the communication between EPA and the state and local conservation districts in order to ensure that landowners understand what is required of them to meet the TMDL nutrient reduction goals. Once that message is clear, then the relationship between the landowner and the Districts will be the avenue to determine what is necessary to meet those goals.

- Available resources should be used effectively to get the best level of improvement in water quality possible. This requires a cost-effectiveness analysis as part of the allocation of loads and selection of qualifying practices.

Response

The CWA Section 303(d) requires TMDLs to be established for impaired or threatened waters at a level necessary to implement the applicable water quality standards with seasonal variations and a margin of safety. Federal regulations at 40 CFR Section 130.7(c) track the statute and require TMDLs to be developed at levels necessary to attain and maintain the applicable narrative and numerical water quality standard with seasonal variations and a margin of safety and that take into account critical conditions. TMDLs are to include wasteload allocations for each point source and load allocations for nonpoint sources. EPA relied on the states, through their WIPs to bring cost effectiveness considerations into the planning. Fortunately, because of much improved final WIPs, EPA has chosen to reduce or remove the backstop allocations that EPA used in the draft TMDL. The final allocations can be found in section 8.

Comment ID 0159.001.005

Author Name: Farasy Tom

Organization: Maryland State Builders Association

Given these loading estimates, a failure to create meaningful water quality credit trading, incentives and other creative programs involving the agriculture and wastewater treatment sectors will clearly lead to a failure of the cleanup effort. Agriculture activities are exempt from the federal Clean Water Act and the only agricultural practices that are regulated through permitting is concentrated animal feeding operations.

Response

EPA commends MSBA's interest in the continued development of Maryland's trading program.

EPA's proposed reductions to POTW and CAFO/AFO allocations in the draft TMDL were backstops resulting from a lack of reasonable assurance by other sectors including Agriculture as demonstrated in WIPs. EPA is responsible for ensuring that nutrient

and sediment reductions envisioned in draft WIPs will be achieved. Continued population growth and development in the Chesapeake Bay watershed is largely responsible for the current state of the Bay and the necessity for a TMDL. EPA understands that the TMDL will affect patterns of growth and economic development, including POTW and sewer capacity, in the watershed. Such adjustments are necessary to achieve the objective of the TMDL, which is to meet water quality standards throughout the watershed.

In the TMDL, EPA has attempted to identify and promote options for the jurisdictions to accommodate growth while meeting the TMDL allocations. Offsets and trading use free market approaches to allow new and existing dischargers to meet their allocations by paying for pollutant reductions at another location. These approaches have been implemented in several Bay jurisdictions. EPA supports these efforts and believes the success of these efforts, particularly for stormwater and on-site or septic systems, depends on the states' success in creating greater demand for load reductions from these sectors. Creating additional pressure on sectors like agriculture that have not traditionally felt a demand to decrease their loadings will stimulate market activity in this area.

CPR has developed a set of metrics to evaluate each state's final Phase I WIP when it is published on November 29, 2010. The metrics will be used to assign letter grades that evaluate (1) the transparency of information in the WIPs in providing key information about mandatory and voluntary pollutant control programs and (2) the strength of these programs in making actual pollutant reductions. The metrics focus on major sectors under the Clean Water Act's National Pollutant Discharge Elimination System (NPDES) permitting program and other elements identified by EPA in guidance documents and letters. [FN1] The comments below first describe the significance of each sector and then address each Bay jurisdiction's submission. We are happy to discuss these comments with you or your staff. Thank you for your leadership and commitment to restore the Bay. During the week of August 16, 2010, CPR sent a copy of these metrics to each of the Bay jurisdictions' leaders and the heads of relevant agencies. Please see the attached list for all the recipients of this correspondence. CPR only received responses from Maryland and West Virginia. A copy of the metrics is attached to these comments. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0185.2]

Overall, the Bay jurisdictions' draft Phase I WIPs do not provide an adequately clear or defined roadmap to achieving the Bay TMDL. The draft WIPs tend to list with varying degrees of specificity the state programs related to achieving the Bay TMDL without explicitly committing to strengthening existing programs or implementing new actions to make actual pollutant reductions. The extent to which states disclosed information for the transparency of information evaluation necessarily determines the ability to evaluate the strength of the programs. In the final Phase I WIPs, all Bay jurisdictions must provide the specific numbers and amounts of resources available and needed to form a baseline of information against which future progress can be compared. All Bay jurisdictions must make specific commitments, demonstrated by establishing timelines and milestones, to improve existing programs or implement new programs to achieve the allocations under the Bay TMDL. The Phase I WIPs should amount to more than an inventory of state programs; they should constitute a defined roadmap to which EPA and the public can hold the Bay jurisdictions accountable.

Because these dischargers must all comply with their permits, a strong and up-to-date NPDES permit program is the guaranteed means of reducing pollutant discharges.

When a permit expires, the facility is not shut down but rather continues to operate indefinitely under its expired permit, which does not incorporate new standards or regulations passed in the interim. A significant number of expired permits indicates that a state lacks the capacity to administer an effective permitting program, a crucial deficiency given the need to rewrite all permits in a timely fashion to meet TMDL allocations. Permits are typically written for a five-year term. Expiring NPDES permits must be renewed promptly, in compliance with any applicable TMDL. For the Bay TMDL, all NPDES permits should incorporate the wasteload allocations by no later than December 30, 2015.[FN 2]

[FN 2] This date assumes that EPA finalizes the Bay TMDL on or before December 31, 2010. Assuming that the last new or reissued permit issued before the Bay TMDL goes into effect is December 30, 2010, and expires on December 30, 2015, this permit would need to be updated or reissued in accordance with the TMDL on or before the expiration date. All currently expired permits, if reissued after the Bay TMDL is in effect, must include the applicable Bay TMDL allocation.

The final Phase I WIP should establish not only on implementation milestones and targets but also institutional milestones to establish programs that better regulate and monitor pollutant discharges. For example, progress on implementation milestones may be measured by counting the number of facilities that undergo necessary upgrades. Institutional milestones, however, focus on the state agency's progress in updating and reissuing permits, targeting enforcement actions, or acquiring new funding to fill existing gaps. Adopting both types of milestones will ensure achievement of the Bay TMDL.

Organization: Center for Progressive Reform (CPR)

A strong, deterrence-based enforcement program is the most effective way to ensure compliance with NPDES requirements. Deterrence-based enforcement is based on the theory that regulated entities will comply with the law where compliance costs less than violating the law. Thus, penalties for noncompliance must be severe enough to motivate compliance. Deterrence-based enforcement is characterized by four essential elements: (1) sufficient, consistent, and regular compliance monitoring to identify violators; (2) timely initiation of enforcement actions against violators; (3) a mandate that the violator come into compliance with applicable laws and regulations; and (4) imposition of penalties that, at a minimum, eliminate any economic benefit that the violator gained from violating the law and that provide a deterrent for future violations.

Because the NPDES permitting program has been the key to reducing pollution from point sources, ensuring compliance through effective enforcement is crucial. The Phase I WIPs should provide detailed information regarding a state's enforcement program in order to allow the public to understand and assess the effectiveness of the program.

One possible venue for annual public disclosure is for the all Bay jurisdictions to pass legislation requiring an annual

report of enforcement activities, such as section 1-301(d) of the Maryland Environment Code.[FN 3] This section requires the Maryland Department of Environment (MDE) to publicly disclose information, including:

- The number of permits issued and in effect for the preceding year; This section requires the Maryland Department of Environment (MDE) to publicly disclose information, including:
- Information on the total number of inspections, audits, or spot checks performed at facilities with permits;
- Information on the total number of injunctions, corrective actions, and stop work orders issued;
- The total amount of money collected as a result of administrative and civil penalties; and
- The number of criminal actions charged, convictions obtained, and fines received.

MDE also discloses the annual budget for each program and the level of staffing. By publishing this information each year, the public can track the effectiveness of MDE's NPDES permitting program and encourage improvements in its enforcement programs. If other states had legislation requiring similar annual disclosure, states may be further encouraged to improve their enforcement programs by comparison and political pressure.

[FN 3] MD Envir. Code § 1-301(d).

While nonpoint sources are not subject to mandatory pollutant controls under the Clean Water Act, they are assigned load allocations under the Bay TMDL. Achieving these load allocations depends largely on voluntary practices and federal, state, and private incentive programs that subsidize farmers for implementing best management practices (BMPs) to control nutrient runoff, for example. In the WIPs, EPA and all Bay states must commit to making every effort to regularly monitor and verify that nonpoint sources that have received public funding for implementing BMPs or other pollutant controls do in fact have these practices in place, maintained, and functioning. For example, federal grant programs in section 319(h) of the CWA and in USDA's primary conservation funding programs (Environmental Quality Incentives Program, Conservation Reserve Program, and Wetlands Reserve Program) provide funding for implementation of these practices. Thus, monitoring and verifying these practices is important not only for achieving substantive reductions in pollutants from nonpoint sources but also for maintaining accountability for spending public funds.

Contingencies are a crucial part of the Phase I WIPs because they provide a concrete, alternative plan for how states will achieve their TMDL allocations if the primary pollutant controls are not implemented or fail to achieve the required reductions. Identifying contingencies requires states to undergo careful planning by identifying the full arsenal of potential tools that can be used to achieve reductions. Committing to implementing strong contingencies also provides assurance that, either through primary controls or the secondary contingent controls, the Bay TMDL and states' allocations will be achieved.

Per EPA guidance, states need to implement contingencies if delays in the adoption of new or revised legislation or regulations occur; if participation rates in voluntary programs fall below projections; or if compliance rates with regulatory programs are not achieved. States should also consider changes in land use, development rates, and voluntary participation rates.

Concentrated animal feeding operations (CAFOs) dot the entire Chesapeake Bay Watershed, with a high concentration of poultry operations on the Delmarva Peninsula. In 2008, Maryland poultry operations generated approximately 650 million pounds of chicken manure.[FN 4] That same year, new federal CAFO regulations went into effect. Among the changes included a requirement that CAFOs submit nutrient management plans (NMPs) as part of the NPDES permit applications. The regulations require state authorities must then review the NMPs and provide the opportunity for public comment and review. State authorities are required to include the terms of the NMP as enforceable elements of the NPDES permits. In general, states are required to update their CAFO permitting programs to be consistent with the federal regulations within one year of the effective date or, if a state statutory change is required, within two years.

Thus, by the end of 2010, all Bay states should have CAFO programs that are consistent with the 2008 federal regulations. More importantly, Bay states must ensure that all facilities that qualify as CAFOs receive permits that are consistent with both the updated federal regulations and the Bay TMDL. States should determine the status of the animal feeding operations in their state and issue CAFO permits where required.

Under the Clean Water Act, stormwater is considered a point source and thus requires a NPDES permit. The stormwater permit covers operators of municipal separate storm sewer systems (MS4s) and construction and industrial stormwater. All Bay states have delegated authority to administer the stormwater permitting program, which is often in turn administered by local governments. Thus, information about how local governments administer this program is crucial to curbing pollutant discharges from stormwater.

Approximately one-third of the nitrogen in the Chesapeake Bay comes from atmospheric deposition through mobile, industrial, agricultural, and natural sources. [FN 5] The boundaries of the Chesapeake Bay airshed extend far beyond the boundaries of the watershed; nevertheless more than half of the atmospheric deposition of nitrogen comes from Bay states. Thus, reducing air deposition will require coordinated efforts by Bay states and EPA under the Clean Air Act to ensure that emitters comply with their permits and to bring effective enforcement actions against those in violation of those permits.

There are far less expensive BMPs that can be established to lower pollution levels. I also expect a variety of lawsuits will be leveled at EPA if it sticks with the lower limits.

Response

EPA appreciates the significant cost pressures facing state and local governments given the current economic climate. However, neither the CWA nor EPA's implementing regulations require the state or EPA to consider the costs to implement the TMDL when establishing the TMDL at a level necessary to achieve the applicable water quality standards. While additional point source controls on wastewater treatment plants can be expensive, EPA proposed this backstop action in the draft TMDL because point sources are the pollutant discharging source sector for which the CWA gives EPA the regulatory authority to ensure implementation of needed controls to meet Pennsylvania's allocations.

EPA has reconsidered its approach to federal backstop allocations as proposed in the draft TMDL. This is in large part due to the improved final Phase I WIPs and informative public comments on this issue. The final TMDL places much greater emphasis on jurisdictions' final Phase I WIPs and less emphasis on backstops in deriving the loading allocations for all sectors. Please see Section 8 of the final TMDL for the final Phase I WIP evaluations and the backstop allocations for each jurisdiction.

- The text does not indicate if the transport factor in the Bay model accounts for reservoirs that are located between the stream and the Bay. It would be helpful to clarify.
- There is a need to define "control strategies" more clearly up front.

Response

Neither the term "transport factor" nor the term "control strategies" appear in the draft TMDL document.

The meaning of "transport factor" is clear enough from the context of the comment. The term used in the draft TMDL is "delivery factor". Assuming these are synonymous, the delivery or transport factors do account for reservoirs. Approximately 40 of the largest reservoirs are simulated in the Bay watershed with a significant effect on delivery factors. See section 6.3.1 on page 6-21 of the draft TMDL.

Organization: Algae Producers of America

Finally, in reviewing the relevant remediation technologies, the Ohio EPA considers the following 5 areas of concern for each suggested technology proposed:

- Does the technology specifically address the cause of water quality impairments?

o Our technology should be considered as part of a comprehensive technology roadmap to address the challenges faced. We have demonstrated the ability to successfully address the reduction of nutrient loads from point sources, such as wastewater treatment facilities and industrial sites to levels below those commonly achieved through ENR technologies. The result is reduced nutrient inflow into targeted waterways.

- Is the technology cost-effective?

o Our technology is a bolt-on module which does not require significant changes to infrastructure. Further, the smaller foot-print required also reduces the valuable land space required. Our mobile demonstration module provides proof of concept before any monies would be expended on a more "permanent" solution, thereby enabling a more informed decision to be made.

- Is the proposed technology sustainable?

- o The use of an algae-based solution as part of a comprehensive strategy is sustainable and environmentally beneficial through its reduction in GHG emissions and production of valuable co-products. Further, we have demonstrated the ability to reduce nutrient loads on a year round basis.

- Has the technology been peer-reviewed or is it experimental in nature?

- o The State of Ohio through its awarding of an Ohio Third Frontier Grant has acknowledged that algae-based solutions are viable possibilities. Our customers who are currently using this technology would support that it does work.

- Does the technology have a track record dealing with problems on the scale needed?

- o Like other significant bio-remediation challenges, the solution to the problems faced will require a comprehensive approach involving technical solutions, land management, and education. Our technology would be considered a part of this effort. In demonstration at several municipal wastewater treatment facilities (up to 8M GPD capacity), we believe our track record is established.

A. Action Items Required to Achieve the Proposed WIP Modification

2. Establish Urban Fertilizer Regulations

Another practical and cost-effective option for the Commonwealth is to establish urban fertilizer regulations that include the following nutrient management strategies to reduce TN and TP loadings from home lawns and commercial landscaped areas:

- a) Ban on phosphorus use except for newly-planted lawns (1st year) and requirement to use slow-release nitrogen (SRN) formulations only;
- b) Ban on sidewalk/driveway applications of fertilizers and lawn clippings;
- c) Requirement that fertilizers be applied only by certified applicators in conjunction with soil testing when not using phosphorus-free/SRN formulations on established (older than 1 year) lawns;
- d) Implementation of education and public outreach programs that communicate the importance of not exceeding recommended application rates and timing; and
- e) Exceptions for organic-based fertilizer formulations that have low TP levels.

Both SRN and phosphorus-free fertilizer are currently available to the public. As an example, Exhibit 6 (Availability of Phosphorus-Free Fertilizer) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] provides photos documenting the availability SRN and phosphorus-free fertilizer at the Merrifield Garden Center in Gainesville, Virginia, on November 2, 2010 [FN38] at the same cost as standard fertilizer. This comparison reinforces the fact that urban nutrient management has the ability to reduce nutrients in an extremely cost effective manner (no cost to less than \$10/year [FN39] for a quarter-acre lot).

[FN 38] In direct comparison of Fairway Formula GreenView fertilizer covering 5,000 square feet per bag. Each formula (29-2-10 Fall fertilizer; 30-0-12 Fall fertilizer with 3/5ths SRN; and 31-0-0 Late Fall fertilizer with 9/10ths SRN) was priced at \$39.99.

[FN 39] Based on conversations with industry experts and cost comparisons at retail stores in July, 2010. Assuming the approximate cost of straight urea fertilizer is \$0.80/pound applied and poly- or sulfur-coated urea fertilizer is \$2.30 to \$2.70/pound applied (an expensive Slow Release Nitrogen Source), with 1 lb/slow release Nitrogen per 1000 sf/year used and no extra cost for including Phosphorus in the fertilizer. However, as noted above, some stores have no price premium for Phosphorus-free and SRN products.

Local governments will be directly impacted by the Bay TMDL, and have consistently been told by EPA and state partners that they will play a major role in how it is implemented. Therefore, it is imperative that EPA and the states respond to the concerns of local governments throughout the Bay Watershed.

EPA's evaluation of the District's and individual state's WIPs are instructive because they are described as the cornerstone of the accountability framework for meeting the Bay TMDL. EPA has concluded that while Maryland and the District of Columbia have some deficiencies, all the other states, Virginia and Pennsylvania, and the headwater states of Delaware, New York, and West Virginia, have serious deficiencies. Their evaluation also concluded that none of the seven WIPs provide "reasonable assurance" that pollution controls identified could actually be implemented to achieve the nitrogen, phosphorus, and sediment reduction targets by 2017 or 2025. In public meetings in October and November throughout the Watershed, EPA has also expressed an expectation that these deficiencies and more detailed information provided by the states in the revised WIPs will lead to a final TMDL with few if any EPA "backstop" measures.

Response

Thank you for your comment. Fortunately, the expectations that EPA expressed this fall have come true. The state WIPs are much improved, allowing EPA to reduce or remove the backstops. Please see Section 8 of the final TMDL report for the results of the final Phase I WIP evaluations for each jurisdiction.

Comment ID 0256.1.001.003

Author Name: Lisanti Mary

Organization: Local Government Advisory Committee (LGAC) to the Chesapeake Bay Executive Council

EPA and the Chesapeake Bay Program have continually recognized the importance of local governments as vital partners in implementing measures that will restore and protect the Chesapeake Bay. LGAC directly advises the Chesapeake Executive Council and participates in the Management Board and the Principal's Staff Committee meetings and other Bay Program activities with partner states and the District of Columbia. Yet there is no direct recognition of local governments in the Draft TMDL, or in the guidance EPA gave to the states for their Watershed Implementation Plans.

Consultation with local governments prior to making TMDL related decisions is absolutely necessary. Some states have created single, broad based stakeholder advisory groups with a few local government officials as members. And they point to those groups as the primary source of input from local governments. Our experience is that process is wholly inadequate. There is little evidence that the majority of states have included the concerns of their local governments in their Watershed Implementation Plans.

In the Virginia pilot projects, there are local and regional governmental units, including cities, counties, towns, planning districts, and soil and water districts. In the pilots, each has distinct experiences, authority, and funding which can make the project stronger if all are involved. The use of more existing, local forums to bring stakeholders together can result in more creative and useful local and or regional solutions. EPA should incorporate the lessons learned in the various state WIP pilot projects into its requirements for local government involvement in the Phase 2 WIPs.

LGAC recommends that EPA issue specific guidance to the states to require meaningful consultation with local governments in the Phase 2 WIPs. Further, EPA should request that all states develop a plan and criteria for local government involvement that would be a part of the WIP approval process. To the extent possible, EPA should spell out its expectations now for local government involvement in the final TMDL issued in December of 2010.

Organization:

However, none of the draft state WIPs submitted to EPA meet even a minimum acceptable standard. Most importantly, none of the draft WIPs provide reasonable assurances that significant non-point source reductions will actually be achieved. Unless EPA firmly corrects these deficiencies, you will ensure a polluted, sick Chesapeake Bay for decades to come.

Response

EPA reviewed each jurisdiction's WIP to ensure that it meets the accountability framework outlined in its September 11, 2008, letter to the Chesapeake Bay Program's Principal Staff Committee (PSC) and further developed in letters sent by EPA to the jurisdictions on November 4, 2009, and December 29, 2009 as well as EPA's April 2010 "Guide for EPA's Evaluation of Phase I Watershed Implementation Plans." Any WIPs that do not meet these expectations may be subject to backstop allocations or other federal actions as described in the referenced letters. EPA's evaluation of each jurisdiction's final WIP can be found in Section 8 of the final TMDL report.

At this stage, we would like to offer one comment on how EPA might strengthen the TMDL moving forward. Specifically, we encourage EPA to provide guidance on how the Phase 2 WIPs should address the need to protect those places in the Bay watershed that have not yet suffered significant degradation. As EPA is well aware, we cannot restore the Chesapeake Bay unless we protect healthy waters at the same time we are improving degraded ones. A balanced approach to water quality management that includes the protection of healthy waters is not only more cost-effective than reducing pollution after degradation occurs, it is also essential to ensure that the scope and scale of the problem does not continue to worsen.

Response

Much of the guidance already provided to the states on the Phase I WIPs, such as the September 11, 2008, letter to the Chesapeake Bay Program's Principal Staff Committee (PSC) and additional letters sent by EPA to the jurisdictions on November 4, 2009, and December 29, 2009 as well as the eight elements outlined in EPA's April 2010 "Guide for EPA's Evaluation of Phase I Watershed Implementation Plans" will be applicable for development of the Phase II WIPs. In addition, EPA is currently working with jurisdictions and local stakeholders to determine what additional support, such as guidance, our partners are seeking for the Phase II WIP process. With regard to the point about protecting already high quality streams, we need to protect them at their high quality. In EPA's professional opinion, the growth provisions of the state WIPs should provide some level of protection. That is, since the Bay TMDL is a cap on additional loads, this should discourage these additional loads from coming into the Bay system.

Comment ID 0302.1.001.010

Organization: The Nature Conservancy

Ensuring that Phase 2 WIPs account for local land and water protection efforts will also encourage local community buy-in in places far from the mainstem Chesapeake Bay, while supporting reasonable assurance that pollution caps can be maintained into the future.

The TMDL has no direct mention of local governments, not are we located within the guidance the EPA gave to the states on the Watershed Implementation plans. This, despite the critical link local government will have on the success and/or implementation of water quality improvement efforts. We would ask at the minimum that the State of Virginia will allowed the time, and very strongly encouraged, to engage local government in the Phase 2 WIP's, where allocations will be made down to the county level.

"Dear Administrator Jackson,

As the EPA reviews the states' cleanup plans for the Chesapeake Bay, I urge you to keep two things in mind. First, the only way to reduce pollution enough to restore the Bay is to require polluters to change their practices. Corporate

agribusiness alone generates 1 billion pounds of chicken manure in the Bay region every year. That kind of pollution is not going to disappear voluntarily, and the EPA should reject any state plan based on the premise that it will.

Response

Organization: Environment America et al.

States Must Adopt Effective, Mandatory Practices for Non-Point Sources. The TMDL pollution reduction levels will not be achieved without deep reductions from the non-point sectors of agribusiness and urban runoff.

Agribusiness. Industrial agribusiness is the most under-regulated source of pollution in the Bay region. The demands of companies like Tyson and Perdue generate 1 billion pounds of chicken manure in the watershed alone.[FN 1] Common sense tells us that voluntary efforts cannot tackle pollution of this magnitude. In fact, the numbers bear out that truth. According to USDA, after 26 years of voluntary conservation programs only 19 percent of the more than 4.3 million acres of harvested crop land in the watershed is now adequately managed to control agricultural runoff. [FN 2] At that rate, the mostly voluntary approach would take another 100 years just to control runoff from harvested crop land. That is not acceptable.

If this TMDL is to actually restore the Bay, then the states must commit in their WIPs to begin treating agribusiness like every other industrial source of pollution - with mandatory pollution reduction measures. For example, the EPA was right to recommend to the State of Maryland that it require cover crops. [FN 3] Now the EPA must continue on this path, insisting that all the states adopt such mandatory practices, including but not limited to these common sense steps:

Cover crops must be planted on fields after corn is harvested or manure is applied.

Manure must be stored in sheds or on slabs with a tarp.

Farmers must install setbacks from streams and ditches.

When manure or sludge is applied, it must be incorporated into the soil within 24 hours or injected.

No manure or sludge application should be allowed from November through March.

Fertilizer Usage on Turf. Addressing nutrient over-application in urban and suburban settings that is comparable to efforts on agricultural lands is important for equity reasons and for water quality reasons. We must reduce needless fertilization of home lawns.

States should eliminate phosphorus from residential fertilizer. Home lawn fertilization constitutes one of the most important and cost-effective nutrient reduction sources. First, home lawn fertilization is not needed to promote healthy turf growth in most lawns. The existing soils are generally capable of supplying enough nutrients, particularly in the case of phosphorus. Second, studies in Minnesota and Michigan communities have shown sharp decreases in phosphorus

concentrations in rivers and lakes within a year of passing a fertilizer phosphate ban.

Thank you for your leadership in this unprecedented opportunity for clean water. Your hard work now relies on ensuring the states hold all Bay polluters accountable.

I urge you to accept state plans only if they require polluters to improve their practices. The past decades have proven that voluntary measures are not enough. Corporate agribusiness alone generates 1 billion pounds of chicken manure in the Bay region every year. As you have suggested, state plans should include a requirement for cover crops to help manage all of that manure.

4. EPA Has the Authority and Responsibility to Require More Rigorous State Efforts to Reduce Pollutant Loadings to the Chesapeake Bay.

Throughout the TMDL, EPA has expressed its willingness to defer to the Bay States' identification and scheduling of specific programs and practices to control pollutant loadings. Some measure of deference is indeed appropriate, given the need for flexible responses to local conditions. However, EPA should not allow the states to exercise unbridled discretion in designing and implementing nutrient and sediment management practices. The goal of the iterative approach embodied in the three phases of WIP preparation is to select, prioritize and localize the practices that are most locally appropriate to control nutrient and sediment loadings to the Bay.[FN 15] In the recently submitted draft Phase I WIPs, Bay States were expected to "include a description of the authorities, actions, and, to the extent possible, control measures that will be implemented to achieve these point source and nonpoint source target loads and TMDL allocations." [FN 16] Naturally, many of the control practices and policies are well known to state agencies, EPA and the affected public after decades of study and evolution in nutrient and sediment management. State, federal, and industrial best practices manuals are replete with standards and specifications for practices and control measures that are currently available to achieve a desired level of pollutant management performance.

EPA's reliance on many programs identified in state WIPs, even in Phase I form, as indicators of "reasonable assurance" is undone by the widespread and significant shortcomings in these documents. All of the draft WIPs suffer from a lack of specific detail or commitment to filling gaps between the allocations and current loads. This is particularly, and disturbingly, true for state-led programs intended to achieve reductions from agricultural, urban stormwater, and on-site treatment (septic) loads. No state was able to firmly and satisfactorily demonstrate a strategy to address gaps in funding for voluntary BMP, technical assistance, or compliance/oversight programs. Despite assurances of widespread adoption of nutrient management planning on AFO/CAFOs throughout the watershed, most states were unable to provide assurances of such high levels or outline mechanisms for updating NMP standards to reflect contemporary, federal best practices. Most states failed to identify, or create, binding and enforceable commitments for reductions from agricultural, stormwater, and septic sources. Almost uniformly, Bay states were unwilling or unable to commit to initiating regulatory or legislative changes necessary to update pollution controls.

b. Urban Stormwater Programs Are Inadequate

Stormwater, both from NPDES permitted MS4s and from unpermitted sources, plays a significant role in nutrient and sediment loadings to the Bay. EPA estimates that existing NPDES MS4 areas contributed over seven million pounds total nitrogen, 900,000 lbs total phosphorus, and nearly 300,000 tons of sediment annually in 2009.[FN 26] Looking more closely at the three states with the largest proportion of stormwater-borne pollutants, this source contributes 28% of the nitrogen, 28% of the phosphorus, and 32% of the sediment discharged to the Bay from Maryland; 33% of the nitrogen, 50% of the phosphorus, and 39% of sediment loads in Virginia; and in Pennsylvania, stormwater contributes 33% of the nitrogen, 16% of the phosphorus, and 21% of the sediment. Stormwater loadings of these pollutants from New York, West Virginia and Delaware represent a far less significant portion of their overall loads, lending emphasis to consistent and aggressive efforts to reduce stormwater pollution from the major states.[FN 27]

Reducing stormwater loadings of nutrients and sediment will require a two-fold effort on the part of EPA and the states. First, states must commit to eliminating, as nearly as possible, discharges of these pollutants from new development and redevelopment projects. Across much of the region, states are making progress toward this goal by updating stormwater permits and regulations to reflect low impact development and green infrastructure approaches. EPA must review these updates for their ability to deliver, in fact, the reductions that they promise in principle. Second, states must commit with equal vigor to programs that will reduce the effectiveness of existing impervious areas. Outside of Maryland and the District of Columbia, there are very few commitments by states to address the significant and permanent flows

from existing development. EPA must take assertive steps to ensure that all Bay states make consistent and measureable progress toward stormwater retrofit goals.

A closer look at the WIPs prepared by the three states generating the most stormwater pollution reveals some significant trends and concerns. Current Virginia and Pennsylvania permits and regulations do not effect measureable, objective performance standards for new development and redevelopment projects.[FN 28] Again, only Maryland and the District have recognized the necessity of reducing existing imperviousness via retrofit policies. None of the three has fully explored the possible application of residual designation authority to prioritize and increase the extent of developed areas subject to stormwater permitting and regulatory requirements. In its evaluation of their revised WIPs, EPA should seek reasonable assurances that stormwater loadings will be reduced to a level reflective of that set in the backstop TMDLs.

[FN 26] Draft TMDL at p. 4-27.

[FN 27] Draft TMDL at pp. 4-6, 4-7.

[FN 28] Pennsylvania relies on a narrative volume control standard that relies on managing the net change from pre-construction to post construction conditions for the 2-year storm event. See, e.g., PA WIP at 86.

Response

EPA in its comments to all states regarding their draft WIP documents has pointed to the need for reasonable assurance to demonstrate that proposed reductions will be achieved. Where state regulations and permits are concerned, EPA does perform a review to ensure consistency with NPDES regulations and any applicable environmental issues, such as the Chesapeake Bay TMDL. For example, EPA recently reviewed revised stormwater regulations in a number of our states including PA, VA, MD and DE, which in some manner address standards for new and redevelopment. Although not all of the state regulations have been formally adopted, EPA is hopeful that they will soon become effective state policies. Furthermore, EPA is encouraging all states to include retrofit standards in MS4 permits, as prescribed in our memo titled “Urban Stormwater Approach for the Mid-Atlantic Region and Chesapeake Bay Watershed” which was published in July 2010. EPA fully intends to use its authority under the CWA and NPDES program for municipal, industrial and construction stormwater permits to provide the reasonable assurance that is sought for ensuring that stormwater load reductions for the Chesapeake Bay will be achieved.

c. Commitments in the Draft WIPs to Reduce Agricultural Loadings Are Inadequate.

NPDES permitting for CAFOs remains a critical regulatory tool for ensuring that these large livestock facilities are designed, operated and managed in a manner which employs the best available technology to eliminate discharges of pollutants to the Bay watershed. Recent amendments to EPA's CAFO regulations, as well as the Agency's May 2010 CAFO permitting guidance, explain EPA expectations of the livestock and nutrient management performance standards for permitted CAFOs, as well as the Agency's interpretation of the CWA permitting obligation for CAFOs that discharge or propose to discharge to waters of the United States. Unfortunately, based on available data, there appear to be significant shortfalls in NPDES permitting for CAFOs in the Bay watershed's most prominent agricultural states. Of the estimated 220 CAFOs in Maryland, only 7 were covered by the state's permit when EPA compiled permitting data this summer. Similarly, though EPA estimates that Virginia has 240 CAFOs according to NPDES definitions, [FN 37] none are presently covered by VPDES permits. Additionally, Virginia expects only 116 CAFOs to be subject to VPDES permitting obligations.[FN 38] Neither EPA nor VA have identified the reason for this discrepancy or measures to address it. In general, none of the state draft WIPs emphasize specific actions or commitments to expand NPDES permitting of CAFOs or oversight to ensure that all eligible CAFOs are brought under NPDES permits in a timely fashion.

The agricultural components of each state WIP incorporate the 2 Year Milestones for this category of sources. However, as outlined briefly above, there are significant shortfalls in progress toward meeting these goals across all Bay states. Yet none of the draft WIPs account for these shortfalls, or provide reasonable assurance that progress toward meeting the Milestones can be accelerated to make up for current deficiencies in pace. For example, according to an analysis conducted by the Chesapeake Bay Foundation, Virginia is failing to make adequate progress toward its goals for livestock exclusion from streams and the establishment of streamside buffers. [FN 39] In its draft WIP, Virginia predicts that adoption of these (and other critical nonpoint source control measures) will reach only single digit levels by 2017.[FN 40] Inexplicably, VA expects implementation levels to reach nearly 90% by 2025. Nowhere does the Commonwealth respond to current shortfalls in meeting its 2 Year Milestones or explain how it will enact binding commitments to provide reasonable assurances that full implementation levels will, in fact, be met. EPA correctly notes that Virginia "removed all regulatory drivers that could compel increased implementation of priority practices. Lack of regulatory driver may make action levels difficult to meet." [FN 41] In reviewing the revised Phase I WIPs submitted by Virginia and the other Bay states, EPA must insist on a full accounting of program shortfalls, uncertain regulatory and incentive-based responses, and the commitments necessary to make significant progress toward assurances that these measures will be implemented.

Among the questionable commitments by Bay states, NRDC is particularly concerned about Pennsylvania's poorly defined efforts to rein in nutrient and sediment loadings associated with the Commonwealth's large number of small dairies. Pennsylvania's draft WIP provides a compendium of available federal and state programs that bear on livestock agriculture manure and husbandry practices, and expresses the Commonwealth's intentions to expand its ability to cooperatively engage with farmers.[FN 42] However, the WIP does not adequately describe commitments to ensure that small dairies comply with the requirements of Pennsylvania's Clean Streams Law or the federal Clean Water Act. EPA notes as much in its evaluation of the Commonwealth's draft WIP; NRDC agrees with this assessment and stresses the need for Pennsylvania to provide reasonable assurance that the cumulative impact of the thousands of small dairies in the state will be redressed through binding commitments implemented in a timely fashion according to prescribed schedules.

Response

EPA is committed to ensuring that all AFOs that discharge or propose to discharge have permits across the nation. EPA will continue to focus its compliance assurance and enforcement efforts in the Chesapeake Bay watershed to ensure that all CAFOs are permitted and are implementing nutrient management plans. EPA has evaluated Virginia's and Pennsylvania's final WIPs to determine if they meet the TMDL reduction goals. Fortunately, much of the concerns that EPA expressed with the draft WIPs have been addressed in the final WIPs. If any Bay jurisdiction does not achieve its 2 year milestones, EPA will take whatever measures it deems necessary to achieve the TMDL reduction goals. These measures may include expanding the CAFO universe to regulate smaller dairy operations.

Recommendation #7: Do Not Mandate Specific Retrofit Levels in the TMDL or the Phase I WIPs

Neither the TMDL nor the state Phase I WIP documents should include reference to a specific level of stormwater retrofit for either MS4 or non-MS4 urban areas. This will allow time for the analyses recommended in Comments # 1 and #4 to be conducted before establishing specific retrofit requirements. Retrofitting requirements in future MS4 permits should consider local fiscal and physical realities.

Response

The final TMDL is heavily reliant on state WIPs for determining which sectors the necessary controls will be obtained. Stormwater controls, and to some extent retrofit of existing stormwater systems will be necessary.

Comment ID 0443.2.001.005

Author Name: Moore Shannon

Organization: Frederick County Government

The County provides the following comments on the Executive Summary of the TMDL: p.7: The EPA evaluation also concluded that none of the seven WIPs provided sufficient reasonable assurance that pollution controls identified could actually be implemented to achieve the nitrogen, phosphorus and sediment reduction targets by 2017 or 2025. The shortfalls of the WIPs, which varied by jurisdiction, included:

1. Vague or no strategy for filling recognized program or resources gaps
 2. Few enforceable or otherwise binding commitments
 3. Discrepancies between implementation levels in model input decks and strategies described in WIP
 4. Reliance on pollution trading programs but no commitment to adopt critical trading drivers such as new regulations
 5. Few dates for key actions and program-building milestones
- Frederick County agrees with EPA because we also do not believe that the actions are implementable, due to lack of coordination with regulated entities that face severe resource constraints.

Nutrient management plans that allocate manure based on crop needs accounting for all sources of nutrients, implementation of BMPs such as no-till, cover crops, stream bank protection, and many other conservation and nutrient management practices has resulted in steady improvement in controlling nutrient pollution in the Bay. Improving management should still be a very high priority in the efforts to clean up the Bay and will continue to contribute to the objectives of the TMDL. But, ultimately improving management alone will not be enough to achieve the goals of the TMDL. In reality the success from management improvements has been the low hanging fruit. Continuing with more of the same will not likely result in a continuation of the historical progress that has been made, even with greater emphasis on requiring and enforcing improved management, which seems to be the main focus of this TMDL. A new paradigm is needed. To follow the analogy of low hanging fruit, we need a ladder (a systemic change) to enable us to

get at the higher fruit and thus achieve the goals of the TMDL. However, this TMDL, as written, focuses almost totally on requirements for changing management and implementation of BMPs to achieve the goals. Also, within the effort to continue to improve management, most of the emphasis seems to be on maximizing the gross number of acres under nutrient management and the gross number of BMPs installed. There seems to be little thought about targeting to focus on management practices that will have the greatest impact on reducing nutrients in the Bay. This was a major frustration in developing the Ag-WIP in PA because there was little or no information provided on the relative impact of different approaches in the Bay model. It seemed like the only option was the E3 scenario, even though there will likely never be adequate resources to implement the E3 scenario. Thus, there was little basis for selecting components to the WIP that would maximize the return for the cost/effort. Because of this focus on accounting for the maximum number of gross acres and BMPs, we need to be careful that TMDL does not just become a paper exercise with little change actually happening on the ground.

Response

\The Chesapeake Bay Program partnership and the agricultural community have made significant past progress towards addressing the loss of nutrients and sediments to the tidal Chesapeake Bay. The agriculture and point source sectors, including municipal waste water treatment plants, have achieved the majority of the pollution reductions to date. Agriculture continues to represent the largest managed land use within the Chesapeake Bay watershed, as well as the largest single source of nutrients and sediment entering the Bay. Consequently, the Bay states are seeking additional nutrient and sediment reductions from the agricultural sector to assist with achieving the water quality requirements of the final Chesapeake Bay TMDL through their supporting WIPs. A portion of this continued reliance by the Bay states to achieve future nutrient and sediment reductions is based on improving the targeting of resources between USDA, EPA and other State agricultural programs, including efforts on the part of conservation districts, tracking and reporting of both cost-shared and non-cost shared agricultural practices to more clearly document implementation of conservation practices by the agricultural community and efforts to identify new technical management practices that are designed to reduce nutrients and improve water quality as a priority consideration. EPA agrees that the most effective means of achieving the results, perhaps through informed targeting, would be helpful in gaining the most reductions thru the least cost. Perhaps phase 2, with an emphasis on local target loads, could help bring this issue into focus.

1. The September 2010 PA WIP was crafted using the best guidance available at the time of preparation. When the PA WIP process began, the citizens, stakeholder groups and the Department of Environmental Protection (DEP) looked to EPA for guidance in crafting the WIP. Throughout the process, EPA was and continues to be less than forthcoming and purposefully vague in their response to DEP and various DEP workgroups that have been established. In order for the State to develop a plan that is both realistic and accountable to the overall goal of restoring the Bay, EPA should have assumed a more proactive role in identifying solutions to the questions and problems.

Response

See response to Comment No. 0432.1.001.010

Comment ID 0479.2.001.004

Author Name: Gansler Douglas

Organization: Maryland Office of the Attorney General

As part of the TMDL process, EPA has requested that each state prepare a watershed implementation plan (WIP) to provide reasonable assurance to EPA that sufficient pollution reduction, from both point and nonpoint sources, will take place to meet each state's allocation. EPA intends these WIPs to be management plans under Section 117(g) of the Clean Water Act, which directs EPA's Administrator to "ensure that management plans are developed and implementation is begun ... to achieve and maintain ... the nutrient goals of the Chesapeake Bay Agreement for the quantity of nitrogen and phosphorus entering the Chesapeake Bay and its watershed, [and] the water quality requirements necessary to restore living resources 111 the Chesapeake Bay ecosystem." 33 U.S.C. § 1267(g)(1)(A)-(B).

Each Bay State also has a legal obligation to ensure that it does not contribute to a violation of downstream water quality standards. Section 122.44(d) of EPA's NPDES regulations makes clear that each NPDES permit shall include any requirements necessary to achieve water quality standards established under § 303 of the Clean Water Act. Such requirements expressly include limitations for all pollutants "which may be discharged at a level which will cause, have reasonable potential to cause, or contribute to an excursion above any State water quality standard"-not just those of the State in which discharge occurs. 40 C.F.R. § 122.44(d)(1)(i) (emphasis added); see also 40 C.F.R. § 122.2 ("State means any of the 50 States ...") and § 123.25 (making § 122.44 applicable to States that are authorized to implement the NPDES Program).

Unfortunately, none of the draft WIPs has met EPA expectations, and none has been found to be sufficient to ensure that upstream states do not contribute to violations of Maryland's water quality standards. For example, the strategies identified in New York's WIP would exceed allocations by 15% for nitrogen and 14% for phosphorous. Delaware exceeded its target allocations for nitrogen and phosphorous by 17% and 8%; West Virginia by 18% and 6%; and Virginia by 6% and 7%. And, while Pennsylvania met its target allocation for nitrogen, it exceeded its phosphorous target allocation by 11 %. By contrast, Maryland's draft WIP met its jurisdiction-wide target allocations for nitrogen, phosphorous and sediment.

The Clean Water Act obligates all Bay States to protect the water quality of the Chesapeake Bay and upstream states are obligated to share in the responsibility to ensure the health of this regionally, nationally, and internationally recognized treasure. See generally 33 U.S.C. § 1313. And yet, the New York, Delaware, West Virginia, Virginia, and Pennsylvania draft WIPs, I submit, are inadequate at the most basic level because they fail to identify enough regulatory, enforcement, or even voluntary strategies to ensure downstream water quality standards are met. New York, while claiming that it would be impossible to meet its allocation because of the high percentage of forested land in its watershed area, has the least aggressive standards for major wastewater treatment plants of any WIP. Pennsylvania's WIP contains no plan for addressing the cumulative impacts of non-enforcement of existing regulations for small dairy farms, and did not even specify its plans for modifying its Manure Management Manual to address the significant phosphorous imbalance from over-application of phosphorous-rich animal manure. Virginia has relied heavily on nutrient-credit trading programs in its WIP, but has not identified a sufficient framework for inspections of agricultural best management practices to ensure the proper implementation of nutrient-credit trading.

As Maryland works to incorporate the input of its residents and the constructive criticism of EPA to create a document that will provide reasonable assurances that the TMDL limits will be achieved, I urge all Bay States to do more to meet the jurisdiction-wide target allocations for nitrogen, phosphorous, and sediment that were set forth by EPA. Cleaning up the Bay will not be easy. Tough choices must be made and innovative ideas must come to the forefront. All sectors of the economy, including agriculture, must comply with best management practices and invest in developing new technologies that will make pollution reduction more efficient. In this first draft, Pennsylvania, New York, Virginia, West Virginia, and Delaware failed to make the hard choices necessary to meet allocations. Each State should revise its WIP to identify pollution reduction programs sufficient to meet EPA allocations.

Response

Overall, the final Phase I WIPs were significantly improved from the draft Phase I WIPs, with most jurisdictions not only meeting their target allocations jurisdiction-wide and basinwide, but also providing adequate reasonable assurance that those target allocations would be met. These improvements are a direct result of the cooperative work and leadership by the jurisdictions, each of which worked closely with EPA over the past few months to strengthen its WIP. This is a notable improvement from the draft Phase I WIPs, where six of the seven jurisdictions did not reach their jurisdiction-wide target allocations for all three pollutants, and no jurisdiction met its target allocations for each pollutant for each major basin within its jurisdiction.

In addition, five of the seven jurisdictions provided adequate reasonable assurance in their final Phase I WIPs that they would meet their target allocations. This also is a significant improvement from the draft Phase I WIPs, where none of the seven jurisdictions

provided adequate reasonable assurance that they would meet their respective target allocations. As a result of these improvements, EPA significantly reduced the backstop allocations for most of the jurisdictions, and in some cases completely removed the backstops.

New York is slightly over its allocations for nitrogen and phosphorus and Pennsylvania is slightly over its allocation for phosphorus. EPA has proposed backstop actions against these two jurisdictions in order to ensure that they meet their assigned allocations. These backstop actions are explained in further detail in Section 8 of the final TMDL.

Our Bay is of central importance to the region's overall environmental quality and economic future. Currently, a variety of initiatives as well as proposed legislation are under consideration as solutions to the decline of the Chesapeake Bay. These include new programs and the infusion of dramatically expanded federal resources to accelerate the restoration of the Chesapeake Bay. However, none of these programs and resources will succeed in restoring our Bay without effective and consistent implementation of the underlying existing law, the Clean Water Act ("CWA"). Unfortunately, for years all of these state/district partners have failed to adequately implement the CWA. Unless these states/this district focus attention on their legally insufficient performance, the extraordinarily important federal efforts now underway to save the Bay will have significantly less chance of succeeding.

Response

EPA agrees that it is important to fully implement the Clean Water Act. But at the same time we must all be aware of the limitations of the Act. Specifically, only voluntary, grant funding is available under the CWA for nonpoint sources. Since the bay is mostly impaired from nonpoint sources, it is important that the states and EPA find additional tools to achieve nonpoint source controls. It is for this reason that EPA is requesting the states to develop WIP that demonstrate how planned pollution controls will be achieved, particularly for nonpoint sources.

CAC strongly supports enforcement and verification as key elements of the WIPs. The WIPs are a crucial complement to the Bay TMDL in allowing the jurisdictions to use their unique economies, cultures, regulatory authorities, and political structures to demonstrate how they will achieve their non-point source load allocations. The WIPs for the TMDLs must be enforceable and enforced. We believe Maryland's requirement to publish an annual report on the Department of Environment's compliance and enforcement activities is a good model that other jurisdictions should

enact through legislation. CAC would be pleased to serve as a "focus group" for MDE to test the ability of citizens to use the reported information.

Response

EPA agrees that enforcement and verification are key elements to be included in each jurisdiction's WIP. EPA reviewed each WIP to ensure that these elements were sufficiently considered in each final Phase I WIP. The results of EPA's evaluation of each jurisdiction's final Phase I WIP can be found in Section 8 of the final TMDL report.

- Provide incentives for higher intensity development. There was a great deal of concern that development pressure in the near term could be sated with low intensity development in areas where higher density is more appropriate and better for water quality. That would leave no capacity for growth in long term scenarios where significant population growth is projected. Furthermore, pollution prevention techniques will be less traditional and more innovative/expensive for higher intensity growth solutions that will support transit and preserve open spaces. Incentives must be incorporated in Watershed Implementation Plan (WIP) guidance to encourage sustainable solutions and development consistent with EPA's Office of Smart Growth.
- Do not encourage low-density infill development. Another facet of the discussion above focused on areas with additional capacity for growth. Existing communities must be strengthened and supported to make and retain sustainable, viable urban areas. Just as in new communities or developments, low intensity, infill development is easier to permit and less expensive to build in the short run. Those types of solutions are lost opportunities to provide for a mix of housing sizes, types, and affordable options. It is also an opportunity to reduce the pollution loading from existing areas constructed when there were no or antiquated storm water regulations. All of these goals can be made more affordable by spreading the cost over more units. Encouraging low-intensity development (even by not stating the goal of high-intensity infill) raises the per unit cost of pollution prevention for communities. A function of TMDL must be to encourage an intensity of infill development that supports walkability and non-motorized transportation options as well as transit, which helps ensure that per-capita nutrient loads are low.
- Provide state-level tools for aligning Watershed Implementation Plans and goals. Any state in the Bay's watershed is competing against all the others for regional economic development opportunities. Communities within Maryland are competing with other Maryland jurisdictions for revenue generating activities like new homes and businesses. In the interest of a level playing field with regard to the costs of TMDL and pollution reduction strategies, the EPA must provide tools to coordinate WIPs across the state and watershed. These may take the form of checklists, approved technologies, common policy objectives and priorities, or guidance. All participants need to be planning under the same rules and assumptions.
- Make recommendations on how to use Smart Growth to achieve TMDL goals. The EPA must apply the best science

and land development techniques to suggest ways to achieve Chesapeake Bay water quality goals in the context of growth demands. The EPA has available to it tremendous resources that municipalities throughout the watershed lack. The EPA should capture and coordinate the expert advice of Smart Growth practitioners and researchers such as EPA's Office of Smart Growth, the National Center for Smart Growth, and the Smart Growth Network along with local groups such as 1000 Friends of Maryland, the Eastern Shore Conservancy, and numerous progressive local Planning departments. From this body of knowledge, the EPA must recommend Smart Growth strategies that will reduce pollutant loading and advance water quality goals. EPA should include differences in nutrient emissions from smart growth development compared to sprawl development in its TMDL model and permit reviews.

Response

EPA agrees with the principles of SmartGrowth and believes that careful urban/suburban planning using the principles of SmartGrowth are important tools to be used to address many of the sediment and nutrient problems within the Chesapeake Bay watershed. With each successive WIP in Phase II and Phase III, it is expected that each jurisdiction will work with its local partners to refine the allocations in the Phase I to a finer scale. Principles such as SmartGrowth EPA may be useful practices that can be utilized by Maryland in developing the finer scale allocations. EPA encourages organizations such as your's to reach out to Maryland to participate in the Phase II WIP development process.

- Promote flexibility in the application of development ordinances and regulations to incorporate development techniques and patterns, like Smart Growth, that will improve water quality. EPA should provide technical assistance and guidance on how to implement such a program. In order to realize the benefits of Smart Growth and advanced techniques of land development such as Form-based Codes and Transfer of Development Rights, jurisdictions must be encouraged to allow them in their development ordinances and regulations. Templates, model language, complementary water quality improvements and other such guidance should be coupled with technical assistance to promote solutions that embrace innovation and adaptation to site-specific opportunities. Cookie cutters don't even work on all cookies.

- The Sustainable Communities Act of 2010 geographic criteria need to include site design. The State of Maryland recently enacted legislation to encourage the creation of sustainable communities. Other states in the watershed have passed or are considering similar legislation. EPA should suggest that all of the states in the Chesapeake Bay watershed include sustainability goals with site design in their criteria and Smart Growth among the recommended guidance to ensure that low-density development does not use up development capacity needed for smart growth..
- Be a strong advocate of Smart Growth to developers on behalf of individual communities, particularly those that do not have staff to provide an outreach role for themselves. Encourage states to be advocates as well. New development is the purview of private companies (developers, designers, constructors). Regulatory flexibility and enticements discussed above may not convince a developer that a sufficient market exists to build in a sustainable, environmentally responsible way. EPA must advocate for sustainable patterns of development. Where communities do not have professional staff to provide their own advocacy, EPA and the state's roles are critical to achieving an outcome that will achieve water quality goals.
- Provide targeted outreach and education support for elected officials. Traditional means of accommodating growth will always be easier, less expensive, and more expedient because it is what we are used to and what our systems are designed to support. Elected officials in jurisdictions across the watershed must be aware of the issues and advocates for change. Without elected officials leading their communities to the understanding that water quality in the Chesapeake affects and is the responsibility of everyone, these efforts will fail as previous ones have. EPA must educate elected officials about the importance, benefits, and opportunities to be gleaned from TMDL compliance.

The strategies above remove barriers to sustainability. They encourage patterns of development that facilitate water quality improvements and growth. They are designed to allow environmentally responsible development to happen and encourage developers to build it. They further help the public and elected officials join in the effort to save the Chesapeake Bay. The scale of change needed to rescue the Bay demands innovation. Accommodating growth in a context of reduction will require participation from all stakeholders. It will require leadership. The Environmental Protection Agency has been given this leadership role.

The Maryland Chapter of APA and its members feel strongly that walkable, sustainable communities complement environmental health. Air and water quality are enhanced by development patterns that discourage personal automobile use. Energy demands are reduced by clustered development, and natural areas are left to flourish. The Maryland Chapter of the American Planning Association urges EPA to use its authority to encourage Smart Growth as a tool in the cleanup of the Chesapeake Bay and as a means for environmental responsibility broadly.

Organization: Senior Bay Scientists and Policy Makers for the Bay

In setting the TMDL, it is essential that there be specific plans to achieve needed reductions in nutrient and sediment loading from nonpoint sources in all 92 waterway segments and that these plans should include an implementation schedule with ongoing verification of implementation and operation to credibly document that they are making real and reasonable progress. Invoking "endangerment" and/or "anti-degradation" authorities could also be used to expand responsibility for addressing water quality impairments from agriculture as well as urban nonpoint sources.

Response

EPA agrees that an implementation schedule and verification are key elements to be included in each jurisdiction's WIP. EPA reviewed each WIP to ensure that these elements were sufficiently considered in each final Phase I WIP. The results of EPA's evaluation of each jurisdiction's final Phase I WIP can be found in Section 8 of the final TMDL report.

EPA will track the jurisdictions' progress toward achieving the gap-filling strategies proposed in their WIPs and their TMDL allocations through the jurisdictions' 2-year milestone commitments as described in Section 7.2.3 of the final TMDL report. Where jurisdictions are not meeting their commitments, EPA may use federal actions as identified in Section 7.2.4 of the final TMDL report.

Comment ID 0516.1.001.010

Organization: Senior Bay Scientists and Policy Makers for the Bay

The comments above and the 25 specific measures detailed below are submitted on the draft TMDL and we would urge EPA to implement the TMDL by the end of this year and to require that these suggestions be incorporated into EPA's plans for the TMDL and by other federal agencies actions under the TMDL process and the Executive Order restoration plan. We also would urge the inclusion of these measures and requirements in state WIPs to meet the reasonable assurances requirements as you review the WIPs under the TMDL process. We believe these changes are essential to insure the Bay's restoration:

BETTER CONTROLS NECESSARY FOR AGRICULTURAL POLLUTANTS.

1) The EPA should require each state's WIP to include requirements to implement measures, including BMPs, throughout each waterway segment in your state of the 92 designated by the EPA for the entire Bay watershed. These are necessary to achieve the nutrient and sediment TMDLs by a date certain to meet "reasonable assurance" expectations. Each state's WIP should include detailed sanctions for any source that fails to meet the TMDL limits and two-year milestones. The primary proposed Federal punitive measure to address failure to achieve two-year milestones appears to be a further reduction in the waste load allocation for point sources. Point source controls are expected to

achieve their allotted nutrient reductions by about 2012. It appears illogical and unfair to punish this sector if it meets the targeted caps while leaving nonpoint sources without any realistic and certain sanctions. It would be much more effective for the EPA and each state to develop regulatory sanctions against nonpoint sources with assured enforcement.

2) Reducing nonpoint source loads from agricultural operations, including any necessary new regulations and better enforcement, should be part of each state's WIP. These must include readily enforceable mechanisms. The required "reasonable assurances" that the states will meet nonpoint source load limits dictate strong, verifiable measures to reduce agricultural nutrients and sediment loads. Assuring monitoring efforts at a reasonable scale for nonpoint source pollutants from agriculture is essential. The monitoring results should be available to the public. The implementation of Best Management Practices (BMPs) needs to be publicly reported at a parcel scale.

3) Discrete, performance-based targets for nutrient and sediment reductions from all nonpoint sources to improve water quality in each of the 92 waterway segments, including all BMPs, should be required in each WIP, and assessments of those BMPs and reduction targets should be required to be conducted by independent third-party entities to assure effectiveness and proper implementation.

Response

EPA in its review of state Watershed Implementation Plans was particularly interested in how state agriculture plans would include traditional and innovative programs, policies, legislation, and any other elements that would support proposed agriculture implementation levels that were included in modeling input decks.

Modeling input decks contained quantitative levels of best management practices which could be viewed as the underlying framework for how load reductions were calculated. In reviewing the state narrative portions of the WIPs there had to be adequate descriptions of the array of agriculture programs that then would provide reasonable assurance that for the BMPs proposed in the modeling deck there was a corresponding narrative.

Nonpoint source programs proved to be one of the most challenging sectors to achieve a high degree of reasonable assurance based on the voluntary and to a certain degree mandatory nature of programs that implement farm conservation programs.

Most states did provide a high degree of details for each program and additionally contingencies/program evaluations to track program progress. In Phase 2 state Watershed Implementation Plans will get into the next level of details for all of the individual segments that make up the Chesapeake Bay watershed.

6) The EPA should require that all state WIPs require that on any agricultural lands that receive human sludge and/or animal waste/manure, cover crops should be mandatory for a minimum of one year after application. Even with the use of cover crops, sludge and animal waste/manure should be required to be injected or incorporated into soils within 24 hours of application. Further, the practice of human sludge or animal waste/manure application to fields with excessive phosphorus levels must be stopped. The WIP should require reducing phosphorus levels to agronomic requirements and soil tests before all applications of human sludge and/or animal waste/manure. These latter measures must be required to assure that phosphorus is not applied where not needed.

7) Greater accountability and verification of performance of agricultural BMPs is essential and the EPA must require this in state WIPs.

8) The EPA and each state WIP should mandate whole-farm water quality plans for all agricultural lands including the next generation of nutrient management, with clear targets, a reasonable implementation schedule, progress checks, and enforcement. This is critical to restoring the Bay and should be mandatory.

Response

Two of the management practices included in your letter- cover crops and better management of phosphorus as part of land application rates are very important to EPA. You may be aware of the Chesapeake Bay Executive Order's Section 502 Technical Guidance document that includes an array of agricultural management practices that address all of the components for reducing nutrients and improving water quality on farms. EPA developed the technical guidance for federal agencies in the Chesapeake Bay to use and also essentially sent a message to states in the Chesapeake Bay watershed that the suite of management practices were the ones, at a minimum, that state agencies should be aware of as programs are updated in the future.

Greater accountability and verification of planned implementation levels have been recognized by EPA as two critical elements that need to be included in state WIPs. Included in state agriculture WIPs were an array of best management practices and programs that helped achieve that 60% of the nutrient reductions by 2017 and 100% of the reductions by 2025. These management practices were reviewed and compared to the modeling input decks to assure that were complementary. EPA will continue to review the 2 year milestones that states have developed as another means to provide accountability for planned nutrient reductions programs.

Organization: Senior Bay Scientists and Policy Makers for the Bay

11) EPAS's TMDL process and review of WIPs should assure that measures are included for improved water quality retrofit requirements for MS4 permits and for all developed lands including road construction or reconstruction, and all such MS4 permits should be required to meet the no net increase in rate, volume, and pollutants rule. For re-development, to the maximum extent practicable, no net increase in rate, volume, or pollutants should be required for a 5-year storm and offsets required where this no net increase requirement cannot be met. Each WIP must include funding mechanisms to provide reasonable assurances that such urban retrofit will be accomplished.

12) The EPA should assure that each state's WIP includes provisions for improved water quality through systematic urban retrofits of large areas of developed lands such as shopping centers, large industrial sites, and other large impervious surfaced areas in private ownership, with mandatory measures and timelines for such retrofits.

Response

EPA published a memo in July 2010 titled "Urban Stormwater Approach for the Mid-Atlantic Region and Chesapeake Bay Watershed" which contains eleven critical elements that EPA wants to see included in all new and reissued MS4 permits. Two of the elements included in the memo are retrofitting for existing discharges and performance standards for new and redevelopment. EPA affirms that these elements be included in all MS4 permits as they are submitted by states for review and approval.

EPA review of State WIPs was very critical of state regulations and permits that were lacking retrofit requirements. This issue has been brought to the attention of individual states as a major focal point moving forward with Phase II of the WIP process and should be considered an effective tool that states use for achieving TMDL reductions.

Organization: Senior Bay Scientists and Policy Makers for the Bay

15) The EPA should encourage state WIPs to require a no net loss of forest coverage in each Bay watershed of the 92 waterway segments to achieve the nutrient and sediment TMDLs by a date certain to meet "reasonable assurance" expectations. WIPs also should contain detailed measures to expand forested buffer coverage to at least 85% of all the shores of the Bay and its tributaries.

16) State's WIPs should target federal and state funds from land preservation programs for the fee simple or easement purchase of sensitive lands such as forests and wetlands on private lands and farm lands, especially those bordering the Bay and its rivers. Acquisitions should take into consideration State Wildlife Action Plans and Green Infrastructure maps that have been updated to reflect the implications of climate change and expected sea level rise.

WIPS SHOULD INCLUDE SEPTIC SYSTEM NUTRIENT REDUCTION REQUIREMENTS.

17) WIPs must include provisions that require all new and replacement on-site waste disposal systems (OSWDS) in the Chesapeake Bay watershed to be systems that utilize the best available technology (BAT) for nitrogen removal.

18) Each state WIP should include requirements for implementation of a mandatory septic inspection program for existing systems, with a requirement for a best available technology (BAT) system for nitrogen removal in failing systems.

19) Each WIP should contain requirements to evaluate existing clusters of septic systems for connection to centralized sewage treatment that uses Enhanced Nutrient Removal (ENR).

BETTER CONTROLS NECESSARY TO REDUCE NUTRIENTS FROM WWTPS IN WIPs.

22) All Wastewater Treatment Plants (WWTPs) should be required to meet nutrient discharge limits of no more than 3.0 mg/l Nitrogen and 0.3 mg/l Phosphorus and these should be included in WIPs.

23) Each state WIP should allocate WWTP pollution loads based on 2010 wastewater flows, assuming a concentration of 3.0 mg/l of nitrogen and 0.3 mg/l of phosphorus. Any increased nitrogen or phosphorus loads with flows beyond 2010 actual flow levels must be offset with equal or greater reductions from other sources.

24) Each WIP must aggressively address and fund infrastructure upgrades to prevent and treat combined sewer overflows.

25) The EPA should act to adopt measures to assure that existing Clean Water Act and other water quality laws are fully enforced, including at all WWTPs, and each WIP should adopt necessary measures to assure such enforcement.

Response

See response to Comment No. 0034-cp.001.001. Also, EPA agrees that the Clean Water Act need to be fully enforced. States and EPA heavily rely on the regulatory provisions of the Clean Water Act to regulate WWTPs. This too will continue to be key in our efforts to realize the nitorgne and phsophorous loading levels we seek for the Bay.

Pollution from urban growth is the one source of nitrogen and phosphorous that is headed in the wrong direction. As the States create their Watershed Implementation Plans (WIP), the EPA should give particular scrutiny to their efforts to minimize pollution from future growth and development.

Response

EPA agrees that future growth must be considered by jurisdictions as part of their WIPs. EPA reviewed the final WIPs for each jurisdiction against EPA's expectations outlined in its November 4, 2009, WIP expectations letter sent to each jurisdiction as well as the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. The results of the final WIP evaluations can be found in Section 8 of the final TMDL. Because the final WIPs are improved from the drafts, EPA has removed or reduced the backstop allocations for wastewater treatment plants.

Organization: The Pew Environment Group

Improvements Needed

From our review of the individual state WIPs, we conclude that the state plans-even supplemented by EPA's backstop proposal-are not strong enough to achieve significant pollutant reductions from CAFOs and the manure generated by intensive livestock confinement in the region.

In discussing reductions from the agricultural sector, the state WIPs summarize existing programs and discuss the need for additional resources to assist farmers with preparation of nutrient management plans and share costs for manure storage facilities, stream fencing, cover crops, manure transport and other best management practices. Several assume significant increases in such practices to achieve large percentages in reductions, but for the most part do not identify

specific new funding sources to assure that farmers will voluntarily adopt additional management measures. Virginia's WIP stresses nutrient trading but does not offer the needed detail on verification and accountability that such a program would require. Maryland's WIP notes that it is considering changes in the use of the phosphorus index but does not yet commit to that positive step. Delaware's WIP acknowledges the need to consider future growth of animal waste, but it presumes, we believe wrongly, that an expected decline in the number of farms negates any need to plan reductions around further increases in livestock numbers or in livestock concentration in areas with excess manure.

Overall, the WIPs and the backstops proposed by EPA build incrementally on existing programs, many of which are needed and worthwhile, but will not, of themselves, provide the level of pollutant reductions needed. The TMDL is necessary because decades of programs using traditional Clean Water Act approaches have not restored the Bay. By definition, then, the TMDL and the WIPs that lay out how it will be implemented must be ambitious and innovative. They should, of course, incorporate the best of the programs that the states and EPA have developed to date, but in order to be successful, they must go beyond those efforts.

When it comes to agriculture in general and CAFOs in particular, we recommend new priorities and approaches.

- Improve Controls on Application of Manure to Cropland

Several states have worked to control releases associated with the use of manure as fertilizer, but those efforts have not been enough. Though nutrient management plans are required by a large segment of the agriculture community in Maryland, Delaware and elsewhere, and some states report high levels of compliance, releases are still unacceptably high overall. The nutrient management plans are a central linchpin for good environmental management, but USDA's own report on the Chesapeake Bay notes that some plans are inadequate on the fundamentals of timing, rate, form and method of fertilizer application, and USDA and others [FN8] have noted that some nutrient management plans in the region are still based on nitrogen and, therefore, sanctioning possible over-application of phosphorus. The Bay states, along with EPA and USDA, must commit to re-evaluating the currently acceptable methods of developing nutrient management plans and assure that deficient plans are corrected expeditiously. In addition, EPA's backstop measures for CAFOs should address manured cropland as well as CAFO production areas.

- Restrict or Eliminate Manure Application in Phosphorus Saturated Soils

As noted above, technical experts have raised concerns that farmers may be applying manure in sensitive areas, either based solely and inappropriately on nitrogen management or based on phosphorus management protocols that fail to consider the potential for non-erosion related releases of the pollutant. If this is the case in even a portion of the watershed, the soil "sink" of phosphorus that is being created will become a new long-term source of pollutant that will

be exceedingly difficult to control. We believe that there is an urgent need to better understand and address the buildup of phosphorus in Bay watershed soils, and urge EPA, USDA and the states to convene an expert panel to assess the status of soils in the watershed, develop plans for tracking trends in soil saturation, and assure that appropriate steps are taken to restrict or eliminate manure application in saturated areas.

[FN8] Caitlin Kovzelove, Tom Simpson, and Ron Korcak, "Quantification and Implications of Surplus Phosphorus and Manure in Major Animal Production Regions of Maryland, Pennsylvania, and Virginia" (Water Stewardship, Inc, February 2010), http://waterstewardshipinc.org/downloads/P_PAPER_FINAL_2-9-10.pdf.

Response

EPA in developing its program technical guidance under section 502 as part of the Executive Order for the Chesapeake Bay included for federal lands guidance that underscored not applying organic fertilizer to cultivating lands should the level of phosphorus soil concentration be above 20 percent. The technical guidance document was developed based on input from well recognized Chesapeake Bay scientists who based upon literature results and practical experience developed a series of important management practices that may be used as EPA develops its Chesapeake Bay CAFO regulation.

EPA is also aware of concerns associated with the over application of poultry litter based on acceptable application rates that are supported by each states' Phosphorus Site Index. In several areas throughout the watershed geographic hot spots were elevated levels of nutrients have been recorded support the fact that the P Index needs to be updated in the very near future. One of the traditional problems associated with how P soil levels increase is the limited accountability of state NMP for grain farmers who can fairly easily apply much larger amounts of poultry litter on corn as an example to achieve higher levels of production.

EPA continues to work with several USDA agencies who have technical responsibilities to develop technical standards for the agricultural community many of which direct water quality impacts to the Chesapeake Bay.

Comment ID 0586.1.001.012

Author Name: Fischer Micaela

Organization: The Pew Environment Group

We also recognize that the Bay states have adopted a variety of programs, including important initiatives to require nutrient management plans from many agricultural producers, track manure shipments, support alternative uses of manure, address release of pollutants to groundwater and take special efforts to maintain high quality waters. These efforts have been important steps in Bay restoration, but more work remains. Unfortunately, the draft WIPs do not yet provide the specific plans for technical standards and technical assistance, financial incentives, regulatory programs and compliance and enforcement strategies that are needed for the next level of effort called for by the Bay Agreement and the TMDL.

Response

See response to Comment No. 0034-cp.001.001

Comment ID 0590.1.001.004

Author Name: Chavez Jennifer

Organization: Earthjustice et al.

3. Evaluation of State WIPs: EPA irrationally and incorrectly classifies the District of Columbia's WIP as having "some" rather than "serious" deficiencies. The proposed WIP provides for only 60% of the sediment reductions needed to meet the TMDL's 2025 target. DC WIP at 17. A plan that fails to provide for almost half of the reductions needed to implement the TMDL is severely deficient, and warrants imposition of the full range of federal backstop measures. At the very least, given that a major portion of the District's sediment load is from MS4 discharges, EPA must require the same or greater level of pollution control for urban MS4 lands as EPA has proposed for moderate and high-level backstop states. Moreover, to the extent this shortfall is attributable to deficiencies in the Maryland WIP (because of upstream sediment loads from Maryland to the Anacostia and Potomac Rivers), EPA must classify the Maryland WIP as seriously deficient as well.

Response

EPA found the draft Phase I DC WIP to be deficient, and agrees that the original sediment gap was significant. In the interim the District has worked to remedy that deficiency, and the final Phase I WIP submitted on November 29, 2010 no longer contains a sediment gap.

By the way, there are some easy ways to reduce pollution and help the economy at the same time. For example, requiring all manure from agricultural operations to be used to make biogas to run small power plants or produce heat, and not simply left in lagoons would drastically reduce pollution, produce energy, and reduce greenhouse gases. It is incomprehensible that this is not required.

Response

See response to Comment No. 0044.1.001.004

Comment ID 0654.001.003

Author Name: Igli Kevin

Organization: Tyson Foods, Inc.

2. Tyson supports the use of Nutrient Management Plans (NMP) as a necessary component of environmentally sound land application practices. Moreover, Tyson believes that all sources of nutrients, including commercial fertilizer, should be land applied according to a NMP. The Bay states have passed laws and implemented regulations requiring that poultry litter utilized as an organic fertilizer be land applied pursuant to site-specific NMPs. EPA's TMDL does not appear to contemplate NMPs governing commercial fertilizer applications. EPA should encourage Bay states to develop NMP requirements for commercial fertilizer users.

Response

Currently, EPA does not have the statutory authority to regulate fertilizer. However, under EPA's CAFO program, fertilizer is taken into consideration as a source of nutrients when developing rates of manure application in a NMP.

Organization:

1. What happened to the 5% Reserve originally required by EPA (to offset model updates underway but not complete) to be included in the WIP to account for modeling updates?

2. Regarding the 5.3 Model:

a. When will a revised version (i.e., 5.3 Model) be published that incorporates the urban land area revisions currently being peer reviewed?

b. How do these areas compare with the numbers released to the public on May 25,2010:
[Please see table 2.b. on page 1 of the original letter (EPA-R03-OW-2010-0736-0687)]

c. What will the effect of these new areas be upon the current loading rates of:
[Please see table 2.c on page 1 of the original letter (EPA-R03-OW-2010-0736-0687)]

d. What effect do you expect this will have on Sector Load Allocations in Phase II?

e. When will the Phase 11 WIP allocations be provided to the public?

Response

1. The 5% temporary reserve was intended to be returned to the states after the models were updated. However, based on public comments received, with the final TMDL, EPA has chosen to dismiss with the reserve concept. So the full allocation has been

provided to the states with no reserve.

2a. The revised p5.3 model with urban land revisions is scheduled to be released in the spring of 2011.

2b. The revised urban areas are still under review so the comparison can not be made yet other than to say that it is very likely that the urban areas will be increasing, especially in lower density areas.

2c. The effect of new urban acreage on loading rates must be estimated based on existing data. Since the overall loads are calibrated to in-stream data, the overall loads will be relatively consistent and therefore it is likely that average loading rates for all land use types will decrease slightly.

2d. Many factors other than the updated model may have an effect on the phase II sector loads, so it is not possible to accurately predict the effect.

2e EPA will announce the schedule for the Phase II WIPs in early 2011.

Organization: Capital Region Council of Governments TMDL Work Group

27. Since EPA places significant weight on the WIPs, these plans should be part of the TMDL itself and subject to public comment and response by EPA.

Response

The WIPs inform the Chesapeake Bay TMDL and how the Bay watershed jurisdictions plan to implement the TMDL. As described in Section 7 of the TMDL, although the WIPs are part of the accountability framework, they are not part of the TMDL itself. As the WIPs were drafted by the jurisdictions and describe actions to be taken by the jurisdictions, comments and responses thereto are more appropriately addressed to the jurisdictions. Comments regarding the manner in which EPA evaluated the WIPs and how the WIPs factor into the TMDL and the accountability framework are properly addressed to EPA; the Agency is responding to these comments and is incorporating them into the final TMDL as appropriate. Also please see response to comment 0737.001.005.

I also want to draw your attention to legislation I recently introduced, the Save the Bay Homeowner Act of 2010 (H .R. 6382), which would allow the 17 million citizens of the Chesapeake Bay watershed to become citizen stewards of the Bay and give them an active role in restoring it. I hope you will include a similar approach in the final TMDL rule.

H.R. 6382 directs the EPA to develop a "Save the Chesapeake Bay Home" designation program that identifies various steps homeowners could voluntarily take around their property to reduce nutrient and sediment runoff and improve water quality in local streams and rivers that feed into the Bay. If a participating home meets certain standards, as developed by the EPA, that home could be designated a "Save the Chesapeake Bay Home." The bill further directs the EPA to give credit to states and local jurisdictions for nutrient and sediment level reduction based upon the number of homeowners that achieve the "Save the Chesapeake Bay Home" designation.

I would urge the Environmental Protection Agency to develop a "Save the Chesapeake Bay Home" designation program in the process of finalizing the Chesapeake Bay TMDL. As state and local governments look for tools to meet new nutrient reductions standards, programs like this can offer new innovative and cost effective ways to help communities meet these requirements. By engaging the millions of people living within the watershed to become citizen stewards of the streams and rivers in their community, we can make additional strides toward truly saving the Chesapeake Bay.

Response

While the TMDL itself does not include implementation strategies, innovative tools such as that proposed in your comment, are what is needed to realizing a restored Bay. . Each jurisdiction is responsible for developing a WIP and identifying regulations, BMPs or other implementation strategies within its WIP for meeting the pollution allocations under the TMDL. As EPA considers future modifications to the TMDL as part of the Phase II and Phase III WIPs, EPA will encourage jurisdictions to implement tools such as those proposed in your comment. Thank you for supporting the efforts to restore the Chesapeake Bay.

Comment ID 0184.1.001.004

Author Name: Hively Christopher

Organization: Town of Culpeper, Virginia

We understand that the Draft TMDL is fundamentally and materially flawed. These deficiencies are thoroughly documented in the comments of the Virginia Association of Municipal Wastewater Agencies, Inc. ("VAMWA"). We request that EPA fully consider and address all of VAMWA's comments, which we generally support and hereby incorporate by reference as if fully set forth herein.

Response

EPA respectfully disagrees with the commenter's assertion that the draft Chesapeake Bay TMDL is fundamentally and materially flawed. Under the Clean Water Act and existing TMDL regulations, EPA is required to use the best available data and information. Building upon decades of Chesapeake Bay region focused scientific investigations, monitoring of the Bay's tidal waters, watershed and airshed since early 1980s, tracking of implementation practices and technologies for the past 25 years, and application of continually upgraded modeling tools by the partnership since the 1980s, the Bay TMDL was developed consistent with these requirements.

Regarding your request to consider VAMWA's comments, EPA has fully addressed VAMWA's comments in their entirety in the responses to comments 0288.1.001.001 thru 0288.1.001.036 and 0288A01.001.001 thru 0288.A51.001.001.

Organization: Hopewell Regional Wastewater Treatment Facility (HRWTF), Virginia

Proposed Backstop Allocations are Unfair Particularly in the James River Basin: The proposed backstop allocations for POTW dischargers are included in the draft Chesapeake Bay TMDL because EPA does not believe Virginia's WIP provides "reasonable assurance" that nonpoint discharges will meet allocations. In the James River Basin, only 17% of the agriculture nitrogen controls have been met. Yet, EPA has proposed what it has termed "moderate" reductions to Virginia's WIP POTW allocations to achieve the nutrient compliance goals rather than expecting a high level of effort from the agricultural sector. EPA should allocate point and nonpoint sources in an equitable manner.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Comment ID 0224.1.001.003

Author Name: Fiala Barbara

Organization: Broome County Executive's Office

The communities of New York State that comprise the headwaters of the Susquehanna and Chemung River watersheds have long recognized their role as partners in the restoration of the Chesapeake Bay. In acknowledgment of that role, New York State has made great strides to improve water quality through stringent regulations and programs in the areas of stormwater pollution prevention and agricultural environmental management, exceeding those mandated by the federal government. As a result, New York State water quality far exceeds that of other jurisdictions in the Chesapeake Bay watershed.

EPA's proposed TMDL imposes disproportionately heavy restrictions on New York. If other states reached the level of performance achieved in New York over the past decade for nitrogen and phosphorous, there would be no need for a TMDL. Even if other states in the watershed achieve their mandated allocations, their water would still contain more nitrogen and phosphorous than New York at present.

Comment ID 0378.1.001.003

Author Name: Warner Floyd

Organization: PA Chamber of Business and Industry

In determining what is fair, reasonable and achievable, EPA and DEP need to consider several embedded questions:

- As part of the big picture, how much does each sector contribute to loadings received by the Bay?
- What measures has each sector already taken to reduce its loadings?
- What steps, commitments, and investments are already in progress - and how will potential changes in direction impact those public and private commitments and investments?
- How well do we understand the existing loadings from each sector or subsector, and the sources of those loadings?
- How will the proposed loading limits impact citizens, taxpayers and business owners - are they affordable, or will they

cause community distress, job and investment losses, and unacceptable economic dislocation?

- Within each source sector, are there truly viable actions that can be taken in a cost-effective manner - and then what does it really take to implement those actions, in terms of steps along the way, financial resources, and timing?

One of the observations one might make about some elements of the Pennsylvania WIP and, even more so, the EPA Backstop TMDL, is that some of these questions appear to be unasked and unanswered. Amid extensive prose concerning modeling and descriptions of various governmental programs, these key questions are all too often left unaddressed in a way that allows for thoughtful selection.

Response

Thank you for those comments. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. For further information regarding the costs of implementation, please see the response to comments 0052.1.001.001 and 0052.1.001.002.

Comment ID 0382-cp.001.004

Author Name: Combs Tina

Organization: Chamber of Commerce, Martinsburg and Berkeley County, West Virginia

The nitrogen, phosphorus and sediment discharge allocations are estimated by algorithmic modeling conducted by an EPA contractor. No direct scientific evidence proves that West Virginia point source discharges impact the Bay or that the assigned allocations will be effective in restoring and protecting the Bay. We believe sound science is needed before wasting millions of dollars in public monies on an inadequate or inappropriate solution to the problem.

Response

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0439.1.001.001

Author Name: Littrell Judy

Organization: New York Association of Conservation Districts

New York State Has Been Proactive in Improving Water Quality of the Susquehanna

NYACD is very concerned of the effects that the proposed TMDL would have on the State of New York. For the past 10 years or so, New York has taken a proactive approach to sending clean water to the Chesapeake Bay, with the formation of the Upper Susquehanna Coalition (USC) which is a group of 16 Soil and Water Conservation Districts (SWCDs) aimed at partnering to improve natural resources in the basin, with a commitment to continue to do so. Because of the proactive work of the USC, the partnering SWCDs, and other partners such as NRCS, the water leaving New York and being tested in Towanda, PA, is deemed to be healthy. Therefore, if each of the Bay states had New York's current water quality, as it is in Towanda, nutrient and sediment problems would be nonexistence in the Chesapeake Bay, and the Bay would be healthy.

New York Being Treated Unfairly: All States in the Basin Need to be on a Level Playing Field

That being the case, NYACD is asking that New York be treated more fairly in terms of the TMDL and the Watershed Implementation Plan, and be given credit for the proactive work that has been done.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and allocations and refer to the response for comment 0080-cp.001.002 regarding New York allocations.

Comment ID 0439.1.001.009

Author Name: Littrell Judy

Organization: New York Association of Conservation Districts

While NYACD understands the importance of restoring water quality to the Bay, it must be done so in a realistic and fair manner. The draft TMDL allocations are unattainable for New York to achieve, based on the health of the water currently leaving New York, and the strength of the programs already in place.

Response

Please refer to the response for comment 0080-cp.001.002 regarding New York allocations.

Comment ID 0439.1.001.011

Comment ID 0528.1.001.016

Author Name: Barnes C.

Organization: County of Spotsylvania, Virginia

VIII. RECOMMENDATIONS

Spotsylvania recommends an evaluation of current BMPs to establish the existing conditions base loads that should be controlled by the draft TMDLs. The current information offered by EPA has many potential flaws. The draft TMDLs are based upon dated information that, while useful for planning purposes, is not appropriate for use as detailed requirements and limits.

Response

EPA respectfully disagrees with the commenter's assertion that the draft Chesapeake Bay TMDL has many potential flaws. Under the Clean Water Act and existing TMDL regulations, EPA is required to use the best available data and information. Building upon decades of Chesapeake Bay region focused scientific investigations, monitoring of the Bay's tidal waters, watershed and airshed since early 1980s, tracking of implementation practices and technologies for the past 25 years, and application of continually upgraded modeling tools by the partnership since the 1980s, the Bay TMDL was developed consistent with these requirements. Please see the response to comments 0238-cp.001.002 and 0379.1.001.006 for more information on the models utilized in the Chesapeake Bay TMDL development.

Please see the response to comments 0648-cp.001.002 and 0238-cp.001.002 regarding BMP credits for water quality improvements.

Comment ID 0529.1.001.003

Author Name: Laczynski Michael

Organization: INVISTA - Waynesboro

In general, it appears that the Draft Chesapeake Bay TMDL provides a waste load allocation for municipal separate storm sewer systems but not for industrial or construction storm water sources. It is our understanding that EPA's designation is in error and that EPA intended for its waste load allocation to include all three sources of storm water loading.

Response

EPA identified expectations and a guide for the contours of the WIPs and asked the jurisdictions to submit WIPs to support their recommendations for EPA's TMDL allocation decisions for various pollutant loading sectors. EPA reviewed the WIPs to determine if they provided adequate reasonable assurance to support the jurisdictions' recommended allocation scenario. Where EPA determined that those WIPs provided adequate reasonable assurance and met the jurisdictions' respective pollutant cap loadings, EPA used all (or those parts found adequate) as the basis for its TMDL allocations for that jurisdiction.

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. If a jurisdiction's WIP provided wasteload allocations to a particular sector such as municipal separate storm sewer systems, industrial or construction storm water sources, then those wasteload allocations would be incorporated into the final TMDL by EPA. Please see Appendix Q and R for more detailed allocation information for annual TMDLs and daily TMDLs, respectively.

Comment ID 0529.1.001.004

Author Name: Laczynski Michael

Organization: INVISTA - Waynesboro

Unfortunately, since the Draft TMDL does not document the total nitrogen, total phosphorus and sediment allocations for the Baugher Farm storm water point source, INVISTA cannot comment on the appropriateness of the allocations other than to say that zero allocations are not feasible. The Virginia General Industrial Storm Water permit currently issued for Baugher Farm has a limit of 100 mg/l Total Suspended Solids for storm water discharged to streams with a Virginia TMDL. The South River currently has a Virginia developed TMDL for benthic organisms (sediment and phosphorus), and bacteria.

EPA must correct the Draft TMDL to reflect its error and should include an explanation as to how it assigns the allocations. This missing information further emphasizes the need for EPA to reissue a corrected Draft TMDL with a more appropriate 90-day comment period.

I appreciate the opportunity to comment on the EPA's Draft Chesapeake Bay Total Maximum Daily Load (TMDL). If you have questions or comments, please do not hesitate to contact me or Brenda Kennell (for technical comments) at the address on the letterhead.

Response

Final TMDL allocations were based on each jurisdiction's WIPs. Regarding specific comments on a jurisdiction's WIP, please refer to the response for comment 0034-cp.001.001. Please see Appendix Q and R for more detailed allocation information for annual TMDLs and daily TMDLs, respectively.

For waters that have both local TMDLs and Bay TMDLs for nitrogen, phosphorus, and sediment, the more stringent of the TMDLs will apply. In some cases, the reductions required to meet local conditions shown in existing TMDLs may be more stringent than those needed to meet Bay requirements, and vice versa. Local TMDL requirements must still be met in addition to these new TMDLs.

EPA has received numerous comments with suggested editorial or typographical revisions. EPA has reviewed each of these suggested revisions and where appropriate, has incorporated them into the final TMDL report. Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Regarding your request to reissue the Draft TMDL and extend the comment period, please see the responses to comments 0062.1.001.004 and 0060.1.001.001.

Comment ID 0535.1.001.003

Author Name: Perkinson Russ

Organization: Virginia Department of Conservation and Recreation

Subsector Equity of Stormwater Allocations

Several subsectors exist for the urban stormwater source sector category. For equity reasons, it is important that EPA's allocations fairly distribute the load among these subsectors.

Recommendation: For any EPA allocations or backstops to urban stormwater, the allocations need to apply equitably across regulated urban stormwater subsectors such as MS4 permits and Industrial Stormwater permits.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0545.1.001.004

Author Name: Friedman Suzy

Organization: Environmental Defense Fund (EDF)

Finally, EPA included "backstop allocations" in the TMDL to assure that attainment will be achieved in the event that States fail to demonstrate reasonable assurance of timely achievement of their allocations through WIPs. Although not the preferred choice for States or EPA, the backstop allocations perform a necessary function of filling in where Bay States fail to promulgate adequate WIPs. We note that EPA continues to work with Bay States to revise their draft WIPs, providing additional opportunity for States to strike the balance themselves in determining load and waste load allocations for point sources and non-point sources. [FN5]

[FN5] We encourage EPA to continue working with New York. New York is, in some ways, uniquely situated with not only a smaller, but also declining, population base over which to spread compliance costs.

Response

Please refer to the response for comment 0246.1.001.004. EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all involved including federal agencies and state and local jurisdictions. EPA encourages all to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals.

Population trends, pollution contributions and equity

It is important to note some important differences between the New York portion of the Chesapeake Bay and the watershed as a whole. According to the Chesapeake Bay Program, 16.6 million people live in the Chesapeake Bay watershed and this number increases by approximately 170,000 people per year. [FN2] In contrast, New York's Southern tier has a stable or slightly declining population currently estimated at 629,767 residents or approximately 3.79% of the basin population. The Chesapeake Bay watershed covers roughly 64,000 square miles. [FN3] Around 6262 square miles, [FN4] or 9.78% of the basin's land mass, are New York State lands. Based on these statistics, population density the New York portion of the watershed, including Delaware County, has been in the neighborhood of

101 persons per square mile since 2000, the year we agreed to participate in the Chesapeake Bay Program. In contrast, tidal portions of the watershed have experienced significant growth over that same time period, to an average population density of 276 persons per square mile. With denser human populations, there is a corresponding increase of infrastructure and human waste, both of which increase N and P contributions to the Chesapeake Bay. This is reflected in changes in water quality of the same time frame. The Chesapeake Bay Program sought New York's cooperation in its efforts to restore the bay in 2000. Since that time N and P contributions from New York State, recorded at the Towanda monitoring station, have dropped 2.44 million pounds and .08 million pounds per year respectively. During that same time, a number of monitoring stations in tidal states reported increases in P and N contributions. [FN5] It is clear to us that differences in population and land use between the headwaters and tidal areas of the basin are in large part responsible for this. To our surprise and dismay, New York is being asked to accept disproportionately heavier restrictions than tidal states--the same states that grew in population, developed area, and pollution contributions while New York did the opposite! Much has been made of the importance of the Chesapeake Bay as an example for other large, complex watersheds such as the Mississippi. What kind of message does this TMDL really send to states in those watersheds? From the outside, it must appear that the best way to avoid a larger share of the regulatory burden under a TMDL is to grow as fast as possible, in as irresponsible a manner as possible, as soon as you hear that a TMDL is imminent. If the Chesapeake Bay TMDL proceeds as written, you can be sure that other states, counties and municipalities will take notice, and realize it is not in their best interest to be proactive in improving water quality the way that we were.

When pressed about the blatant inequities of this situation at the October 27th meeting of the Upper Susquehanna Coalition, EPA staff insisted that this was the only way to get tidal states to agree to the TMDL. We reject the idea that headwaters communities deserve to be punished as a requirement of the Chesapeake Bay Program's success. As we have experienced in our interactions with NYC, it is easy for regulatory agencies to place the burden of water quality protection on headwaters communities with low population and low income, because their lack of resources makes it difficult for them to fight for a fair deal. Tidal states stand to gain the most from improving the health of the Bay. They ought to accept an equitable share of the responsibility for its cleanup.

While the Pennsylvania WIP tries to allocate reductions fairly among all sectors, EPA has taken a posture that we believe is irrational, unattainable, arbitrary and counterproductive. In its comments dated September 27, 2010, EPA has purported to find that the Pennsylvania WIP is deficient in failing to provide "reasonable assurance" that the reductions would be achieved in all identified sectors. In particular, EPA claims that the actions identified to address non-point sources, such as agriculture, stormwater, forests and on-lot septic systems, were not adequately described or sufficient. To address these "gaps", EPA has proposed what it calls a "Back Stop TMDL." Rather than framing actions to address the sectors that purportedly are not doing their share, EPA proposes to shift the burden of reductions from these non-point sectors to municipal treatment plants and industries.

Under EPA's proposed Backstop TMDL, EPA proposes to push every municipal treatment plant to the "limits of technology" and beyond that proposes allocations to industries (such as the GTP Facility) that are well beyond any known technology. EPA has described the limits of technology for POTWs as achieving 3 mg/l of nitrogen and 0.1 mg/l

of phosphorus - although there are in fact very few treatment plants in the U.S. that have achieved those concentrations consistently.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and allocations. EPA incorporated federal backstop measures into the draft TMDL because of deficiencies in the majority of draft Phase I Watershed Implementation Plans (WIPs) submitted by the states and District of Columbia in September 2010. Most of these draft Phase I WIPs did not identify programs to sufficiently reduce pollution to meet TMDL allocations and provide assurance the programs could be implemented. As a result, EPA's backstop measures in the draft TMDL focused on tightening controls on federally permitted point sources of pollution, such as wastewater treatment plants, large animal agriculture operations and municipal stormwater systems.

Although a number of backstop options existed, EPA primarily relied on decreasing the WLAs to the point sources in the draft TMDL. EPA did that because point sources are the pollutant discharging source sector for which the CWA gives EPA the clearest authority to ensure implementation of needed controls. Because EPA determined that the jurisdictions' draft Phase I WIPs did not achieve the target allocations or did not provide adequate reasonable assurance, EPA provided draft TMDLs with backstop allocations that reduced the point source loadings as necessary to compensate for the deficiencies EPA identified in the reasonable assurance components of the jurisdictions' draft Phase I WIPs addressing nonpoint source reductions.

EPA has revised its allocations in the Final TMDL as compared with those proposed in the draft TMDL. This is in large part due to the improved final Phase I WIPs and informative public comments on this issue. It was always EPA's preference that the jurisdictions' final Phase I WIPs are used to meet the final TMDL allocations rather than backstop allocations. However, the final Phase I WIPs needed to meet the expectations outlined in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction and meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. Where final Phase I WIPs did not meet these criteria, EPA proposed backstop allocations in the draft TMDL. After applying all backstop allocations that EPA determined were necessary in the final TMDL, EPA ran the combination of specific practices and allocations through the Scenario Builder, Watershed Model and Water Quality Sediment Transport Model (WQSTM) to ensure that the allocations provided in the final TMDL would result in the attainment of WQS. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

For the Bay TMDL, EPA believes that the assumptions underlying its backstop allocations are reasonable according to EPA's existing authority under the CWA and EPA's commitment to ensure and track implementation of actions necessary to restore the Bay by 2025 consistent with Executive Order 13508 (FLCCB 2010). EPA has described in the Federal Strategy and elsewhere, including in its May 2010 settlement agreement resolving the Chesapeake Bay Foundation's lawsuit, its plans for rulemaking addressing nutrient and sediment pollution in the Bay from both the stormwater and CAFO sectors and for tracking and ensuring progress in meeting the TMDL's nitrogen, phosphorus and sediment targets.

Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

But EPA's approach to industry is even more unreasonable and arbitrary. Without evaluating the industries involved, or what measures they each have in fact already put in place to reduce nutrients, EPA explains that the method used to come up with the numbers in the Backstop TMDL made "the assumption that the loads are reduced below the loads identified in the jurisdiction's draft Phase I WIP at a rate equivalent to significant municipal WWTPs going from the WIP loading level to an E3 loading level (down to 3 mg/L TN and 0.1 mg/L TP). In translation, as we understand this, EPA calculated an average percentage reduction in loadings that municipal wastewater treatment plants might make to achieve the limits of technology, and then applied the same percentage to every industry - irrespective of the current situation at each industry, and irrespective of whether their situation was anything at all like a municipal treatment plant.

Response

Please refer to the response for comment 0067.1.001.009. Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

The result, buried in Table 02 of the EPA TMDL, is quite astonishing. For the GTP Facility, EPA has proposed to reduce Total Nitrogen loadings from the level that the Pennsylvania WIP assigns (600,515 lbs/year) to just 3,693 lb/year, and to reduce Total Phosphorus loads from the Pennsylvania WIP value (1,577 lb/year) to 31 lb/year. Based on the GTP Facility's flow rates, the EPA Backstop TMDL would equate to requiring a Total Nitrogen concentration of around 1 mg/l or less, and at Total Phosphorus concentration of less than 0.01 mg/l.

These resulting concentration values are well beyond (indeed, for phosphorus, one order of magnitude below) what EPA itself has acknowledged are the limits of technology.

Response

Please refer to the response for comment 0067.1.001.009. Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

The EPA Backstop TMDL blithely suggests that perhaps the difference could be made up by purchasing credits - but as EPA well knows, there are nowhere near the number of credits available or predicted to be available to cover these values. Moreover, EPA's other comments on the Pennsylvania WIP draw into serious question whether the Pennsylvania credit trading program will remain viable (as EPA seems to be requiring that the baseline for creating credits be redefined from that used to create credits to date).

Response

Such a result would not be our choice, but the result of a poorly-conceived, thoughtless, irrational and wholly arbitrary decision by EPA to punish municipalities and industries for the alleged inadequacies in efforts by other sectors to reduce their nutrient loads. Instead of tackling the real challenges in a constructive manner, EPA proposes to shoot and kill those who are trying to do their part - in the process wasting hundreds of millions of dollars of public and private investments already underway to meet the Pennsylvania WIP objectives.

Throwing out the Pennsylvania WIP to impose a Backstop TMDL containing impossible and draconian mandates on December 31, 2010 will not achieve anything other than create a train wreck, and such a train wreck is not a viable pathway to achieve real Pay improvements. As our region and nation struggle to come out of the greatest economic downturn since the crash of 1929, now is not the time to waste lime, taxpayer funds, and private resources - and it is not the time to take regulatory decisions that threaten to shut down industrial plants and displace employment.

Response

Please refer to the response for comment 0229.1.001.005. The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. EPA SHOULD NOT GIVE PA ANY SLACK. IT SHOULD ENFORCE THE LAW. LOCAL FARMERS WAIT TIL 5PM FRI OR SAT AM TO BURN PLASTIC BARRELS NEXT TO STREAMS. AND THEY HAVE LIVESTOCK IN THE STREAMS ALMOST EVERYWHERE YOU LOOK AROUND HERE.

The DEP has not enforced Federal or PA State laws in the past. The newspaper articles recently published in Lancaster about the Bay and the Amish show a continued reluctance to enforce the laws that impact the Bay. The attachment [Comment Letter contains additional information in the form of an attachment. See original comment letter 0114.1 through 0114.6] contains documents proving that DEP has not enforced the Clean Streams Act. And they show how EPA had to come to 2 very small STPs in Adams County PA to enforce what DEP would not. This was after DEP was confronted with it's own documents (same as some attached) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0114.1 through 0114.6] from it's own file room over the course of 4 days of research into one local watershed. DEP refused to discuss it.

Maryland is impacted more than PA by PA DEP not enforcing the law. And DEP of PA raising the argument that EPA should stick to big cities and big farm operations-letting DEP allow 'unENforcement' as has happened in the past is no longer a viable option for any party concerned with the Bay. The SRBC has these documents and did not act. Obviously DEP has them and the thousands of other pages of showing inspections noting overloads, periiits issued before planning modules approved, etc.... Maryland did not want them, but maybe that has changed.

In the EPA review of the Virginia Watershed Implementation Plan (WIP) the EPA has declared the original draft proposal as inadequate in that it misses the modeled Nitrogen and Phosphorus by 6% and 7% respectively. In natural systems, this is well within an expected variation, therefore the Virginia plan should not be subject to the backup requirements.

EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Comment ID 0213.1.001.006

Author Name: Daley Edwin

Organization: Hopewell Regional Wastewater Treatment Facility (HRWTF), Virginia

EPA's backstop allocations proposal takes a "one-size-fits-all" approach to POTWs and is requiring POTWs in the James River Basin to achieve nitrogen and phosphorus reductions of 4 mg/l and 0.3 mg/l respectively. This approach does not take into account any unique characteristics of POTWs such as HRWTF with its industrial wastewater base. EPA and Virginia DEQ have previously recognized this uniqueness by basing HRWTF's effluent limits on a flow weighted average of industrial effluent guidelines for the pulp and paper and organic chemical, plastics, and synthetic fibers industries along with domestic secondary treatment standards. By using this "one-size-fits-all" POTW approach, EPA is proposing to cut HRWTF's nitrogen allocation by 66% or 1.2 million lbs/year and our phosphorus allocation by 39% or 30, 000 lbs/year. These drastic cuts are likely not achievable with current technology and clearly are not sustainable to our community.

Because of higher than normal influent temperatures and wastewater that is inhibitory to traditional nitrification, HRWTF has for two decades studied nitrogen removal technologies and determined that the limit of technology for HRWTF was 8 mg/l vs. 3mg/l for conventional POTWs. In addition, during the James River Tributary Strategy process, Virginia DEQ acknowledged that BNR equivalency for HRWTF was 12 mg/l compared to 5 mg/l for most POTWs. Based on the knowledge that we have of our wastewater, we are certain that HRWTF cannot reasonably achieve the proposed backstop allocations.

Moreover, our influent wastewater is phosphorus deficient, which requires the addition of phosphorus at a cost of \$70,000 a year in order for biological treatment to occur. Exact amounts of phosphorus needed for biological activity is difficult to control with current technology, however, our effluent phosphorus averages 0.7 mg/l annually. Reducing HRWTF's phosphorus allocation by 39% will require the installation of phosphorus removal technology to a facility that ADDS phosphorus to consistently meet a 0.3 mg/l limitation.

Imposing the proposed backstop allocations on POTWs like HRWTF, places an unfair disadvantage on the Hopewell industries. Other industries that are direct discharges into the James River are not faced with large reductions in their nutrient allocations. By virtue of discharging into the regional treatment system, which, as previously mentioned, was endorsed by EPA, the Hopewell industries will have to pay their share of the costs which will be substantial for HRWTF to meet these backstop allocations. We do not believe our industries can sustain large increases in sewer charges and may choose to close or move where it is more economically stable. In fact, one of the Hopewell industries just emerged from bankruptcy in 2010.

Proposed Backstop Allocations Affect Regulatory Stability and Planning:

In January 2007, almost 4 years ago, Virginia issued its Nutrient General Permit and established the Nutrient Credit Exchange Association, which set the allocations and trading rules for point source discharges into Virginia's Bay tributaries. Compliance plans were developed and approved. Treatment plants designed and built. Virginia's point source allocation achieved. Now, under the proposed TMDL and proposed backstop allocations, it appears that "no good deed goes unpunished". The regulatory stability that Virginia dischargers thought was evident in the general permit and trading agreements will be erased by EPA if the current draft of the TMDL goes into effect.

Since 1985, three major nitrogen reduction projects were implemented in Hopewell at a cost of \$25 million. These project reduced nitrogen in our effluent by 69%. Even with that investment and that much reduction, we are still marginally meeting our current nitrogen allocation. We are currently implementing the first phase of a two phase plan toward additional nitrogen removal. The first phase, at a cost of \$30 million is currently under construction. The second phase was in the preliminary stages of preliminary engineering. However, since the introduction of the draft TMDL, and the uncertainty of final limitations, phase two of the project has been postponed. We doubt that HRWTF is the only

facility that is taking this approach. We believe EPA's proposed TMDL may actually delay Bay clean-up by creating an environment of regulatory uncertainty and setting the stage for future litigation.

Proposed Point Source Backstop Allocation for Sediment is Unnecessary: TSS from point sources is a de minimis load of less than 1%. In EPA's public meetings on the TMDL, one of the slides showed that Virginia's WIP met the sediment allocation. If this is the case, then why are sediment backstop allocations necessary? We believe EPA is being arbitrary in placing this requirement in the draft TMDL. If this requirement remains in the final TMDL, it will require POTWs to install filters to meet a 5 mg/l TSS limit, which will provide no benefit to water quality and will only add unnecessary costs to an already onerous regulation.

Response

we also object to the threatened but not applied "full backstops" that would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow).

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: Algae Producers of America

Reviewing the EPA Evaluation of the Pennsylvania Draft Watershed Implementation Plan, it was noted a rating of "Serious Deficiencies" was assigned due to P (11%) and TSS (1%) being over the 7/1 and 8/13 allocations. As a result, a High Level backstop allocation for Pennsylvania point sources is possible unless the Phase I WIP is strengthened. This could result in significant additional costs if the limit of technology (3mg/L TN and 0.1mg/L TP) for Waste Water Treatment Plants is required. Further, the limit of technology levels identified are representative of Biological Nutrient Reduction (BNR) technologies. There is a growing movement towards Enhanced Nutrient Reduction (ENR) technologies and it is quite possible that these more stringent requirements could be mandated. As summarized in the earlier tables, we have consistently demonstrated the ability to exceed even the more stringent ENR targets at multiple sites.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: Logan Township

The Backstop provisions in the draft EPA TMDL for the Chesapeake Bay are severe and in some cases unachievable.

The Backstop, if implemented, will create severe hardship on most of the residents and businesses in our community and beyond. The actions will likely be legally challenged and progress towards Chesapeake Bay goals will be further delayed.

Questionable data used in determining TMDL limits.

Over the past several years that we have been addressing the need to clean up the Bay, we have been given erroneous information on not only the methods used to determine the extent of the damage, but what levels of remediation are needed to correct the damage that was done. If there would have been any agreement between and within the governmental agencies charged with the duties of finding a solution to the bay's problems we would be much further ahead. If Best Management Practices would have been properly taught to POTW's (as they are to agriculture) we would be much further ahead. So now the answer seems to be, to place the enormous expense of cleanup on those contributing to the bay's problems by 15%, while those contributing to the Bay's issues by 85% still fall into the Best Management Practices category.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay. Additionally, the implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. For further information regarding the costs of implementation, please see the response to comments 0052.1.001.001 and 0052.1.001.002.

Please see the response to comments 0238-cp.001.002 and 0379.1.001.006 for more information on the models and data utilized in the Chesapeake Bay TMDL development.

Author Name: Hazenstab Robert

Organization: Duncansville Municipal Authority

The Duncansville Municipal Authority in Blair County, Pennsylvania has just completed a \$11 million dollar project to upgrade and expand its wastewater treatment plant. Construction was completed in July 2010. A large portion of this project was undertaken because the Authority had been issued a new NPDES permit in September 28, 2007. That

permit required the removal of total nitrogen (TN) and total phosphorous (TP) down to much lower levels than the previous plant had been capable of achieving. The new levels include annual cap loads for TN and TP and are summarized below:

	Previous Permit Limits	Sept. 28, 2007 Permit Limits
Design Flow	1.217mgd	1.75mgd
CBOD5	25 mg/l	25 mg/l
TSS	30 mg/l	30 mg/l
NH3-N (Nov-Oct)	3.5 mg/l	3.5 mg/l
NH3-n (Nov-April)	9.0 mg/l	9.0 mg/l
TN	NA Monitor/Report	6.0mg/l*
TP	NA Monitor/Report	0.8 mg/l*
Annual Cap Load TN	NA	22,228 lbs/yr
Annual Cap Load TP	NA	2,963 lbs/yr
TN @ 1.75 mgd	NA	4.17mg/l
TP @ 1.75 mgd	NA	0.55 mg/l

*Based on cap load limits @ 1.217mgd

The Authority constructed chemical addition facilities, denitrification filter and an effluent pump station to ensure that the plant had TN and TP removal capabilities to the levels required to meet the annual cap loads contained in the September 28, 2007 permit.

The Authority had to increase the billed rates to its customers significantly as a result of this project. The monthly sewer bill had been \$37 per month before this project. As a result of the project, a typical monthly residential sewer bill (4,000 gallons per month) has increased to \$62 per month. This is a 67% increase above the previous monthly sewer rate. Customers using more than 4,000 gallons per month are paying even higher monthly charges.

These rates would be much higher had the Authority not received substantial grant funds to help reduce costs to the local customers.

The Authority is now aware that the U.S. EPA is considering levying "backstop TMDLs" on the Duncansville plant that will reduce its annual cap load to 4,695 pounds per year for TN and 97 pounds per year for TP. At these annual loadings, the average daily flow concentration for TN and TP has to be as follows:

[Original comment letter contains additional information in a table comparing TN and TP concentrations. See original comment letter.]

Our newly constructed plant upgrade cannot meet the proposed "Backstop TMDL" limits at the plant design flow of 1.75 mgd. Since we have infiltration and inflow (I/I) in our sewer system, wet weather flows exceed our daily design flow capacity and the presence of TMDLs as low as the ones proposed only accentuates the problem of meeting a daily limit for TN and TP.

If the Backstop TMDL limits become part of our NPDES permit, then we will be forced to construct yet another plant

upgrade and incur additional costs, which would have to be passed on to our sewer customers. We find the prospect of embarking on yet another plant upgrade so soon after completing the present upgrade to be infeasible. Our community is not a wealthy community by any means. Increasing sewer rates even more, particularly in these difficult economic times, is not a situation we want to face.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. 4. The newly constructed plant upgrades cannot achieve the proposed new TMDL backstop levels. The denitrification filter system is designed to remove TN using methanol. Overdosing with methanol does not guarantee further reductions in TN without causing other operational difficulties and effluent degradation. For example, overdosing of methanol could lead to excess methanol in the effluent which adds CBOD₅, in the effluent. Also this is wasteful of an expensive chemical. Furthermore the on-line continuous nitrate monitoring system cannot measure down to the levels needed to accurately and reliably prevent overdosing. Excess methanol also triggers production of sulfide reducing bacteria and this then begins causing H₂S gas generation. Effluent quality would drop due to presence of higher TSS. Odor generation requires odor treatment, yet another expense to deal with.

Further downstream unit processes would be needed to remove additional TN and TP down to the levels under the capabilities of the present new denitrification system. And as U.S. EPA admits, current technology cannot reliably get effluents below 3.0 and 0.1 mg/l for TN and TP respectively.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which

EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Comment ID 0228.1.001.007

Author Name: Rolband Michael

Organization: Wetland Studies and Solutions, Inc.

The EPA backstop proposes 4.0 mg/L for TN and 0.30 mg/L for TP for Virginia; yet, for Delaware, Pennsylvania, New York, and West Virginia, the EPA proposed a more restrictive backstop of 3.0 mg/L and 0.10 mg/L. Table 3 puts these numbers in perspective:

Table 3: Flow Weighted Average for Concentrations (mg/L) used for Current WLAs for Significant Dischargers by basin. [Please see page 5 of the original letter (Docket ID 0228.1.001.007).] [FN11]

Furthermore, in the Potomac Embayment, the following WWTPs already operate at TN concentrations of 3.0 mg/L and TP concentrations of 0.18 mg/L:

- Quantico Wastewater Treatment Facility;
- Aquia Wastewater Treatment Facility;
- Dale Serv. Corp - Section 1 & 8 Wastewater Treatment Facilities;
- H L Mooney Wastewater Treatment Facility;
- Arlington County Water Pollution Control Facility;
- Alexandria Sanitation Authority Wastewater Treatment Facility; and
- Norman M Cole Jr. Pollution Control Facility.

A recent article in the Washington Post titled, "Potomac River now healthier than in '50s, study shows," [FN12] discussed the dramatic changes in the Potomac River (TP concentration of 0.20 mg/l) since the 1960s and attributed the turnaround to upgrades at the Blue Plains treatment plant. (See Exhibit 3, "Potomac River now healthier than in '50s, study shows.") [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] In stark comparison is the current condition of the James River with significantly less stringent WWTP requirements (TP concentration of 0.65 mg/l). An article in The Virginia-Pilot titled, "Algae blooms strike Hampton Roads waters - again," [FN13] discussed the recurrence of algae blooms in the Hampton Roads area and cited "industrial dischargers" as one source of the problem. (See Exhibit 4, "Algae blooms strike Hampton Roads waters - again.") [Comment Letter contains additional information in the form of an attachment. See original comment letter 0228.1] The direct link between water quality and the WWTP effluent concentrations shown in Table 3 is clear.

[FN11] Current concentrations were calculated from design flows and waste load allocations which were provided by Russ Baxter (DEQ- Chesapeake Bay Program) via e-mail on 9/21/2010.

Comment ID 0229.1.001.002

Author Name: Black David

Organization: Harrisburg Regional Chamber & Capital Region Economic Development Corporation (CREDC)

DEP's proposed Phase 1 WIP was based upon loading limits of 6 mg/l total nitrogen and 0.8 mg/l total phosphorus at design flow for major point sources. EPA believes DEP's WIP does not provide reasonable assurance that the state will meet its load reduction requirements. As a result, EPA in its proposed TMDL has included a "backstop" which includes more stringent limits of 3 mg/l total nitrogen and 0.1 mg/l total phosphorus at design flow. EPA's backstop will have a significant economic impact on the sewage treatment plants and their ratepayers.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0229.1.001.005

Author Name: Black David

Organization: Harrisburg Regional Chamber & Capital Region Economic Development Corporation (CREDC)

The Chamber & CREDC opposes EPA's proposed more stringent backstop.

Response

EPA has received numerous comments stating general opposition for EPA's backstop allocations. It is EPA's preference that the jurisdictions' final Phase I WIPs are used to meet the final TMDL allocations rather than backstop allocations. However, the final Phase I WIPs needed to meet the expectations outlined in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction and meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. Where final Phase I WIPs did not meet these criteria, EPA established backstop allocations. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please also refer to the response for comment 0067.1.001.009 for general information on backstop allocations.

Comment ID 0229.1.001.006

Author Name: Black David

Organization: Harrisburg Regional Chamber & Capital Region Economic Development Corporation (CREDC)

The Chamber & CREDC supports a nutrient trading and offsetting program as developed by DEP and is concerned that EPA's backstop may hinder its development.

Response

EPA supports trading as outlined in Section 10 of the TMDL and looks forward to working with PA on its trading program. Please see the response to comment 0139.1.001.017 where EPA discusses the desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions.

Comment ID 0230.1.001.002

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

HRSD is fully prepared to comply with any new regulations resulting from the TMDL. However, as an organization that believes strong science should support all regulations, HRSD is concerned with EPA's recent actions. Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations") and the associated waste load allocations were established to meet the same water quality standards the TMDL must meet, based on EPA's own Chesapeake Bay/James River water quality model. The only significant change between the issuance of those regulations and the EPA's Draft TMDL is an update of the model and changes in how the model is applied. We have significant concerns with EPA's Draft TMDL and object to EPA's proposed "backstop" actions against the Commonwealth of Virginia and our facilities.

Response

Please refer to the response for comment 0229.1.001.005. Please see the response to comments 0238-cp.001.002 and 0379.1.001.006 for more information on the models utilized in the Chesapeake Bay TMDL development.

Comment ID 0230.1.001.004

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

We strongly oppose EPA's inequitable proposal to transfer more burden to our WWTPs and similar point sources. We object to EPA's currently proposed "backstops" (4 mg/L TN and 0.3 mg/L TP at design flow) in lieu of the WLAs in the Virginia Regulations, and we also object to the threatened but not applied "full backstops" that would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow).

Response

Please refer to the response for comment 0067.1.001.009. EPA's Backstops Negatively Impact Smart Growth and Future Economic Development

Virginia's WIP better enables nutrient loads from future growth to be managed in an environmentally beneficial manner, specifically enabling a least a modest amount of capacity to be available for normal wastewater flow increases over time with advanced nutrient removal technology. This treatment would be possible in lieu of this growth being served by far less efficient on-site disposal systems ("OSDSs") such as septic systems. Further reductions to existing allocations as EPA proposes could increase net (i.e., POTW plus OSDS) nitrogen loadings, work counter to smart growth principles by driving growth away from existing urbanized areas with advanced centralized treatment, and lead to negative environmental results.

VAMWA has performed simple calculations to quantify the net increase in nitrogen loading that could result from reducing POTW allocations and directing the flow associated with the "lost" treatment capacity (due to overly stringent wasteload allocations) to OSDSs. VAMWA has concluded that a reduction in the concentrations of POTW allocations could result in a net increase in total nitrogen loadings to surface water, even using the use of costly denitrifying OSDSs. Thus, EPA's backstops risk this adverse environmental impact.

Preserving POTW allocations at current levels also provides capacity for future healthy economic growth. If EPA refuses to revise its Draft TMDL, POTWs will lose some ability to serve future economic development.

To the extent that EPA believes POTWs will be able to avail themselves of non-point source offsets and thus be in a position to provide treatment capacity to customers, VAMWA notes that offsets are not widely available at the present time and thus do not represent a viable option for planning, financing or constructing major public infrastructure.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

IV. EPA's BACKSTOPS WILL NEGATIVELY IMPACT SMART GROWTH & ECONOMIC DEVELOPMENT

A. Smart Growth

Most major POTWs in the Chesapeake Bay watershed currently have allocations that were calculated using design flows and a TN concentration between 4 and 6 mg/L. In comparison, secondary treatment POTWs may discharge at a concentration of approximately 25 mg/L TN plus or minus. The generally-agreed upon limit of technology (LOT) for nitrogen removal at POTWs is 3 mg/L; thus, treatment at the 4-6 mg/L level is about 85%-to 95% of the maximum technically feasible reduction.

After making these major reductions, what remains is only limited capacity for POTWs to serve future growth in wastewater flows in the environmentally beneficial manner of using these advanced treatment facilities rather than to less effective on-site disposal systems ("OSDSs"). In contrast, the reductions reflected in EPA's TMDL could increase net (POTW+OSDS) nitrogen loadings, harm smart growth, and cause environmental detriments associated with OSDS-based sprawl. [FN39]

The interaction between POTW and OSDS loads is of high importance when considering future growth. VAMWA has performed simple calculations to quantify the net increase in nitrogen loading that could result from reducing POTW allocations and directing the flow associated with the "lost" treatment capacity to OSDSs.

The conclusion based upon those computations is that reduction in the concentrations of POTW allocations could result in a net increase in total nitrogen loadings to surface water, even using denitrifying OSDSs. Some of the potential increase could be prevented by wastewater recycle/reuse, depending on land availability, demand for recycle water, and costs. However, these calculations underscore the importance of joint planning of POTW and OSDS loads in light of future growth. EPA's decision to cut POTW allocations in its Draft TMDL risks this future environmental impact.

[FN39] See C. Bell and K. Dorken Paper (Calculation of Net Load Increases from Diverting Future Wastewater Flows to On-Site Disposal Systems Instead of ENR POTWS) (attached hereto as Appendix 20).

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

UOSA's Waste Load Allocation in the VPDES General Permit and Further Reduction Due to Backstop Measure

During the VPDES Nutrients General Permit (9VAC25-820) public comment period, Dr. Grizzard, OWML's Director, expressed concern that the current allocation of 1.316 million pounds/year of nitrogen (8 mg/L at 54 mgd capacity) in the UOSA Nutrient General Permit may not be adequate at all times to prevent nitrate deficiencies and the resultant consequences discussed previously. However, UOSA accepted its VPDES General Permit with that TN allocation and has committed to manage nitrate discharges to match what is best for Occoquan water quality to the extent practicable and still not exceed its allocation. If UOSA's allocation were reduced to 657,841 pounds/year, UOSA would be in a position of having to conduct a year-round maximum denitrification effort which would undoubtedly result in nitrate deficiencies and a significant release of phosphorus, ammonia and manganese from reservoir sediments. The backstop measure of reducing UOSA's TN WLA from 1.316 million pounds/year to 657,841 pounds per year could result in the degradation of the Occoquan Reservoir's water quality similar to the pre-UOSA 1960s condition and also increase nutrient loads to the Potomac River and the Bay.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0231.1.001.009

Author Name: Boepple Charles

Organization: Upper Occoquan Sewage Authority (dba Upper Occoquan Service Authority)

We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against waste water treatment plants (WWTPs). EPA currently proposes to cut Virginia's stringent nutrient waste load allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations"). EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is a nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Summary

UOSA requests that the TN WLA of 1.316 million pounds/year be preserved in any future Chesapeake Bay TMDL. Research and water quality surveillance have unequivocally shown that reducing UOSA's TN WLA will result in water quality degradation of the water supply.

The draft TMDL document Executive Summary states:

"It is important to note that the pollution controls employed to meet the TMDL will also have significant benefits for water quality in tens of thousands of streams, creeks and rivers throughout the region." (Executive Summary, Page 3)

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Author Name: Boepple Charles

Organization: Upper Occoquan Sewage Authority (dba Upper Occoquan Service Authority)

As it stands, the draft Bay TMDL is not protective of the Northern Virginia water supply. EPA officials, in public meetings have acknowledged that the broad brush backstop provisions may not be the smart way to address local considerations such as the protective nature of the nitrate in UOSA's discharge. We strongly encourage EPA to do the correct and smart thing for the Occoquan, its 1.7 million drinking water customers, the Potomac and the Bay and remove from the TMDL any further consideration of the backstop provision as it applies to UOSA.

Response

Please refer to the response for comment 0229.1.001.005.

Comment ID 0234.1.001.002

Author Name: Dickey Dean

Organization: Prince William County Service Authority (PWCSA), Virginia

PWGSA is particularly concerned regarding the proposed EPA TMDL backstop WLA for the UOSA water reclamation plant. First, the reduction in UOSA's WLA endangers the water quality of the Occoquan Reservoir. The Occoquan Reservoir provides drinking water to approximately 1.4 million Northern Virginia residents, including many residents of Prince William County. Second, the required upgrades to meet the proposed backstop WLA at UOSA would represent a very substantial cost to our ratepayers for no improvement in the water quality of either the Potomac River or the Chesapeake Bay. PWCSA delivers approximately 36% of the flow to the UOSA plant.

UOSA is already one of the most advanced wastewater treatment plants in the country and has supported indirect reuse for over 30 years. It meets or exceeds most drinking water standards. Considering that its flow can be well over 50% of the input to the Occoquan Reservoir during low flow periods, it certainly should discharge truly exceptional quality water. However, the health of the Reservoir also depends on UOSA to supply much of the nitrate that would have to be removed if the backstop TN WLA is included in the final TMDL . The Occoquan Watershed Monitoring Laboratory (OWML,) has studied the Occoquan in depth since 1974. OWML is operated by the Virginia Tech Department of Civil Engineering, and it is overseen by the Occoquan Watershed Monitoring Subcommittee (OWMS) on

behalf of the State Water Control Board. OWML has determined, and repeatedly proved, that nitrate levels in the Occoquan serve to trap phosphorus in the sediments. Without the required levels of nitrate, OWML studies and models have determined that the Occoquan Reservoir's water quality would degrade substantially. Given the key role of the Reservoir in the interconnected Northern Virginia system, degradation of the Reservoir could be deleterious to the health and well-being of over a million residents. We urge the EPA in the strongest possible terms to remove UOSA from the list of municipal plants facing backstop WLAs.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0238-cp.001.004

Author Name: Pangraze P.

Organization: Holladay Properties, Inc.

The EPA should delay adoption of the TMDL and backstops for at least one year and until no sooner than December 31, 2011 for the following reasons:

No legal authority exists for the full range of urban/suburban retrofits the EPA draft TMDL or backstops would require of existing properties, including state and local highways. These include installing rain gardens and tearing up parking lots and installing stormwater controls including pervious asphalt. Such controls are far more expensive and achieve far less pollutant reductions per dollar spent than wastewater treatment plant upgrades (which developers pay for too) or many agricultural best management practices.

Thank you for your comment. Please see the response to comment number 0232.1.001.004.

Comment ID 0245-cp.001.006

Author Name: Coulter Laurie

Organization: Virginia Crop Production Association, Inc. (VACPA)

Virginia's Watershed Implementation Plan (WIP) reflects some practices for agriculture that VACPA strongly believes,

given proper implementation and funding, will result in significant water quality improvements. Agricultural Resource Management or Conservation Plans to meet the individual conservation needs of each farm will result in progress without mandating a "one-size-fits-all approach". We question the "reasonable assurance" offered by EPA's backstops, as current regulatory authority and details on new requirements are both unclear. Instead of forcing states to regulate their way out of "backstops," we urge EPA to allow Virginia to implement its own plans for achieving clean water goals without costly, burdensome regulations.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0246.1.001.004

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

While we ultimately hope to see Virginia improve its WIP, we do support EPA's proposed TMDL backstops if Virginia fails to implement adequate measures to protect the Bay. We believe that if the backstops are properly implemented, they will help address many of the pollution sources we have documented.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. EPA has received numerous comments stating general support for EPA's backstop allocations. It is EPA's preference that the jurisdictions' final Phase I WIPs are used to meet the final TMDL allocations rather than backstop allocations. However, the final Phase I WIPs needed to meet the expectations outlined in EPA's November 4, 2009, WIP expectations letter sent to each jurisdiction and meet all of the eight elements outlined in EPA's April 2, 2010, Guide for Evaluation of the Phase I Watershed Implementation Plans. Where final Phase I WIPs did not meet these criteria, backstop allocations were applied. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please also refer to the response for comment 0067.1.001.009 for general information on backstop allocations.

Comment ID 0246.1.001.006

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

EPA has identified several backstops that it will employ in the event Virginia fails to make adequate improvements to its WIP. The backstops include subjecting all AFOs to the same pollution control requirements currently required of permitted CAFOs, either by amending the CAFO regulations or through EPA's residual designation authority under 40 C.F.R. §122.23(c).[FN 13] Additionally, "all animals except dairies . . . on AFOs that are not subject to CAFO permit conditions . . . [will] receive feed management."[FN 14] In sum, EPA will require that a greater percentage of Virginia's farms implement the BMPs currently required only of CAFOs.

[FN 13] ENVTL. PROT. AGENCY, DRAFT CHESAPEAKE BAY TMDL: SECTION 8: WATERSHED IMPLEMENTATION PLAN EVALUATION AND BACKSTOP ALLOCATIONS 11, 15 (Sept. 24, 2010) ("will become regulated through some... appropriate designation/rulemaking/permits").

Comment ID 0246.1.001.010

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

In the event that Virginia fails to improve its strategy for achieving ninety-five percent implementation, EPA's backstop of reducing CAFO thresholds would help approach the necessary implementation levels. EPA could amend its regulations to require that all CAFOs implement this BMP and then reduce the CAFO threshold. As a result, EPA's backstops could ensure that more farms would follow this BMP. Consequently, Shenandoah Riverkeeper supports EPA's use of backstops if Virginia fails to provide reasonable assurance that it can achieve its implementation goals.

Author Name: Kelble Jeff

Organization: Potomac Riverkeeper Inc. (Shenandoah and Potomac Riverkeeper)

Based on the current draft of Virginia's WIP, we support the backstops EPA proposes in the draft TMDL. We would much rather see a Virginia driven solution to achieve the pollution reductions needed to restore the Bay. Such a solution would include funding commitments for incentive programs, improvements in regulatory programs, and increases in

staff and effort needed for both types of programs. Unfortunately, Virginia's draft WIP is grossly inadequate, and leaves us no choice but to support EPA's backstop measures.

Comment ID 0257.1.001.008

Author Name: Christian Stephen

Organization: Berkeley County Development Authority, Berkeley County, Martinsburg, West Virginia

EPA has imposed stricter limits upon the regulated wastewater treatment plants. The imposed limits correspond to EPA's maximum theoretical load reduction, or "E3" scenario: assuming the best case and that all available control technologies are deployed and represented at the highest technologically achievable levels of treatment, regardless of costs. This scenario would lead to more onerous rates for wastewater customers and leave even less opportunity for future growth in Berkeley County. These backstop limits must be removed.

Response

Author Name: Foley Sharon

Organization: Harrisonburg-Rockingham Regional Sewer Authority (HRRSA)

EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow

levels (2007 to 2009 average flow rather than design flow). Such actions and threats by EPA on the wastewater sector are completely unjustified and would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions since roughly 80 percent of the nutrient load is attributable to nonpoint sources.

Response

Comment ID 0265.1.001.009

Author Name: Clark, Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

At the outset, the Hampton Roads Localities wish to make clear that they are supportive of the TMDL's goals as reflected in their ongoing commitment of significant resources to implementation of their MS4 programs. Further, the Localities are supportive of and are prepared to commit more resources to their MS4 programs if needed to help restore the Chesapeake Bay and protect the James and York rivers, but the commitment of more resources must be supported by sound science. Unfortunately, however, as explained below, the TMDL lacks a sound scientific basis. Consequently, the Localities have very little confidence in the accuracy of the James and York river basin-wide backstop allocations in general and the urban runoff sector backstop allocations in particular. Further, even if one assumes for the sake of argument that these allocations accurately reflect the load reductions needed to restore the Bay and protect the James and York rivers, the magnitude of the tasks and estimated costs of achieving the load reductions are so great that it is not reasonable to expect that the reductions can be attained by EPA's 2025 deadline.

Response

Please refer to the response for comment 0067.1.001.009. Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

On January 30, 2009, EPA sent a letter to the Director of VADEQ regarding Virginia's current regulatory approach with regard to existing nutrient cap loadings.[FN3] EPA's letter included clear support for Virginia's current program, and a confirmation that the cap loads were properly designed to meet Bay water quality requirements:

Virginia developed the Virginia Chesapeake Bay Watershed General NPDES Permit, and an associated trading program to specifically address the point source allocations for each Virginia watershed in the Chesapeake Bay. EPA's Chesapeake Bay Program verified that those cap loadings were sufficient to achieve Bay water quality. Based on the assignment of wasteload allocations and EPA evaluation of the applicable cap load, EPA found that the General Permit ensured that individual point source discharges would not cause or contribute to an exceedance of the applicable Bay water quality standards. [FN4]

Inexplicably, 21 months later, EPA proposes to radically alter Virginia's regulatory regime and thus negatively impact the associated \$2 billion construction program and an established trading program. EPA's actions in its Draft TMDL are irresponsible and cannot be reconciled with any reasoned approach to TMDL development.

[FN3] Attached hereto as Appendix 2. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A2],

[FN4] January 30 Letter at p. 2. In this letter, EPA also confirmed that it sent a letter on December 14, 2006 in which it "reported 'no objection' to the General Permit..."

Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

In addition, EPA's backstops set a universal technology standard on POTWs across Virginia. This is inconsistent with Virginia's more scientifically defensible site-specific approach in the Virginia Regulations. Virginia's allocations recognize that (1) the James and York River basins do not contribute to the mid-Bay impairments and instead are regulated differently for local quality objectives, and (2) a number of Virginia plants have valid site-specific needs for the allocations alternative allocations. As to the second point, for example, UOSA's allocation reflects the unique drinking water considerations of its immediate receiving water, the Occoquan Reservoir. EPA's backstop WLA would endanger the water quality of the Reservoir, and, in turn, drinking water for to up to a million Northern Virginia residents. Other POTWs with particular WLAs under Virginia law include the City of Hopewell's POTW (80% industrial flow which is far higher than a typical municipal facility) and Virginia's CSO communities (City of Lynchburg and City of Richmond). EPA's failure to consider these important issues in its Draft TMDL is unreasonable.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0288.1.001.026

Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

EPA'S BACKSTOPS ELIMINATE PLANNED AGRICULTURAL LOAD REDUCTIONS DESPITE THOSE CONTROLS BEING AMONG THE MOST COST-EFFECTIVE MEASURES FOR IMPROVEMENT

Section 6 of the Draft TMDL document describes EPA's allocation method for relating relative impact to needed controls. The methodology recognizes that nonpoint sources cannot attain the same levels of control as point sources, and calls for 55-75% of E3 nitrogen controls from nonpoint sources such as agriculture. However, EPA's "backstop" allocations appear to have been accompanied by increases in allocations to nonpoint sources, such that agriculture in many basins fall well short of the intended level of nitrogen control. In so doing, EPA has dispensed with the fairness/equity concepts developed by its own TMDL work group, and shifted implementation away from the most cost-effective, environmentally beneficial practices.

Overall, EPA's Draft TMDL appears to put Virginia agriculture at a 48% level of nitrogen control (relative to E3), well below the 55-75% level indicated by the relative-effectiveness allocation methodology and far short of controls called for in both Virginia's Tributary Strategy and Draft WIP (Figure 5). This is partly driven by the lower levels of effort in the Potomac River Basin (51%), but primarily driven by an extraordinarily low (17%) level of effort for the James River

Basin, which is akin to the 2009 progress levels (Figure 6). VAMWA fails to comprehend how EPA can make deep and costly cuts to point source allocations in the James River Basin while concluding that agriculture requires no further improvements in this basin.

[Figure 5: Comparison of agricultural controls among model scenarios. Please see original document 0288.1]

Agricultural management practices include most of the practices that the EPA and others (e.g., Chesapeake Bay Commission, 2004) have identified as the most-cost effective, including nutrient management, conservation tillage, cover crops, and riparian buffers. Relative to many urban and wastewater-based practices, these practices provide much high levels of ancillary environmental benefits such as wildlife habitat, stream habitat protection, flood control, and greenhouse gas reduction. To illustrate these points, Appendix 43 [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A43] presents a case study of alternative nutrient controls for the York River basin using the BMP Benefit Planner ver. 1.1.[FN74] The case study demonstrates that the DO-based overall loading goal can be achieved in a much more cost-effective, environmentally beneficial manner by a different combination of point and nonpoint source controls than reflected in the draft TMDL allocations.

[Figure 6: Comparison of agricultural nitrogen controls among basins for EPA's proposed TMDL scenario. Please see original document 0288.1]

VAMWA expects EPA to allocate point and nonpoint sources in an equitable manner that requires a high level of effort from both sectors. In particular, EPA must remedy the low level of agricultural controls proposed for the James River basin, consistent with the widespread understanding that the agricultural sector has abundant opportunities for improvement and cost-effective load reductions.

[FN74] Malcolm Pirnie, Inc., working on behalf of VAMWA, has developed a spreadsheet based model to compare implementation scenarios with regard to environmental sustainability and cost effectiveness. More specifically, the BMP Benefit Planner ver. 1.1 considers energy usage, indirect and direct GHG emissions, carbon sequestration, costs (i.e., capital, operations and maintenance, annualized), and other ancillary benefits (i.e., wildlife habitat, instream habitat, aesthetics, public health, flood hazard mitigation, and groundwater re-charge and base-flow protection). The model addresses a number of common management practices involving wastewater upgrades and various agricultural and urban practices.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0293.1.001.013

Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

For these reasons above, VAMSA objects to EPA's determination to impose a "backstop" that mandates retrofits. This error must be corrected before EPA issues its final TMDL. For the above reasons, EPA's position on "reasonable assurance" is unlawful and unreasonable and arbitrary and capricious.

VAMSA's position is further supported by the fact that EPA has no authority pursuant to the CWA to review and/or approve or disapprove Virginia's Draft WIP. EPA's decision to do so, and its proposal to override Virginia's WIP, is unlawful.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Comment ID 0314.001.005

Author Name: Santulli Thomas

Organization: Southern Tier Central Regional Planning and Development Board (STCRPDB)

In light of the unreasonable allocations provided to New York and the limited time available for the states to develop Draft Watershed Implementation Plans (WIPs), it is not surprising that EPA's evaluation of the New York WIP found shortfalls in pollution loading reductions. As a result of these perceived shortcomings, the Draft TMDL proposes that New York be subject to "high-level backstop allocations." The proposed backstop actions focus on federally-permitted pollution sources, but do not represent achievable or cost-effective means of reaching the desired load reductions. In New York, the regulated sources (wastewater treatment plants, animal feeding operations, and municipal separate storm sewer systems (MS4s)) represent a small fraction of the pollution sources. The proposed actions would impose extreme economic hardship on watershed residents, without producing the desired improvements in delivered load.

The proposed federal backstop actions do not constitute a credible strategy for achieving water quality standards in the Bay and should thus be eliminated. EPA should instead engage in constructive partnerships with the states to develop realistic, economically viable water quality improvement strategies and identify sources of funding to implement those strategies.

1. EPA's Proposed Wasteload Allocation For Sediments Is Neither Necessary Or Appropriate For Industrial and Many Municipal Facilities.

EPA indicates in the executive summary of the draft Chesapeake Bay TMDL that Virginia "does meet allocations for sediment (12 percent under)." This statement is based on the EPA review of the Virginia Watershed Implementation Plan ("WIP"). Nevertheless, EPA proposes a further tightening of the TSS limits for all dischargers to an equivalent effluent concentration of 5 mg/L. This level of effluent TSS concentration for industrial dischargers and for many municipal facilities, especially those that receive a high proportion of industrial wastewater, is extremely difficult if not impossible to meet given the typical solids composition in these wastewaters. This is certainly true for pulp and paper mill effluents. This fact is reflected in the higher TSS limits that are allowed by the New Source Performance Standards ("NSPS") for certain industrial categories. For example, a paper mill producing 3,000 tons per day of paperboard from

wastepaper is allowed under 40 CFR Part 430, Subpart J to discharge 13,800 pounds of TSS per day on a 30-day average. This equates to an effluent concentration of 87 mg/L at a discharge flow rate of 19 mgd. These are technology-based effluent limits for new sources which represents a high degree of treatment. These effluent TSS numbers are indicative of the practical limitations in removing TSS from the highly treated effluents discharged by pulp and paper mills.

EPA states in the Proposed TMDL (Section 4.5.2) that wastewater discharges from industrial wastewater facilities "do not represent a significant source of sediment (i.e. less than 0.5 percent of the 2009 total sediment load)." Given this acknowledgement and the fact that the proposed TSS levels in the Virginia WIP are acknowledged by EPA to be 12 percent under the proposed loading target/goal, the proposed significant tightening of effluent TSS in industrial discharges is perplexing and totally unwarranted. If the TMDL is finalized as proposed, it would result in the expenditure of millions of dollars by industrial dischargers with no assurance of meeting the artificially low standard proposed and with little or no benefit to the Bay.

The impact of this approach on point sources will result in huge economic implications for a de minimis source that has no chance of impacting the desired overall result. It is imperative that EPA re-consider their sediment control proposal.

Response

Please refer to the response for comment 0299.1.001.006 for additional information on sediment allocations to WWTPs.

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

4. Apply Wasteload-Reductions Across All Discharges So That Point Source Facilities Are Not Disproportionately Impacted

To achieve the necessary reductions required by the Proposed TMDL it is unfair and punitive for EPA to focus solely on permitted dischargers. EPA acknowledges this approach in the Executive Summary of the draft TMDL where they state "For the most part in making the hybrid allocations, EPA decreased the allocations to the point sources (over which

EPA has or could assert regulatory control) and increased the load allocations to unregulated nonpoint sources." Continuing to ratchet down the loadings from point sources without a comparable reduction in other sources will result in huge capital and operational costs without being able to achieve the ultimate goal for the Bay.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

2. Waste Load Allocations for Delaware Industrial WWTPs Should Be the Same as those Allocations Found in the State WIP

The EPA has proposed imposing backstop allocations upon point sources within states who's Watershed Implementation Plans (WIPs) have been determined to be deficient in pollutant load reductions and/or reasonable assurance. EPA has proposed implementing high level backstop allocations for Delaware point sources. Under a high level backstop the waste load allocations (WLAs) for industrial WWTPs have been "reduced below the loads identified in the jurisdiction's draft Phase I WIP at a rate equivalent to significant municipal WWTPs ... (down to 3 mg/L TN and 0.1 mg/L TP)." EPA's published proposed Total Nitrogen limit for the INVISTA Seaford facility of 59,828 lbs/yr is inconsistent with and significantly lower than the Delaware draft WIP allocation.

INVISTA believes that the current WLAs established by Delaware and reflected in the draft Phase I WIP, are appropriate for industrial dischargers, including significant industrial dischargers. Even more importantly, WLAs for industrial dischargers should never be less than those specified in the state's WIP. The Delaware WIP allocations are based on a history of modeling exercises, data collection and local research. The modeling and data analysis has been transparent and enabled all stakeholders to understand the process and the data. The Delaware WIP accounts for the facility-specific nature of industrial discharges. The Delaware DNREC has taken the time to understand how the differing process and wastewater characteristics as well as economics of each industrial facility result in varying wastewater discharge characteristics and thus differing impacts on water quality. With this in mind and based on extensive modeling and data analysis, the DNREC has matched the appropriate WLAs with each industrial facility. EPA cannot ignore the work conducted by DNREC and thus should not apply arbitrary nutrient loading limits as a result of its backstop efforts. Therefore, we request that the EPA TN allocation for the INVISTA-Seaford site match the allocation designated by the Delaware Phase I WIP.

Organization: Rebkee Company

We at the Rebkee Company have great concerns with the draft TMDL and backstops proposed by the EPA, many of which have already been raised by Governor McDonnell and Secretary Domenech

--No legal authority exists for the full range of urban/suburban retrofits the EPA draft TMDL or backstops would require of existing properties, including state and local highways. These include installing rain gardens and tearing up parking lots and installing stormwater controls including pervious asphalt. Such controls are far more expensive and achieve far less pollutant reductions per dollar spent than wastewater treatment plant upgrades (which developers pay for too) or many agricultural best management practices contained in the Virginia draft WIP. Agricultural BMPs could be funded through a nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. The backstop provision also incorporates a numeric value inconsistent with industrial treatment technologies. Not all industrial wastes are equivalent to municipal characteristics. Economic burdens to industrial operations will only lead to assessment of whether operations can be successful in the United States or these manufacturing operations should seek foreign locations to meet budget and employee objectives. EPA needs to explain how industrial facilities with nitrogen levels greater than 100mg/l can achieve 3.0mg/l as a discharge limit.

Organization: Virginia Manufacturers Association VMA

EPA has acknowledged that Virginia's WIP met the sediment allocation required by EPA. See EPA's Draft Bay TMDL Executive Summary, page 7. As part of its allocation scheme for sediment, Virginia's WIP assigned an across-the-board point source TSS concentration of 30 mg/l for significant dischargers. This across-the-board application is in error, and it is VMA's understanding that Virginia will be correcting this assumption in the next iteration, recognizing site-specific capabilities and impacts of industrial point sources. Even with this change, the WIP will continue to outperform EPA's sediment target. Accordingly, EPA cannot demonstrate a need to impose either the partial or full backstop allocations for TSS.

Even if additional TSS reductions were necessary, EPA has not provided any evidence that those reductions must come from industrial point sources. Section 4.5.2 of the TMDL indicates that from the 75 significant and 1,446 non-significant industrial point sources, the estimated 2009 TSS waste load to the Chesapeake Bay was 0.5% of the total load. Furthermore, EPA notes that the TSS load for industrial point sources is not significant and thus does not present the TSS model by jurisdiction.

The model runs performed by EPA demonstrate that the TSS load from industrial point sources is not significant. The model input from DEQ set a TSS target of 30 mg/l for significant point source dischargers. EPA ran the model with that input but also ran it with a target of 5 mg/l. The results of those model runs show only minimal changes. This is because the TSS load from point sources is so de minimis that it has no impact on the model outcome, regardless of the concentration target that is assigned. The drastic reductions proposed by EPA will have no meaningful effect on the impaired segments of the watershed.

In short, there is no evidence in the record to support EPA's proposed allocations for TSS for industrial facilities in the partial or full backstop scenarios.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Comment ID 0376.1.001.015

Author Name: Smith Brooks

Organization: Virginia Manufacturers Association VMA

EPA appears to have developed the full backstop allocations as a threat to Virginia -- revise your WIP or suffer the

consequences. EPA fails to provide any explanation for how or when the full backstop allocations would apply, other than a vague statement that they could be used if a state's WIP is not adequately modified. However, there is nothing in the TMDL record to support these allocations. And there is nothing in the law that would empower EPA to bear out this threat. The backstop allocations are arbitrary and capricious and should be stricken from the TMDL.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0376.1.001.016

Organization: Virginia Manufacturers Association VMA

EPA's full backstop allocations impose absurd reductions on industrial facilities. For example, for one significant industrial discharger in the York River, EPA's partial backstop WLA (which we support) is set at 23,617 lb/yr TN and 6,804 lb/yr TP (delivered loads). By contrast, the full backstop allocation for this same facility is 8,074 lb/yr TN and 1,098 lb/yr TP. Likewise, a significant discharger in the James is allocated a partial backstop WLA of 136,510 lb/yr TN and 2,329 lb/yr TP; under the full backstop allocation the same facility is assigned 33,096 lb/yr TN and 272 lb/yr TP. These reductions are severe, may be unachievable and, more likely than not, are unnecessary. However, EPA's record offers nothing about their achievability or need, let alone how they were derived. VMA has grave concerns about these omissions.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Comment ID 0378.1.001.006

Author Name: Warner Floyd

Organization: PA Chamber of Business and Industry

The proposal in the EPA Backstop TMDL to arbitrarily move loading reductions from non-point sources to municipal and industrial wastewater facilities is fundamentally unfair, unrealistic and unachievable.

While the Pennsylvania WIP attempted to allocate reductions fairly among all sectors, EPA has taken a position in its Backstop TMDL that can only be described as irrational, unattainable, arbitrary and counterproductive.

In comments dated September 27, 2010, EPA purported to find that the Pennsylvania WIP was deficient in failing to provide "reasonable assurance" that the reductions would be achieved in all identified sectors. In particular, EPA claimed that the actions identified to address non-point sources, such as agriculture, stormwater, forests and on-lot septic systems, were not adequately described or sufficient. To address these "gaps", instead of framing actions to address the sectors that allegedly are not doing their share, EPA has proposed in its "Backstop TMDL" to impose a wholesale shift of the burden of reductions from these non-point sectors to municipal treatment plants and industries.

Under EPA's proposed Backstop TMDL, EPA proposes to push every municipal treatment plant to the "limits of technology" and for industries, proposes to push beyond that to levels that are well beyond any known technology.

EPA has described the limits of technology for POTWs as achieving 3 mg/l of nitrogen and 0.1 mg/l of phosphorus - although there are in fact very few treatment plants in the U.S. that have achieved those concentrations consistently. Pushing every municipal sewage plant to the extreme limits of technology will engender billions of additional dollars in investment, while the reductions in additional loadings are actually quite marginal. The Pennsylvania Municipal Authorities Association estimates an additional \$3-4 billion in capital requirements, over and above what our municipalities are already committed to expend. Further, changing course at this late date, after many municipalities have already designed and launched the process for modifying their facilities to meet the numbers in the Pennsylvania WIP, threatens to waste precious public dollars, and impose even more burdensome demands on municipal rate payers. Given the fiscal situation faced by many Pennsylvania communities during the slow recession recovery period, it is far from clear if or how they could access capital markets to meet such funding requirements. Indeed, some of the key communities in this watershed are already in "distressed municipality" status.

But EPA's approach to industry is even more unreasonable and arbitrary. Clearly without taking any time to evaluate the industries involved, or what measures they each have in fact already put in place to reduce nutrients, EPA performed what can only be described as an arbitrary, capricious and wholly unscientific formulaic exercise. EPA explains that the method used to come up with the numbers in the Backstop TMDL made "the assumption that the loads are reduced below the loads identified in the jurisdiction's draft Phase I WIP at a rate equivalent to significant municipal WWTPs going from the WIP loading level to an E3 loading level (down to 3 mg/L TN and 0.1 mg/L TP)". In translation, EPA calculated an average percentage reduction in loadings that municipal wastewater treatment plants might make to achieve the limits of technology, and then applied the same percentage to every industry - irrespective of the current situation at each industry, and irrespective of whether their situation was anything at all like a municipal treatment plant.

The astonishing results are buried in Table Q2 of the EPA TMDL, in a manner that only the very dedicated few could even find them, and arrayed in a manner that even fewer could understand what they mean. What Chamber members have found in Table Q2 is nothing short of disastrous, irrational and unimplementable. As examples:

- For one Chamber member in the inorganic chemicals business - an entity that just five years ago won awards for voluntarily reducing nitrogen loads by over 1 million pounds per year - EPA has proposed to reduce Total Nitrogen loadings from the level that the Pennsylvania WIP assigns (600,515 lbs/year) to just 3,693 lb/year, and to reduce Total Phosphorus loads from the Pennsylvania WIP value (1,577 lb/year) to 31 lb/year. Based on that facility's flow rates, the EPA Backstop TMDL would equate to requiring a TN concentration of around 1 mg/l or less, and a TP concentration of less than 0.01 mg/l. These resulting concentration values are well beyond (indeed, for phosphorus, one order of magnitude below) what EPA itself has acknowledged are the limits of technology. This Chamber member has candidly advised that if EPA is successful in imposing such limits, a shutdown of the facility - and the unemployment of some 900 workers - is the only viable option.

- For another Chamber member in the pharmaceutical industry, EPA has assigned backstop TMDL loadings of 9,050 lbs/year Total Nitrogen and 188 pounds/year Total Phosphorus, versus PA WIP loadings of 44,497 pounds/year TN and 11,748 pounds/year TP. Based on the flows at this industry, the proposed backstop effluent concentrations would be 1.42 mg/l TN and 0.03 mg/l TP. As before, these concentrations are orders of magnitude less than the "limits of technology" limits of 3 mg/l TN and 0.1 mg/l TP. This represents a significant discrepancy.

Furthermore, Section 8, pg. 8-16 of the draft TMDL states that for industrial backstop loadings, "the WLAs for industrial WWTPs make the assumption that the loads are reduced below the loads identified in the jurisdiction's draft Phase 1 WIP at a rate equivalent to significant municipal WWTPs going from the WIP loading level to an E3 loading level (down to 3 mg/L TN and 0.1 mg/L TP)." PA's WIP loading level for significant municipal WWTPs is 6 mg/L TN and 0.8 mg/L TP. Following the rationale presented in Section 8, pg 8-16, significant industrial WWTP's in Pennsylvania would be required to reduce TN levels by 50% and TP levels by 87.5% from what was presented in the WIP. For this pharmaceutical company, this would equate to backstop WLA's of 22,248 pounds/year TN and 1,468 pounds/year TP based on the pharmaceutical company's flows. Again, the backstop WLA's in Table Q-2 of the draft TMDL are 9,050 pounds/year TN and 188 pounds/year TP, presenting a significant discrepancy with the rationale on page 8-16. And again, we request EPA explain these significant discrepancies.

Table 9-4 of Chapter 9 of the draft TMDL presents individual WLA's based on Chesapeake Bay water quality standards. The WLA's for this same Chamber member are 21,595 lbs/year TN and 450 lbs/year TP. Based on the member's flows, these mass loads equate to concentrations of 3.4 mg/l TN and 0.07 mg/l TP, which are in fact closer to the proposed backstop TMDL concentrations of 3 mg/l TN and 0.1 mg/l TP than the backstop WLA's in Appendix Q-2.

The Chamber member is extremely confused and concerned about this glaring and seemingly widespread discrepancy between the loadings that EPA indicated they were intending to publish and what actually appeared in Tables 9-4 and Q-2.

In addition to TN and TP loadings, Table Q-2 of the draft TMDL assigns a backstop sediment load of 121,498 pounds/year. This is a reduction from this company's current effluent sediment load of 13,070 pounds/month (156,840 pounds/year) as established by pharmaceutical effluent limit guidelines. What is EPA's technical basis for the draft TMDL sediment loading, especially considering that the pharmaceutical ELG load has been established as Best Available Technology (BAT) for the pharmaceutical industry?

- These discrepancies and disparities are again exemplified in the backstop TMDL for a consumer products manufacturing industry located in the Susquehanna watershed. This industry has been a leader in the reduction of

nutrients in their wastewater effluent. They have voluntarily reduced nitrogen discharge loads by 40% since 1995, and 88% since 1985, resulting in total nitrogen removal of 640,000 pounds/year. These voluntary reductions resulted in this industry being recognized with a significant achievement award by the Chesapeake Bay Program's "Businesses for the Bay," and a Pennsylvania Governor's Waste Minimization Award. Annual nitrogen discharge loads are now less than 100,000 pounds. This industry was a critical partner with the introduction of legislation (phosphorus reduction to municipal sewage treatment plants via reformulation of dishwasher detergents), and reformulated their brand of dishwasher detergent to remove phosphorus.

The backstop TMDL loads in Appendix Q2 for this industry represent loadings that are significantly less than the loads than can be achieved by the limits of technology, and result in effluent concentrations that are orders of magnitude less than the published backstop TMDL concentrations of 3 mg/l TN and 0.1 mg/l TP. The backstop TMDL loads in Appendix Q2 are 34,232 pounds/year TN and 292 pounds/year TP. Based on these backstop TMDL loads, the calculated effluent concentrations are 1.46 mg/l TN and 0.012 mg/l TP using the industry's current actual discharge flow rates (less than the industry's rated flow rates). As with the previous examples, this is a glaring discrepancy with EPA's proposed backstop TMDL concentrations.

The proposed loads for this industry in the Pennsylvania WIP are 100,360 pounds/year TN and 5,441 pounds/year TP. EPA's proposed backstop TMDL would require an additional 66% reduction in nitrogen and 95% reduction in phosphorus compared to the loads in the Pennsylvania WIP, and would require technology that far exceeds the supposed "limits of technology." For an industry that has been a proactive leader in the voluntary reduction of effluent nutrient loadings, these additional proposed load reductions pose no value to the Bay, no cost-value for the industry, and in general just make no sense even if they had been calculated correctly.

- These severe discrepancies in the draft TMDL are not isolated to just industry. A Pennsylvania municipal wastewater treatment plant (POTW) has also noticed substantial calculation and/or waste load allocation discrepancies in their proposed backstop TMDL loadings. This POTW just completed an \$11 million upgrade to meet TN and TP limits mandated by PA DEP as part of their NPDES permit renewal. This plant upgrade expenditure resulted in a 67% increase in sewer bills for their rate payers. The new limits for the POTW are 6 mg/l TN and 0.8 mg/l TP, which are the effluent limits in the PA WIP. Based on the POTW's flow, these effluent limits equal mass loadings of 22,228 pounds/year TN and 2,963 pounds/year TP. In Appendix Q2, EPA has proposed backstop TMDL loadings of 4,695 pounds/year TN and 97 pounds/year TP. Not only do these proposed backstop loadings represent reductions of 78.9% TN and 96.7% TP from PA WIP limits just achieved through considerable expense, but they also equate to concentration limits of 1.34 mg/l TN and 0.026 mg/l TP. As with all of the prior examples, the proposed backstop loadings in Appendix Q2 for this POTW are orders of magnitude lower than EPA's intended backstop loading concentrations of 3 mg/l TN and 0.1 mg/l TP. Even if the Appendix Q2 backstop loadings had been calculated correctly, a requirement for this POTW to reduce effluent loads further than achieved by their \$11 million upgrade (and significant sewer rate increase) is completely ludicrous, unfair, and present minimal value to the Bay.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the

methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: PA Chamber of Business and Industry

At the same time, EPA's approach to setting cap loads for non-significant industries, without any facts, is unreasonable and doomed to failure. While the Pennsylvania WIP rationally targets loading reductions on significant dischargers, EPA proposes to extend nitrogen and phosphorus caps to each and every industry in the watershed, no matter how small. EPA's approach is unfair, irrational, and threatens the employment base of this Commonwealth.

The nutrient values listed in EPA's Backstop TMDL for non-significant industrial dischargers were developed in the absence of data, since in most cases these small discharges have not yet been subject to TN or TP monitoring. Thus, unburdened by facts, EPA pushed forward to assign TN and TP values - burying them in a table that almost no one except the most sophisticated user could discern. For many small facilities, the TN and TP values are simply listed as zero.

Taken together, such non-significant discharges are expected to contribute only a minor fraction of the TN and TP loadings to the Bay - a fraction that is so low that the Pennsylvania DEP rationally decided they simply did not warrant regulation at this time. Skewing such logic, EPA would nevertheless like to proceed to impose "zero" values, irrespective of the consequences, in order to satisfy an entirely bureaucratic compulsion to "regulate everything."

The imposition of unachievable "zero" limitations - mandated to become effective the next time each facility's NPDES permit is renewed -- will inevitably result in shutdown of those facilities.

It is hard to understand how a Federal Administration so vocally and repeatedly pledged to the preservation and recovery of employment would even conceive of such a proposal. Instead of trying to address the Bay's needs in a balanced and rational manner, EPA is simply proposing to punish those already doing their fair share. Creating a train wreck through the imposition of impossible and draconian mandates is not the way to achieve real Bay improvements.

Response

Organization:

The EPA should delay adoption of the TMDL and backstops for at least one year and until no sooner than December 31, 2011 for the following reasons:

- No legal authority exists for the full range of urban/suburban retrofits the EPA draft TMDL or backstops would require of existing properties, including state and local highways. These include installing rain gardens and tearing up parking lots and installing stormwater controls including pervious asphalt. Such controls are far more expensive and achieve far less pollutant reductions per dollar spent than wastewater treatment plant upgrades (which developers pay for too) or many agricultural best management practices contained in the Virginia draft WIP. Agricultural BMPs could be funded through a nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Response

Regarding your comment to delay the adoption of the TMDL, please see the response to comment 0062.1.001.004.

Please refer to the response for comment 0067.1.001.009. Organization: New York State Department of Environmental Conservation

---EPA's Stormwater Proposal is Excessive

--Requires vast retrofits to only a few urban areas at a cost of \$400 million-2 billion

--Would require almost a zero discharge of runoff, which is stricter than any existing regulatory requirement (CWA. regulations and permits)

---EPA's Agricultural Proposal for NY Would Hurt Farms

--Would necessitate that NY farms engage in interstate trading to offset nutrient loading. This would involve small farms buying credits from large WWTPs in MD & VA, which is only a paper loading reduction and no real benefit to the Bay.

--Treats 40 head farm like a permitted Large CAFO (700+ dairy cows) by requiring strict implementation of costly management practices.

--Fails to account for a 30% decrease in farm animals in the Southern Tier since 1985.

--Incorrectly assumes that NY does not have enough land to support existing manure management from farms.

--Reliance on source reductions means that farms will go out of business in order for NY to meet its proposed allocation.

---EPA's Nitrogen Limits for Wastewater Provide Little Benefits to the Bay

--For NY wastewater treatment plants, 50-90% of nitrogen in the effluent does not reach the Bay due to natural in-stream processing

--EPA's requirements will result in additional treatment in NY plants and the reconstruction of entire facilities at a cost that could reach as high as \$500 million with little benefits to the Bay.

Organization: Environment America et al.

If any state is lacking in this regard, the EPA must swiftly follow through in its plan to backstop state plans with

additional load reductions. That is, if a state fails to demonstrate how it will reliably achieve pollution allocations in a particular sector, the EPA should transfer those allocations to another sector so that the state will achieve its overall assigned TMDL pollution allocations. This will be especially critical in the case of nonpoint pollution. The EPA must use the final TMDL to re-allocate nonpoint load reductions to point sources, like sewage treatment plants, whenever a state fails to demonstrate how it will achieve its required nonpoint reductions.

Response

Enforce the TMDL and the WIPs. In a number of documents the EPA has described certain enforcement actions it could take if states do not meet the goals of the TMDL or their own WIPs. The EPA took its first enforcement step by threatening a federal backstop for states that do not adequately demonstrate how they will achieve the TMDL pollution reduction numbers. The backstop is simply the EPA's means of ensuring those reductions occur, by shifting around some of the allocations within a state. The EPA should follow through on this threat, if necessary, with the release of the final TMDL in December 2010.

This approach nets a fraction of the needed reductions from Pennsylvania and carries a huge financial burden to the rate-paying public. More Draconian is that many of the industrial point sources are listed as having nutrient limits that appear to be arbitrary and are well below the limit of technology. This approach exasperates the unstable economic conditions that exist today. This approach will likely lead to multiple legal actions that will result in significant delays to the restoration of the Bay.

Author Name: Salada Ian

Organization: Penn State University

3. The TMDL lists backstop allocations imposed by EPA on wastewater treatment plant (WWTP) point sources of annual total nitrogen (TN) of 3 mg/l and annual total phosphorus (TP) of 0.1 mg/l at design flows, will create an unjustified economic burden on the customers of these system. These proposed total nitrogen and total phosphorus effluent limits are at the limit of technology. The Pennsylvania Department of Environmental Protection (PA DEP) has already imposed National Pollutant Discharge Elimination System (NPDES) Permit Limits of annual total nitrogen (TN) of 6 mg/l and annual total phosphorus (TP) of 0.8 mg/l at design flows. Each of these Pennsylvania facilities would have already spent tens of millions of dollars to comply with the PA DEP imposed NPDES Permit Limits.

a. The annual total nitrogen (TN) of 6 mg/l and annual total phosphorus (TP) of 0.8 mg/l at design flows can be achieved biologically in the activated sludge process through denitrification process and biological phosphorus uptake process. The activated sludge process is the common used process in Pennsylvania by WWTPs. The added benefit of the denitrification is the reduction of electrical energy consumption and net gain of alkalinity to the WWTP effluent. The reduction of electrical energy has a secondary impact of less air emissions from the electrical generating facility, which is generating electricity for the WWTP.

b. The annual total nitrogen (TN) of 3 mg/l and annual total phosphorus (TP) of 0.1 mg/l at design flows cannot be achieved biologically in activated sludge processes. Additional processes, such denitrification filters will need to be added to the facilities to achieve the total nitrogen removal requirements; chemical precipitation and filtration will be required to be added to the facilities to achieve the total phosphorus removal requirements. These upgrades will costs tens of millions of dollars per facility. Many of these WWTP facilities will not have the hydraulic profiles for the effluent from their existing processes to gravity flow through these new processes, and hence will need to consume additional electrical energy to pump the water to these new processes. These 4 processes require chemicals; methanol or another carbon source for the denitrification processes, and coagulants (i.e. aluminum sulfate, ferric chloride) for the phosphorus removal. The manufacture of chemical will require the consumption of additional electrical energy. This consumption of additional electrical energy will create more air emissions which lead to more deposition of contaminants of the Chesapeake Bay. The coagulants used to precipitate phosphorus will be collected on these filters and generate chemical sludges that will need to be disposed.

Sediment Control

EPA's Chesapeake Bay Program Office website states that the sources of sediment to the Bay are agriculture (60%), natural sources (21%), and urban/suburban runoff and in-stream sediment (19%). Furthermore, Section 4.5.2 of the proposed TMDL states that the estimated 2009 TSS waste loads from industrial facilities to the Chesapeake Bay is only 0.5% of the total load. In contrast to EPA's own data, EPA's proposed control of point sources for TSS under the backstop measures in the draft TMDL to address the sediment impairment in the Chesapeake Bay is unfounded and is not based on sound and reasoned science to resolve the impairment. The sediment of concern is primarily inorganic in nature, and is associated with erosion from upland land surfaces and erosion of stream corridors (US Geological Survey, A Summary Report of Sediment Processes in Chesapeake Bay and Watershed, 2003). Industrial effluent sources of TSS originating from biological treatment, such as from GP's Big Island Mill, primarily consist of organic solids. The organic content of these solids is typically between 70 to 90 percent and a large part of the organic content is capable of being biologically degraded. The amount transported as sediment would thus be reduced considerably versus the total amount of TSS originally present. The National Council for Air and Stream Improvement (NCASI) has shown that any such solids originating from a pulp and paper mill are organic in nature and have a very low available nutrient component (Dr. William E. Thacker, A Review of the Characteristics and Fate of Suspended Solids Discharged with Biologically Treated Effluents from Pulp and Paper Mills, NCASI, October 2010 - note: see VMA comments for reference).

The ability of a wastewater treatment plant to meet extremely low effluent TSS limits is dependent on the type of wastewater treated. EPA originally established technology-based guidelines recognizing the unique aspects of various industry types. EPA's proposed TMDL does not make such distinctions, instead applying an across-the-board allocation based on a treatment technology achieving 5 mg/l for municipal effluent. The filtration technology available would not be

capable of achieving a TSS concentration of 5 mg/L in many industrial settings due to the nature of the TSS generated. Again, a more site-specific determination of appropriate limitations, and an analysis of the need for such limitations, is necessary but missing from EPA's draft TMDL. [See VMA comment]

Uncertainty of TMDL Requirements Delays and Prevents Compliance and Adds Cost

POTW's typically deliver complex treatment plant upgrades that take about 5 to 6 years from start of planning to initiation of operation. The EPA construction grants program experience was even longer from start to finish.

Given that Pennsylvania developed its CBTS in 2004 through 2006 and that many POTW's have already received annual cap loads and compliance schedules in their NPDES permits with EPA's encouragement and approval and started construction and given that EPA has announced backstop cap loads based on effluent concentrations that are 50 percent of the CBTS limits for total nitrogen and 12.5 percent of total phosphorus:

1. What should a POTW in a planning phase plan for? Should it plan for the CBTS limits or the backstop limits or both?
2. The same question for a POTW under construction? Should it change order in extra treatment?
3. What about the Milton Regional Sewer Authority. Our project is almost ready to be bid. What should we build?
4. Even if EPA does not deploy backstop limits with the initial issuance of the TMDL, what assurances will EPA make that backstop limits will not be deployed at any of the two year reviews or at the end of the current NPDES permit term?
5. Will POTW's be able to succeed in arguing financial impossibility in cases where they have gone into substantial debt to achieve the CBTS limits and are subsequently subject to backstop limits?
6. How will long term contracts that POTW's may have for the purchase or the sale of credits be dealt with if backstop limits are deployed or in the case that thresholds for the creation of credits changes?
7. Similarly, how will nutrient credit generation and purchase be calculated given different delivery ratios in the 5.3 model versus the 4.3 model upon which the trading program has been built?

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Organization: Milton Regional Sewer Authority

Reallocation Of Loads To Other Segments Is Unjustified and Unfair

The EPA conclusion that the failure of the agricultural and developed segments to meet their allocations should not be a reason to reward those segments by reducing the allocations of the point sources and assigning the difference to the agricultural and developed segments. EPA, in fact, rewards the non-attainment segments, but penalizes the point source segment which is the best performing and closest to compliance segment.

Using the EPA reasoning, point sources should stop compliance, appeal their permits and refuse to implement nutrient reduction so that they receive the same reward as the agricultural and developed segments. This makes no sense.

1. What are the expected additional capital, annual, and present worth costs associated with implementation of the backstop limits of 3 mg/l total nitrogen and 0.1 mg/l total phosphorus?
2. What are the expected savings in capital, annual, and present worth costs associated with implementation the reallocation of additional total nitrogen and total phosphorus to the agricultural and developed segments?
3. What analysis has EPA made on the social and economic impacts of such re-allocation?

Response

Please refer to the response for comment 0067.1.001.009. Organization: Natural Resources Defense Council (NRDC)

3. EPA's Stringent Backstop Allocations Comprise a Reasonable and Legally Warranted Response to Inadequate State WIPs.

NRDC is supportive of the general approach to backstop allocations that EPA has chosen, which focuses for the most part on lowering point source WLAs to better ensure that needed reductions will take place. We agree with this approach because EPA has more authority to guarantee that reductions occur as needed from point sources (including, for instance, objecting to NPDES permits with inadequate WQBELs). However, NRDC stresses that EPA must commit to expeditiously establish the allocations and take the other actions outlined in the backstop TMDLs, rather than simply being prepared to do so upon failure of any state to meet a deadline or other requirement of its WIP or 2 Year Milestones.[FN 10]

[FN 10] See generally 33 U.S.C. 1313(d)(2) (providing for corrective EPA action within 60 days of inadequate TMDL submission).

Comment ID 0418.1.001.005

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

NRDC is concerned by one other element of the backstop allocations. EPA indicates that its backstop will include "finer-scale allocations," such as "individual WLAs for the significant municipal and industrial wastewater discharging facilities and sector-specific aggregate WLAs for stormwater, CAFOs, and nonsignificant municipal and industrial wastewater discharging facilities" in the non-tidal states (PA, WV, NY). This is something that already exists for the tidal jurisdictions. If we understand correctly, this means that the non-tidal jurisdictions presently have WLAs only for point sources generally, and we believe that finer-scale allocations are necessary irrespective of where the discharge is in the watershed. For example, EPA guidance provides that, in the case of stormwater discharges,

EPA recommends expressing the wasteload allocation in the TMDL as either a single number for all NPDES-regulated storm water discharges, or when information allows, as different WLAs for different identifiable categories, e.g., municipal storm water as distinguished from storm water discharges from construction sites or municipal storm water discharges from City A as distinguished from City B. These categories should be defined as narrowly as available information allows (e.g., for municipalities, separate WLAs for each municipality and for industrial sources, separate WLAs for different types of industrial storm water sources or dischargers).[FN 11]

In other words, EPA seems to contemplate that there will always be at least a WLA for stormwater discharges, and a TMDL should have individual WLAs for identifiable segments of the stormwater universe. In our view, this should also be the case for other point source sectors - CAFOs, non-significant industrial & municipal dischargers, e.g. - and significant facilities should have easily-calculable individual WLAs. Given that NPDES permits will in any event have to have WQBELs that "are consistent with the assumptions and requirements of any available wasteload allocation for the discharge," [FN 12] this work is essential anyway.

[FN 11] Memorandum from Robert H. Wayland, III, Director, U.S. EPA Office of Wetlands, Oceans and Watersheds & James A. Hanlon, Director, U.S. EPA Office of Wastewater Management, to U.S. EPA Regional Water Division Directors (Nov. 22, 2002), available at http://www.epa.gov/reg3wapd/tmdl/pa_tmdl/wissahickon/WissahickonTMDLI.pdf.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. EPA disagrees with commenter's characterization of legal requirements for individual WLAs. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0418.1.001.006

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

In light of the deficiencies in the Draft Phase I WIPs, NRDC generally agrees with EPA's commitment to assert a range of backstop TMDLs where state WIPs failed to either meet expectations or failed to account for sufficient progress toward nutrient and sediment reductions. The increasing degrees of severity in EPA's backstop responses appear soundly tailored to achieve reductions by reducing allocations to point sources subject to NPDES permit and other oversight authorities. The backstop adjustments of allocations where state WIPs are too speculative in one of several

ways, including "[h]eavy reliance on trading to finance reductions and offset growth, but no commitment to adopt critical trading components such as clear baselines, liability, enforceability, tracking, and regulatory drivers" are reasonable exercises of EPA's responsibility to require "reasonable assurances" that states will reduce pollutant loading to TMDL allocation levels.[FN 13]

[FN 13] See Draft TMDL at pp. 8-6, 8-7.

While we hope for greater assurances in the revised WIPs due to EPA before the issuance of the Final TMDL, we have significant concerns that the level of assurances so far provided by the states falls far short of the mark. We encourage EPA to maintain its strong backstop pressure, and to insist that revised Phase I WIPs fully address the shortcomings identified by the Agency's review of the initial drafts. EPA should not accept, as "reasonable assurance," revised WIPs that do not envision specific binding commitments and other structures to assure that adequate funding, policies, and regulations are in place to assure that load reductions will be achieved.

Comment ID 0418.1.001.022

Author Name: Devine Jon

Organization: Natural Resources Defense Council (NRDC)

Throughout the Bay watershed, as with the rest of the nation, a significant portion of the developed landscape falls outside the jurisdictional boundaries of permitted MS4s. As EPA has noted in a related context, increasing the ability of this program to reduce stormwater pollution may depend on expanding this jurisdictional area. We encourage EPA to approach this effort through a two-fold effort: first, as we note above, EPA should consider exercising its own residual designation authority, using the discretion provided by section 402(p)(2)(E) of the Clean Water Act; and second, EPA should insist that all Bay States comply with their RDA obligations, whether as a matter of "reasonable assurance," or in its exercise of its responsibilities under section 117. Maryland, for example, notes that "non-regulated urban" stormwater discharges account for significant portions of its overall nitrogen, phosphorus and sediment loadings.[FN 36]

At a minimum, Clean Water Act section 402(p)(2)(E) stresses the importance of federal and/or state designations of additional areas subject to stormwater management controls when runoff from these areas impairs water quality. At least initially, we agree with EPA's decision to leave RDA designations to the respective Bay States. Nevertheless, EPA should express a clear preference, as well as guidelines or detailed expectations, for the kinds of discharges for which states should consider RDA designations. Moreover, reliance on significant state use of RDA designations is an appropriate way to calculate the backstop TMDL allocations. To the extent that states fail to designate and require permits of areas that are significant contributors of stormwater pollutants, EPA should step in to do so. EPA designations may be an efficient tool for targeting particularly problematic categories of stormwater loading across the Bay watershed. Notably, EPA's exercise of its Residual Designation Authority has the effect of converting stormwater loadings from being Load Allocations to binding, enforceable Waste Load Allocations, implemented through NPDES permits and providing greater assurances that reductions will, in fact, be achieved.

Author Name: Owens James

Organization: Hampton Roads Association for Commercial Real Estate

The EPA should delay adoption of the TMDL and backstops for at least one year and until no sooner than December 31, 2011 for the following reasons:

· No legal authority exists for the full range of urban/suburban retrofits the EPA draft TMDL or backstops would require of existing properties, including state and local highways. These include installing rain gardens and tearing up parking lots and installing stormwater controls including pervious asphalt. Such controls are far more expensive and achieve far less pollutant reductions per dollar spent than wastewater treatment plant upgrades (which developers pay for too) or many agricultural best management practices contained in the Virginia draft WIP. Agricultural BMPs could be funded through a nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Response

Regarding your comment to delay the adoption of the TMDL, please see the response to comment 0062.1.001.004.

Please refer to the response for comment 0067.1.001.009. Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Comment ID 0431.1.001.003

Author Name: Tolbert James

Organization: City of Charlottesville, Virginia

The EPA backstops requiring 50% of urban land to meet aggressive performance standards through retrofit/redevelopment in the City of Charlottesville is unnecessary, unfounded and inappropriate. The cost of this requirement is expected to be \$15.6 million per year and there is no scientific evidence that this level of treatment is needed.

Response

Please refer to the response for comment 0067.1.001.009. Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Chesapeake, Virginia

At the outset, the Hampton Roads Localities wish to make clear that they are supportive of the TMDL's goals as reflected in their ongoing commitment of significant resources to implementation of their MS4 programs. Further, the Localities are supportive of and are prepared to commit more resources to their MS4 programs if needed to help restore the Chesapeake Bay and protect the James and York rivers, but the commitment of more resources must be supported by sound science. Unfortunately, however, as explained below, the TMDL lacks a sound scientific basis. Consequently, the Localities have very little confidence in the accuracy of the James and York river basin-wide backstop allocations in general and the urban runoff sector backstop allocations in particular. Further, even if one assumes for the sake of argument that these allocations accurately reflect the load reductions needed to restore the Bay and protect the James and York rivers, the magnitude of the tasks and estimated costs of achieving the load reductions are so great that it is not reasonable to expect that the reductions can be attained by EPA's 2025 deadline.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please also see the response to comment 0293.1.001.017 for more information on the James River allocations.

Please see the response to comments 0238-cp.001.002 and 0379.1.001.006 for more information on the models utilized in the Chesapeake Bay TMDL development.

EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all stakeholders involved including federal agencies and state and local jurisdictions. EPA encourages all stakeholders to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals. It will be a challenge to meet the 2025 deadline but EPA is committed to work with its stakeholders and jurisdictional partners in order to achieve this.

11. EPA and States Should Require Greater 'Reasonable Assurance' from Agricultural Sources and Avoid Placing Undue Burden on Regulated Entities

State WIPs should provide more reasonable assurance that agricultural-based load allocations can be met so as to avoid federal imposition of backstopping measures on regulated sources such as MS4 stormwater permittees and municipal wastewater treatment plants. This is especially important because cost effectiveness studies have indicated that many agricultural practices can reduce pollution at a lower cost/pound than stormwater practices, particularly retrofits.[FN3]

Example:

As EPA noted in its evaluations of the Virginia draft WIP, that document fails to provide enough assurance that the level of agricultural BMP implementation assumed by the plan will actually occur. That is one of the major reasons why the EPA proposed highly ambitious levels of stormwater retrofits in its backstop options. Given that these proposed levels would be prohibitively expensive to achieve and may be unobtainable for other reasons, such as scheduling and site constraints, a more realistic approach would be to achieve more reductions from implementation of agricultural practices (ref. Section 7. Reasonable Assurance & Accountability Framework).

Recommendation #11: Pursue Additional Reductions from Non-regulated Sources

EPA and the states should outline various strategies for pursuing additional reductions from non-regulated sources and quantify the amount of 'unregulated' loads that are not currently being required to be reduced. This should include very clear programmatic and potential policy approaches, potential enhanced funding, and use of regulatory options as they may exist - as well as the potential load reductions that could be achieved through such measures so that policy makers can fully evaluate how best to approach this issue (ref. Section 4.3 Pollutant Source Sector Contributions, & 4.7 Nonpoint Source Load Summaries). Ultimately achieving and maintaining the Bay's water quality will require that all loads are fully accounted for and managed to some degree.

[FN3] (See "Cost Effectiveness Strategies for the Bay: Smart Investments for Nutrient and Sediment Reduction," Chesapeake bay Commission, 1997)

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Comment ID 0443.2.001.007

Author Name: Moore Shannon

Organization: Frederick County Government

The County provides the following comments on the Executive Summary of the TMDL: p. 7-8: "Once EPA evaluated a WIP and found shortfalls in pollution loading reductions and/or assurance that reductions would be achieved, EPA included only the parts of the WIP that it determined to be adequate and appropriate in its TMDL allocation. EPA then determined how to make up that shortfall and/or insufficient amount of reasonable assurance for the remainder of the allocation. EPA considered varying levels of federal backstop allocations that adjusted loads delivered to the Bay to ensure water quality standards are met. The result is a draft TMDL that merges jurisdictions' WIP allocations with varying degrees of federal backstop allocations in all seven jurisdictions, as well identification of additional federal actions that EPA is prepared to take if jurisdictions do not achieve milestones on schedule."

- If this is the case, then all of our comments about the WIP also apply to the draft TMDL, seeing as how it is a hybrid with the WIP. We are attaching our comments about the WIP in regards to this section.

Organization: Virginia Municipal League (VML)

We respectfully request removal of the federal "backstops".

Understanding there is a question as to whether EPA has the legal authority to employ backstops as part of Virginia's draft WIP; VML questions their applicability at this stage in the process. Specifically, we will not fully realize the success or failure of specific parts of the WIP until actual implementation begins. Additionally, it is premature to determine that the WIP is inadequate when we have not even begun the process of determining actions to be completed at the sub watershed level with Phase 2 of the WIP. Indeed, we view this as an iterative process where the Phase 2 WIP and subsequent 2-year milestone evaluations will result in changes to improve the TMDL. Lastly, and consistent with the theme of our comments, absent federal and state appropriations to carry out the backstop measures there is no "reasonable assurance" that the draft TMDL can be implemented. In summary, VML contends that the 2-year milestone evaluations will be the appropriate time to evaluate whether the EPA needs to consider additional measures in order to meet target load allocations.

3. The serious deficiencies evaluation by US EPA for the West Virginia Watershed Implementation Plan resulted in "aggressive" backstops. These backstops have serious implications for the state. First, the 3mG/L for nitrogen pushes the limit of existing technology. The threat of instituting measures for livestock operations like "precision feed management" for almost all animals in the watershed are indicative of a heavy handed federal dictator, not a federal partner. What is truly discerning is the fact that US EPA's own experts sent out to the state could not even identify practices called for in the proposed backstops (precision feed management).

Response

3. At least with regard to Pennsylvania, the Draft TMDL differs significantly from state Watershed Implementation Plan ("WIP"), without explanation or examination of the state's reasoning for its proposal. The Pennsylvania WIP allocated 1,820,139 pounds per year of Total Nitrogen ("TN"). The Draft TMDL allows only 413,449 pounds per year of TN. The Pennsylvania WIP allocated 64,683 pounds per year of Total Phosphorus ("TP"). The Draft TMDL allows only 4,181 pounds per year of TP. The Draft TMDL fails to explain the basis for this extreme differential and to provide adequate analysis of the Pennsylvania WIP and the assumptions and goals underlying it.

Finally, we have serious concerns about Federal Backstops. EPA does not need to substitute its version of heavy-handed, government regulation if the state chooses to build off of the incentive-based practices and programs that have resulted in progress over these many decades.

EPA's "backstop" measures put in the TMDL will certainly result in more costs for permitted facilities, such as large animal feeding operations, processing facilities, and urban landscapes. We question the "reasonable assurance" offered by EPA's backstops, as current regulatory authority and details on new requirements are both unclear. Instead of forcing states to regulate their way out of "backstops," we urge EPA to allow Virginia to implement its own plans for achieving clean water goals-without costly, burdensome regulations.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. V. Monitoring and Modeling Data

A. The draft TMDL cites a number of factors addressed through the watershed model, including the assertion that "non-regulated non-point sources of nitrogen, phosphorus and sediment are fully considered and evaluated...in terms of their relative contributions to water quality impairment of the Chesapeake Bay's tidal waters." If EPA decides to proceed with its "backstop allocation" approach, regulating only point sources of pollutants to the Bay, will the TMDL cease to be scientifically sound and reliable because the non-point source sector has been taken out of the regulatory equation?

B. Watershed model data has been unavailable for review or has been available only in extremely complex and large data sets that are unusable to the public. Beginning in mid-summer, numerous requests have been made to the Department to release the 5.3 delivery ratios. The Department never provided that data, indicating that the Department could not obtain the data from EPA. Only several days before the end of the comment period did EPA furnish the delivery ratios, first in a file that contained over 1.4 million lines of data, then in tables which included all Pennsylvania NPDES permits. Furthermore, the data was not sorted for significant point sources and did not identify 1, 2, and 3 POTW's or provide the facility names. Delivery ratios are critical to evaluating compliance paths for POTW's.

1. Is the modeling so incomplete that moving forward with the TMDL is unwise?
2. What is the status of completion of the 5.3 Chesapeake Bay Watershed Model?
3. Will each new model run in the future necessitate changing to the TMDL and all the policy, regulation, programs, etc. that result from the TMDL?
4. Do delivery ratios decline with reduced nutrient loadings? If that is the case, have reduced delivery ratios been forecast in the model to decline in future years? This question is based on the demonstrated tendency for lower concentrations of nutrients to be consumed nearer the point of discharge than the instance where large concentrations are discharged.
5. Do delivery ratios change with climate change and has this been forecast in the model?

VI. Nutrient Inputs to the Bay Is a Mere Estimate

A. While POTW's report exact nutrient contributions in their discharges in their monthly DMR's the volume of nutrients entering the Chesapeake Bay is a modeling estimate. In the case of New York and Pennsylvania, continuous sampling for just a few points would allow the exact calculation of nutrient contributions to the Bay.

B. It is troubling that the exact amount of nutrients and sediment reaching the Bay from Pennsylvania is not known through continuous measurement, but rather estimated by model. The Department asserts that if more BMP's were reported in Pennsylvania, the model would predict that less nutrient and sediment would reach the Bay even if those BMP's had been implemented years ago. Is this assertion true? The point source community monitors its effluent in

accordance with their respective NPDES permits. Why does Pennsylvania not monitor what it discharges into the Bay? Previous inquiries indicate that it is not the Department's responsibility to undertake such monitoring, but rather the United States Geological Survey's. Why would the process of adding additional data into a model result in Pennsylvania discharging less to the Bay? This is not scientifically sound and questions the entire TMDL process.

Please confirm that the Department's assessment in the WIP is correct and that the simple reporting of more BMP implementation would reduce Pennsylvania's contribution to the Bay.

G) EPA's proposed backstop measures and additional regulations

Virginia's WIP reflects some practices for both agriculture and turfgrass that we strongly believe, given proper implementation and funding, will result in significant water quality improvements, including:

- Agricultural Resource Management or Conservation Plans to meet the individual conservation needs of each farm will result in progress without mandating a "one-size- fits-all approach".
- Turfgrass/green industry practices through utilizing nutrient management plans, an1ending the content of certain fertilizer products, and educating homeowners, while carefully balancing the costs and unintended consequences of under-managed or under-fertilized turfgrass.

Simply put, if the state chooses to build off of the incentive-based practices and programs that have already resulted in progress for decades, EPA does not need to substitute its version of heavy-handed, government regulation. EPA's "backstop" measures put in the TMDL will certainly result in more costs for permitted facilities, such as large animal feeding operations, processing facilities, and urban landscapes.

As outlined in the legal analysis referenced earlier in these comments, we question the "reasonable assurance" offered by EPA's backstops, as current regulatory authority and details on new requirements are both unclear. Again, instead of forcing states to regulate their way out of "backstops," we urge EPA to allow Virginia to implement its own plans for achieving clean water goals-without costly, burdensome regulations.

Response

Comment ID 0479.1.001.004

Author Name: Gansler Douglas

Organization: Maryland Office of the Attorney General

With the establishment of the Chesapeake Bay TMDL, I commend EPA for setting stringent standards and exercising oversight of state implementation of those standards. Unfortunately, several of the states' draft WIPs contain serious deficiencies, including, in some cases, a failure to even attempt to meet the jurisdiction-wide allocations set for them as part of the TMDL planning process. See Section 8, Watershed Implementation Plan Evaluation and Draft Backstop Allocations, available at <http://www.regulations.gov/search/Regs/home.html#documentDetail?R=0900006480b5e745>. I applaud EPA for identifying the inadequate plans and for creating backstop allocations for point sources that will ensure the reductions outlined in the Bay TMDL will be met within a reasonable time period. If the state WIPs do not improve significantly in their final form, EPA should maintain the backstop allocations it has identified. And if any state WIP departs even further from its allotted allocation in its final revision, EPA should impose additional requirements to create reasonable assurance that all TMDL allocations will be met.

Response

Comment ID 0480.1.001.008

Author Name: Falk Hilary

Organization: Choose Clean Water Coalition

EPA Has Properly Included "Backstop" Allocations in its TMDL

In its TMDL document EPA describes, thoroughly and accurately, the lengthy history leading to its development of the draft TMDL, including the legal framework (Sections 1 - 3), much of which has been summarized above. In Section 8, it describes the development by the states of their Watershed Implementation Plans, EPA's evaluation of them, and the use by EPA of "backstop" allocations which EPA developed, based on its exhaustive modeling and data-gathering efforts, to ensure that, where the WIPs fail to demonstrate eventual achievement of the loading caps, the "backstop" allocations will do so.

Over the course of more than two decades EPA has worked closely with the Bay states to develop effective strategies to restore the water quality of the Bay and to achieve compliance with water quality standards. The framework which

allows each Bay state to develop a WIP, in which the state may establish allocations for sources within its boundaries which will achieve water quality standards for each segment before EPA applies backstop allocations (only if needed), is part of that joint effort. In its WIP each state must also provide assurance that it has and will use the authority and resources necessary to ensure that its allocations will be fully implemented so as to achieve eventual compliance with water quality standards.

As discussed above, EPA is legally required to establish the TMDLs on its own under Sections 303(d) and 117(g) of the Clean Water Act. However, allowing the states the "first shot" at prescribing effective loading allocations for sources within their jurisdictions lets them determine which combination of point and nonpoint source controls will provide, from their perspective, the most cost-effective or preferable approach to achieve water quality goals, provided each segment's overall loading cap is satisfied. As EPA stated in Section 8.3: "Backstop allocations were established to fill a loading shortfall in the jurisdiction's draft Phase 1 WIP or to increase the level of reasonable assurance that the overall TMDL pollutant cap will be achieved." To the extent that a WIP does not provide a combination of load and wasteload allocations to sources and categories of sources which is sufficient to satisfy the TMDL requirements which EPA provided to the states during the summer of 2010, based on its modeling results, for any segment within its jurisdiction, EPA's "backstop" allocations were applied so as to reasonably assure compliance, as EPA is required to do under Clean Water Act Sections 303(d) and 117(g). Given the serious deficiencies in most of the draft Phase 1 WIPs it was necessary for EPA to make substantial use of the backstops.

The result of this approach is that EPA is holding itself ultimately accountable for ensuring that the resulting allocations meet the requirements of Section 303(d) while allowing the states to propose allocations of their own through their WIPs. For the reasons described above, this strategy, and EPA's implementation of it, are fully supported by the Clean Water Act.

Response

Comment ID 0495.1.001.004

Author Name: Long Jim

Organization: Mattawoman Watershed Society

The need for a strong Bay TMDL with federal enforcement backstops is supported by Mattawoman's degradation in the face of continual warnings.

Mattawoman's recent decline [Uphoff, 2009] occurs in the face of a long history of alarms about the vulnerability of its remarkable assets to urbanization, not unlike the warnings and failed actions for the Bay at large. Hence it provides a lens that underscores the present inadequacy of state and federal enforcement of the Clean Water Act (CWA), and focuses the urgent need for a transition from voluntary to regulatory enforcement.

Among the warnings are:

- In 1990, Mattawoman's vulnerability to the growth inducing impacts of the new Mattawoman Wastewater Treatment Plant (WWTP) was expressed in a Memorandum of Understanding (MOU) between the funding participants, i.e., the EPA, MDE, and Charles County [MOU, 1990]. The MOU purported to alleviate secondary impacts. It is a great irony of the CWA that it is partly responsible for the WWTP, which enabled the development that has brought Mattawoman to its present precarious state.
- In 1992, a DNR fishery study concluded that Mattawoman represented "as near to ideal conditions as can be found in the northern Chesapeake Bay," and warned that it "should be protected from overdevelopment" [Carmichael, 1992].
- In 1996, the Maryland Department of Natural Resources (DNR) commenting on Charles County's Comprehensive Plan, noted that "[p]rotection of this watershed appears to be in direct conflict with the location and size of the development district" [DNR, 1996]. (The development district is an area 30% larger than Washington DC that blankets much of the Mattawoman watershed, and that was enabled by the EPA and MDE funded WWTP.) Yet resource protection within the development district (e.g. stream buffer width) is less than other areas in the county.
- In 1996, Mattawoman was designated as impaired on the 303(d) list in 1996 for excess nitrogen, phosphorus, and sediment. (It has since been removed for sediment.) [MDE,2005]
- In 1997, DNR wrote a report specifically outlining the vulnerability to development of Mattawoman and DNR lands within the watershed [DNR, 1997].
- In 1998, in the state-federal Clean Water Action Plan, Mattawoman was among only 17 of the 138 eight-digit watersheds in Maryland singled out as being both of very high quality and of very high vulnerability. Mattawoman's vulnerability stemmed from urbanization. The Clean Water Action Plan warned (emphasis added): "The State considers that these watersheds deserve special attention in order to address degradation that already is experienced in some areas before the pristine resources in the watershed are lost."
- In 2002, Mattawoman was again designated as impaired on the 303(d) list, now for impacts to the biological integrity of its benthic and fish communities in the nontidal river. [MDE, 2005]
- In 2003, the Army Corps authored the Mattawoman Creek Watershed Management Plan, and warned of the projected growth: "These intense development practices would have severe repercussions on the biological community and would decrease the habitat quality within the estuary" (emphasis added). The basis of this and other warnings in the plan was an extensive analysis of current land-use conditions and the impacts of projected growth determined from well-calibrated hydrological modeling as described above [ACOE, 2003].
- In 2005, EPA approved a TMDL for nitrogen and phosphorus.
- Also in 2005, concerns for the impacts of increasing impervious surface on Mattawoman's vaunted fisheries were highlighted in separate DNR reports. [Groves, 2005; Uphoff, 2005].
- In 2009, DNR reported a serious decline in fish-species richness and in the populations of remaining species in the freshwater-tidal estuary, and linked the declines to watershed urbanization [Uphoff, 2009]. Thus the consequences

warned of above are now evidently coming true at a rapid pace.

By detailing how continued warnings about an especially noteworthy eight-digit watershed are now coming true, the above list amply demonstrates the ineffectiveness of past strategies to protect the Bay at large against increasing urbanization. In spite of MS4 permits dating back to 1997, and purported "reasonable assurances" in a TMDL, Mattawoman's biological resources are waning. Given such data, we believe the justification for stronger EPA measures is self evident. In particular, the need for effective EPA backstops is critical.

As an example, consider Charles County's MS4 permit. In 2002, a condition of the permit required the county to retrofit 10% of its untreated impervious surface during each 5-year permit cycle. As explained in the appended comments to MDE, it appears that the county is falling seriously behind this requirement, with no incentive administered by the state to improve.

Similarly, in its annual MS4 reports, Charles County publicizes its Mattawoman Creek Watershed Management Plan [ACOE, 2003], when in fact it is not making progress on the most important recommendation in the plan, namely the protection of the Mattawoman stream valley (including tributaries). The plan is intimately connected to MS4, as it was undertaken as a condition of the county's first MS4 permit. In the plan, the Army Corps states unequivocally that "[p]rotection of the stream valley represents the single most important action that can be taken to protect the natural resources of the Mattawoman Creek." (Note that this conclusion was made in the absence of any freedom to adjust land-use scenarios, such as reconsidering the concept of a development district.) The county has had since 2005 the LIDAR-based stream valley delineation but in five years has failed to draft a protective ordinance.

In spite of these MS4 failures and the absence of any measures to begin meaningfully enforcing Mattawoman's TMDL, all while the Creek is exhibiting signs of decline [ACOE, 2003; TMDL, 2005; Uphoff, 2009], we note that MDE issued in 2009 permits for an airport extension that would bury ~800 feet of a Mattawoman tributary, channeling it in box culvert. This tributary drains to anadromous fish spawning reaches of the creek. Of the airport extension, the National Marine Fisheries Service (NMFS) stated "the runway realignment will have devastating impacts on the subject watershed" and concluded "we have significant concerns regarding the potential impacts on downstream resources and spawning habitat" [NMFS, 2001]. NMFS also emphasized the growth inducing impacts of a new reliever airport, stating "we are also concerned about cumulative impacts this proposal will have on wetlands and instream habitat throughout the local region." Similarly strong statements were made by the Army Corps, the National Park Service, and DNR. Unfortunately, EPA did not comment. Clearly a stronger federal oversight of all permits based on the Clean Water Act is called for if Bay restoration is to be successful.

Past history such as outlined here overwhelmingly justifies stronger federal enforcement of the Clean Water Act, which clearly confers the needed authority to regulate for clean water. Without stronger actions, such as much needed "backstop" enforcement of MS4 permits, Bay resources such as Mattawoman Creek, and by logical extension the Bay itself, will continue to experience chemical, physical, and biological degradation. The end result will be an impoverished environment for residents of the Bay watershed in the form of fewer recreational opportunities, lost ecological services, costly restoration measures, and the absence of sustainable economies based on the Bay's natural resources.

At the outset, the Hampton Roads Localities wish to make clear that they are supportive of the TMDL's goals as reflected in their ongoing commitment of significant resources to implementation of their MS4 programs. Further, the Localities are supportive of and are prepared to commit more resources to their MS4 programs if needed to help restore the Chesapeake Bay and protect the James and York rivers, but the commitment of more resources must be supported by sound science. Unfortunately, however, as explained below, the TMDL lacks a sound scientific basis. Consequently, the Localities have very little confidence in the accuracy of the James and York river basin-wide backstop allocations in general and the urban runoff sector backstop allocations in particular. Further, even if one assumes for the sake of argument that these allocations accurately reflect the load reductions needed to restore the Bay and protect the James and York rivers, the magnitude of the tasks and estimated costs of achieving the load reductions are so great that it is not reasonable to expect that the reductions can be attained by EPA's 2025 deadline.

we also object to the threatened but not applied "full backstops" that would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and also reduce the "flow basis" (2007 to 2009 average flow rather than design flow).

Response

the threat of backstops alone will be insufficient- More creative thinking about motivating state action is necessary. While we support the EPA in utilizing the backstop approach if necessary to supplement a lack of reasonable assurance in state actions, we think the draft TMDL needs to be more creative in motivating states to control pollution from non-point sources. The implicit threat of increasingly stringent federal "backstop" regulation of point source pollution to compensate for state inaction on non-point source pollution may not motivate all the states to seriously address non-point source pollution in the long run. From a cost-benefit perspective, it is inefficient to try to meet TMDL limits primarily by regulating point sources that experience diminishing marginal returns on pollution abatement. The political reality is that regulating non-point pollution sources personally involves far more people/voters in their daily lives, forcing behavioral changes or extracting a cost for not changing. The potential benefit for these affected people/voters is obscured by the framing of the TMDL as a plan for the health of the often geographically distant Bay, rather than the whole watershed and its numerous streams. From the deficiencies of most state WIPs and the absence of specificity on actions, it is likely that some elected leaders will not embark on a program of seemingly all cost and no benefit for their constituents. Blaming the EPA for more stringent regulations on point source polluters could be the preferred option.

Therefore, point source backstops alone will likely be insufficient to clean-up the watershed. The federal agencies should explore ways to tie federal assistance to the states in the Chesapeake Bay watershed for the very activities that produce the nutrient and sediment loads, like, agriculture subsidies and highway construction, to state progress on regulating non-point source pollution.

Unless more creative means to motivate state regulation of non-point source pollution are found, EPA will have to put a disproportionate amount of regulations on permitted point sources, which will be highly motivated to resist bearing the unbalanced burden of reducing nutrient and sediment pollution in the watershed. Concentrated costs in a relatively small group of actors could cause political push-back against the regulations. Progress on improving the water quality of the Bay under these circumstances would require sustained political support from the White House for decades (an unlikely scenario) and unfairly saddle many point sources with additional reductions that are not as cost-effective compared to [missing end of sentence]

Response

Please refer to the response for comment 0246.1.001.004.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all stakeholders involved including federal agencies and state and local jurisdictions. EPA encourages all stakeholders to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals. It will be a challenge to meet the 2025 deadline but EPA is committed to work with its stakeholders and jurisdictional partners in order to achieve this.

Organization: County of Lycoming, Pennsylvania

Lycoming County appreciates the opportunity to review and provide comments on the United States Environmental Protection Agency's (EPA) draft Total Maximum Daily Load (TMDL). Since 2007, the County has proactively worked to develop and implement a county-based nutrient management strategy designed to implement at the local level the goals and objectives of Pennsylvania's Chesapeake Bay Tributary Strategy. Lycoming County, working along with the Pennsylvania Departments of Environmental Protection and Community and Economic Development and other state and federal organizations, has invested more than \$600,000 in developing and implementing this strategy. Current public funding support committed to this effort to date stands at almost \$1.5 Million. The County supports EPA's efforts to implement the TMDL and DEP's efforts to develop a viable WIP to cost-effectively implement the TMDL. However, the County is extremely concerned about EPA's strategy to include a "Backstop TMDL" in the current process. We believe this will be detrimental to the County's efforts to implement its Chesapeake Bay Nutrient Management Strategy as well as impose significant burdens on its residents, businesses, other sectors, and wastewater treatment plants.

While contingency planning is always appropriate, the Backstop TMDL should not be introduced in this process until the Phase 2 WIPs are submitted in November of 2011. The Backstop TMDL that ramps up the treatment requirements for wastewater treatment plants and enforces more regulatory actions on other sectors could bring into question the validity of all voluntary actions taken by Lycoming County in implementing its Chesapeake Bay Nutrient Management Strategy during the past two years. The county has invested substantial resources while participating in the process and maintaining close coordination with both DEP and EPA in order to help us meet DEP and EPA expectations. We have worked aggressively to "do the right thing." We are concerned that at this critical moment in time, the Backstop TMDL will bring into question: "What is the right thing?" The threat of punitive backstop measures has also strained the positive relationships that have been built across source sectors at both the state and local levels. We need to get through the Phase II WIP process before we start questioning our strategies to make progress in cleaning up the Chesapeake Bay.

The County is very concerned about actions of other levels of government compromising the proactive efforts of our local government. The County hopes that the comments below provide EPA with a better understanding of the County's concerns and comments regarding the draft TMDL and its resolve to successfully implement the goals, objectives, and

strategic actions associated with its local-developed Chesapeake Bay Nutrient Management Strategy. These comments incorporate input received from local stakeholders, including members of the County's Chesapeake Bay Tributary Strategy Advisory Committee.

Response

Organization: County of Lycoming, Pennsylvania

Comment #2 - The County's approach to addressing the requirements of the Chesapeake Bay agreement and the development of its Chesapeake Bay Nutrient Management Strategy is to bring stakeholders, made up of both point source and non-point source representatives, together to work toward a solution that is more beneficial for the entire community. The threat of a "backstop" TMDL that regulates point source entities has concerned all of the County's stakeholders. If implemented, it will place the point source entities (i.e., sewage treatment plants) and the non-point source entities (i.e., farmers) on opposite sides of the discussions and possibly result in "finger pointing". This will not be productive and will result in these two sectors not wanting to work together.

Response

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

Comment #7 - There needs to be a balanced approach to reducing the nitrogen and phosphorus from the Chesapeake Bay region. The draft backstop TMDL requires a significant amount of the responsibility on the point source discharges. The County's approach has been balanced between the non-point and point source entities. During the past few years, Lycoming County has built a county-wide nutrient credit trading program that is centered on the development of Best Management Practices (BMPs) for non-point sources.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0512.1.001.010

Author Name: Lehman Megan

Organization: County of Lycoming, Pennsylvania

Comment #11 - The County recommends that EPA and DEP investigate the BMP improvements that already exist. The EPA should put the backstop TMDL requirements on hold until an accurate and reasonable inventory of existing agricultural BMPs can be developed. Assessing and documenting existing, uncounted BMPs should be a priority for the Phase II WIPs. The backstop TMDL should be postponed by EPA until after the Phase II WIPs are completed, and if backstop measures are enacted, they should be targeted geographically.

Response

Please refer to the response for comment 0067.1.001.009. A. The 3.0 mg/L Maximum TN Effluent Limit Is Not Attainable as LOT for WWTPs in Upstate New York

The EPA claims that a 3.0 mg/L maximum TN effluent limit is the LOT for WWTPs. Nevertheless, the EPA provides no scientific or technical basis to conclude that this limit is, in fact, feasible or attainable in our Upstate New York climate, especially considering that biological treatment processes "slow down" as the temperature of the influent decreases. In our case, we range from three to four months per year with influent temperatures less than 11 degrees Centigrade ("°C"). Over the past four winters, our lowest average monthly influent temperature has been 8.3°C, and the lowest daily influent temperature was 5.7°C. For the 12 months ending September 30, 2010, the arithmetic mean of our monthly average TN results is 6.12 mg/L, which is just slightly above the monthly design goal for our denitrification process. This past winter, our effluent maximum monthly average TN results were 7.20 mg/L for December 2009, 6.13 mg/L for January 2010, 6.35 mg/L for February 2010, and 5.93 mg/L for March 2010. Further, the following lend support for the proposition that denitrification (and corresponding nitrification) processes "slow down" in colder weather such that the "real world" LOT is nowhere near EPA's claimed maximum 3.0 mg/L for TN:

<<http://pubs.nrc-cnrc.gc.ca/rp/rppdf/s02-004.pdf>> - Development of Biological Nutrient Removal Technology in Western Canada, Journal of Environmental Engineering Science [National Research Council of Canada], Vo1. 1, 2002, pp. 33-43, Oldham [Stantec Consulting Ltd.] and Rabinowitz [Reid Crowther & Partners Ltd.] - concluding that production of a maximum 6 mg/L TN and 0.5 mg/L TP effluent has been shown to be feasible in cold weather climates of Western Canada. Given the moderating effect of the Pacific Ocean, the climatology of Western Canada has similarities to Upstate New York.

<<http://www.nywea.org/clearwaters/pre02fall/312030.html>> - Pilot Biological Nutrient Removal, Clearwaters [New York Water Environment Association], Vol. 31, No. 2, Summer 2001, Bodniewicz [Metcalf & Eddy] and Mahoney [NYC-DEP] - concluding that, in the New York City area's climate (which is significantly warmer than Upstate New York's on a year-round basis), there exists potential to produce an effluent in the range of 5-8 mg/L maximum TN. The report noted that, in all three pilot units studied, "significant problems arose with accurate DO [dissolved oxygen] control" and there were issues with reliable addition of methanol, a carbon source for denitrification. At our Facilities, we have also experienced these operational challenges, both of which present significant obstacles to translating theoretical and laboratory predictions into "real world" results.

<http://www.dep.state.pa.us/dep/deputate/watermgt/wsm/wsm_tao/InnovTechForum/InnovTechForum- IIA-Gilligan_1.pdf> - Demonstration of Low Temperature Nitrification with a Short SRT, WEFTEC 2000, Kos, Head, Oleszkiewicz, and Warakowski [Lotepro Environmental Systems & Services] - showing the reduction in nitrification rates and corresponding increase in solids retention time to achieve equivalent nitrification results in an activated sludge process at temperatures ranges from 7.5 - 20°C. "The ability of the conventional activated sludge process to nitrify is highly temperature dependent. At low winter temperatures, nitrification can be sustained only if the activated sludge process is operated at relatively high solids retention time (SRT) values". Key findings reported (and summarized in Figure 5 on p. 7 of the paper) include observation of an 81-83% reduction of the nitrification rate at 10°C in nitrifiers grown at 30°C and 47-59% reduction of the nitrification rate at 10°C in nitrifiers grown at 20°C as well as the fact that, in all cases, reductions in the nitrification rate measured under actual facility conditions were greater (i.e., the operational

nitrification rate was lower) than the "theoretical" reduction rates predicted by laboratory bench testing. This is a crucial point: scientific and engineering theories and laboratory "bench tests" most times cannot be replicated under "real world" conditions.

<http://www.chesapeakebay.net/content/publications/cbp_13136.pdf> - Nutrient Reduction Technology Cost Estimations for Point Sources in the Chesapeake Bay Watershed, November 2002, Nutrient Reduction Technology Cost Task Force of the Chesapeake Bay Program - stating it was determined by the NRT Cost Task Force that it would not be feasible and in most cases non-cost effective to consider a level of implementation in New York greater than TN <8.0 mg/L and TP <2.0 mg/L, especially with respect to smaller plants discharging 0.5 MGD or less.

<http://www.sciencedirect.com/science?_ob=ArticleURL&_udi=B6V6C-516MRFK-7&_user=10&_coverDate=11%2F26%2F2010&_rdoc=1&_fmt=high&_orig=search&_origin=search&_sort=d&_docanchor=&view=c&_acct=C000050221&_version=1&_urlVersion=0&_userid=10&md5=74dfd4b6dcb30826839ebb30c26aa82b&searchtype=a> - announcing a report to be published in the upcoming November 26, 2010 issue of the Journal of Hydrology (at pp. 507-514) on a study of biofilter columns in thermostat-controlled climate rooms (at 2, 7, and 20°C) to investigate the effect of low temperatures on nutrient removal, billed as concluding, "Unfortunately, nitrogen removal was poor."

To the extent the TMDL contains unattainable standards and unachievable results, the TMDL is not approvable.

B. The 0.1 mg/L Maximum TP Effluent Limit Is Not Attainable as LOT for WWTPs in Upstate New York

Although the EPA claims that a 0.1 mg/L maximum TP effluent limit is the LOT for WWTPs, the EPA provides no scientific basis to conclude that this limit is, in fact, feasible or attainable in our Upstate New York climate, especially considering the effect of colder temperatures on biological treatment processes as discussed above. In the Canadian study cited above, the demonstrated feasible maximum "real world" TP effluent average in cold weather climates is five times higher than what the EPA claims to be the LOT in the TMDL.

Again, to the extent the TMDL contains unattainable standards and unachievable results, the TMDL is not approvable.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please refer to the response for comment 0080-cp.001.002 regarding New York allocations.

Comment ID 0515.1.001.007

Author Name: Crumb Edward

Organization: Binghamton-Johnson City Joint Sewage Board

F. The EPA Provides No Technical Data to Justify Imposition or Effectiveness of "Backstop Allocations"

Nowhere in the TMDL does the EPA give any technical data to justify its menu of backstop allocations or provide any CBWM results that would demonstrate the effectiveness of each level of the backstop allocations. It is arbitrary and capricious as well as an abuse of discretion for the EPA to threaten backstop allocations in the absence of credible data demonstrating that the backstop allocations would produce any better WQ in a corresponding Bay watershed segment than the jurisdiction's WIP-I.

According to the USGS, if all Bay watershed jurisdictions had WQ equal to New York's, the Bay would not be impaired. Indeed, the CBWM estimates that New York contributes only 4% of total TN delivered into the Bay, 5% of TP, and 4% of TSS. Given the defects and reliability issues with the CBWM discussed and referenced above, it may actually be the case that New York's real delivered loadings are even lower.

As to WWTPs, the EPA's proposed backstop allocations for New York lack a rational basis because, collectively, the 28 significant WWTPs in New York are an insignificant source of TN (0.57% of total TN delivered into Bay), TP (1.13% of total TP delivered into Bay), and sediment (less than 0.5% of total sediment delivered into the Bay, and expressly acknowledged to be "insignificant" in the TMDL). Further, at the TMDL's assigned Delivery Coefficients for our WWTP, we would need to remove 1.6 pounds TN at EOS in order to prevent one pound of TN from being delivered to the Bay (at an assigned 63.9% Delivery Coefficient for TN); 2.2 pounds TP at EOS in order to prevent one pound of TP from being delivered to the Bay (at an assigned 45.4% Delivery Coefficient for TP); and 2.5 pounds Total Sediment at EOS in order to prevent one pound of Total Sediment from being delivered to the Bay (at an assigned 39.8% Delivery Coefficient for Total Sediment). Given New York's unimpaired WQ and given the extent of "over control" needed to achieve these levels of prevention of delivery into the Bay, the EPA's proposed backstop allocations mandate unattainable requirements, as discussed above, and inequitable reductions, as further discussed below.

It must also be noted that the levels of proposed backstop allocations which would limit WWTPs to discharges "based on current flows" are unrealistic as to those WWTPs serving communities with combined sewers where both the annual flows and daily flows are subject to high variability in proportion to precipitation as well as ice/snow storage and snowmelt. Especially in consideration of the value that a WWTP which treats stormwater from a combined sewer collection system contributes to overall Bay watershed WQ, the EPA must amend its proposed backstop allocations to account for variations in "current flow" from year to year for those WWTPs treating stormwater, perhaps by basing such allocations on a 10-year rolling average adjusted, of course, in proportion to any actual expansion or upgrade in WWTP capacity or capability. In this way, backstop allocations that are unattainable or impossible to meet can be avoided, as can permit violations due to natural causes.

Backstop allocations proposed for MS4s/urban stormwater/CSOs are also unrealistic and lack an EPA explanation of any basis for them or the effect that such allocations would have in each of the 92 covered segments in the Bay. It must also be noted that New York is a leader in control of this discharge segment as demonstrated by its recently updated "toolbox" of MS4 regulations, best management practices ("BMPs"), and publications providing technical assistance. The requirements for engineering reports to be submitted with all discharge applications, as well as

requirements to provide engineer certifications during implementation and operation, provide a high degree of assurance that New York will successfully maintain and improve its already non-impaired WQ in relation to discharges from this segment, yet the EPA fails to recognize, accept, or credit the effect of these improvements recently added and, thus, now "on the books".

As to agriculture, New York has an active program underway to add wetlands and riparian buffer zones to its agricultural lands in order to capture, retain, and/or treat nutrients and sediment. In acknowledgement that, on a proportionate basis, agricultural lands contribute large amounts of nutrients and sediment to the Bay watershed in New York as well as other state waterbodies, New York has made available more money to farms to protect watersheds and improve nutrient and sediment management than is presently being applied-for. A report released by the New York State Comptroller's Office within the past 10 days finds that available funds are going unspent, such that there is a high potential for carrying-out control measures on more of New York's agricultural lands within the Bay watershed. See, <<http://www.osc.state.ny.us/press/releases/oct10/102910f.htm>>. New York's Certified Agricultural Environmental Management ("AEM") Program, discussed in New York's WIP-I, constitutes a highly-effective means to implement BMPs and other practices that can further improve New York WQ in the Bay watershed.

Because of the large percentage of forest, open water, and low-density developed land (together, comprising about 72-76% of the New York portion of the Bay watershed) as well as the fact that most of the TN deposited into the New York portion of the Bay watershed originates in Midwestern states and Canada, the NYS-DEC is powerless to enforce a solution or effectively address this loading source in its WIP-I. In order to be fair, the EPA must make allowances for this in the TMDL as well as in the two-year milestones. With respect to the backstop allocations, New York should not be required to "over control" in other sectors so as to compensate for this source of TN loadings which it cannot control. Thus, it is the federal government which must "step-up", strictly enforce the CAA as to aerial deposition of nitrogen originating from emissions of power plants and "smokestack industries" in Midwestern states, and the federal government must negotiate an effective, enforceable treaty with Canada to provide meaningful control of this source. The TMDL should clearly address the steps the federal government will commit to take in this regard as well as the specific impact to be achieved in reduction of these loadings. The EPA's commitment to exercising leadership and control on a federal basis to eliminate interstate pollution sources which contribute significantly to the nitrogen loadings in the New York portion of the Bay watershed should be measured, monitored, and subject to accountability measures expressly stated in the TMDL.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

2. The Backstop Provisions for Stormwater Should not Be Prescriptive

Table 8-6 of the TMDL indicates that the backstop provision for stormwater will be "MS4: 50% of urban MS4 lands meet aggressive performance standard through retrofit/ redevelopment." This is somewhat self-contradictory as it first asserts that a performance standard will be applied but then stipulates specific practices. In essence this is a practice-based requirement. On the surface, this would restrict flexibility for the MS4 by precluding any measures other than retrofits, such as the purchase of nutrient credits on the trading market. This would unnecessarily increase costs and again, raise the affordability issue.

WRI recommends that the backstop provision be revised to set performance standards and provide MSs as much flexibility as possible on how to meet the standards.

3. Some Backstop Measures Could Make Things Worse

The main backstop measure that EPA has at its disposal is the lowering of wasteload allocations for wastewater treatment plants. The maximum application of this measure would be to reduce the annual load limit and treatment requirement to a load based on existing flow and the limit of technology for nutrient removal; in other words, capping the plant at existing loads treated to the maximum extent possible. This would mean that no further growth could be allowed in the plant's service area because the plant could not meet its permit limits if such growth were to occur. The only way to avoid this would be to ensure the existence of a viable nutrient trading program with an adequate supply of credits.

If such a trading program did not exist or credit supplies were inadequate, then the plant would have to impose a moratorium on new connections in its service area. While EPA may feel that this is an acceptable outcome for states that do not provide reasonable assurance for nonpoint source reductions, it should carefully consider the potential unintended consequence of driving new development to unsewered areas to be served by septic systems. The nitrogen load from a house on septic, even with a denitrifying septic system, would be substantially higher than if the house were connected to a municipal system treating wastewater to the limit of technology. Maryland's WIP states that "per household, the (nitrogen) load from new development on well and septic is almost five times as great as new loads from sewer areas." . Imposing sewer moratoria and driving development to currently undeveloped and unsewered areas could also endanger smart growth and encourage sprawl with its myriad adverse environmental and social impacts.

EPA should reevaluate this backstop provision in a more holistic manner and ascertain if in fact it would produce a net benefit. If not, lowering wasteload allocations should be dropped as a backstop measure.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to comment 0139.1.001.017 where EPA discusses the desire for trading to aid in alleviating some of the financial burden across the Bay jurisdictions. For further information on funding sources, please see the response to comment 0038.1.001.024 outlining the federal efforts towards Chesapeake Bay restoration.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Comment ID 0530.1.001.002

Author Name: Gulibon Grant

Organization: Pennsylvania Builders Association

PBA is proud of the contributions that its members have made-often working collaboratively with representatives of state and municipal governments, sewage treatment plants, agricultural interests, environmental organizations, and other business groups-in developing Pennsylvania's response to the challenges posed by the Chesapeake Bay TMDL. In Pennsylvania, these diverse constituencies, which in the past had often worked in opposition to each other on Bay-related issues, have in recent years found myriad areas of agreement and have come together to find common solutions where possible. As a result, much faster and more substantial progress has been made on a voluntary, collective basis than had previously been achieved on an adversarial one.

PBA is very concerned, however, that the progress Pennsylvania has achieved will be undermined-and possibly reversed in some cases-by EPA's threatened "backstop allocations." The approach represented by the "backstop" strategy is precisely the opposite of that which has begun to work so well in Pennsylvania. It pits one sector (sewage treatment plants) against others (urban-suburban stormwater and agriculture) in the hope that the treatment plants will advocate for stricter measures against the other sectors (and therefore avert the "backstop" allocation that they face), rather than encouraging the sectors to continue to collaborate in the service of their own interests and by so doing advance the cause of protecting the Bay. The more likely result under the "backstop" scenarios (including forcing sewage treatment plants to treat to the limit of technology, retrofitting existing urban areas, regulating more small farms as concentrated animal feeding operations, further tightening stormwater controls for new development, and imposing a higher "baseline" for trading and offsetting initiatives by non-point sources) will be that scarce public and private resources will be directed to relatively more costly, less efficient pollution reduction methods-an outcome that runs counter to that desired.

Author Name: Abraham Phillip

Organization: Virginia Association for Commercial Real Estate (VACRE)

VACRE urges EPA to delay adoption of the TMDL and any decision to impose backstops on the states for at least one year and until no sooner than December 31, 2011. We ask for this for the following four reasons:

Finally, no legal authority exists for the full range of urban/suburban retrofits the EPA draft TMDL or backstops would require of existing properties, including state and local highways. These include installing rain gardens and tearing up parking lots and installing stormwater controls including pervious asphalt. Such controls are far more expensive and

achieve far less pollutant reductions per dollar spent than wastewater treatment plant upgrades (which developers pay for too) or many agricultural best management practices contained in the Virginia draft WIP. Agricultural BMPs could be funded through a nutrient exchange program and/or nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Response

Regarding your comment to delay the adoption of the TMDL, please see the response to comment 0062.1.001.004.

As a member of the Chesapeake Bay Blue Ribbon Finance Panel, I am quite dismayed the direction being taken by the EPA in regards to the proposed nitrogen/phosphorus requirements. Millions and millions of dollars have been spent on committees, publications, and expenses with little or no positive outcome. Time and time again it has been pointed out that improper modeling was used to reach the proposed limits; with no funding mechanisms in place to assist individuals or city/county governments to meet these requirements. At last count, WV alone needs 2 billion dollars for water/wastewater projects throughout the State. Targeting one area is not a viable option for any State Legislature. It appears the only option left is for the States to file a collective suit against these proposals and use valuable resources to stop this madness. For a federal agency to state time and again they don't care how we reach these limits, get it done or we will impose backstops to make sure you do is not cooperation, it is tyranny and needs to be addressed.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all stakeholders involved including federal agencies and state and local jurisdictions. EPA encourages all stakeholders to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals. It will be a challenge to meet the 2025 deadline but EPA is committed to work with its stakeholders and jurisdictional partners in order to achieve this.

Comment ID 0534.1.001.004

Author Name: Golazeski Daria

Organization: Broome-Tioga Stormwater Coalition (BTSC)

Since the BTSC's inception we have worked closely with the NYSDEC and we are confident that New York State has put forth a concerted effort to devise a draft Watershed Implementation Plan that sets forth goals to achieve realistic and attainable results. Yet, these efforts still have fallen short of the EPA's desired reductions. Due to the already low pollutant levels in New York these required reductions cannot be met, and therefore, the extreme expense associated with the mandates will be fruitless. Rather than imposing a penalty for the great strides that have been achieved, the successes that have been accomplished in New York, by the NYSDEC, the BTSC and other groups committed to water quality improvement, should be held as a model for other jurisdictions in the Chesapeake Bay Watershed.

EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

Response

Non-point Sources of Nutrients are the Correct Focus of the State Watershed Implementation Plans and EPA's TMDL

The high quality effluent from the Spring Grove mill is typical of the effluents from the overwhelming majority of industrial and municipal point source dischargers in the Chesapeake Bay watershed. Over the past forty years, US EPA and their state environmental agency counterparts have worked in harmony through the effluent guidelines and NPDES permitting processes to continuously improve the waste treatment processes at industrial and municipal waste water treatment plants. This has resulted in the high quality effluents that are now discharged into the nation's receiving waters.

Accordingly, it is no surprise that most of the excess nutrients causing eutrophication in the nations waterways including the Chesapeake Bay are coming from non-point sources, not point sources. The watershed implementation plans (WIPs) submitted by the states and the District of Columbia acknowledge this fact and correctly focus most of their nutrient and sediment reduction efforts on non-point sources. While some of the state WIPs could be more comprehensive, US EPA's backstop TMDL measures to force point source dischargers to make additional reductions to their nutrient and sediment discharges are not realistic nor technological possible in most cases. Instead of threatening to force or actually forcing those dischargers that have already made significant and costly improvements to reduce nutrient and sediment discharges, US EPA should continue to work cooperatively with their state and federal partners to assist non-point source dischargers to make significant and cost effective reductions in nutrient and sediment discharges.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. EPA Has Properly Included "Backstop Allocations" in its TMDL

In its TMDL document EPA describes, thoroughly and accurately, the lengthy history leading to its development of the draft TMDL, including the legal framework (Sections 1 - 3), much of which has been summarized above. In Section 8 it describes the development by the states of their Watershed Implementation Plans, EPA's evaluation of them, and the use by EPA of "backstop" allocations which EPA developed, based on its exhaustive modeling and data-gathering efforts, to ensure that, where the WIPs fail to demonstrate eventual achievement of the loading caps, the "backstop" allocations will do so.

Over the course of more than two decades EPA has worked closely with the states within the Chesapeake Bay watershed to develop effective strategies to restore the water quality of the Bay and to achieve compliance with water quality standards. The framework which allows each state to develop a WIP, in which the state may establish

allocations for sources within its boundaries which will achieve water quality standards for each segment before EPA applies backstop allocations (which are applied only if needed), is part of that joint effort. In its WIP each state must also provide assurance that it has and will use the authority and resources necessary to ensure that its allocations will be fully implemented so as to achieve eventual compliance with water quality standards.

As discussed above, EPA has the legal authority to establish the TMDLs on its own under Sections 303(d) and 117(g) of the Clean Water Act. However, allowing the states the "first shot" at prescribing effective loading allocations for sources within their jurisdictions lets them determine which combination of point source and nonpoint source controls will provide, from their perspective, the most cost-effective or preferable approach to achieve water quality goals, provided each segment's overall loading cap is satisfied. To the extent that a WIP does not provide a combination of load and wasteload allocations to sources and categories of sources which is sufficient to satisfy the TMDL requirements which EPA provided to the states during the summer of 2010, based on its modeling results, for any segment within its jurisdiction, EPA's "backstop" allocations were applied so as to reasonably assure compliance, as EPA is required to do under Clean Water Act Sections 303(d) and 117(g). Given the serious deficiencies in most of the draft Phase 1 WIPs it was necessary for EPA to make substantial use of the backstops.

The result of this approach is that EPA is holding itself ultimately accountable for ensuring that the resulting allocations meet the requirements of Section 303(d) while allowing the states to propose allocations of their own through their WIPs. For the reasons described above, this strategy, and EPA's implementation of it, are fully supported by the Clean Water Act.

Author Name: Bauhan Hobey

Organization: Virginia Poultry Federation (VPF)

Aside from EPA's failure to follow the Clean Water Act with respect to development of a Chesapeake Bay TMDL, the agency's policy of threatening TMDL "backstops" against federally permitted point sources for perceived WIP deficiencies is also counterproductive and poor public policy. The proposed backstops call for greater nutrient reductions at municipal wastewater treatment facilities and greater regulation of animal feeding operations (AFO's), this despite limited authority to require NPDES permits for AFOs and the fact that both wastewater plants and poultry AFO's in Virginia have already complied with stringent regulatory requirements at considerable expense.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs

and EPA allocations. Please refer to the response for comment 0067.1.001.009. EPA is under a legal obligation to establish a TMDL that meets water quality standards in the Bay which is explained in the response to comment 0139.1.001.017.

Comment ID 0608.1.001.002

Author Name: Pallansch Karen

Organization: Virginia Sanitation Authority, City of Alexandria

We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations"). EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). Implementation of "full backstop" allocations at 2007-2009 average flows would require significant upgrades to our facility with construction costs exceeding \$280 million. This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is a nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

Comment ID 0610.1.001.001

Author Name: Randall Clifford

Organization: Occoquan Watershed Monitoring Program (OWMP)

Our comments relate specifically to the issue of nitrogen management at the Upper Occoquan Service Authority (UOSA) Water Reclamation Facility (WRF) located in Centreville, Virginia and discharging to the Occoquan Watershed.

Standing for Commentary

The Occoquan Watershed Monitoring Subcommittee (OWMS), and the Occoquan Watershed Monitoring Program (OWMP), are charged under the provisions of the Occoquan Policy (VR 680-11-05) with maintaining a continuous record of water quality in the Occoquan Watershed and Reservoir, and reporting to DEQ any changes in water quality due to either point source discharges or nonpoint sources. The purpose of the Occoquan Policy is to ensure the preservation of the Occoquan Reservoir as a reliable drinking water supply for the Fairfax County Water Authority (now Fairfax Water), which currently serves a population of over 1.5 million in the Northern Virginia region. We are, respectively, the Chairman of the OWMS, and the Director of the OWMP, capacities in which we have served since 1972 and 1975, respectively. From this perspective, we have reviewed the Draft TMDL document with a view to determining if there are any issues with respect to maintaining acceptable raw water quality in the Occoquan Reservoir drinking water supply. While not directly within the field of responsibility of the OWMP, we have also reviewed the draft with respect to likely impacts on nutrient loads delivered to the Potomac Estuary (and thence to the Chesapeake Bay) from the Occoquan Watershed.

In careers totaling over eight decades in Virginia, we have both worked (and continue to work) on issues fundamentally related to restoration of the Bay. Professor Randall was appointed to the inaugural Scientific and Technical Advisory Committee (STAC) of the Chesapeake Bay Program by the Governor of Virginia in 1984, for service beginning in 1985, and served on STAC for 21 consecutive years, including four years as the first Committee-elected chair. He has also conducted fundamental research and extensive implementation of biological processes for the removal of nutrients from

wastewater, and the fruits of his efforts may be seen throughout the Bay Watershed. Professor Grizzard has also served as a member of STAC, and has conducted basic research on the transport of nutrients in stormwater, and on the interactions of nutrients between the water column and sediments of impounded waters, efforts of obvious concern for the Occoquan Program, as well as the Bay restoration efforts.

With our respective responsibilities and professional backgrounds, we are writing to voice an urgent concern relative to the application of the backstop provision (as described in Chapter 8 of the TMDL draft) for the total nitrogen load allocation to the UOSA WRF.

Response

Please refer to the response for comment 0229.1.001.005.

Comment ID 0610.1.001.004

Author Name: Randall Clifford

Organization: Occoquan Watershed Monitoring Program (OWMP)

The assumption that applying the backstop nitrogen removal requirement to the UOSA WRF discharge will result in a 1:1 reduction in nitrogen delivery to the Chesapeake Bay is fundamentally flawed. In fact, imposing the limit may have the unintended consequence of actually increasing the phosphorus and nitrogen loads exiting the Occoquan Reservoir, and at the same time further degrading water quality in a critically needed drinking water supply. The previously-cited 2005 report from OWML (An Assessment of the Water Quality Impacts of Nitrate in Reclaimed Water Delivered to the Occoquan Reservoir) reached similar conclusions.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Author Name: Randall Clifford

Organization: Occoquan Watershed Monitoring Program (OWMP)

Upon its review of that document, the Occoquan Watershed Monitoring Subcommittee unanimously accepted the report recommendations, and directed the chairman to communicate those findings to the Virginia DEQ. That letter (previously cited as Attachment A) [Comment Letter contains additional information in the form of an attachment. See original

comment letter 0610.1] contained the following recommendation:

"...it is the conclusion of the OWMS that implementation of the proposed [technology-based] nitrogen reductions for UOSA would be detrimental to water quality in the Occoquan Reservoir, and would needlessly threaten the public health of the more than 1.2 million FW [Fairfax Water] customers who rely on the Reservoir for drinking water. Therefore, the OWMS, by unanimous vote, recommends that the new nitrogen reduction requirements not be imposed on the UOSA WRF at this time, and that the current nitrogen management strategy of the Occoquan Policy remain in force pending the completion of needed research by OWML."

We should point out at this time, that the above-referenced recommendations of the OWMS were that no reductions in nitrate in the UOSA discharge would be undertaken unless necessitated by the requirement to maintain a raw water intake concentration of no more than 5 mg/L as N. In 2007, and contrary to recommendations of the OWML assessment and the OWMS, the Virginia DEQ imposed the current annual total N load cap of approximately 1.3 million pounds.

Even though this decision was taken 3 years ago, we have continued to think it was an unwise approach to managing the system, and the current backstop nitrogen removal proposal has certainly elevated our level of concern about unintended consequences. Our concerns were specifically highlighted in our letter to Virginia DEQ on 25 May, 2007 (Attachment C) regarding the 1.3 million pound permit limit. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0610.1] Professor Grizzard continued to voice our misgivings about consideration of further lowering the UOSA load allocation in an opinion delivered to UOSA in a letter dated 14 September, 2009 (Attachment D). [Comment Letter contains additional information in the form of an attachment. See original comment letter 0610.1]

Now, as then, we strongly caution against the application of new nitrogen load reductions to the UOSA WRF, particularly at this point in time. The risks of undesirable outcomes with respect to local water quality are simply too great, as are the risks of not achieving the anticipated results for the Chesapeake Bay. A far more rational approach to nitrogen management in the Occoquan Watershed would be to continue to build on the base of the water quality studies and modeling work currently underway so that further refinements in a management strategy may be developed in a way that carries a lower risk of triggering unacceptable water quality outcomes.

We are appreciative of the opportunity to voice our opposition to the current backstop proposal, and we hope that a careful review of our concerns will be conducted. Because of the foresight of regulatory agencies in the Commonwealth of Virginia and other watershed stakeholders, extending back over four decades, we are in a unique position to make careful and supportable management decisions in the Occoquan Watershed. In our judgment, it would be unwise to proceed with new decisions that are not similarly well-grounded on the scientific understanding that has been developed in this critical Northern Virginia water resource.

Comment ID 0614.1.001.003

Author Name: Street William

Organization: James River Association (JRA)

JRA much prefers the development and implementation of a sufficient Virginia Watershed Implementation Plan (WIP) as the guide for efforts to achieve water quality standards for the James River that would obviate the need for any EPA backstop actions. However, in the event that the state fails to fulfill its own legal duties and obligations to address water pollution and impairments in the James River, JRA supports EPA enactment of backstop actions to provide reasonable assurance that necessary pollution reductions will be achieved.

The EPA should delay adoption of the TMDL and backstops for at least one year and until no sooner than December 31, 2011 for the following reasons:

- No legal authority exists for the full range of urban/suburban retrofits the EPA draft TMDL or backstops would require of existing properties, including state and local highways. These include installing rain gardens and tearing up parking lots and installing stormwater controls including pervious asphalt. Such controls are far more expensive and achieve far less pollutant reductions per dollar spent than wastewater treatment plant upgrades (which developers pay for too) or many agricultural best management practices contained in the Virginia draft WIP. Agricultural BMPs could be funded through a nutrient trading fund which accepts payments from urban/suburban land disturbing projects.

Response

Regarding your comment to delay the adoption of the TMDL, please see the response to comment 0062.1.001.004.

Organization: CET Engineering Services

Why were the caploads of the Pennsylvania significant industries reduced so dramatically? From the attached table [Comment Letter contains additional information in the form of an attachment. See original comment letter 0629.1.001.001], the PA WIP allocated 1,820,139 pounds per year of Total Nitrogen. The EPA draft TMDL Backstop allocates 413,449 pounds per year. The PA WIP allocated 64,683 pounds per year of Total Phosphorus. The EPA draft TMDL Backstop allocates 4,181 pounds per year.

How were the Pennsylvania cap loads for the individual industries calculated? The attached table [Comment Letter

contains additional information in the form of an attachment. See original comment letter 0629.1.001.001] compares Pennsylvania significant cap loads from the PA WIP versus the EPA TMDL Backstop. As an example, some industries got merely 1% of the PA WIP Total Nitrogen capload and some were allocated 49%. Several of the insignificant industrial point sources were given caploads of zero (0) pounds per year of total phosphorus.

Why are the Pennsylvania industrial caploads significantly lower than municipal cap loads? In the EPA draft TMDL Backstop, municipal point source capload allocations were based on 3 mg/l of TN and 0.1 mg/L of TP and insignificant municipal point sources on 8 mg/L of TN and 2 mg/L of TP at design flow conditions. As the attached table [Comment Letter contains additional information in the form of an attachment. See original comment letter 0629.1.001.001] shows, the industrial caploads are significantly lower.

Why were many industrial facilities given limits less than the limit of treatment technology at design flow conditions? The caploads cannot be achieved when the industry must treat the wastewater to reduce the concentrations of TN or TP in the discharge. This condition forces every industrial facility, as it approaches design conditions, to purchase nutrient credits, if they can.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

As a resident of Pennsylvania, a municipal consultant, a boater and fisherman and a concerned citizen, I have followed and been involved in the Chesapeake Bay Tributary Strategy implementation and now the DEP's Watershed Implementation Plan. The Environmental Protection Agency's draft Backstop Chesapeake Bay TMDL is a disappointing action that must be reconsidered. I have included comments to the EPA's plan below.

Comment #1:

High-level Backstop allocations with additional loadings allocated to Point Sources (the Wastewater Treatment Plants), bluntly, is a very poor use of the people's money. The EPA should and must consider the impertinence of this "limit of technology" action and must revise its allocations.

In considering the limits of technology, the EPA should consider its 2009 "Nutrient Control Design Manual State of Technology Review Report" and the typical treatment plants ability to meet these total maximum daily limits on a

continuous basis. The ability for all point source/wastewater plants in the watershed to meet these particular limits on a daily basis is questionable. The level of treatment by a point source is typically better than the permit requirements in order to ensure some time to adjust to the inconsistent wastewater flows and concentrations. That, by EPA definition means that the point sources must treat to greater than the limits of technology to meet the limit of technology allocation set by the EPA.

In considering this reallocation of the load, the EPA must consider that the point sources have actively participated in the load allocation process and have consistently been willing to do an appropriate share of the load reduction. To that purpose, the point sources developed a clear strategy with the DEP, with the EPA's full knowledge and participation, and are well on their way to achieving compliance with the expected load reduction and can be expected to significantly overachieve the reduction for the next five to ten years.

Comment #2:

The notion put forward by the EPA that Pennsylvania has done little to improve water quality in the Chesapeake Bay watershed is false and misleading.

Over the past 5 years, Pennsylvania, through the DEP and local efforts, has enhanced enforcement of, and has been updating, its rules, standards, and regulations. The DEP's State Water Plan of 2008 is intended to "integrate and leverage existing state and federal stormwater management regulations, policies, and requirements" through "appropriate legislation, regulation, and administrative changes." The concept is to provide "an effective, straightforward, seamless stormwater management program that is blind to regulatory origin." Pennsylvania has been and is continuing to thoughtfully fulfill its obligation to be good stewards of our natural assets. Though progress may not be as rapid as hoped for by many, and expected by national regulators, the progress has been steady. We as a State believe it is about to rapidly turn a corner towards greater coordinated compliance and better water quality through new regulatory efforts and better cooperative programs.

Some of the programs and regulations already moving the State toward cleaner water include the Stormwater Management Act 167; Sewage Facilities Act 537; Municipalities Planning Code, Chapters 102 and 105; NPDES MS4; and, through EPA and DEP, established local total maximum daily loads (TMDLs). Some of the current programs that have been undergoing comprehensive reviews and significant changes include:

- Title 25, Article II, Chapter 92a National Pollutant Discharge Elimination System (NPDES) program updates, including municipal separate storm sewer system (MS4)
- Title 25, Article II, Chapter 96 Water Quality Standards Implementation requiring TMDL development for various water courses in the state
- Title 25, Article II, Chapter 102 Erosion and Sediment Control, and Stormwater Management program updates (includes Best Management Practices, BMPs)

In order to "bring people into compliance," the DEP, has several established regulations that are slated for increased enforcement and greater use, including:

- Nutrient Trading Program through Pennsylvania Infrastructure Investment Authority (PENNVEST) and independent brokers
- Title 25, Article II, Chapter 105, Dam Safety and Waterway Management

- Title 25, Article II, Chapter 93, Water Quality Standards
- Act 167, Pennsylvania's Stormwater Management Act
- Act 38, Pennsylvania's Nutrient Management Act

To facilitate municipal compliance with the new rules and regulations, the state legislature is responding to concerns over legal aspects of funding and control of stormwater facilities and MS4 watershed programs by putting forward legislation for development for stormwater authorities (HB 1390).

The DEP has added language to the Pennsylvania Chapter 92a standards that incorporates the "latest" EPA MS4 regulations. This will ensure that Pennsylvania's rules and regulations will automatically incorporate the new EPA regulations when they are updated and keep Pennsylvania in compliance with federal rules.

There are many local efforts that have been implemented, including various county plans for consolidated nutrient trading to more functionally guide the non-point source community. These include the existing watershed groups that work to enhance the conditions of the watersheds and educate the surrounding communities. Also included are the groups like the Lancaster County Clean Water Consortium that have been gathering resources and leading local, ground up efforts to clean up the rivers and streams.

All these things take time. The Bay did not become as it is in a few years. The legal framework and the education of the public to properly work towards the restoration of the watersheds leading to the Bay may not happen in an amenable a time frame for the EPA. The EPA should and must work with Pennsylvania to assist the State in achieving these goals. The Backstop TMDL's are not an appropriate means of working with the people of Pennsylvania..

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. The Environmental Protection Agency's draft Backstop Chesapeake Bay TMDL is a disappointing action that must be reconsidered. I have included comments to the EPA's plan below.

Conclusion: I hope that the "Backstop" has been an effort to direct attention to the Bay's watersheds and focus attention

on specific goals and necessary improvements to clean up the Chesapeake Bay. Pennsylvania's WIP should be accepted and the fine details should be worked out this next year in the revised WIP. The EPA should focus on achieving fair and equitable solutions and seize on this opportunity to engage local, state and federal stakeholders in achieving the goals to protect this natural resource.

We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations"). EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

Response

Please refer to the response for comment 0067.1.001.009. Due to long-term devastating economics conditions for agriculture, federal back-stops alone will be enough to drive farmers out of business. Individual businesses, farmers, and the State cannot meet this unfunded mandate from EPA without significant federal funding.

Instead of forcing states to regulate their way out of back-stops, we urge EPA to allow Virginia to implement its own

plans for achieving clean water goals without costly, burdensome regulations.

Response

Please refer to the response for comment 0229.1.001.005. The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. CAFO/AFO

On page 8-15 and 8-16 of the draft TMDL, "moderate" level backstop allocations are described for Animal Feeding Operations (AFOs) and Concentrated Animal Feeding Operations (CAFOs) in Virginia. The "full treatment train" for AFO production areas is described on page 8-15 as containing waste management, barnyard runoff control, and mortality composting. Virginia agrees that in order to protect water quality, AFOs must implement practices that address management of animal waste produced, control of runoff, and mortality management. These three components can be addressed using a wide array of best management practices (BMPs). The terms "waste management" and "barnyard runoff control" are sufficiently broad to accommodate the varied site-specific practices that could be used; however, limiting mortality management to composting is overly restrictive. Other options such as rendering, landfilling, and

incineration are also viable options that would produce an equivalent pollutant reduction.

Recommendation: Replace "mortality composting" with "mortality management."

Response

Comment ID 0681.1.001.005

Author Name: Baxter Russ

Organization: VA Department of Environmental Quality

The EPA backstop applies across-the-board allocations for significant municipal wastewater plants based on TN = 4 mg/l. This approach to setting wastewater allocations has particular adverse impacts involving three dischargers in the James River basin:

Hopewell Regional - influent is 80% industrial waste; due to unique wastewater characteristics of industrial facilities, a 5 mg/l concentration of nitrogen for a municipal treatment plant is equivalent to 12 mg/l for Hopewell, and 3 mg/l for municipal treatment plant is equivalent to 8 mg/l for Hopewell.

Recommendation for Hopewell Allocation: Base the TMDL WLA on 10 mg/l [which is equivalent to 4 mg/l at a POTW]; results in a WLA of 1,522,780 lbs/yr., which is a 913,668 lbs/yr increase over the EPA backstop.

Response

Please refer to the response for comment 0067.1.001.009. 1. Why would EPA propose significant WTPs in

West Virginia, Delaware, New York, and Pennsylvania discharge at

	If Applied to Virginia - Reduces Loads by
TN =3.00 mg/l	8.30 million pounds
TP = 0.10 mg/l	1.14 million pounds

And then propose Virginia and Maryland at

	If Applied to Virginia - Reduces Loads by
TN =4.00 mg/l	5.70 million pounds
TP = 0.30 mg/l	0.54 million pounds

When:

Organization: National Association of Clean Water Agencies (NACWA)

Publicly owned treatment works (POTWs), most of which have already made significant strides in reducing their contribution of nutrients, and MS4 utilities will be most directly affected by the proposed TMDL. At its foundation, EPA's approach to the Bay promises a more holistic program capable of looking across the watershed to address the variety of sources impacting the bay. However, effective TMDLs require fair and cost-effective allocations to all sources and must not over-burden municipal dischargers simply because the authority to address the other sources is lacking. However, achievement of the load reductions in EPA's proposed TMDL falls squarely, and inequitably, on the backs of the POTWs and MS4s in the Bay watershed.

Response

Please refer to the response for comment 0067.1.001.009. Organization:

1. Question: USEPA is proposing placing a 5 mg/L. Total Solids concentration (annual average wasteload) on POTWs in Virginia. Solids from soil erosion sources are generally 80-95 percent inert and exhibit a charge exchange relationship, which permit phosphorus attachment to these inert particular matter. On the other hand, Total Suspended Solids from POTWs are generally 60-80 percent volatile in nature and are derived generally from treatment bacteria cellular degraded mass, which exhibit no charge relationship with phosphorus. These volatile solids further biologically degrade upon entering the aquatic environment with little on no impact on water column light transmission, or an ultimate impact on SAV. Why is USEPA concerned with further controlling Total Suspended Solids from POTWs?

2. Question: USEPA is proposing placing a 4 mg/L. Total Nitrogen (annual average wasteload) on POTW's in the James Watershed. We operate a POTWs in the James above the fall-line (non-tidal fresh) and our Nutrient General Permit allows for 6 mg/L. TN and 0.5 mg/L.TP on an annual average. Based on our facility being an E3 facility, our Environmental Management System goals, our WQIF Grant and our strong desire to protect our aquatic environment, we decided to pursue a basis of design of 5 mg/L. TN and 0.3 mg/L. TP. We are presently two years into a four-year construction schedule on a 45 million ENR upgrade.

VAMWA research is showing little is gained in Chlorophyll response to the additional investment in infrastructure and additional O&M chemical feed costs. Why would USEPA propose major design and construction changes before we

have placed into service our new ENR process? If the USEPA's backstop proposal holds, will the federal government provide 100% funding construction grants for this potential regulatory required construction?

Response

No to Federal Backstops

Virginia's Watershed Implementation Plan (WIP) reflects some practices for both agriculture and turfgrass that we strongly believe, given proper implementation and funding, will result in significant water quality improvements.

--Agricultural Resource Management or Conservation Plans to meet the individual conservation needs of each farm will result in progress without mandating a "one-size-fits-all approach".

--We support working with the turfgrass/green industry to make progress through utilizing nutrient management plans, amending the content of certain fertilizer products, and educating homeowners, while carefully balancing the costs and unintended consequences of under-managed or under-fertilized turfgrass.

EPA does not need to substitute its version of heavy-handed, government regulation if the state chooses to build off of the incentive-based practices and programs that have resulted in progress over the decades.

EPA's "backstop" measures put in the TMDL will certainly result in more costs for permitted facilities, such as large animal feeding operations, processing facilities, and urban landscapes.

We question the "reasonable assurance" offered by EPA's backstops, as current regulatory authority and details on new requirements are both unclear.

Instead of forcing states to regulate their way out of "backstops," we urge EPA to allow Virginia to implement its own plans for achieving clean water goals-without costly, burdensome regulations.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations") . EPA also threatens to cut WWTP allocations further to so-called "full backstop" levels, which would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and possibly even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which necessarily depends on major nonpoint source reductions because the Bay is nonpoint source dominated system with roughly 80 percent of the nutrient load attributable to nonpoint sources.

Response

In light of the unreasonable allocations assigned to New York, it is not surprising that EPA found shortfalls in the load reductions that are proposed in the state's draft Watershed Implementation Plan (WIP). EPA's proposed solution is to exert severe federal regulatory control over regulated sources in New York. These "backstop" measures would impose severe economic hardships on wastewater treatment plants, animal feeding operations, and municipal separate storm sewer systems (MS4s). However, it is unlikely that these punitive measures could achieve the desired pollution reduction results.

The proposed federal backstop actions do not constitute a credible strategy for achieving water quality standards in the Bay and should thus be eliminated. EPA should instead engage in constructive dialog with the states to develop realistic, economically viable water quality improvement strategies.

Organization: Town of Leesburg, Virginia

Each year the Town must prioritize the level of maintenance required and permissible with the amount of local funding provided. As the Town's size increases and resources are spread thinner, this becomes more and more of a challenge. In order for the Town to implement the proposed EPA backstops for WLA of the proposed pollutants there must be flexibility for the Town to comply. Retrofitting in the Old and Historic District as well as many parts of the Town will be challenging due to the geographic, geologic, geotechnical, topographical, and historical nature of the Town's historic character.

The Final TMDL Should Not Include any federal Backstops.

New York has one of the most advanced and well implemented CAFO control and other agricultural stormwater related water quality improvement program in the country. New York has announced that, in its final Phase I WIP, it will provide supplemental information to support the basis for its "reasonable assurance" that the WIP will achieve the Nt, Pt and Sediment reductions forecasted in the draft WIP. This WIP must be accepted and the State be given at least 4 years to demonstrate that it is on track to achieve its forecasted N, P and sediment reductions.

EPA should not be second guessing New York and the other Bay States with respect to the Non-Point Source reductions they believed can be "reasonably assured" to be achieved. New York has expressed its confidence that, if it is given fair allocations, the implementation plan included in its draft WIP will lead to even further significant reductions in New York's already low nutrient-related contributions to the Bay watershed. We understand that EPA and NYSDEC have come to a conceptual agreement that the State has established the requisite "reasonable assurance" that the Non-Point Source-related elements in its proposed WIP are realistic and achievable. Therefore, a decision to allow the final TMDL to be based on New York's proposed WIP is reasonable and supported by the evidence that will be submitted to EPA by NYSDEC. The draft New York WIP will still need to be modified to reflect such things as the fact that BATTLOT for biological treatment of high organic strength industrial food processing wastewater is higher than the 5 mg/L Nt and 0.5 mg/L Pt which NYSDEC has determined represents BAT/LOT for most municipal WWTPs within the Bay Watershed. After EPA has approved the final TMDL, the New York WIP must be used as an "Adaptive Management" document which can change as experience is gained (or if the New York Allocations are increased.)

New York has one of the most advanced and well implemented CAFO control and other agricultural stormwater related water quality improvement programs in the country. We understand that, in its final Phase I WIP, New York will be improving its documentation as to why "reasonable assurance" exists that the WIP will achieve the Nt, Pt and Sediment reductions forecasted in the draft WIP. This WIP must be accepted and then be given at least 4 years to see if the State is on track to achieve its forecasted N, P and sediment reductions.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Comment ID 0747.001.003

Author Name: Hankins Joseph

Organization: Jefferson County (West Virginia) Public Service District

The high "backstopping" provisions on point sources implemented by USEPA in response to West Virginia's WIP deficiencies are counter-productive and should be withdrawn. Requiring nutrient reductions to the limits of technology will add tens of millions of dollars to capital upgrade project costs and future operating expense in rural communities with minimal impact in incremental nutrient reduction. If the most aggressive mass loading reductions prove to be necessary in the future, barring a local WQS limit, point sources should be able to seek landscape or non-point offsets to meet the cap as the more cost effective and environmentally consistent approach to the problem. Requiring limit of technology treatment to reduce nutrients dramatically increases energy costs, may increase GHG footprints, and diverts community financial investment that might be more efficiently used in non-structural practices.

Comment ID 0764.001.003

Author Name: Young Leroy

Organization: Pennsylvania Fish & Boat Commission (PFBC)

EPA has determined that Pennsylvania's WIP is deficient in proving that the draft pollution reduction plans adequately address the nutrient loading allocation limits. Because of these deficiencies, EPA has now imposed federal backstop measures into the draft TMDL that unfairly target point source discharges to meet the desired nutrient loading limits. These newly created loading limits assigned for our SFH's are not attainable. For example, DEP set a draft nitrogen load of 110,347 lbs/year at the Benner Spring SFH. EPA's draft TMDL requires a reduction of the nitrogen load at this hatchery by 63% to 40,866 lbs/year. For phosphorus, DEP provided us with a draft limit of 2,285 lbs/year which EPA now proposes to reduce by 88% to 284 lbs/year. If these proposed limits were made law, the PFBC would be forced to terminate our trout-rearing program within the Susquehanna River watershed.

Upon reading EPA's comments through the WIP critique, it is obvious that EPA believes that DEP has not provided sufficient information and acceptable planning to address non-point sources such as agriculture and stormwater runoff.

DEP has stated in previous meetings that 86% of Pennsylvania's nutrients that enter the Chesapeake Bay come from non-point sources. That means that only 14% of the Susquehanna River's nutrient loading can be addressed through management of point source loading management. Point source discharges, such as the PFBC hatcheries, are easy to identify and quantify; thus they have become targets of opportunity to reduce loading while the non-point sources, which are more difficult to quantify and control, are receiving much less scrutiny. The PFBC supports reducing nutrient loading; however, the magnitude of reduction in EPA's proposed backstop measures make it appear as though Pennsylvania's TMDL budget can be achieved from reducing the nutrient loading from 30 dischargers. We disagree with this approach.

The PFBC is greatly concerned with EPA's proposed backstop measures and we distribute recommend that EPA reconsider a more equitable approach to attain nutrient loading goals. We believe that EPA should continue to meet with DEP and the other Bay jurisdictions to work out a long-term plan that equitably nutrient management responsibility around the Chesapeake Bay Watershed. We favor an approach which sets limits at the current level of discharges so that nutrient loading is contained and then seeks to phase-in reductions over a stepped down process in time to meet the 2025 goals. Likewise, loading limits should be weighted so that both point and non-point contributors proportionately share in the burden of cleaning up the Bay. To do otherwise will unduly favor one industry or community over another. The low hanging fruit has always been the point source discharges. We strongly believe that it is past time to put the same effort into getting non-point discharges under control.

21.2 - HYBRID WIP BACKSTOP ALLOCATION

Comment ID 0067.1.001.004

Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

GTP, along with other major industries in the Basin, has sought to work with the Pennsylvania DEP through the past decade in developing realistic, rational and workable approaches to allocating nutrient reduction targets and achieving those targets in an effort to meet the objectives of controlling Pennsylvania's loadings into the Chesapeake Bay.

Over the past decade, the GTP Facility has taken concerted actions, through process changes and other measures, to reduce nitrogen in our wastewaters - in the process earning the Governor's Award for Environmental Excellence in September 2002 recognizing our leading and voluntary efforts to reduce nitrate discharges by some 1 million pounds

per year. That same year, we earned a Business for the Bay award for outstanding achievement in nutrient reduction. We have clearly demonstrated our willingness to do our fair share in addressing the Bay's needs, long before regulatory mandates.

Further, as DEP and EPA are well aware, significant point sources (both POTWs and industries) have worked with DEP and other stakeholders over the past decade in working through the many issues that are inherent in arriving at a workable and fair watershed implementation plan. This process has not been easy, and sacrifices, investments, and burdens have had to be borne by all major point sources. The fundamental framework for the Pennsylvania WIP, as applicable to point sources, was worked out as part of Pennsylvania's Chesapeake Bay Tributary Strategy and the subsequent Chesapeake Bay Steering Committee. That framework set specific objectives for nitrogen and phosphorus loadings from major point sources, recognizing that in Pennsylvania all point sources taken together amount to just 12% of all nitrogen loads, 29.6% of all phosphorous loads, and a mere 0.6% of sediment loads generated in Pennsylvania that are delivered to the Bay. [FN1] Put another way, non-point source loads are and remain the vast majority of nutrient and sediment loadings to the Bay - and even if every sewage treatment plant and industry shut down, those non-point source loadings would remain a loading challenge to the Bay.

Thus, the Pennsylvania Chesapeake Bay Tributary Strategy, and the proposed Pennsylvania WIP that built upon that strategy as submitted to EPA in late September 2010, set specific loading targets for each significant sewage plant and industrial discharger (including the GTP Facility). For industries, DEP applied the Chesapeake Bay Industrial Wastewater Compliance Plan dated January 2010 (the "2010 Compliance Plan"), to allocate Total Nitrogen and Total Phosphorus loadings to all major industrial users. Applying the 2010 Compliance Plan, in early March 2010, DEP issued letters to each major industrial facility under 25 Pa. Code §92.8a, requiring the submission of plans and schedule to meet the proposed Nitrogen and Phosphorus cap loads. Those submissions were due in early September 2010, and we submitted such a plan and schedule.

Under the 2010 Compliance Plan, DEP has calculated certain nutrient cap loads for the GTP Facility, consisting of a Total Nitrogen Cap of 600,515 pounds per year and a Total Phosphorus Cap of 1,577 pounds per year. Our plan of action to meet those loading limits was submitted on August 26, 2010, and we are currently in the midst of implementing the action steps outlined in that plan.

[FN1] Percentages based on table entitled "Pennsylvania 2009 Nutrient and Sediment Loads Delivered to Chesapeake Bay EPA Phase 5.3 Watershed Model" in the Pennsylvania Chesapeake Watershed Implementation Plan (Sept. 2010) at pg. 13.

No to Federal Backstops

Virginia's Watershed Implementation Plan (WIP) reflects some practices for both agriculture and turfgrass that we strongly believe, given proper implementation and funding, will result in significant water quality improvements.

--Agricultural Resource Management or Conservation Plans to meet the individual conservation needs of each farm will result in progress without mandating a "one-size-fits-all approach".

--We support working with the turfgrass/green industry to make progress through utilizing nutrient management plans, amending the content of certain fertilizer products, and educating homeowners, while carefully balancing the costs and unintended consequences of under-managed or under-fertilized turfgrass.

EPA does not need to substitute its version of heavy-handed, government regulation if the state chooses to build off of the incentive-based practices and programs that have resulted in progress over the decades.

EPA's "backstop" measures put in the TMDL will certainly result in more costs for permitted facilities, such as large animal feeding operations, processing facilities, and urban landscapes.

We question the "reasonable assurance" offered by EPA's backstops, as current regulatory authority and details on new requirements are both unclear.

Instead of forcing states to regulate their way out of "backstops," we urge EPA to allow Virginia to implement its own plans for achieving clean water goals-without costly, burdensome regulations.

Author Name: Foley Sharon

Organization: Harrisonburg-Rockingham Regional Sewer Authority (HRRSA)

As you may know, Virginia has achieved significant point source reductions in both Total Nitrogen and Total Phosphorus through its Watershed General Permit which requires compliance with stringent waste load allocations by December 31, 2010. In addition, the Watershed General Permit led to the formation of the Virginia Nutrient Credit Exchange Association, which provides for a comprehensive and accountable program to facilitate point-to-point nutrient trading among its participants of which HRRSA is a member. Accordingly, based on Virginia's proven track record in successfully developing and implementing these highly effective programs, HRRSA does not understand why EPA has so readily predicted failure of and summarily rejected the Virginia WIP on grounds of "inadequate reasonable assurance". Virginia should be given the opportunity to demonstrate that its WIP can meet the Bay TMDL two-year milestones without imposition of EPA's "backstop" actions.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

These written comments will focus on the impacts specific to INVISTA Waynesboro. With respect to our other concerns we refer EPA to the written comments provided by the Virginia Manufacturers Association (VMA) [refer to EPA-R03-OW-2010-0736-0376] and the Federal Water Quality Coalition [refer to EPA-R03-OW-2010-0736-0481].

Backstop Allocations for Virginia Industrial WWTPs Should Be the Same as those Allocations Found in the State WIP

The EPA has proposed imposing backstop allocations for state Watershed Implementation Plans that the Agency has determined do not meet the requested pollutant loading reductions and/or reasonable assurance criteria. EPA has proposed implementing moderate backstop allocations for Virginia point sources. Under a moderate backstop, the waste load allocations (WLAs) for industrial WWTPs and non-significant WWTPs are assumed to be at the same level as the Virginia draft Phase I WIP allocations.

INVISTA agrees that the current WLA established by Virginia general nutrient permit (including INVISTA - Waynesboro), and reflected in the draft Phase I WIP and Draft TMDL, are appropriate for industrial discharges, including significant industrial dischargers. But even more importantly, no matter the results of the Agency's evaluation of the Virginia WIP, WLA's for industrial dischargers should never be less than those specified in the state's WIP. The Virginia waste load allocations established by the state's General Permit for Total Nitrogen and Total Phosphorus Dischargers and Nutrient Trading in the Chesapeake Bay Watershed, and by extension, the Virginia WIP allocations, are based on a long history of modeling exercises, data collection and on-the-ground research. Virginia's proposal has been fully vetted through notice and comment rulemaking. The modeling and data analysis has been transparent and enabled all stakeholders to understand the process and the data. The Virginia WIP accounts for the facility-specific nature of industrial discharges. The Virginia Department of Environmental Quality (VDEQ) has taken the time to understand how the differing process and wastewater characteristics as well as economics of each industrial facility results in varying wastewater discharge characteristics and thus differing impacts on water quality. With this in mind and based on extensive modeling and data analysis, the VDEQ has matched the appropriate WLAs with each industrial facility. EPA cannot ignore the work conducted by VDEQ and thus should not apply arbitrary nutrient loading limits as a result of its backstop efforts.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0299.1.001.004

Author Name: Laczynski Michael

Organization: INVISTA - Waynesboro

Backstop Allocations Must Be Based on the Characteristics of Industrial Facilities

The Draft TMDL, as part of its high level and full backstop allocation descriptions, proposes to reduce the WLAs for industrial WWTPs to "a level where the reduction rates for significant industrial WWTPs by jurisdiction are equivalent to the significant municipal WWTP reduction from WIP to E3 (3 mg/l TN and 0.1 mg/l TP)." Applying concentration performance capability similar to a POTW upon an industrial facility is inappropriate. As we understand, the high level and full backstop allocations are based on the ability of publicly owned treatment works (POTW) to meet these limits through facility upgrades. However, the assumptions made and data evaluated for influent nitrogen and phosphorus concentrations and treatment and design capabilities at POTWs are not applicable to industrial operations, such as ours, that are generating and treating an entirely different wastewater stream.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: Virginia Department of Transportation (VDOT)

Table 8-6 on page 8-11 of the draft TMDL discusses backstop allocation options that could be enforced by EPA if WIPs do not meet the two-tier standard expected by EPA. One of the options would be:

- "requiring 50% of urban MS4 lands to meet the aggressive performance standard through retrofit/ redevelopment; 50% of unregulated land treated as regulated, so that 25% of unregulated land meets aggressive performance standard designation as necessary. "

This option is proposed for both the moderate, high, and full backstopping scenarios in the draft TMDL. VDOT asserts that it is unreasonable to develop a moderate backstop level option that is identical to the full backstop option. This inequity is particularly troublesome because the cost of implementing urban stormwater retrofits for an MS4 within an urbanized area would be one of the most costly options per pound of nutrient removal. According to the National Research Council publication entitled *Urban Stormwater Management in the United States* (2008), retrofitting an existing urban area with stormwater management designed for nutrient removal can be as high as \$850,000 per city block. According to the Center for Watershed Protection, the cost of stormwater retrofits per acre of treatment can range from \$40,000-120,000. Given these significant costs, VDOT requests that EPA identify a graduated series of backstop options that are commensurate with the different levels rather than mandating retrofitting/redevelopment actions for the urban MS4 sector.

Comment ID 0300.1.001.015

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

On pages 8-14 to 8-15 of the draft TMDL, it states that "In the urban lands covered by MS4 permits, the TMDL WLAs for jurisdictions receiving a moderate backstop (Virginia) makes an assumption that the MS4 permit has controls sufficient to implement a performance standard equal to the nutrient and sediment reductions that would result from the following practices:

Regions with karst topography (low permeability); Coastal Plain Lowlands (groundwater).

- 50 percent of area-impervious cover reduction, e.g., cisterns and collections systems to capture rainwater for reuse
- 30 percent of area-filtering practices e.g., sand filters, bioretention, dry wells, designed to reduce nitrogen by 40 percent, phosphorus by 60 percent, and sediment by 80 percent from a pre-EMP condition.
- 20 percent of area-infiltration practices e.g., infiltration trenches and basins, designed to reduce nitrogen by 85 percent, phosphorus by 85 percent, and sediment by 95 percent from a pre-BMP condition.

Ultra-urban regions- defined as high- and medium-intensity land cover.

- 50 percent of area-impervious cover reductions, e.g., cisterns and collections systems to capture rainwater for reuse.
- 30 percent of area-filtering practices, e.g., sand filters, bioretention, dry wells, designed to reduce nitrogen by 40 percent, phosphorus by 60 percent, and sediment by 80 percent from a pre-BMP condition.
- 20 percent of area-infiltration practices, e.g., infiltration trenches and basins, designed to reduce nitrogen by 85 percent, phosphorus by 85 percent, and sediment by 95 percent from a pre-BMP condition.

Other urban/suburban regions

- 10 percent of area-impervious cover reduction.
- 30 percent of area-filtering practices, e.g., sand filters, bioretention, designed to reduce nitrogen by 40 percent, phosphorus by 60 percent, and sediment by 80 percent from a pre-BMP condition.
- 60 percent of area-infiltration practices designed to reduce nitrogen by 85 percent, phosphorus by 85 percent, and sediment by 95 percent from a pre-BMP condition.

EPA assumes that the applicable MS4 performance standard applies to 50 percent of urban lands through a combination of retrofit and redevelopment requirements. Jurisdictions may meet the WLA assumptions by: (a) applying a different set of practices that would result in equivalent nutrient and sediment reductions, (b) applying a more aggressive performance standard on a smaller percentage of urban lands included within the WLA, or (c) apply a less aggressive performance standard on a larger percentage of urban lands as long as the total nutrient and sediment reduction from the urban lands assumed to be within the WLA are equal to or greater than the reductions that are assumed within the WLA compared to a pre-BMP condition.

The stormwater WLA also assumes that 50 percent of urban lands that are not covered by MS4 permits are treated like MS4 areas, meaning that 25 percent of unregulated stormwater (i.e., 50 percent of 50 percent) is assumed to meet the performance standard for nutrient and sediment reductions described above. Before imposing such controls, it is assumed that (1) unregulated sources will someday be regulated under the NPDES permit program through appropriate designation/rulemaking/permits; and (2) the categories' projected load reductions (based on NPDES effluent controls consistent with the WLA) will result in those needed reductions. As explained above in Section 8.3.1, additional controls would be imposed only after the source is designated or otherwise regulated by an NPDES permit, and after an effective NPDES permit coverage is established.

Finally, the stormwater WLA assumes that all areas subject to a construction general NPDES permit will implement erosion and sediment control practices that would result in a 25 percent reduction in nitrogen, a 40 percent reduction in phosphorus and sediment compared to a pre-BMP condition on bare, construction land."

VDOT is concerned with the proposed practice of mandating stormwater management practices to such broad physiographic types. As an agency that maintains thousands of miles of roads and operates approximately 160 facilities in the Chesapeake Bay watershed within many physiographic regions, this initiative would further complicate the implementation process. According to the Clean Water Act, and the MS4 /NPDES regulations, specific BMPS would need to be developed by a MS4 permittee to ensure that their pollutant loadings achieve the WLA for each impaired waterbody. This process requires consideration of the specific conditions in an impaired waterway. Given that, VDOT believes it is unnecessary and redundant to place prescriptive actions on the allowable BMPs that could be used within what are very broadly defined physiographic types. VDOT requests that EPA work closely with the states to allow maximum flexibility in the alternatives for the backstop options. These options should not require specific BMPs but allow all effective structural BMPs and non-structural actions, including nutrient exchange, to be used to achieve pollutant load reductions.

2. Built upon a decade of stakeholder involvement, the Pennsylvania WIP comes closest to providing a fair, realistic and achievable approach to nutrient reductions.

No one will claim that the proposed Pennsylvania WIP is perfect; there are clearly some areas for potential improvement. However, a decade of stakeholder dialogue and compromise has lead to a WIP which comes closest to

providing a fair, realistic and generally achievable approach to nutrient and sediment reductions over the timeframe to achieve interim objectives by 2017 and longer-term objectives by 2025.

What is most important to understand is that for certain sectors, including significant municipal and industrial point sources, the Pennsylvania WIP represents a series of commitments and courses of action that are already well underway. Although painful and expensive, the Pennsylvania WIP reflects actions that industry and publicly-owned treatment works ("POTWs") have engaged to deliver - with real effort and real dollars expended and committed.

That commitment needs to be viewed in context. The Pennsylvania WIP framework sets specific objectives for nitrogen and phosphorus loadings from major point sources, recognizing that in Pennsylvania all point sources taken together amount to just 12% of all nitrogen loads, 29.6% of all phosphorous loads, and a mere 0.6% of sediment loads generated in Pennsylvania that are delivered to the Bay.[FN1] Put another way, non-point source loads are and remain the vast majority of nutrient and sediment loadings to the Bay - and even if every sewage treatment plant and industry were to shut down, those non-point source loadings would remain a loading challenge to the Bay.

At this point, all but the non-significant POTWs (those with a design flow < 400,000 gpd) will be covered by cap loads imposed in permits issued by December 31, 2010, with the cap loads for the vast majority of Phase I and 2 systems becoming effective over the next two years. All of these systems are set to achieve agreed upon limits based upon concentrations of 6.0 mg/l of total nitrogen ("TN") and 0.8 mg/l of total phosphorus ("TP") at their design average annual daily flow. And since many, if not all of these plants, are not currently operating at their design flow rates, the actual load delivered to the Bay is anticipated to be somewhat lower.

For all significant industrial discharges, DEP has already proceeded with implementing cap loads through its Chesapeake Bay Industrial Wastewater Compliance Plan dated January 2010 (the "2010 Compliance Plan"), which formed the basis for allocating TN and TP loadings to all major industrial users. Applying the 2010 Compliance Plan, in early March 2010, DEP issued letters to each major industrial facility under 25 Pa. Code §92.8a, requiring the submission of plans and schedules to meet the proposed TN and TP cap loads. Those submissions were due in early September 2010, and we understand that most or all facilities submitted such a plan and schedule. Based on information from Chamber members, those facilities are already underway with investments - in some cases significant investments - to meet the cap loads proposed by DEP even in advance of those cap loads actually appearing in final NPDES permits.

The fact that these commitments have been made, and that such expenditures are already underway, is a crucial consideration in framing any WIP or TMDL. Once such commitments are made and projects are underway - as is the case with many communities and industries - one cannot simply change directions and objectives. One of the corollary requirements of "fair, reasonable, and achievable" is predictability and consistency. Municipalities and industries cannot be expected to commit and expend hundreds of millions of dollars (and taxpayers and consumers cannot be expected to ultimately pay the price of such investments), only to face a governmental "bait-and-switch" that renders such commitments a nullity and investments a waste of resources.

[FN 1] Percentages based on table entitled "Pennsylvania 2009 Nutrient and Sediment Loads Delivered to Chesapeake Bay EPA Phase 5.3 Watershed Model" in the Pennsylvania Chesapeake Watershed Implementation Plan (Sept. 2010) at pg. 13.

Organization: City of Falls Church, Virginia

Reasonable Assurance

The EPA has concluded that Virginia's WIP fails to comply with EPA's July 1,2010 and August 13,2010 nutrient and sediment allocations and does not adequately establish reasonable assurance. EPA has established what it is calling a "backstop allocation" in response. This backstop is meant to "...reduce the point source loadings as necessary to compensate for the deficiencies EPA identified in the reasonable assurance components of the jurisdictions' draft Phase I WIPs addressing nonpoint source reductions." This approach to urban stormwater differs from the approach taken by Virginia in its Draft WIP. Virginia's Draft WIP does not mandate retrofits/restoration.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0401.001.003

Author Name: Rohrer L.

Organization:

We question the "reasonable assurance" offered EPA's backstops, as current regulations and detail new requirements are both unclear. Instead of forcing states to regulate their way out of "backstops" we urge EPA to allow Virginia to implement its plans for achieving clean water goals - without a burdensome regulations.

Response

Please refer to the response for comment 0229.1.001.005. Please also refer to the response for comment 0067.1.001.009. No to Federal Backstops

- Virginia's Watershed Implementation Plan (WIP) reflects some practices for both agriculture and turfgrass that we strongly believe, given proper implementation and funding, will result in significant water quality improvements.
 - o Agricultural Resource Management or Conservation Plans to meet the individual conservation needs of each farm will result in progress without mandating a "one-size-fits all approach".
 - o We support working with the turfgrass/green industry to make progress through utilizing nutrient management plans, amending the content of certain fertilizer products, and education homeowners, while carefully balancing the costs and unintended consequences of under-managed or under-fertilized turfgrass.
- EPA does not need to substitute its version of heavy-handed, government regulation if the state chooses to build off of the incentive-based practices and programs that have resulted in progress over the decades.
- EPA's "backstop" measures put the TMDL will certainly result in more costs for permitted facilities, such as large animal feedings operations, processing facilities, and urban landscapes.
- We question the "reasonable assurance" offered by EPA's backstops, as current regulatory authority and details on new requirement are both unclear.
- Instead of forcing states to regulate their way out of "backstops," we urge EPA to allow Virginia to implement its own plans for achieving clean water goals-without costly, burdensome regulations.

Response

Organization: University of Richmond Environmental Law and Policy

It is important for the EPA to keep in mind that in order to decrease the amount of damage done on the bay, steps must be taken in other states to prevent pollution from running downstream in the Virginian area. If the EPA only focuses on the main part of the bay, the problem will never be resolved.

Response

Please see the response to comments 0267.1.001.006 and 0568.1.001.007 for more information on how upstream loadings of pollutants contribute to the downstream non-attainment of water quality standards.

Comment ID 0038.1.001.013

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

Jenning's presentation also pointed out that most of the pollution damaging the bay is coming from agriculture, wastewater, and urban runoff. If it is well known that this is where the problem lies, I believe the EPA should focus all their energy on the causes of the main problems. Once these are under control, it will be easier to focus on the less damaging causes of pollution.

Response

Please refer to Section 4 of the TMDL report for information on sources of nitrogen, phosphorus, and sediment to the Chesapeake Bay watershed.

Comment ID 0038.1.001.030

Author Name: Eisen Professor Joel

Organization: University of Richmond Environmental Law and Policy

Under the Clean Water Act, the EPA has the obligation and responsibility to protect our waters and prevent pollution and preserve the wildlife within our lakes, rivers and streams. In the 1972 amendments, the permit program "NPDES" or "National Pollutant Discharge Elimination System" was formulated and structured to regulate the discharge of pollutants from point sources. Without a permit, point source pollution was considered illegal. While this ruling has been in place for many years, there have been many missed deadlines and insufficient efforts in this area. The Bay still need to lose 63 million pounds of nitrogen and 3.1 million pounds of phosphorus to get to a "healthy" weight of 187.4 million pounds of nitrogen and 12.5 million pounds of phosphorus released into the Bay annually.

Response

Organization:

Virginia's draft watershed implementation plan (WIP) does not provide "reasonable assurance," in other words, the details and a commitment, that a reliable source of funding for farmers is forthcoming. If the state does not provide such assurance that all pollution sources--including agriculture--have the tools to do their part, then EPA has no choice under the law but to tighten requirements on sources it has direct authority to regulate, specifically, wastewater treatment plants, cities, and large animal operations.

Organization:

The TMDL current values should be kept in the final version of the document. They cannot be increased! Any increase bears the risk of producing health problems to the entire population living in the Bay region. It should be the responsibility of the states to ensure the maintenance of these levels, but just because they are not able to do so does not justify increasing the TMDL. Backstop allowances are preferable to increasing pollution levels if there is no other way for the states to reduce their releases of pollutants in waters. The health of the ENTIRE population is far more important than the economic well-being of PART of the population affected by pollution reduction measures.

Comment ID 0086-cp.001.001

Author Name: Strait Craig

Organization:

I strongly disagree with the backstop limits of 3 mg/l total Nitrogen and 0.1 mg/l total Phosphorus that are being proposed for point source wastewater treatment facilities. When I first learned of these potential requirements, I questioned the ability of laboratories to accurately and precisely analyze samples to these stringent parameters. In October 2009, I collected three grab samples from the effluent of the wastewater plant that I manage. Each of these samples were split and sent to three different PADEP certified laboratories to be analyzed for dissolved Phosphorus and ortho Phosphorus. Results from the three labs were consistent for only one of the analytical tests performed. Results from the remaining five analytical tests performed varied by as much as 1.3 mg/l between the different labs. This clearly illustrates that the analytical methods used to test Phosphorus, of any species, has a margin of error that is much greater than the proposed 0.1 mg/l requirement. These samples were collected and analyzed according to the

procedures outlined in Standard Methods.

Response

This is a valid concern that jurisdictions will need to be cognizant of when implementing lower nitrogen and phosphorus limits for WWTPs. According to “Standard Methods for the Examination of Water and Wastes” the analytical method for phosphorus detects phosphate at 0.001 mg/L while the analytical method for nitrogen detects total Kjeldahl nitrogen (TKN) at 0.1 mg/L and nitrate-nitrite nitrogen at 0.05 mg/L. All certified laboratories may not be able to achieve these detection limits so WWTP operators will need to ensure that the laboratory they select (or their in-house laboratory) has this capability. There are programmatic actions that jurisdictions may take to ensure that their certified laboratories are aware of the lower method detection limits (MDLs) needed. For example, jurisdictions may designate required MDLs in the permit for those parameters where laboratory detection limits are close to the regulatory limit.

In the backstop allocations for the different Bay states, all but Maryland and the District of Columbia had point source requirements that mandate all construction land to be subject to sediment and erosion control by a general permit. This however disregards the fact that states like Virginia have these permits but have poor enforcement. There is no "first-step" state level permitting, monitoring, or complaint agency responsible for this. Instead in Virginia, the local governments are responsible for granting the construction permits and are responsible for monitoring and responding to complaints. As a second step if no response is made to a complaint, then concerned citizens can call the local Virginia DEQ office to address it. This not only disregards the fact that local governments, especially in fiscally challenging times, have more incentive to bring development to their governance, but more importantly, local authorities of limited resources and potentially little training are in charge of these permits and the monitoring of compliance. Based on many of my own personal simple roadside, easy access construction site observations, it appears as if they are unable or unwilling to enforce simple installment of silt fences. If anything, there should be more funded and trained enforcement, ideally managed by state level officials. Furthermore, surface or deep mining practices, drilling/exploration for oil and gas (inclusive of the associated roads and off-site disposal areas), tilling, planting, or harvesting of agricultural, forestry, and horticultural crops, livestock feedlots, and railroad construction are in fact exempt from construction permits in Virginia according to the DEQ. Including these sources and increasing enforcement of regulations will help accomplish what the construction permits actually seek to achieve. Otherwise, the backstop allocations will be as dysfunctional as the original WIPs.

- Agriculture currently contributes the highest loads, and has made the least improvements to date, despite the availability of public funding. As a result, the lowest cost per pound reductions available are in this sector and the states should require agriculture to accept the appropriate responsibility for change. The proposed EPA backstop measures and state plans provide the wrong incentives for performance by this sector.

Organization: Maryland State Builders Association

The EPA is requiring several States to reduce or retrofit with stormwater treatment systems up to 50% of the impervious surfaces in MS4 jurisdictions and 25% in non-MS4 regulated areas. Montgomery County's MS4 is proposing 30% of impervious area retrofit. The issue is that if the area doubles-these requirements and their associated costs will double without any public consideration of their cost-as the WIP's are based on a percentage of a number that is expected to change.

Response

Please refer to the response for comment 0067.1.001.009. Although the proposed backstop allocations reflect the difficulty of achieving significant load reductions from the agriculture and onsite septic sectors, they fall far short of reflecting the difficulty of achieving such reductions from the urban runoff sector. EPA appears to simply assume that the reductions can be achieved because MS4s are subject to federal and state permitting authority under the NPDES, but this assumption fails to recognize that the Localities own, on average, only about 20 percent of the land area within their respective jurisdictions. Therefore, most of the retrofits needed to achieve the load reductions will have to be implemented on private lands over which the Localities have no control in the absence of new development or redevelopment requiring local land use approvals. Eminent domain costs resulting from these requirements will be substantial.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0174.1.001.003

Author Name: Rolband Michael

Organization: Wetland Studies and Solutions, Inc.

EPA-implemented backstops for the urban sector should be based on acres rather than a percent of urban area because the effect of EPA's urban acreage revisions in 2011 could drastically alter the requirements and costs for the urban sector.

Both the EPA backstops and some of the draft State WIPs contained discussion of urban retrofits based on percentages of urban land instead of specific acreage requirements. EPA should define acreage requirements rather than percentage requirements for urban retrofits if backstops are implemented. The calculations for pervious and impervious urban acreage in the current Chesapeake Bay Community Watershed Model are in flux and are likely to increase substantially [FN3] (see comment #1, above). Therefore, all WIP provisions or EPA backstops that focus on restoration or retrofit of a percentage of urban area are likely to also increase substantially in area. Such increases will dramatically increase the requirements and costs on the urban sector.

[FN3] Based on an a memo dated 5/25/2010 received from Peter Claggett (USGS) to Mike Rolband (WSSI), pervious and impervious surfaces are likely to change by a factor of 2 to 3.

Response

In a June 11, 2010 letter from Shawn Garvin (EPA Region 3 Administrator) to the Principals' Staff Committee (accessible at <http://archive.chesapeakebay.net/pubs/TMDLScheduleLetter.pdf>), EPA committed to evaluate whether to revise the Chesapeake Bay model in 2011 by utilizing the results of updates on nutrient management effectiveness and suburban land characteristics. The states and the District are then expected to submit draft Phase II Watershed Implementation Plans, allocating the pollutant loads to a much finer geographic scale, and reflecting any potential revised load distributions and other updates resulting from the revised model. Before 2017, EPA will review its models and determine if further upgrades are needed. In 2017 the states and the District will submit Phase III implementation plans to ensure that all the control measures needed to meet Bay water quality standards will be in place by 2025.

For information on backstop allocations, please see refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: Town of Culpeper, Virginia

We own and operate a municipal wastewater treatment plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We expect to do our part for the Bay restoration. In fact, we completed an extensive upgrade to our WWTP in 2010 to include nutrient removal technology. This upgrade installed a 5 stage biological nutrient removal process, new clarifiers, de-nitrification filters and other improvements necessary for the removal of phosphorus and nitrogen at a cost in excess of \$27 million.

We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Author Name: Newsome Michael

Organization: Home Builders Association of Virginia (HBAV)

HBAV would also question the wisdom and authority the EPA to mandate that private owners reduce or retrofit their property's impervious surfaces, as may be imposed in the proposed backstop allocations. Both the U.S. Constitution and Virginia Constitution protect private property owners from a "taking without just compensation" by the government. The very high estimated costs associated with the retrofit requirements or mandates in the proposed backstop allocations clearly approach a "taking without just compensation" of private property. HBAV would urge the EPA to seek other less expensive and less intrusive solutions to the clean up of the Bay and its tributaries.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0194.1.001.005

Author Name: Ashley Keith

Organization: Home Builders Association of Metro Harrisburg

EPA has indicated that point sources may have to go to the "limit of technology" to treat their sewage. This is an incredibly dumb thing to do. Stakeholders spent hundreds of hours developing their point source strategy which again has been communicated to many plant operators. Some plants are in the midst of retrofitting their plants and those retrofits were not based on the lower limits EPA is talking about.

Response

Please refer to the response for comment 0067.1.001.009. The "backstop" TMDL is just a bad idea. If it is instituted in will not speed up the achievement of pollution reductions but will turn the public and the stakeholders against EPA. If you truly want to work in cooperation with us, you will NOT issue a backstop TMDL. When you come right down to it, implementing a backstop TMDL will not make anyone work any harder on this problem. In fact, it will alienate many, and be perceived as "big brother" telling us what to do.

Comment ID 0196.1.001.001

Author Name: Moffett Jesse

Organization: Frederick-Winchester Service Authority

The Frederick-Winchester Service Authority, as a regional wastewater provider, has been a longtime participant in the Bay Initiative which is evident from our voluntary participation as far back as 1998 and with the recent completion of enhanced nutrient removal upgrades at our facilities.

We own three (3) municipal wastewater treatment plant ("WWTP") that discharge highly-treated wastewater within the Chesapeake Bay watershed pursuant to state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

Our efforts along with those of over 120 other facilities discharging within the Bay drainage basin have been remarkable to say the least. In our particular case we have accomplished over a 60% reduction in the number of pounds of nitrogen discharged to the Bay while seeing our critical and necessary service grow by nearly 200% since the start of the Bay Initiative. I am sure that no other contributing source can make that claim.

We expect to continue to do our part for the Bay restoration. In fact, two of our facilities, (Opequon Water Reclamation Facility (12.6 MGD) and Parkins Mill Wastewater Treatment Plant (5.0 MGD)) which are designated as significant dischargers have undergone upgrades to ENR facilities.

Considering that we have just invested close to \$50M dollars in just treatment enhancements to accomplish ENR levels of treatment and to hear EPA's threats of "backstop" action against us and other facilities raises significant concerns. Here we have invested, along with the Commonwealth, in huge capital projects to meet technology stringent limits along with wasteload allocation caps and it will now all be thrown out the window. Customers will be required to pay for the next twenty or thirty years for useless capital investments coupled with excessive O&M costs. With no changes, we are already anticipating chemical and energy costs to increase by potentially 30%. The outcome of all of this being nothing more than throwing money into a "bottomless pit".

Clearly, we have significant concerns with EPA's Draft TMDL and its fairness. The EPA's threatened "backstop" action against WWTPs does nothing but create a road block for success. As WWTPs and point sources in general show positive results and become a smaller and smaller portion of the pie the roughly 80 percent of the nutrient load attributable to nonpoint sources continues to grow unabated.

As a fix, EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations") and possibly the flow basis for allocations to past flow levels (2007 to 2009 average flow rather than design flow). This would reflect an unfair, punitive action by EPA that would do little to advance the Bay cleanup, which honestly depends on major nonpoint

source reductions.

Author Name: Frederick Thomas

Organization: Rivanna Water & Sewer Authority

We own and operate a municipal wastewater treatment plant ("WWTP") that purifies and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We are doing our part for the Bay restoration. In fact, our WWTP is in the process of being upgraded with nutrient removal technology with a cost of approximately \$49,233,000. The cost of this nutrient removal upgrade project at this stressful economic time places undue pressure on our capital budget and will soon add every future year to our operational budget. We are committed to protection of our aquatic streams, rivers and the bay system; however we are already doing more than we were originally asked to do. For example, our wastewater facility discharge wasteload allocation was granted at 6 mg/L total nitrogen and 0.5 mg/L total phosphorus. We decided to design and upgrade our nutrient removal project to a total nitrogen concentration of 5 mg/L and total phosphorus concentration of 0.3 mg/L. We are now close to two years into this project with greater than 65% completed.

Based on the above information, we have significant concerns with EPA's Draft TMDL and object to EPA's proposed "backstop" actions against the Commonwealth of Virginia and our wastewater facility. EPA proposes to cut our facility's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality

Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Page 4-25 provides: "EPA's intent in creating the MS4 Stormwater Program was to regulate stormwater discharges by requiring the municipalities to develop management programs to control stormwater discharging via the MS4, i.e., stormwater collected by the MS4 from throughout its service area." The existing regulatory program for construction

activities coupled with PennDOT's policies satisfy this intent. PennDOT's service area is the rights of way from its roadways that were located in regulated urbanized areas. PennDOT has policies on erosion and sedimentation, post construction stormwater control, maintenance activities, and fertilizer applications that manage stormwater in its rights of way. Unlike municipal MS4 who may have jurisdiction over the development and use of land within their municipal boundaries, PennDOT has no authority to regulate the use or development of adjacent properties. PennDOT will bear the costs of the implementation of the "new" standards which will be funded using State and Federal monies (i.e., the taxpayer) and would reduce the number of completed projects necessary to protect the safety of the traveling public. Given the potential to impact Federal funds received by DOTs, EPA should consult with FHWA, a sister agency, prior to imposing any additional standards or recommending the expansion of the MS4 area beyond regulated urbanized areas.

Response

Please refer to the response for comment 0067.1.001.009. Organization: Pennsylvania Department of Transportation

On page 7-2 of the Draft Bay TMDL, EPA states: "Without a demonstration of reasonable assurance that nonpoint source allocations will be met, a TMDL would have to assign all the necessary reductions to the point sources." PennDOT would like a detailed legal justification for this position. PennDOT maintains that the CWA does not require that a TMDL be achieved through point source reductions only. Rather, the TMDL should be based on the contribution of the activity to the impairment. Making a permittee meet more stringent standards when the permittee is not responsible for that magnitude of contribution is a regulatory taking and a serious violation of the permittee's due process rights. The point source permittees should not have to bear the financial burden caused by sediment contributions from other known sources, e.g., agriculture activities (70% contribution) and timber activities (19% contribution).

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0201.1.001.007

Author Name: Fawver Gary

Organization: Pennsylvania Department of Transportation

First, what legal authority does EPA have for setting waste load allocations backstops for the PA WIP? Second, retrofits should not be required of all MS4s. The contribution of the MS4 should be considered. As discussed above in detail, for sediment, the contribution of MS4s to the sediment loads in the Bay are minuscule, so imposing additional standards on MS4s will result in no benefit to the Bay. Retrofits would be extremely costly to PennDOT to implement with minimal benefit to the load allocation.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0201.1.001.009

Author Name: Fawver Gary

Organization: Pennsylvania Department of Transportation

Fourth, PennDOT maintains the position that retrofits can only be required under the MS4 permit program if a project

within the regulated urbanized areas requires an NPDES permit for construction activities and results in an increased discharge. Retrofits are post construction stormwater controls. Post Construction Stormwater Controls are only required for new development or redevelopment projects greater than or equal to one acre. 40 C.F.R. §122.134(b)(5).

Response

Comment ID 0201.1.001.010

Author Name: Fawver Gary

Organization: Pennsylvania Department of Transportation

Fifth, PennDOT further maintains that a permittee can only be subject to retrofits under an NPDES permit for construction activities if the permittee is a contributor to the impairment. As stated above, in Pennsylvania, only 0.6% of the 2009 load allocation for sediment is from point sources. The 0.6% includes contributions from wastewater facilities, industrial facilities, combined sewer overflows, sanitary sewer overflows, NPDES permitted stormwater (MS4s and construction and industrial sites), and CAFOs. See page 10 of the PA WIP. The contribution of sediment to the Bay from PennDOT's MS4 is minuscule. PennDOT's MS4 contribution is addressed through the application of the recently revised PADEP regulations at 25 Pa. Code Chapter 102 to PennDOT's projects.

Organization: Town of Kilmarnock, Virginia

We own and operate a municipal wastewater treatment plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient waste load allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Organization: Virginia Chapter-Sierra Club

It is the Virginia Chapter-Sierra Club's sincere hope that the EPA backstop actions not have to be applied to Virginia. We would prefer to see a plan that is developed by Virginia that meets the assigned load allocations and provides reasonable assurance that the actions necessary to achieve those allocations will be enacted.

However, if Virginia fails to amend the draft WIP and provide reasonable assurance than we believe it is the responsibility of the EPA to enact those backstops included in the draft TMDL.

Response

Organization: Maury Service Authority (MSA)

The Maury Service Authority owns and operates the Lexington-Rockbridge Regional Wastewater Treatment Plant ("WWTP") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We are doing our part for the Bay restoration. Our WWTP is being upgraded with nitrogen removal equipment in our oxidation ditch, chemical feed equipment, additional digesters and new effluent filters to remove phosphorous. This \$14,000,000 upgrade project will increase energy consumption, increase chemical consumption, increase sludge hauling efforts and generally increase operating costs at the plant by about 10%. Sewer bills will increase for a small community who is still paying for a new wastewater treatment plant that they build in 1999.

We have significant concerns with EPA's Draft TMDL and object to EPA's proposed "backstop" actions against the Commonwealth of Virginia and our facility. EPA proposes to cut our facility's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Organization: Hanover Courthouse, Hanover County, Virginia

The backstops proposed by the EPA further reduce the limits, which will result in the need to expend even more public resources even though the Chesapeake Bay will not benefit. The EPA has supported the concept of regulatory stability, recognizing the significant expenditures and programmed expenditures by the Virginia POTWs. The imposition of the backstops undermines the concept of regulatory stability. Virginia's regulatory approach has a lengthy and relevant history on establishing nutrient wasteload allocations that must be taken into account when establishing those same types of wasteloads in the TMDL. This is made evident as set forth in Virginia's EPA approved Water Quality Management Planning Regulation, 9VAC25-720 and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820, which include stringent point source regulations. Those regulations established a comprehensive program for the regulation of POTWs.

Response

Author Name: Strauss Sandra

Organization: Pennsylvania Council of Churches

In its TMDL document EPA describes, thoroughly and accurately, the lengthy history leading to its development of the draft TMDL, including the legal framework (Sections 1 - 3), much of which has been summarized above. In Section 8, it describes the development by the states of their Watershed Implementation Plans, EPA's evaluation of them, and the use by EPA of "backstop" allocations which EPA developed, based on its exhaustive modeling and data-gathering efforts, to ensure that, where the WIPs fail to demonstrate eventual achievement of the loading caps, the "backstop" allocations will do so.

Over the course of more than two decades EPA has worked closely with the Bay states to develop effective strategies to restore the water quality of the Bay and to achieve compliance with water quality standards. The framework which allows each state to develop a WIP, in which the state may establish allocations for sources within its boundaries which will achieve water quality standards for each segment before EPA applies backstop allocations (which are applied only if needed), is part of that joint effort. In its WIP each state must also provide assurance that it has and will use the authority and resources necessary to ensure that its allocations will be fully implemented so as to achieve eventual compliance with water quality standards.

As discussed above, EPA is legally required to establish the TMDLs on its own under Sections 303(d) and 117(g) of the Clean Water Act. However, allowing the states the "first shot" at prescribing effective loading allocations for sources within their jurisdictions lets them determine which combination of point source and nonpoint source controls will provide, from their perspective, the most cost-effective or preferable approach to achieve water quality goals, provided each segment's overall loading cap is satisfied. As EPA stated in Section 8.3: "Backstop allocations were established to fill a loading shortfall in the jurisdiction's draft Phase 1 WIP or to increase the level of reasonable assurance that the overall TMDL pollutant cap will be achieved." To the extent that a WIP does not provide a combination of load and wasteload allocations to sources and categories of sources which is sufficient to satisfy the TMDL requirements which EPA provided to the states during the summer of 2010, based on its modeling results, for any segment within its jurisdiction, EPA's "backstop" allocations were applied so as to reasonably assure compliance, as EPA is required to do under Clean Water Act Sections 303(d) and 117(g). Given the serious deficiencies in most of the draft Phase 1 WIPs it was necessary for EPA to make substantial use of the backstops.

The result of this approach is that EPA is holding itself ultimately accountable for ensuring that the resulting allocations meet the requirements of Section 303(d) while allowing the states to propose allocations of their own through their WIPs. For the reasons described above, this strategy, and EPA's implementation of it, are fully supported by the Clean Water Act.

Comment ID 0230.1.001.009

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

The Virginia WIP recognized the efforts made by HRSD and the rest of Virginia's wastewater treatment organizations to meet the 2005 waste load allocations, leaving the point source nutrient allocations essentially unchanged from the 2005 levels. The expanded nutrient trading program proposed in the Virginia WIP would allow local governments flexibility in meeting the additional challenges they face in removing nutrients from urban runoff. While the TMDL does not address affordability, local governments do not have the option to ignore cost and must have the flexibility to implement the most cost effective solutions. The TMDL virtually eliminates this flexibility.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0230.1.001.011

Author Name: Henifin Edward

Organization: Hampton Roads Sanitation District (HRSD)

HRSD previously submitted comments (on December 18, 2009) through VAMWA in response to EPA's September 19, 2009 Notice and Initial Request for Public Input regarding the development of a Chesapeake Bay TMDL. VAMWA is a statewide association that includes the owners and operators of publicly-owned wastewater treatment works ("POTWs") throughout Virginia. Many of VAMWA's members discharge to the Chesapeake Bay or its tributaries pursuant to state-issued National Pollutant Discharge Elimination System ("NPDES") permits. In addition to laying out a number of Guiding Principles VAMWA felt strongly must be considered by EPA as it developed the TMDL, VAMWA also

commented extensively on the need for regulatory stability for POTWs and made a number of recommendations regarding the development of the TMDL.

VAMWA submitted comments on December 18, 2009, in response to EPA's September 19, 2009 Notice and Initial Request for Public Input regarding the development of a Chesapeake Bay TMDL. In addition to laying out guiding principles for a reasonable and effective TMDL,[FN1] VAMWA commented extensively on the need for "regulatory stability" for POTWs relative to the existing upgrade program currently underway and also offered many policy and technical recommendations. [FN2]

Unfortunately, EPA has largely disregarded VAMWA's December 2009 Comments. Moreover, EPA has incorrectly and illegally rejected Virginia's Draft WIP and instead has proposed "backstop" allocations based on EPA's previously proposed, but withdrawn and never promulgated, "reasonable assurance" regulation. The result is a TMDL that is fundamentally flawed on both technical and legal grounds. EPA's present course is obviously and openly straining the otherwise collaborative, multi-jurisdictional Bay Program partnership. Beyond the unfortunate implications of those actions for the Bay Program, HRSD is concerned that EPA's recent approach may delay rather than further the Bay restoration process.

As explained in greater detail later in these comments, EPA's Draft TMDL suffers from a number of serious deficiencies that negatively impact both the likelihood of a successful restoration process as well as the reasonableness and legality of the TMDL.

[FN1] These Guiding Principles included sound science, cost-effectiveness, feasibility, an holistic approach, ancillary benefits, climate change mitigation, and regulatory stability. Although EPA has acknowledged that many of these are important concepts, EPA's Draft TMDL is inconsistent with its avowed goals. Specifically, EPA has failed to: (1) base allocations on sound science; (2) consider cost-effectiveness as a part of making source sector allocations (there are no discussions regarding how much the Bay TMDL will cost, whether we will be spending our dollars in the most cost-effective way, and whether there will be an adequate environmental and economic benefit for our financial commitment); (3) make appropriate timing accommodations to make the TMDL realistically feasible (a phase-in of efforts or tying implementation to funding); (4) consider and include additional reasonable options for reductions (filter feeders, innovative nutrient reduction technologies, air deposition); (5) weigh various clean-up options based upon the potential for ancillary benefit (for example, cover crops can provide not only nutrient reductions but also additional positive environmental and aesthetic impacts); (6) avoid actions that may negatively contribute to climate change (additional POTW reductions can result in more greenhouse gas emissions and the unnecessary use of expensive electricity (and associated fuels) along with expensive treatment chemicals whose manufacture and distribution have additional environmental impacts); (7) and preserve existing POTW allocations.

[FN2] VAMWA's December 2009 Comments are attached hereto as Appendix 1, and are incorporated by reference. VAMWA also incorporates by reference all References listed at the conclusion of these comments and all additional Appendices attached to these comments. Additionally, VAMWA incorporates by reference all EPA files or documents, no matter the form, and all materials from EPA Chesapeake Bay teams, committees, subcommittees, or workgroups pertaining to Bay clean-up efforts.

Organization: Hampton Roads Sanitation District (HRSD)

VIII. EPA'S BACKSTOPS ELIMINATE PLANNED AGRICULTURAL LOAD REDUCTIONS DESPITE THOSE CONTROLS BEING AMONG THE MOST COST-EFFECTIVE MEASURES FOR IMPROVEMENT

Section 6 of the Draft TMDL document describes EPA's allocation method for relating relative impact to needed controls. The methodology recognizes that nonpoint sources cannot attain the same levels of control as point sources, and calls for 55-75% of E3 nitrogen controls from nonpoint sources such as agriculture. However, EPA's "backstop" allocations appear to have been accompanied by increases in allocations to nonpoint sources, such that agriculture in many basins fall well short of the intended level of nitrogen control. In so doing, EPA has dispensed with the fairness/equity concepts developed by its own TMDL work group, and shifted implementation away from the most cost-effective, environmentally beneficial practices.

Overall, EPA's Draft TMDL appears to put Virginia agriculture at a 48% level of nitrogen control (relative to E3), well below the 55-75% level indicated by the relative-effectiveness allocation methodology and far short of controls called for in both Virginia's Tributary Strategy and Draft WIP (Figure 5). This is partly driven by the lower levels of effort in the Potomac River Basin (51%), but primarily driven by an extraordinarily low (17%) level of effort for the James River Basin, which is akin to the 2009 progress levels (Figure 6). HRSD fails to comprehend how EPA can make deep and costly cuts to point source allocations in the James River Basin while concluding that agriculture requires no further improvements in this basin.

<Figure 5: "Comparison of agricultural controls among model scenarios" on page 49 of Comment Letter EPA-R03-OW-2010-0736-0230>

Agricultural management practices include most of the practices that the EPA and others (e.g., Chesapeake Bay Commission, 2004) have identified as the most-cost effective, including nutrient management, conservation tillage, cover crops, and riparian buffers. Relative to many urban and wastewater-based practices, these practices provide much high levels of ancillary environmental benefits such as wildlife habitat, stream habitat protection, flood control, and greenhouse gas reduction. To illustrate these points, Appendix 43 presents a case study of alternative nutrient controls

for the York River basin using the BMP Benefit Planner ver. 1.1.[FN74] The case study demonstrates that the DO-based overall loading goal can be achieved in a much more cost-effective, environmentally beneficial manner by a different combination of point and nonpoint source controls than reflected in the draft TMDL allocations.

<Figure 6: "Comparison of agricultural nitrogen controls among basins for EPA's proposed TMDL scenario" on page 50 of Comment Letter EPA-R03-OW-2010-0736-0230>

HRSD expects EPA to allocate point and nonpoint sources in an equitable manner that requires a high level of effort from both sectors. In particular, EPA must remedy the low level of agricultural controls proposed for the James River basin, consistent with the widespread understanding that the agricultural sector has abundant opportunities for improvement and cost-effective load reductions.

[FN74] Malcolm Pirnie, Inc., working on behalf of VAMWA, has developed a spreadsheet based model to compare implementation scenarios with regard to environmental sustainability and cost effectiveness. More specifically, the BMP Benefit Planner ver. 1.1 considers energy usage, indirect and direct GHG emissions, carbon sequestration, costs (i.e., capital, operations and maintenance, annualized), and other ancillary benefits (i.e., wildlife habitat, instream habitat, aesthetics, public health, flood hazard mitigation, and groundwater re-charge and base-flow protection). The model addresses a number of common management practices involving wastewater upgrades and various agricultural and urban practices.

Response

Please refer to the response for comment 0067.1.001.009. Author Name: Helsel, Jr. Gordon

Organization: City of Poquoson, Virginia

Poquoson and other coastal communities that drain directly to the Bay are being penalized with overly rigorous requirements based on inland river and stream impairments.

Response

Please see the response to comment 0235.1.001.014.

Comment ID 0235.1.001.012

Author Name: Helsel, Jr. Gordon

Organization: City of Poquoson, Virginia

Poquoson is a low-lying area, with a maximum elevation of approximately 10 feet above sea level. Some of our streets and lands experience almost-daily tidal inundation. A significant portion of Poquoson's drainage conveyance system experiences reversed flow twice a day during high tides, or is continually submerged. It is impossible to separate what pollutants are coming from upland development, and what pollutants are carried in with the tide. Nutrients, sediment and salt from the bay are found and cannot be separated from our yards, pipes, and ditches. This limits water re-use markets; makes water sampling ineffective; and eliminates many treatment options.

Prior to putting its draft stormwater regulations on hold, Virginia was developing regionally-based treatment recommendations, focusing on what would actually work in each of the state's geographic areas. The new EPA backstop measures revert to a statewide, "one size fits all" approach. Given our region's high groundwater, poor soils and low elevations, we question whether we can physically construct enough treatment measures to meet the backstops.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which

EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Please also see the response to comment 0235.1.001.011 regarding sediment and nutrient loads associated with tidal shoreline erosion.

Comment ID 0235.1.001.014

Author Name: Helsel, Jr. Gordon

Organization: City of Poquoson, Virginia

The EPA appears to be ignoring the impact of placing Poquoson and other coastal communities into upland river watersheds that do not actually receive our storm water runoff. This will lead to allocations that are not scientifically justified, and to localities having to address other watersheds' impairments. The EPA website places Poquoson in two watersheds: Watershed 02080101, the Lower Chesapeake Bay; and Watershed 02080108, Lynnhaven-Poquoson. TMDL maps and Virginia's James River Tributary strategy place Poquoson in the James River watershed. Poquoson does not drain to the James River. It drains to the Chesapeake Bay. On its website, the EPA acknowledges that not all drainage divides shown on its maps are accurate.

Making allocations to the City based on James River impairments and water quality is akin to "guilt by association." While Poquoson may be located within short distance of the James, its receiving streams do not share the river's chlorophyll a impairment. No action taken within City limits will help improve water quality in the James River. The decision to eliminate coastal watersheds and to arbitrarily include coastal communities in nearby river basins will result in scientifically unjustifiable allocations. In Poquoson's case, this random drawing of a line on a map will cost our citizens millions of dollars as we are compelled to alleviate an impairment we did not cause and cannot remedy.

Response

EPA agrees that the city of Poquoson drains into two minor rivers that drain into the main Bay. Even though Poquoson does not drain directly into the James River, it still has an effect. The mainstem Bay water is clearly connected to the tidal James, and the counter-clockwise circulation pattern in the Bay causes water draining from Poquoson to travel upcurrent of the mouth of the James River. Please see the response to comments 0267.1.001.006 and 0568.1.001.007 for more information on how upstream loadings of pollutants contribute to the downstream non-attainment of water quality standards.

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please also see the response to comment 0293.1.001.017 for more information on the James River allocations.

Comment ID 0249.1.001.010

Author Name: Mixell John

Organization: Fort Littleton Wastewater

The Backstop provisions in the draft EPA TMDL for the Chesapeake Bay are severe and in some cases unachievable. The Backstop, if implemented, will create severe hardship on most of the residents and businesses in our community and beyond. The actions will likely be legally challenged and progress towards Chesapeake Bay goals will be further delayed.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Comment ID 0252.1.001.016

Author Name: Bond Arthur

Organization: City of Frostburg, Maryland

The forth specific comment is that Frostburg must get credit for its and other regional efforts and locally developed and implemented plans so that a fair allocation of effort and cost is applied to the Bay TMDL control plan; and that the State play fair with local stream mandates while the Bay focus is ongoing.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water

quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

Finally, it is EPA's desire to credit all water quality improvements as they occur. EPA has requested that nitrogen, phosphorus and sediment controls be reported annually. This data will be compared with water quality monitoring throughout the watershed so that loads can be tracked and verified.

Comment ID 0253.1.001.001

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

Thank you for the opportunity to comment on EPA's Draft TMDL for the Chesapeake Bay and Virginia's WIP. The County of Henrico, Virginia (the "County"), understands and appreciates that the Chesapeake Bay is a nationally important natural resource. It fully supports efforts to improve the Bay's water quality. However, the County is concerned that the allocations and pollution limits ("backstops") established by EPA in its draft TMDL are unrealistic and unachievable, especially in the time frame required by the TMDL. Unrealistic goals will not result in sustained improvement of the Bay's water quality.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Author Name: Hazelett Virgil

Organization: County of Henrico, Virginia

As a matter of first principles, the County is concerned with EPA's decision in the draft TMDL to reject Virginia's Watershed Implementation Plan (WIP) and impose "backstops." EPA has no authority under the Clean Water Act (CWA) to reject a state's implementation plan. If EPA elects to preserve this decision in its final TMDL, it will have acted beyond the scope of its legal authority.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: County of Henrico, Virginia

Regarding EPA's Virginia WWTP backstops, the County strongly opposes EPA's inequitable proposal to transfer more burden to our WWTP and similar point sources. We object to EPA's currently proposed "backstops" (4 mg/L TN and 0.3 mg/L TP at design flow for WWTPs) in lieu of the WLAs in the Virginia Regulations, and we also object to the threatened but not applied "full backstops" that would decrease the concentration basis further (3 mg/L TN and 0.1 mg/L TP at design flow) and even the flow basis to past flow levels (2007 to 2009 average flow rather than design flow).

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Organization: District of Columbia Water and Sewer Authority

DC Water has been able to locate the WLAs assigned to Blue Plains in the Draft WIP in Table 9-1 of the draft TMDL Report. However, it has not been able to locate the WLAs for Outfall 001 and the combined sewer overflows (CSOs) that will remain after implementation of DC Water's Long Term CSO Control Plan (LTCP).

Response

Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Comment ID 0257.1.001.005

Author Name: Christian Stephen

Organization: Berkeley County Development Authority, Berkeley County, Martinsburg, West Virginia

Berkeley County must not only reduce current levels of discharge, but must also account for and limit new and increased flows. Additional discharge resulting from development may be allowed only with corresponding nitrogen and/or phosphorus reductions elsewhere to achieve a "net zero" pollution rate.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0257.1.001.009

Author Name: Christian Stephen

Organization: Berkeley County Development Authority, Berkeley County, Martinsburg, West Virginia

In summary, Berkeley County is prepared to do its "fair share" of nutrient reduction in order to improve local water quality and the Bay; however, the "fair share" needs to be grounded in sound science with an approach that will not unduly burden citizens and will allow Berkeley County to recognize its growth potential in the future.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Given the expected success of the point source sector to surpass compliance goals, it is inconceivable that EPA would require the more draconian measures of 3 mg/l TN and 0.1 mg/l TP included in their TMDL "backstop" measures. This is especially troubling when it actually amounts to a penalty for meeting and exceeding existing goals simply to pass additional point source reductions on to sectors that have not been able to present clear evidence of compliance to meet their own reductions. This point was made very clear in EPA's PA WIP Deficiency Letter, September, 2010: Load from point source reductions redistributed to forest, septic, and agriculture sources as possible while still meeting nitrogen, phosphorus and sediment allocations.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Organization: Pennsylvania Municipal Authorities Association (PMAA)

What makes the entire Bay nutrient reduction effort unconscionable is that EPA is foisting the responsibility for correcting nearly all non-compliance onto the states. Non-point source contributors to sediment and nutrient loads remain largely uncaptured by federal law. This lack of oversight through a federal statutory program is glaring in its omission, both for the Bay and other impacted watersheds nationwide. To exacerbate that situation by excessively targeting those sectors it can exert control over, even if the resulting reductions are de minimus, amounts to nothing more than an accounting process for the sake of showing some activity is occurring, even if it amounts to little in the result column.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0263.1.001.001

Author Name: Foley Sharon

Organization: Harrisonburg-Rockingham Regional Sewer Authority (HRRSA)

The Harrisonburg-Rockingham Regional Sewer Authority (HRRSA) owns and operates the North River Wastewater Treatment Facility (WWTF), a regional municipal wastewater treatment plant serving the City of Harrisonburg, Rockingham County and the Towns of Bridgewater, Dayton and Mt. Crawford, Virginia. The North River WWTF, which has been operating a biological nutrient removal process since 2001, produces an exceptional, highly treated effluent within the Chesapeake Bay watershed in accordance with a Virginia Pollutant Discharge Elimination System (VPDES) permit.

HRRSA remains committed to doing our fair share to restore the Bay. Our sustaining commitment to the Bay clean-up effort is exemplified by the North River WWTF's multi-million dollar enhanced nutrient removal (ENR) and expansion project which will be completed by the end of this year. With a total project budget of over \$90 million, HRRSA has expended considerable resources in ensuring a successful and timely completion of this extensive, three-year project. In addition to increased debt service on approximately \$64 million in new loans, the ENR project has also resulted in significantly higher operating and maintenance expenses resulting from dramatically increased energy requirements and additional chemical usage and solids production from operation of the new enhanced nutrient removal process. These additional costs have been borne by our member localities through increased rates to their customers.

HRRSA has significant concerns with EPA's Draft TMDL and strongly objects to the disproportionate share of EPA's threatened "backstop" actions that are unfairly directed at already highly regulated and controlled wastewater treatment facilities. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Comment ID 0276.1.001.001

Author Name: Nale Regis

Organization: Hollidaysburg Sewer Authority, Hollidaysburg, Blair County, Pennsylvania

The Hollidaysburg Sewer Authority is located in Blair County, Pennsylvania and owns, operates and maintains a wastewater treatment plant that serves portions of four (4) townships as well as the entire Borough of Hollidaysburg. The plant is rated for 6 millions gallons per day. The Authority recently was re-issued its NPDES permit (PA #0043273) on September 27, 2010. That permit contains requirements to achieve annual cap loading limits of 111,513 pounds of total nitrogen (TN) and 14,612 pounds of total phosphorous (TP) beginning on October 1, 2012.

The Authority has completed its planning studies for achieving the above annual cap loading limits, which were part of the Commonwealth of Pennsylvania's Chesapeake Bay Tributary Strategy. Design of new plant facilities is currently in progress. In fact the Authority filed an application with PaDEP for a Part II Water Quality Management Permit for the construction of the proposed facilities on October 29, 2010.

To achieve compliance with the newly issued NPDES permit, the Authority was proposing to upgrade its main wastewater treatment process to provide enhanced TN removals, build new sludge management facilities and purchase TP credits long term. Current estimated construction cost of the project is \$8 million dollars. The Authority's sewer customers are facing a monthly increase in the fixed portion of their monthly sewer bill of at least \$5.00 per month just to cover the debt service on the anticipated construction loans. Increased operations and maintenance costs will add

even more to the monthly sewer bill.

Recently the U.S. EPA has proposed to institute "Backstop TMDL's" on municipal and industrial point source sewage treatment plants in the portions of Pennsylvania that are tributary to the Chesapeake Bay. The U.S. EPA assigned the Hollidaysburg plant the following "Backstop TMDL" limits:

Pollutant Parameter	Backstop TMDL	Resultant Average Concentration @ 6.0 mgd
Total Nitrogen (TN)	9,804 lbs/yr	0.53 mg/l
Total Phosphorous (TP)	350 lbs/yr	0.019 mg/l
Total Sediment (TS)	025823 mil/lbs/yr (25,823 lbs/yr)	1.4 mg/l

The resultant average concentrations at the design plant flow of 6 million gallons per day (6 mgd) are much lower than the U.S. EPA's own limits of current technology for TN and TP. Those limits of current technology are 3.0 mg/l and 0.1 mg/l for TN and TP respectively.

The proposed "Backup TMDL's" will require the Authority to construct additional treatment units to remove TN and TP down to the limits of current technology. Additionally to achieve compliance below those limits the Authority would likely then purchase TN and TP credits as needed. The additional costs to do this are unknown at this time but surely run into the millions of dollars to construct such facilities. Operations and maintenance costs increases would result as well.

The Authority is already facing increased O&M costs for wastewater treatment in 2011 due to the impending increases in electric and natural gas utility rates. These utilities are expected to increase in the 15-20% range. These utility rates will affect the Authority's residential, commercial and institutional users as well.

Comment ID 0281.1.001.001

Author Name: Hammes Dale

Organization: Loudoun Water

We own and operate a municipal water reclamation facility ("WRF") that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We expect to do our part for the Bay restoration. Our Broad Run WRF has been designed with nutrient removal technology that will achieve our required waste load allocation through its five stage process that includes a membrane bioreactor. The facility, permitted at 11 mgd, was constructed at a cost of \$240 million including \$57 million in nutrient removal processes. The operational cost for this process is approximately \$4/1000 gallons which is four times the cost of the previous treatment cost. To help pay for these costs, Loudoun Water increased its rates by 12 percent last year and has plans in place to increase rates by an additional ten percent for each of the next two years.

We recognize the effort to continue to find ways to protect the Chesapeake Bay as a valuable resource, however we have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Comment ID 0286.1.001.001

Author Name: Salisbury Galen

Organization: Chemung County Sewer Districts (CCSD)

I am writing to document my concerns and issues with the draft Chesapeake Bay Total Maximum Daily Load (TMDL) allocations that have been recently issued by the US Environmental Protection Agency (EPA). The Bay and its tributaries are indeed national treasures that have been negatively impacted by many years of environmental stresses and misuse and are beyond a reasonable doubt in need of significant attention. However I strongly feel that the draft TMDL allocations as presented by the EPA will not achieve the goal of cleaning up the Bay because they place unattainable pollution reductions on the New York and other headwater states. The listed TMDL allocation limits would require an extremely high financial expenditure that would jeopardize the economic well being of many of the headwater communities and may therefore not be achievable.

New York has been at the forefront of environmental issues, including water quality for many years and the New York State Department of Environmental Conservation has been an extremely active and forward-looking agency since the environmental awareness issues began in the early 1970's. New York began investing heavily early on in its' water and wastewater infrastructure systems throughout the state using money that came from federal, state and local tax dollars. The results of these investments is what we benefit from today and can be noted by the quality of the water that exists throughout New York, some of which makes its way to the Bay. In fact it is known that if the water quality of the entire Bay watershed had the same phosphorous, nitrogen and sediment concentrations that New York's portion of the watershed currently has, the Bay would not be impaired. New York should be recognized and credited for the investment it has made over the last 40 years in our water and not be punished with such a low allocation as appears in the draft TMDL. In essence, New Yorkers would be paying for another 30 years for that which they have already paid for over the past 40 years - clean water.

Comment ID 0288.1.001.006

Author Name: Pomeroy Christopher

Organization: Virginia Association of Municipal Wastewater Agencies, Inc. (VAMWA)

Virginia's regulatory approach was developed beginning in 2005, with the agreement of a number of local government organizations including VAMWA and of the major citizen environmental groups. In 2005, the Virginia State Water Control Board ("SWCB" or "Board") adopted a package of stringent regulations; [FN6] in 2007, the SWCB adopted a related permitting regulation. These actions (listed below) established a comprehensive program for the (early) regulation of municipal dischargers (collectively, the "Virginia Regulations"):

--Water Quality Management Planning Regulation Amendments, 9VAC25-720

--Nutrient Enriched Waters Policy Amendments, 9VAC25-40-70

--Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820

These regulations were developed pursuant to a statute enacted in 2005 and codified at Virginia Code § 62.1-44.19:12 et seq.

Extensive deliberations and efforts went into the statewide effort to develop Virginia's regulatory wasteload allocations. The SWCB took final action based upon those considerations, and wastewater plants (including POTWs) across the Commonwealth made major investments based upon the Board's decision.

Based on the referenced statute and regulations of the SWCB, the Virginia Nutrient Credit Exchange Association, Inc. (the "Nutrient Exchange") was created, and the Nutrient Exchange and its participants have developed the Exchange Compliance Plan. [FN7] This represents the most extensive, proactive effort to plan and construct municipal wastewater treatment in Virginia since national requirement for secondary treatment established in the 1970s. The Compliance Plan addresses how participating facilities will achieve and maintain compliance with their regulatory nutrient allocations beginning January 1, 2011. VADEQ has approved the Nutrient Exchange's Compliance Plan each year beginning with the first such plan in 2007 through November 2010.[FN8]

The approved Exchange Compliance Plan is based on construction of a large number of advanced nutrient removal facilities throughout the five major river basins as well as a number of nutrient credit trades pursuant to the State Water Control Law's Chesapeake Bay Nutrient Credit Exchange Program article and the Board's Watershed General Permit. These trades are also contractual obligations of the participants through the complex, multi-party Nutrient Credit Services Agreement, which was executed by the parties in 2007.[FN9]

To help support this construction program and related nutrient credit trading, the General Assembly has appropriated over \$600 million in cost-share funding for treatment upgrades.[FN10] The projects are constructed by the facility owners, and the State cost-share funding is disbursed, in accordance with the terms and conditions of numerous individual Water Quality Improvement Fund Grant Agreements to which VADEQ is a party.[FN11] Virginia's POTWs have also made significant investments in facilities to reduce loadings based upon 2005 nutrient allocations. In sum, Virginia's POTWs have estimated total costs between \$1.5 billion and \$2.0 billion to upgrade POTWs to meet nutrient loading reduction requirements.

As a result of these many efforts by the Commonwealth and local governments, Virginia is in the fortunate position of

being able to testify in a recent congressional hearing to Virginia's remarkable progress, including the expectation of meeting its regulatory point source allocations by the December 31, 2010 deadline.[FN12] In his September 2009, testimony before the Subcommittee on Water Resources and the Environment of the House Committee on Transportation and Infrastructure, Virginia's Secretary of Natural Resources highlighted the State's financial participation and commended the Nutrient Exchange for its role in facilitating the nutrient upgrades.[FN13]

As noted above, EPA has previously agreed that regulatory stability should be a fundamental component of the Bay TMDL. Indeed, because of the significant investment made by local governments and the Commonwealth (as well as other Bay states), the EPA Regional Administrator publicly agreed that regulatory stability is a "priority need" and a "matter of fiduciary responsibility and public trust:"

"...the large scale public investments (estimated at over \$4 billion) that are now being carried out throughout the watershed to upgrade and reduce nutrient discharges from point sources. A stable regulatory environment is a priority need for these facilities and a matter of fiduciary responsibility and public trust. Therefore, EPA considers requiring further point source upgrades to the limits of technology as an option of last resort and is avoidable if the Bay partners use our creative energies to deliver sufficient nonpoint pollutant reduction commitments.[FN14]

In addition, the Office of Inspector General has also agreed that allocations for significant wastewater treatment facilities should remain unchanged:

Although EPA and its Bay partners could obtain additional nutrient reductions from significant municipal wastewater treatment facilities..., these additional reductions are not cost effective or practical. Obtaining these additional reductions would require justifying additional expenditures, recalculating wasteload allocations, and reopening and modifying permits already being put in place. At this point, EPA has no plans to require additional reductions from wastewater treatment facilities.[FN15]

Indeed, according to the latest Phase 5.3 model runs, wastewater represented 21 and 25 percent of the average annual nitrogen and phosphorus load, respectively, to the Chesapeake Bay under the 2009 progress scenario. Under the critical 3-year condition for the TMDL (1993-1995), wastewater would represent an even lower proportion of the nutrient load with existing controls.

Moreover, wastewater treatment plants lead all sectors in nutrient load reduction. For example, the estimated 2008 wastewater loads represent a 45-percent reduction from 1985 levels and a 62-percent reduction from "no action" levels. Wastewater treatment plants are still in the process of completing major upgrades and are the only sector predicted to achieve tributary strategy loads shortly after 2010. With current levels of nonpoint source controls, the wastewater cap loads will represent only about 15-percent of the average annual nitrogen load to the Bay, and even less under critical hydrologic conditions.

Although the wastewater sector is proud of its progress in nutrient load reduction, most treatment plants are allocated at close to limit-of-technology levels, and there is almost no benefit to further reductions in point source allocations. Non-point source reduction will remain the primary means to achieve the overall loading caps.

In contrast, the Susquehanna River basin alone contributes 44 percent of the total nitrogen load to the Bay. This value actually underestimates the impact of the Susquehanna basin, because it is among the most "effective" basins at

impacting hypoxia in the mainstem Bay. When relative effectiveness is considered, the Susquehanna River basin accounts for more than 60 percent of the "algal units" delivered to the Bay. Regardless of implementation actions in other basins, load reductions in the Susquehanna basin are the key to attaining water quality goals.

Despite the extraordinary efforts made by Virginia's POTWs, and EPA's own prior statements, EPA's Draft TMDL threatens to disrupt these very productive recent efforts.

EPA has concluded that Virginia's WIP fails to comply with EPA's July 1, 2010 and August 13, 2010 nutrient and sediment allocations[FN16] and does not adequately establish reasonable assurance. EPA has established what it is calling a "backstop allocation" in response.[FN17] This backstop is meant to "...reduce the point source loadings as necessary to compensate for the deficiencies EPA identified in the reasonable assurance components of the jurisdictions' draft Phase I WIPs addressing nonpoint source reductions."[FN18]

Each of the Bay States received a "minor", "moderate", or "high" backstop depending upon EPA's view of how severely the state had missed the allocation targets and reasonable assurance mandate. Virginia received a "moderate" backstop to bridge the gap between EPA's expectations and the Virginia Draft WIP.[FN19] The "moderate" backstop sets wastewater discharge allocations based on concentrations of 4 milligrams per liter ("mg/l") for total nitrogen ("TN") and 0.3 mg/l for total phosphorus ("TP") and design flows (i.e., plant capacity).[FN20]

EPA also established what it calls "full" backstops for all Bay States. For wastewater, "full" backstops set allocations for nutrients based upon limits of technology (3 mg/l for TN and 0.1 mg/l for TP) and historical flows (2007 to 2009 averages) rather than design flows.[FN21] According to the Draft TMDL, EPA will use the "full" backstops "...in any of the seven watershed jurisdictions if EPA determines that a jurisdiction's final Phase I WIP is weaker than its draft Phase I WIP and requires additional backstop actions to ensure that point and nonpoint source reductions sufficient to meet WLAs and LAs are achieved and maintained". [FN22] VAMWA strongly opposes the use of either "moderate" or "full" backstops in Virginia.

[FN6] For reference see September 12, 2005 and November 4, 2005 Memoranda from DEQ to SWCB (attached hereto as Appendix 5) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A5].

[FN7] Attached hereto as Appendix 6. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A6]

[FN8] VADEQ's approval letters are attached hereto as Appendix 7. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A7],

[FN9] See Appendix 6. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A6],

[FN10] Fifty-five (55) POTWs have signed grant agreements with the Commonwealth for partial grant funding for upgrades. In sum, these grant agreements represent an invest by the Commonwealth of approximately \$648.23 million. Despite the commitment made by Virginia and local governments (for the balance of the approximately \$2 billion effort), Virginia's program is facing significant funding shortfalls. Virginia is projecting a shortfall in funding of approximately

\$112 million by July 2011, and has begun pro-rated payments in an effort to shore up the Water Quality Improvement Fund budget.

[FN11] A sample agreement is attached hereto as Appendix 8. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A8]

[FN12] In addition to strides made in Virginia, Baywide, the wastewater source sector was well on its way to achieving a significant percentage of their ultimate clean-up goals by 2005. As a presentation from the Chesapeake Bay Program Office ("CBPO") shows (pertinent page attached as Appendix 9) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A9], wastewater (both municipal and industrial) had achieved 63% of the nitrogen reduction goal (loadings reduced by 30.4 million pounds per year from 1985-2004) and 80% of the phosphorous reduction goal (loadings reduced by 4.9 million pounds per year from 1985-2004).

[FN13] Former Secretary of Natural Resources Preston L. Bryant's written comments are attached hereto as Appendix 10. [Comment Letter contains additional information in the form of an attachment. See original comment letter 0288.A10]

Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC)

The EPA's own calculations and charts show that the James River has a minimal affect on Bay water quality. Thus, the most rigid of the TMDLs is placed on the body of water that has the least impact on the bay. The James River TMDLs are an example of the EPA overreaching its authority as to the Bay clean-up project.

Response

Please see the response to comment 0293.1.001.017 for more information on the James River allocations.

EPA reminds the commenter that EPA is under a legal obligation to establish a TMDL that meets water quality standards in the Bay which is explained in the response to comment 0139.1.001.017.

Comment ID 0300.1.001.014

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

Table 9-3 of the draft TMDL provides preliminary WLAs that are aggregated for the source sectors. VDOT understands that the Phase II WIP and revised TMDL will refine the WLAs by stream shed, but that the WLAs will still be aggregated among many parties. In order to avoid potential legal problems, VDOT requests that the EPA and relevant state agencies establish the guidelines that would be used to segregate WLAs among the different parties should that become necessary in the future.

Response

EPA agrees that guidelines are necessary to describe how sector aggregate WLAs should be distributed to permittees included in that aggregate. However, EPA believes that these guidelines should be developed by each jurisdiction and included in the Phase I and II WIPs.

Comment ID 0300.1.001.017

Author Name: Whirley Gregory

Organization: Virginia Department of Transportation (VDOT)

VDOT is concerned that the proposed revisions to the NPDES construction general permit would require aggressive controls for nutrient removal, which heretofore have not been required. Erosion and sediment controls at construction sites have been designed to prevent/control sediment runoff primarily through perimeter and temporary controls. If specific target reductions are required for phosphorus and nitrogen removal, then the erosion and sediment controls would need to be much more comprehensive and would need extended detention, infiltration, or bio-retention management that is typical of permanent stormwater management facilities used for nutrient removal. This change in regulatory standards would result in a significant cost increase for treatment. For example, Virginia's 2005 Tributary Strategy Plan estimated the cost of traditional BMPs for erosion and sediment control to be about \$2,000 per acre treated with a maintenance cost of approximately \$500. This compares with the estimated costs for an infiltration BMP of approximately \$5,285 per acre treated with a maintenance cost of \$528 and a filtering BMP cost of approximately \$12,719 per acre treated with a maintenance cost of \$763. Given this 300-600 percent difference in treatment costs, VDOT requests that EPA reconsider this proposed revision to the NPDES construction general permit program and allow the focus of erosion and sediment controls to remain on erosion prevention and sediment removal.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Organization: The Nature Conservancy

We commend EPA for incorporating the following elements into the TMDL and accountability framework:

4. Providing necessary federal backstop actions but seeking to avoid reliance on such an approach. Unfortunately, the history of Bay restoration efforts demonstrates that there are so many players involved that success is unlikely unless one entity with sufficient enforcement authority ultimately takes the lead. The Conservancy hopes that many of the federal backstop actions EPA has outlined will prove unnecessary, and we know you share this sentiment. We do commend EPA, however, for clearly laying out the consequences if states and other jurisdictions fail to achieve pollution reductions through their own plans.

If the final TMDL is to succeed in achieving actual restoration of the Chesapeake Bay, the allocations must be revised to be both equitable and theoretically achievable .

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0315.001.001

Author Name: Scott Edward

Organization: Commonwealth of Virginia

Through the tributary strategies, Virginia is committed to significant additional reductions in nitrogen, phosphorus, and sediment pollution going forward. My review of data from the Chesapeake Bay Commission shows that in many cases the tributary strategies are essentially equivalent to the draft allocations proposed by EPA, and are in some cases lower. With this framework in place, EPA's haste to act and public disparagement of Virginia's Watershed Implementation Plan are puzzling.

Response

Tributary Strategies were developed by each jurisdiction to implement nitrogen, phosphorus, and sediment cap loads established by the Bay partners in 2003 to protect the Bay. However, this effort was intended to guide nutrient and sediment reductions up to 2010 and was not intended to satisfy EPA's TMDL obligations under the Clean Water Act. Furthermore, the Bay models have been updated with the latest science and monitoring data. The Bay TMDL used these updated models to establish revised nitrogen, phosphorus, and sediment loading requirements used by the jurisdictions to develop Phase I Watershed Implementation Plans (WIPs). Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. The WIPs are part of the accountability framework outlined in the Chesapeake Bay Protection and Restoration Executive Order 13508. The WIPs help ensure implementation of the Chesapeake Bay TMDL but are not an approvable part of the TMDL.

Regarding your comment that the TMDL development process was rushed, please see the response to comment 0137.1.001.004.

Organization: Rapidan Service Authority (RSA)

We own and operate a municipal wastewater treatment plant ("WWTP") in the Rappahannock River Basin that cleans and discharges highly-treated wastewater within the Chesapeake Bay watershed pursuant to a state-issued National Pollutant Discharge Elimination System ("NPDES") permit.

We expect to do our part for the Bay restoration. In fact, our WWTP is in the process of being upgraded with nutrient removal technology. We are constructing a 5 Stage Bardenpho treatment plant at a capital cost of over \$16,000,000. As a result we recently implemented a 55% rate increase for the users of this system which was difficult in the present economic downturn. Further, we anticipate our annual O&M costs increasing by a significant amount over what we have historically spent. A major portion of this increase is related to adding staff, chemical and electrical costs associated with this type of treatment plant. Not only will we need to add several more operators, we expect to use considerable more chemicals and electric in order to achieve the required nutrient removal.

We have significant concerns with EPA's Draft TMDL and object to EPA's threatened "backstop" actions against WWTPs. EPA currently proposes to cut Virginia's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Comment ID 0331.1.001.006

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

Although the proposed backstop allocations reflect the difficulty of achieving significant load reductions from the

agriculture and onsite septic sectors, they fall far short of reflecting the difficulty of achieving such reductions from the urban runoff sector. EPA appears to simply assume that the reductions can be achieved because MS4s are subject to federal and state permitting authority under the NPDES, but this assumption fails to recognize that the Localities own, on average, only about 20 percent of the land area within their respective jurisdictions. Therefore, most of the retrofits needed to achieve the load reductions will have to be implemented on private lands over which the Localities have no control in the absence of new development or redevelopment requiring local land use approvals. As previously noted, the costs of land acquisition alone will be enormous.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0331.1.001.008

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

Stormwater management in the City is also hampered by the difficulty of infiltration in some areas where extensive clay soils prevent or retard infiltration, and by the very high groundwater table, which is a problem almost everywhere in the City's Chesapeake Bay Watershed. The topography of the City is very flat and there is an extensive tidal influence, thus making retrofits a costly option. If the EPA backstops remain, the City could retrofit all of its property, and still not meet the required allocation. Further, the use of multiple treatment options to meet the EPA's desired efficiencies will increase the amount of land required for retrofitting in the portion of the City that is already fully developed. As a result, the City will be forced to acquire private property interests to allow it to retrofit to a level that would meet the EPA's allocation.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Comment ID 0340.1.001.003

Author Name: Miner Steven

Organization: Accomack County, Virginia

The EPA's backstop TMDLs are stringent actions, especially for waste water treatment plants associated with municipalities and food processing plants. The EPA is avoiding the same actions on deficiencies in non point sources, agricultural lands, saying that the states should regulate these, and any actions should be through the Farm Bill. While both Agriculture and waste water treatment plants associated with food processing have responsibility for the protection of water quality, EPA's "back-stop" TMDL's should not penalize waste water treatment plants and other point source discharges in our community due to the failure of the State and the Federal Farm bill to appropriate sufficient technical

or financial resources to address the non-point source issue, especially if the local government has limited authority to directly address the non-point sources of water pollution.

On behalf of the Moshannon Valley Joint Sewer Authority (hereinafter "Authority") and in response to the presentation by your staff at the public hearing on October 19, 2010 at the State College Knights of Columbus on Stratford Drive, I present herein my comments on the Draft Chesapeake Bay TMDL's, dated September 22, 2010.

The Authority is currently designing the improvements to their Regional Water Pollution Control Facility (hereinafter "Plant") anticipated to cost \$14.7 million. This project is being implemented because of the Chesapeake Bay Tributary Strategy biological nutrient limits being imposed upon the Authority through its "draft" NPDES permit.

The proposed backstop biological nutrient removal limits of 3 mg/l for Nitrogen and 0.1 mg/l for Phosphorus will require the Authority to add approximately \$7 million to the already expensive project. The Authority is opposed to these backstop limits.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. It's from this perspective that we view the proposed reductions for New York (XX% TN, XX% TP and XX%TSS) as surprising, unrealistic and disappointing; surprising because the proposal is not reflective of an understanding of the role of headwaters in watershed dynamics; unrealistic given the highly unfavorable cost benefit ratio and its long term negative impact to the region; and disappointing because it was the result of a human decision making process.

Please refer to the response for comment 0080-cp.001.002.

Comment ID 0361.1.001.003

Author Name: Weidenbach Richard

Organization: Delaware County Soil and Water Conservation District (SWCD), New York

EPA is acting punitively in assigning the proposed TMDL values to New York State. In 2000, New York State's Governor and the 16 Conservation Districts in the Susquehanna watershed signed onto a multi-state agreement to voluntarily reduce its nutrient and sediment loading from the New York portion of the watershed. We have successfully worked hard with our agricultural community to reduce this loading, yet EPA has not credited New York for its reductions. At one public forum sponsored by the Upper Susquehanna Coalition of Soil and Water Conservation Districts, EPA's TMDL Manager inferred that crediting New York State for all its past loading reductions would be "politically uncomfortable" for EPA. We find it appalling that a federal agency that should be acting scientifically is "knee deep" in regional politics. EPA's conclusion not to credit New York State for its reductions, while other states did not or even increased their loading, is punitive. In fact, it sends a clear message to other regions around this country that are facing the possibility of a TMDL to continue to pollute until a regulatory action is taken. This disincentive approach by EPA threatens to undermine the many voluntary proactive approaches to pollution reductions that have been successful in many regions throughout the nation. We strongly suggest that EPA rethink its regulatory mindset to include reward and encouragement of voluntary efforts that achieve the same water quality objectives.

Organization:

o The pollutant allocations in the WIP for the urban/suburban and all other sectors should be returned to the levels recommended by the Secretary's Stakeholders Advisory Group (SAG). The revised WIP should restore equity to the allocations as recommended by the SAG which already require significant reductions for all sectors except Wastewater Treatment Plants (WTPs).

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0370-cp.001.004

Author Name: Page T.

Organization:

o The Virginia WIP submitted to EPA in September fails to take into account cost-effectiveness. Urge Virginia to use available data to take it into account in their revised WIP. The draft WIP unfairly shifts additional burdens onto the urban/suburban, on-site septic and agriculture sectors while reducing the contribution from WTPs to virtually no increase going forward. The BMPs required by the urban suburban sector to meet this shift are documented by Mike Rolband to be more than 10 times more expensive than available WTP technologies that could be phased-in with EPA approval over the full 15 year TMDL implementation period.

Comment ID 0370-cp.001.005

Author Name: Page T.

Organization:

o The additional allocations required by the draft TMDL after returning to the equitable distribution recommended by the SAG should be met through WTPs. The urban/suburban sector will have to pay these WTP costs as well but at far less cost than requiring urban retrofits beyond the levels already included in the SAG WIP. The greatest burden of this requirement for additional urban retrofits will fall on VDOT and therefore the state itself.

5. The path forward must be positive, not punitive. Industry, municipalities, and the public can only support a watershed implementation approach that fairly distributes responsibilities - where all contribute to the solution, and with actions that are reasonable and cost-effective.

Throwing out the Pennsylvania WIP to impose a Backstop TMDL containing impossible and draconian mandates on December 31, 2010 will not achieve anything other than to create a train wreck. Such a track is not a viable pathway to achieve real Bay improvements. As our region and nation struggle to come out of the greatest economic downturn since the crash of 1929, now is not the time to waste time, taxpayer funds, and private resources - and it is not the time to take regulatory decisions that threaten to shut down industrial plants and displace employment.

We believe the Pennsylvania WIP is generally on the right track. To the extent that implementation steps and programs for certain non-point sectors need to be fleshed out in further detail, EPA must give the Commonwealth sufficient time to work out those details.

Organization: City of Falls Church, Virginia

While the Draft WIP lacks clarity on what the exact requirements would be for urban and suburban stormwater, EPA's Draft TMDL defines an aggressive backstop allocation of retrofitting 50% of impervious land. The backstop is a primary concern given its tremendous potential to become the centerpiece of our Virginia Pollutant Discharge Elimination System General Permit for Small Municipal Separate Storm Sewer System ("MS4") and primary driver of expenditures in stormwater management for the next 15 years.

Author Name: Combs Tina

Organization: Chamber of Commerce, Martinsburg and Berkeley County, West Virginia

As a result, EPA has imposed stricter limits upon the regulated wastewater treatment plants. The imposed limits correspond to EPA's maximum theoretical load reduction, or "E3" scenario: assuming the best case and that all available control technologies are deployed and represented at the highest technologically achievable levels of treatment, regardless of costs. This scenario would lead to more onerous rates for wastewater customers and leave even less opportunity for future growth in Berkeley County. These backstop limits must be removed.

In summary, Berkeley County is prepared to do its "fair share" of nutrient reduction in order to improve local water quality and the Bay; however, the "fair share" needs to be grounded in sound science with an approach that will not unduly burden citizens and will allow Berkeley County to recognize its growth potential in the future. Thank you for your consideration of our comments.

The following are comments submitted to me from Jefferson County Commissioner, Lyn Wildmyer, Region 9 Chesapeake Committee Chair:

"We state in the strongest terms that EPA should recognize and continue longstanding DEP target standards of 5 mg/L TN and .5 mg/L TP rather than impose more restrictive standards of .3 and .1. The proposed federal "backstop" standards are fiscally devastating and from a clean water perspective, unnecessarily stringent.

The state of West Virginia has been working for years through its stream restoration program using the 5/.5 standards. It is unreasonable and unrealistic to impose more stringent standards now. We understand from the meeting we have attended on the TMDL that the "backstop" standards are the "gold-plated" maximum achievable goals given cutting edge technology and state of the art treatment plants."

Response

I am a farmer in Rockingham County, Virginia. I am also a member of the Mennonite faith. I'm concerned that several issues being discussed will affect my lifestyle and potentially my ability to farm. Please understand I choose not to participate in the legislative process or government programs for my personal financial benefit in accordance with my religious beliefs. That said I sincerely hope the following information will be considered when developing and implementing both the TMDL and the Watershed Improvement Plan for the State of Virginia.

Fifth : We have demonstrated our ability to work with state and local agencies to improve water quality . Many of our farms already have permits from various state agencies. We hope control of the plan and all regulations will be managed at the state level .

Response

EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all stakeholders involved including federal agencies and state and local jurisdictions. EPA encourages all stakeholders to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals. It will be a challenge to meet the 2025 deadline but EPA is committed to work with its stakeholders and jurisdictional partners in order to achieve this.

Comment ID 0407.1.001.003

Author Name: Krouskop Dirk

Organization: MeadWestvaco Corporation (MWV)

MWV is a member on the Virginia Nutrient Credit Exchange Program. The Nutrient Credit Exchange Program established in Virginia was developed in reliance on the long-standing expectation that investments in technology would achieve the desired nutrient reductions. The 5 mg/l TSS (sediment) limitations proposed in EPA's partial and full backstop proposals undermines this process because technologies other than those pursued to date for nutrient reductions would be required. EPA's proposal, in effect, makes TSS the driver for technology investments rather than nitrogen and phosphorus. This is a marked shift in the program that undermines the investments and nutrient trading program established under Virginia's regulatory trading program.

Response

Author Name: Paulson Eric

Organization: Virginia State Dairyman's Association (VSDA)

VSDA is also alarmed at the inclusion of federal backstops in the proposed TMDL plan. This targets and punishes larger operations for no other reason than they are under EPA jurisdiction. A more reasonable approach is to work with Virginia's current incentive based system to help operations of all sizes work towards a common goal. CAFO's in Virginia already work under stringent federal and state guidelines and further regulations will only add more costs to the operation. Instead of overreaching their authority, we also urge EPA to work with Virginia on programs such as the Virginia Pollution Abatement program that are often more stringent than federal CAFO permits and are highly effective. Moving more operations under federal permits would create unnecessary paperwork and have little impact on water quality.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which

EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all involved including federal agencies and state and local jurisdictions. EPA encourages all to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals. Table 3 shows the percent change between EPA's "2010 No Action" and EPA's backstop allocation scenarios. It appears that EPA used the agricultural source sector to balance the load reductions to meet the James River basin TMDL allocations, because the TN edge of stream loads increased by 12 percent while the sediment loads decreased by 50 percent. Therefore, if EPA continues to apply backstop allocations, loads to compensate for the CS-C WLAs that EPA missed in the draft TMDL should come from the agricultural source sector, which should not harm agriculture. Agricultural BMPs that target sediment reductions will most likely reduce nitrogen and phosphorus loads as well. EPA should evaluate the expected performance of the agricultural BMPs and identify the nitrogen and phosphorus loads that could be used to offset the allocations for the CS-C WLA, which should be incorporated into the final TMDL. An example of these calculations is shown in Exhibit C. [Comment Letter contains additional information in the form of an attachment. Please refer to Exhibit C of the original letter (Docket ID EPA-R03-OW-2010-0736-0419.1)].

Author Name: Pryor Wayne

Organization: Virginia Farm Bureau Federation

C. EPA Has Not Provided Sufficient Evidence of the Environmental Benefits to be Achieved through Its Proposed Backstops.

EPA has not provided any evidence that the partial and full backstop scenarios in its TMDL are necessary to achieve an environmental benefit. Moreover, EPA's proposal overlooks significant programs included in Virginia's WIP that would result in significant water quality improvements.

For example, the following agricultural practices, included in Virginia's WIP, given proper implementation and funding, will result in significant water quality improvements. The development of Agricultural Resource Management or Conservation Plans to meet the individual conservation needs of each farm will result in progress without mandating a "one-size-fits-all approach." Likewise, the use of nutrient management plans encourages individualized management plans that are designed to reduce nutrient and sediment discharges.

Virginia's WIP proposes to build off of the incentive-based practices and programs that have already shown significant progress. EPA has not provided any evidence that it needs to intervene in this process and substitute its version of heavy-handed, government regulation.

Response

Please refer to the response for comment 0067.1.001.009. Comment ID 0439.1.001.006

Author Name: Littrell Judy

Organization: New York Association of Conservation Districts

New York's WIP was developed by partners in natural resource management - USC, DEC, Ag and Markets, NRCS, Cornell University, and various other stakeholders. A realistic approach was used based on current water quality, proactive programs already in place, and funding sources, which are limited. New York's WIP proposed spending \$200 million in technical and financial assistance by 2025. The EPA nutrient and sediment allocations and backstop mandates are unattainable and extremely costly with minimal nutrient reduction benefits and minimal impact on water quality in the Bay.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by

the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Organization: Virginia Association of Counties (VACo)

1.) Fiscal and economic impacts upon local governments

Unlike EPA, local governments have a fiduciary responsibility to the citizens they serve to seek the most cost-effective solutions available. EPA's refusal to engage in frank discussions about economic impacts is a disservice to the public. Instead of representing a healthy, collaborative partnership, the Chesapeake Bay DRAFT TMDL is more reflective of a "command and control" model demanding an "E3" ("everything done by everybody everywhere") approach that is highly unrealistic, prohibitively expensive, and undermines the regulatory stability needed for the proper management of wastewater facilities. Furthermore, representatives from EPA have stated in public meetings with stakeholders in Virginia that EPA will not consider economic impacts, affordability or cost effectiveness as part of the process for developing a TMDL.

Characteristic of EPA's aggressive approach is the employment of "backstop allocations." EPA's establishment of backstop allocations will place local governments in an extremely difficult and unfair position. Local governments will be penalized if they fail to achieve pollutant reductions from multiple sources that they have not historically been responsible for regulating, nor had the legal authority to control. One chief area of concern is storm water retrofits, where local governments would be held responsible for correcting design flaws in storm water systems that have been constructed over the past century or longer. While VACo concurs that upgrades to many of these systems throughout Virginia may be desirable for improving water quality and often necessary to address flood control problems, EPA's timetable for requiring them is highly unrealistic and a potential source for extreme fiscal stress upon localities throughout Virginia. For example, the consulting and engineering firm CDM, has estimated that the cost associated with urban storm water retrofits in the Virginia portion of Chesapeake Bay watershed will range between \$678 and \$1,717 per household per year until 2025.

Recently, two independent consulting firms completed studies estimating that the annual cost for construction associated with storm water retrofits in Fairfax County, Virginia alone would amount to \$250 million, or more. Currently, Fairfax County finances its storm water system through a dedicated real estate tax of \$.015 per \$100 in assessed value of real property. This translates to an average of about \$70 per year per residential unit. A \$250 million annual cost for storm water retrofits in Fairfax County under the DRAFT TMDL translates to an annual increase in the yearly storm

water assessment from \$70 to \$630 per household.

Estimates for Fairfax County are consistent with analyses that have been conducted in other parts of Virginia. For example, an analysis conducted by the Hampton Roads Planning District Commission in the southeastern region of Virginia (HRPDC) has estimated that per capita costs on an annual basis would range between \$284 and \$658 in its 12-member jurisdictions. Please see the table showing anticipated BMP costs and annual per capita costs for each HRPDC locality:

[Table. Please see page 5 of the original letter (Docket ID 0736-0440.10)]

Even in times of robust economic growth, the economic impacts of this magnitude upon local governments and taxpayers in Virginia would be unsustainable. Under current economic circumstances, these impacts are especially damaging. Please consider these realities under which Virginia's local governments have operated in recent years:

- Because of the state's fiscal conditions, state aid to localities has fallen by \$1 billion since 2008.
- These cuts in state aid have affected the resources dedicated to the funding of our public schools, mental health programs, social services and public safety.
- The fiscal conditions of recent years have forced many local governments in Virginia to cut back services and their workforces.
- Between June, 2009 and June, 2010, 15,600 local government jobs in Virginia disappeared.

For at least the next few years, Virginia's local governments are likely to operate under similar economic conditions. These points, however, are not being made to suggest that local governments do not have responsibilities, and should not be active partners in improving water quality. VACo's chief contention is this: there is a major role that federal and state governments must play in providing meaningful financial assistance to local governments if Chesapeake Bay restoration efforts are to succeed. To achieve the water quality goals established by EPA, federal and state agencies must also be partners in helping local governments find the most cost-effective approaches possible.

Recommendation:

Establish a high-level forum similar to the 2004 Chesapeake Bay Watershed Blue Ribbon Panel for analysis of fiscal and economic impacts and negotiations among Bay Partners on how financial responsibilities should be shared. This Blue Ribbon Panel was composed of 15 distinguished leaders from the private sector, government and the environmental community and chaired by former Governor Gerald Baliles. It was established by the Chesapeake Bay Executive Council "to identify funding sources sufficient to implement basinwide clean-up plans" to restore water quality in the Chesapeake Bay.

One chief criticism by the Panel was that past efforts to restore Chesapeake Bay were "poorly coordinated" partly because of their lack of "a permanent funding base that is sufficiently large to do the job" (Please see Saving a National Treasure: Financing the Cleanup of the Chesapeake Bay, A Report to the Chesapeake Executive Council from the Chesapeake Bay Watershed Blue Ribbon Panel, October 2004). To correct these major deficiencies, both in the areas of funding and coordination, the Panel recommended the establishment of a \$15 billion interstate Chesapeake Bay Financing Authority; \$12 billion of which would be capitalized through federal appropriations, with the remaining \$3 billion contributed by the states in the Chesapeake Bay watershed and the District of Columbia. Unfortunately, the

Panel's recommendations were quickly and summarily dismissed and now seem largely forgotten.

The imperative for federal leadership in assuming a greater share of financial responsibility was underscored in 2004 when the Chesapeake Bay Watershed Blue Ribbon Advisory Panel issued a report stating that the "most up-to-date cost of implementing all strategies (associated with restoring the Chesapeake Bay) is \$28 billion in total upfront capital costs, including some items that are primarily for the benefit to local waters, and not the Bay itself." If the Chesapeake Bay is truly regarded as the "national treasure" as characterized in President Barack H. Obama's Executive Order 13508, the Blue Ribbon Panel's recommendations must be resurrected for serious consideration. As the Panel's recommendations are reconsidered, there must also be updated analysis of full program costs that take into consideration changes in economic conditions that have transpired over the past six years.

Response

Thank you for your comments. Please see the response to 0038.1.001.024 outlining the federal effort towards the Bay. EPA will not be identifying the total federal, state, local and private cost burden in the TMDL for reasons discussed in the response to comment 0139.1.001.017. Please see the response to comment 0733.001.005 for EPA's consideration of the Blue Ribbon Panel's recommendations.

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

8. EPA Needs to Build Flexibility into its Backstopping Approach

Given the limited time available for states to revise their WIPs in response to public comment, it is unrealistic to expect that states will be able to address all of the potential gaps in their WIPs that EPA has identified. Accordingly, the use of federal backstopping actions to revise the allocations should be delayed. EPA also should allow sufficient time for initiatives that address gaps to actually be implemented at the state level (e.g., state legislatures cannot approve programs and funding initiatives to assist local governments by December 31, 2010) before imposing backstops (ref. Section 8.3 Draft Backstop Allocations).

Recommendation #8A: Refrain from Imposing Backstop Provisions before the Phase II WIPs are Completed or if Other Regulatory Measures Aren't Completed In Time

EPA should refrain from issuing any backstop requirements until the Phase II WIPs are completed and approved; backstops addressing retrofit requirements for MS4 permittees should be contingent on the availability of appropriate cost-share funding assistance. (See comment #2.) In addition, if expected reductions in Clean Air Act measures are not

implemented as envisioned (ref. Section 4.7.2 Atmospheric Deposition, and Section 5.9.3 Atmospheric Loads) it would not be appropriate for EPA to automatically impose backstop measures to compensate for those gaps - especially given EPA's stated commitment to ensure those air reduction goals are met.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0443.2.001.003

Author Name: Moore Shannon

Organization: Frederick County Government

The County provides the following comments on the Executive Summary of the TMDL:

p.6: "If a jurisdiction's plans are inadequate or its progress is insufficient, EPA can invoke a suite of backstop actions to ensure pollution reductions. These include expanding coverage of NPDES permits to sources that are currently unregulated, increasing oversight of state-issued NPDES permits, requiring additional pollution reductions from point sources such as wastewater treatment plants, increasing federal enforcement and compliance in the watershed, prohibiting new or expanded pollution discharges, redirecting EPA grants, and revising water quality standards to better protect local and downstream waters."

- None of these actions addresses inadequate resources on the part of local governments. EPA has a plan to punish local governments for not meeting TMDL requirements without assurance that meeting such requirements is even possible. This potentially puts Frederick County in a terrible position where it would be subject to enforcement and legal actions even with the best of efforts.

Response

Please refer to the response for comment 0067.1.001.009. 4. Retrofits for Urban Stormwater

Chapter 8 provides Draft Backstop Measures which relies only on retrofits with respect to urban stormwater. The City has implemented some retrofits for municipal properties, as well as enhanced riparian buffers, using local Fee in Lieu monies. However, the City does not have the regulatory authority or the financial resources to implement the level of retrofits in the Draft TMDL, nor the level of retrofits in the states September 24, 2010 Technical Correction to Virginia's Draft WIP.

EPA's evaluation of Virginia's Draft WIP (Section 8) was not predicated on the subsequent WIP Technical Corrections submitted the same day as the Draft TMDL (September 24, 2010); therefore we do not know if these will be accepted in lieu of the Moderate Backstop measures. It is estimated that EPA's Backstop allocation will cost the City between \$10 - \$30m per year in retrofit costs alone. Additional retrofit costs will include securing easements/land acquisition and maintenance. In these austere times, funding is not available at the local level for this program. Meeting this level of retrofits will require Federal and state assistance.

Additionally, the cost of structural BMPs in urban areas will be disproportionately more expensive for infill projects given the price of urban land in the metro area. This will increase sprawl and not promote the type of Smart Growth development we are encouraging. EPA's Moderate Backstop (Draft TMDL Section 8) calls for 50% "impervious cover reductions" through "capture of rainwater for reuse". Reuse practices in dense, urban settings can not be accomplished wholly through outdoor reuse, which means grey-water systems will be required and costs will skyrocket beyond the above figure into the \$50m/yr. The Federal Backstop requirement calling for 20% of area retrofitted for "infiltration" practices is also not feasible in an urban setting with near-surface impermeable clay soils.

In addition to unavailable funding, the City does not have the legal authority to mandate retrofits on private lands. Even if authority was granted to acquire rights on private property for this purpose, the higher land values and density in the City raises the question of equity as compared to more rural jurisdictions. Broad-brush prescriptive measures will have unequal impacts.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Please see the response to comment 0501.1.001.005 for more information regarding funding to municipalities and states for updates to infrastructure such as POTWs/WWTPs and MS4/stormwater systems.

C. Reallocation Of Loads To Other Sectors Is Unjustified and Inequitable

1. The draft TMDL states that "EPA is establishing draft backstop allocations that reduce the point source loadings as necessary to compensate for the deficiencies EPA identified in the reasonable assurance components of the jurisdictions draft Phase I WIPs addressing non-point source reductions."

2. EPA's discretionary decision to assign all non-point source loading reductions to the point sources is without support. In its September 27, 2010 Comment Document on Pennsylvania's WIP, EPA states that "load from point source reductions [will be] redistributed to forest, septic, and agriculture sources as possible..." There is no justification for shifting such loading reduction from forest and agriculture sources onto the ratepayers of municipal wastewater treatment plants in Pennsylvania.

3. EPA's conclusion that the failure of the non-point source sector to meet its allocations should not be a reason to reduce the allocations of the point source sector and assign the difference to the non-point source sector.

4. The draft TMDL fails to adequately address any mechanisms to reduce the loading from non-point sources, which account for the majority of the loadings to the Chesapeake Bay.

5. Does EPA expect that regulating only the point sources of nutrients will satisfy the restoration objectives of the Bay TMDL?

D. Limit of Treatment Technology for POTW's is Incorrect

1. Please describe how EPA determined the limits of technology for nitrogen and phosphorus (3 mg/l and 0.1 mg/l,

respectively) to be used in conjunction with the backstop allocation approach and the documents supporting such determination.

2. Please identify what treatment technology is required for achieving this performance (e.g., MBR's, denite filters).
3. Please state what consideration has been given to the colder wastewater temperatures that prevail in Pennsylvania than in, say, mid-Maryland.
4. Please provide the analysis that relates the limit of treatment technology to the results that would be reported in a DMR given that the limit of detection of total phosphorus is 0.06 mg/l and that a non-detection result will be reported as 0.03 mg/l and not as 0.00 mg/l.
5. Please provide the analysis that relates annual cap loads, given colder wastewater temperature and higher flows in January through April and December of each year, to the aforementioned limit of technology limits for nitrogen and phosphorus.
6. Why is limit of technology applied without regard to delivery ratios?
7. If the requested information is not available, please explain why consideration was not given to these matters.
8. Can special circumstances be argued that limit of technology does not apply to a particular POTW? For example, would a Pennsylvania POTW with a combined sewer system be able to argue that the limit would not apply?

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Regarding questions on limit of technology for POTWs, please see the response to comment 0414.1.001.005.

Comment ID 0473.1.001.007

Author Name: Pechart Michael

Organization: Pennsylvania Department of Environmental Protection and Department of Agriculture

- The revised WIP that is being submitted to EPA shows that the Commonwealth gives reasonable assurances that it can meet load allocations at the border. As a non-tidal state, Pennsylvania disagrees with the imposition of "federal backstop measures" in the draft Chesapeake Bay TMDL, including the establishment of individual waste load allocations (WLAs) for all significant point sources, aggregate WLAs for other entities regulated by the NPDES, and aggregate load allocations (LAs) for nonpoint source sectors.

Response

Please refer to the response for comment 0229.1.001.005. Please also see the response to comments 0267.1.001.006 and 0568.1.001.007 for more information on how upstream loadings of pollutants contribute to the downstream non-attainment of water quality standards.

Author Name: Hobbs Jack

Organization: Town of Amherst, Virginia

We have significant concerns with EPA's Draft TMDL and object to EPA's proposed "backstop" actions against the Commonwealth of Virginia and our facility. EPA proposes to cut our facility's stringent nutrient wasteload allocations ("WLAs") currently set forth in Virginia's EPA-approved Water Quality Management Planning Regulation, 9VAC25-720, and Chesapeake Bay Watershed General Permit Regulation, 9VAC25-820 (collectively, the "Virginia Regulations").

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0497.1.001.004

Author Name: Hobbs Jack

Organization: Town of Amherst, Virginia

We strongly oppose EPA's inequitable proposal to transfer more burden to our WWTP and similar point sources. We object to EPA's currently proposed "backstops" (4 mg/L TN and 0.3 mg/L TP at design flow) in lieu of the WLAs in the Virginia Regulations

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0510.1.001.002

Author Name: Haterius Stephen

Organization: National Association of State Departments of Agriculture (NASDA)

NASDA's concerns with the Draft TMDL fall into two broad categories: (1) the national implications associated with EPA's acknowledgement that the agency's approach for the Chesapeake Bay and Draft TMDL will be replicated in other watersheds across the country and (2) concerns regarding the development process of the Draft TMDL and its implications on agricultural producers in the six Chesapeake Bay states. While these comments focus largely on our specific concerns with elements of the Draft TMDL, NASDA is very concerned about the potential national ramifications this draft could have on national water policy. EPA has made numerous direct connections between its current activities in the Chesapeake Bay, and its desire to implement similar strategies in other watersheds. In fact, in the August 2010 draft Strategy for Achieving Clean Water, the agency emphasized that, "Success in cleaning up the Chesapeake Bay watershed will be a model for watershed protection in other parts of the country." We are particularly concerned about elements of the Draft TMDL, as well as other related activities of the agency, that undermine state authority and responsibilities under the Clean Water Act.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please see the response to comment 0571.1.001.005.

Comment ID 0510.1.001.011

Author Name: Haterius Stephen

Organization: National Association of State Departments of Agriculture (NASDA)

The Draft TMDL is arbitrary and capricious. The TMDL allocations are based on data that EPA acknowledges is flawed. EPA acknowledges that the allocations are likely to be revised in 2011 when better data on the application and effectiveness of agriculture nutrient management plans and better data on the extent of impervious surfaces in suburban development are incorporated in the Chesapeake Bay watershed model. Yet, EPA plans to proceed to issue a TMDL that will have real regulatory consequences notwithstanding the fact that EPA knows that it is inaccurate.

C. Equity of Allocations as between Bay Jurisdictions is Essential

The federal government must be actively involved in ensuring that there is a "level playing field" throughout the Bay watershed so that citizens in different states (or citizens of different regions within the same state) are not disparately impacted by the TMDL (keeping in mind the relative contributions of the jurisdictions to the degradation of the Bay as well as the direct benefits that will accrue to each jurisdiction from restoration of the Bay). To do otherwise creates financial disincentives for industries and residents to locate or remain in the more stringently-regulated or impacted communities and, conversely, incentivizes siting decisions by industries into less stringently-regulated or impacted communities where, for example, their wastewater discharges would not be as well-treated to the high water quality standards necessary to meet the TMDL, or the Bay's WQ needs.

Proportionately, the TMDL requires New York to do more than other jurisdictions given its remote "headwater state" status and the effect of the Delivery Coefficients whereby multiple pounds of nutrients or sediments must be removed at EOS in New York to prevent delivery of a single pound into the Bay (in contrast, the Bay shoreline jurisdictions have Delivery Coefficients close to 100% such that their respective removals and improvements translate nearly pound-for-pound in delivery prevention to the Bay). Further, because New York is already a leader and has unimpaired WQ at the Pennsylvania border, the EPA's approach of allocating "by reduction from existing conditions" (as opposed to seeking to attain a defined WQ standard) requires New York to do more proportionately than other Bay watershed jurisdictions. The graphs at the bottom of the first page of the attached Upper Susquehanna Coalition ("USC") Fact Sheet clearly illustrate that, on a strict WQ basis, there is a much smaller need for WQ improvement in New York in order to meet the TMDL's allocations [Comment Letter contains additional information in the form of an attachment. See original comment letter 0515.1]. Most importantly, these graphs are based on actual measured USGS WQ data at Towanda, Pennsylvania and, with respect to New York, do not reflect the metabolizing/neutralizing effect of the Pennsylvania and Maryland portions of the Susquehanna River which will result in further reduction of the eventual "delivered load" when the New York delivered water reaches the Bay. Therefore, when "Delivery Coefficients" are taken into account, significantly larger reductions are required of New York at EOS than would be needed to meet the WQ standards required at entry to the Bay under the TMDL. As a result, the TMDL requires the New York portion of the Bay watershed to perform, and bear the cost of, work needed to meet other Bay jurisdictions' obligations to the Bay (whereas, as noted above, some 22% of the human population in the New York portion of the Bay watershed subsists below the federal poverty line, and New York receives no corresponding direct economic benefit from the Bay).

D. The EPA's TMDL Allocations Do Not Appear to Reflect a Unit Area Loading Analysis

The attached memorandum regarding unit area loadings prepared by the USC provides a detailed analysis of unit area loadings within the Bay watershed [Comment Letter contains additional information in the form of an attachment. See original comment letter 0515.1]. Did the EPA take into account unit area loadings in developing the TMDL? (The TMDL does not contain any such discussion). If so, did the EPA include adjustments for both human population density AND animal life density (agriculture and wild [aquatic and terrestrial])?

Comment ID 0534.1.001.002

Author Name: Golazeski Daria

Organization: Broome-Tioga Stormwater Coalition (BTSC)

The communities of New York State that comprise the headwaters of the Susquehanna and Chemung River watersheds have long recognized their role as partners in the restoration of the Chesapeake Bay. In acknowledgment of that role, New York State has made great strides to improve water quality through stringent regulations and programs in the areas of stormwater pollution prevention and agricultural environmental management, exceeding those mandated by the federal government. As a result, New York State water quality far exceeds that of other jurisdictions in the Chesapeake Bay watershed. The BTSC comprised of 15 municipalities in Broome and Tioga Counties, was formed in 2004 to address the issues surrounding local stormwater pollution and has worked toward goals to reduce our pollutant load to the Chesapeake Bay.

EPA's proposed TMDL imposes disproportionately heavy restrictions on NY. If other states reached the level of performance achieved in New York over the past decade for Nitrogen and Phosphorous, there would be no need for a TMDL. Even if other states in the watershed achieve their mandated allocations, their water would still contain more N and P than New York at present.

Response

Please refer to the response for comment 0080-cp.001.002.

Comment ID 0534.1.001.005

Author Name: Golazeski Daria

Organization: Broome-Tioga Stormwater Coalition (BTSC)

The restoration of the Chesapeake Bay requires the participation of all partners and jurisdictions located in the Bay watershed. In order to move forward in confidence, the TMDL load allocations need to be viewed as equitable, attainable and affordable by all parties involved.

Therefore, in regard to the establishment of the Chesapeake Bay TMDL in New York State, the Broome-Tioga Stormwater Coalition stands by the assessment of the NYS Department of Environmental Conservation and its water quality partners as set forth in the draft Watershed Implementation Plan. Furthermore, we urge the EPA to work with New York to develop a plan that will restore the Bay in a manner that is not an unbearable burden on New York State communities.

7. UWAG questions the achievability of the Bay TMDL.

EPA's draft TMDL imposes severe reductions on regulated point sources. In some cases, the allocations for these sources have been cut by more than 50% when compared to the corresponding state targets for restoring the Bay.[FN 20] In Virginia, EPA assigned sediment allocations using an across-the-board TSS concentration target of 5 mg/l for all industrial and municipal point sources. Even with filtration, this target is unachievable for many industrial facilities and, in any event, is unnecessary to meet EPA's environmental objectives (see earlier example on page 5).

UWAG is concerned about the achievability of the allocations set forth in the draft TMDL. UWAG is even more concerned about EPA's apparent failure to consider achievability in setting these allocations.

Over the past decade, there has been growing awareness of the need for assessing achievability as part of (or even before) the TMDL development process. The National Research Council stressed this in its landmark 2001 report, *Assessing the TMDL Approach to Water Quality Management*. The Government Accounting Office did so, as well, in its

2003 report, Improved EPA Guidance and Support Can Help States Develop Standards That Better Target Cleanup Efforts. And even EPA has conceded that it needs to do a better job assessing achievability, a concession made in the Agency's 2002 report, The Twenty Needs Report: How Research Can Improve the TMDL Program.

Nothing in the current record addresses the achievability of the draft TMDL from a socio-economic perspective. We believe this is a critical shortcoming in the proceeding, and one that needs to be corrected through the use attainability analysis ("UAA") work that EPA initiated but never fully completed.[FN 21] Unless and until EPA assesses and confirms that its proposed TMDL reductions will not cause widespread socio-economic impact, EPA should not finalize the TMDL. If EPA does finalize the TMDL without such an assessment, then its action will trigger the expenditure of public and private resources, as well as permitting and enforcement actions that may prove to be misdirected, unnecessary, or unachievable.

At a minimum, we believe that EPA must amend the record to include a demonstration that the TMDL is in fact achievable. And EPA must then give interested stakeholders, like UWAG, an opportunity to review this record. If aspects of the TMDL are not achievable, then EPA cannot proceed as proposed.

[FN 20] By way of example, Virginia's target for the Hopewell Regional Waste Treatment Facility was 1,785,125 lbs/yr TN. EPA adjusted this to 609,112 lbs/yr, a 66% reduction. Similarly, Virginia's target for the HRSD-Chesapeake/Elizabeth Waste Treatment facility was 1,074,590 lbs/yr TN. EPA adjusted this to 292,374 lbs/yr, a 73% reduction.

[FN 21] EPA's UAA effort included the development of a scenario to assess and quantify the technical, operational, and economic achievability of the reductions projected by EPA's Bay models. However, without explanation, EPA abandoned this effort in April 2009.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Please see the response to 0139.1.001.017 which discusses the issue of cost analysis and economic benefits of improved water quality and comment 0038.1.001.024 which outlines the federal effort towards the Bay.

Comment ID 0565.1.001.004

Author Name: Faggert Pamela

Organization: Dominion Resources Services, Inc.

Conclusion

We appreciate the opportunity to comment on the EPA draft TMDL as applicable. We understand that at this stage in the restoration of the Chesapeake Bay, challenging decisions abound. We urge the EPA to maintain equity within its next iteration of the draft TMDL, and we request that the EPA work with the Chesapeake Bay jurisdictions to avoid the disparate impacts of the proposed backstops.

Response

Please refer to the response for comment 0246.1.001.004. EPA agrees that ensuring that the nutrient and sediment reductions occur is the responsibility of all involved including federal agencies and state and local jurisdictions. EPA encourages all to develop partnerships with each other to provide innovative and effective ways for meeting the TMDL goals.

Organization: National Association of Home Builders (NAHB)

b. No Data is Provided to Demonstrate that the "Backstop Allocations" are Necessary or Achievable in Practice

After receiving the state WIPs in the beginning of September and with very little time for review, EPA very quickly deemed all of them inadequate in some way or another. EPA then determined how to make up the shortfall in a state's "insufficient" pollution loading reductions and/or insufficient amount of reasonable assurance for the remainder of the allocation. EPA then applied these various "backstop allocations" to the state WIPs. The agency, however, provides no details for how it determined the adequacy of the WIPs or how the need for, or level of, backstop allocations was established.

EPA's "moderate" backstop allocations for urban stormwater in the WIPs for Delaware, New York, Pennsylvania, Virginia and West Virginia, for example, are shown on pages 8-14 and 8-15 of the proposal. The performance standards in the backstop allocations have surely never been met before by an MS4 anywhere in the country, yet EPA provides no support for its statement that the backstop allocations for urban stormwater programs are necessary or achievable, not to mention affordable, goals for MS4s. Details regarding how and why the backstop allocations were derived and how they are expected to be attained are vital to understanding the TMDL as well as its overall impact. Likewise, the agency must provide information on expected costs of meeting the standards and the impacts of those costs on the regional economy and the affordability of housing.

Finally, the direction and intent of the backstop allocations is not always clear. NAHB understands the language on pages 8-14 and 8-15 concerning the goals of the backstop allocations for urban stormwater to mean that 50 percent of the MS4's existing impervious cover would be affected by the proposed rules. As we understand the language, in regions with karst topography and coastal plain lowlands, for example, 50 percent of the impervious cover in the MS4

must be reduced by 50 percent using cisterns and collection systems so that a maximum of 25 percent of impervious cover will remain in the MS4 by 2025. In addition, filtering practices are required so that environmental impacts are reduced from another 15 percent of the existing impervious cover by 2025 and infiltration practices are required so that environmental impacts are reduced from another 10 percent of the existing impervious cover by 2025. Thus, by the end of 2025, the requirement allows that 50 percent of the original impervious pavement will remain unaddressed. Does EPA concur with our understanding of the language of the backstop allocations for urban stormwater?

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Comment ID 0572.1.001.006

Author Name: Robinson Steve

Organization: National Association of Conservation Districts (NACD)

NACD is also concerned by EPA's efforts to pressure states into compliance through the use of backstop actions, including the redirecting of EPA grants. This is a troubling departure from the state and federal cooperation envisioned by the CWA. Under the CWA, states are responsible for carrying out CWA programs, and EPA does not dictate how water quality standards are met.

We strongly oppose EPA's top-down, regulatory approach and its counter-productive restrictions that would not only limit opportunities for agriculture operations, but threaten to put many out of business. It is important that EPA gives locally-led efforts an opportunity to succeed. EPA's focus should be to provide resources and tools-including financial and technical assistance- needed for successful state and local Chesapeake Bay watershed efforts. NACD encourages EPA to work collaboratively with local communities and stakeholders, instead of relying solely on regulatory and enforcement tools. This investment-along with appropriate conservation incentives-will provide for the most successful implementation of conservation strategies and best management practices to accomplish these vital goals.

Conservation districts are committed to making a difference in the Chesapeake Bay. With 121 districts covering the Bay watershed, our ability to work with landowners and local communities to implement conservation practices and address both rural and urban nonpoint source issues is unrivaled. NACD and our members look forward to providing leadership and support toward ongoing Chesapeake Bay restoration efforts.

Response

Please refer to the response for comment 0229.1.001.005. The implementation of this TMDL is not intended to restrict development or impede economic vitality in any community. Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

H. The TMDL does not acknowledge and accept Virginia's proposal to revise the chlorophyll standards and improve the modeling framework

Appendix 2 of Virginia's WIP contains a Draft James River Chlorophyll-a study plan. Successful completion of this study plan is essential to address the stated deficiencies of the standard and the associated modeling framework that are referenced in these comments. EPA has ignored the importance or implications of this study in the Chesapeake Bay TMDL. The existing allocations listed in the EPA TMDL for the James River based on chlorophyll-a (23.48 mpy TN, and 2.340 mpy TP) should be replaced with allocations consistent with Tributary Strategies. EPA's TMDL should include the chlorophyll-a study in the TMDL. However, EPA must clearly state the level of unreliability that exists with the present chlorophyll-a standard and the modeling results in the TMDL document.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction. Please also see the response to comment 0293.1.001.017 for more information on the James River allocations.

7. Water Quality Standards and Wasteload Allocations

There are a number of questions we have regarding the allocations that are included in the TMDL and the WQS upon which they are based.

For example, Section 3.2.3 of the TMDL states:

Several tidal Bay segment-specific applications of DO criteria are unique to Maryland. In the middle-central Chesapeake Bay segment (CB4MH), restoration variances of 7 and 2 percent apply to the application of the deep-water and deep-channel designated use DO criteria, respectively. In the Patapsco River segment (PATMH), a restoration variance of 7 percent applies to the application of the deep-water criteria (COMAR 26.08.02.03-

3(c)(8)(e)(vi). Such restoration variances are consistent with EPA-published guidance (USEPA 2003c) and were approved by EPA on August 29, 2005.

Additionally, footnote 18 that is referenced in this paragraph states:

A restoration variance is the percentage of allowable exceedance based on water quality modeling incorporating the best available data and assumptions. The restoration variances are temporary and will be reviewed at a minimum every 3 years, as required by the CWA and EPA regulations. The variances could be modified on the basis of new data or assumptions incorporated into the water quality model. COMAR 26.08.02.03-3(C)(8)(h).

It is not clear whether these "restoration variances" were the water quality standards used in establishing the TMDL. TMDLs must be developed to meet current established water quality standards, not "variances" which are temporary standards. Additionally, as stated in the EPA memorandum entitled Guidance for 2004 Assessment, Listening and Reporting Requirements Pursuant to Sections 303(d) and 305(b) of the Clean Water Act, from the Director of Wetlands, Oceans, and Watershed, Diane Regas states:

States should be aware that a TMDL should be developed to meet the existing WQS, not a temporary variance that is less stringent than the existing WQS.

http://www.epa.gov/owow/tmdl/tmdl0103/2004rpt_guidance.pdf

We know EPA developed the target allocations with the restoration variances based on what was presented during various WQGIT meetings. The text of the TMDL infers that EPA approved the original variances as a WQS. Variances are part of a WQS action - but they are still considered variances and not the applicable WQS.

Additionally, there are no WLAs based on current WQS at all. EPA has allocations applied to segments, but no aggregate or individual WLAs for sources." The regulation clearly requires the development of a WLA for these sources.

Section 9 of the TMDL is suppose to contain the Chesapeake Bay TMDLs. Section 9.1 includes the Chesapeake Bay segment annual and daily allocations to meet "Proposed Amended" WQS. In section 9.1 there are four tables (emphasis added in bold):

--Table 9-1. Draft Chesapeake Bay TMDL total nitrogen (TN) annual allocations (pounds per year) by Chesapeake Bay segment for the proposed amended Chesapeake Bay WQS

--Table 9-2. Draft Chesapeake Bay TMDL total phosphorus (TP) annual allocations (pounds per year) by Chesapeake Bay segment for the proposed amended Chesapeake Bay WQS

--Table 9-3. Draft Chesapeake Bay TMDL sediment (SED) annual allocations (thousands of pounds per year) by Chesapeake Bay segment for the proposed amended Chesapeake Bay WQS

--Table 9-4. Individual WLAs (Annual) for the 483 significant permitted dischargers to meet TMDLs to address the proposed amended Chesapeake Bay WQS

Section 9.2 includes the Bay segment annual and daily allocations to meet "Current" WQS. In Section 9.2 there are three tables (emphasis added in bold):

--Table 9-5. Draft Chesapeake Bay TMDL total nitrogen (TN) annual allocations (pounds per year) by Chesapeake Bay segment for the current Chesapeake Bay WQS

--Table 9-6. Draft Chesapeake Bay TMDL total phosphorus (TP) annual allocations (pounds per year delivered to tidal waters) by Chesapeake Bay segment for the current Chesapeake Bay WQS

--Table 9-7. Draft Chesapeake Bay TMDL sediment (SED) annual allocations (thousands of pounds per year) by Chesapeake Bay segment for the current Chesapeake Bay WQS

Section 9 does not include a table with individual WLAs for the 483 significant permitted dischargers to address the current Chesapeake Bay WQS.

Additionally, Section 9 explains that additional information is included in the appendices. From Section 9.1

More detailed annual LAs by sector and annual WLAs by individual facility are provided in Appendix Q. Daily LAs and WLAs for the areas draining to the 92 segments are provided in Appendix R.

From Section 9.2

More detailed annual LAs by sector and annual WLAs by individual facility are provided in Appendix Q. Daily LAs and WLAs for the areas draining to the 92 segments are provided in Appendix R.

A review of the appendices is very difficult. Appendix Q1 is a file created using pdf technology and is 480 pages long with no formatting of the table. Many of the pages consist of one or two columns of numbers. Column headers are located if reviewing the file page-by-page. The headers indicate the data are for "ProposedWQS".

The same search was conducted in Appendix Q2. Appendix Q2 also had 480 pages, most of which were two to three columns of numbers and approximately 20 pages with no data. The headers in Q2 indicate the data are for "FullBackStopTMDL." There is no information to indicate whether this is for "Proposed" or "Current" WQS.

Appendix R included an introduction on the first page of the file explaining the data in the appendix.

Appendix R includes detailed nitrogen, phosphorus, and sediment daily allocations to achieve the proposed amended WQS (Section 8)

A review of the available information in the TMDL indicates EPA has failed to provide the individual WLAs for the current WQS. As noted in Section 1 of the TMDL:

A TMDL specifies the maximum amount of a pollutant that a waterbody can receive and still meet applicable WQS. A mathematical definition of a TMDL is written as the sum of the individual WLAs for point sources, the LAs for nonpoint

sources and natural background, and a margin of safety [CWA section 303(d)(1)(C)]:

$$\text{TMDL} = \text{WLA} + \text{LA} + \text{MOS}$$

where

WLA = wasteload allocation, or the portion of the TMDL allocated to existing and/or future point sources.

LA = load allocation, or the portion of the TMDL attributed to existing and/or future nonpoint sources and natural background.

MOS = margin of safety, or the portion of the TMDL that accounts for any lack of knowledge concerning the relationship between effluent limitations and water quality, such as uncertainty about the relationship between pollutant loads and receiving water quality, which can be provided implicitly by applying conservative analytical assumptions or explicitly by reserving a portion of loading capacity.

The regulations at 40 CFR 130.2 and 130.7 define what constitutes a TMDL and how the TMDL is to be developed by the state. The regulations clearly require that a WLA be included in the TMDL and the TMDL clearly be established to meet the current water quality standards, not proposed water quality standards. The regulations note:

the term "water quality standard applicable to such waters" and "applicable water quality standards" refer to those water quality standards established under section 303 of the Act, including numeric criteria, narrative criteria, waterbody uses, and antidegradation requirements.

"Proposed" water quality standards are not water quality standards "established under section 303." Therefore, this TMDL needs to be withdrawn and re-proposed in the Federal Register and include WLAs designed to meet the "applicable" water quality standard.

EPA must withdraw the TMDL and re-draft the report to clearly explain how the "variances" were used or not used in establishing the TMDL and to provide WLA for applicable sources based on current WQS.

Response

The final Chesapeake Bay TMDLs were developed to meet the applicable water quality standards as shown in Sections 3 and 9 of the final TMDL Report. Tables 9-1 through 9-3 of the final TMDL report present TMDL allocations for each of the 92 segments for nitrogen, phosphorus, and sediment, respectively. Table 9-4 of the final TMDL report presents nitrogen, phosphorus, and sediment WLAs for each of the 483 significant permitted dischargers. More detailed annual TMDLs, load allocations (LAs), and wasteload allocations (WLAs) are provided in Appendix Q while daily TMDLs, LAs, and WLAs are provided in Appendix R. All TMDL allocations were developed to meet applicable water quality standards. For additional information on restoration variances, please see Section 3.2.3 of the final TMDL Report.

Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Regarding your comment to withdraw the TMDL, please see the response to comment 0062.1.001.004.

EPA Must Consider the Important Characteristics of Pulp and Paper Mill Waste Waters When Setting Nutrient Limits

Unlike untreated municipal waste waters, untreated pulp and paper mill waste waters contain very low levels of the phosphorous and nitrogen. In fact, most pulp and paper mills must add nutrients to their incoming waste waters to promote the growth of the right populations of micro-organisms needed to break down the waste material in the waste water. In the case of Glatfelter's Spring Grove mill, the waste water treatment plant receives the secondarily treated waste waters from two nearby municipal waste water treatment plants thereby providing tertiary treatment for those municipal waste waters while providing the industrial waste water with the nutrients needed to operate properly. However, even with these extra nutrients, Glatfelter must still add additional phosphorous to maintain the correct biological community in the secondary waste water treatment plant.

NCASI completed a comprehensive survey of nutrient minimization in biologically treated pulp and paper mill effluents. Mills using an activated sludge process with low final effluent concentrations of phosphorous and nitrogen had average final effluent concentrations ranging from 0.1 - 0.90 mg/L total phosphorous and 1.3 - 4.7 mg/L total nitrogen. (See Attachment A) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0604.1]. Lowering nutrients to levels less than these best performing mills is only accomplished at the risk of impairing the entire waste water treatment process.

Accordingly, EPA should base its final effluent nutrient requirements for pulp and paper mill effluents on the demonstrated average performance of these mills and not on the results of an arbitrary modeling exercise.

Response

Please refer to the response for comment 0413.1.001.005 regarding paper and pulp mills. Additionally, it is noted that the wasteload allocations in the final TMDL are largely based on state WIP rather than EPA backstop allocations.

Organization: P. H. Glatfelter Company

EPA's Proposed Limits on Sediments Do Not Consider the Properties of Suspended Solids Discharged from Waste Water Treatment Plants

The proposed TMDL for the Chesapeake Bay treats all sediments equally when there are significant physical and chemical differences between different types of sediments such as soil from farm land erosion and suspended solids from municipal and industrial waste water treatment plants. The sediments that settle to the bottom of the Chesapeake Bay and suffocate submerged aquatic vegetation or cloud the water column are primarily mineral in nature and are the result of soil and stream erosion associated with storm events. On the other hand, the suspended solids that are discharged from municipal and industrial waste water treatment plants are primary biological in nature.

As documented in Thacker (2010) (See Attachment B) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0604.1] the suspended solids discharged from pulp and paper mill waste

water treatment plants are mostly biological in nature and consist of bacteria and bacteria cell fragments that typically less than 10 um in diameter and serve as a food source for aquatic organisms ranging from benthic macro-invertebrates to fish. These sediments do not travel long distances from the tributaries into which they are discharged and are thus not the cause of the sediment issues in the bay.

Accordingly, EPA should differentiate between the sediments coming from municipal and industrial waste water treatment plants and sediments from nonpoint sources. Waste water treatment plants that are meeting the suspended solids limits established from US EPA's effluent guidelines should not be required to further reduce suspended solids to an arbitrary level based on modeling.

Response

Please refer to the response for comment 0299.1.001.006 for additional information on sediment allocations to WWTPs and to the response for comment 0413.1.001.005 regarding paper and pulp mills.

32. The draft TMDL states that "EPA is establishing draft backstop allocations that reduce the point source loadings as necessary to compensate for the deficiencies EPA identified in the reasonable assurance components of the jurisdictions draft Phase I WIPs addressing nonpoint source reductions" (p.8-9).

(a) Does EPA consider the bases for development of the Bay TMDL, including the monitoring, modeling, identification of critical conditions, etc. essentially a non-issue, now that EPA has indiscriminately foisted upon the point sources the loading reductions assigned to the non-point sources. (See draft TMDL, Sections 1-6.)

(b) EPA appears ambivalent and is completely ignoring the fact that municipal wastewater treatment plants have

collectively spent or allocated hundreds of millions of dollars toward design and engineering to meet the discharge requirements in their current state issued NPDES permits, which were intended to demonstrate compliance with Chesapeake Bay-related standards. Many of these upgrades may become obsolete and cannot be used in conjunction with the "backstop allocation" approach limit of technology standard for nitrogen and phosphorus. How can EPA justify this potentially significant waste of money in these difficult economic times to meet the most stringent standard possible, simply because the government is unwilling to allocate loading reductions to non-point sources? EPA must provide to the public justification for such an extraordinary waste of money and full disclosure on the process leading to this decision.

Response

Please refer to the response for comment 0067.1.001.009. Organization: Capital Region Council of Governments TMDL Work Group

46. Attached is a letter sent to the Department by the commenter, dated November 1, 2010, addressing the Department's draft WIP and EPA's "backstop allocation" approach. Dear Mr. Hines:

We are writing this letter to you on behalf of the Capital Region Council of Governments ("CAPCOG") and its TMDL Work Group regarding the draft Chesapeake Bay TMDL ("Draft TMDL"), which was issued on September 24, 2010. The purpose of this letter is not to comment specifically on the Draft TMDL or on Pennsylvania's draft Watershed Implementation Plan ("WIP"). Comments to both of these documents will be provided at the appropriate time. Nevertheless, the CAPCOG would like to express its extreme displeasure with the Draft TMDL's approach to addressing pollutant reductions to the Chesapeake Bay from Pennsylvania, specifically as these reductions relate to wastewater treatment plants within the Commonwealth. Putting aside any legal issues that may be relevant to this matter, the United States Environmental Protection Agency's ("EPA") September 27, 2010 comments to Pennsylvania's draft WIP indicate that EPA is poised to force the Pennsylvania Department of Environmental Protection ("Department") to impose additional nitrogen and phosphorus limits on significant wastewater treatment plants in the Commonwealth at a crippling cost to ratepayers, despite the fact that these ratepayers having already collectively spent or allocated hundreds of millions of dollars to meet discharge limits mandated by the Department to address nutrient loadings to the Bay. That is, unless the Department acts quickly to prevent such an inequitable situation from occurring.

Over the past year, the Department has repeatedly and publicly assured Pennsylvania wastewater treatment plants that there will be no more stringent limits imposed upon them with respect to the Chesapeake Bay, beyond those limits contained in their current NPDES permits. During recent public meetings, the Department confirmed this position despite EPA's September 27, 2010 comment document to Pennsylvania's draft WIP, which stated that "unless DEP significantly improves and submits a final Phase I WIP addressing the concerns raised [by EPA]: significant municipal plants in the Commonwealth will be forced to meet the "limit of technology" for nitrogen and phosphorus (3 mg/l TN and .1 mg/l TP). (This scenario is part of EPA's "backstop .allocation" approach should Pennsylvania's final WIP be disapproved by EPA) At this critical juncture in the development of the Chesapeake Bay TMDL, the Department must demonstrate that its assurance that no more stringent limits will be placed on point sources is more than merely "lip-service."

As you are aware, EPA's position throughout the TMDL development process is that it lacks authority under the Clean Water Act to regulate non-point sources, and that it is the Department's obligation under state law to address the non-point source sector's pollutant contribution to the Bay. Unless we are mistaken, EPA is telling the Department that unless the Department can provide EPA with "reasonable assurance" that Pennsylvania's WIP will meet the Commonwealth's loading reduction obligations under the Draft TMDL, sewer ratepayers alone will be forced to bear virtually the entire economic burden to ensure that Pennsylvania's loading reduction requirements under the Bay TMDL are met. The inequity of this result will be profound. For example, the Department's own data indicate that wastewater treatment plants contribute only twelve percent (12%) of the nitrogen loading in Pennsylvania, while agriculture and forest together account for nearly eighty percent (80%) of the nitrogen loading. Yet, under EPA's backstop allocation

approach, the wastewater treatment plants will be responsible for nearly all of the associated loading reductions. (It should be noted here that the nutrient contribution from non-point sources is about eight-times the volume of nutrients from point sources.) Therefore, Unless the Department is firmly committed to addressing the non-point source sector loading reductions through its regulatory authority under the Clean Streams Law or other relevant statutes, wastewater treatments plants will be responsible for not only their loading reductions, but also those of the non-point source sector. Forcing ratepayers in the Commonwealth to directly subsidize and pay for the cost of loading reductions for the non-point source sector is simply unacceptable. Frankly, the Commonwealth's wastewater treatment plants and their customers should not be pawns in a policy dispute between the federal and state governments over their political reluctance to fairly and equitably allocate nutrient reductions amongst all sources of nutrients to the Bay. Moreover, does anyone within the Department (or EPA for that matter) actually believe that regulating the point sources, but ignoring the non-point sources, will lead to the restoration of the Chesapeake Bay?

As you know, the cost to implement the limitations in the wastewater treatment plants' current permits exceeds \$1 billion. Under EPA's backstop allocation approach, some newly constructed plant features will become instantly obsolete because the new limits to be imposed by EPA will require process and plant redesign. We understand that the Department itself estimates that the additional cost to the treatment plants to meet the limit of technology standards will be \$1 billion. If that is, indeed, the case, particularly in these troubled economic times, EPA and the Department will have to answer to each and every ratepayer in the Commonwealth for their profoundly wasteful decisions.

In summary, it is incumbent upon the Department to reinvent its WIP and assign proper responsibility for the reduction in pollutants to the Bay to the sector that contributes the largest percentage of such pollutants, the non-point source sector. EPA is adamant that it will not regulate non-point sources; therefore, the Department must mandate non-point source reductions with the same vigor with which it issued expensive cap loads on sewer ratepayers. Therefore, it appears that the Department has two choices: 1) revise its WIP to establish effective and mandatory non-point source sector loading reductions; or 2) maintain the status quo and completely disregard the thousands of ratepayers in the Commonwealth who will be forced to bear the burden of an inequitable and disparate plan to restore the Chesapeake Bay. We trust that the Department will choose the former option, and submit a final WIP to EPA on November 29, 2010 which will leave EPA with no other option but to abandon its backstop allocation approach in Pennsylvania.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Regarding specific comments on a jurisdiction's WIP, please refer to the response for comment 0034-cp.001.001.

Unachievable : The proposed allocations appear to be based on the expectation that New York can provide water that is clean enough to dilute pollutants from other parts of the watershed. In addition to being unfair, the draft allocations are so stringent that they are probably unachievable. This means that they would place great hardship on New York, but would still not achieve the desired water quality benefits in the Chesapeake Bay. We thus request that the proposed allocations be replaced with reasonable allocations that are both equitable and achievable .

NYS has put forth a concerted effort to devise a draft Watershed Implementation Plan that sets forth goals to achieve realistic and attainable results, yet still has fallen short of the EPA's desired reductions. Due to the already low pollutant levels in NY these required reductions cannot be met, and therefore, the extreme expense associated with the mandates will be fruitless. Rather than imposing a penalty for the great strides that have been achieved, the successes that have been accomplished in NY should be held as a model for other jurisdictions in the Chesapeake Bay Watershed.

The restoration of the Chesapeake Bay requires the participation of all partners and jurisdictions located in the Bay watershed. In order to move forward in confidence, the TMDL load allocations need to be viewed as equitable, attainable and affordable by all parties involved.

the proposed nutrient and sediment allocations for New York State have been determined by New York State's conservation professionals to not only be unobtainable as proposed but would also have a catastrophically negative impact on the agricultural community of the Chesapeake Bay Watershed of New York and

NOW THEREFORE BE IT RESOLVED that the Chenango County Water Quality Coordinating Committee call upon the New York State Farm Bureau, New York State Department of Agriculture and Markets, and the New York State Soil and Water Conservation Committee to pursue talks with the New York State Department of Environmental Conservation, along with State and Federally elected officials to ensure reasonable and obtainable nitrogen, phosphorous and sediment allocations in New York State for the impending Chesapeake Bay Watershed Total Maximum Daily Load (TMDL).

The Proposed TMDL is Arbitrary Because it Fails to Account for the Decades of Responsible Stewardship that Reduced Contributions of New York State and the Southern Tier and Rewards States Who Increased Contributions to the Chesapeake Bay Watershed

EPA has been appropriately describing the proposed Chesapeake Bay TMDL ("Bay TMDL") as a needed "pollution diet." However, New York has been on a pollution diet for more than 20 years during which it has steadily decreased the size of its Nitrogen and Phosphorus "waistline." [FN1] This has been accomplished through a variety of programs and is demonstrated by the fact that between 1985 and 2010 New York reduced its Nitrogen and Phosphorus loadings to the Chesapeake Bay watershed by 2.44 million pounds a year (MPY) and 0.08 MPY respectively. Despite New York State's efforts, during the same period baseline contributions from some of the other states within the Chesapeake Bay watershed has actually grown. New York State and the Southern Tier Are Responsible Environmental Stewards and Good Neighbors to the Bay.

EPA has been describing the proposed Bay TMDL as a needed "pollution diet". We believe that this is an appropriate descriptor. We further believe however, that New York has been on this diet for more then 20 years and during that time it has slowly but steadily decreasing the size of its nitrogen and phosphorus "waistline". For example, between 1985

and 2010 New York reduced its Nitrogen and Phosphorus loadings to the Chesapeake Bay watershed by 2.44 million pounds a year (MPY) and 0.08 MPY respectively, while baseline contributions from some of the other Bay States has grown.

[FN1] Because New York has already met its 2025 sediment allocation as stated in the draft Bay TMDL, these comments focus mainly on its proposed nutrient (Nitrogen and Phosphorus) allocations.

Neither the Load or the Waste Load Allocations are Achievable

As discussed in Section V below, using Nitrogen as an example, because of the more severe winters in new York as compared to the southern portions of the Watershed, the Limit of Technology (LOT) for Biological Nutrient Removal (BNR) is probably 5 mg/L or higher. Because wastewater makes up approximately 88% of the point source load, it is assumed that approximately 88% of the mandated point source reductions would have to come from wastewater sources. According to Table 4-8 in the Draft TMDL, the modeled New York municipal wastewater design flow is 62 MGD [FN11], which would equate to an average Nt concentration of 4.1 mg/L, which is lower than the assumed BNR LOT in New York. Thus, it will be virtually impossible to achieve this allocation. At an average Nt Annual Loading rate equivalent to 5.0 mg/L (the LOT as determined by NYSDEC) and assuming a 62 MGD flow rate, approximately 0.94 MPY of Nitrogen would be discharged. The draft TMDL (in Table 9-1) proposes a final point source (waste load) allocation of 0.89 MPY [FN12]. This indicates that even at the New York LOT, just the WWTP load would be higher than the proposed Nt point source allocation, even before the contributions from the other Point Sources are added in. Clearly this WLA is not achievable.

The only other non-de minimis Point Source category in New York identified in the Draft TMDL are the two MS4 communities, which have an estimated total Nitrogen loading of approximately 0.23MPY per year. Under the reductions discussed in the Draft NY WIP is slated to be reduced to 0.11 MPY. In addition, there currently exist a number of permitted Combined Sewer Overflow (CSO) points within the NYC Bay watershed. A large portion of that storm water associated with these CSOs (including the "first flush") is already captured and treated at a municipal WWTP. Treating excess wet weather flow is beyond the present WWTP's technology of control. Already that portion of the flow that exceeds the existing WWTP's capacity. Total sewer separation is cost prohibitive. Therefore, consistent with the draft NY WIP and discharges from these CSOs should continue to be managed through their respective Long Term Control Plans. Clearly, even if all the nitrogen was removed from these MS4 stormwater (which is an impossibility) and the NY LOT is achieved, the proposed Point Source allocation of 0.89 MPY cannot be met.

Turning to the draft TMDL's Non-Point Source (Load) Allocation, the Draft TMDL (in Table 9-1) calls for New York achieving a final allocation of 7.35 MPY. While this number seems high, once the combined Forrest and Air Deposition fraction, which is assumed to not be reducible, is subtracted, it leaves only 3.70 MPY available to be allocated between all agricultural non-point sources and the non-MS4 "Urban" runoff. The Coalition supports NYSDEC's conclusion expressed in the Draft NY WIP, that only an additional approximate 0.05 MPY reduction in the estimated 0.37 MPY non-MS4 "urban" runoff is likely achievable, forcing agricultural NPS croplands to bear the brunt of the Draft TMDL's Non-Point Source Reduction. Thus, the required agricultural NPS nitrogen reduction would have to be 4.11 MPY- 3.65 MPY = 0.46 MPY (delivered). Because the NY Susquehanna River delivery factor is only approximately 40%, this means that New York farmers within the watershed would have to reduce the amount of Nitrogen in their non-CAFO related stormwater runoff by approximately 1.15 MPY.

In another example, although New York State currently has the lowest unit area loading for Total Phosphorus of any of the states and the District of Columbia, given the current Pt allocation, New York is being required to remove the greatest percentage of phosphorus. This is contradictory, excessive, and unfair. The following graph presents the required Pt reduction percentage for each of the states and the District of Columbia. As shown, New York State would have to remove approximately 35 percent of its existing Pt loading to achieve the draft Pt allocation of 520,000 lbs/year.

It is the Coalition's understanding that the USC has estimated that the agriculture allocations could not be met even if 50% of the existing farms stopped farming and allowed their lands to go fallow and if the number of farm animals currently being raised at Confined Animal Feeding Operations (CAFOs) and smaller Animal Feeding Operations (AFOs) located within the New York portion of the Bay watershed was reduced by 50%. Such measures would have dire impacts on food production and the State economy generally, and on other worthy environmental and sustainable agriculture initiatives, including specifically that food be locally grown where possible.

[See Figure 5 on page 17 of original comment letter 0746.1]

Because achievement of the Draft TMDL's required nutrient reductions cannot be achieved without putting a significant number of farms out of business, or driving municipalities either towards bankruptcy and/or ignoring more pressing environmental and other needs, it is not achievable. Because the allocation methodology used in the Draft TMDL is unachievable, its use to set the TMDL's allocations is arbitrary, capricious and an abuse of discretion.

[FN11] And because there seems to be an assumption that the industrial WWTPs can reach the same LOT as the municipal WWTPs. While the Southern Tier Bay TMDL Coalition does not accept this assumption, it is applied here for simplicity sake.

[FN12] For simplicity sake, the TMDL reductions are those specified in the Draft TMDL without subtracting the additional "reserve" amounts. If the Reserve amounts are subtracted from New York's allocated loads, then these allocations will be even more unachievable.

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

In keeping with EPA's past commitments, the TMDL must not include numeric nitrogen, phosphorus or sediment-related allocation for any sub-group of sources (i.e. WWTPs, AFOs and MS4s on the Point Source side and the various categories of Non-Point Source (NPS) land uses on the NPS side. Instead, just an aggregate allocation for all the Point Sources and another one for all the Non-Point Sources categories should be included. Further division of the final WLA should not occur until the next revision of the model is published in 2011. In keeping with this, Appendix Q must be removed from the TMDL.

Response

Please refer to the response for comment 0067.1.001.009. Section 8 of the final TMDL report describes the methodology by which EPA evaluated the jurisdictions' final Phase I WIPs, the process for developing the backstop allocations, the WIP evaluation findings and the resulting backstop allocations EPA established for each jurisdiction.

Another aspect of the backstop allocations that EPA established for the nontidal jurisdictions of Pennsylvania, New York, and West Virginia is to make finer-scale allocations than those included in the Phase I WIPs provided by the nontidal jurisdictions. EPA stated in its November 4 and December 29, 2009, letters to the jurisdictions that it would do so by establishing individual and aggregate, rather than gross, WLAs and LAs for the nontidal jurisdictions if their Phase I WIPs did not provide adequate reasonable assurance. That finer-scale allocation sets individual WLAs for the significant municipal and industrial wastewater discharging facilities and sector-specific aggregate WLAs for stormwater, CAFOs, and nonsignificant municipal and industrial wastewater discharging facilities. EPA is establishing the finer-scale allocations to provide permit writers with enough information to issue and renew NPDES permits consistent with the Chesapeake Bay TMDL WLAs. Those allocations are at the same scale as those made to the tidal jurisdictions of Delaware, Maryland, Virginia, and the District of Columbia.

Appendix Q will not be removed from the TMDL. Please see the response to comment 0681.1.001.014 for additional information on Appendix Q.

Organization: Cameron Committee for a Safe Environment (CCSE)

There is a standing offer to any EPA staff to take a guided tour of the Dickson Corporation's CAFO areas of operation showing the ongoing pollution of a wetland and areas of field erosion currently polluting watershed streams in order to backup claims made in this commentary. An alternate offering of substantiating comments in the form of pictures and correspondence with NYDEC concerning soil erosion will be sent upon request.

It must be stated and fully understood that the above commentary is a micro-snapshot of only one problem in one county of NY. How widespread and typical this problem is I cannot say but this is one problem that contradicts NYDEC claims of exemplary oversight for a large farm CAFO/Sludge operation and is proof that, at least in this case, much is needed to be done. NY communities in the Chesapeake Bay watershed contain many good farmers who are conservationists and who, unlike the Dickson Corp., are to be applauded for the way in which they operate their farm businesses. Those farmers who are doing their part must not be punished by ill-crafted EPA directives because of the bad actors. Policies and solutions must be 'critical-thought' driven to serve and further the goal of a better environment for all and not as blunt instruments that will financially punish the well managed farms of New York state.

Page 48 Gap Analysis

The Authority agrees with the conclusion that four years into the Point Source Allocation Strategy, no gap should be anticipated.

Page 48 Contingencies

As stated in an earlier comment, point sources require program stability. As long as they are in the process of meeting the standards set for them in 2006, no change in those standards should be allowed and DEP should not be permitted to reduce their allocation to make up for a failure in another sector, such as the non-point source sector.

Response

EPA appreciates the comment. EPA's allocation applicable to WWTPs including the commenter has changed significantly based in part on receipt of a Final Phase I WIP from Pennsylvania, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLAs applicable to commenter. [Assuming no WWTP backstop] The TMDL process is intended to provide consistency and a degree of stability among the Bay states.

Organization: Town of Amherst, Virginia

We object to the waste inherent in EPA's proposed override of the Virginia Regulations and Virginia WIP through the Draft TMDL and its elements that relate to our WLAs.

Response

The draft WIP in Virginia was insufficient to achieve the allocated loads or to demonstrate reasonable assurance. For this reason, in the draft TMDL EPA applied backstop allocations. Fortunately, the final VA WIP was much improved, and EPA consequently reduced or removed the backstops. EPA's assessment of the VA WIP can be found in Section 8.

Author Name: Wernick R.

Organization:

A New York Times article (October 16, 3010) reports Shawn M. Garvin's recommendation to revoke the permit for the Spruce #1 Mine in West Virginia.

That recommendation must be put into practice and enforced. For too long under the administration of George W. Bush, the EPA bowed to pressure by the administration and "Big Coal" and its lobbyists. Revocation of the permit would prevent further environmental and social destruction caused by the permits allowing "mountain top removal" that already have been issued and implemented. Coal is not a clean fuel, and it is highly unlikely that it ever can be. But the destruction of thousands of acres of land and miles of streams is neither wise nor acceptable. Clean water, wildlife, and the health of communities all are connected.

May I add that if the EPA truly wishes to receive public comment on issues, it should amend its website to facilitate such comment. If this letter has been addressed to the wrong office, please forward it to the correct one.

Response

Thank you for your comment in response to EPA's NPDES mining program. However, the topic for this public comment period is the Bay TMDL so no additional comment is required.

22.1 - MS4S

Comment ID 0154-cp.001.009

Author Name: Dyson Gary

Organization: Planning and Code Administration, City of Gaithersburg, Maryland

- The majority of properties in Gaithersburg were developed prior to 1985. The City only owns 10% of the land in the City limits and has no legal authority to force changes on privately owned property. Many areas, both public and private have existing conditions such as steep slopes and/or shallow storm drains which will make retrofits very expensive. The City has numerous streets with no public right-of-way beyond the pavement. The proposed retrofit requirement of 20% by 2017 is not financially feasible, and presents significant technical problems as well.

Response

EPA believes that retrofits are necessary to achieve the relevant allocations. Most robust stormwater programs should include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have

discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Comment ID 0169.1.001.028

Author Name: Crim Martin

Organization: Town of Occoquan, Virginia

Of all the source sectors covered by the TMDLs, none is affected more by the 2025 deadline than the urban runoff sector because much of the difficulty and cost of achieving the urban runoff load reductions is associated with retrofits independent of redevelopment. Historic re-development rates in the Occoquan watershed fall far short of those that would be needed to achieve the load reductions without forcing the localities to acquire the easements needed for the retrofits and assuming responsibility for retrofit installation and maintenance.

Response

While the TMDL does not specifically add any requirements for retrofitting, EPA agrees that some retrofitting will likely be necessary in order to meet the relevant TMDL allocations by 2025, and that those retrofits would need to occur at a rate that exceeds typical redevelopment. There are many ways to implement retrofits, including in existing public rights-of-way and incentivizing on private property. Options don't necessarily require municipalities to acquire easements, or undertake installation and maintenance.

Comment ID 0212.1.001.003

Author Name: Greenland Victoria

Organization: Arlington County, Department of Environmental Services, Virginia

Unfortunately, the dramatic hydrologic and hydraulic changes and resulting water quality impacts of nearly a century of development and drainage decisions that occurred in urban areas like Arlington County before the establishment of the NPDES stormwater program cannot be fully reversed. Arlington County recently initiated an extensive retrofitting program working with the nationally-recognized Center for Watershed Protection. However, the work to date indicates that retrofit potential and implementation timeframes will fall well short of Bay TMDL and MS4 permit requirements, even while providing important and needed water quality benefits.

Response

EPA appreciates the commitment of commenter towards environmental restoration. While the TMDL does not specifically require retrofitting, EPA believes that robust retrofitting programs are likely to be necessary to achieve the relevant allocations by 2025. State are working through their Watershed Implementation Plans implementing the TMDL to balance retrofit rates against other

actions in order to achieve allocations by 2025.

Comment ID 0265.1.001.011

Author Name: Clark, Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

The proposed backstop allocations reflect EPA's determination that Virginia's proposed allocations for the agriculture and onsite septic systems were too small in light of the absence of direct federal and state regulatory authority over these sectors. Although the urban runoff sectors gained additional allocations with the backstop, the gains are small and appear to reflect EPA's mistaken assumption that steep load reductions can be achieved by the urban runoff sector because this sector, unlike the agriculture and onsite septic system sectors, is subject to direct federal and state regulatory authority under the National Pollutant Discharge Elimination System (NPDES). However, this assumption fails to recognize the significant economic, technical and legal obstacles associated with controlling nutrient and sediment loads in urban runoff within an MS4 - particularly MS4s in coastal regions such as Hampton Roads - as well as the Localities' limited ability to require retrofits on private property.

Response

EPA does believe that some amount of urban retrofitting is necessary in order to achieve the necessary pollutant reductions, and that a robust MS4 program will include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Please see response to Comment 0067.001.009.

Comment ID 0265.1.001.013

Author Name: Clark, Stan

Organization: Hampton Roads Planning District Commission (HRPDC), Hampton, Virginia

Treatment of well over half of the urban land area in the Localities would require extensive retrofits of existing development, most of which would have to be implemented independent of re-development in order to have any hope of meeting EPA's 2025 deadline. This is because re-development rates in the Hampton Roads region do not even begin to approach the rates that would be needed to achieve the backstop allocations entirely through re-development between now and 2025. The Phase I and Phase II Localities own an average of thirteen and three percent, respectively, of the urban land that would have to be treated to achieve the backstop allocations. The remaining urban land is privately owned, and the Localities cannot compel private landowners to install retrofits in the absence of re-development requiring local land use approvals. Consequently, assuming for the sake of argument that they could meet the 2025 deadline, the Localities would have to acquire extensive easements through negotiation and condemnation for

the installation and maintenance of controls. Easement acquisition, in turn, would add billions of dollars and years to the implementation schedule. Further, much of the Locality-owned urban land is utilized for utility infrastructure such as water, sewer, telephone, and electric lines. Even if one assumes that it would be feasible to use this land for storm water controls, the cost of moving or constructing around the utility infrastructure would add hundreds of millions of dollars to the \$9.8 billion estimate and add years to the implementation schedule.

The foregoing analysis shows that controlling nutrient and sediment loads from urban runoff poses many of the same challenges and obstacles as controlling loads from agriculture and onsite septic systems. All three of these sectors will require extensive land-based controls on private property to achieve their respective allocations. EPA, Virginia, and the Localities cannot simply force private land owners to install controls in the absence of direct regulatory authority over the land owner (in the case of EPA and the State) or re-development requiring local approvals (in the case of the Localities). EPA appears to recognize the limits of its own authority over non-point source agriculture and onsite septic systems, but apparently refuses to recognize the limits on the Localities' authority over existing development. The Localities can acquire easements through negotiation or condemnation and install the controls themselves, but easement acquisition under these circumstances is extraordinarily time consuming and expensive.

In summary, it is apparent that EPA has wrongly assumed that the urban runoff sector allocations can be achieved by 2025 by virtue of federal and state regulatory authority over MS4s. In so doing, EPA has failed to recognize that in the absence of redevelopment requiring local land use approvals, the Localities have no more regulatory authority to require retrofits of existing development than either EPA or the Commonwealth of Virginia. Therefore, even if one assumes that the Localities can afford to spend well over one billion dollars each year between now and 2025 (which they cannot), EPA has not and cannot provide reasonable assurance that the James River basin backstop urban runoff allocations can be attained by 2025.

Having increased the agriculture and onsite septic system sector allocations to provide reasonable assurance that these allocations can be attained, it is incumbent upon EPA to increase the urban runoff sector allocations as well to account for the limits on federal, state, and local regulatory authority over existing development as well as the immense cost and difficulty associated with installing urban runoff retrofits.[FN 6] Increased allocations for the urban runoff sector would contribute toward providing reasonable assurance that the sector's allocations can be attained at some point in the future by reducing the extent of the retrofits that would be required to attain the allocations. As discussed below in Section VI, the correct starting point for developing increased allocations for the urban runoff sector would be for EPA to use the James River allocations in the 2005 Tributary Strategies rather than the allocations proposed in the TMDL. The urban runoff sector allocations derived from the Tributary Strategies would have to be significantly higher than those currently proposed by EPA if the Localities are to have any chance of achieving their allocations by 2025. Even with significantly higher allocations, however, it is unlikely that the Localities and private property owners would be able to implement all of the required retrofits by EPA's 2025 deadline because in addition to installing retrofits on public land and requiring retrofits on private land as redevelopment occurs, the Localities would also have to acquire easements to install retrofits on private land that was not undergoing re-development. As explained in these comments, easement acquisition is an extraordinarily time-consuming and expensive process.

[FN 6] "Reasonable assurance" is not required by or defined in federal law; however, since EPA has chosen to employ reasonable assurance as the driver for assigning allocations among the source sectors, it is required to apply reasonable assurance among the sectors in a reasoned and consistent manner. The Localities submit that EPA has acted arbitrarily by proposing allocations for the urban runoff sector that do not account for the same factors (i.e., limited

regulatory authority and economic feasibility associated with land-based controls) that it used to propose allocations for the agriculture and onsite septic system sectors. In fact, the much higher cost and greater difficulty of controlling nutrient and sediment loads from the urban runoff sector compared to the agriculture sector strongly suggests that on a pound-for-pound basis, the load reductions required of the urban runoff sector should be far less than the load reductions required of the agriculture sector. An analysis of the James River sector allocations shows that the level of effort required of the agriculture sector to achieve its allocations is considerably less than the level of effort required of the urban runoff sector to achieve its allocations.

Response

EPA believes that robust MS4 programs are necessary to achieve the relevant allocations, and most should include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

EPA points out that achieving allocations will be challenging for all sectors, and increasing an allocation in one area necessitates a decrease in another area. EPA believes that current allocations reflect a reasonable balance of considerations among all sectors contributing nutrients and sediment in the Bay Watershed. EPA also notes that states have the option to shift the balance of implementation responsibility among sectors as long as the total allocations are achieved.

Comment ID 0293.1.001.008

Author Name: Pomeroy Christopher

Organization: Virginia Municipal Stormwater Association, Inc. (VAMSA)

In addition, EPA has not clearly addressed the distinction between TMDL WLAs and MS4 effluent limitations. Consistent with EPA's existing regulations and guidance, the Bay TMDL should clearly state that MS4s are not subject to numeric effluent limitations. Under section 402(p) of the CWA, the legal compliance standard for MS4s is based on a "maximum extent practicable" ("MEP") level of effort. Here, given the extremely stringent proposed allocations, this should be made clear in the TMDL.

Response

MS4 permits must include provisions necessary to comply with the water quality objectives of the Clean Water Act, including implementation of wasteload allocations. Where the NPDES authority determines that MS4 discharges have the reasonable potential to cause or contribute to a water quality standard excursion, EPA recommends that, where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations as necessary to meet water quality standards as these types of effluent limitations create objective and accountable means for controlling stormwater discharges.

Comment ID 0298.2.001.005

Author Name: Clark Stan

Organization: Hampton Roads Planning District Commission (HRPDC)

Although the proposed backstop allocations reflect the difficulty of achieving significant load reductions from the agriculture and onsite septic sectors, they fall far short of reflecting the difficulty of achieving such reductions from the urban runoff sector. EPA appears to simply assume that the reductions can be achieved because MS4s are subject to federal and state permitting authority under the NPDES, but this assumption fails to recognize that the City owns, on average, only about 35% of the impervious land area within its borders. Therefore, most of the retrofits needed to achieve the load reductions will have to be implemented on private lands over which the Localities have no control in the absence of new development or redevelopment requiring local land use approvals. Eminent domain costs resulting from these requirements will be substantial.

Response

Please refer to comment 0067.1.001.009

Comment ID 0316.001.006

Author Name: Bulova Sharon

Organization: County of Fairfax, Virginia

Finally, in developing the Chesapeake Bay TMDL, we must all remember that the current conditions in our urbanized watersheds developed over many decades and that most of the land is privately owned. Plans and programs developed under the current initiatives need to take into account what can be achieved by localities, given their unique constraints over the short and long-term. There are significant environmental benefits to redevelopment and transit-oriented development, as well as adverse environmental impacts associated with sprawl; and beneficial development and redevelopment projects should not be hindered as a result of this effort. If the costs of these stormwater management efforts are made to be too high, or if the stormwater management standards effectively become unattainable, these beneficial redevelopment efforts will be hindered. A punitive focus on MS4 permits could ultimately prove detrimental to water quality by preventing development and redevelopment in already urbanized areas and driving new development into rural areas. Improvements can and should be made in how urban and suburban stormwater is managed, but they must be made in a sustainable manner by working collectively towards a common goal.

Response

EPA agrees that redevelopment and transit-oriented development can provide environmental benefits when done correctly. EPA does not believe that well-formulated stormwater regulations are inconsistent with these types of development or the inherent goals, nor do they encourage sprawl.

Comment ID 0331.1.001.007

Author Name: Wilson B.

Organization: City of Virginia Beach, Virginia

I. INFORMATION REGARDING CITYOF VIRGINIA BEACH, VIRGINIA

A. The City of Virginia Beach is both an urban and rural municipality located at the mouth of the Chesapeake Bay. The City of Virginia Beach consists of approximately 248 square miles, with a population of approximately 433,500. Only the urban northern portion of the City is located in the Chesapeake Bay watershed. Significant portions of the City, including its rural southern portion, are not located in the Watershed, as portions of the City drain southerly and to the Atlantic Ocean.

B. City MS4 Program-The City is considered a large MS4 locality and its stormwater is regulated by the MS4 permit issued to the City. That permit is now approximately nine (9) years old, and was originally issued in March 2001.

C. Factors Affecting Stormwater Control in City-The City of Virginia Beach is in a unique and untenable situation regarding its ability to meet any required allocations. There is very little agriculture in the City's Chesapeake Bay Watershed. The City does not operate any wastewater treatment plants (Hampton Roads Sanitation District) and, as a result of a comprehensive program of extending public sewer facilities to properties in the Chesapeake Bay Watershed, there are very few private septic systems left in the Chesapeake Bay Watershed. As a result, the City is forced to realize all of its reductions in the urban stormwater arena, where any reductions are the most costly and the least efficient.

Response

EPA appreciates the comment, and the acknowledgment that MS4 programs will be notable players in implementation of nutrient and sediment reductions in the watershed. EPA believes there are a number of reasonable solutions for recognizing reductions in urban stormwater.

Comment ID 0394.001.007

Organization: Environment America et al.

Stormwater. As development continues to march across the open spaces of the Chesapeake Bay region, nutrient pollution from stormwater has been increasing. We cannot let that continue. It will take enormous effort to ensure that polluted runoff decreases at the same time that the construction industry rebounds.

One of the most important tools is Municipal Separate Storm Sewer System (MS4) permits. States issuing these permits should require that all MS4 and other stormwater permits incorporate the wasteload allocation numbers from the TMDL. Also, as MS4 permits are required of more jurisdictions and the requirements of the permits become stricter, we need to make sure there are significant consequences for failing to comply with the terms of those permits.

Response

EPA appreciates the comment, and the acknowledgment that MS4 programs will be notable players in implementation of nutrient and sediment reductions in the watershed. EPA also agrees that it is a requirement of the Clean Water Act to include appropriate provisions in permits to implement relevant wasteload allocations, and that those provisions must be enforceable and enforced.

Organization: Maryland State Highway Administration (SHA)

If the MS4 jurisdictions are to be expanded to include the entire Maryland Bay watershed, and if the impervious accounting requirements are to be imposed on the MS4 Phase II jurisdictions as well as the non-MS4 areas, then sufficient time to develop the base impervious surfaces, stormwater facility treatment areas, land uses and right-of-way would be necessary. Our previous MS4 Phase I permit allowed 5 years to meet the impervious accounting requirement before imposing retrofit percentages.

Response

EPA appreciates the comment.

ii. Retrofits

Despite the pressing need to reduce stormwater loadings from areas of existing imperviousness, only Maryland and the District of Columbia WIPs contain commitments to undertake stormwater retrofit programs. Both jurisdictions, in their express preference for green infrastructure management practices, provide clear models for the other Bay States to emulate. Even so, and as NRDC has elsewhere expressed, EPA must commit to engaging with these two jurisdictions to ensure that retrofits result in meaningful water quality gains, are implemented on schedule and according to watershed prioritization, and are pursued to the maximum extent technically feasible.

Virginia and Pennsylvania, in contrast, present no definite retrofit policies or plans in their WIPs. Virginia's aspirational consideration of cost-share structures to fund BMPs and BMP retrofits has potential to reduce the fiscal implications of a broad retrofit policy, but without a commitment or detailed revenue and organizational scheme is effectively meaningless. As EPA has noted in its critique of Pennsylvania's WIP, restrictions on stormwater generation from future development is not an effective retrofit policy; unfortunately, the Commonwealth has made no effort to create a meaningful retrofit program. We applaud EPA's commitment to base the backstop allocations for both Virginia and Pennsylvania on a requirement that 50% of urban MS4 lands meet aggressive performance standard through retrofit/redevelopment; 50% of unregulated land treated as regulated, so that 25% of unregulated land meets aggressive performance standard.[FN 34] However, we strongly encourage the Agency to pursue commitments from both states to undertake strong retrofit programs, with specific commitments and policies, as part of their final Phase I WIPs.

In exercising its continuing oversight responsibilities and authority, EPA must ensure that measures to reduce impacts from existing imperviousness are implemented consistently across the Bay watershed. The retrofit expectations conveyed by the Agency in its "Urban Stormwater Approach" memorandum should serve as a baseline not just for the states in the region, but for EPA's own review and approval of new or renewed MS4 permits across the watershed. [FN 35] MS4 permits must contain locally relevant requirements to develop prioritized, defensible, and achievable retrofit programs, tied to performance standards and enforceable compliance schedules.

[FN 34] Draft TMDL at pp. v, vi.

[FN 35] US EPA, Urban Stormwater Approach for the Mid-Atlantic Region and Chesapeake Bay Watershed, July 2010, at 3-4.

Response

EPA appreciates the comment, and will continue to work with state programs both through WIP development and review and permit oversight processes, to develop and enhance meaningful stormwater retrofit provisions.

EPA Backstop - 50% Retrofit of Urban Lands

Comment:

The EPA has proposed a backstop to retrofit 50% of urban lands to address discrepancies between the WIP and the WLA. Being a fully developed urban locality, it would be unrealistic for the City to meet the EPA backstops of retrofitting 50% of its urban land. The City has a total area of 15,340 acres of land, of which only 2,538 acres are municipally owned lands, according to data provided by the Norfolk Real Estate Assessor's Office. Assuming it is feasible to install BMPs on all municipal lands, the City could only retrofit 16.5% of our urban land. The remaining 33.5% of urban land

requiring retrofit is privately owned.

The City does not have the legal authority to require private property owners to install or retrofit BMPs unless the property owner decides to develop or redevelop their land, triggering local land use approvals. In order to meet the 50% retrofit requirements, the City would have to buy private property, offer monetary incentives or take on additional maintenance requirements in order to retrofit BMPs, further stressing the existing storm water revenue. Land acquisition and condemnation is expensive and takes time.

Recommendations:

The EPA has stated that the backstops will only apply if the Commonwealth of Virginia fails to provide concrete details on how they plan to implement the various programs described in the Draft WIP. The City suggests that instead of introducing back stops for the Virginia WIP to include the 50% urban land retrofit, the EPA consider adopting nutrient reductions based on the Tributary Strategies. Furthermore, we recommend extending the deadline for final development of the Phase I WIP to May 2011 to allow the Commonwealth of Virginia time to provide a more detailed and binding WIP as described above.

Response

EPA does believe that some amount of urban retrofitting is necessary in order to achieve the necessary pollutant reductions, and that a robust MS4 program will include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Allocations

The EPA James River basin backstop allocations for the urban runoff sector are higher than those assigned in the Draft WIP because the EPA does not consider nutrient credit exchange. However, with an average reduction of a 54 percent reductions in phosphorus required to achieve the backstop allocation, it is still beyond a level that is practicable given Norfolk's hydrology, geology and available commercial technologies. To achieve the 54 percent phosphorus reduction, the City would be required to treat approximately 65 percent of the impervious land area with structural best management practices (BMP).

The City owns approximately 2,500 acres of land within our boundaries. These holdings contain only 16.5 percent of the required impervious land area that would require treatment to achieve the EPA backstop. The remaining reductions

would need to be achieved with retrofits on private land.

Under current state law, localities do not have the authority to compel private land owners to retrofit storm water treatment in the absence of development or redevelopment. Consequently, the City would have to purchase the land needed for easements. Land acquisition is an expensive and time consuming process that will add greatly to the cost and time required to achieve the reductions. Current state law limits localities from condemnation except for very specific purposes. These laws will also need to be amended in order to implement these programs.

Response

EPA believes that robust MS4 programs are necessary to achieve the relevant allocations, and most should include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

Organization: Hampton Roads Planning District Commission (HRPDC), Chesapeake, Virginia

The proposed backstop allocations reflect EPA's determination that Virginia's proposed allocations for the agriculture and onsite septic systems were too small in light of the absence of direct federal and state regulatory authority over these sectors. Although the urban runoff sectors gained additional allocations with the backstop, the gains are small and appear to reflect EPA's mistaken assumption that steep load reductions can be achieved by the urban runoff sector because this sector, unlike the agriculture and onsite septic system sectors, is subject to direct federal and state regulatory authority under the National Pollutant Discharge Elimination System (NPDES). However, this assumption fails to recognize the significant economic, technical and legal obstacles associated with controlling nutrient and sediment loads in urban runoff within an MS4 - particularly MS4s in coastal regions such as Hampton Roads - as well as the Localities' limited ability to require retrofits on private property.

Organization: Hampton Roads Planning District Commission (HRPDC), Chesapeake, Virginia

Treatment of well over half of the urban land area in the Localities would require extensive retrofits of existing

development, most of which would have to be implemented independent of re-development in order to have any hope of meeting EPA's 2025 deadline. This is because re-development rates in the Hampton Roads region do not even begin to approach the rates that would be needed to achieve the backstop allocations entirely through re-development between now and 2025. The Phase I and Phase II Localities own an average of thirteen and three percent, respectively, of the urban land that would have to be treated to achieve the backstop allocations. The remaining urban land is privately owned, and the Localities cannot compel private landowners to install retrofits in the absence of re-development requiring local land use approvals. Consequently, assuming for the sake of argument that they could meet the 2025 deadline, the Localities would have to acquire extensive easements through negotiation and condemnation for the installation and maintenance of controls. Easement acquisition, in turn, would add billions of dollars and years to the implementation schedule. Further, much of the Locality-owned urban land is utilized for utility infrastructure such as water, sewer, telephone, and electric lines. Even if one assumes that it would be feasible to use this land for storm water controls, the cost of moving or constructing around the utility infrastructure would add hundreds of millions of dollars to the \$9.8 billion estimate and add years to the implementation schedule.

The foregoing analysis shows that controlling nutrient and sediment loads from urban runoff poses many of the same challenges and obstacles as controlling loads from agriculture and onsite septic systems. All three of these sectors will require extensive land-based controls on private property to achieve their respective allocations. EPA, Virginia, and the Localities cannot simply force private land owners to install controls in the absence of direct regulatory authority over the land owner (in the case of EPA and the State) or re-development requiring local approvals (in the case of the Localities). EPA appears to recognize the limits of its own authority over non-point source agriculture and onsite septic systems, but apparently refuses to recognize the limits on the Localities' authority over existing development. The Localities can acquire easements through negotiation or condemnation and install the controls themselves, but easement acquisition under these circumstances is extraordinarily time consuming and expensive.

In summary, it is apparent that EPA has wrongly assumed that the urban runoff sector allocations can be achieved by 2025 by virtue of federal and state regulatory authority over MS4s. In so doing, EPA has failed to recognize that in the absence of redevelopment requiring local land use approvals, the Localities have no more regulatory authority to require retrofits of existing development than either EPA or the Commonwealth of Virginia. Therefore, even if one assumes that the Localities can afford to spend well over one billion dollars each year between now and 2025 (which they cannot), EPA has not and cannot provide reasonable assurance that the James River basin backstop urban runoff allocations can be attained by 2025.

Having increased the agriculture and onsite septic system sector allocations to provide reasonable assurance that these allocations can be attained, it is incumbent upon EPA to increase the urban runoff sector allocations as well to account for the limits on federal, state, and local regulatory authority over existing development as well as the immense cost and difficulty associated with installing urban runoff retrofits.[FN 6] Increased allocations for the urban runoff sector would contribute toward providing reasonable assurance that the sector's allocations can be attained at some point in the future by reducing the extent of the retrofits that would be required to attain the allocations. As discussed below in Section VI, the correct starting point for developing increased allocations for the urban runoff sector would be for EPA to use the James River allocations in the 2005 Tributary Strategies rather than the allocations proposed in the TMDL. The urban runoff sector allocations derived from the Tributary Strategies would have to be significantly higher than those currently proposed by EPA if the Localities are to have any chance of achieving their allocations by 2025. Even with significantly higher allocations, however, it is unlikely that the Localities and private property owners would be able to implement all of the required retrofits by EPA's 2025 deadline because in addition to installing retrofits on public land

and requiring retrofits on private land as redevelopment occurs, the Localities would also have to acquire easements to install retrofits on private land that was not undergoing re-development. As explained in these comments, easement acquisition is an extraordinarily time-consuming and expensive process.

[FN 6] "Reasonable assurance" is not required by or defined in federal law; however, since EPA has chosen to employ reasonable assurance as the driver for assigning allocations among the source sectors, it is required to apply reasonable assurance among the sectors in a reasoned and consistent manner. The Localities submit that EPA has acted arbitrarily by proposing allocations for the urban runoff sector that do not account for the same factors (i.e., limited regulatory authority and economic feasibility associated with land-based controls) that it used to propose allocations for the agriculture and onsite septic system sectors. In fact, the much higher cost and greater difficulty of controlling nutrient and sediment loads from the urban runoff sector compared to the agriculture sector strongly suggests that on a pound-for-pound basis, the load reductions required of the urban runoff sector should be far less than the load reductions required of the agriculture sector. An analysis of the James River sector allocations shows that the level of effort required of the agriculture sector to achieve its allocations is considerably less than the level of effort required of the urban runoff sector to achieve its allocations.

Response

EPA believes that robust MS4 programs are necessary to achieve the relevant allocations, and most should include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land.

EPA points out that achieving allocations will be challenging for all sectors, and increasing an allocation in one area necessitates a decrease in another area. EPA believes that current allocations reflect a reasonable balance of considerations among all sectors contributing nutrients and sediment in the Bay Watershed. EPA also notes that states have the option to shift the balance of implementation responsibility among sectors as long as the total allocations are achieved. Also please see response to comment # 0389.1.001.020.

3, Non-Structural BMPs: Chesapeake Bay Preservation Act and MS4 Permit Program

The City is a Phase II MS4 stormwater community. The permit requires a lot of non-structural BMPs under the Six Minimum Controls. The WIP should consider these as "BMPs" for modeling and pollutant reduction purposes or consider halting these requirements. Uniform removal efficiencies should be assessed across the six states and the District. The Tier 2 element of Section 7.2 Accounting for Growth suggests that these existing practices will be built upon in the Phase II WIP process. We agree that these should be accounted for, but strongly suggest that these

existing programs be assigned nutrient and sediment reductions soon as possible. The costs of new permit requirements, including non-structural BMPs and accounting, add to the financial burden placed on localities. Consideration of existing practices and enhanced implementation of non-structural practices should occur prior to requiring localities to implement new, more costly practices such as the backstop measure of urban stormwater retrofits.

Response

EPA can and will consider any set of controls, practices and management measures for which a reasonable pollutant reduction/management can be quantified. The model currently includes a number of practices for which quantification protocols have been developed. EPA intends to develop protocols for additional measures as stakeholders indicate a need, and where robust performance data can be provided.

EPA does not believe the necessary pollutant reductions will be achieved without some level of retrofitting, but certainly encourages all implementers to consider the least expensive solutions first.

6. MS4 Allocation

During Phase I of this process, EPA has provided an aggregate allocation for urban stormwater covered an MS4 permit, while Phase II will provide individual allocations for MS4 permits. EPA has not clearly addressed the distinction between TMDL WLAs and MS4 effluent limitations. Consistent with EPA's existing regulations and guidance, the Bay TMDL should clearly state that MS4s are not subject to numeric effluent limitations. Under section 402(p) of the Clean Water Act, the legal compliance standard for MS4s is based on a "maximum extent practicable" ("MEP") level of effort. Here, given the extremely stringent proposed allocations, this should be made clear in the TMDL.

Response

Wasteload allocations are the pollutant loads assigned to a discharge or group of discharges by a TMDL. Effluent limitations are the articulation of the relevant WLAs (and other objectives) as enforceable permit requirements.

MS4 permits must include provisions necessary to comply with the water quality objectives of the Clean Water Act, including implementation of wasteload allocations. Where the NPDES authority determines that MS4 discharges have the reasonable potential to cause or contribute to a water quality standard excursion, EPA recommends that, where feasible, the NPDES permitting authority exercise its discretion to include numeric effluent limitations as necessary to meet water quality standards as these types of effluent limitations create objective and accountable means for controlling stormwater discharges.

Author Name: Barnes C.

Organization: County of Spotsylvania, Virginia

Although the proposed backstop allocations reflect the difficulty of achieving significant load reductions from the agriculture and onsite septic sectors, they fall far short of reflecting the difficulty of achieving such reductions from the urban runoff sector. EPA appears to simply assume that the reductions can be achieved because MS4s are subject to federal and state permitting authority under the NPDES, but this assumption fails to recognize that the Localities own, on average, only about 20 percent of the land area within their respective jurisdictions. Therefore, most of the retrofits needed to achieve the load reductions will have to be implemented on private lands over which the Localities have no control in the absence of new development or redevelopment requiring local land use approvals. Eminent domain costs resulting from these requirements will be substantial.

Response

EPA does believe that some amount of urban retrofitting is necessary in order to achieve the necessary pollutant reductions, and that a robust MS4 program will include a retrofit element. There are a variety of solutions for retrofitting sites with physical constraints, and a number of communities have discovered cost effective ways to address these challenges, both in public rights-of-way and by incentivizing retrofits on private land. Comment ID 0746.1.001.033

Author Name: Carl Jimmie

Organization: Southern Tier Chesapeake Bay TMDL Commenting Coalition

Creation of New MS4s/Extension of Boundaries of the Current MS4s

The creation of new MS4s and the extension of the geographic boundaries of the existing MS4s would result in a large financial and regulatory burden being placed on small communities, with little to no measurable environmental benefits, beyond those currently obtained with existing regulatory structures and requirements. With this approach, smaller municipalities would be designated as MS4s. The subsequent reduction in pollutant loadings from stormwater discharges in these new and expanded MS4s would be only a small portion of the overall load from urban runoff sources in New York's portion of the Bay watershed, which in turn is a small portion of the overall nutrient loading to the Bay.

5. More Stringent Design Standards for Existing MS4s

More stringent design standards for stormwater management facilities, such as enhanced phosphorus removal requirements, would act to increase development costs and would act to increase the sizing, costs, and complexity of stormwater management practices. This would represent another hurdle to the growth/redevelopment of a MS4 community.

A requirement for the retrofitting of existing stormwater discharges with structural treatment practices would place an immense financial burden upon municipalities, with little benefit in regards to nutrient reduction. The draft TMDL's Backstop allocations would require 50 percent of the expanded urban MS4 lands to meet aggressive performance standards through retrofit/redevelopment. The NYSDEC has estimated an associated cost of \$1 to \$6 billion to accommodate this. The cost-effectiveness of this requirement would be non-existent, given the limited nutrient reduction achievable.

In regards to MS4s within the Bay watershed, the requirement for the retrofitting of existing stormwater discharges should not automatically be imposed upon an MS4. Nutrient loads from MS4s within the watershed are only a small portion of the overall loads to the Bay. Furthermore, the ratio of cost (\$) per lb of nutrients removed is exceedingly high for urban stormwater. Simply, removing nutrients from urban stormwater via storm system improvements most likely is not the most cost effective means to reducing the overall nutrient load to the Bay.

Response

Creation of New MS4s/Extension of Boundaries of the Current MS4s:

The CWA and the NPDES regulations allow for EPA and NPDES authorized States to designate, additional stormwater discharges for regulation. See 40 CFR 122.26 (a)(9)(i)(C), (a)(9)(i)(D), (b)(4)(iii), (b)(7)(iii), (b)(1 S)(ii) and I 22.32(a)(2). EPA has become concerned that NPDES authorities have generally not adequately considered exercising these authorities to designate for NPDES permitting storm water discharges that are currently not required to obtain permit coverage but that are significant enough to be identified in the load allocation component of a TMDL. Accordingly, EPA encourages permitting authorities to consider designation of stormwater sources in situations where coverage under NPDES permits would afford a more effective mechanism to reduce pollutants in stormwater discharges than available nonpoint source control methods. With respect to EPA's backstop allocations for stormwater, please see response to comment # 0067.1.001.009.

EPA has not proposed the creation of new MS4s nor the extension of MS4 boundaries for existing MS4s. EPA does believe that currently unpermitted stormwater discharges will need to be more effectively controlled, including through the designation of some of those discharges for permitting. However, the MS4 program is only one of several options to achieve this. State NPDES authorities may choose to utilize this option. To date, the states proposing to extend stormwater regulations to additional discharges are considering the use of state-wide rules to impose standards on new and redevelopment projects, not the extension of MS4 programs.

More Stringent Design Standards for Existing MS4s:

EPA has proposed neither the use of design standards nor the use of enhanced phosphorus removal (as the term is typically used) for municipal stormwater discharges. In fact, as a general approach, EPA does not believe that these are the most effective frameworks.

EPA does believe that stormwater discharges should be subject to more specific and stringent performance standards, but does not believe that they will increase development costs. In fact, EPA believes that the more effective stormwater controls, often termed green infrastructure, conservation design, and/or runoff reduction, have been demonstrated to be no more expensive than traditional stormwater management approaches.

EPA does believe that some amount of urban retrofitting is necessary in order to achieve the necessary pollutant reductions. However, where state programs propose solutions that can meet the overall wasteload allocations EPA will not automatically impose backstop retrofit requirements on MS4s. The backstop framework is one logical algorithm to achieve the allocations, but not the only one. EPA continues to encourage states to develop the frameworks that will work best for their jurisdictions' sets of unique circumstances.

As indicated in our compliance plan and schedule, with the process and operational changes already underway at the GTP Facility, coupled with our existing treatment processes, GTP believes that it will be able to achieve compliance with the TN cap load limit proposed in Pennsylvania WIP and set forth in DEP's March 2010 §92.8a notice.

Response

EPA acknowledges the comment.

Comment ID 0067.1.001.006

Author Name: Venezia Carmen

Organization: Global Tungsten & Powders Corporation (GTP)

The TP Cap is a bigger challenge - not because we are a large contributor of phosphorus, but rather because our phosphorus loadings are highly variable and compared to water volume are relatively low. We set forth in our plan a 15-step process to achieve the target phosphorus loadings, and are currently at step 6 - having completed jar tests and design work, and having submitted to DEP plans for modifications to our treatment plant that we are hopeful will allow us to meet the cap load. We are scheduled to proceed with those treatment plant modifications upon plan approval from DEP, with the target of completing construction within 11-13 weeks from approval.

More Draconian is that many of the industrial point sources are listed as having nutrient limits that appear to be arbitrary and are well below the limit of technology.

Response

Regarding the levels established in the TMDL, permit limits are written to either technology-based or water quality-based levels. Permits do not specify technologies to be used to meet permit limits, however, performance is established based on the application of best practicable control technology currently available (BPT) and by application of best available technology economically

achievable (BAT). In summary limits must be met by performance by well operated plants within industrial categories using the best control and treatment measures that are capable of being achieved.

The prior owner of the Waynesboro facility added an anoxic biological nutrient removal (BNR) system at a significant capital cost in 1999, and thereafter enhanced the system's denitrification capabilities, with additional recirculation measures in 2003. The facility's wastewater treatment plant is equipped with a steam injection system to maintain temperatures favorable for nitrifying bacteria growth even during winter months. As a result of adding BNR and optimizing temperatures during the winter, during normal facility loading, the INVISTA-Waynesboro's WWTP reduces influent TN from an estimated annual average of 75 mg/L to 18 mg/L, an approximately 75 percent reduction. Thus, if the proposed backstops for significant POTW were to be applied to INVISTA-Waynesboro, or other similar industrial facilities during implementation of the WIP for the TMDL, even after the facility's substantial investment in BNR technology, we know based on available information that it is not technically feasible to meet a 4 mg/L annual average TN discharge limit.

INVISTA respectfully suggests that it may be premature for EPA to impose such limits on dischargers other than a category EPA has studied. As a textile fibers manufacturer, the wastewater discharge from INVISTA's Waynesboro WWTP is subject to federal effluent guideline limitations for the Organic Chemical Plastics and Synthetic Fibers ("OCPSF") standards, which are incorporated into the VPDES permit. EPA has not established technology-based effluent limitations for either nitrogen or phosphorus for an OCPSF facility. Were EPA to propose technology-based effluent guideline limitations for these parameters, it would undergo an extensive rulemaking effort that included gathering and evaluating detailed wastewater influent, treatment and discharge information from the dischargers - municipal, industrial, or otherwise - that it intended to regulate with such standards. EPA should similarly collect and evaluate information from dischargers in the federal effluent category prior to imposing a limitation developed for

POTWs that industries like INVISTA may or may not be able to meet with current technology.

Organization: Smurfit-Stone Container Corporation

Smurfit-Stone Container Corporation ("Smurfit-Stone") is one of the largest manufacturers of paperboard and paper-based packaging in the United States. It is also a global leader in the collection of recycled paper. Smurfit-Stone owns and operates 140 facilities across the country, including two paper mills, nine corrugated container (box) plants, two chip mills and one recycling facility in the Chesapeake Bay watershed states.

Smurfit-Stone's two paper mills are located in Virginia, one of which discharges directly to surface waters under an individual National Pollutant Discharge Elimination System ("NPDES") permit, and a second mill which discharges to a municipal wastewater treatment system. These mills will be affected by the United States Environmental Protection Agency's ("EPA") proposed Chesapeake Bay TMDL establishing effluent loadings for nutrients and sediments (75 Fed. Reg. 57776, September 22, 2010) (the "Proposed TMDL"). As a result of EPA's proposed TMDL, SSCC's mill that discharges directly to a tributary of the Chesapeake Bay would be forced to make extraordinary capital expenditures to reduce the nutrient concentrations in an effluent that is nutrient deficient. Further, there is no proven technology currently in use in the pulp and paper industry that is capable of consistently achieving the nutrient and Total Suspended Solids ("TSS") concentrations that would be required by the Proposed TMDL.

Municipal treatment systems that discharge to the Chesapeake Bay or its tributaries also will likely be forced to require the Smurfit-Stone facilities and other indirect dischargers to make nutrient and TSS reductions or fund expensive capital projects to install additional technology for compliance with EPA's Proposed TMDL. Smurfit-Stone facilities also may be subject to increased sewer rates as municipalities attempt to cover their costs of compliance with the Proposed TMDL. As a result of the foregoing, Smurfit-Stone has a direct and substantial interest in EPA's proposed action to establish TMDL mass loadings for nutrient and sediment contributors into the Chesapeake Bay watersheds.

Response

EPA appreciates that industrial process changes which will result in a long term benefit, do not come without an upfront cost. However, EPA's final TMDL is based on the Virginia WIP rather than EPA backstops for WWTPs.

Comment ID 0319.1.001.006

Author Name: Butler Nina

Organization: Smurfit-Stone Container Corporation

In conclusion, Smurfit-Stone recommends that EPA modify the Proposed TMDL to address the significant issues raised by the company, VMA and AF&PA, and prevent unintended consequences by:

--Eliminating the proposed effluent TSS loadings and revert to the existing permitted levels. The existing industrial TSS levels comprise less than 0.5 percent of the total load going to the Bay and downward adjustments to these existing levels will result in significant expense with little or no benefit;

Response

Thank you for your comments. EPA has reviewed the information presented by the commenter including that of the VA Manufacturer's Association and the American Forest and Paper Association. This comment suggests that certain industrial facilities are a minor contributor of TSS in the Bay and therefore EPA should not apply stringent TSS backstops to these facilities. EPA has modified (relaxed) the TSS WLAs for significant point sources. These limits are now based on the state plan. The final WLAs for these facilities can be found in Section 9.

3. Backstop Allocations Can Not be One Size Fits All, but Instead Must Be Specific to the Characteristics of Each Industrial Facility

The Draft TMDL, as part of its high level and full backstop allocation descriptions, proposes to reduce the WLAs for industrial WWTPs to "a level where the reduction rates for significant industrial WWTPs by jurisdiction are equivalent to the significant municipal WWTP reduction from WIP to E3 (3 mg/l TN and 0.1 mg/l TP)." Further, unlike toxic pollutants such as metals, which require limits on concentration, nutrient limits should be load based and not concentration based. Applying concentration performance capability similar to a POTW upon an industrial facility is inappropriate. As we understand, the high level and full backstop allocations are based on the ability of publicly owned treatment works (POTW) to meet these limits through facility upgrades. However, the assumptions made and data evaluated for influent nitrogen and phosphorus concentrations and treatment and design capabilities at POTWs are not applicable to industrial operations, such as ours, that are generating and treating an entirely different wastewater stream.

INVISTA respectfully suggests that it may be premature for EPA to impose such nutrient and sediment limits on dischargers other than a category EPA has studied-such as POTWs. As a textile fibers manufacturer, the wastewater discharge from INVISTA-Seaford's WWTP is subject to federal effluent guideline limitations for the Organic Chemical Plastics and Synthetic Fibers ("OCPSF") standards, which are incorporated into the facility's current NPDES permit. EPA has not established technology-based effluent limitations for either nitrogen or phosphorus for an OCPSF facility.

Were EPA to propose technology-based effluent guideline limitations for these parameters, it would undergo an extensive rulemaking effort that included gathering and evaluating detailed wastewater influent, treatment and discharge information from the dischargers - municipal, industrial, or otherwise - that it intended to regulate with such standards. EPA should similarly collect and evaluate information from dischargers in the federal effluent category prior to imposing a limitation developed for POTWs that industries like INVISTA-Seaford may not be able to meet with current technology.

Organization: INVISTA

While we sincerely hope that EPA will not resort to the backstop provisions, INVISTA requests that at least for industrial facilities, the load allocations be based on mass load rather than concentration. While the latest technology such as biological nutrient removal (BNR) can reduce TN significantly, the final effluent concentration is a function of the influent TN concentration. Industry wastewater influent concentration can be significantly higher than that for a typical municipal facility. Therefore, while the percent removal (treatment capacity) of an industrial wastewater treatment facility can be equal or even better than a municipal facility, it would be difficult, perhaps impossible, to meet a concentration limit of 3 mg/L.

Organization: Georgia-Pacific LLC (GP)

Technological Limitations and Impacts of Reducing Nitrogen and Phosphorus Levels in Pulp and Paper Mill Effluents

GP operates its wastewater treatment facilities as required by 40 CFR 122.41(e) which is a required component of all NPDES permits, including those in Virginia:

(e) Proper operation and maintenance. The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control (and related appurtenances) which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance also includes adequate laboratory controls and appropriate quality assurance procedures. This provision requires the operation of back-up or auxiliary facilities or similar systems which are installed by a permittee only when the operation is necessary to achieve compliance with the conditions of the permit.

Since pulp and paper mill wastewater is typically nutrient-deficient, mills must add small amounts of nitrogen and phosphorus to achieve proper biological degradation of organic wastes. These additions of nitrogen and phosphorus to the wastewater treatment systems cannot simply be turned off: they are necessary for compliance with 40 CFR 122.41(e) and, without the addition of these nutrients, other effluent parameters, such as 5-day biochemical oxygen demand (BOD5) and TSS would increase dramatically since biological degradation would be impacted. Additionally, the relative amounts of nutrients being added are already optimized since adding excess nutrients would be unnecessary and expensive. Thus, there is not an option for GP to simply reduce or eliminate nutrient additions to its treatment system without risking noncompliance with effluent five-day biochemical oxygen demand (BOD5) and TSS limits.

We are unaware of any pulp and paper mill treatment systems that include nutrient controls for both phosphorus and nitrogen. EPA considers the limit of technology treatment levels for municipal wastewater treatment plants for biological nutrient removal to be 3 mg/l for total nitrogen and 0.1 mg/l for total phosphorus (draft TMDL, page 8-17, USEPA 2010). However, this technology has not been successfully applied to pulp and paper mill effluents. Thus, there is not a straightforward design example that demonstrates continued compliance with very low nutrient levels, such as those that may be unreasonably required by EPA's backstop levels.

GP has prepared preliminary cost estimates for the Big Island paper mill in meeting reduced nutrient levels as described in the VA DEQ WIP. The current estimated costs for the upgraded treatment facilities are estimated as approximately \$14 million. However, these costs were developed prior to the moderate backstop levels proposed by EPA for the Virginia WIP. We do not believe that existing nutrient removal technologies can achieve EPA's proposed backstop levels for a pulp and paper mill effluent for this type pulp and paper mill.

The implementation of this wastewater treatment system upgrade option would present the following additional complications and potential environmental impacts:

Increased energy consumption.

A corresponding increase in the generation of greenhouse gases.

Increased sludge generation, resulting in increased landfill costs and the need to permit and install new disposal areas.

Increased chemical consumption for precipitation processes.

GP is committed to protecting the Chesapeake Bay. At our Big Island Mill, GP has, over the past ten years, reduced nutrient and TSS discharges. Some of the efforts and projects that GP has instituted include:

A dredging program to remove solids from the polishing pond and limited re-entrainment of solids and feedback of nitrogen and phosphorus into the water column.

The addition of a polymer system to the secondary clarifier to reduce the discharge of TSS to the polishing pond, and reduced final effluent TSS levels.

The use of COD monitoring for influent loading information and nutrient feed control.

A change to a nutrient product that is comprised of UAN (urea ammonium nitrate) and ammonium polyphosphate that delivers higher available nitrogen per unit of feed and allows for lower phosphorus usage. Since our system requires minimal phosphorus addition, this has helped reduce residual phosphorus considerably.

The addition of oxygen to the primary clarifier for more efficient primary treatment and increased removal of TSS.

Conducted a study that demonstrated operation at a lower phosphorus level in the system while supporting efficient treatment. This has allowed for a reduction in nutrient usage in the activated sludge treatment system and subsequently reduced effluent phosphorus levels.

Additionally, GP has participated in the Virginia Nutrient Credit Exchange program since 2007 and offered nutrient credits (primarily phosphorus) on the exchange for sale. We believe the Virginia Nutrient Credit Exchange program represents a model for other states to follow and we applaud the Virginia DEQ in its forward-thinking actions to reduce nutrients from both point and non-point sources. We believe this is a demonstrated working program and a vital part of Virginia's watershed implementation plan.

Response

EPA agrees with the commenter that the WLAs established by the TMDL are low and will not be easy to achieve. The achievable concentrations for nitrogen and phosphorous commenter mentions are for municipal wastewater, which is expected to contain higher influent concentrations than those for a paper mill. Paper mills are expected to meet TMDL based limits by employing additional technologies, including but not limited to such things as, greater clarification of effluent, filtering or more extensive biological treatment to meet the limits that are required. It should also be noted that compliance with the new limits is not immediate, rather, new limits will be incorporated into permits at the time existing permits are either modified or reissued. NPDES regulations allow for the incorporation of schedules into permits or enforcement documents, as appropriate, to provide time to meet newly imposed limits.

Organization: Milton Regional Sewer Authority

District of Columbia Blue Plains POTW Treated Differently from Pennsylvania's POTW's

The Blue Plains POTW NPDES permit was effective September 30, 2001.

1. Why is the Blue Plains POTW allowed to discharge from just one of its outfalls concentrations of total nitrogen and total phosphorus greater than EPA's assumed limit of technology? The NPDES permit provides for limits of 3.88 mg/l total nitrogen and 0.18 mg/l total phosphorus.
2. Why do the limits contained in the Blue Plains POTW NPDES permit allow cap loads of 4,377,580 pounds per year total nitrogen which is equal to the load granted to all 183 significant POTW's in Pennsylvania (before the consideration of the average Pennsylvania delivery ratio of 0.75. and Blue Plains delivery ratio of 1.0)?
3. Why is there no cap load for total phosphorus in the Blue Plains permit?
4. Why is the concentration limit for total phosphorus 0.18 mg/l instead of the EPA assumed limit of technology of 0.1 mg/l?
5. Why are the proposed backstop limits for Pennsylvania POTW's lower than the limits imposed on Blue Plains in light of Blue Plains much higher delivery ratios and the Pennsylvania POTW's in the Potomac basin being upstream of the Blue Plains discharge?
6. Why is the "calculated cap load" (based on design flow times monthly maximum concentration) for total phosphorus 202,737 pounds per year when the total nitrogen cap for all Pennsylvania point sources is 200,000 pounds per year?
7. Same question, but asked in light of the difference in delivery ratios for Blue Plains and all of Pennsylvania.
8. Are the Blue Plains planned total nitrogen reductions beginning in January 1, 2015 considered in the current model and in the resultant allocation of loadings to states and segments within state?

Response

Commenter asserts that the Blue Plains WWTP (BP) is treated differently than POTWs in PA. BP is the largest advanced wastewater treatment plant in the world; because it is very large, the volume of its effluent is also very large and even meeting very stringent limits, its output is well beyond the nutrient controls of the many significant WWTPs in Pa. There are no one-size-fits all NPDES permits for POTWs; permit conditions are based on a variety of requirements including but not limited to state water quality standards so there are numerous ways that differences can exist. The limits written into the BP NPDES for TN are very strict, at the limit of TN removal technology. Meeting the TN limit at BP is contingent upon the completion of an enhanced clarification system (ENR) costing approximately \$800M. The ENR system also removes pathogens and particulates from wastewater and reduces turbidity and disinfectant-consuming constituents thereby increasing the effectiveness of subsequent disinfection.

The BP WWTP has two outfalls; the primary outfall for treated effluent is 002; a second outfall, 001 is a CSO- related by-pass which discharges during wet weather. The TN limit applies for the whole facility, e.g., 001 and 002. The TN limit is based on the nitrogen cap loadings established in accordance with the EPA Bay guidance, state water quality standards and the tributary strategies developed for the Bay. The TP limit is based on a variety of operational issues and water quality agreements for the

Potomac. It was modified in the 2003 permit issuance and carried over since that time. As with every permit reissuance, the TP limit will be reevaluated when the permit is reissued or modified.

EPA modeling did not include a scenario for 2015, however BP planned reductions were considered in all WIP and backstop scenarios and in the resultant WLA.

The total cap load for all point sources cited in this comment is incorrect. Please refer to table 9-1 of the final TMDL document for the correct loads.

I. Proposed Limits for Significant Dischargers

Dominion has significant concerns regarding the potential imposition of both the EPA's moderate and full Federal backstops. As mentioned above, Dominion owns and operates the Chesterfield Power Station, a 1700-Megawatt fossil fuel power station in Chesterfield, Virginia. The EPA's moderate backstop, as set forth in Section 9, Table 9-4 of the Draft Chesapeake Bay TMDL, proposes the following wasteload allocations (WLAs) for the Chesterfield Power Station:

Facility - Dominion - Chesterfield Power Station
Annual Nitrogen WLA (lb) - 343,939
Annual Phosphorus WLA (lbs) - 185
Annual Sediment WLA (lbs) - 0.000000

[Reproduced from the original located on page 1 of original letter EPA-R03-OW-2010-0736-0565.1]

EPA indicates that if the Virginia WIP is not strengthened by the Commonwealth, then the agency will include the moderate backstop limits in the final TMDL and possibly include the full backstop limits if warranted. The EPA's full backstop WLAs proposed for the Chesterfield Power Station, located in Table Q-2 of the draft Chesapeake Bay TMDL, are as follows:

Facility - Dominion- Chesterfield Power Station
Annual Nitrogen WLA (lbs) - 166,036
Annual Phosphorus WLA (lbs) - 43
Annual Sediment WLA (mill lbs) - 0.000000

[Reproduced from the original located on page 2 of original letter EPA-R03-OW-2010-0736-0565.1]

Per the recent meeting of the Virginia Water Commission held on October 26, 2010, we understand that the

Commonwealth and the EPA are working towards a resolution that will avoid the federal backstops in the final TMDL, pending ongoing negotiations around the concept of "reasonable assurances." Given that negotiations are underway and that no final decision has been reached regarding the incorporation of backstop limits on point source discharges, we offer the follow perspective on the backstops.

A. Sediment Backstops

The moderate backstop numbers listed above propose a total annual sediment wasteload allocation (WLA) of 0.00 for the Chesterfield Power Station. It is our understanding that calculations performed by Tetra Tech on behalf of the EPA produced the zero sediment WLA because the input deck provided to TetraTech did not include flow data for the Chesterfield Power Station. As a result, the moderate and full backstops propose incorrect and not reasonable achievable sediment WLAs for the Chesterfield Power Station. Dominion is providing the following flow data to the Commonwealth and EPA to correct the input decks being used to develop the sediment TMDL:

Outfall 004, 2006-2009: Average Flow 10.04 MGD Maximum Flow 12.06 MGD

Outfall 005, 2006-2009: Average Flow 2.74 MGD Maximum Flow 4.59 MGD

As acknowledged by EPA in its evaluation of the Virginia WIP, the sediment reductions called for in the Virginia WIP exceed the sediment load reduction goal set by the EPA by as much as 12%. (EPA's Draft May TMDL Executive Summary at 7). Moreover, the EPA has noted that wastewater sources of sediment are an insignificant portion of the Chesapeake Bay sediment load. In Section 4.5.2 of the EPA's draft TMDL, EPA indicates that from the 75 significant and 1,446 non-significant industrial discharges, the estimated 2009 TSS wasteload to the Chesapeake Bay is 0.5% of the total load. Furthermore, in Section 4 of the draft TMDL the EPA determines, "[m]odeled sediment loads for those [industrial] facilities are not present because wastewater discharging facilities represent a de minimis source of sediment." (EPA Draft TMDL at 4-17). The small amount of sediment from industrial wastewater is controlled in VPDES permits by existing technology-based limits in the form of monthly average Total Suspended Solids (TSS) concentrations. Additionally, we wish to note that TSS and sediment resulting from stream bank erosion and soil erosion are not the same. Much of the sediment of concern with regards to the Chesapeake Bay is inorganic in nature and is associated with erosion from upland land surfaces and erosion of stream corridors. By contrast, the sediment found in most industrial processes is organic. Existing cost-effective filtration technologies are not likely to achieve EPA's backstop allocations, because the organic nature and small size of the industrial TSS makes it difficult to settle. While we support the collective effort to restore water clarity and submerged aquatic vegetation through the control of sediment, we believe that the sediment backstops for point sources are not prudent given existing controls and the de minimis impact of such discharges.

B. Nutrient Backstops

Under the Water Quality Management Planning Regulation (9 VAC 25-720) and the resultant Watershed General Permit for Total Nitrogen and Total Phosphorus Discharges and Nutrient Trading in the Chesapeake Bay Watershed in Virginia (9 VAC 25-820), the Chesterfield Power Station holds a nitrogen WLA of 352,036 pounds and a phosphorus WLA of 210 pounds. We are currently able to comply with the nitrogen and phosphorus WLAs. At this time, however, compliance with the Chesterfield Power Station's phosphorus WLA can be accomplished only through the purchase of available nutrient credits.

Over the past several years Dominion has made a considerable investment in state-of-the-art air quality control equipment, and we expect to install additional emissions control technologies to achieve various emissions reductions in the future. An unintentional outcome of the operation of this air emissions control equipment is the addition of nutrient loadings. For example, Dominion is in the process of adding a second Flue Gas Desulfurization (FGD) unit at Chesterfield. As the two FGD units become fully operational, they are expected to impact the nitrogen and phosphorus discharges at the station. However, these emissions controls remove substantially more nutrients from the air than will be returned to the water.

The Chesterfield Power Station also reclaims and reuses wastewater from the Proctors Creek Wastewater Treatment Plant. This beneficial reuse of water at the Chesterfield Power Station reduces water intensity at the facility and helps conserve the water resources of the Commonwealth. At the time WLAs were assigned to the Chesterfield Power Station under the Water Quality Management Planning Regulation, the reuse of the Proctors Creek WWTP effluent was not under consideration. Without out careful consideration of benefits of this reuse of water it is could become even more difficult for Dominion to comply with its existing nutrient WLAs.

The Chesterfield Power Station also has a large volume of non-contact cooling water. We ask that the Commonwealth continue to exclude non-contact cooling water discharges from applicable WLAs. We also ask that DEQ give consideration to excluding other similar discharges that contain "background" nutrient loadings such that WLAs are based upon net loadings.

Dominion urges the EPA to maintain the current WLAs for the Chesterfield Power Station. The nutrient reductions contemplated in the moderate and full backstops become achievable only if sufficient nutrient credits are available for exchange. We support provisions that allow nutrient trading and offsets to achieve water quality goals. However, we are concerned that the federal backstops may result in a nutrient credit market where demand exceeds supply.

Comment ID 0565.1.001.003

Author Name: Faggert Pamela

Organization: Dominion Resources Services, Inc.

II. Proposed Limits for Non-significant Dischargers

The EPA proposes the following WLAs for non-significant Dominion facilities in the Chesapeake Bay Watershed (Table Q-2 of the Draft TMDL):

[Please see table on page 4 of the original letter EPA-R03-OW-2010-0736-0565.1]

Upon inquiry to the EPA, however, it was determined on November 1, 2010 that the backstop numbers listed in Table Q-2 for non-significant Dominion facilities were incorrect. The EPA has provided the following corrected WLAs:

[Please see table on page 5 of the original letter EPA-R03-OW-2010-0736-0565.1]

We appreciate EPA's willingness to reexamine the backstop numbers for our facilities and their gracious provision of corrected numbers. However, we are concerned that both the original and the corrected backstop numbers do not comport with actual loadings at these facilities. If the backstops move forward, we encourage the EPA to develop WLAs that represent the effluent characteristics and recognize the nature of operations at each facility. New WLAs that are incongruous with actual discharges, loadings, and treatment capabilities may ultimately result in WLAs that fail to ensure the maintenance of water quality standards.

For example, the corrected full backstop numbers listed above propose nitrogen, phosphorus, and sediment WLAs of 0.00 for the Mt. Storm Power Station. As discussed with the Chesterfield Power Station sediment WLA, the input decks used to calculate these WLAs relied on incorrect flow data. Prior to November 2009, the Mt. Storm Power Station did not have instrumentation to measure flow at Outfall 001. Since the installation of flow measurement instrumentation, flows from Outfall 001 have ranged from a monthly average of 0.55 MGD to as much as a monthly average of 152 MGD. At this time, Dominion has only the one year of measured flow data for outfall 001 at Mt. Storm and is concerned that the figures shown above may not reflect future operations and flows. If the federal backstops move forward, we hope that there will be an opportunity to gather more accurate flow data before establishing WLAs for nutrient and sediment loadings at the Mt. Storm facility.

We also note that the WLAs proposed in the backstops do not distinguish between stormwater outfalls, non-process, process, and sewer outfalls at or between the facilities listed above. In general, the Dominion facilities listed above have several outfalls. Additionally, the Castlewood Facility is a biology, recycling, and materials handling facility with one discharge, a stormwater outfall. However, in the backstop, a WLA has been developed for the Castlewood Facility that is identical to WLAs developed for the Yorktown Power Station, the Chesapeake Energy Center, and the Dominion Gravel Neck and Surry Power Station. The capability to treat nutrients and sediment sufficiently varies greatly between stormwater and industrial sources. Accordingly, without further clarification, it seems that setting identical numerical limits for stormwater and industrial outfalls will not produce the "reasonable assurances" that the EPA desires.

Similarly, the EPA proposes nitrogen, phosphorus, and sediment WLAs of zero for the Dominion Gas Transmission Sabinsville Station. The Sabinsville Station discharge results from a stormwater pond outfall. Flows at this facility are not measured due to the fact that flows generally occur only during periods of rain. Freshwater springs at the facility also create some flow from the stormwater pond, however, during periods of no rainfall no flows may occur.

The Dominion Gas Transmission Tioga facility represents yet another distinct category of discharge. The discharge at this facility is the result of a sewage package plant. The flows from this discharge are not measured due to the intermittency of the discharge. At this time, the facility is manned by 2 people over a 24-hr period. It is estimated that the flows from this facility are somewhat less than the sewage discharge resulting from a typical household of 3 or 4 people.

We understand that the EPA is looking at all types of industrial outfalls to find reductions in the absence of "reasonable assurances" that reductions will be achieved from all contributing sources. However, we request that the EPA take into

account the unique differences in stormwater, process water, non-process water, and sewer water when evaluating the appropriateness of controls on affected facilities. In order to aid the EPA, we are providing a chart in Appendix A [Comment Letter contains additional information in the form of an attachment. See original comment letter 0565.1] that illustrates the various outfall types at potentially affected Dominion facilities.

Dominion is also concerned that stale data and data aggregated from sources other than the permittee have been employed to develop the non-significant backstops. EPA recognizes that most non-significant facilities do not have monitoring data for nutrients and sediment, since such facilities have not been required to monitor for these effluent constituents. Thus, when developing the draft TMDL backstops for non-significant facilities, the EPA relied upon estimates from Tetra Tech based on the Typical Pollutant Concentrations for non-significant industrial plants.

The aggregation of data from across an industry or industry sector may produce illogical results when applied to an individual facility, especially where individual facilities within an industry can have very different effluent characteristics. In such a case, the employment of typical pollutant concentrations for an industry may produce permit limits that fail to recognize facility capabilities and protect water quality.

Dominion is concerned that the EPA industry concentration estimates do not represent the characteristics of the effluents at our facilities in a manner that is accurate or appropriate to ensure the protection of water quality. We have examined the non-significant facilities listed above, but we have been unable to make any determinations on the appropriateness of the limits proposed by the EPA due to the lack of sufficient, representative monitoring data for nitrogen, phosphorus, sediment, and flow at our facilities. We, therefore, support requests made from the Bay jurisdictions to monitor for nitrogen, phosphorus, sediment, and flow at non-significant facilities.

Response

EPA's allocation applicable to WWTPs and industrial sources including the commenter has changed significantly based in part on receipt of a Final Phase I WIP from the State, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter. Implementation of the NPDES effluent limits and control actions, regardless of whether they are WIP or backstop derived, will be accomplished through the NPDES permit consistent with the WLAs, and those limits will be developed using actual site conditions. The allocation commenter discusses is the backstop allocation. Backstop allocation scenarios were designed to have a specific control level on all facilities in the absence of consideration of actual site specific technologies. Thus, backstop allocations represent an overall level of control, rather than site specific application. Backstop allocations may not appear reasonable for facilities in the absence of information relating to specific levels of control. Backstop allocations are only intended to be used by EPA in this TMDL in the event that other reduction scenarios fail to meet required water quality standards

EPA's Backstop Waste Load Allocations for Glatfelter and Other Dischargers Are Incorrectly Calculated and Unattainable

In the text of the Executive Summary and in several chapters of the main text of the TMDL document (for example, see Table 8-6 in Section 8, page 11), EPA states that it their intent to force point source municipal and industrial waste water treatment plants to attain final effluent concentrations of 3 mg/l total N and 0.1 mg/L total P at design flows in states that have been designated as having a high-level backstop allocation. EPA states that these concentrations are the "advanced wastewater treatment limits of technology" for nitrogen and phosphorous. However in the supporting document Table Q-1 - Proposed WQS - Annual Loads, EPA has calculated a total annual Phosphorous load for Glatfelter of 847 pounds per year, which translates into a final effluent concentration of less than 0.01 mg/L or an order of magnitude less concentration than EPA itself admits is technically feasible. The same difference between the EPA limit of technical feasibility and the allocated load is present for most other municipal and industrial dischargers, at least in Pennsylvania.

It is unclear if it is really EPA's intent to make municipal and industrial dischargers attain final effluent concentrations of nitrogen and phosphorous that EPA itself admits are not attainable or if EPA has made a significant error in its modeling of the waste load allocations. In any case, EPA needs to make the results of the modeling consistent with its own admission about the technological limits of waste water treatment plants to remove nutrients.

Response

EPA's allocation applicable to WWTPs and industrial sources including the commenter has changed significantly based in part on receipt of a Final Phase I WIP from Pennsylvania, and consideration of comments including this one. Please see Section 9 and Appendix Q for the final WLA applicable to commenter.

EPA's Proposed TMDL Does Not Properly Account for the Removal of Nutrients in Intake Waters

Using NPDES permit effluent monitoring data and upstream and downstream water quality data collected as part of the NCASI Long Term Receiving Water Study, Glatfelter has demonstrated to Pennsylvania DEP that the mill removes more nutrients from Codorus Creek than it return to the creek in its effluent discharge.

In a response to a request from PA DEP, Glatfelter on June 12, 2008 submitted a "Significant Industrial Discharger" report to the department documenting the operation of the mill's waste water treatment plant and summarizing the available data on nutrients. (See Attachment C) [Comment Letter contains additional information in the form of an attachment. See original comment letter 0604.1] In particular, Glatfelter documented that the mill is a net sink for total nitrogen. At a location upstream of the discharge but downstream of the intake, the average total nitrogen concentration

of Codorus Creek (3.90 mg/L) was higher than the water quality monitoring station downstream from the discharge (3.36 mg/L), while the average effluent concentration (2.56 mg/L) was lower than either the upstream or downstream station.

The mill updated this information in a May 21, 2010 letter to PA DEP and documented that in 2008 and 2009, the effluent concentration of total nitrogen was 2.4 mg/L while the upstream and downstream concentrations were 4.03 and 3.45 mg/L, respectively. (See Attachment D [Comment Letter contains additional information in the form of an attachment. See original comment letter 0604.1]) Likewise for total phosphorous, in 2008 and 2009, the downstream concentration of total phosphorous was less than the upstream concentration of total phosphorous for 46 of 70 paired samples, while the absolute concentration differences were not as remarkable as those noted for nitrogen.

EPA's proposed TMDL should provide Glatfelter and other dischargers that remove nutrients, with a proper nutrient credit or at the very least should not require them to remove additional nutrients.

Response

EPA acknowledges the beneficial effects of the paper mill that results in a decrease of nitrogen concentration between influent and effluent. Commenter states that that this mill has effectively lowered the effluent nitrogen concentration to an average of 2.4 mg/l which already is within the range achievable by technology. If additional treatment is necessary, such technologies as additional biological treatment, filtering or clarification may be considered. Fortunately, the final state WIPs were much improved, allowing EPA to choose to reduce or remove the backstop allocations in the final TMDL.

For those facilities which discharge to nutrient impaired streams, purchasing of nutrient credits is not allowed by the PA DEP. Therefore, how is the industrial facility on that impaired stream to meet its allocations if the caploads are below the limit of treatment technology and nutrient credits cannot be purchased?

Organization:

I am especially concerned that controls on water pollution from animal feces from confined animal feeding operations will not be strong enough. However, the targets are at least a very good start toward that goal.

Response

Please refer to response to comment 0228.1.001.002. EPA's evaluation of the final WIP can be found in Section 8 of the final TMDL report.

Comment ID 0102-cp.001.002

Author Name: Goggin Brenna

Organization: Delaware Nature Society

In Delaware, like most of the Bay states, agriculture makes up almost half of the land use, meaning the pollutant loads from agricultural land uses are comparable to residential land uses on a per acre basis. The Society supports the EPA's regulatory requirements for point sources such as CAFO's. These stringent regulations will ensure CAFO's reduce their nutrient discharge of nitrogen necessary to achieve the objectives of the TMDL for the Chesapeake Bay.

Response

The EPA regulates animal feeding operations (AFOs) that discharge or propose to discharge pollutants into waters of the United States under its Concentrated Animal Feeding Operation (CAFO) regulations. Poultry operations in Delaware with over 37,500 birds are required to get permits and implement nutrient management plans (NMPs). These NMPs outline how the operations manage their manure so that none of it runoffs into the Chesapeake Bay.

At this time the effectiveness of the agricultural BMPs is based on limited research. The calculations of the nutrient and sediment reduction efficiencies are based on current best scientific estimates. Due to the limited number of field studies, the accuracy or reliability of these agricultural BMPs is not available.

We have confidence that our research and academic communities are capable of determining the reliability of the agricultural BMPs if funds are provided to accomplish such an objective. Adequate field testing of the Ag BMPs is needed to ensure that the reduction of nutrients and the reduction of sediment are positively correlated. If research

reveals that certain practices have a negative correlation then implementation of these certain practices may not be advisable.

Livestock Exclusion of Streams Health Risk Assessment

Exclusion of livestock by creating riparian buffers would increase the wildlife habitat and the potential reservoir of infection of wildlife diseases.

There about 150 diseases that can be transmitted from wild and domestic animals to humans.[FN 5]

Alternative Livestock Watering Beneficial to Herd Health

Research indicates that providing alternative water source for livestock would result in increased weight gains.[FN 4]

[FN 4] Veira, D., Meristem Land & Science, Water wisdom boosts cattle performance, Jan. 29, 2003 [FN 5]Tortora, G., et al, Microbiology An Introduction, Fourth Edition

[FN 5] Tortora, G., et al, Microbiology An Introduction, Fourth Edition

Response

Fencing cattle out of streams is one of the Best Management Practices (BMPs) that EPA advocates for reducing pollutant loads.

Stream fencing prevents physical damage caused by cattle and reduces sediment loads to the Chesapeake Bay. Stream fencing also prevents the direct deposit of manure, urine, and their associated nutrient loads into the stream. Farmers have also told EPA that fencing cattle out of streams improves herd health for the farmer.

Author Name: Ranck Rebecca

Organization: Wenger's Feed Mill, Inc.

The second reason for concern is the proposed ruling in which EPA's TMDL creates more regulations on already heavily regulated Concentrated Animal Feeding Operations (CAFOs). The main concern with this aspect is CAFOs are already regulated through National Pollutant Discharge Elimination System Permits that are required based on the

number of animals housed per farm. These permits are very consistent and require documentation of all aspects of the production facility. These permits require annual and often times several inspections a year. Seeking to further regulate these operations will not be an effective way to reduce more of the nutrient and sediment load contributing to the Bay. Continuing to only target one group of larger producers is not going to further reduce nutrient and sediment loads in large quantities.

Response

EPA recognizes that many animal operations in the watershed are CAFOs covered by NPDES permits that require nutrient management plans. Nevertheless, EPA has documented that significant opportunities still exist for CAFOs to implement improved nutrient management practices that will provide further reductions in nutrients to the Bay watershed. EPA is also considering rulemaking options to reduce nutrient and sediment loadings from animal operations including CAFOs.

Comment ID 0181.1.001.006

Author Name: Ranck Rebecca

Organization: Wenger's Feed Mill, Inc.

Being a regulated entity for poultry layer production, it is difficult to see what reductions will come from further regulating CAFO operations.

Response

Thank you for your comment regarding nutrient reductions from a CAFO. EPA has assessed management practices for the production area of a permitted CAFO that could be included in a NPDES permit. It is EPA's opinion that there are additional management practices e.g. roof gutters to keep clean water clean and stormwater ponds that could capture storm events that would further reduce nutrient runoff. There has also been research done on reducing the release of nitrogen from poultry houses and a few management practices that are being used to reduce nitrogen from being deposited in nearby receiving streams.

Comment ID 0277.1.001.003

Author Name: Shambaugh Brenda

Organization: PA Association of Conservation Districts (PACD)

The U. S. EPA has discussed changing the Concentrated Animal Feeding Operation (CAFO) standards, making them more stringent. If that were to occur, additional, smaller farm operations would be classified as CAFO units. PACD strongly disagrees with this concept. Permitting a farm does not equate to more significant nutrient reductions, and could be counter-productive to our nutrient reduction goals making the concept not only unpractical, but inappropriate. Pennsylvania has more stringent regulations than any other state in the Chesapeake Bay watershed. A more sensible

and realistic approach is to facilitate a concerted outreach program to the agricultural community concentrating on bringing all PA farms into compliance. To help meet this goal, PACD and the Natural Resource Conservation Service (NRCS) is developing, and will soon be implementing, a training program for conservation planning. A private consultant will work with us to facilitate a course entitled "Introduction to Conservation Planning." It is hoped that 60 to 90 conservation district staff, non-profit staff, consultants, state agency personnel, and extension employees will be participate in the program and then deliver direct conservation planning assistance to farm operators and rural landowners throughout Pennsylvania.

Response

EPA appreciates the comment and the commitment of the commenter towards environmental goals. EPA also recognizes that Pennsylvania and the agricultural community, have made significant past progress towards addressing the problem of excess nutrients and sediments to the tidal Chesapeake Bay. The agriculture and point source sectors, including municipal waste water treatment plants, have achieved the majority of the pollution reductions to date. Agriculture continues to represent the largest managed land use within the Chesapeake Bay watershed, as well as the largest single source of nutrients and sediment entering the Bay. Consequently, EPA, Pennsylvania and the Bay states are seeking additional nutrient and sediment reductions from the agricultural sector to assist with achieving the water quality requirements of the Chesapeake Bay TMDL through their supporting Watershed Implementation Plans (WIPs). A portion of this continued reliance by EPA on state WIPs to achieve future nutrient and sediment reductions is based on improving the tracking and reporting of both cost-shared and non-cost shared agricultural practices to more clearly document implementation of conservation practices by the agricultural community. If the implementation of the state's WIP should result in fewer nutrient and sediment reductions, exceeding the TMDL load allocations, EPA reserves its authority to take additional federal actions to achieve those allocations. Two possible actions are a revision of the CAFO program requirements through rulemaking and/or NPDES program amendments, and designating additional specific AFO as CAFOs that would then be required to obtain NPDES permits. EPA's backstop allocation include AFOs as well as CAFOs in the wasteload allocation portion of the TMDL but does not by itself require AFOs to apply for NPDES permit or effect their status as nonpoint sources under the CWA. Such backstop allocations are based on the assumption that EPA or the State would take some action in the future. Before an AFO would be required to apply for an NPDES permit, EPA would need to go through the federal regulatory designation process set forth at 40 CFR 122.23(c). See Section 8.3 for more detailed discussion of backstop allocations.

Organization: New York State Department of Environmental Conservation

NY's Technical Standards Afford Superior Protection of the Environment.

There have been several recent media references to the shortcomings of phosphorus runoff management tools and how these tools allow continued degradation of the Chesapeake Bay. Contrary to some generalized statements made about phosphorus (P) indices in the public press, the New York P index (NY PI) does not allow unlimited application of manure. The NY PI, introduced in 2001, is an indicator of P loss potential and allows for ranking of fields for risk of loss of both particulate and soluble P forms, reflecting the predominant pathways for P runoff. The NY PI requires P

application restrictions if P runoff potential is high and elimination of P application (manure or fertilizer) where P runoff risk potential is very high. Where P sources (soil, manure, fertilizer) and P transport risk potential are both high, the NY PI causes farms to change management of a field to reduce the risk of P loss or apply manure elsewhere. The NY PI and related guidance continue to undergo changes as insights are gained into P movement in our landscapes but we are confident that the NY P index is an effective and appropriate tool for environmental protection. [FN17]

New York's CAFO farms must comply with stringent technical standards designed to afford superior protection of the environment. The technical standards take the form of USDA-NRCS conservation practice standards and state regulatory requirements, both of which exceed the minimum requirements set by EPA and USDA-NRCS and are tailored to be most effective for NYS conditions based on applied research from Cornell University - NYS' land grant university. As such, CAFO farms must utilize professional engineers in the design and implementation of their waste storage structures, must adhere to stringent setbacks for nutrient applications in farmlands adjacent to New York's waters and must make those applications in accordance with science-based nutrient management plans. In the New York State portion of the Chesapeake Bay watershed about 42% of the total animals units are regulated under the stringencies of the New York CAFO permit. They have had nutrient management plans, developed by a certified planner, for approximately 10 years. These plans, at a minimum, must be balanced for crop N needs in accordance with Land Grant guidelines and, if the NY PI score becomes high, or very high, P applications from manure or fertilizer must be limited (high) or cease altogether (very high). Each field on these farms needs to be evaluated for the NY PI and these assessments have often stimulated both redistribution within the farm and collaborative agreements between dairy farmers and their cash grain or vegetable producing neighbors. The CAFO program ensures that manure nutrients from large farms are recycled to grow crops rather than allowing those nutrients to reach the waters of New York State[FN18] It is these stringent technical standards and the CAFO program's proven rate of implementation and enforcement that protects water quality within the Bay water shed and is responsible for a significant portion of the nutrient load reduction New York has been able to achieve in the last ten years.

Additionally, in New York, in order for farms to receive state or federal funding for implementation of best management practices those practices must be designed, constructed, operated and maintained in accordance with the same USDA-NRCS conservation practice standards required in the regulatory CAFO program. New York NRCS has, for the past four years, required producers to have a current CNMP to be eligible for EQIP funds to install livestock waste practices. Only practices required in the CNMP are eligible for EQIP funding. NRCS also provides funding for the development of CNMPs for producers who do not have them. Similarly, any practice installed under the AEM program must meet these same technical standards.

2. EPA is Confusing Regulation with Impact.

EPA, through this TMDL, has mistaken regulatory initiatives with solutions that will result in restoration of Chesapeake Bay. Many of the immediate Bay states have nutrient management programs "on the books" that do little to control manure distribution or reduce applications rates and are very liberal compared to New York's nutrient guidelines that are required to be implemented by all CAFOs and many AFOs. Consequently, regardless of barrier type BMPs, many farms and fields in the immediate Bay states receive nutrient rates that cannot be recycled by crops, and the Chesapeake Bay is still impaired. What EPA must do is peer beyond the regulatory veil and look to states with guidelines that actually protect water quality, not the status quo, with documented success and clean water and demand the same results from those states that continue to produce poor water quality. An unbiased evaluation of the nutrient management programs of the various Bay states would identify those states whose guidelines protect water

quality, and provide a basis for a model program that would, if consistently and uniformly implemented, result in tangible benefits to the Bay. The deliverables in the state watershed implementation plans must include documentation of soil test nutrient levels being restored to agronomically appropriate levels without continued reliance on ammonia volatilization or multiple years worth of P application or P applications to crop removal regardless of how high the soil test P level is to make the nutrients "balance". It is unreasonable to expect the land in these areas to be able to recycle the nutrients, in particular the phosphorus, from many highly dense areas of animal agriculture including numerous landless poultry operations.

New York State animal agriculture is dominated by dairy cows and our dairy cow feeding programs are dominated by home grown forages. Home grown forage typically includes hay, hay crop silage and corn silage or the like. The typical dairy cow gets about one-half or more of her total diet from forage. Forage is bulky and heavy (often 60-70% water) and so is usually produced relatively close to where the cows are located. This means that most New York State dairy farms tend to have a fairly large land base (resulting in a relatively low animal density of 0.43 animal units per acre) that allows farmers to produce low cost feed nearby AND to use manure as the nutrient source for those crops in a reasonably balanced fashion, reducing the need for fertilizer [FN19]

EPA's agricultural-related focus must be on the lands in the Chesapeake Bay watershed and respect that there are places that simply have too many animals for the associated land base. Unless EPA addresses the underlying problem with how some types of agriculture are organized in some areas, there is no suite of BMPs or backstop measures that can restore the Chesapeake Bay: there are simply too many manure nutrients chasing too little land to solve this with land-based BMPs alone.

Consider the following points:

1) New York producers have made huge strides in reducing fertilizer and feed use of P over the past 10 years. The amount of fertilizer P used on farms decreased from 35.1 million lb P in 1997 to 28.1 million lb of P in 2002, down to 23.2 million lb of P in 2006 amounting to a shift in average P fertilizer application rate from 9 lbs P/acre (equivalent to 21 lbs P fertilizer/acre) in 1997 to 6 lbs P/acre (equivalent to 15 lbs P fertilizer/acre) in 2006 (Figure 1). Combine these statistics with conservative estimates for reduction in feed P use by dairy farms (23%), amounting to a reduction of approximately 9 million pounds of P per year (about 12 of this reduction due to smaller dairy cow population, the other 12 due to active decisions by farm managers to reduce ration P levels), and it becomes evident that New York State producers have reduced P use by tens of millions of pounds per year in the last decade, while improving overall productivity as shown by an increase in the average crop yields and milk production over the same time period. These changes mean significantly less P is being brought into the state and hence less is prone to environmental loss.[FN20]

2) The reductions in P use in crop production and dairy rations have changed New York State from a P excess state just ten years ago to one that is now in approximate balance for agricultural P sources. This means that currently all the fertilizer and manure P managed by New York State farms equals the amount of P removed by crops. This does not mean that every field is in perfect P balance, but clearly shows that we do not have significant P excesses in this state. [FN21]

3. New York's Agricultural Environmental Management (AEM) Program

There are two primary and intertwined programs in New York that address agriculture: the New York CAFO regulatory

program and the NY Agricultural Environmental Management Program. It is important to note that the New York CAFO program covers all farms with as few as 200 cows with binding permits, whereas under the USEPA program, only some farms with greater than 700 animals would be covered by regulatory permits. 65 CAFOs are permitted in the New York Chesapeake Bay watershed. New York's AEM program is currently working with 2,285 additional farms in the New York Chesapeake Bay watershed. New York's CAFO and AEM programs cover 95% of the dairies in the New York portion of the Chesapeake Bay watershed.

New York State supports "Environmentally and Economically Sustainable Agriculture."

New York farmers are active stewards. More than 12,000 farms statewide of all types and sizes are involved in AEM, a program that responds to environmental needs with cost effective improvements that benefits farms and communities. Using a voluntary, yet highly interactive, incentive-based approach to meet local, state and national water quality objectives, AEM has become the primary program for agricultural conservation in New York. AEM core concepts include an incentive-based approach, attending to specific farm needs and reducing farmer liability by providing approved protocols to follow. AEM provides a coordinated and confidential planning assessment method that addresses watershed needs. Initiation of the assessment process is recognition of the impact farm activities have on the environment.

[PLEASE SEE FIGURE ON PAGE 22 OF THE ORIGINAL LETTER #0389]

Tier 1: inventory of farm resources, environmental concerns and interests;

Tier 2: assessment of environmental risk and existing stewardship at the farm and watershed scales;

Tier 3: conservation planning to address environmental concerns with BMPs according to NRCS planning methods;

Tier 4: implementation of BMPs according to NRCS standards (includes contractual obligations/timelines, use of certified professionals such as PEs, design documentation and on-going O&M requirements); and

Tier 5: evaluation of BMPs to ensure on-going environmental protection.

4. New York State Environmental Protection Fund - Agricultural Non-Point Source Abatement and Control Grant Program (AgNPS)

--\$81 million has been allocated through AgNPS for conservation practices over 16 rounds of funding since 1994.

--Plus \$25 million in cash and in-kind investment by farmers.

--USDA-NRCS programs roughly match AgNPS funds annually.

AgNPS and NRCS programs are the major pathways for implementation and have contractual requirements during and after implementation.

Response

EPA appreciates the comment and the commenter's commitment to an environmentally sound agriculture program. EPA disagrees that the TMDL requires AFOs to apply for NPDES permits.

See response to Comment ID 0277.1.001.003 for more discussion of the backstop allocation.

Thank you for providing a comment on New York's Technical Standards. You indicate that CAFO farms must comply with stringent technical standards designed to afford superior protection of the environment. The technical standards take the form of USDA-NRCS conservation practice standards and state regulatory requirements, both of which exceed the minimum requirements set by EPA and USDA-NRCS and are tailored to be most effective for NYS conditions based on applied research from Cornell University - NYS' land grant university. During NY's development of the agriculture Watershed Implementation Plan there were several conference calls between EOA and the NY agriculture work group which was very helpful in understanding some important environmental issues related to technical standards and in particular appropriate agronomic application rates for land application of manure and to a lesser extent poultry litter. It was EPA's understanding that more detailed information would be included in NY's final WIP that would provide adequate documentation of progress made over the years by Cornell University and other state and local agencies involved in addressing technical standards. As we await the final WIP submission EPA is planning on reviewing all state CAFO related technical standards as part of a national analysis to insure that state adopted technical standards are as protective of water quality and result upon implementation the reduction of harmful nutrients.

Organization: Pennsylvania Farm Bureau

8. EPA's preoccupation with imposing federal permitting requirements on all farms is counterproductive to environmental quality.

EPA seems to be preoccupied with regulating all of Pennsylvania's animal farms as Concentrated Animal Feeding Operations ("CAFOs") and requiring all Pennsylvania farms to obtain National Pollutant Discharge Elimination System ("NPDES") permits as a condition for farm operation. Frankly, this is regulatory overkill. Most smaller family farms cannot afford the thousands of dollars of additional costs they will absorb to attain the services needed in the formal presentation and approval of NPDES permits. And these additional costs will unnecessarily divert monies that could be otherwise used to carry out environmental practices identified in manure management and soil conservation plans.

We believe the marginal environmental benefits to be attained under a directive for NPDES permitting of all animal farms does not justify the commitment of the high costs that Pennsylvania farmers would need to incur.

Response

EPA disagrees that the TMDL requires AFOs to apply for NPDES permits.

See response to Comment ID 0277.1.001.003 for a more detailed discussion.

Comment ID 0466.1.001.005

Author Name: Suarez Julie

Organization: New York Farm Bureau (NYFB)

In contrast to other Bay watershed states, New York's BMPs and certified nutrient management plans (CNMPs) have greater efficacy and impact because they are already utilizing advanced agronomic science in their nutrient management efforts and working off of an elevated standard of water quality protection. For example, New York is nutrient deficient and maintains extensive erosion control because of its progressive CAFO permit program. No other Bay state has accomplished this through their state nutrient management program. New York's CAFO program has been designed with the needed flexibility and rigor to protect water quality while adopting better sciences and management approaches in nutrient planning both in the field and on the farmstead.

For this reason, NYFB strongly objects to detailed federal CAFO regulatory requirements that do not take into account geographic and farmstead specific differences, creating significantly more burden on regulated farms and reducing environmental effectiveness. For example, EPA's CAFO regulations drastically increase paperwork burdens on farms and state regulatory agencies while actually preventing the spreading of manure over a larger number of acres. Given this track record, instilling new planning requirements on a federal basis would not be productive given the vast differences in soil types, contours and climate that exist throughout the Chesapeake Bay Watershed.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. By June 30, 2012, EPA plans to propose revisions to its Concentrated Animal Feeding Operations (CAFO) regulations under the Clean Water Act. EPA may propose expanding the universe of CAFOs by means which might include making it easier to designate an animal feeding operation as a CAFO or increasing the number of animal operations that would qualify as CAFOs. EPA may also consider requiring permitted CAFOs to implement "next generation" nutrient management plans and requiring off-site manure transfer reporting and recordkeeping. EPA will take final action on the CAFO regulations by June 30, 2014. These measures represent EPA's intent to fine-tune the CAFO regulations to ensure they are effective at achieving the objectives of the CWA with special intentions to the Chesapeake Bay TMDL. EPA acknowledges the critical role that states play in providing the appropriate financial and technical assistance necessary to ensure that individual farms are in compliance with federal and state regulations.

7. We do not support the notion of increasing NPDES permitted activities obligation to Bay restoration. In our

experience, requiring a majority of farming operations to obtain a CAFO will not yield a clean Chesapeake. Permits and paperwork do not equal clean water. People and Practices will restore the Bay.

Response

EPA disagrees that the TMDL require AFOs to apply for NPDES permits under the CWA. See response to Comment ID 0277.1.001.003 for further discussion.

Comment ID 0482.1.001.002

Author Name: Bodine Susan

Organization: Agricultural Retailers Association et al.

Instead of letting states build on that success, EPA is attempting to impose a top-down, federal regulatory approach on the agriculture and forestry communities. Thus, it appears that EPA's proposals are attempts to drive livestock and agricultural operations out of the Chesapeake Bay region through unnecessary and overly burdensome regulation. In fact, by attacking efficient practices, such as increasing crop yields by using nutrients or increasing animal production efficiencies, EPA may impede agriculture's progress as a steward of the environment.

Response

Thank you for your comments about EPA involvement with the livestock and poultry industry. EPA wants to assure you that we strongly believe that agricultural land use activities are far better for the environment than converting these valuable lands to urban. We have recognized that the agricultural sector has made a lot of progress in implementing a variety of management programs and will be relied upon to continue to help restore the Chesapeake Bay. Yet, after 25 years of efforts to restore the Bay, the Bay remains impaired. For this reason it is time to pursue newer, bolder approaches to achieving the necessary controls.

Comment ID 0586.1.001.004

Author Name: Fischer Micaela

Organization: The Pew Environment Group

Despite past and continuing efforts, including financial incentives, technical assistance, education and voluntary programs, there is much more that agriculture can do throughout the watershed to reduce its impact on the Bay. In particular, we believe that improved management of the huge volumes of manure generated by large-scale operations would result in significant and cost-effective pollution reductions from agricultural sources, and we urge the Agency and the states to place a renewed focus on the management of manure from concentrated animal feeding operations in the context of this TMDL.

We concur with those who stress the importance of maintaining agriculture and agricultural land in the Bay watershed region, but we also believe that releases from agriculture can be curbed dramatically without losing the farming that is an important economic sector and cultural element of the Bay region. In addition, we understand that many individual farmers have adopted important conservation practices over the years and we commend them for their stewardship initiative. Taken as a whole, however, the agricultural sector-like others in the Bay region-has yet to take all of the actions that will be necessary to restore the Bay and protect it for future generations.

In reviewing the draft WIPs, we are disappointed to find that the Bay states, for the most part, rely on a business-as-usual model for managing CAFO releases. In our view, they fall far short of what can and should be undertaken.

Response

EPA notes that the TMDL allocations have been significantly revised based in part of the submission of the Final Phase I WIPs by the States and consideration of comments including this one. Please see Section 8 of the TMDL for a discussion of the final WIPs and EPA allocations. EPA has been engaged in detailed discussions with Region 3 States as they are required to update or develop CAFO regulatory programs to conform to EPA's 2008 CAFO regulation. Over the past year EPA has approved state CAFO programs in Virginia, Maryland, West Virginia and are evaluating Delaware's program submission. Discussions with Pennsylvania continue as EPA looks forward to finishing that evaluation in 2011.

The commenter points out that state CAFO programs fall short of what needs to be undertaken. In consideration of proposing a revised CAFO regulation, EPA has announced that it will include a proposed Chesapeake Bay CAFO regulation. A draft of the new regulation is due to be completed by 2012. In terms of any specific provisions to share at this time, EPA is not in a position to do so. EPA refers the commenter to Technical program guidance published pursuant to Section 502 of the Chesapeake Bay Executive Order 13508. That Guidance provides comprehensive listing on management practices that may lay the groundwork for revised regulations.

While the new Chesapeake Bay CAFO regulation is being developed, EPA has the authority under current federal regulations to designate certain additional animal feeding operations as CAFO requiring an NPDES permit.

EPA, over the next several years, as the new Chesapeake Bay CAFO rule is developed will continue to provide oversight and review state CAFO programs including technical standards to determine adequate levels of implementation. EPA will also be tracking 2 year milestone activities that include issuance of State NPDES CAFO permits to again determine program adequacy.

Thank you for your comment.

Comment ID 0586.1.001.010

Author Name: Fischer Micaela

Organization: The Pew Environment Group

--Consider Future Growth

Just as the states must plan for future residential and commercial growth in this TMDL, we believe they must consider the future growth of the animal population and its attendant manure generation. Consideration should be given to two areas of growth. First, future increases in animal numbers or animal density, and secondly, increasing soil saturation levels in certain areas. If national and regional trends continue, the number of individual farms may decline but animal numbers or animal density may still increase. The states should establish plans for managing such growth, with the possibility of prohibiting new or expanded large-scale operations in hotspot areas or making approval of new or expanded operations contingent on the adoption of a full suite of state-of-the-art best practices, such as precision farming. We believe that states must also plan for the contingency, which appears likely under current practices, that increases in soil phosphorus saturation will reach critical levels in certain areas and that additional areas will require P based nutrient management. If these conditions are reached, as they apparently have been in some areas, some farmers may not be able to apply manure to their crops, and excess manure may have to be transported even greater distances.

Response

EPA shares many of your concerns as we recognize that there is widespread over application of fertilizers and manures for a variety of reasons principally focused on obtaining maximum crop yields while minimizing the amount of land needed. We have taken a strong position in the Chesapeake Bay Executive Order Technical Guidance - Section 502 document in that for levels of soil phosphorus above 20% we are recommending zero application of organic fertilizers.

We would anticipate that States because of increasing levels of soil phosphorus levels in a number of counties throughout the Chesapeake Bay would commit to developing a science based comprehensive plan that address P imbalances over time with the ultimate goal of reaching P agronomic rates for maximum crop yield. Plan components could include:

- Commitment to develop approaches for P management beyond the P index that are consistent with EPA's 502 guidance in order to reach ultimate goal of P agronomic rates.

SERA-17 national phosphorus scientists have been very clear that the P index is an interim step and won't solve the P imbalances in high density animal areas. Furthermore, the USDA CEAP study indicates weaknesses in the current nutrient management approach resulting in 81% of cropland requiring additional nutrient management. Therefore, the P management approach should go beyond the P index and include interim goals that continually move you closer to reaching agronomic P rates such as:

- o Revising P index, followed by
- o Capping manure application at P saturation levels of 35% or greater by date certain, followed by
- o Capping manure application at P saturations of 20% or greater by date certain.

- Commit to developing a plan for targeted education/outreach to producers to explain the need to phase out manure application on high-P soils.

- Commit to work with USDA to secure federal funding to help with this transition. For the poultry sector this could be a commitment to work with NRCS, Conservation Districts, Poultry integrators, and other private investors to encourage producers to sign up for the NRCS EQIP Alternative Manure Use program. For dairy, this could be a commitment to work with USDA to fund

dairy manure storage facilities were needed to help with transition.

- Commitment to explore alternative uses for manure.
- Commit to date by when this new P management approach will be incorporated into the revised Nutrient Management Plans

From review of the large body of literature on agriculture and water quality, we conclude that farming and livestock operations can reduce their loadings to the Bay significantly and thereby mitigate the need for Bay communities to undertake at least a portion of the most expensive alternatives. Farmers should not bear a disproportionate share of the Bay's "pollution diet," but should shoulder a fair share of the burden required to restore this national treasure. We are hopeful that the agricultural community, the Bay states and EPA will rise to the challenge with innovative and effective programs for controlling CAFO-related nutrient releases.

We appreciate the opportunity to share our perspective.
