## Executive Summary

The United States Environmental Protection Agency (EPA) Region 1 and United States Army Corps of Engineers New England District (USACE NAE) have been collecting long-term monitoring (LTM) data at the New Bedford Harbor Superfund Site (site) since 1993 to quantify the long-term environmental effects and effectiveness of remediation efforts in the harbor. This report presents data collected for the sixth round of the LTM (LTM VI) performed at the site in 2014. Sediment grabs were collected for chemical and physical testing as well as benthic community analysis to assess sediment conditions. Surficial sediment (top 2 centimeter [cm]) was analyzed for polychlorinated biphenyls (PCBs), total organic carbon (TOC) content and grain size distribution. Sediments from the biologically-active zone (top 10 cm) were analyzed for benthic infauna and grain size. These data will be evaluated by EPA in the context of the broader LTM program (1993 to 2014) to assess spatial and temporal trends in the data and the effects and/or effectiveness of the remedial activities.

The LTM VI sampling was conducted between September 20, 2014 and September 30, 2014. Samples were collected from 79 stations in three main areas in New Bedford Harbor designated as the Upper Harbor (Area 1), Lower Harbor (Area 2), and Outer Harbor (Area 3). Overall, the results were comparable with past LTM years. Total PCB concentrations in sediment were highest in the Upper Harbor and decreased from north to south. The average total PCB concentration was one order of magnitude higher in the Upper Harbor (83.1 parts per million [ppm]) compared to the Lower Harbor (2.82 ppm) and two orders of magnitude higher in the Upper Harbor compared to the Outer Harbor (0.166 ppm). Additionally, total PCB concentrations were more variable in the Upper Harbor (from 0.502 to 934 ppm) compared to the Lower Harbor (from 0.226 to 8.7 ppm) and Outer Harbor (from 0.003 to 0.766 ppm) areas. The Lower Harbor has shown a notable consistently decreasing trend in average PCB concentrations, particularly between the 2009 event and the 2014 event (from 5.1 ppm to 2.8 ppm) and for the Outer Harbor, a slighter decreasing overall trend since the program started in 1993. For benthic infauna, the dominant species in the Upper Harbor were consistent with previous LTM years (*Gemma gemma*, *Mulinia lateralis*, *Streblospio benedicti*, and *Tharyx acutus*) and the diversity continued to increase from north to south with highest diversity observed in the Outer Harbor. The benthic infauna data showed higher species count in all three areas of the harbor than previous years, which has been the trend over the last few LTM surveys (Nelson and Bergen, 2012).

## Chapter 1. Introduction

This report presents the results of sampling activities performed at the New Bedford Harbor Superfund Site in 2014 in support of the long-term monitoring (LTM) program. Sediment grabs were collected to characterize physical, chemical, and biological conditions in the surface sediment. Sediment data were provided to the United States Army Corps of Engineers New England District (USACE NAE), and the United States Environmental Protection Agency Region 1 (EPA), to assess effects and effectiveness of the New Bedford Harbor Superfund remediation efforts.

The remedial action at the site addresses the removal of approximately 900,000 cubic yards of PCB-contaminated sediment. In order to assess the effectiveness of the New Bedford Harbor Superfund remediation efforts, a long-term environmental monitoring plan has been developed by the EPA's Research Laboratory, Atlantic Ecology Division (AED) in Narragansett, Rhode Island. This plan incorporates an intensive sampling and analysis effort for the purpose of quantifying the long-term environmental effects of reduced PCB levels in the sediments and water column of the New Bedford Harbor estuary as a result of remediation efforts. The five previous sampling rounds for this program include: the "baseline" sampling event conducted in October 1993 (LTM I), a second event (LTM II) conducted immediately after removal of the "hot spot" sediments in October of 1995, a third event conducted in 1999 (LTM III), the fourth round of sampling and analysis conducted in 2004 (LTM IV), a fifth round conducted in 2009 (LTM V) and the sixth round in 2014 (LTM VI). This Summary Report describes the results of the sampling activities conducted under LTM VI sampling and analysis conducted in 2014. This work was performed by Battelle for the USACE NAE. CR Environmental participated in the collection activities as a subcontractor to Battelle.

### 1.1 SITE DESCRIPTION

The New Bedford Harbor Superfund Site (site), located in Bristol County, Massachusetts, extends from the shallow northern reaches of the Acushnet River estuary south through the commercial harbors of New Bedford and Fairhaven and into 17,000 adjacent acres of Buzzards Bay (Figure 1-1).

Industrial and urban development surrounding the harbor has resulted in sediments becoming contaminated with high concentrations of many pollutants, notably polychlorinated biphenyls (PCBs) and heavy metals. PCB concentration gradients within harbor sediments generally decrease from north to south. The source of the PCB contamination has been attributed to two electrical capacitor manufacturing facilities that operated between the 1940s and 1970s. One facility, Aerovox Corporation, is located near the northern boundary of the site, and the other, Cornell-Dubilier Electronics, Inc., is located just south of the New Bedford Harbor hurricane barrier. The two facilities are known to have discharged PCB-laden wastes either directly into the harbor or indirectly via discharges to the City's sewerage system. EPA added New Bedford Harbor to the National Priorities List in 1983 as a designated Superfund Site. USACE NAE is responsible for carrying out the design and implementation of remedial measures at the site through an Interagency Agreement with EPA. The remedy for the site includes the removal of approximately 900,000 cubic yards of PCB-contaminated sediment, followed by offsite and onsite disposal of dredged and excavated sediments.

The site has been divided into three geographic areas: the Upper, Lower and Outer harbors, consistent with geographic features, basin morphology and gradients of contamination (Figure 1-1). The Upper Harbor comprises approximately 187 acres, with current sediment PCB levels ranging from below detection to approximately over 1,000 parts per million (ppm). The boundary between the Upper and Lower Harbor is the Coggeshall Street Bridge; at this point the harbor is constricted to a width of approximately 100 feet. The Lower Harbor comprises approximately 750 acres, with current sediment PCB levels ranging from below detection to over 100 ppm. The boundary between the Lower and Outer Harbor is the 150-foot wide opening in the New Bedford hurricane barrier.

## 1.2 PROJECT OBJECTIVES

The objectives of this study were to collect and analyze the sixth round of samples for the LTM project (LTM VI). The data will be evaluated by EPA in context of the broader LTM program (1993-2014) to assess spatial and temporal chemical and biological trends in sediment and biota and the effects and/or effectiveness of the remedial activities.

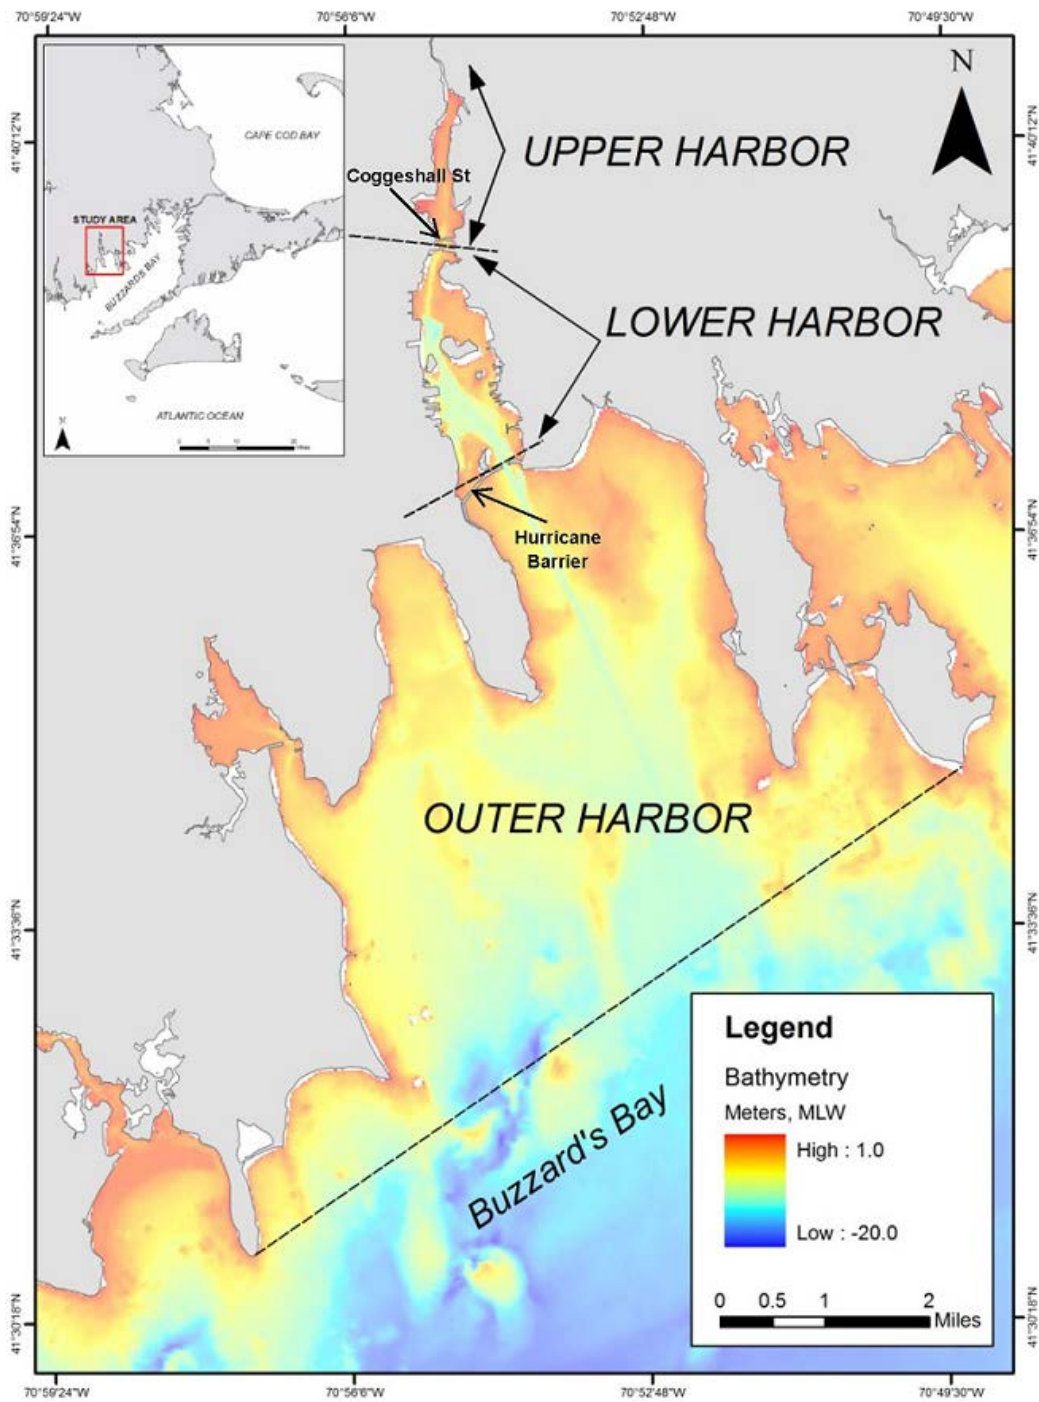

Figure 1-1. Location of the Site in Southeastern Massachusetts

## Chapter 2. Methods

This section describes the methods used to collect and analyze the LTM VI sediment samples for physical, chemical and biological analysis. These methods are described in detail in the approved project Field Sampling Plan (FSP) and Quality Assurance Project Plan (QAPP) (Battelle, 2014a and 2014b).

### 2.1 LTM VI SAMPLING APPROACH

The sampling approach for the LTM VI study included collection, processing and analysis of sediment grabs to determine the physical, chemical and benthic infauna composition of the sediment at each monitoring location. Sediment samples were collected at each of the 79 stations for physical and chemical (grain size, total organic carbon [TOC] content, and PCBs) analyses, as well as biological analysis (i.e., benthic community analysis). In situ water quality measurements (temperature, salinity, turbidity, and dissolved oxygen [DO]) were also collected at each station.

#### 2.1.1 SEDIMENT AND WATER QUALITY SAMPLING

The sampling locations were provided by USACE NAE, and were selected using a systematic, probabilistic sampling design developed by EPA/AED in Narragansett, Rhode Island. This unbiased design allows the three segments of the harbor to be compared spatially and temporally to quantify changes resulting from dredging the contaminated sediments. Sampling was conducted at 79 separate stations located in the three distinct geographical areas of New Bedford Harbor:

- Upper Harbor (Area 1) – Wood Street to the Coggeshall Street Bridge (27 stations)
- Lower Harbor (Area 2)– Coggeshall Street Bridge to Hurricane Barrier (29 stations)
- Outer Harbor (Area 3)– Hurricane Barrier to edge of Fishing Closure Area III (23 stations)

Within each of the three areas a hexagonal sampling grid was established by EPA AED. The sampling grid and station locations are shown in Figure 2-1. Because the areas in each of the three areas become progressively larger, the hexagonal sampling grid is proportionally adjusted to obtain approximately the same number of stations in each area. The hexagons in the Upper Harbor have a radius (center to side mid-point) of 88 meters; in the Lower Harbor the radius of each hexagon is 175 meters, and the hexagons in Outer Harbor have a radius of 793 meters.

The sampling effort followed the methodology detailed in EPA's Environmental Monitoring and Assessment Program (EMAP) (Versar, 1991). Sample collection procedures and grab acceptability were in accordance with Section 6 (Sediments Collection) of the Coastal 2000 Northeast Component: Field Operations Manual (Appendix A). All samples were collected from Battelle's Research Vessel (R/V) *Gale Force*, a 20-foot pontoon boat or from CR Environmental's R/V *Cynthia Lee*, a 42-foot provincial lobster boat.

Navigation was performed using hand-held differential global positioning system (dGPS) units. Samples were taken as close to the center of the hexagon station as possible. In general, these targets were achieved. However, where obstacles, underwater debris, or unacceptable sampling material was present, the sampling was moved to the nearest acceptable location. All sample locations were within the station hexagon.

At each station, water quality measurements of salinity, temperature, turbidity, and DO were taken using a YSI EXO2 multi-parameter water quality sonde. The sonde was manually lowered to a depth of approximately 0.5 to 1 meters from the bottom, where the depth and in situ water quality measurements were recorded by hand on the station log sheets. Sediment samples at each station were collected for the analysis of grain, size, TOC, and PCB congeners. Three benthic biology samples were collected at each station: two for analysis and one for archival purposes.

## CHAPTER 2. METHODS

Grab samples for chemistry analysis were collected at all of the stations using a 0.04-m<sup>2</sup> Van Veen grab sampler. Each grab was inspected for acceptability (i.e., penetration  $\geq$  7 cm, and level, intact sediment). If the grab was deemed unacceptable it was discarded over the opposite side of the vessel to avoid contaminating subsequent samples and the equipment was washed with site water. Once the grab was deemed acceptable, it was visually characterized for sediment type, color, and organisms present on the surface. Appendix B includes photographs of representative grabs collected during the LTM VI study. The top 2 cm were then transferred to a pre-cleaned stainless steel 2-gallon mixing bowl using a pre-cleaned stainless steel spoon avoiding sediment in contact with the sides of the grab. In some cases, multiple grabs were taken to ensure sufficient material was collected for all physical and chemical analyses. The sample was thoroughly homogenized and then subdivided into the sample analysis containers.

The grab samples for benthic community and associated grain size analysis were collected using a 0.04-m<sup>2</sup> Van Veen grab sampler. Triplicate grabs of the top 10 cm were taken at each of the stations for benthic infauna analysis. Once the grab was deemed acceptable, a grain size sample was collected (from the infauna grab) by inserting an open-ended syringe through the entire depth of the core and drawing the sediment out, thereby capturing a small sediment core representing the entire thickness of the grab. The remaining material was transferred to a sieving station and passed through a 0.5 millimeter (mm) sieve. All of material remaining in the sieve was transferred to a clean labeled plastic jar, preserved with 10% formaldehyde, borax, and site water.

For both the sediment and infauna grab samples, the vessel was moved slightly while on station to avoid resampling the same location. After each station was completed, the grab samplers were decontaminated with soap and water and rinsed with site water. If an oily sheen was present, the grab samplers were wiped with an acetone wipe.

### 2.1.2 FIELD QUALITY CONTROL

The dGPS units (Garmin GPS Map 76CSx) were checked at the beginning and end of each sampling day against an established benchmark at the Sawyer Street facility. The calibration check was recorded on the differential GPS calibration field log, and maintained in the project files (Appendix A). The instrument measures displacement from the benchmark; displacements ranged from 0 to 3 meters with a majority of the checks being less than 1 meter.

Field-based quality control (QC) samples were collected during the sediment sampling event, and included field replicates (i.e., duplicates). Field replicates were collected at the same time, from the same location, using the same techniques. Field replicates were handled, containerized, stored and transported in the same manner as field samples. For sediment grabs, the field replicate represented a second (different) grab collected from co-located locations (i.e., the same location as the parent grab sample). Field replicates (duplicates) were collected at a frequency of approximately one per 20 samples for chemistry samples.

(Hexagons with center dot represent station locations [Nelson & Bergen, 2012].)

Figure 2-1. Map of the New Bedford Harbor LTM IV Sampling Area

## 2.2 LABORATORY TESTING

Laboratory testing was performed to characterize sediment grain size, TOC and PCB concentrations in the sediment surface (top 2 cm) and benthic infauna and associated grain size in the biological active zone (surface, up to 10 cm). Laboratory data generated by the participating laboratories were submitted to the project database.

### 2.2.1 PHYSICAL AND CHEMICAL ANALYSIS

#### 2.2.1.1 GRAIN SIZE

Grain size analysis was performed by GeoTesting Express (GTX; Acton, Massachusetts) following ASTM D422-63. Sediment grain size was determined with phi-classes for sands using wet sieve and silt and clay fractions using a hydrometer. Wet sieving yielded the following phi-classes: gravel (>2.00 mm), very coarse sand (1.00-2.00 mm), coarse sand (0.50-1.00 mm), medium sand (0.25-0.50 mm), fine sand (0.125-0.25 mm) and very fine sand (0.063-0.125 mm). Hydrometer analysis was performed on the portion passing through the #200 sieve to determine silt (1.95 to 62.5 micrometer [ $\mu\text{m}$ ]) and clay (<1.95  $\mu\text{m}$ ) content. Results were reported as percent retained within each fraction.

#### 2.2.1.2 TOTAL ORGANIC CARBON

TOC analysis was performed by Alpha Analytical (Mansfield, Massachusetts) following EPA 9060, and each sample was analyzed in duplicate. An aliquot of sample was homogenized, pre-treated with phosphoric acid and heated to 103-105°C to convert the inorganic carbon prior to analysis. Organic carbon was measured using combustion and a carbonaceous analyzer. The sample, of approximately 2 to 5 mg, was oxidized in a pure oxygen environment, introduced into a furnace by a 60-slot Autosampler, and then combusted. The carrier gas (Ox) was combined with the carbon content of the combusted sample to form CO<sub>2</sub>. Elements, such as halogens and sulfur, were removed by scrubbing reagents in the combustion zone. A thermal conductivity detector then measured the CO<sub>2</sub> content. The amount of CO<sub>2</sub> derived from a sample is directly proportional to the concentration of organic carbonaceous material in the sample. Results were reported in units of percent dry weight.

#### 2.2.1.3 NOAA 18 PCB CONGENERS BY GC/ECD

PCB analysis for the 18 National Oceanic and Atmospheric Administration (NOAA) congeners analyzed for the National Status and Trends program was performed by Battelle (Norwell, Massachusetts). Prior to extraction, samples were air dried for approximately one to three days (depending on moisture content) and a percent moisture determination was performed on the air-dried sediment to verify that percent solids in the samples were >50% and to report data on a dry weight basis.

For extraction and analysis, approximately 1 to 10 grams of the well mixed, air-dried sample was spiked with surrogate internal standards (SIS) and extracted three times with methylene chloride. The combined sample extract was dried over anhydrous sodium sulfate, concentrated and cleaned using florisil to isolate the PCBs and activated copper to remove sulfur. The final extracts were concentrated, fortified with recovery internal standards (RIS), and submitted for analysis.

PCB analysis was performed by gas chromatography/electron capture detection (GC/ECD) using dual column confirmation. An initial calibration consisting of target analytes was analyzed prior to sample analysis to demonstrate the linear range. Calibration verification was performed before and after every 10 samples or at the beginning and end of every 24-hour period in which samples were analyzed, whichever was shorter. Concentrations of target congeners were calculated versus RIS using the average response factors generated from the initial calibration. Positive congener results were confirmed by a secondary column confirmation analysis with the higher of the two results reported, unless analyst discretion required otherwise (e.g., the result without an interference signal was reported). Congener results that were greater than 40% different between the first and second column analysis were 'p' qualified.

## CHAPTER 2. METHODS

Sample results were reported by the laboratory in nanograms per gram (ng/g) dry weight to three significant figures. All data were reported as surrogate corrected to correct for extraction efficiency. Total PCB was calculated as the sum of the detected NOAA 18 congeners (a value of ½ the reporting limit [RL] was used for non-detects). Total PCB results were converted to ppm basis (ppm = ng/g result divided by 1,000).

### 2.2.2 BIOLOGICAL ANALYSIS

Benthic biology sorting, enumeration, and identification were performed by Barry Vittor & Associates in Mobile, Alabama. Biological laboratory procedures were carried out according to protocols established in EMAP Laboratory Methods Manual – Estuaries Volume 1 – *Biological and Physical Analyses* (EPA, 1995) Section 5. Two of three replicate grab samples collected at each station were analyzed taxonomically. The third sample was archived.

### 2.2.3 LABORATORY QUALITY CONTROL

A routine set of laboratory-based QC samples was prepared with the LTM VI sediment samples to monitor accuracy and precision. For PCB congener analysis, QC samples included a procedural blank, laboratory control sample (LCS), LCS duplicate (LCSD), a matrix spike (MS), a matrix spike duplicate (MSD), and a standard reference material (SRM) with each batch of 20 or fewer samples. For TOC, each sample was analyzed in duplicate and each set of 20 or fewer samples included a SRM. For sediment grain size, one laboratory duplicate was analyzed with each set of 20 or fewer samples. For benthic infauna, QC measures followed the EMAP protocols and included re-sorting and re-identification of randomly selected samples, and validation of taxonomic/enumeration data entries.

QC sample results were evaluated against the project measurement performance criteria (MPC). Data that did not meet the MPC were evaluated to determine the impact(s) on data quality, and corrective action was taken as appropriate.

### 2.2.4 DATA VALIDATION

Data validation was performed by Battelle. PCB congener results for the LTM VI sediment samples received data validation at the Tier 1 Stage 2A level and sediment grain size and TOC data received Tier I Stage 1 level using the following guidelines, as applicable to each method:

- EPA New England Environmental Data Review Supplement for Regional Data Review Elements and Superfund Specific Guidance/Procedures, April 2013
- EPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008
- EPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010.

Benthic infauna data did not receive external data validation.

## Chapter 3. Results

This section summarizes results from the sampling and physical, chemical and biological testing of the LTM VI sediment samples.

### 3.1 FIELD MONITORING SUMMARY

Sediment samples were collected at each of the 79 stations for physical (grain size and TOC) and chemical (PCBs) analyses as well as for benthic community analysis. In situ field measurements (temperature, salinity, turbidity, and DO) were also collected at each station (see Appendix A). The field survey report which summarizes the field sampling activities and provides a copy of all field logs is provided in Appendix A.

#### 3.1.1 WATER QUALITY

The *in situ* water quality measurements were taken prior to the collection of each sediment sample. The parameters collected included salinity, temperature, turbidity, and DO, and are summarized in Table 3 of Appendix A (Field Report). The sampling water depth ranged from the shallow stations (0.1 to 12.8 ft) in the Upper Harbor, to moderate depths in the Lower and Outer Harbors (0.3 to 37.9 ft). As expected, salinity and DO followed trends along a north/south gradient. In the upper reaches of the harbor, where the Acushnet river enters the system, salinities were lower than in other areas (mean = 30.2 parts per thousand [‰]). Upper Harbor salinities ranged from 29.3 to 30.7‰. The range of salinities in the Lower Harbor was 30.5 to 33.3‰ with a mean of 32.8‰. Outer Harbor salinity measurements were uniform, with a mean of 33.5‰. In the Upper Harbor, DO values ranged from 5.0 to 7.54 milligrams per liter (mg/L), with a mean of 5.9 mg/L. DO ranged from 5.59 to 6.88 mg/L in the Lower Harbor, with a mean of 6.18 mg/L. In the Outer Harbor, DO ranged from 6.16 to 8.43 mg/L with a mean of 7.08 mg/L. Temperature was consistent throughout the study area with a mean of 19.56 °C.

### 3.2 LABORATORY TESTING

Statistical summaries of the LTM VI sediment data are provided in Table 3-1. The statistical summaries include the following information for each test parameter by geographic region of the harbor: number of samples, detection frequency, minimum concentration, central tendency (arithmetic average and median), standard deviation, and location of the maximum detected value. Complete test results, along with results from the analysis of field- and laboratory-based QC samples, are provided in Appendices C, D, and E.

#### 3.2.1 GRAIN SIZE DISTRIBUTION OF THE SEDIMENT SURFACE

Sediment grain size distribution was measured in four samples from each station. One sample was associated with the grab samples analyzed for chemistry, while the remaining three were associated with the grab samples collected for benthic infauna analyses. The grain size results reported in Table 3-1 are from the samples associated with the chemistry grab (top 2 cm). Complete grain size results for chemistry and benthic grabs are provided in Appendix C. Grain size data for the chemistry grab sample are presented here.

Surface sediments collected from the three regions of New Bedford Harbor had variable grain size distributions, ranging from sand to silt. Surface sediments from the Upper Harbor were generally more fine-grained (Figure 3-1), with mean values of 61.3% fines (silt + clay), 32.7% sand, and 6.67% gravel (Table 3-1). The Lower Harbor was more evenly distributed with mean values of 50.7% fines, 42% sand and 7.2% gravel. The Outer Harbor was characterized more as a sandy environment with the mean values of 50.0% fines, 43.1% sand, and 6.96% gravel.

Figure 3-1. Grain Size Distribution of Chemistry Samples Collected during LTM VI in New Bedford Harbor (top 2 cm).

### 3.2.2 TOTAL ORGANIC CARBON OF THE SEDIMENT SURFACE

TOC levels ranged from 0.07% to 8.4% in surface (top 2 cm) sediment at New Bedford Harbor (Table 3-1). TOC levels were higher on average in the Upper Harbor (mean = 4.76%), and decreased in a north-to-south direction (means of 2.69% and 1.41% in the Lower and Outer Harbors, respectively) (Table 3-1). The highest TOC level was measured at Station 108 located in the northern region of the Upper Harbor and the lowest level was measured at Station 318, located in the Outer Harbor.

### 3.2.3 PCB CHARACTERIZATION OF THE SEDIMENT SURFACE

Total PCB concentrations ranged from 0.003 to 934 ppm in surface sediment (top 2 cm) throughout New Bedford Harbor (Table 3-1). Table 3-2 presents the total PCB values for all stations sampled during LTM VI. Consistent with past LTM studies (Nelson and Bergen, 2012), the highest concentrations were measured in the Upper Harbor, and concentrations decreased in a north-to-south direction (Lower to Outer Harbor). The average total PCB concentration in the Upper Harbor (arithmetic average of total PCB measured in all 27 Upper Harbor stations) was 83.1 ppm, which is one order of magnitude higher than the Lower Harbor average concentration (2.82 ppm) and two orders of magnitude higher than the Outer Harbor average concentration (0.166 ppm) (Table 3-1). The highest concentration of total PCB was measured at Station 115, located in the northeast region of the Upper Harbor and directly across from the former Aerovox facility (Figure 3-3).

Within each region of the harbor, the widest range of total PCB concentrations was observed in the Upper Harbor (0.502 to 934 ppm; Table 3-1, Figure 3-3). The Lower Harbor had a more narrow range of total

## CHAPTER 3. RESULTS

PCBs concentrations (0.226 to 8.70 ppm; Table 3-1, Figure 3-4) and the Outer Harbor had the smallest range (0.003 to 0.766 ppm; Table 3-1). The lowest concentrations of total PCBs were measured in Outer Harbor sediments (Figure 3-5).

Total PCB concentrations were compared with published sediment data quality guidelines, effects range-low (ER-L, 0.0227 ppm) and effects range-medium (ER-M, 0.18 ppm) (Long et al., 1995). All samples in the Upper and Lower Harbors had total PCB concentrations greater than the ER-M. Of the 23 sampling locations in the Outer Harbor, nine stations had total PCB concentrations less than the ER-L and seven were below the ER-M but above the ER-L. The remaining seven Outer Harbor stations were above the ER-M. Table 3-2 shows the total PCB values for all stations sampled during LTM VI. The samples that were below the ER-L are bolded and the stations that were between the ER-L and ER-M level are italicized.

**Table 3-1. Total Organic Carbon, Grain Size, and PCB Summary Results for New Bedford Harbor LTM VI Survey**

| Area         | Parameter              | Units | No. Obs. | % Detected | MIN   | Mean  | Std. Dev. | Median | MAX   | Location of MAX (Station ID) |

<sup>1</sup> Sand is a sum of all sand fractions (very coarse, coarse, medium, fine, very fine).

<sup>2</sup> Fines is a sum of the silts and clays.

<sup>3</sup> Total PCB is the sum of 18 NS&T congeners using surrogate corrected data and ½ the RL for non-detects.

### 3.2.4 BENTHIC INFAUNA OF THE SEDIMENT SURFACE

Laboratory analysis of the benthic samples included identification of all species collected. Following EMAP protocols, oligochaetes were not identified to the species level. Oligochaetes are included in both density and species richness totals. In addition, when juvenile or damaged specimens could not be identified to species, the category “sp.” was used. If no species were identified in the genus to which these specimens belong within any given Harbor area, then the taxon is included in discussions of both density and species richness for that area and is included in the species list. If species were identified (and especially if more than one species was identified) in the genus in a given Harbor area, then the taxon was considered as contributing to the total density of infaunal organisms, but was not included in discussions of species richness nor in the species list.

Table 3-3 shows the number of taxa and total count (sum of organisms collected in all replicates) in each of the three areas sampled. There were clear gradients of increasing species richness and decreasing counts from the Upper to the Outer Harbor. Although the number of stations sampled differed slightly among the areas, the differences in species richness and number of individuals (count) were large enough to dismiss the sampling effort as a major factor. Overall, the Lower Harbor had only 20% of the individuals but nearly 30% more species than the Upper Harbor and the Outer Harbor had only 16% of the individuals but almost twice as many species as the Lower Harbor.

**Table 3-3. Species Richness and Total Density in the Three Areas of New Bedford Harbor**

|  | Area  |       |       |
|--|-------|-------|-------|
|  | Upper | Lower | Outer |
| Mean Number of Taxa per station        | 23.8  | 22.1  | 40.6  |
| Mean Number of Individuals per Station | 3197  | 956   | 916   |
| Species Richness                       | 139   | 175   | 273   |
| Total Count                            | 86318 | 27715 | 21497 |

#### 3.2.4.1 UPPER HARBOR (AREA 1)

Stations in the Upper Harbor were characterized by intermediate species richness (as measured by number of taxa; ranging from 17 to 46 unique taxa per station and averaging 23.8) and high densities, particularly of the dominant organisms (Appendix F). Table 3-4 shows the top dominant species (those contributing  $\geq 1\%$  of total infaunal count), their total count in all Upper Harbor replicates combined, and the number of stations within the Upper Harbor where they occurred.

Three species had greater than 10% dominance in the Upper Harbor, including *Gemma gemma* followed by *Mulinia lateralis* and *Streblospio benedicti*. *Gemma gemma* was the most abundant species (40.0%), and was found at 24 of the 27 Upper Harbor locations. The highest station count (17,925), 51.8% of the individuals, was found at Station 117. *Mulinia lateralis*, a small opportunistic bivalve, was the second most dominant organism (14.4%) and found at 21 of the 27 Upper Harbor stations. The third most abundant species in the Upper Harbor (12.8%) was *Streblospio benedicti*, a small polychaete relatively tolerant to elevated levels of sediment organics (Reish, 1979), a trait that contributes to its success as a pioneering, opportunistic species. It was found in 26 of the 27 Upper Harbor locations. Of the 11,062 individuals found in the Upper Harbor, 36.5% were found at three stations (Stations 111, 130 and 138).

**Table 3-4. Dominant Species in NBH Area 1 (Upper Harbor)**

| Species                           | Total Count | Percent Dominance | Number of Stations |
|-----------------------------------|-------------|-------------------|--------------------|
| <i>Podarke obscura</i>            | 885         | 1.0%              | 24                 |

### 3.2.4.2 LOWER HARBOR (AREA 2)

Stations in the Lower Harbor were characterized by intermediate species richness (ranging from 6 to 59 taxa per station, averaging 22.1) and intermediate counts. Table 3-5 shows the top dominant species, their total count in all Lower Harbor replicates combined, and the number of stations within the Lower Harbor where they occurred.

Three species had greater than 10% dominance in the Lower Harbor, including *Tharyx acutus*, *Tubificidae spp.* and *Streblospio benedicti*. *Tharyx acutus* was the most abundant species (15.0%) in the Lower Harbor, occurring at a higher percentage but with lower numbers than in Upper Harbor. It was found at 19 of the 29 Lower Harbor Stations with 96.7% of the individuals present in just six stations (Stations 207, 216, 218, 230, 237, 250) with the highest count (1159) at Station 218. The clitellate oligochaete *Tubificidae spp.* was the second most dominant organism (13.8%) and found in 24 of the 29 stations. The highest count (1,786), which is 46.8% of the total individuals in the Lower Harbor, was found at Station 224. The third most abundant species in the Lower Harbor, as well as the Upper Harbor, was *Streblospio benedicti*. It was found in 26 of the 29 stations at a similar percentage, 12.6%, but a much smaller number of individuals relative to the Upper Harbor.

**Table 3-5. Dominant Species in NBH Area 2 (Lower Harbor)**

| <b>Species</b>                     | <b>Total Count</b> | <b>Percent Dominance</b> | <b>Number of Stations</b> |
|------------------------------------|--------------------|--------------------------|---------------------------|
| <i>Gemma gemma</i>                 | 323                | 1.2%                     | 5                         |
| <i>Cylichna oryza</i>              | 366                | 1.3%                     | 3                         |
| <i>Ampelisca abdita</i>            | 513                | 1.9%                     | 12                        |
| <i>Polydora cornuta</i>            | 527                | 1.9%                     | 18                        |
| <i>Leitoscoloplos robustus</i>     | 628                | 2.3%                     | 8                         |
| <i>Hypereteone fauchaldi</i>       | 654                | 2.4%                     | 25                        |
| <i>Macoma tenta</i>                | 707                | 2.6%                     | 17                        |
| <i>Ampelisca sp.</i>               | 739                | 2.7%                     | 16                        |
| <i>Pectinaria gouldi</i>           | 905                | 3.3%                     | 21                        |
| <i>Leitoscoloplos sp.</i>          | 1218               | 4.4%                     | 24                        |
| <i>Mediomastus ambiseta</i>        | 1293               | 4.7%                     | 21                        |
| <i>Capitella capitata complex</i>  | 1352               | 4.9%                     | 21                        |
| <i>Grandidierella bonnieroides</i> | 1482               | 5.3%                     | 20                        |
| <i>Mulinia lateralis</i>           | 1843               | 6.6%                     | 23                        |
| <i>Streblospio benedicti</i>       | 3503               | 12.6%                    | 26                        |
| <i>Tubificidae spp.</i>            | 3814               | 13.8%                    | 24                        |
| <i>Tharyx acutus</i>               | 4167               | 15.0%                    | 19                        |

### 3.2.4.3 OUTER HARBOR (AREA 3)

Stations in the Outer Harbor were characterized by the highest species richness (ranging from 17 to 104 taxa per station and averaging 40.6) and the lowest counts of all three areas. The relatively low number of widespread taxa exemplifies the greater complexity of the infaunal community in the Outer Harbor. Table 3-6 shows the top dominant species and their total count in all Area 3 replicates combined.

*Macoma tenta* and *Tharyx acutus* were the top two most abundant taxa, each comprising 10% or 11%, respectively, of the total abundance. *Macoma tenta* was found at 14 of the 23 stations and at four of these stations (334, 338, 339, 340) the counts were between 333 and 378 individuals per station. The cirratulid *Tharyx acutus* also reached its highest abundance at this station (11.2%) and 2,407 individuals were counted. It was present in 16 of the 23 Outer Harbor stations with 94% of the individuals found at just four stations (304, 333, 335, and 352). It was most abundant at Station 352 with a count of 896 individuals, which is 37.2% of the total individuals counted in the Outer Harbor.

**Table 3-6. Dominant Species in NBH Area 3 (Outer Harbor)**

| Species                               | Total Count | Percent Domiance | Number of Stations |
|---------------------------------------|-------------|------------------|--------------------|
| <i>Mediomastus</i> spp.               | 232         | 1.1%             | 4                  |
| <i>Scolelepis texana</i>              | 242         | 1.1%             | 11                 |
| <i>Nemertinea</i>                     | 250         | 1.2%             | 21                 |
| <i>Crepidula plana</i>                | 251         | 1.2%             | 9                  |
| <i>Nucula proxima</i>                 | 276         | 1.3%             | 17                 |
| <i>Anadara transversa</i>             | 280         | 1.3%             | 12                 |
| <i>Prionospio (minuspio) perkinsi</i> | 296         | 1.4%             | 14                 |
| <i>Globosolembos smithi</i>           | 311         | 1.4%             | 8                  |
| <i>Nephtys incisa</i>                 | 368         | 1.7%             | 12                 |
| <i>Mitrella lunata</i>                | 385         | 1.8%             | 18                 |
| <i>Boonea seminuda</i>                | 688         | 3.2%             | 11                 |
| <i>Acteocina canaliculata</i>         | 828         | 3.9%             | 15                 |
| <i>Myodocopa</i>                      | 871         | 4.1%             | 17                 |
| <i>Mediomastus ambiseta</i>           | 987         | 4.6%             | 18                 |
| <i>Cylichna oryza</i>                 | 1007        | 4.7%             | 12                 |
| <i>Polygordius</i> sp. a              | 1078        | 5.0%             | 5                  |
| <i>Tubificidae</i> spp.               | 1116        | 5.2%             | 20                 |

| <i>Macoma tenta</i>                   | 2159        | 10.0%            | 14                 |
| <i>Tharyx acutus</i>                  | 2407        | 11.2%            | 16                 |

### 3.3 QUALITY CONTROL

Grain size, TOC, total PCB, and benthic infauna results from the field- and laboratory-based QC samples are reported with the laboratory data packages provided in Appendices C through F. Results from the analysis of the field- and laboratory-based QC samples were evaluated against the MPC as described in Worksheet #28 of the QAPP (Battelle, 2014b) to assess accuracy and precision.

#### 3.3.1 FIELD REPLICATES

Four field replicates (a second grab collected at a given station) were collected, resulting in four field replicates for the LTM VI sampling event. The relative percent difference (RPD) between PCB and TOC data met MPC criteria (<50% RPD) (Table 3-7). Field replicates of the chemistry grab were not subsampled for grain size distribution because benthic infauna grabs were sampled in triplicate and each was subsampled for grain size distribution analysis.

**Table 3-7. Total PCB and TOC in Field Replicates Results (Surface top 2 cm)**

| Station | Total PCB<br>(ppm dry weight) |                 | RPD  | TOC (%)  |                 | RPD  |
|---------|-------------------------------|-----------------|------|----------|-----------------|------|
|         | Original                      | Field Replicate |      | Original | Field Replicate |      |
| 139     | 24.6                          | 26.0            | 2.63 | 5.76     | 6.37            | 6.82 |
| 152     | 12.8                          | 11.0            | 10.8 | 4.72     | 3.98            | 11.0 |
| 242     | 1.12                          | 1.10            | 0.00 | 1.54     | 2.26            | 27.0 |
| 306     | 0.003                         | 0.002           | 4.00 | 0.076    | 0.068           | 7.27 |

### 3.3.2 LABORATORY QUALITY CONTROL SAMPLES

The review of the laboratory QC data for the grain size, TOC, and total PCB analyses is documented in quality assurance (QA)/QC narratives, which are provided with the sample data in Appendices C through F.

The grain size fractions reported were gravel, very coarse sand, coarse sand, medium sand, fine sand, very fine sand, silt, and clay. The precision between grain size fraction results, for laboratory duplicates and field replicates, frequently met the QAPP MPC for the fine grained fractions (i.e., silt, clay and fine sand) but was more variable for the coarser fractions (e.g., gravel, very coarse sand) that were measured at levels closer to the detection limits.

For TOC, the laboratory QC data met the MPC, indicating that the analytical methods were in control and data quality is acceptable. For example, the method blanks had no detects. The RPD for the lab duplicates ranged from 0 to 49%; all met the MPC (25%) with the exception of one replicate in one batch. The SRM recoveries were between 84% and 119%, which were within the MPC of 75 to 125%.

For PCB analyses, laboratory-based QC samples met the MPC, indicating that the quality of the PCB data is acceptable and the analytical methods are in control. For example, target PCB congeners were undetected in the procedural blanks, indicating that the methods were free of contamination. In addition, recovery and precision results for LCS and LCS duplicate (LCSD) QC samples were acceptable for all target compounds, indicating that the methods were in control. Recovery and precision results for the MS and MSD were good with no exceedances noted in any of the batches. PCB surrogate recoveries also generally met the project data quality objectives. Two exceedances occurred at Station 115 for the undiluted sample which exhibited high levels of target analytes that interfered with SIS and internal standards. The primary dilution is used as the primary file for this sample, where the SIS was diluted out. SIS are appropriately H qualified.

During review of the PCB data it was revealed that each batch of samples included all required QC samples, except for the SRM. Rather, the laboratory analyzed a matrix duplicate, which was not required according to the project QAPP.

Results from the Tier I validation of the grain size, TOC, and PCB congener data indicate that these data are useable. The data validation reports are provided in Appendix G.

The benthic infauna analysis laboratory QC consisted of a review of accuracy rates for sorting and identification. Results indicated that the sorting and identification accuract rates were well above standard levels for taxonomy. All taxonomic data were entered into EXCEL spreadhseets. The data was checked for accuracy against original taxonomic data sheets. The sorting QC results were 100% for all 17 QC samples analyzed. The taxonomy QC results ranged from 96 to 100% for all 35 samples/taxa reviewed. The laboratory data were found to be acceptable.

## Chapter 4. Discussion

This section includes a brief discussion of the LTM (1993-2014) data for total PCB and benthic infauna; a more detailed evaluation of spatial and temporal trends in the LTM data (1993 to 2014) will be performed by EPA.

As has been the case since 1993, levels of total PCBs are generally highest in the Upper Harbor and decrease along a gradient to the Outer Harbor (Table 4-1). The table also shows that in 2014, average concentrations of total PCBs are comparable to 2009 in the Upper Harbor, show a notable decrease in the Lower Harbor between 2009 and 2014 and a smaller overall decrease in the Outer Harbor since the program started in 1993.

**Table 4-1. Average Total PCB Concentrations in Surface (top 2 cm) Sediment at New Bedford Harbor, LTM 1993 to 2014**

| Area         | Total PCB (ppm) |                   |                   |                   |                   |                   |
|--------------|-----------------|-------------------|-------------------|-------------------|-------------------|-------------------|
|              | 2014            | 2009 <sup>1</sup> | 2004 <sup>1</sup> | 1999 <sup>1</sup> | 1995 <sup>1</sup> | 1993 <sup>1</sup> |
| Upper Harbor | 83              | 75                | 61                | 109               | 139               | 109               |
| Lower Harbor | 2.8             | 5.1               | 4.8               | 7.2               | 7.2               | 74                |
| Outer Harbor | 0.2             | 0.2               | 0.2               | 0.4               | 0.4               | 0.8               |

<sup>1</sup> Total PCB values taken from Nelson and Bergen (2012) which are surface weighted values; 2014 values are the arithmetic mean.

Species richness of the New Bedford Harbor benthic community is lowest in the Upper Harbor and increases from north to south through the Harbor with the highest species richness found in the Outer Harbor (Table 3-3). In the Upper Harbor in 2014, the top three dominant species were *Streblospio benedicti*, *Mulinia lateralis*, and *Gemma gemma*. The polychaete *Streblospio benedicti* and the bivalve *Gemma gemma* have consistently been among the dominant taxa throughout the first four LTM surveys that took place (ENSR, 2001). Stations in the Lower Harbor were characterized by intermediate species richness and intermediate counts. Table 3-5 shows the top dominant species in 2014. Three species had greater than 10% dominance in the Lower Harbor, including *Tharyx acutus*, *Tubificidae spp.* and *Streblospio benedicti*. *Tharyx acutus* was the most abundant species (15.0%) in the Lower Harbor, occurring at a higher percentage but with lower numbers than in Upper Harbor. Stations in the Outer Harbor were characterized by the highest species richness and the lowest counts of all three areas. The relatively low number of widespread taxa exemplifies the greater complexity of the infaunal community in the Outer Harbor.

## 1. Introduction

In order to assess the effectiveness of the New Bedford Harbor Superfund remediation efforts, a long-term environmental monitoring plan has been developed by the U.S. Environmental Protection Agency's Research Laboratory, Atlantic Ecology Division (EPA AED) in Narragansett, Rhode Island. This plan incorporates an intensive sampling and analysis effort for the purpose of quantifying the long-term environmental effects of reduced polychlorinated biphenyl (PCB) levels in the sediments and water column of the New Bedford Harbor estuary as a result of remediation efforts. The five previous sampling rounds for this program include the "baseline" sampling event conducted in October 1993 (long-term monitoring [LTM] I), a second event (LTM II) conducted immediately after removal of the "hot spot" sediments in October of 1995 and three subsequent events conducted in 1999, 2004, and 2009 (LTM III, IV, and V). This Survey Report describes the sampling activities conducted under the sixth round of sampling and analysis (LTM VI). This work was performed by Battelle for the U.S. Army Corps of Engineers New England District (USACE NAE). CR Environmental participated in the collection activities as a subcontractor to Battelle.

The overall objective of LTM VI was to gather chemical, biological, and physical data for sediments currently in place after multiple years of dredging. Sampling was conducted at 79 separate stations located in three distinct geographical areas of New Bedford Harbor (Figure 1):

- Area 1 – Wood Street to the Coggeshall Street Bridge (27 stations, Figure 2)
- Area 2 – Coggeshall Street Bridge to Hurricane Barrier (29 stations, Figure 3)
- Area 3 – Hurricane Barrier to edge of Fishing Closure Area 3 (23 stations, Figure 4)

Sediment samples were collected at each of the 79 stations for chemical (PCBs and total organic carbon [TOC] content), physical (grain size), and biological (benthic species enumeration) analyses. An additional sample from 20 locations identified by EPA was collected for research purposes being conducted under a separate effort. In situ field measurements (temperature, salinity, turbidity, and dissolved oxygen) were also collected. The actual sampling locations in each of the areas are shown in Figures 2, 3 and 4.

This survey report describes the activities conducted during sampling and provides a synopsis of some preliminary observations from the survey. A description of survey methods is provided in Section 2. A chronological summary of survey activities for grab sampling and in situ data collection is provided in Section 3. Preliminary survey results are provided in Section 4. A description of survey problems and corrective actions, as well as recommendations for future surveys, can be found in Section 5.

## 2. Methods

Details on the survey/sampling methods can be found in the Draft Final New Bedford Harbor Long-Term Monitoring VI Field Sampling Plan which is included as Appendix B to the Final New Bedford Harbor Long-Term Monitoring VI Quality Assurance Project Plan (QAPP; Battelle, 2014).

Field collections were performed using two separate field teams each equipped with its own vessel, chief scientist, crews, and full set of sampling equipment. The two vessels were the *R/V Gale Force*, a 20-ft pontoon boat, and the *R/V Cynthia Lee*, a 42-foot provincial lobster boat. Mobilization occurred on September 19 and the morning of September 22, 2014. Demobilization occurred over two days, October 1 and 2, 2014. Survey personnel and roles are listed below in Tables 1 and 2.

### 2.1. In Situ Sensor Data Collection

At each station in situ water quality measurements were taken prior to the collection of sediment samples. Measurements included salinity, temperature, turbidity, and dissolved oxygen, and are summarized in Table 3. The measurements were taken using a YSI EXO2 multi-parameter water quality sonde. The sonde was manually lowered to a depth of approximately 0.5 to 1 meter from the bottom, where the depth and in situ data were recorded by hand on the station log sheets.

While on the Gale Force, navigation data were stored electronically in a hand-held differential global positioning system (dGPS) unit and also recorded on the station log sheets. Electronic data were downloaded to a personal computer once the survey was completed. Onboard the Cynthia Lee, navigation data were stored electronically in Hypack<sup>®</sup> software.

### **2.2. Sediment Grab Sample Collection and Processing**

Grab samples for chemistry analysis were collected at all of the stations using a 0.04-m<sup>2</sup> Van Veen grab sampler. Each grab was inspected for acceptability. If the grab was deemed unacceptable, it was discarded over the side of the vessel in an area that would avoid contaminating subsequent samples and the equipment was rinsed with site water. Once the grab was deemed acceptable by the Chief Scientist, the top 2 cm was transferred to a decontaminated stainless steel or glass mixing bowl and the material was homogenized using a decontaminated stainless steel or a dedicated spoon. Care was taken to avoid taking sediment which had contacted the sides of the grab to reduce potential cross contamination. Sufficient material was collected for grain size, PCB, and TOC analysis. The sample containers were then labeled and stored on ice until being transferred to the field sample custodian at the shoreside facility.

Grab samples for infauna analysis, and associated grain size, were collected concurrently with the grabs for compositing described above. The infauna grab samples were collected using a 0.04-m<sup>2</sup> Van Veen grab sampler. Triplicate grabs were taken at each station. Once the grab was deemed acceptable, a grain size sample was collected by inserting an open ended syringe through the entire depth of the grab and drawing the sediment out, thereby capturing a small sediment core representing the entire depth of the grab. This was repeated until 250 mL of sediment was

removed for the grain size sample. The remaining material was transferred to a sieving station and passed through a 0.5 mm sieve. All material remaining in the sieve was transferred to clean plastic jar, preserved with 10% formaldehyde, borax, and site water, and then labeled. Grain size samples were stored on ice until being transferred to the field sample custodian.

For both the sediment and infauna grabs, the vessel was moved slightly while on station to avoid resampling the same location. After each station was completed, the grab samplers were decontaminated with soap and water and rinsed with site water. If an oily sheen was present, the grab samplers were wiped with an acetone wipe.

### 3. Survey Chronology

Mobilization occurred on Friday, September 19, 2014. Supplies and equipment were transferred to the USACE field site in New Bedford Harbor, MA. The Gale Force was mobilized that day and the R/V Cynthia Lee was mobilized on the morning of September 22, 2014. Table 4 summarizes the chronology of sampling days for each survey vessel (i.e., Gale Force and Cynthia Lee). On September 29, 2014 an internal QA audit was conducted by Battelle to ensure all sampling procedures followed the procedures outlined in the QAPP (Battelle, 2014). Demobilization occurred on October 1 and 2, 2014 along with shipping of the remaining samples. Note: All times are recorded as Eastern Daylight Time.

**Table 4. Chronology of Sampling Days**

| Station ID                              | Time of First Grab | Time of Last Grab | # of Unsuccessful Grabs | Station Comments  |
|---|--------------------|-------------------|-------------------------|---|
| <b>Cynthia Lee – September 22, 2014</b> |                    |                   |                         |   |

## 4. Survey Results

Composite sediment samples, triplicate infauna samples, and in situ sensor data were collected at 79 stations. In addition, four stations (139, 152, 242, and 306) were sampled for duplicate PCB and TOC samples. A single grab was collected and subsampled (top 10 cm collected) for EPA at 20 stations. At Station 212, a second grab was needed to provide sufficient volume for the 2-liter EPA sample due to the high abundance of large quahogs. Sampling was completed in 7 days for the field effort, plus 2 days of mobilization and demobilization for a total of 9 days. A summary of the stations sampled are presented in Table 4.

A total of 719 samples were collected from the sediment grabs collected at the 79 LTM stations. Sediment characteristics varied depending on collection location. The sediments in the Upper and Lower Harbor varied from black, silty mud to sand to gravel. The sediments in the Outer Harbor consisted mostly of grey, silty mud, with occasional sandy sites or sites that consisted primarily of shells.

## 5. Problems Experienced, Actions Taken, and Recommendations

### 5.1. Logistical

The QAPP called for each vessel to perform navigation checks at the beginning and end of each survey day at a known location. This turned out to be infeasible for the Cynthia Lee. The vessel-mounted dGPS could not be easily removed and verified against known points. Rather, a handheld dGPS was compared to the vessel-mounted dGPS.

### 5.2. Technical

Two stations in Area 1 were resampled due to low sample volume during the first attempt. Seven stations were moved from the target location due to poor sampling conditions (i.e., rocks, or shells present in high quantity) or because the target coordinates were on land. Two stations were moved due to the presence of a commercial fishing boat located on the target coordinates. The specific stations are noted above in the survey chronology (Table 4).

At the field duplicate stations, samples were inadvertently collected for grain size although this was not required according to the QAPP. The duplicate samples for other grain size were discarded in the appropriate waste stream at the New Bedford Harbor Superfund field site. Although there is no impact on the survey data, this deviation is explained here because field logs show the collection of these samples.

**TAILGATE SAFETY MEETING RECORD FORM**

Date 9/22/14 Time (local) 0800 Project Number: 100053747

Project Name: New Bedford Harbor Long Term Monitoring

Specific Location: New Bedford Harbor

Type of Work: Grab Sampling, Seiving

Chemicals present: Primary contaminants of interest: PCBs, Metals

**SAFETY TOPICS DISCUSSED**

Protective Clothing/Equipment: Level D

Hazards of Chemicals Present: Sediments: PCBs, Metals

Physical Hazards: Slips, trips, falls, drowning, lifting heavy objects, weather, pinch points in the Grab

Special hazards: Formalin

Other topics: \_\_\_\_\_

Client: Battelle Memorial Institute  
 Project: New Bedford Harbor  
 Location: New Bedford, MA  
 Project No: GTX-302366  
 Boring ID: 216-14LTM  
 Sample Type: bag  
 Tested By: jbr  
 Sample ID: NBH14-0028DUP  
 Test Date: 10/15/14  
 Checked By: jdt  
 Depth: ---  
 Test Id: 309478  
 Test Comment: ---  
 Sample Description: Wet, very dark gray silty sand  
 Sample Comment: ---

## Particle Size Analysis - ASTM D422

| Sieve Name | Sieve Size, mm     | Pct Retained | Spec. Percent | Complies |

**Sample/Test Description**

Sand/Gravel Particle Shape : ANGULAR  
 Sand/Gravel Hardness : HARD  
 Dispersion Device : Apparatus A - Mech Mixer  
 Dispersion Period : 1 minute  
 Specific Gravity : 2.65  
 Separation of Sample: #230 Sieve

Client: Battelle Memorial Institute  
 Project: New Bedford Harbor  
 Location: New Bedford, MA  
 Project No: GTX-302366  
 Boring ID: 338-14LTM  
 Sample Type: bag  
 Tested By: jbr  
 Sample ID: NBH14-0273  
 Test Date: 11/04/14  
 Checked By: jdt  
 Depth: ---  
 Test Id: 310493  
 Test Comment: ---  
 Sample Description: Wet, olive gray silt with sand  
 Sample Comment: ---

## Particle Size Analysis - ASTM D422

D-2

**Project Name:** NEW BEDFORD HARBOR LTM VI  
**Project Number:** \* 7;

**Lab Number:** L1422692  
**Report Date:** 10/16/14

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

## GLOSSARY

### Acronyms

|      |  |
|------|--|
| EDL  | -Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).                        |
| EPA  | -Environmental Protection Agency.  |
| LCS  | -Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.   |
| LCSD | -Laboratory Control Sample Duplicate: Refer to LCS.  |
| LFB  | -Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.  |
| MDL  | -Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.   |
| MS   | -Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.  |
| MSD  | -Matrix Spike Sample Duplicate: Refer to MS.   |
| NA   | -Not Applicable.   |
| NC   | -Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.  |
| NI   | -Not Ignitable.  |
| RL   | -Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.  |
| RPD  | -Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report. |
| SRM  | -Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.  |

### Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### Terms

**Total:** With respect to Organic analyses, a 'Total' result is defined as the summation of results for individual isomers or Aroclors. If a 'Total' result is requested, the results of its individual components will also be reported. This is applicable to 'Total' results for methods 8260, 8081 and 8082.

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

Report Format: Data Usability Report

**Project Name:** NEW BEDFORD HARBOR LTM VI  
**Project Number:** GTX-302366

**Lab Number:** L1422692  
**Report Date:** 10/16/14

#### Data Qualifiers

- G** -The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** -The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** -The lower value for the two columns has been reported due to obvious interference.
- M** -Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** -Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** -The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** -The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** -Analytical results are from sample re-analysis.
- RE** -Analytical results are from sample re-extraction.
- S** -Analytical results are from modified screening analysis.
- J** -Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** -Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Certification Information

Last revised April 15, 2014

---

**The following analytes are not included in our NELAP Scope of Accreditation:**

### Westborough Facility

**EPA 524.2:** Acetone, 2-Butanone (Methyl ethyl ketone (MEK)), Tert-butyl alcohol, 2-Hexanone, Tetrahydrofuran, 1,3,5-Trichlorobenzene, 4-Methyl-2-pentanone (MIBK), Carbon disulfide, Diethyl ether.

**EPA 8260C:** 1,2,4,5-Tetramethylbenzene, 4-Ethyltoluene, Iodomethane (methyl iodide), Methyl methacrylate, Azobenzene.

**EPA 8330A/B:** PETN, Picric Acid, Nitroglycerine, 2,6-DANT, 2,4-DANT.

**EPA 8270D:** 1-Methylnaphthalene, Dimethylnaphthalene, 1,4-Diphenylhydrazine.

**EPA 625:** 4-Chloroaniline, 4-Methylphenol.

**SM4500:** Soil: Total Phosphorus, TKN, NO<sub>2</sub>, NO<sub>3</sub>.

**EPA 9071:** Total Petroleum Hydrocarbons, Oil & Grease.

### Mansfield Facility

**EPA 8270D:** Biphenyl.

**EPA 2540D:** TSS

**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

---

**The following analytes are included in our Massachusetts DEP Scope of Accreditation, Westborough Facility:**

### Drinking Water

**EPA 200.8:** Sb,As,Ba,Be,Cd,Cr,Cu,Pb,Ni,Se,Tl; **EPA 200.7:** Ba,Be,Ca,Cd,Cr,Cu,Na; **EPA 245.1:** Mercury;

**EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B**

**EPA 332:** Perchlorate.

**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, Enterolert-QT.**

### Non-Potable Water

**EPA 200.8:** Al,Sb,As,Be,Cd,Cr,Cu,Pb,Mn,Ni,Se,Ag,Tl,Zn;

**EPA 200.7:** Al,Sb,As,Be,Cd,Ca,Cr,Co,Cu,Fe,Pb,Mg,Mn,Mo,Ni,K,Se,Ag,Na,Sr,Ti,Tl,V,Zn;

**EPA 245.1, SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2340B, SM2320B, SM4500CL-E, SM4500F-BC,**

**SM426C, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F,**

**EPA 353.2:** Nitrate-N, **SM4500NH3-BC-NES, EPA 351.1, SM4500P-E, SM4500P-B, E, SM5220D, EPA 410.4,**

**SM5210B, SM5310C, SM4500CL-D, EPA 1664, SM14 510AC, EPA 420.1, SM4500-CN-CE, SM2540D.**

**EPA 624:** Volatile Halocarbons & Aromatics,

**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9222D-MF.**

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

**Report Date:** 10/22/14

**Case Narrative (continued)**

Total Organic Carbon

The L1423076-02 Sample Replicate RPD for Total Organic Carbon is outside the acceptance criteria of 30%. A double-burn re-analysis was performed with confirming results. The result is reported from the initial analysis only. The elevated RPD has been attributed to the non-homogeneous nature of the sample.

The L1423076-13 Sample Replicate RPD for Total Organic Carbon is outside the acceptance criteria of 30%. A double-burn re-analysis was performed with confirming results. The result is reported from the initial analysis only. The elevated RPD has been attributed to the non-homogeneous nature of the sample.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### Acronyms

|      |   |
|------|---|
| EDL  | - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).                        |
| EPA  | - Environmental Protection Agency.  |
| LCS  | - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.   |
| LCSD | - Laboratory Control Sample Duplicate: Refer to LCS.  |
| LFB  | - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.  |
| MDL  | - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.   |
| MS   | - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.  |
| MSD  | - Matrix Spike Sample Duplicate: Refer to MS.   |
| NA   | - Not Applicable.   |
| NC   | - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.  |
| NI   | - Not Ignitable.  |
| RL   | - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.  |
| RPD  | - Relative Percent Difference: The results from matrix and/or matrix spike duplicates are primarily designed to assess the precision of analytical results in a given matrix and are expressed as relative percent difference (RPD). Values which are less than five times the reporting limit for any individual parameter are evaluated by utilizing the absolute difference between the values; although the RPD value will be provided in the report. |
| SRM  | - Standard Reference Material: A reference sample of a known or certified value that is of the same or similar matrix as the associated field samples.  |

### Footnotes

- 1 - The reference for this analyte should be considered modified since this analyte is absent from the target analyte list of the original method.

### Terms

**Total:** With respect to Organic analyses, a "Total" result is defined as the summation of results for individual isomers or Aroclors. If a "Total" result is requested, the results of its individual components will also be reported. This is applicable to "Total" results for methods 8260, 8081 and 8082.

**Analytical Method:** Both the document from which the method originates and the analytical reference method. (Example: EPA 8260B is shown as 1,8260B.) The codes for the reference method documents are provided in the References section of the Addendum.

### Data Qualifiers

- A** - Spectra identified as "Aldol Condensation Product".
- B** - The analyte was detected above the reporting limit in the associated method blank. Flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For MCP-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank. For DOD-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte at less than ten times (10x) the concentration found in the blank AND the analyte was detected above one-half the reporting limit (or above the reporting limit for common lab contaminants) in the associated method blank. For NJ-Air-related projects, flag only applies to associated field samples that have detectable concentrations of the analyte above the reporting limit. For NJ-related projects (excluding Air), flag only applies to associated field samples that have detectable concentrations of the analyte, which was detected above the reporting limit in the associated method blank or above five times the reporting limit for common lab contaminants (Phthalates, Acetone, Methylene Chloride, 2-Butanone).
- C** - Co-elution: The target analyte co-elutes with a known lab standard (i.e. surrogate, internal standards, etc.) for co-extracted analyses.
- D** - Concentration of analyte was quantified from diluted analysis. Flag only applies to field samples that have detectable concentrations of the analyte.
- E** - Concentration of analyte exceeds the range of the calibration curve and/or linear range of the instrument.

**Report Format:** Data Usability Report

**Project Name:** NEW BEDFORD HARBOR LTM VI  
**Project Number:** GTX-302366

**Lab Number:** L1423076  
**Report Date:** 10/22/14

#### Data Qualifiers

- G** - The concentration may be biased high due to matrix interferences (i.e. co-elution) with non-target compound(s). The result should be considered estimated.
- H** - The analysis of pH was performed beyond the regulatory-required holding time of 15 minutes from the time of sample collection.
- I** - The lower value for the two columns has been reported due to obvious interference.
- M** - Reporting Limit (RL) exceeds the MCP CAM Reporting Limit for this analyte.
- NJ** - Presumptive evidence of compound. This represents an estimated concentration for Tentatively Identified Compounds (TICs), where the identification is based on a mass spectral library search.
- P** - The RPD between the results for the two columns exceeds the method-specified criteria.
- Q** - The quality control sample exceeds the associated acceptance criteria. For DOD-related projects, LCS and/or Continuing Calibration Standard exceedences are also qualified on all associated sample results. Note: This flag is not applicable for matrix spike recoveries when the sample concentration is greater than 4x the spike added or for batch duplicate RPD when the sample concentrations are less than 5x the RL. (Metals only.)
- R** - Analytical results are from sample re-analysis.
- RE** - Analytical results are from sample re-extraction.
- S** - Analytical results are from modified screening analysis.
- J** - Estimated value. This represents an estimated concentration for Tentatively Identified Compounds (TICs).
- ND** - Not detected at the reporting limit (RL) for the sample.

## LIMITATION OF LIABILITIES

Alpha Analytical performs services with reasonable care and diligence normal to the analytical testing laboratory industry. In the event of an error, the sole and exclusive responsibility of Alpha Analytical shall be to re-perform the work at it's own expense. In no event shall Alpha Analytical be held liable for any incidental, consequential or special damages, including but not limited to, damages in any way connected with the use of, interpretation of, information or analysis provided by Alpha Analytical.

We strongly urge our clients to comply with EPA protocol regarding sample volume, preservation, cooling, containers, sampling procedures, holding time and splitting of samples in the field.

## Certification Information

Last revised April 15, 2014

---

**The following analytes are not included in our NELAP Scope of Accreditation:**

### Westborough Facility

**EPA 524.2:** Acetone, 2-Butanone (Methyl ethyl ketone (MEK)), Tert-butyl alcohol, 2-Hexanone, Tetrahydrofuran, 1,3,5-Trichlorobenzene, 4-Methyl-2-pentanone (MIBK), Carbon disulfide, Diethyl ether.

**EPA 8260C:** 1,2,4,5-Tetramethylbenzene, 4-Ethyltoluene, Iodomethane (methyl iodide), Methyl methacrylate, Azobenzene.

**EPA 8330A/B:** PETN, Picric Acid, Nitroglycerine, 2,6-DANT, 2,4-DANT.

**EPA 8270D:** 1-Methylnaphthalene, Dimethylnaphthalene, 1,4-Diphenylhydrazine.

**EPA 625:** 4-Chloroaniline, 4-Methylphenol.

**SM4500:** Soil: Total Phosphorus, TKN, NO<sub>2</sub>, NO<sub>3</sub>.

**EPA 9071:** Total Petroleum Hydrocarbons, Oil & Grease.

### Mansfield Facility

**EPA 8270D:** Biphenyl.

**EPA 2540D:** TSS

**EPA TO-15:** Halothane, 2,4,4-Trimethyl-2-pentene, 2,4,4-Trimethyl-1-pentene, Thiophene, 2-Methylthiophene, 3-Methylthiophene, 2-Ethylthiophene, 1,2,3-Trimethylbenzene, Indan, Indene, 1,2,4,5-Tetramethylbenzene, Benzothiophene, 1-Methylnaphthalene.

---

**The following analytes are included in our Massachusetts DEP Scope of Accreditation, Westborough Facility:**

### Drinking Water

**EPA 200.8:** Sb,As,Ba,Be,Cd,Cr,Cu,Pb,Ni,Se,Tl; **EPA 200.7:** Ba,Be,Ca,Cd,Cr,Cu,Na; **EPA 245.1:** Mercury;

**EPA 300.0:** Nitrate-N, Fluoride, Sulfate; **EPA 353.2:** Nitrate-N, Nitrite-N; **SM4500NO3-F:** Nitrate-N, Nitrite-N; **SM4500F-C, SM4500CN-CE, EPA 180.1, SM2130B, SM4500CI-D, SM2320B, SM2540C, SM4500H-B**

**EPA 332:** Perchlorate.

**Microbiology:** **SM9215B; SM9223-P/A, SM9223B-Colilert-QT, Enterolert-QT.**

### Non-Potable Water

**EPA 200.8:** Al,Sb,As,Be,Cd,Cr,Cu,Pb,Mn,Ni,Se,Ag,Tl,Zn;

**EPA 200.7:** Al,Sb,As,Be,Cd,Ca,Cr,Co,Cu,Fe,Pb,Mg,Mn,Mo,Ni,K,Se,Ag,Na,Sr,Ti,Tl,V,Zn;

**EPA 245.1, SM4500H,B, EPA 120.1, SM2510B, SM2540C, SM2340B, SM2320B, SM4500CL-E, SM4500F-BC, SM426C, SM4500NH3-BH, EPA 350.1:** Ammonia-N, **LACHAT 10-107-06-1-B:** Ammonia-N, **SM4500NO3-F,**

**EPA 353.2:** Nitrate-N, **SM4500NH3-BC-NES, EPA 351.1, SM4500P-E, SM4500P-B, E, SM5220D, EPA 410.4, SM5210B, SM5310C, SM4500CL-D, EPA 1664, SM14 510AC, EPA 420.1, SM4500-CN-CE, SM2540D.**

**EPA 624:** Volatile Halocarbons & Aromatics,

**EPA 608:** Chlordane, Toxaphene, Aldrin, alpha-BHC, beta-BHC, gamma-BHC, delta-BHC, Dieldrin, DDD, DDE, DDT, Endosulfan I, Endosulfan II, Endosulfan sulfate, Endrin, Endrin Aldehyde, Heptachlor, Heptachlor Epoxide, PCBs

**EPA 625:** SVOC (Acid/Base/Neutral Extractables), **EPA 600/4-81-045:** PCB-Oil.

**Microbiology:** **SM9223B-Colilert-QT; Enterolert-QT, SM9222D-MF.**

**Lab Number:** L1423331  
**Report Date:** 10/23/14

### Case Narrative

The samples were received in accordance with the Chain of Custody and no significant deviations were encountered during the preparation or analysis unless otherwise noted. Sample Receipt, Container Information, and the Chain of Custody are located at the back of the report.

Results contained within this report relate only to the samples submitted under this Alpha Lab Number and meet all of the requirements of NELAC, for all NELAC accredited parameters. The data presented in this report is organized by parameter (i.e. VOC, SVOC, etc.). Sample specific Quality Control data (i.e. Surrogate Spike Recovery) is reported at the end of the target analyte list for each individual sample, followed by the Laboratory Batch Quality Control at the end of each parameter. If a sample was re-analyzed or re-extracted due to a required quality control corrective action and if both sets of data are reported, the Laboratory ID of the re-analysis or re-extraction is designated with an "R" or "RE", respectively. When multiple Batch Quality Control elements are reported (e.g. more than one LCS), the associated samples for each element are noted in the grey shaded header line of each data table. Any Laboratory Batch, Sample Specific % recovery or RPD value that is outside the listed Acceptance Criteria is bolded in the report. All specific QC information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications. Soil/sediments, solids and tissues are reported on a dry weight basis unless otherwise noted. Definitions of all data qualifiers and acronyms used in this report are provided in the Glossary located at the back of the report.

In reference to questions H (CAM) or 4 (RCP) when "NO" is checked, the performance criteria for CAM and RCP methods allow for some quality control failures to occur and still be within method compliance. In these instances the specific failure is not narrated but noted in the associated QC table. The information is also incorporated in the Data Usability format of our Data Merger tool where it can be reviewed along with any associated usability implications.

Please see the associated ADEx data file for a comparison of laboratory reporting limits that were achieved with the regulatory Numerical Standards requested on the Chain of Custody.

#### HOLD POLICY

For samples submitted on hold, Alpha's policy is to hold samples (with the exception of Air canisters) free of charge for 21 calendar days from the date the project is completed. After 21 calendar days, we will dispose of all samples submitted including those put on hold unless you have contacted your Client Service Representative and made arrangements for Alpha to continue to hold the samples. Air canisters will be disposed after 3 business days from the date the project is completed.

Please contact Client Services at 800-624-9220 with any questions.

**Case Narrative (continued)**

Total Organic Carbon

The WG733445-6 MS recoveries, performed on L1423331-21, are outside the 75-125% acceptance criteria for Total Organic Carbon (Rep1 - 64%), possibly due to sample matrix. The associated SRM recoveries are within criteria indicating the sample batch was in control, and all sample results were accepted.

The WG733478-4 MS recoveries, performed on L1423331-03, are outside the 75-125% acceptance criteria for Total Organic Carbon (Rep1 - 137%) and Total Organic Carbon (Rep2 - 73%), possibly due to sample matrix. The associated SRM recoveries are within criteria indicating the sample batch was in control, and all sample results were accepted.

The WG733721-3 MS recoveries, performed on L1423331-33, are outside the 75-125% acceptance criteria for Total Organic Carbon (Rep2 - 136%), possibly due to sample matrix. The associated SRM recoveries are within criteria indicating the sample batch was in control, and all sample results were accepted.

I, the undersigned, attest under the pains and penalties of perjury that, to the best of my knowledge and belief and based upon my personal inquiry of those responsible for providing the information contained in this analytical report, such information is accurate and complete. This certificate of analysis is not complete unless this page accompanies any and all pages of this report.

## GLOSSARY

### Acronyms

|      |   |
|------|---|
| EDL  | - Estimated Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The EDL includes any adjustments from dilutions, concentrations or moisture content, where applicable. The use of EDLs is specific to the analysis of PAHs using Solid-Phase Microextraction (SPME).                        |
| EPA  | - Environmental Protection Agency.  |
| LCS  | - Laboratory Control Sample: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.   |
| LCSD | - Laboratory Control Sample Duplicate: Refer to LCS.  |
| LFB  | - Laboratory Fortified Blank: A sample matrix, free from the analytes of interest, spiked with verified known amounts of analytes or a material containing known and verified amounts of analytes.  |
| MDL  | - Method Detection Limit: This value represents the level to which target analyte concentrations are reported as estimated values, when those target analyte concentrations are quantified below the reporting limit (RL). The MDL includes any adjustments from dilutions, concentrations or moisture content, where applicable.   |
| MS   | - Matrix Spike Sample: A sample prepared by adding a known mass of target analyte to a specified amount of matrix sample for which an independent estimate of target analyte concentration is available.  |
| MSD  | - Matrix Spike Sample Duplicate: Refer to MS.   |
| NA   | - Not Applicable.   |
| NC   | - Not Calculated: Term is utilized when one or more of the results utilized in the calculation are non-detect at the parameter's reporting unit.  |
| NI   | - Not Ignitable.  |
| RL   | - Reporting Limit: The value at which an instrument can accurately measure an analyte at a specific concentration. The RL includes any adjustments from dilutions, concentrations or moisture content, where applicable.  |
