#### DOCUMENTATION OF ENVIRONMENTAL INDICATOR DETERMINATION

Interim Final 2/5/99

#### **RCRA Corrective Action**

### Environmental Indicator (EI) RCRIS code (CA725) Current Human Exposures Under Control

Facility	Name:	Virginia Commonwealth University – Oliver Hall 1015 West Main Street Room 3040 Oliver Hall Richmond VA				
Facility	Address:					
Facility	EPA ID#:	VAD000798652				
Ι.	groundwater, s	ole relevant/significant information on known and reasonably suspected releases to soil, surface water/sediments, and air, subject to RCRA Corrective Action (e.g., from Solid Waste Units (SWMU), Regulated Units (RU), and Areas of Concern (AOC)), been <b>considered</b> in this on?				
<u> </u>	_X	If yes - check here and continue with #2 below.  If no - re-evaluate existing data, or  if data are not available skip to #6 and enter "IN" (more information needed) status code.				

#### **BACKGROUND**

Oliver Hall is located on the West Campus of Virginia Commonwealth University in Richmond, Virginia. The building is situated near other university buildings and on the corner of Main Street and Beech Street. Approximately 2 miles to the east is Interstate 95. The geographic location of the hazardous waste storage area is 37' 32' 43" latitude and 77' 27' 18" longitude.

Oliver Hall has operated as a hazardous waste storage facility since January 15, 1976. Oliver Hall became subject to regulations promulgated under the Resource Conservation and Recovery Act on November 19, 1980. This facility qualified for interim status as a hazardous waste management facility on August 21, 1981.

On September 2, 1983, the Virginia Department of Waste Management (VDWM) requested that VCU submit a Part B application for Oliver Hall. On April 20, 1984 VCU notified VDWM that they would not be seeking a Part B permit. Oliver Hall's interim status was terminated on November 20, 1984. On February 15, 1985, VDWM approved the closure plan. On October 22, 1985, VDWM approved the final closure of Oliver Hall as a treatment, storage, and disposal facility.

While Oliver Hall has been closed as a treatment, Storage and Disposal facility, it still maintains its status as a small generator of hazardous waste. Hazardous wastes are presently stored at the facility but are removed within the required 90-day period.

#### **Definition of Environmental Indicators (for the RCRA Corrective Action)**

Environmental Indicators (EI) are measures being used by the RCRA Corrective Action program to go beyond programmatic activity measures (e.g., reports received and approved, etc.) to track changes in the quality of the environment. The two EI developed to-date indicate the quality of the environment in relation to current human exposures to contamination and the migration of contaminated groundwater. An EI for non-human (ecological) receptors is intended to be developed in the future.

#### **Definition of "Current Human Exposures Under Control" EI**

A positive "Current Human Exposures Under Control" EI determination ("YE" status code) indicates that there are no "unacceptable" human exposures to "contamination" (i.e., contaminants in concentrations in excess of appropriate risk-

based levels) that can be reasonably expected under current land- and groundwater-use conditions (for all "contamination" subject to RCRA corrective action at or from the identified facility (i.e., site-wide)).

## **Relationship of EI to Final Remedies**

While Final remedies remain the long-term objective of the RCRA Corrective Action program the EI are near-term objectives which are currently being used as Program measures for the Government Performance and Results Act of 1993, GPRA). The "Current Human Exposures Under Control" EI are for reasonably expected human exposures under current land- and groundwater-use conditions ONLY, and do not consider potential future land- or groundwater-use conditions or ecological receptors. The RCRA Corrective Action program's overall mission to protect human health and the environment requires that Final remedies address these issues (i.e., potential future human exposure scenarios, future land and groundwater uses, and ecological receptors).

## **Duration / Applicability of EI Determinations**

EI Determinations status codes should remain in RCRIS national database ONLY as long as they remain true (i.e., RCRIS status codes must be changed when the regulatory authorities become aware of contrary information).

## Current Human Exposures Under Control Environmental Indicator (EI) RCRIS code (CA725)

Page 3

2. Are groundwater, soil, surface water, sediments, or air **media** known or reasonably suspected to be "**contaminated**" above appropriately protective risk-based "levels" (applicable promulgated standards, as well as other appropriate standards, guidelines, guidance, or criteria) from releases subject to RCRA Corrective Action (from SWMUs, RUs or AOCs)?

Yes

No

Groundwater	X		
Air (indoors) <sup>2</sup>	X		
Surface Soil (e.g., <2 ft)	X		
Surface Water	X		
Sediment	X		
Subsurf. Soil (e.g., >2 ft)	X		
Air (outdoors)	X		
<ul> <li>If no (for all media) - skip to #6, and enter "YE," status code after providing or citir appropriate "levels," and referencing sufficient supporting documentation demonstration these "levels" are not exceeded.</li> </ul>			
•	or any media) - continue after identifying key contaminants in each "contaminated" a, citing appropriate "levels" (or provide an explanation for the determination that the		

medium could pose an unacceptable risk), and referencing supporting documentation.

Rationale / Key Contaminants

# Rationale and Reference(s):

RCRA SITE VISIT REPORT Virginia Commonwealth University – Oliver Hall VAD000798652 January 23, 2006

If unknown (for any media) - skip to #6 and enter "IN" status code.

#### Footnotes:

<sup>&</sup>lt;sup>1</sup> "Contamination" and "contaminated" describes media containing contaminants (in any form, NAPL and/or dissolved, vapors, or solids, that are subject to RCRA) in concentrations in excess of appropriately protective risk-based "levels" (for the media, that identify risks within the acceptable risk range).

<sup>&</sup>lt;sup>2</sup> Recent evidence (from the Colorado Dept. of Public Health and Environment, and others) suggest that unacceptable indoor air concentrations are more common in structures above groundwater with volatile contaminants than previously believed. This is a rapidly developing field and reviewers are encouraged to look to the latest guidance for the appropriate methods and scale of demonstration necessary to be reasonably certain that indoor air (in structures located above (and adjacent to) groundwater with volatile contaminants) does not present unacceptable risks.

## Current Human Exposures Under Control Environmental Indicator (EI) RCRIS code (CA725)

Page 4

3. Are there **complete pathways** between "contamination" and human receptors such that exposures can be reasonably expected under the current (land- and groundwater-use) conditions?

## **Summary Exposure Pathway Evaluation Table**

Potential **Human Receptors** (Under Current Conditions)

Contaminated" Media	Residents	Workers	Day- Care	Construction	Trespassers	Recreation	Food <sup>3</sup>
Groundwater							
Air (indoors)							
Soil (surface, e.g., <2 ft)							
Surface Water							
Sediment							
Soil (subsurface e.g., >2 ft)							
Air (outdoors)							

Instructions for **Summary Exposure Pathway Evaluation Table**:

- 1. Strike-out specific Media including Human Receptors' spaces for Media which are not "contaminated" as identified in #2 above.
- 2. enter "yes" or "no" for potential "completeness" under each "Contaminated" Media -- Human Receptor combination (Pathway).

Note: In order to focus the evaluation to the most probable combinations some potential "Contaminated"
Media - Human Receptor combinations (Pathways) do not have check spaces (""). While these
combinations may not be probable in most situations they may be possible in some settings and should be
added as necessary.

If no (pathways are not complete for any contaminated media-receptor combination) - skip to #6, and enter "YE" status code, after explaining and/or referencing condition(s) in-place, whether natural or man-made, preventing a complete exposure pathway from each contaminated medium (e.g., use optional <u>Pathway Evaluation Work Sheet</u> to analyze major pathways).
 If yes (pathways are complete for any "Contaminated" Media - Human Receptor combination) - continue after providing supporting explanation.
 If unknown (for any "Contaminated" Media - Human Receptor combination) - skip to #6 and enter "IN" status code

#### **Rationale and Reference(s):**

<sup>&</sup>lt;sup>3</sup> Indirect Pathway/Receptor (e.g., vegetables, fruits, crops, meat and dairy products, fish, shellfish, etc.)

## Current Human Exposures Under Control Environmental Indicator (EI) RCRIS code (CA725) Page 5

4.	Can the <b>exposures</b> from any of the complete pathways identified in #3 be reasonably expected to be " <b>significant</b> " (i.e., potentially "unacceptable" because exposures can be reasonably expected to be: 1) greater in magnitude (intensity, frequency and/or duration) than assumed in the derivation of the acceptable "levels" (used to identify the "contamination"); or 2) the combination of exposure magnitude (perhaps even though low) and contaminant concentrations (which may be substantially above the acceptable "levels") could result in greater than acceptable risks)?
	If no (exposures can not be reasonably expected to be significant (i.e., potentially "unacceptable") for any complete exposure pathway) - skip to #6 and enter "YE" status code after explaining and/or referencing documentation justifying why the exposures (from each of the complete pathways) to "contamination" (identified in #3) are not expected to be "significant."
	If yes (exposures could be reasonably expected to be "significant" (i.e., potentially "unacceptable") for any complete exposure pathway) - continue after providing a description (of each potentially "unacceptable" exposure pathway) and explaining and/or referencing documentation justifying why the exposures (from each of the remaining complete pathways) to "contamination" (identified in #3) are not expected to be "significant."
	If unknown (for any complete pathway) - skip to #6 and enter "IN" status code
	Rationale and Reference(s):

<sup>4</sup> If there is any question on whether the identified exposures are "significant" (i.e., potentially "unacceptable") consult a human health Risk Assessment specialist with appropriate education, training and experience.

## Current Human Exposures Under Control Environmental Indicator (EI) RCRIS code (CA725) Page 6

5.	Can the "significant" <b>exposures</b> (identified in #4) be shown to be within <b>acceptable</b> limits?			
	If yes (all "significant" exposures have been shown to be within acceptable limits) - continue and enter "YE" after summarizing <u>and</u> referencing documentation justifying why all "significant" exposures to "contamination" are within acceptable limits (e.g., a site-specific Human Health Risk Assessment).			
	If no (there are current exposures that can be reasonably expected to be "unacceptable")- continue and enter "NO" status code after providing a description of each potentially "unacceptable" exposure.			
	If unknown (for any potentially "unacceptable" exposure) - continue and enter "IN" status code			
	Rationale and Reference(s):			

(CA72	Check the appropriate RCRIS status codes for the Current Human Exposures Under Control EI event code (CA725), and obtain Supervisor (or appropriate Manager) signature and date on the EI determination below (and attach appropriate supporting documentation as well as a map of the facility):					
	of the information expected to be "U facility, EPA ID Oliver Hall Rich determination wi changes at the facNO - "Current I	n contained in this EI Determination, ' Juder Control" at the <u>Virginia Comm</u> # <u>VAD000798652</u> , located at <u>1015</u> mond <u>VA</u> under current and reasonall be re-evaluated when the Agency/S	west Main Street Room 3040 bly expected conditions. This tate becomes aware of significant  Control."
