Under Section 509(b)(1) of the Clean Water Act, judicial review of these regulations is available only by filing a petition for review in the United States Court of Appeals within ninety days after these regulations are considered issued for purpose of judicial review. Under Section 509(b)(2) of the Clean Water Act, these requirements of the regulations may not be challenged later in civil or criminal proceedings brought by EPA to enforce these requirements. These regulations provide final effluent limitations guidelines for "best available technology economically achievable" (BAT), and establishes final pretreatment standards for existing sources (PSES) and for new sources (PSNS). The Agency has decided to retain its previously promulgated "new source performance standards" (NSPS) for this industry. Effluent limitations guidelines for "best practicable control technology currently available" (BPT) were not modified by EPA in this rulemaking. The Agency is reserving coverage of "best conventional pollutant control technology" (BCT) effluent limitations guidelines because the methodology to assess the cost reasonableness of BCT has not yet been established. The Agency is withdrawing storm water runoff limitations promulgated on May 9, 1974 (39 FR 16560) for BPT, BAT, and NSPS, because these limitations were remanded by the court in American Petroleum Institute v. EPA, 540 F. 2d 1023 (10th Cir. 1976).

These regulations shall become effective December 1, 1982. The compliance date for the newly issued PSNS regulation is the date that the new source commences discharge. The compliance date for PSES is the same as the compliance date for the interim final PSES for this industry promulgated on March 23, 1977. (See 42 FR 15684). The PSES promulgated today is no more stringent than the interim final PSES.

The compliance dates for the newly promulgated regulations shall become effective March 23, 1982. The Agency has decided to retain its previously promulgated "new source standards for poured systems" (NSPS) because the Agency has determined that the most important pollutants or pollutant parameters in petroleum refining industry can be found in civil or criminal proceedings brought by EPA to enforce these requirements. These regulations are BPT and NSPS.

The record for this rulemaking will be available for public review within four weeks after the date of publication in EPA's Public Information Reference Unit, Room 2004 (Rear) (EPA Library), 401 M Street, S.W., Washington, D.C. The EPA information regulation (40 CFR Part 2) provides that a reasonable fee may be charged for copying.

Technical information may be obtained by writing to William A. Tellier, Effluent Guidelines Division (W1-552), EPA, 401 M Street, S.W., Washington, D.C. 20460, or by calling (202) 426–4917. Copies of the technical development and economic documents can be obtained from the National Technical Information Service, Springfield, Virginia 22161 (703/487–6000).

I. Legal Authority

II. Scope of this Rulemaking

The petroleum refining industry is included within the U.S. Department of Commerce, Bureau of the Census, Standard Industrial Classification (SIC) 2911. A detailed overview of the petroleum refining industry can be found in the proposed regulations of December 21, 1979 for this industry (44 FR 75928).

The most important pollutants or pollutant parameters in petroleum refinery wastewaters are: (a) toxic pollutants (chromium); (b) conventional pollutants (TSS, Oil and Grease, BOD$_5$, and pH); and (c) nonconventional pollutants (phenolic compounds, AAP, COD, sulfide and ammonia). EPA's 1973 to 1976 rulemaking efforts emphasized the achievement of best practicable control technology currently available (BPT) by July 1, 1977. In general, BPT represents the average of the best existing performances of well-known technologies for control of traditional (i.e., "classical") pollutants.

In contrast, this round of rulemaking aims for the achievement by July 1, 1984, of the best available technology economically achievable (BAT) that will result in reasonable further progress toward the national goal of eliminating...
the discharge of all pollutants. At a minimum, BAT represents the best economically achievable performance in any industrial category or subcategory. Moreover, as a result of the Clean Water Act of 1977, the emphasis of EPA's program has shifted from "classical" pollutants to the control of a lengthy list of toxic pollutants.

EPA is promulgating BAT, PSES, and PSNS for each of the five subcategories established for this industry. BPT, BAT and NSPS effluent limitations for storm water runoff are for all direct dischargers and all BCT requirements, including storm water runoff, are being reserved for future rulemaking.

III. Summary of Legal Background

The Federal Water Pollution Control Act Amendments of 1972 established a comprehensive program to "restore and maintain the chemical, physical, and biological integrity of the Nation's waters" (Section 101(a)). To implement the Act, EPA was to issue effluent standards, pretreatment standards, and new source performance standards for industry dischargers. The Act included a timetable for issuing these standards. However, EPA was unable to meet many of the deadlines and, as a result, it was sued by several environmental groups. In settling this lawsuit, EPA and the plaintiffs executed a court-approved "Settlement Agreement". This Agreement required EPA to develop a program and adhere to a schedule in promulgating effluent limitations guidelines and standards for the "priority" pollutants and classes of pollutants for 21 major industries. See Natural Resources Defense Council, Inc. v. Train, 8 ERC 2120 (D.D.C. 1978). See also: 43 FR 8106; 46 FR 2266; 46 FR 10723.

Many of the basic elements of this Settlement Agreement program were incorporated into the Clean Water Act of 1977. Like the Agreement, the Act stressed control of toxic pollutants including the 65 "priority" pollutants and classes of pollutants for 21 major industries. See Natural Resources Defense Council, Inc. v. Train, 8 ERC 2120 (D.D.C. 1978). See also: 43 FR 8106; 46 FR 2266; 46 FR 10723.

6. Pretreatment Standards for New Sources (PSNS). Like PSES, PSNS are to prevent the discharge of pollutants which pass through, interfere with, or are otherwise incompatible with the operation of the POTW. PSNS are to be issued at the same time as NSPS. New indirect dischargers, like new direct dischargers, have the opportunity to incorporate the best available demonstrated technologies. The Agency considers the same factors in promulgating PSNS as it considers in promulgating PSES.

IV. Prior Regulations and Methodology and Data Gathering Efforts

A. Prior Petroleum Refining Regulations

EPA promulgated BPT, BAT, NSPS, and PSNS for the petroleum refining point source category on May 9, 1974 (39 FR 15560). The BPT, BAT, and NSPS regulations were challenged by the American Petroleum Institute (API) and others in the United States Court of Appeals for the Tenth Circuit. Both BPT and NSPS were upheld by the Court, with the exception of limitations for storm water runoff which were remanded for further consideration. BAT, including limitations for storm water runoff, was remanded for further consideration. American Petroleum Institute v. EPA, 540 F.2d 1023 (10th Cir. 1976). Interim final PSNS was promulgated on March 23, 1977 (42 FR 15684) in response to the Settlement Agreement.

BAT and BCT were proposed on December 21, 1979 (44 FR 75928). At the same time, the Agency proposed to revise NSPS, PSNS, and PSES.

B. Methodology and Data Gathering Efforts

The methodology and data gathering efforts used in developing the proposed regulations were summarized in the preamble to the proposed petroleum refining regulations published on December 21, 1979 (44 FR 75928).

EPA has prepared the following reports concerning data it has acquired on this industry since the December 1979 proposed regulations were published: (1) a report entitled Petroleum Refining Industry, Refinements to 1979 Proposed Flow Model; and (2) a report entitled Petroleum Refining Industry, Surrogate Sampling Program. The Agency has rejected the options which utilized the date and conclusions from these reports in this rulemaking; therefore, the results were not used by EPA as bases for the Agency's regulations in today's rulemaking.

V. Control Treatment Options and Technology Basis for Regulations

A. Final BAT Limitations

EPA is promulgating BAT limitations which are equivalent to the BPT level of control (Option 9 discussed below). These limitations are based on both in-plant and end-of-pipe technologies, including sour water stripping to control ammonia and sulfide, water use management, sewer segregation, wastewater, flow equalization, initial oil and solids removal (API separators or baffle plate separators), advanced oil and solids removal (clarifiers, dissolved air flotation, or filters), biological treatment, and filtration or other "polishing" steps. The flow model and subcategorization scheme upon which these limitations are based are the same as those used for developing the BPT effluent limitations. BAT removes 96 percent of the toxic pollutants from raw wastewaters discharged by the petroleum refining industry.

1. Control Treatment Options for BAT.

The control and treatment technology options that EPA investigated for use in this industry for BAT are presented below. Options 1 through 6 were considered in formulating the proposed rule. Option 7, a modification of Option 2, and Option 8, a modification of Option 9, were developed on the basis of information available at the time of the 1979 proposal, modified as a result of information collected by EPA after the proposed rule was published, as well as from public comments received on the proposed rule. Option 9, the BPT level of control, was reconsidered after publication of the proposed rule, as a result of public comments received.

Option 1—Discharge flow reduction of 27 percent from the proposed model flow, achieved through greater reuse and recycle of wastewaters, in addition to BAT treatment.

Option 2—Discharge flow reduction of 52 percent from the proposed model flow, achieved through greater reuse and recycle of wastewaters, in addition to BAT treatment.

Option 3—Discharge flow reduction of 27 percent from the proposed model flow per Option 1, plus enhanced BAT treatment with powdered activated carbon to reduce residual toxic organic pollutants.

Option 4—Discharge flow reduction of 52 percent from the proposed model flow per Option 2, in addition to BAT treatment plus segregation and separate treatment of cooling tower blowdown. Cooling tower blowdown treatment for metals removal includes reduction of hexavalent chromium to trivalent chromium, pH adjustment, precipitation, and settling or clarification.

Option 5—Discharge flow reduction of 27 percent from the proposed model flow per Option 1, in addition to BAT treatment plus granular activated carbon treatment to reduce residual toxic organic pollutants.

Option 6—"A "no discharge of wastewater pollutants" (i.e., zero discharge) standard based upon reuse, recycle, evaporation, or reinjection of wastewaters.

Option 7—Discharge flow reduction of 37.5 percent from revised model flow achieved through greater reuse and recycle of wastewaters, in addition to BAT treatment.

Option 8—Discharge flow reduction of approximately 20 percent from revised model flow achieved through greater reuse and recycle of wastewaters, in addition to BAT treatment.

Option 9—Flow equalization, initial oil and solids removal, advanced oil and solids removal, biological treatment, and filtration or other final "polishing" steps. This option is the basis of the existing regulations.

2. Technology Basis for the Final BAT Regulation. (a) Final BAT Limits: EPA is promulgating BAT limitations based on Option 9 which is equivalent to the BPT level of control. Regulated pollutants for BAT are (1) nonconventional pollutants: Chemical oxygen demand (COD), total phenols (4AAP), ammonia(N), sulfides; and (2) toxic pollutants: total chromium, and hexavalent chromium.

(b) Changes From Proposal: The options considered in formulating the proposed rules were based on various combinations of wastewater flow reduction and improved performance of wastewater treatment technology. A flow modeling approach was used for regulatory purposes to define the industry's current wastewater generation and to correlate effluent flow with process variables. The proposed 1979 flow model was developed to establish the average wastewater flow that can be expected from refineries with similar process configurations. The proposed flow model was also used to determine specific effluent limitations for the prescribed levels of flow reduction in Options 1 through 5.

The proposed regulation was based on the Option 2 level of control. This option proposed to regulate chemical oxygen demand (COD), total phenols (4AAP), ammonia(N), sulfide, total chromium, and hexavalent chromium.
The Agency determined that, regardless of the amount of flow reduction, the levels of ammonia, sulfide, and COD would not measurably change compared to the BPT level of control. The control of ammonia and sulfide is achieved through steam stripping, an in-plant control technique. No technologically feasible process changes or in-plant controls beyond those presently in use in this industry were identified to further reduce ammonia and sulfide. The Agency's attempts to quantify or predict changes in COD levels with implementation of flow reduction/water reuse technologies were inconclusive.

The proposed regulation would have limited total phenols at a mass equivalent of 19 μg/l. The Agency received a number of comments on this issue stating that the proposal to limit total phenols at 19μg/l was too stringent because technology is not available to consistently achieve such a level. Additional information on phenol was collected by EPA in the "Long Term Data Collection Survey" and the "Surrogate Sampling Program" (See Sections IV and XVI) subsequent to the December 1979 proposal. Information collected included effluent data from 37 refineries for calendar year 1979. Analysis of the data collected during these two studies concluded that existing BPT treatment systems are not achieving the proposed 19 μg/l level on a long term basis. However, the results do show that such systems are capable of achieving the 100 μg/l level of control previously established for determining BPT mass limitations.

The preamble to the 1979 proposal (44 FR 75939) stated that implementation of Option 2 would result in the removal of approximately 123,000 pounds of chromium per year, at an incremental (beyond BPT) annual cost of $62 million and a capital cost of $138 million (1979 dollars). This 123,000 pounds of chromium per year represents the incremental removal from the BPT level to the BAT Option 2 level. However, based upon reevaluation of the effluent data base, the Agency has found this figure was overstated because the observed chromium discharge of refineries with BPT level treatment was considerably less than that allowable by the BPT chromium limitations. The actual amount of chromium which would have been removed under this option is approximately 32,000 pounds per year. The capital costs, to a considerable extent, represent retrofit costs.

BAT Option 2 was developed using the proposed 1979 flow model. However, based upon data submitted by commenters and the "Flow Model" study performed by EPA after the proposal (See Section IV), the proposed 1979 flow model was modified. The technical points raised by some of the commenters were of considerable assistance in the flow model refinement process. The main emphasis of the comments concerned the statistical deficiencies of the proposed model, the choice of model variables, and aspects of the resulting model fit. The structure of the model and the process variables to be included were reexamined and modified accordingly. This refinement process resulted in the revised 1979 flow model which was more representative of the current wastewater generation in the industry. Thus, Option 2 has been rejected because it was based on the proposed flow model that has been modified. (See discussion of Option 7 below).

**Other Options Considered**

Because BAT Option 1 relies on the same technology as BAT Option 2, ammonia, sulfide, and COD levels would not be measurably changed by implementing Option 1. The total phenol limitation for this option was based upon the same 19 μg/l concentration level as was used for Option 2. However, as previously discussed, BPT end-of-pipe treatment has not been shown to be capable of achieving this concentration level on a long term basis.

The Agency's analysis of available data shows that implementation of Option 1 would remove an additional 1 percent beyond BPT treatment levels of toxic pollutants that are present in raw wastewaters. This translates into an additional removal beyond BPT of approximately 1.3 pounds of toxic pollutants per day, per direct discharge refinery. The proposed 1979 regulation would require $23.5 million additional capital investment at an annual cost of $9.3 million (1979 dollars) to implement Option 1 for this industry. The capital costs, to a considerable extent, represent retrofit costs. This option was rejected because it was based on the proposed 1979 flow model, which, as discussed above, has been modified. (See discussion of Option 8 below).

The Agency's analysis of available data shows that implementation of Option 3 would remove an additional 1.5 percent (beyond BPT treatment) levels of beyond BPT treatment levels. This translates into an additional removal beyond BPT of approximately two pounds of toxic pollutants per day, per direct discharge refinery. The two end-of-pipe treatment technologies that were used to establish Option 3 are rotating biological contactors (RBC) and powdered activated carbon (PAC) treatment. At the time of the Agency's data collection efforts in 1976-1979, there were seven facilities using these technologies. The Agency determined that, upon analysis of available data, there are significant operational (mechanical) problems with RBC technology. The Agency also found that full-scale experience with PAC technology was mixed, i.e., some facilities experienced consistently measurable pollutant reductions as intended, while others experienced inconsistent or no measurable effluent reductions. Because of these operational problems observed in full-scale facilities, there was limited performance information available. While both of these technologies appear promising, the Agency believes there is not enough performance information available at this time upon which to base national regulation for this industry.

Option 4 was predicated on industrywide ability to segregate, collect, and separately treat cooling tower blowdown, the major source of chromium for this industry. The wastewater recycle/reuse study (See Section IV), completed after the publication of the proposed regulation, concluded that, for existing sources, it is extremely difficult in many instances to segregate cooling tower blowdown for chromium treatment. Cooling tower recirculation and blowdown is typically practiced at numerous locations throughout a refinery. Extensive collection systems would be necessary at many refineries to collect all blowdown streams for separate treatment. In addition, not all cooling tower blowdown streams are collectible. For instance, cooling water when used as makeup for refinery processing commingles with process water and cannot be traced or segregated, especially in older refineries. Therefore, the Agency has determined that it would not be proper to base BAT effluent limitations guidelines on this technology option.

The alternative for additional chromium removal beyond BPT is to treat the combined final effluent. However, further end-of-pipe treatment for chromium in combined final effluent after BPT treatment would result in limited, if any, measurable effluent reduction benefits. This is because the chromium level in combined final effluent (115 μg/l observed average) approximates the level achievable by any further treatment of this type of wastewater. For the foregoing reasons,
the Agency rejected Option 4 for this industry.

BAT Option 5 was predicated on industry's ability to install and operate granular activated carbon (GAC) treatment as an end-of-pipe technology. In the preamble to the 1979 proposal (44 FR 75933), the Agency stated that granular activated carbon (GAC) treatment is not a demonstrated technology in this industry. The Agency also stated that toxic pollutant removal generally increases with the use of GAC. However, because the levels of toxic pollutants after BPT treatment are so low, additional pollutant reduction across GAC treatment would be minimal. Difficulties in quantifying pollutant reductions were experienced when the Agency conducted six pilot plant treatability studies using GAC on BPT-treated wastewaters in this industry. See 44 FR 75930. EPA is not aware of any petroleum refinery presently using this technology. Although this technology is used in other industries, EPA has no adequate data to indicate that this technology is capable of being transferred to the petroleum refining industry. For the foregoing reasons the Agency rejected Option 5 for this industry.

The Agency rejected BAT Option 6, a zero discharge requirement: (1) Because of its high capital and operating costs, including significant retrofit expenditures; and (2) because analysis of the zero discharge technologies revealed that significant non-water quality impacts would result from their use. These non-water quality impacts include generation of large amounts of solid waste and very high energy consumption.

BAT Option 7 is the revision of regulatory Option 2, and is based upon a discharge flow reduction of 37.5 percent from the revised 1979 model flow. The Agency revised the costs to implement Option 7 recycle and reuse technologies. An estimated capital cost of $112 million dollars and $37 million dollars annually would be required for refiners to comply with Option 7 (1979 dollars). The Agency's analysis of available data shows that implementation of Option 7 would remove 310,000 pounds of toxic pollutants annually beyond BPT treatment levels, which is equivalent to an additional 1.5 percent (beyond BPT treatment levels) of toxic pollutants from raw wastewaters. This translates into an additional removal beyond BPT of approximately two pounds of toxic pollutants per day, per direct discharge refinery. The Agency believes, that given all of these factors, the costs involved do not warrant selection of Option 7 for this industry. BAT Option 8 is a revised version of Option 1 reduction of 20 percent from the revised 1979 model flow. The Agency has not performed a detailed cost analysis for Option 8 but rather has estimated such costs based upon the costing procedure developed for Option 7. (Option 7 is the revision of the regulatory Option 2 selected in the 1979 proposal). The Agency's analysis of available data shows that implementation of Option 8 would remove an additional 80,000 pounds of toxic pollutants annually beyond BPT treatment levels, which would be an additional one percent (beyond BPT treatment levels) of toxic pollutants from raw wastewaters at a capital cost of $77 million dollars and an annual cost of $25 million (1979 dollars). This translates into an additional removal beyond BPT of 1.3 pounds of toxic pollutants per day, per direct discharge refinery. The Agency believes that given all of these factors, the costs involved do not warrant selection of Option 8 for this industry.

Option 9 is based upon the same flow model and subcategorization scheme that were used for developing the BPT regulations promulgated by the Agency in 1974. A process classification system was used to divide the industry into five subcategories. A procedure was developed to establish effluent limitations for each subcategory. The resulting limits were defined in terms of a quantity of pollutant per unit of feedstock (mass allocation), and were derived by multiplying a predicted wastewater per unit of production times an achievable effluent concentration for each pollutant. A flow modeling approach, based on process configuration, was used to predict expected wastewater flow for an individual refinery, and is referred to as the "BPT flow model".

Option 9 was selected by the Agency as the basis for the final BAT regulations. Considering the limited pollutant reduction benefits associated with Options 1 through 8, the inability to quantify nonconventional pollutant reduction via Options 1 through 8, the costs involved of going beyond the BPT level of control, and the 96 percent reduction in toxic pollutant loadings achieved by BPT, the Agency has determined that the BAT should be equivalent to the BPT level of control for this industry. Option 9 and Options 1 through 8 were considered in formulating the proposed rule and were based upon the 1979 flow model. Option 4, the existing NSPS level of control, was reconsidered after publication of the proposed rule as a result of the public comments and is based upon the 1974 flow model.

Option 1—Discharge flow reduction of 52 percent from model flow, achieved through greater reuse and recycle of wastewaters, in addition to BPT treatment. This option is equivalent to BAT Option 2.

Option 2—Discharge flow reduction of 27 percent from model flow, achieved through greater reuse and recycle of wastewaters in addition to BPT treatment. Option 2 is based upon the same flow model and subcategorization scheme that were used for developing the BPT regulations promulgated by the Agency in 1974. A process classification system was used to divide the industry into five subcategories. A procedure was developed to establish effluent limitations for each subcategory. The resulting limits were defined in terms of a quantity of pollutant per unit of feedstock (mass allocation), and were derived by multiplying a predicted wastewater per unit of production times an achievable effluent concentration for each pollutant. A flow modeling approach, based on process configuration, was used to predict expected wastewater flow for an individual refinery, and is referred to as the "BPT flow model".

Option 3—Zero discharge of wastewater pollutants. Option 4—Discharge flow reduction of 25 percent to 50 percent of average BPT flow, depending upon subcategory, achieved through greater reuse and recycle of wastewaters in addition to BPT treatment. Option 4 is based upon the 1974 flow model and 1974 subcategorization scheme, is the existing NSPS.

2. Technology Basis for the NSPS Regulation. (a) NSPS Limits: EPA is retaining the existing NSPS which are based on recycle and reuse technology resulting in pollutant reductions that range from 25 to 50 percent beyond BPT removals, depending upon the subcategory. Regulated pollutants for NSPS are BOD5, total suspended solids, chemical oxygen demand, oil and grease, total phenols (4AAP), ammonia (N), sulfide, total chromium, hexavalent chromium, and pH.

(b) Changes from Proposal: The proposed NSPS regulation was based on Option 3. Upon reevaluation of the existing data base and evaluation of comments received on the proposed regulation, EPA has decided not to revise the existing NSPS.

Option 3, zero discharge, was rejected for the following reasons. First, it generates significant adverse non-water quality environmental impacts, including the production of large amounts of solid waste and high energy consumption. Second, EPA estimates that the annual costs of achieving zero
discharge are extremely high, especially in geographical areas of low evapotranspiration which requires energy intensive forced evaporation techniques. It would cost an estimated $4.6 million (1979 dollars) annually for a 150,000 barrels per day new source of refinery in the cracking subcategory to comply with a zero discharge requirement. Third, only marginal additional water pollution reduction benefits would be achieved beyond the existing NSPS requirement. The quantities of pollutants that would be removed daily are 2.48 pounds of total phenols (4AAP), 3.9 pounds of hexavalent chromium, 6 pounds of total chromium, 308 pounds of total suspended solids, and 361 pounds of BOD. EPA believes that the high costs of implementing such requirements would raise serious barriers to any decision involving construction of a new source refinery.

Other Options Considered

NSPS Option 1 is equivalent to proposed BAT Option 2. The technology for this option is the same as that for the existing NSPS regulations—wastewater recycle and reuse technologies, in addition to BPT end-of-pipe treatment. The Agency compared effluent reductions achievable by existing NSPS and this option. The analysis was performed on a model greenfield new source refinery (190,000 bbl/day), which is classified as a "Subcategory B" refinery as defined by the existing regulation ("cracking"). This model refinery was configured to correspond with demand growth forecasts published by the Department of Energy (See the Economic Analysis document.) This comparison concluded that effluent reductions resulting from existing NSPS and this option are comparable. The costs to implement this option are comparable to the existing NSPS. Non-water quality environmental impacts and energy requirements are also comparable to existing NSPS. Accordingly, there would be no benefit in revising the existing NSPS option.

NSPS Option 2 is equivalent to proposed BAT Option 5, which is based on granular activated carbon (GAC) treatment as an end-of-pipe technology. For the reasons stated in the above discussion on BAT Option 5, the Agency believes that GAC treatment is not a demonstrated technology for this industry. Accordingly, the Agency rejected Option 2 for this industry.

NSPS Option 4, is the existing NSPS level of control. It consists of recycle and reuse technologies to achieve flow reduction of from 25 to 50 percent of average BPT flow, depending upon the subcategory. For the reasons discussed above, after careful consideration of the options proposed in 1979, together with the public comments received, the Agency finds no reason for revising current NSPS. Accordingly, the existing level of NSPS, Option 4, is retained.

C. Final Pretreatment Standards for Existing Sources (PSES)

Interim final PSES was promulgated by the Agency on March 23, 1977 (42 FR 15684) and is currently in effect. Regulated pollutants are oil and grease (100 mg/1) and ammonia-N (100 mg/l) each on a daily maximum basis. EPA is retaining the existing PSES regulation, with one modification. An alternative mass limitation for ammonia(N) is provided for those indirect dischargers whose discharge to the POTW consists solely of sour waters.

1. Control Treatment Options Considered. The control and treatment options that EPA investigated for PSES in this industry are presented below. Options 1 and 2 were considered in formulating the proposed rule. Option 3, the existing PSES level of control, was reconsidered after publication of the proposed rule as a result of public comments received on it. As a result of public comments, Option 3 also contains an alternative mass limitation for ammonia(N).

Option 1—Chromium reduction by pH adjustment, precipitation and clarification technologies applied to segregated cooling tower blowdown, plus control of oil and grease and ammonia at the existing PSES level of control.

Option 2—Establish two sets of pretreatment standards. The first would be Option 1 control for refineries discharging to POTW with existing or planned secondary treatment. The second would be Option 1 control plus treatment for total phenols based on biological treatment for those refineries discharging to a POTW that has been granted a waiver from secondary treatment requirements under Section 301(h) of the Act. EPA’s proposed pretreatment standards for existing sources were based on this option. For a further discussion see the 1979 proposed petroleum refining regulation at 44 FR 75935.

Option 3—Reduction of oil and grease and ammonia based on oil/water separation and steam stripping technologies. This option is the basis for the existing interim final PSES regulation. An alternative mass limitation for ammonia(N) is included for those indirect dischargers whose discharge to the POTW consists solely of "sour" waters. Sour waters generally result from water brought into direct contact with a hydrocarbon stream, and contain sulfides, ammonia and phenols. The Agency developed an alternative mass limitation for ammonia in response to public comments received on the proposed regulation. Several commenters indicated that, when the refinery discharge to the POTW consists solely of sour waters, the achievement of the 100 mg/l ammonia concentration limitation is often not possible. This is because steam stripping technology, the basis for the limitations, cannot consistently reduce ammonia in sour water streams to the 100 mg/l level. Thus, an equivalent mass limitation for ammonia was developed by the Agency.

2. Technology Basis for the Final PSES Options. (a) Final PSES Limits: EPA is retaining the existing PSES regulation. Regulated pollutants are oil and grease and ammonia(N), each limited at 100 mg/l on a daily maximum basis. An alternative mass limitation for ammonia-N is also provided as described above.

(b) Changes from Proposal: The proposed regulation was based on Option 2 for the PSES control level. EPA has rejected Option 2 because it now believes that it is not feasible and that it would be inappropriate to establish national pretreatment standards that take into account whether a discharger uses a POTW which has received a 301(h) waiver. Rather, the need for more rigorous pretreatment controls should be resolved on a case-by-case basis during the Section 301(h) waiver process. This is because the level of treatment proposed by Section 301(h) applies to an entire site, whereas the Section 301(h) process entails the consideration of site-specific toxic pollutant problems.

Options 1 and 2 as proposed also would have established a chromium limitation for PSES. This limitation was proposed to avoid concentration of chromium in POTW sludge. At the time of proposal, the Agency believed such concentrations would limit a POTW’s use or management alternatives of the sludge. Based upon review of existing information and analysis of public comments on the proposal, EPA has determined that this rationale is not valid on a nationwide basis. For this industry, chromium levels in sludge from POTW receiving petroleum refinery wastes generally do not impact on sludge disposition or alternatives for use. There are no Section 405 sludge standards directed at concentrations of chromium in the sludge. Accordingly, EPA has determined that the better approach is to leave it to the POTW to establish chromium pretreatment...
standards for existing sources if refinery waste would limit their sludge disposal alternatives. The general pretreatment regulations specifically provide POTW's with this authority. (See 40 CFR 403.5).

EPA has determined that toxic pollutants "pass through" a POTW. The Agency generally considers that there is pass through of a pollutant if the percent of the pollutant removal by a well-operated POTW achieving secondary treatment is less than the percent removed by the BAT model treatment technology. Under this approach, chromium passes through a POTW. The Agency's BAT model treatment system removes 80 percent of the chromium, whereas a well-operated POTW achieving secondary treatment removes 65 percent of the chromium. In addition, under this approach the toxic pollutants identified in Appendix D—Parts II/III of this Federal Register notice may pass through a POTW.

As discussed under BAT Option 4 above, the Agency found it infeasible in many instances to segregate cooling tower blowdown for chromium treatment on an industry-wide basis. Accordingly, EPA has determined that implementation of Option 1 for PSES is not achievable on an industry-wide basis. As an alternative, treatment of the combined refinery waste stream for chromium removal would require installation of most if not all of the BPT treatment train. Installation of such treatment for all indirect dischargers would cost an estimated $110 million in capital costs, with a total annual cost of $42 million in 1979 dollars. The Agency did not propose requiring installation of BPT-type treatment on an industry-wide basis for indirect dischargers. EPA did not receive any comments during the public comment period suggesting such a requirement. For the foregoing combination of reasons, and given the costs involved, EPA does not believe installation of the BPT treatment train for chromium removal for indirect dischargers is warranted.

The toxic pollutants listed in Appendix D of this preamble were detected in petroleum refinery waste streams that are discharged to POTWs. The Agency has decided not to establish PSES for these toxic pollutants in this industry for the following reasons:

The pollutants listed in Part I and Part II of Appendix D are excluded from national regulation in accordance with Paragraph 8 of the Settlement Agreement because either they were found to be susceptible to treatment by the POTW and do not interfere with, pass through, or are not otherwise incompatible with the POTW, or the toxicity and amount of incompatible pollutants are insignificant.

The pollutants listed in Part III of Appendix D are excluded for several reasons in accordance with Paragraph 8 of the Settlement Agreement. First, there is significant removal of some of these pollutants by the existing oil/water separation technology used to comply with the pretreatment standard for oil and grease. Second, there is significant removal of these pollutants by the POTW treatment processes by air stripping and biodegradation. Third, the amount and toxicity of these pollutants does not justify developing national pretreatment standards.

D. Final Pretreatment Standards for New Sources (PSNS)

PSNS was promulgated by the Agency on May 9, 1974 (39 FR 16560) and is currently in effect. Pretreatment Standards for incompatible pollutants are equivalent to NSPS.

1. Control Treatment Options Considered. The control and treatment options that EPA investigated for PSNS in this industry are the same as those presented for PSES, as described above. Option 1 was selected as the basis for PSNS. As a result of public comment, the final PSNS contains an alternative mass limitation for ammonia(N).

Option 1—Chromium reduction by pH adjustment, precipitation and clarification technologies applied to segregated cooling tower blowdown, plus control of oil and grease and ammonia to 100 mg/1 each.

Option 2—Establish two sets of pretreatment standards as for PSES Option 2.

2. Technology Basis for the Final PSNS.

(a) Final PSNS Limits: EPA is promulgating PSNS equivalent to Option 1. Regulated pollutants are oil and grease and ammonia(N), each limited at 100 mg/1, on a daily maximum basis, and total chromium at the equivalent of 1 mg/1 for the cooling tower discharge part of the total refinery flow to the POTW. An alternative mass limitation for ammonia(N) is also provided, as described above for PSES.

(b) Changes from Proposal: The final PSNS limits are equal to Option 1, the option selected at proposal. Chromium was selected for regulation for PSNS because: (1) It was determined to "pass through" POTWs as described above; (2) treatment technology is available and demonstrated; and (3) there are no retrofit problems or retrofit costs involved with implementing Option 1.

Alternative mass limitations for ammonia(N) are also provided, as discussed previously.

Pretreatment costs for a typical new source refinery are estimated to be $260,000 in capital costs and $190,000 in annual costs (1979 dollars).

VI. Costs and Economic Impacts

Executive Order 12291 requires EPA and other agencies to provide regulatory impact analyses for rules that result in an annual cost to the economy of 100 million dollars or more or that meet other economic impact criteria. In addition, the Clean Water Act specifies that the Agency should consider the costs and economic impacts in establishing effluent limitations and standards. The Agency does not consider this final regulation to be a major rule. This rulemaking satisfies the requirements of the Executive Order for a non-major rule.

The economic impact assessment is presented in Economic Impact Analysis of Proposed Revised Effluent Limitations for the Petroleum Refining Industry (EPA). Copies of the analysis can be obtained by contacting the National Technical Information Service, 5282 Port Royal Road, Springfield, VA 22161 (703/487-4600).

BPT/PSES

EPA is making substantial changes to the regulations that were proposed in December 1979. The limitations promulgated today for existing sources do not reflect any treatment requirements beyond BPT for existing direct dischargers. For indirect dischargers the PSES promulgated today is no more stringent than existing pretreatment standards already in effect. Accordingly, EPA expects no incremental costs or impacts for existing plants from this rulemaking.

NSPS

EPA is not imposing any more stringent NSPS by today's action. Accordingly, today's action will not affect the rate of entry of new refineries into the industry. Moreover, EPA does not expect the NSPS promulgated in 1974 to change the rate of entry or growth of the industry. The Agency expects that if a firm decides to bring a new refinery on line, the control costs that will be required to meet these standards are relatively small compared to the total cost required to start a greenfield operation. The current economic analysis was based on a 330,000 barrel per day refinery with a configuration appropriate for production of gasoline, distillate fuels and petrochemical feedstocks. There would essentially be no additional investment required for meeting the current
standard beyond the BPT level of control. This is because the "add-on" recycle technology for the existing NSPS can be incorporated in the water supply, use, and treatment systems during planning and construction of the new source. Therefore, this regulation is expected to have negligible economic effects on the industry.

Due to significant changes in the world market for refined petroleum products, however, the Agency does not anticipate any new sources within the petroleum refining category through 1990. A refinery can be a new source if it is a "greenfield site" or if modification of an existing plant is extensive enough to be "substantially independent" of an existing source. (See 45 FR 59943, September 19, 1980.) The Agency expects that in the latter case the control costs that would be required to meet these standards would be less than the cost in the case of a greenfield operation.

PSNS

EPA believes that for indirect dischargers the PSNS promulgated today is no more stringent than existing PSNS. Under the existing PSNS, chromium was subject to regulation on a case-by-case basis along with other pollutants. The Agency expects that if a firm decides to bring a new indirect discharger on line, the control cost that will be required to meet these standards are relatively minor compared to the total investment cost for a new refinery and would not pose a barrier to entry. The Agency believes that where an existing refinery is modified so that it is considered a new source, the costs for chromium treatment would not be greater than the costs for a greenfield refinery and the cost of chromium treatment would not be a significant factor in the decision to modify that refinery.

Public Law 96-354 requires that a Regulatory Flexibility Analysis (RFA) be prepared for regulations proposed after January 1, 1981 that have a significant effect on a substantial number of small entities. This regulation was proposed on December 21, 1979. Therefore, a Regulatory Flexibility Analysis is not required. The Agency does not believe that this regulation will have a significant impact on a substantial number of small entities.

VII. Non-Water Quality Environmental Impacts

Eliminating or reducing one form of pollution may cause other environmental problems. Sections 304(b) and 306 of the Act require EPA to consider the non-water quality environmental impacts (including energy requirements) of certain regulations. In compliance with these provisions, we considered the effect of this regulation on air pollution, solid waste generation, water scarcity, and energy consumption. This regulation was circulated to and reviewed by EPA personnel responsible for non-water quality programs. While it is difficult to balance pollution problems against each other and against energy use, we believe that this regulation will best serve often competing national goals.

The following non-water quality environmental impacts (including energy requirements) are associated with the final regulation. The Administrator has determined that the impacts identified below are justified by the benefits associated with compliance with the limitations and standards.

A. Air Pollution

The petroleum refining regulations will not result in any additional air quality impacts beyond those from compliance with existing regulations.

B. Solid Waste

The petroleum refining regulations will not result in any additional solid waste impacts beyond those from compliance with existing regulations.

C. Consumptive Water Loss

The petroleum refining regulations will not result in any additional water consumption beyond that from compliance with existing regulations.

D. Energy Requirements

The petroleum refining regulations will not result in any additional energy requirements beyond those for compliance with existing regulations.

VIII. Pollutants and Subcategories Not Regulated

The Settlement Agreement contains provisions authorizing the exclusion from regulation, in certain circumstances, of toxic pollutants and industry categories and subcategories.

A. Exclusion of Pollutants

Paragraph 8(a)(iii) of the Settlement Agreement authorizes the Administrator to exclude the following toxic pollutants from regulation: (a) Those not detectable by Section 304(h) analytical methods or other state-of-the-art methods; (b) those present in amounts too small to be effectively reduced by available technologies; (c) those present only in trace amounts and neither causing nor likely to cause toxic effects; (d) those detected in the effluent from only a small number of sources within a subcategory and uniquely related to those sources; and (e) those that will be effectively controlled by the technologies on which other effluent limitations and standards are based.

The toxic pollutants excluded from regulation in all subcategories because they were not detectable by Section 304(h) analytical methods or other state-of-the-art methods are listed in Appendix A for direct dischargers and Appendix B for indirect dischargers.

The toxic pollutants that will be effectively controlled by the technologies on which other effluent limitations and standards are based are listed in Appendix C for direct dischargers.

B. Exclusion of Subcategories

Paragraph 8(b) of the Settlement Agreement authorizes the Administrator to exclude from regulation a category if: (i) 95 percent or more of all point sources in the subcategory introduce into POTWs only pollutants which are susceptible to treatment by the POTW and which do not interfere with, do not pass through, or are not otherwise incompatible with such treatment works; or (ii) the toxicity and amount of the incompatible pollutants introduced by such point sources into POTWs is so insignificant as not to justify developing a pretreatment regulation. The pollutants excluded under Paragraphs 8(b)(i), 8(b)(ii), and 8(a) are listed in Appendix D for indirect dischargers.

IX. Responses to Major Comments

This section contains responses to those issues raised in a large number of the comments received and which affect all subcategories. The original comments and a summary of the comments received and our detailed responses to all comments are included in a report "Responses to Public Comments, Proposed Petroleum Refining Effluent Guidelines and Standards", which is included in the public record for this regulation.

Most of the commenters criticized the need for further control beyond existing BPT and NSPS and the alleged technical inadequacy of data to support the proposed regulations. Since the Agency has decided to promulgate BAT equivalent to BPT retain the existing NSPS and retain the existing PSES regulation (with an alternative mass limitation provided for ammonia (N)), EPA believes it unnecessary to address in detail many of the comments in this preamble. A brief summary of significant comments received by the Agency, together with the Agency's responses, is set forth below:

A. Regulation Beyond the BPT Level

Many of the commenters indicated
that further control beyond BPT is unwarranted since BPT technology already reduces significant quantities of toxics.

The Agency agrees with the commenters that BPT technology already removes significant quantities of toxic and other pollutants and is thus promulgating BAT equal to BPT. One of the many factors considered in formulating the final rule are the very low pollutant levels in BPT effluents and the overall effectiveness and efficiency of the treatment systems already in place in removing toxic and other pollutants.

Other commenters argued for BAT to be promulgated at the proposed BAT level or a more stringent level, including zero discharge or separate treatment of cooling water discharges. The reasons for not adopting levels of treatment are discussed in Section V above.

The proposed requirement for separate treatment of cooling tower blowdown for existing dischargers was not adopted as a result of public comments received. In addition, the Agency performed a study which evaluated the cost and feasibility of implementing recycle and reuse technologies. The study (Recycle/Reuse Study referenced in section IV) indicated that the collection of all the cooling tower water is infeasible in many existing refineries because of leaks and auxiliary uses and thus supports the Agency's decision not to impose this requirement.

Several commenters argued that the proposed zero discharge requirement for new sources has questionable effluent reduction benefits and the Agency did not consider the benefit/cost ratio of zero discharge. The factors that led to the Agency's decision to retain the existing NSPS are discussed in Section V.

B. Pretreatment Standards for POTW with § 301(h) Waivers

Some commenters argued that EPA has no authority to establish more stringent pretreatment standards for refineries that discharge to POTW with Section 301(h) waivers.

Although the Agency does not agree with these commenters, we have decided to change the proposed approach and establish one set of pretreatment standards for all indirect dischargers in this industry. This industrial category is the only one for which EPA proposed separate pretreatment standards for indirect dischargers whose wastes go to POTWs with § 301(h) waivers. The Agency would like to gain more experience with § 301(h) applicants before considering a two-tier pretreatment requirement. Added experience will enable the Agency to decide whether control of toxics should be effectuated through requirements imposed on POTW during the § 301(h) waiver process or by revised pretreatment standards.

C. Pretreatment Standards for Hydrogen Sulfide and Mercaptans

A few commenters indicated that hydrogen sulfide and mercaptans can cause damage to the wastewater collection systems and can cause significant odor problems at the treatment plant if not removed. Pretreatment standards were recommended.

Pretreatment standards adopted today limit ammonia to 100 mg/l. The technology for control of ammonia is steam stripping, the same technology required for sulfide removal. The Agency therefore believes that the technology for control of ammonia will also control sulfide and therefore that it is not necessary to establish separate pretreatment standards for sulfide. Mercaptans were not found to be a problem warranting national regulation. Any POTW experiencing problems caused by mercaptans should impose the appropriate pretreatment standards on a case-by-case basis.

D. Total Phenol (4AAP)

Several commenters indicated that EPA has incorrectly assumed that total phenols as determined by the 4-aminoantipyrine method (4AAP) is a toxic pollutant in this industry.

The Agency agrees. Total phenols (4AAP) measures many compounds, including the phenolic compounds that are on the Agency's list of priority pollutants. Because the 4AAP method measures more compounds than just the GC/MS compounds, it does not provide an accurate quantification of the toxic pollutant phenol (GC/MS). Thus, total phenols (4AAP) is considered a non-conventional pollutant for this industry.

E. Regulation of Toxic Organics

It was argued that EPA should promulgate effluent limitations guidelines for specific toxic pollutants such as methylene chloride, carbon tetrachloride, mercury, ethylbenzene, naphthalene, 2,4-dimethylphenol, benzene, toluene, and carbon tetrachloride were either not detected in BPT treated wastewaters or were present at average concentrations that were at or less than the level of quantification, which is nominally 10 ppb.

F. Indicator and Surrogate Pollutants.

Comments were received from industry and private citizens on the possible use of indicator or surrogate pollutant limitations. Most of the comments were not favorable. The industry commenters argued that indicator limitations, if necessary, should be developed on a case-by-case basis. Industry also questioned the use of total organic carbon (TOC), chemical oxygen demand (COD), and BPT-limited pollutant parameters as indicators for toxic pollutants. The Agency, therefore, decided to retain the toxics directly instead of relying on indicators. Additionally, many commenters pointed out the difficulty in using the BPT pollutant parameters as indicators of toxic pollutants.

In the Solicitation of Comments section of the preamble to the 1979 proposal (40 FR 45941), the Agency requested comments on the possibility of regulating toxic pollutants with limitations on indicator pollutants. While EPA recognizes that the relationship between "indicator" and toxic pollutants may not be quantifiable on a one-to-one basis, we believe control of the "indicator" pollutants would reasonably assure control of toxic pollutants with similar physical and chemical properties.

Subsequent to the 1979 proposal, the Agency conducted a sampling program at two refineries for a period of sixty days to determine whether an indicator/surrogate relationship existed between the BPT pollutant parameters and the toxics. The results of the study confirm the difficulties of using such parameters and indicates that a statistically significant correlation between candidate surrogate/indicator parameters and toxic pollutant parameters does not exist for this industry. The Agency, therefore, decided not to issue limitations for indicator or surrogate pollutants in this rule.

Specific toxic pollutants other than chromium are not regulated by today's rule for reasons presented in Sections V and VIII of this preamble.
G. New Source Construction

It was argued that there is no basis for EPA's statements that no new refineries will be entering the industry. Commenters stated that new refineries are currently planned, such as the one in Portsmouth, Virginia. The U.S. refining industry has experienced a dramatic reversal of historical growth trends as a result of the reduction in consumption of petroleum products that has taken place since 1978. U.S. crude oil runs peaked at 14.7 million barrels per day in the calendar year 1978. Runs have decreased each year since then reaching 12.5 million barrels per day for the calendar year 1981. In early 1982 runs dropped to below 11.5 million barrels per day—representing percentage capacity utilizations in the low 60's. The 1981 DOE Annual Report to Congress predicts production to regain strength to 1981 DOE Annual Report to Congress capacity utilizations in the low 60's. The calendar year 1981. In early 1982 runs have decreased each year since then reaching 12.5 million barrels per day for the calendar year 1981. In early 1982 runs dropped to below 11.5 million barrels per day—representing percentage capacity utilizations in the low 60's. The Agency believes that these forecasts of 14.4 million barrels per day in 1985 and 14.7 million barrels per day in 1986 and 1987 are realistic and that the petroleum refining industry will enter the period of growth that the DOE Annual Report to Congress predicted.

The petroleum refining industry will continue to grow as oil demand increases. The industry will continue to focus on high-quality, low-sulfur products. The future of new refinery construction will depend on the growth of the industry and the demand for high-quality products.

The Agency believes that these forecasts of 14.4 million barrels per day in 1985 and 14.7 million barrels per day in 1986 and 1987 are realistic and that the petroleum refining industry will enter the period of growth that the DOE Annual Report to Congress predicted. The Agency believes that new refineries will be entering the industry.
policy. For example, even if this regulation does not control a particular pollutant, the permit issuer may still limit such pollutant on a case-by-case basis when limitations are necessary to carry out the purposes of the Act. In addition, to the extent that State water quality standards or other provisions of State or Federal law require limitation of pollutants not covered by this regulation (or require more stringent limitations on covered pollutants), such limitations must be applied by the permitting authority.

A second topic that warrants discussion is the operation of EPA's NPDES enforcement program, many aspects of which were considered in developing this regulation. Although the Clean Water Act is a strict liability statute, the initiation of enforcement proceedings by EPA is discretionary. EPA has exercised and intends to exercise that discretion in a manner that recognizes and promotes good-faith compliance efforts and conserves enforcement resources for those who fail to make good-faith efforts to comply with the Act.

XIV. Public Participation

Numerous agencies and groups have participated during the development of these effluent limitations guidelines and standards. Following the publication of the proposed rules on December 21, 1979, in the Federal Register, EPA provided the development document supporting the proposed rules to industry, Government agencies, and the public sector for comments. Five technical workshops were held on the proposed rulemaking. On April 9, 1980, in Washington, D.C., a public hearing was held on the proposed pretreatment standards.

The individuals and organizations that submitted written comments during the comment period on the proposed regulation are listed in Appendix A of this preamble.

All comments received have been carefully considered, and appropriate changes in the regulations have been made whenever available data and information supported such changes. Major issues raised by commenters are discussed in Section IX of this preamble. A summary of all the comments received and our detailed responses to all comments are included in a report "Responses to Public Comments, Proposed Petroleum Refining Effluent Guidelines and Standards," which is a part of the public record for this regulation.

The regulation was submitted to the Office of Management and Budget for review as required by Executive Order 12291.

List of Subjects in 40 CFR Part 419

John W. Hernandez,
Acting Administrator.

XVII. Appendices

Appendix A—Priority Pollutants Not Detected in Treated Effluents Discharged Directly, and Excluded From Regulation

Pursuant to Paragraph 8(a)(ii) of the Settlement Agreement, the following 98 priority pollutants are excluded from national regulation because they were not detected in effluents from BPP treatment systems by Section 304(h) analytical methods or other state-of-the-art methods:

39.0 Standards of performance for new sources.

4.4 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best conventional pollutant control technology currently available.

4.3 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best available technology economically achievable.

4.2 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available.

4.1 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best available technology economically achievable.
Sec. 419.54 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best conventional pollutant control technology. [Reserved]

419.55 Pretreatment standards for new sources.

419.56 Standards of performance for new sources.

419.57 Pretreatment standards for new sources. Authority: Secs. 301, 304 (b), (c), (e), and (g), 306 (b) and (c), 307 (b) and (c), and 501 of the Clean Water Act (the Federal Water Pollution Control Act Amendments of 1972 as amended by the Clean Water Act of 1977) (the "Act"); 33 U.S.C. 1311, 1314 (b), (c), (e), and (g), 1316 (b) and (c), 1317 (b) and (c), and 1361; 86 Stat. 816, Pub. L. 92-500; 91 Stat. 1567, Pub. L. 95-217.

Subpart A—Topping Subcategory

§ 419.10 Applicability; description of the topping subcategory.

The provisions of this subpart apply to discharges from any facility that produces petroleum products by the use of topping and catalytic reforming, whether or not the facility includes any other process in addition to topping and catalytic reforming. The provisions of this subpart do not apply to facilities that include thermal processes (coking, vis-breaking, etc.) or catalytic cracking.

§ 419.11 Specialized definitions.

For the purpose of this subpart:
(a) Except as provided below, the general definitions, abbreviations, and methods of analysis set forth in Part 401 of this chapter shall apply to this subpart.
(b) The term "runoff" shall mean the flow of storm water.
(c) The term "ballast" shall mean the flow of waters, from a ship, that is treated along with refinery wastewaters in the main treatment system.
(d) The term "feedstock" shall mean the crude oil and natural gas liquids fed to the topping units.
(e) The term "once-through cooling water" shall mean those waters discharged that are used for the purpose of heat removal and that do not come into direct contact with any raw material, intermediate, or finished product.
(f) The following abbreviations shall be used: (1) Mgal means one thousand gallons; (2) Mbbl means one thousand barrels (one barrel is equivalent to 42 gallons).

§ 419.12 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT).

(a) Except as provided in 40 CFR 125.30-32, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT):

(b) The limits set forth in paragraph (a) of this section are to be multiplied by the following factors to calculate the maximum for any one day and maximum average of daily values for thirty consecutive days.

(1) Size factor.

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Maximum for any 1 day</th>
<th>Average of daily values for 30 consecutive days shall not exceed</th>
</tr>
</thead>
<tbody>

<tr>
<td>10.5 to 11.49</td>
<td>1.79</td>
</tr>
</tbody>
</table>

(3) See the comprehensive example Subpart D § 419.42(b)(3).

(c) The following allocations constitute the quantity and quality of pollutants or pollutant properties controlled by this paragraph and attributable to ballast, which may be discharged after the application of best practicable control technology currently available, by a point source subject to this subpart, in addition to the discharge allowed by paragraph (b) of this section.

The allocation for ballast water flow, as kg/cm³ (Mg/MMBbl), shall be based on those ballast waters treated at the refinery.

<table>

<td>0.008</td>
<td></td>
</tr>
</tbody>
</table>

1 See footnote following Table in § 419.13(c).

2 Within the range of 6.0 to 9.0.

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph attributable to once-through cooling water are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/l.

(e) Effluent Limitation for Runoff—[Reserved].
### § 419.13 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best available technology economically achievable (BAT).

(a) Except as provided in 40 CFR 125.30-32, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best available technology economically achievable (BAT):

- **Pollutant or pollutant property**
- **Maximum values for any 1 day**
- **Average of daily values for 30 consecutive days shall not exceed**
- **Process configuration**
- **Process factor**

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Maximum values for any 1 day</th>
<th>Average of daily values for 30 consecutive days shall not exceed</th>
<th>Process configuration</th>
<th>Process factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>COD</td>
<td>117</td>
<td>60.3</td>
<td>COD</td>
<td>1.27</td>
</tr>
<tr>
<td>Phenolic compounds</td>
<td>0.168</td>
<td>0.078</td>
<td></td>
<td></td>
</tr>
<tr>

<td></td>
</tr>
</tbody>
</table>

### § 419.14 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best conventional pollutant control technology (BCT). [Reserved]

### § 419.15 Pretreatment standards for existing sources (PSES).

Except as provided in 40 CFR 403.7 and 403.13 any existing source subject to this subpart which introduces pollutants into a publicly owned treatment works must comply with 40 CFR Part 403 and achieve the following pretreatment standards for existing sources (PSES).

The following standards apply to the total refinery flow contribution to the POTW:

### § 419.16 Standards of performance for new sources (NSPS).

(a) Any new source subject to this subpart must achieve the following new source performance standards (NSPS):

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Maximum values for any 1 day</th>
<th>Average of daily values for 30 consecutive days shall not exceed</th>
<th>Process configuration</th>
<th>Process factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oil and Grease</td>
<td>100</td>
<td>100</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Ammonia as N</td>
<td>100</td>
<td>100</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

### Footnote:

1. Where the discharge to the POTW consists solely of sour water, the owner or operator has the option of complying with this limit or the daily maximum mass limitation for ammonia set forth in § 419.13 (a) and (b).

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph, attributable to once-through cooling water, are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/l.

**Within the range of 6.0 to 9.0.

Subpart B—Cracking Subcategory

§ 419.20 Applicability; description of the cracking subcategory.

The provisions of this subpart are applicable to all discharges from any facility that produces petroleum products by the use of topping and cracking, whether or not the facility includes any process in addition to topping and cracking. The provisions of this subpart are not applicable, however, to facilities that include the processes specified in Subparts C, D, or E of this part.

§ 419.21 Specialized definitions.

The general definitions, abbreviations and methods of analysis set forth in Part 401 of this chapter and the specialized definitions set forth in § 419.11 shall apply to this subpart.

§ 419.22 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT).

(a) Except as provided in 40 CFR 125.30–32, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available:

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Maximum for any 1 day</th>
<th>Average of daily values for 30 consecutive days shall not exceed</th>
</tr>
</thead>
<tbody>
<tr>

<td></td>
</tr>
<tr>
<td>Oil and grease</td>
<td>24.9</td>
<td></td>
</tr>
<tr>
<td>pH</td>
<td>(*)</td>
<td></td>
</tr>
</tbody>
</table>

*Where the discharge to the POTW consists solely of four waters, the owner or operator has the option of complying with this limit or the daily maximum mass limitation for ammonia set forth in § 419.16 (a) and (b).  
(b) The following standard is applied to the cooling tower discharge part of the total refinery flow to the POTW by multiplying: (1) The standard; (2) by the total refinery flow to the POTW; and (3) by the ratio of the cooling tower discharge flow to the total refinery flow.

<td>1.04</td>
</tr>
<tr>
<td>Ammonia (as N)</td>
<td>100</td>
<td>1.13</td>
</tr>
</tbody>
</table>

(b) The following standard is applied to the cooling tower discharge part of the total refinery flow to the POTW by multiplying: (1) The standard; (2) by the total refinery flow to the POTW; and (3) by the ratio of the cooling tower discharge flow to the total refinery flow.

(b) The following standard is applied to the cooling tower discharge part of the total refinery flow to the POTW by multiplying: (1) The standard; (2) by the total refinery flow to the POTW; and (3) by the ratio of the cooling tower discharge flow to the total refinery flow.

Subpart C—Petrochemical Subcategory

§ 419.30 Applicability; description of the petrochemical subcategory.

The provisions of this subpart are applicable to all discharges from any facility that produces petroleum products by the use of topping, cracking, and petrochemical operations whether or not the facility includes any process in addition to topping, cracking, and petrochemical operations. The provisions of this subpart shall not be applicable, however, to facilities that include the processes specified in Subparts D or E of this part.

§ 419.31 Specialized definitions.

For the purpose of this subpart:

(a) The general definitions, abbreviations, and methods of analysis set forth in Part 401 of this chapter and the specialized definitions set forth in § 419.11 shall apply.

(b) The term "petrochemical operations" shall mean the production of second-generation petrochemicals (i.e., alcohols, ketones, cumene, styrene, etc.) or first generation petrochemicals and isomerization products (i.e., BTX, olefins, cyclohexane, etc.) when 15 percent or more of refinery production is as first-generation petrochemicals and isomerization products.
§ 419.32 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available.

(a) Except as provided in 40 CFR 125.30-32, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT):

(b) The limits set forth in paragraph (a) of this section are to be multiplied by the following factors to calculate the maximum for any one day and maximum average of daily values for thirty consecutive days.

(1) Size factor.

<table>

</tbody>
</table>

(b) The following standard is applied to the cooling tower discharge part of the total refinery flow to the POTW by multiplying: (1) The standard; (2) by the total refinery flow to the POTW; and (3) by the ratio of the cooling tower discharge flow to the total refinery flow.

§ 419.37 Pretreatment standards for new sources (PSNS).

(3) See the comprehensive example in Subpart D, §419.42(b)(3).

(c) The provisions of §419.16(c) apply to discharges of process wastewater pollutants attributable to ballast water by a point source subject to the provisions of this subpart.

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph, attributable to once-through cooling water, are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/l.

(e) Effluent Limitations for Runoff—[Reserved]

§ 419.38 Applicability; description of the lube subcategory.

Subpart D—Lube Subcategory

§ 419.40 Applicability; description of the lube subcategory.

The provisions of this subpart are applicable to all discharges from any facility that produces petroleum products by the use of topping, cracking, and lube oil manufacturing processes, whether or not the facility includes any process in addition to topping, cracking, and lube oil manufacturing processes. The provisions of this subpart are not applicable, however, to facilities that include the processes specified in Subparts C and E of this part.

§ 419.41 Specialized definitions.

The general definitions, abbreviations and methods of analysis set forth in Part 401 of this chapter and the specialized definitions set forth in §419.11 shall apply to this subpart.

§ 419.42 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT).

(a) Except as provided in 40 CFR 403.7, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best practicable control technology currently available (BPT):

</tbody>
</table>

For any point source subject to the provisions of this subpart, the following effluent limitations representing the degree of effluent reduction attainable by the application of the best available technology economically achievable (BAT):

- **BOD**
  - Maximum: 50.6
- **TSS**
  - Maximum: 35.6
- **COD**
  - Maximum: 180.0
- **Phenolic compounds**
  - Maximum: 0.38
- **Ammonia as N**
  - Maximum: 23.4
- **Sulfide**
  - Maximum: 0.33
- **Total chromium**
  - Maximum: 0.77
- **Hexavalent chromium**
  - Maximum: 0.068

**Notes:**
- See footnote following table in §419.13(c)(2).
- Within the range of 6.0 to 9.0.

(b) The limits set forth in paragraph (a) of this section are to be multiplied by the following factors to calculate the maximum for any one day and maximum average of daily values for thirty consecutive days.

1. **Size factor.**

<table>
<thead>
<tr>
<th>1,000 bbl of feedstock per stream day</th>
<th>Size factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 49.9</td>
<td>0.71</td>
</tr>
<tr>
<td>50.0 to 75.4</td>
<td>0.74</td>
</tr>
<tr>
<td>75.0 to 99.9</td>
<td>0.81</td>
</tr>
<tr>
<td>100.0 to 125.9</td>
<td>0.88</td>
</tr>
<tr>
<td>125.0 to 149.9</td>
<td>0.97</td>
</tr>
<tr>
<td>150.0 to 174.9</td>
<td>1.05</td>
</tr>
<tr>
<td>175.0 to 199.9</td>
<td>1.14</td>
</tr>
<tr>
<td>200.0 or greater</td>
<td>1.19</td>
</tr>
</tbody>
</table>

2. **Process factor.**

<table>
<thead>
<tr>
<th>Process configuration</th>
<th>Process factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 6.49</td>
<td>0.81</td>
</tr>
<tr>
<td>6.5 to 7.49</td>
<td>0.88</td>
</tr>
<tr>
<td>7.5 to 7.99</td>
<td>1.00</td>
</tr>
<tr>
<td>8.0 to 8.49</td>
<td>1.09</td>
</tr>
<tr>
<td>8.5 to 8.99</td>
<td>1.19</td>
</tr>
<tr>
<td>9.0 to 9.49</td>
<td>1.29</td>
</tr>
<tr>
<td>9.5 to 9.99</td>
<td>1.41</td>
</tr>
<tr>
<td>10.0 to 10.49</td>
<td>1.53</td>
</tr>
<tr>
<td>10.5 to 10.99</td>
<td>1.67</td>
</tr>
<tr>
<td>11.0 to 11.49</td>
<td>1.82</td>
</tr>
<tr>
<td>11.5 to 11.99</td>
<td>1.98</td>
</tr>
<tr>
<td>12.0 to 12.49</td>
<td>2.15</td>
</tr>
<tr>
<td>12.5 to 12.99</td>
<td>2.34</td>
</tr>
<tr>
<td>13.0 or greater</td>
<td>2.44</td>
</tr>
</tbody>
</table>

3. **Example of the application of the above factors.** Example—Lube refinery 125,000 bbl per stream day throughput.
(3) See the comprehensive example in Subpart D, § 419.42[b][3].

(c) The provisions of § 419.13(c) apply to discharges of process wastewater pollutants attributable to ballast water by a point source subject to the provisions of this subpart.

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph, attributable to once-through cooling water, are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/l.

(e) Effluent Limitation for Runoff

§ 419.44 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best conventional pollutant control technology (BCT)—[Reserved]

§ 419.45 Pretreatment standards for existing sources (PSES).

Except as provided in 40 CFR 403.7 and 403.13 any existing source subject to this subpart which introduces pollutants into a publicly owned treatment works must comply with 40 CFR Part 403 and achieve the following pretreatment standards for existing sources (PSES). The following standards apply to the total refinery flow contribution to the POTW:

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Pretreatment standards for existing sources—maximum for any 1 day</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) The limits set forth in paragraph (a) of this section are to be multiplied by the following factors to calculate the maximum for any one day and maximum average of daily values for thirty consecutive days.

(1) Size factor.

<table>
<thead>
<tr>
<th>1,000 bbl of feedstock per stream day</th>
<th>Size factor</th>

<td>1.88</td>
</tr>
<tr>
<td></td>
<td>34.0</td>
<td>2.01</td>
</tr>
</tbody>
</table>

(3) See the comprehensive example in Subpart D, § 419.42(b)[3].

(c) The provisions of § 419.15(c) apply to discharges of process wastewater pollutants attributable to ballast water by a point source subject to the provision of this subpart.

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph, attributable to once-through cooling water, are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/l.

(e) Effluent Limitations for Runoff—[Reserved]

§ 419.47 Pretreatment standards for new sources (PSNS).

Except as provided in 40 CFR 403.7, any new source subject to this subpart which introduces pollutants into a publicly owned treatment works must comply with 40 CFR Part 403 and achieve the following pretreatment standards for new sources (PSNS).

(a) The following standards apply to the total refinery flow contribution to the POTW:

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Pretreatment standards for new sources, maximum for any 1 day</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>

(b) The following standard is applied to the cooling tower discharge part of the total refinery flow to the POTW by multiplying: (1) The standard; (2) by the total refinery flow to the POTW; and (3) by the ratio of the cooling tower discharge flow to the total refinery flow.

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Pretreatment standards for new sources, maximum for any 1 day</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Subpart E—Integrated Subcategory

§ 419.50 Applicability; description of the integrated subcategory.

The provisions of this subpart are applicable to all discharges resulting from any facility that produces petroleum products by the use of topping, cracking, lube oil manufacturing processes, and petrochemical operations, whether or not the facility includes any process in addition to topping, cracking, lube oil manufacturing processes, and petrochemical operations.

§ 419.51 Specialized definitions.

The general definitions, abbreviations, and methods of analysis set forth in Part 401 of this chapter and the specialized definitions set forth in § 419.31 shall apply to this subpart.

§ 419.52 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best practical control technology currently available (BPT).

(a) Except as provided in 40 CFR 125.30–32, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best practical control technology currently available (BPT):

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Maximum for any 1 day</th>
<th>Average of daily values for 30 consecutive days shall not exceed</th>
</tr>
</thead>
<tbody>
<tr>
<td>COD</td>
<td>388.0</td>
<td>150.0</td>
</tr>
<tr>
<td>Phenolic compounds</td>
<td>23.4</td>
<td>10.8</td>
</tr>
<tr>
<td>Sulfide</td>
<td>0.35</td>
<td>0.158</td>
</tr>
<tr>
<td>Total chromium</td>
<td>0.068</td>
<td>0.032</td>
</tr>
</tbody>
</table>

(b) The limits set forth in paragraph (a) of this section are to be multiplied by the following factors to calculate the maximum for any one day and maximum average of daily values for thirty consecutive days.

(1) Size factor.

<table>
<thead>
<tr>
<th>1,000 bbl of feedstock per stream day</th>
<th>Size factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 124.9</td>
<td>0.73</td>
</tr>
<tr>
<td>125.0 to 124.9</td>
<td>0.76</td>
</tr>
<tr>
<td>150.0 to 174.9</td>
<td>0.63</td>
</tr>
<tr>
<td>175.0 to 189.9</td>
<td>0.91</td>
</tr>
<tr>
<td>200 to 244.9</td>
<td>0.99</td>
</tr>
<tr>
<td>225 or greater</td>
<td>1.04</td>
</tr>
</tbody>
</table>

(2) Process factor.

<table>
<thead>
<tr>
<th>Process configuration</th>
<th>Process factor</th>
</tr>
</thead>
<tbody>
<tr>
<td>Less than 6.49</td>
<td>0.75</td>
</tr>
<tr>
<td>6.5 to 7.49</td>
<td>0.82</td>
</tr>
<tr>
<td>7.5 to 7.99</td>
<td>0.82</td>
</tr>
<tr>
<td>8.0 to 8.49</td>
<td>1.00</td>
</tr>
<tr>
<td>8.5 to 8.99</td>
<td>1.00</td>
</tr>
<tr>
<td>9.0 to 9.49</td>
<td>1.20</td>
</tr>
<tr>
<td>9.5 to 9.89</td>
<td>1.30</td>
</tr>
<tr>
<td>10.0 to 10.49</td>
<td>1.42</td>
</tr>
<tr>
<td>10.5 to 10.99</td>
<td>1.54</td>

<td>11.0 to 11.49</td>
<td>1.58</td>
</tr>
<tr>
<td>11.5 to 11.99</td>
<td>1.63</td>
</tr>
<tr>
<td>12.0 to 12.49</td>
<td>1.74</td>
</tr>
<tr>
<td>12.5 to 12.99</td>
<td>1.83</td>
</tr>
<tr>
<td>13.0 or greater</td>
<td>2.09</td>
</tr>
</tbody>
</table>

(3) See the comprehensive example in Subpart D, § 419.42(b)(3).

(c) The provisions of § 419.12(c) apply to discharges of process wastewater pollutants attributable to ballast water by a point source subject to the provision of this subpart.

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph, attributable to once-through cooling water, are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/L.

(e) Effluent Limitations for Runoff—[Reserved]

§ 419.53 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best available technology economically achievable (BAT).

(a) Except as provided in 40 CFR 125.30–32, any existing point source subject to this subpart must achieve the following effluent limitations representing the degree of effluent reduction attainable by the application of the best available technology economically achievable (BAT):

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Maximum for any 1 day</th>
<th>Average of daily values for 30 consecutive days shall not exceed</th>
</tr>
</thead>
<tbody>
<tr>
<td>COD</td>
<td>136.0</td>
<td>70.0</td>
</tr>
<tr>
<td>Phenolic compounds</td>
<td>0.14</td>
<td>0.068</td>

</tr>
</tbody>
</table>

(3) See the comprehensive example in Subpart D, § 419.42(b)(3).

(c) The provisions of § 419.13(c) apply to discharges of process wastewater pollutants attributable to ballast water by a point source subject to the provisions of this subpart.
§ 419.55 Pretreatment standards for controlled pollutants or pollutant properties with this waters, the owner or operator has the option of complying

Oil and grease

POTW:
The following standards apply to the standards for existing sources

concentration not to exceed

discharged with a total organic carbon concentration not to exceed 5 mg/l.

§ 419.54 Effluent limitations guidelines representing the degree of effluent reduction attainable by the application of the best conventional pollutant control technology (BCT)—[Reserved]

§ 419.55 Pretreatment standards for existing sources (PSES)

Except as provided in 40 CFR 403.7 and 403.13 any existing source subject to this subpart which introduces pollutants into a publicly owned treatment works must comply with 40 CFR 403 and achieve the following pretreatment standards for existing sources (PSES). The following standards apply to the total refinery flow contribution to the POTW:

- BOD
- TSS
- COD
- Oil and grease
- Phenolic compounds
- Ammonia as N
- Sulfide
- Total chromium
- Hexavalent chromium

§ 419.56 Standards of performance for new sources (NSPS).

(a) Any new source subject to this subpart must achieve the following new source performance standards (NSPS):

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Pretreatment standards for existing sources—maximum for any 1 day</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>English units (pounds per 1,000 bbl of feedstock)</td>
</tr>
<tr>
<td></td>
<td>Metric units (kilograms per 1,000 m³ of feedstock)</td>
</tr>
<tr>
<td></td>
<td>Milligrams per liter (mg/l)</td>
</tr>
</tbody>
</table>

(b) The limits set forth in paragraph (a) of this section are to be multiplied by the following factors to calculate the maximum for any one day and maximum average of daily values for thirty consecutive days.

<table>
<thead>
<tr>
<th>1,000 bbl of feedstock per stream day</th>

(3) See the comprehensive example in Subpart D. § 419.42(b)(9)

(c) The provisions of § 419.15(c) apply to discharges of process wastewater pollutants attributable to ballast water by a point source subject to the provision of this subpart.

(d) The quantity and quality of pollutants or pollutant properties controlled by this paragraph, attributable to once-through cooling water, are excluded from the discharge allowed by paragraph (b) of this section. Once-through cooling water may be discharged with a total organic carbon concentration not to exceed 5 mg/l.

§ 419.57 Pretreatment standards for new sources (PSNS).

Except as provided in 40 CFR 403.7, any new source subject to this subpart which introduces pollutants into a publicly owned treatment works must comply with 40 CFR Part 403 and achieve the following pretreatment standards for new sources (PSNS).

(a) The following standards apply to the total refinery flow contribution to the POTW:

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Pretreatment standards for new sources—maximum for any 1 day</th>
</tr>
</thead>
</table>

(b) The following standard is applied to the cooling tower discharge part of the total refinery flow to the POTW by multiplying: (1) The standards; (2) by the total refinery flow to the POTW; and (3) by the ratio of the cooling tower discharge flow to the total refinery flow.

<table>
<thead>
<tr>
<th>Pollutant or pollutant property</th>
<th>Pretreatment standards for new sources—maximum for any 1 day</th>
