Detection of Emerging Environmental Pollutants using LC-MS/MS

Jennifer Krone & André Schreiber
SCIEX, Concord, Ontario (Canada)

Outline

- Using SCIEX LC-MS/MS for:
- EPA 537 (PFAA)
- Investigation of PFAA from packaging into food
- EPA 539 (hormones in drinking water)
- Marine and freshwater toxins

EPA 537 – Analysis of Perfluoroalkyl Acids (PFAA) Specified Under the UCMR3

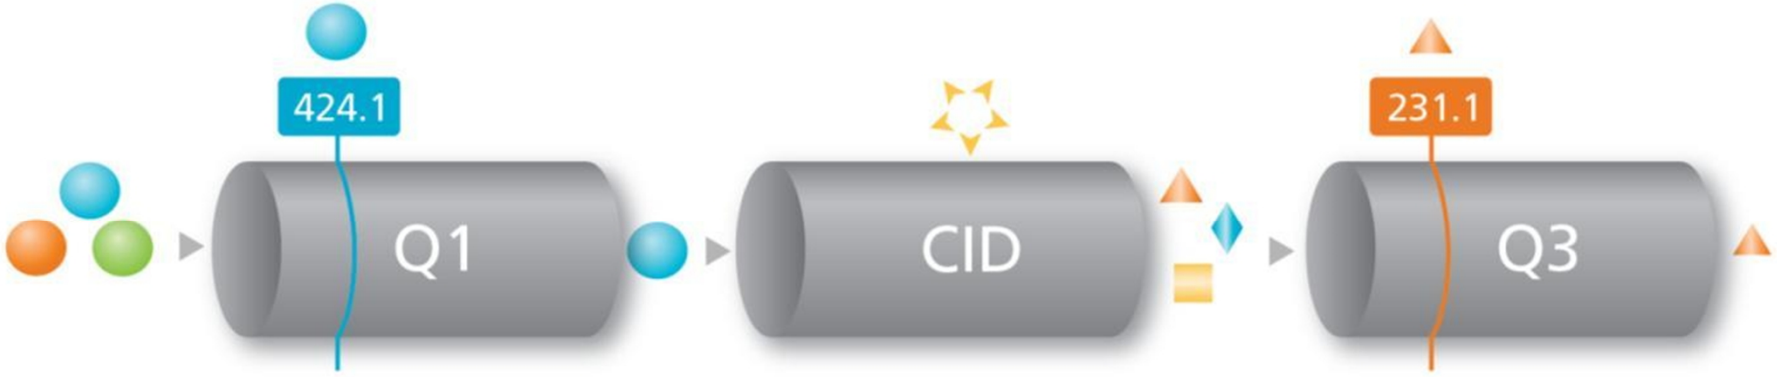
* The authors would likes to thank Lily Sanchez, Lee Yoo , and Mike Wehner of Orange County Water District (Fountain Valley, California,).

Experimental

- Solid Phase Extraction (SPE) following the EPA 537 method section 10, 11, and 12
  - All required quality control parameters (section 9.3) were met or exceeded
- Agilent 1260 with Eksigent ULC 100 HTC-xt autosamples
  - Atlantis T3 analytical column (150 x 2.1 mm, 5 µm)
  - Gradient with water + 20mM ammonium acetate and methanol
  - 5 µL injection (vs. 10 µL in EPA 537)
  - Atlantis T3 column (50 x 2.1mm, 5 µm) was also used as a delay column (installed between pump and autosampler)
- SCIEX QTRAP® 6500 system with IonDrive® source (400ºC)
  - Negative polarity Electrospray Ionization (ESI)
  - Multiple Reaction Monitoring (MRM)

Triple Quadrupole – Multiple Reaction Monitoring (MRM)

Highest Selectivity and Sensitivity for Screening and Quantitation



Filter Fragment Filter

MRM Transitions for PFAAs, ISTDs and Surrogates

2 MRM Transitions Were Monitored for Each Target PFAA

Compound	Q1	Q3	RT	DP (V)	CE (V)

AB SCIEX

Analysis of Selected Microcystins in Drinking and Surface Water Using a Highly Sensitive Direct Injection Technique

Jens Dahlmann[1] and Bernd Luckas[2]
[1]AB SCIEX Darmstadt (Germany) and [2]University of Jena, Department of Food Chemistry, Jena (Germany)

Overview

This application note describes a direct injection method using Liquid Chromatography (LC) coupled to tandem Mass Spectrometry (MS/MS) to analyze several microcystins, including MC-LR, in drinking and surface water. Time consuming and laborious extraction steps, i.e. SPE, are not required due to the high sensitivity and selectivity of the MS/MS detection using the AB SCIEX API 4000™ LC/MS/MS system. A limit of quantitation (LOQ) of 0.1 µg/L was achieved which is 10 times below the guideline value proposed by the World Health Organization (WHO).

Introduction

Microcystins (MC) are naturally occurring toxins produced by certain genera of cyanobacteria (Figure 1). Reports suggest that microcystins are hepatotoxic and they might also be tumor initiators.[1]

Traditionally MC were analyzed by HPLC with UV detection[2,3] but nowadays analytical methods are shifting more towards mass spectrometric detection.[4-6]

MC are cyclic peptides and the general structure is cyclo [-D-Ala-X-D-MeAsp-Y-Adda-D-Glu-Mdha-], where X and Y are variable L-amino acids, e.g. leucine (L), arginine (R), tyrosine (Y), tryptophan (W), and phenylalanine (F) as X, as well as arginine (R), alanine (A), and methionine (M) as Y (Figure 2). Due to the two variable amino acids and methylation/demethylation of the other amino acids, there is a large variety of microcystin compounds. More than 100 microcystins have been identified to date. In contrast to microcystins, nodularin (NOD) is a cyclic pentapeptide produced by *Nodularia spumigena* with the structure cyclo [-D-MeAsp-L-Arg-Adda-D-Glu-Mdhb-], where Mdhb stands for 2-(methylamino)- 2-dehydrobutyric acid.

The Microcystin MC-LR (Figure 2) is typically tested as a marker for cyanobacteria occurrence and is regulated by the WHO in the guidelines for drinking-water quality at a value of 1 µg/L.[7]

Figure 1. Bloom (left) and microscopic image (right) of *Planktothrix rubescense*

Experimental

Standard

Microcystin standards are available from Enzo Life Science International (http://www.enzolifescience.com).

Figure 2. Structure of MC-LR where X is leucine and Y is arginine

p 1

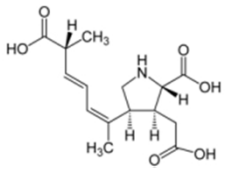
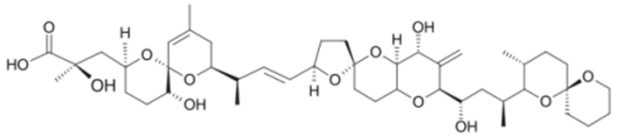
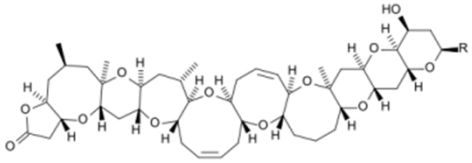
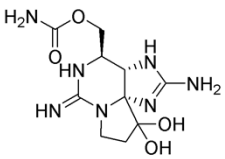
Toxins Overview

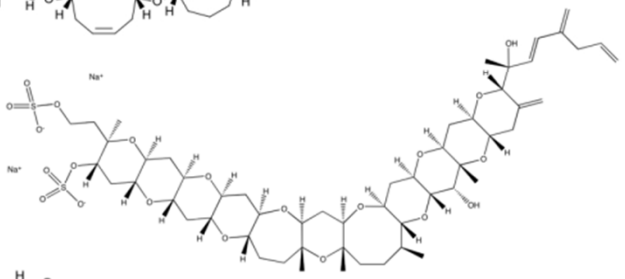
- Amnesic shellfish poisoning (ASP)
  - Amino acids: Domoic acid
- Diarrhetic shellfish poisoning (DSP)
  - Polyethers: Okadaic acid and derivatives
- Neurotoxic shellfish poisoning (NSP)
  - Cyclic polyether: Brevetoxin, Yessotoxin
- Paralytic shellfish poisoning (PSP)
  - Alkaloids: Anatoxin, Saxitoxin
- Cyanotoxins
  - Cyclic peptides: Microcystins (MC), Nodularin
- ***Analytical challenges***
  - Both hydrophilic and lipophilic compounds
  - ionic and non-ionic substances
  - Some compounds are not detectable without derivatization (UV, FLD),
  - Different matrices (algae, cyanobacteria, mussel, fish, drinking water etc.)

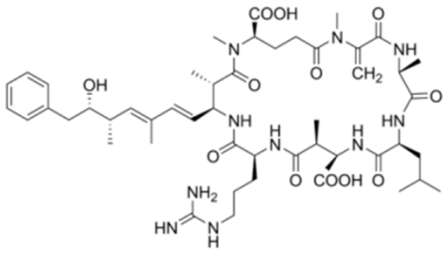




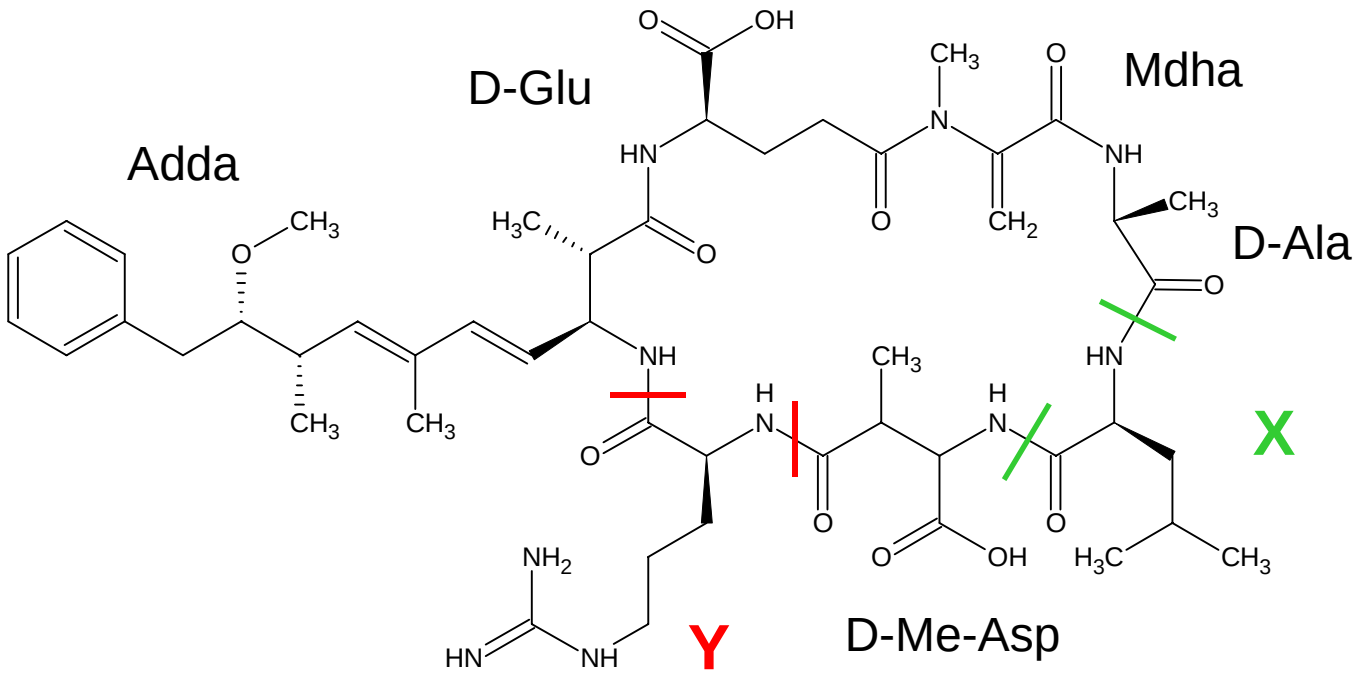








Structure of Microcystin-LR (MC-LR) Regulated by WHO



Why Use LC/MS/MS for marine biotoxin analysis?

- Chromatography with spectrometric detection
  - LC with UV or FLD, GC-MS, HPTLC
  - Non- specific, low sensitivity
  - Rigorous sample preparation and derivatization often required
  - Difficulty to analyze multiple analytes in a single run
- Immunoassay (i.e. ELISA) and Bioassays
  - Not specific, problems with cross contamination, false positive
  - Difficulty to distinguish between multiple analytes
  - Mouse or rat bioassay – ethical issues
- LC-MS/MS
  - Highly selective, sensitive and accurate quantitation
  - Reduced sample preparation
  - No issue with false positives
  - Provides both qualitative and quantitative analysis in a single run
  - Meet all requirements for modern residue analysis

Regulation

- Old official method for detection of biotoxins
  - Mouse bioassay, rat bioassay
- Commission regulation EU No. 5/2011
  - “these bioassays have shortcomings and are not considered an appropriate tool for control purposes because of the high variability in results, the insufficient detection capability and the limited specificity”
  - “A liquid chromatography-mass spectrometry (LC-MS/MS) method was validated under the coordination of the European Union Reference Laboratory on marine biotoxins (EU-RL)”
- EU-harmonized SOP using LC-MS/MS for lipophilic marine biotoxins:
  - Okadaic acid (OA), Pectenotoxin (PTX), Azaspiracid (AZA), Yessotoxin (YTX) group toxins

11.1.2011 EN Official Journal of the European Union L 6/3

COMMISSION REGULATION (EU) No 15/2011

of 10 January 2011

amending Regulation (EC) No 2074/2005 as regards recognised testing methods for detecting marine biotoxins in live bivalve molluscs

(Text with EEA relevance)

THE EUROPEAN COMMISSION,

Having regard to the Treaty on the Functioning of the European Union,

Having regard to Regulation (EC) No 853/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific hygiene rules for food of animal origin (1), and in particular Article 11(4) thereof,

Having regard to Regulation (EC) No 854/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific rules for the organisation of official controls on products of animal origin intended for human consumption (2), and in particular Article 18(1)(a) thereof,

Whereas:

(1) Regulation (EC) No 854/2004 lays down specific rules for the organisation of official controls on products of animal origin and Regulation (EC) No 853/2004 lays down specific requirements concerning hygiene rules for food of animal origin. Implementing measures for those Regulations as regards recognised testing methods for marine biotoxins are set out in Commission Regulation (EC) No 2074/2005 of 5 December 2005 laying down implementing measures for certain products under Regulation (EC) No 853/2004 of the European Parliament and of the Council and for the organisation of official controls under Regulation (EC) No 854/2004

Chair of EFSA noted that these bioassays have shortcomings and are not considered an appropriate tool for control purposes because of the high variability in results, the insufficient detection capability and the limited specificity.

(4) Recently developed alternatives to the biological methods for the determination of the marine biotoxins with lower limits of detection (LOD) have successfully been tested in prevalidation studies.

(5) A liquid chromatography-mass spectrometry (LC-MS/MS) method was validated under the coordination of the European Union Reference Laboratory on marine biotoxins (EU-RL) in an inter-laboratory validation study carried out by the Member States. This method is publicly available for consultation in the web page of the EU-RL (http://www.aesan.msps.es/en/CRLMB/web/home.shtml). This validated technique of liquid chromatography (LC) mass spectrometry (MS) should be applied as the reference method for the detection of lipophilic toxins and used as matter of routine, both for the purposes of official controls at any stage of the food chain and own-checks by food business operators.

(6) Any other recognised method, different from the liquid chromatography (LC) mass spectrometry (MS), could be applied for the detection of lipophilic toxins provided

EUROPEAN UNION REFERENCE LABORATORY FOR MARINE BIOTOXINS

EU-Harmonised Standard Operating Procedure for determination of Lipophilic marine biotoxins in molluscs by LC-MS/MS

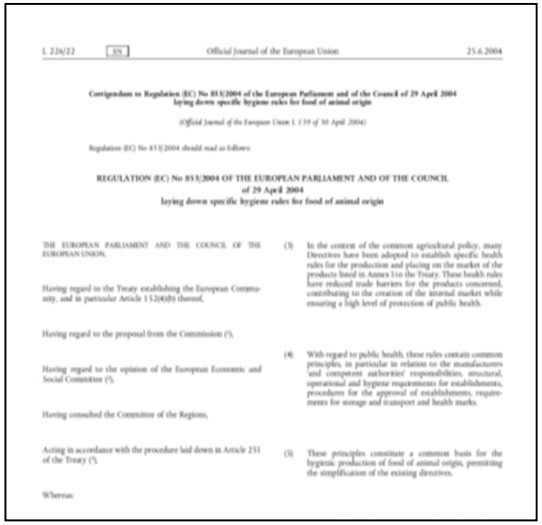
Version 2, July 2010

Coordination:

European Union Reference Laboratory for Marine Biotoxins (EU-RL-MB)
Agencia Española de Seguridad Alimentaria y Nutrición (AESAN)
Estación Marítima S/N
36200 Vigo, Spain
E-mail: eurlmb@msps.es
http://www.aesan.msps.es/en/CRLMB/web/home.shtml

Regulated Residue Levels

- Regulation (EC) No. 853/2004
- Food business operators must ensure that live bivalve molluscs placed on the market for human consumption… must not contain marine biotoxins in total quantities.. that exceed the following limits:
  - 800 µg/kg of PSP toxins
  - 20 mg/kg of domoic acid for ASP
  - 160 µg/kg of okadaic acid equivalents
  - 1 mg/kg of yessotoxin equivalents
  - 160 µg/kg of azaspiracid equivalents
- ***Cyanotoxins***
  - WHO guidelines for drinking water quality 1 µg/L
  - Many countries, especially with geographies in warmer climate zones detect at 0.1 µg/L or lower



L 226/22 EN Official Journal of the European Union 25.6.2004

Corrigendum to Regulation (EC) No 853/2004 of the European Parliament and of the Council of 29 April 2004 laying down specific hygiene rules for food of animal origin

(Official Journal of the European Union L 139 of 30 April 2004)

Regulation (EC) No 853/2004 should read as follows:

REGULATION (EC) No 853/2004 OF THE EUROPEAN PARLIAMENT AND OF THE COUNCIL of 29 April 2004 laying down specific hygiene rules for food of animal origin

THE EUROPEAN PARLIAMENT AND THE COUNCIL OF THE EUROPEAN UNION,

Having regard to the Treaty establishing the European Community, and in particular Article 152(4)(b) thereof,

Having regard to the proposal from the Commission (1),

Having regard to the opinion of the European Economic and Social Committee (2),

Having consulted the Committee of the Regions,

Acting in accordance with the procedure laid down in Article 251 of the Treaty (3),

Whereas:

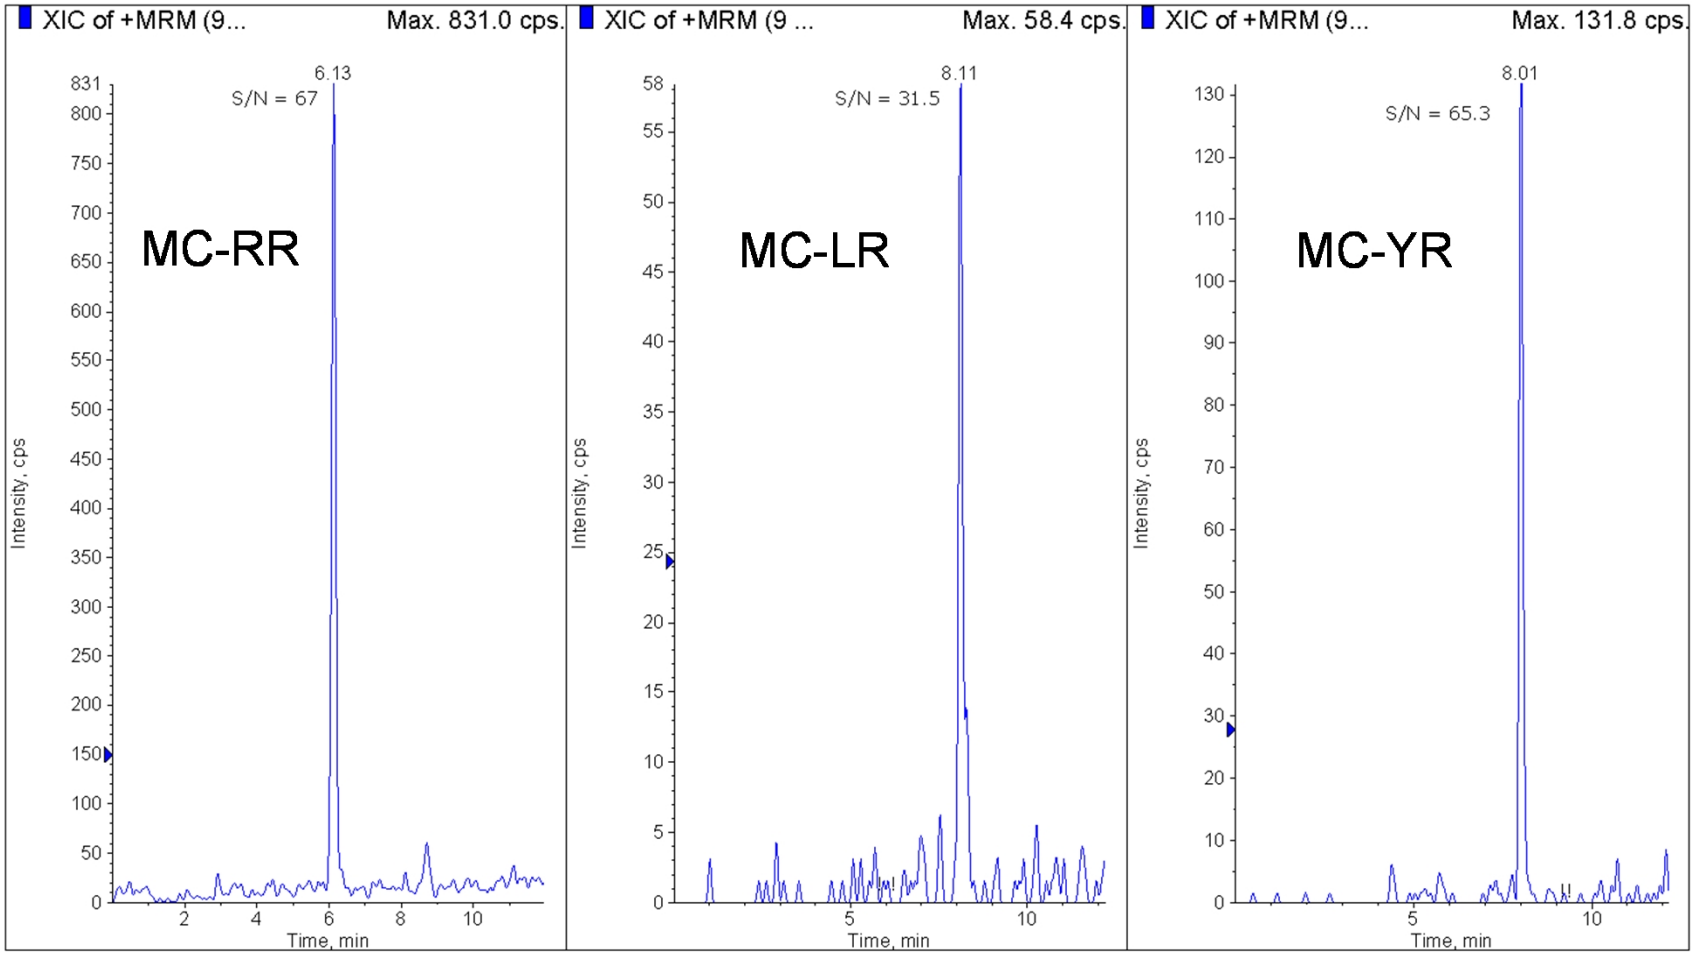
(1) In the context of the common agricultural policy, many Directives have been adopted to establish specific health rules for the production and placing on the market of the products listed in Annex I to the Treaty. These health rules have reduced trade barriers for the products concerned, contributing to the creation of the internal market while ensuring a high level of protection of public health.

(4) With regard to public health, these rules contain common principles, in particular in relation to the manufacturers and competent authorities' responsibilities, structural, operational and hygiene requirements for establishments, procedures for the approval of establishments, requirements for storage and transport and health marks.

(5) These principles constitute a common basis for the hygienic production of food of animal origin, permitting the simplification of the existing directives.

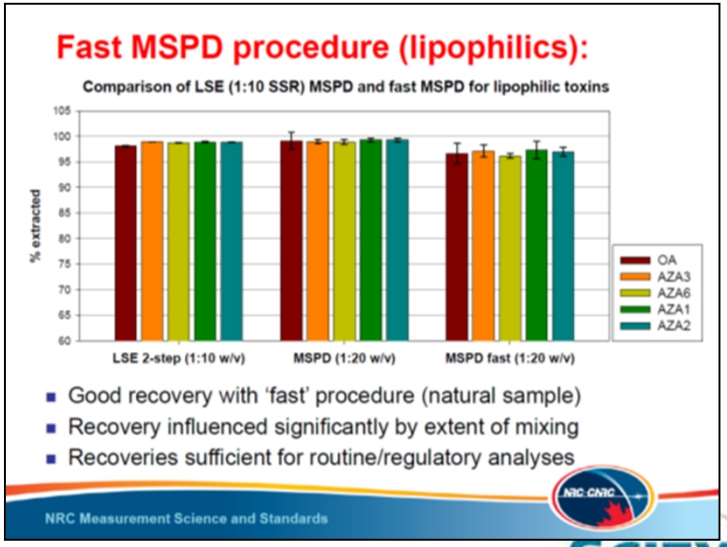
Detection of 0.1 µg/L of Microcystins in Drinking Water

25 µL injected into an API 4000™ System (over 10 years ago)



Standards and Sample Preparation

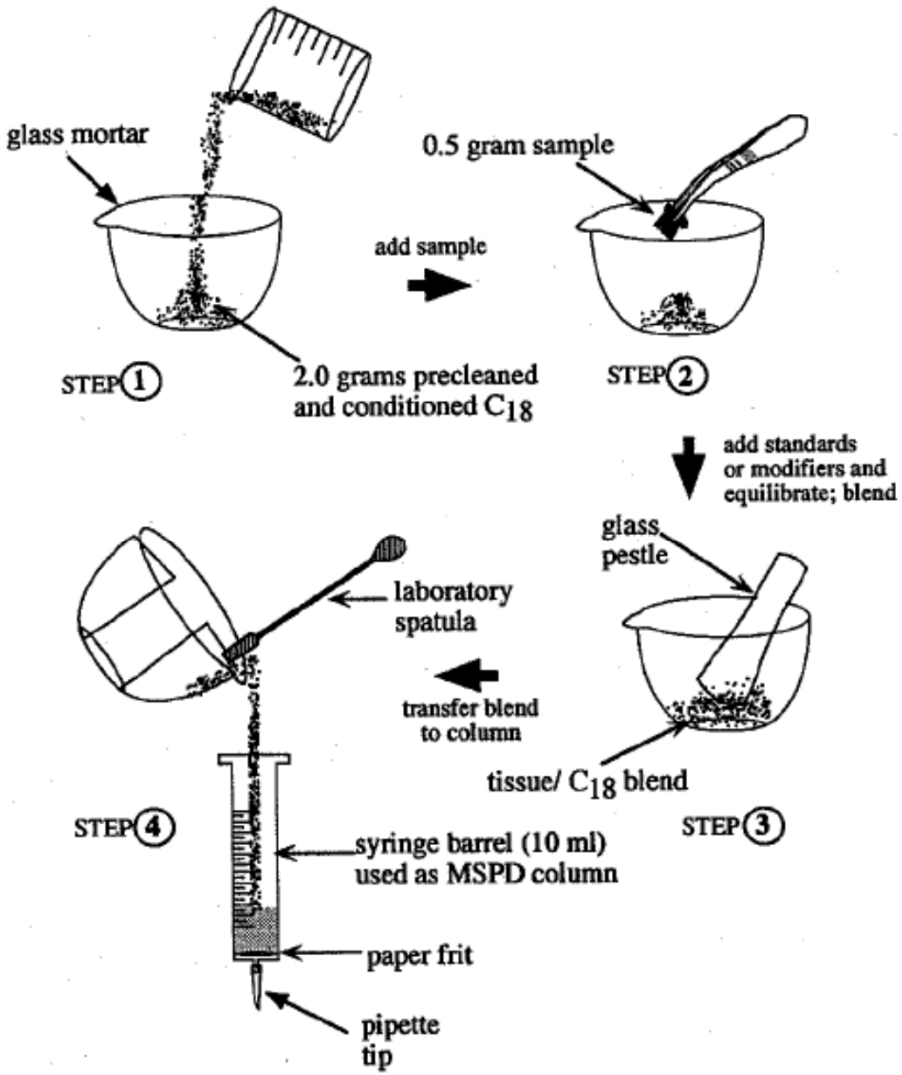
- Standards and CRM from National Research Council of Canada, NRC (Halifax, Canada)
- EU-harmonized SOP
  - Methanol extraction from homogenized tissue
  - Alkaline hydrolysis to determine total content of OA group toxins
- New developments by M. Quilliam and P. McCarron at NRC
  - Matrix Solid Phase Dispersion (MSPD)
  - Fast MSPD procedure: mixing, elution
  - and in-line filtration of extracts
  - Presented at AOAC Annual Meeting (2011) and AOAC Annual Meeting of Pacific NW Section (2012) on 'Marine and Freshwater Toxins Analysis'



Basic MSPD Procedure

- Mix sample and extraction material (bonded silica)
  - Typical ratio 0.5 g sample : 2.0 g dispersant
- Prepare column
- Extraction by eluting column with appropriate solvent(s)
  - Analyte dependent

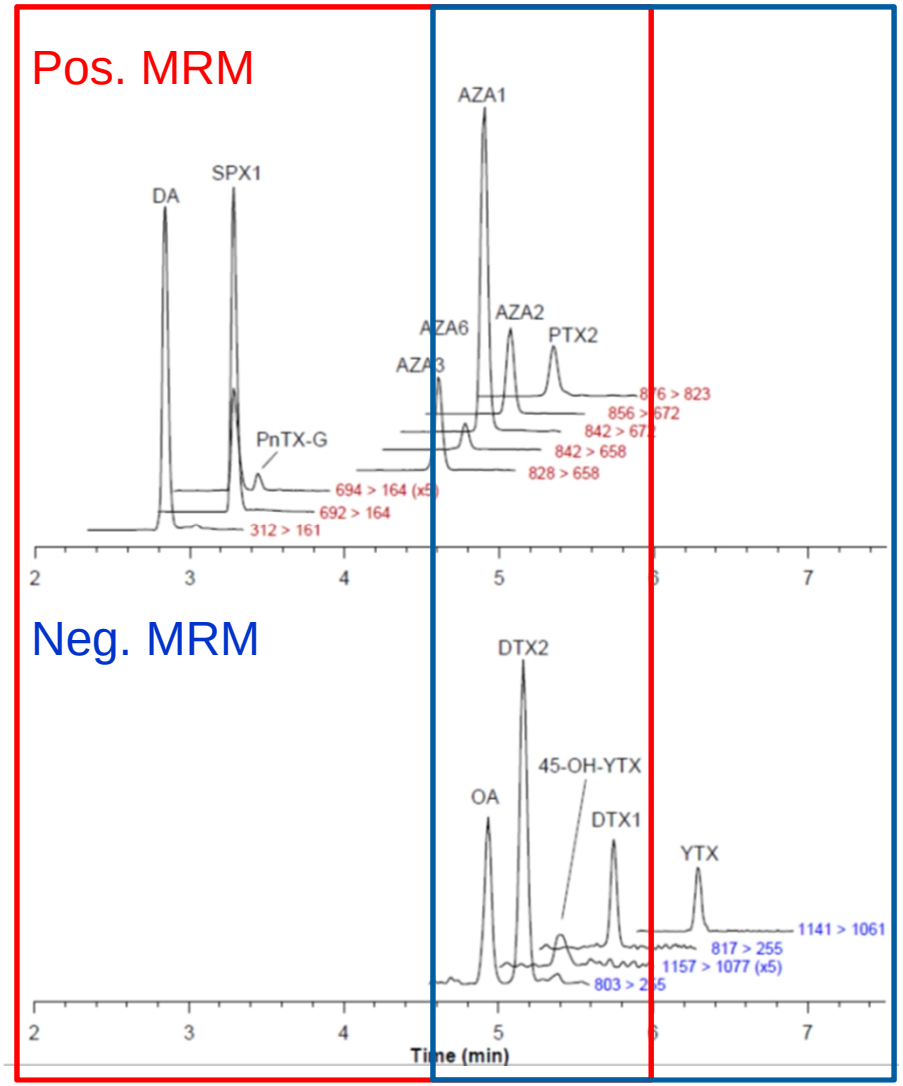
S. A. Barker, J. Chromatogr. A 885 (2000) 115-127



Liquid Chromatography

- EU-harmonized SOP
  - Reversed phase (RP column)
  - Acidic conditions (water, acetonitrile, formic acid)
  - Basic conditions (water, acetonitrile, pH=11 with ammonia or bicarbonate
- New developments by M. Quilliam and P. McCarr
  - Neutral conditions (water, acetonitrile, ammonium acetate)
- HILIC conditions for PSP toxins
- Faster analysis using UHPLC conditions
  - Small particle size columns, 2.5 or 3 µm
  - Core-shell particle columns, i.e. Kinetex, UHPLC speed and separation efficiency at reduced pressure

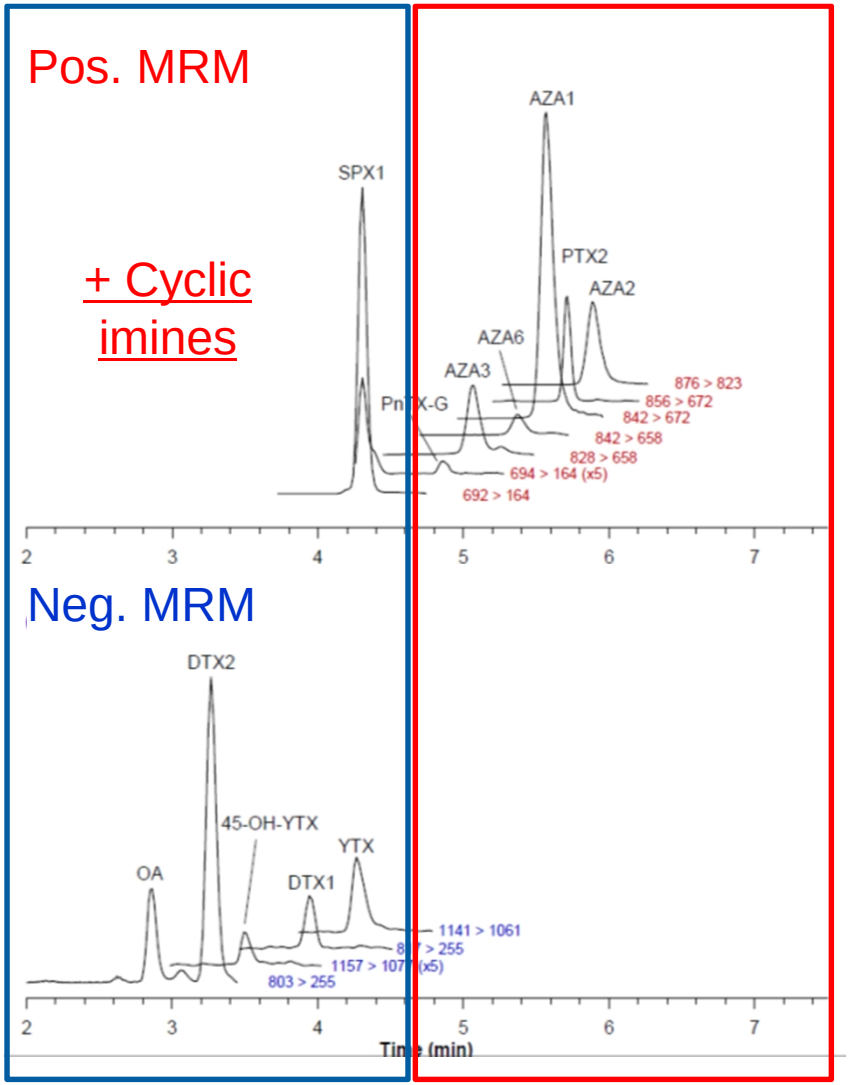
Acidic LC Conditions



CRM-FDMT1

- Phenomenex LUNA C18(2) 2.5 µm (50 x 2 mm) with gradient of water / acetonitrile + 50 mM formic acid and 2 mM ammonium formate
- Good peak shape and resolution
- Suited to MS/MS instruments capable of rapid polarity switching

Neutral LC Conditions



CRM-FDMT1

- Phenomenex Gemini-NX C18 3 µm (50 x 2 mm) with gradient of water / acetonitrile + 5 mM ammonium aceate
- Good peak shape and resolution
- Separation of regulated toxins into periods according to best ionization conditions
- Not useful for domoic acid (analyzed by LC-FLD at the NRC)

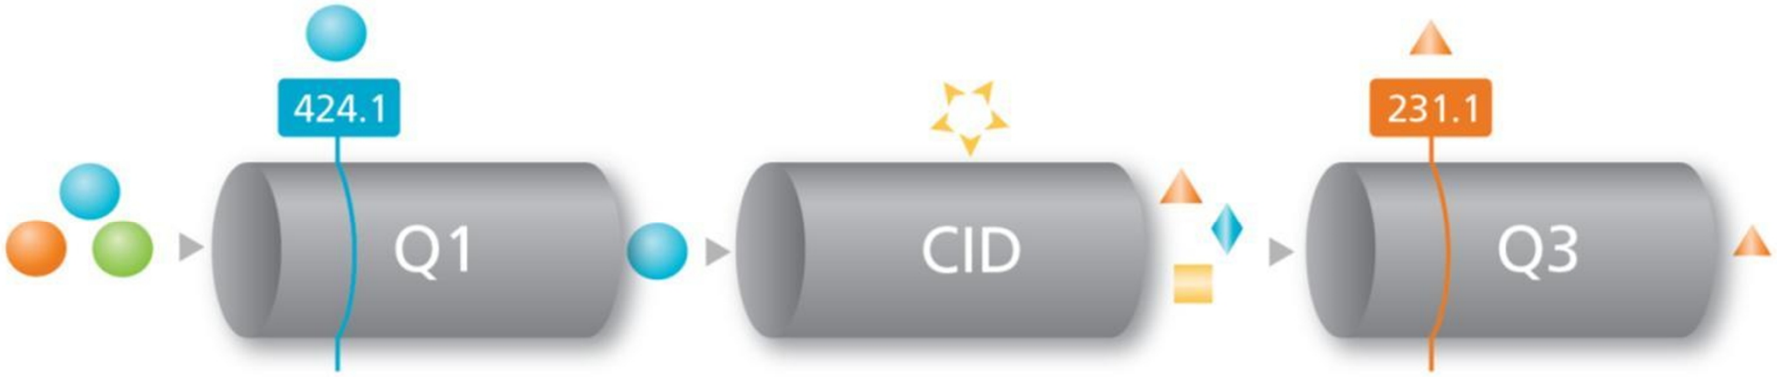
MS/MS Detection

SCIEX QTRAP® 4500 system

- EU-harmonized SOP
  - AB SCIEX 3200 QTRAP® system
  - Electrospray Ionization (ESI)
  - Multiple Reaction Monitoring (MRM)
  - 2 Transitions per compound (ratio for identification)
- Newer triple quadrupole LC-MS/MS instruments offer
  - Higher sensitivity
    - Reduced matrix effects and interferences after dilution of extract
    - Detection at lower levels allows prediction of upcoming problems when analyzing phytoplancton and water samples
  - Fast polarity switching
- QTRAP® and TripleTOF® technology offers
  - Unique features for quantitation and identification (EPI, MRM^3) and unknown screening and identification of new toxins (TOF-MS and MS/MS)

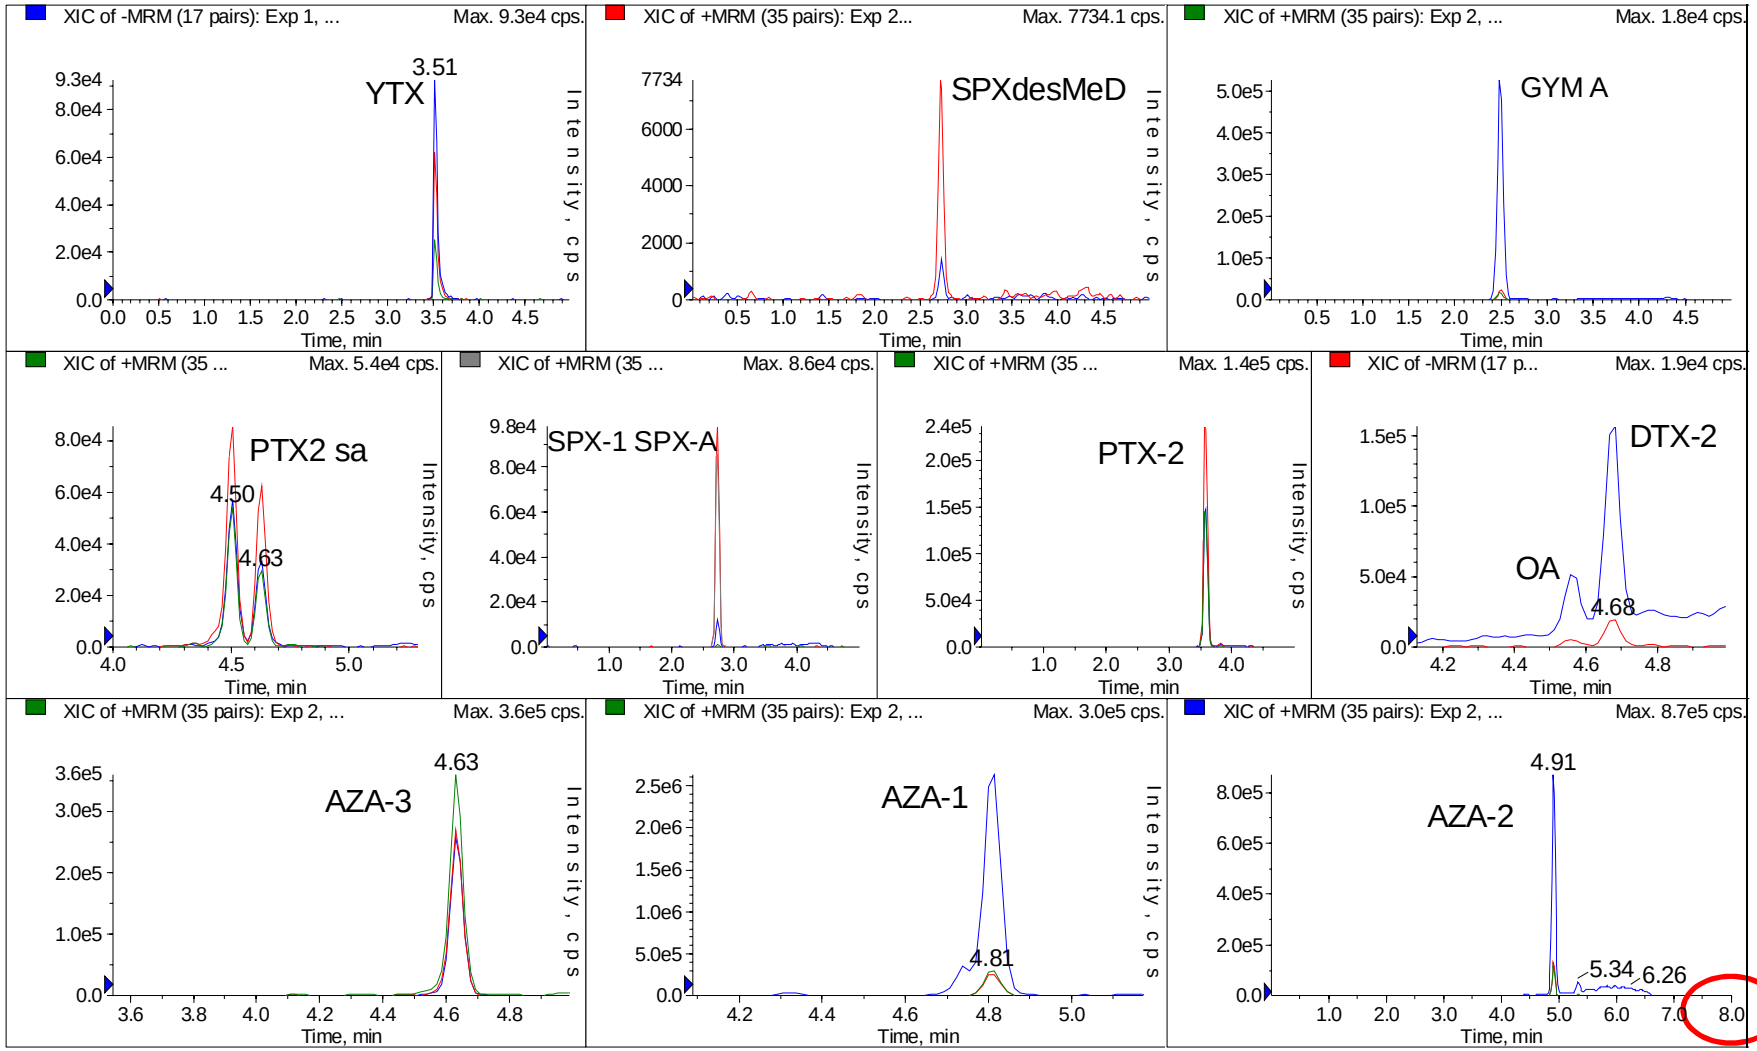
Triple Quadrupole – Multiple Reaction Monitoring (MRM)

Highest Selectivity and Sensitivity for Screening and Quantitation



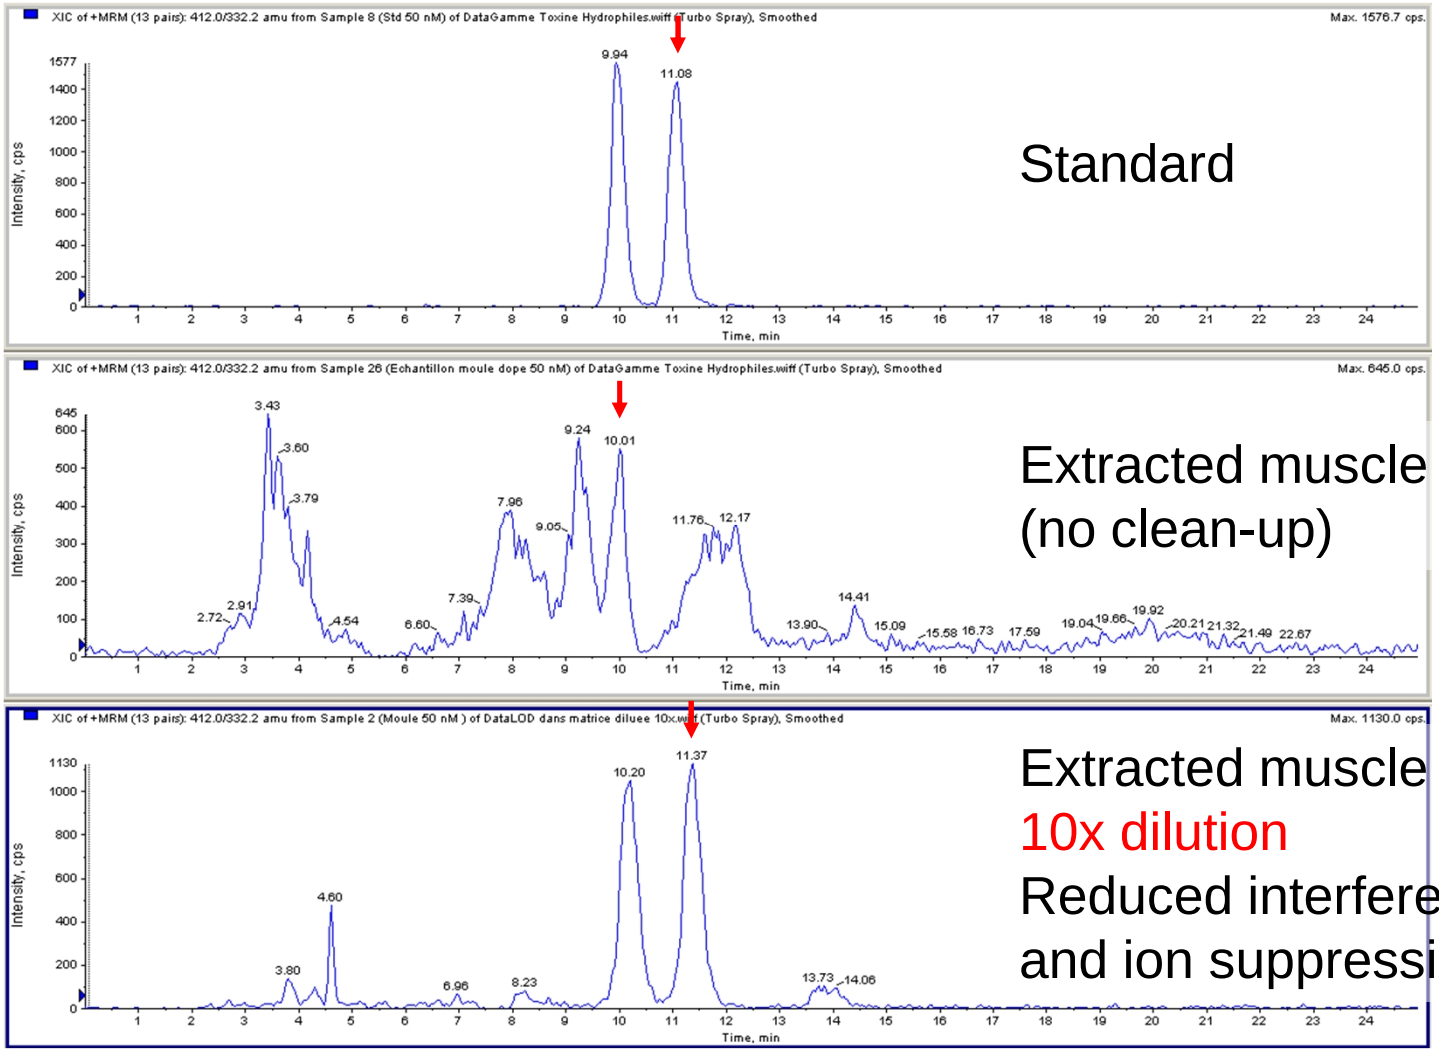
Filter Fragment Filter

QTRAP® 5500 System with Polarity Switching



Fast acidic LC using Phenomenex Kinetex C18 2.7µm (50x2mm) column

QTRAP® 5500 System – Reduced Matrix Effect



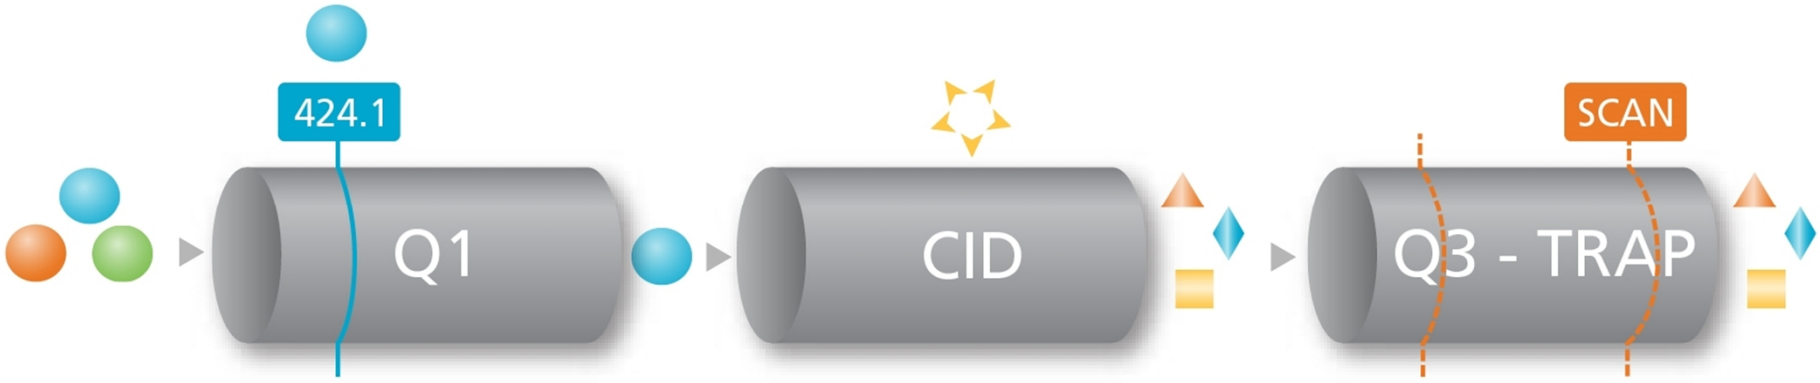
Standard

Extracted muscle sample (no clean-up)

Extracted muscle sample
10x dilution
Reduced interferences and ion suppression

QTRAP® System – MS/MS Full Scan and Library Searching

High Selectivity and Fast MS/MS Scan to Increase Confidence



Filter Fragment Trap and Scan

MRM Quantitation and QTRAP® Full Scan MS/MS can be combined in Information Dependent Acquisition (IDA) methods for simultaneous quantitation and Identification

QTRAP® 4500 System – MS/MS Identification
