

IMCAL

IMPERIAL CALCASIEU

REGIONAL PLANNING & DEVELOPMENT COMMISSION

August 12, 2014

Gregory A. Green
Director, Outreach and Information Division
Office of Air Quality Planning and Standards
U.S. Environmental Protection Agency

Ref: Lake Charles MSA Ozone Advanced Program

Dear Mr. Green;

The Imperial Calcasieu Regional Planning and Development Commission (IMCAL) serving in the capacity as the Lake Charles Urbanized Metropolitan Planning Organization (LCMPO) herein submit an updated version of the "Path Forward Action Plan" (i.e. Ozone Advance Program Plan) for September 2014. I believe the community is really starting to get a better understanding of how important all of our action can play in the continued success for economic developmental growth anticipated in Southwest Louisiana for the next few years. We are seeing decreases in our local monitoring systems for parts per billion. I look forward to see what impact our plan will make on the educational side with our local schools after our recommendations to the School Board. Please accept this updated version and we look forward to our continued efforts.

If you have any questions, please do not hesitate to contact our office.

Sincerely,

Grant L. Bush
Director of Transportation
IMCAL/LCMPO

List of Frequently Used Acronyms

8-Hour Ozone Flex Program
APU: Auxiliary Power Units
AQTF: Air Quality Task Force
CAA: Clean Air Act
CFC: Chlorofluorocarbon
CO₂: Carbon Dioxide
EPA: U. S. Environmental Protection Agency
IMCAL/MPO: Imperial Calcasieu Regional Planning & Development Commission and Lake Charles Area Metropolitan Planning Organization
LAIA: Lake Area Industry Alliance
LDEQ: Louisiana Department of Environmental Quality
LDOTD: Louisiana Department of Transportation and Development
MOA: Memorandum of Agreement
MSA: Calcasieu-Cameron Parishes Metropolitan Statistical Area
NAAQS: National Ambient Air Quality Standards
NECO: Neighborhood Eco Pass
NMOG: Non-Methane Organic gases
NO_x: oxides of nitrogen
O₃: Ozone
ppb: parts per billion
ppm: parts per million
RVP: Reid Vapor Pressure
SWLA: Southwest Louisiana
tpd: tons per day
tpy: tons per year
VMEP: Voluntary Mobile Source Emission Reduction Program
VMT: Vehicle Miles Traveled
VOC: volatile organic compounds

Education: Air Quality 101 and History of This Program

What Is Ozone?

Ground Level Ozone: Ozone is not emitted directly into the air, but forms through reaction of nitrogen oxides (NO_x) and volatile organic compounds (VOC) in the presence of sunlight.

Elevated ozone levels typically occur during the summer months.

What You Need To Know About Ozone And Your Health:

Ozone can...

- Irritate the respiratory system
- Reduce lung function
- Aggravate asthma
- Aggravate chronic lung diseases, such as emphysema and bronchitis
- Inflammate and temporarily damage the lining of the lung
- Impair the body's immune system defenses

Who is sensitive to Ozone?

- Children
- Adults who are active in the outdoors
- People with respiratory diseases
- People with unusual susceptibility to ozone

What is Ozone?

- Ozone: "Good up high, bad nearby."
- In the stratosphere, ozone occurs naturally and screens out harmful ultraviolet rays from the sun
- Ground-level ozone results from a photochemical reaction of nitrogen oxides (NO_x) and volatile organic compounds (VOCs) in the presence of sunlight
- At ground-level, ozone is a principal component of smog and one of six "criteria pollutants" for which EPA has set national ambient air quality standards (NAAQS).

What is Particulate Matter (PM)?

- The term Particulate Matter (PM) includes both solid particles and liquid droplets found in air. Many man-made and natural sources emit PM directly or emit other pollutants that react in the atmosphere to form PM. These solid and liquid particles come in a wide range of sizes. Particles less than 10 micrometers in diameter tend to pose the greatest health concern because they can be inhaled into and accumulate in the respiratory system.

Introduction

On April 4, 2012, EPA's Office of Air Quality Planning and Standards announced their new voluntary Ozone Advance Program. It continues and expands EPA's cooperative work with state, tribal, and local governments. The Program is patterned after earlier ozone mitigation programs such as Ozone Flex and Early Action Compacts, although divorced from ozone attainment regulatory requirements altogether. The overarching objective of the Ozone Advance Program is to encourage emission reductions in ozone attainment areas to help them to continue to meet the NAAQS. Program goals designed to help achieve the objective are:

1. Help attainment areas to ensure continued attainment of the ozone standard and health protection;
2. Better position areas to remain in attainment; and
3. Efficiently direct available resources toward actions to address ozone problems quickly.

It is believed that participating in the program would facilitate the area's efforts to achieve and maintain the ozone standard as well as provide for possible mitigation of consequences of failure to attain the standard.

On June 25, 2012, IMCAL prepared a letter with the Notice of Intent and request to be accepted into the EPA's Ozone Advance Program. On July 13, 2012, IMCAL received a letter from EPA indicating that the Lake Charles MSA area met the eligibility criteria and was welcomed as a participant in this innovative program. See Attachment I for a map of the area.

In the summer of 2012, numerous air monitors ranging from Vinton, Carlyss, and Westlake reported levels of ozone or "smog" below, but close to the NAAQS. Southwest Louisiana (SWLA) is designated as an "Attainment Area", but the Louisiana Department of Environmental Quality has recommended that SWLA local government agencies reduce emissions to continue "Attainment" and not obtain "Non-Attainment" status by participating in the EPA Ozone Advance Program.

EPA announced the Particulate Matter Program in January 2013. The Ozone and the Particulate Matter Programs then joined and became the Advance Program. Since being approved into the EPA Advance Program, local government agencies in Southwest Louisiana created an Air Quality Task Force and charged it in developing a short and long-term plan of measures aimed at reducing ozone pollution in its Metropolitan Statistical Area (MSA), which includes Calcasieu and Cameron Parishes. This plan represents the collaborative effort of a group of governmental bodies and non-profit organizations dedicated to improving the air quality in a number of parishes including the villages, cities and towns of Vinton, Sulphur, Westlake, Lake Charles, Cameron, Grand Chienier, and Iowa.

Participation in the Advance Program entails:

- Using best efforts to move quickly toward implementing measures that might reduce ozone levels and increase public awareness;

- Develop a plan (“path forward”) within a year of sign up;
- Implement path forward measures as soon as possible;
- Annual informal status check-ins.

The Lake Charles MSA area might benefit from participating in the Program through:

- Enhanced ozone attainment efforts and greater probability for maintaining the NAAQS for ozone and PM_{2.5};
- EPA assistance;
- A rallying vehicle for public/stakeholder awareness and involvement;
- Recognition of the area’s efforts to maintain and achieve ozone attainment;
- Preference for the Diesel Emission Reduction Act program funding.

Who We Are

The metropolitan planning and economic development organizations, local governments, state environmental agencies, businesses, industries, educational institutions and other community collaborators working in partnership with the Louisiana Department of Environmental Quality (LDEQ) to improve air quality in the Lake Charles MSA area. This coalition is called the Air Quality Task Force of Southwest Louisiana (AQTF of SWLA). A list of our members is located in Attachment II.

Our Mission

The AQTF of SWLA is committed to improving air quality in the Lake Charles MSA (Calcasieu and Cameron parishes) of Southwest Louisiana through voluntary actions and reasonable, effective regulatory actions.

Our Goals

- Improve air quality through voluntary actions;
- Create a public awareness and promote individual responsibility through education; and
- Provide credible measures of air quality improvement efforts.

The AQTF of SWLA has determined that our “path forward” should include the following tasks:

1. Develop and implement an effective public awareness/outreach program;
2. Identification and documentation of ozone mitigation measures already implemented in the Lake Charles MSA;
3. Identification and documentation of ozone mitigation measures that are in the process of currently being implemented, including scheduled completion dates;
4. Research, analysis, and compilation of additional measures that would be feasible and cost-effective for implementation in the Lake Charles MSA;
5. Selection of a suite of measures for which to pursue implementation;

6. Annual check-ins, to provide the status of local air quality, measures and programs in place and lessons learned. Re-evaluate and revise path forward as necessary.

The AQTF of SWLA continually asks its members at each of its meetings to help identify, evaluate, and implement innovative ozone mitigation measures in the Lake Charles MSA area to help improve air quality and maintain attainment status in the NAAQSs for ozone and particulate matter. Information about the Advance Program and Ozone Action Days can be found on IMCAL's and the Chamber SWLA's websites.

To stimulate thinking about possible ozone reduction measures, our taskforce has compiled a preliminary list of innovative ozone mitigation strategies under the areas of alternative energy, energy efficiency, episodic controls, and urban heat island measures. Additionally, we feel it would be helpful to consider the various measures according to emissions sources categories:

- Area Source (e.g. homes, businesses, lawn care, agriculture)
- Mobile Sources
 - On-road (e.g. cars, trucks)
 - Off-road (e.g. trains, planes, marine vessels, construction equipment)
- Point Source (e.g. industrial facilities)

I. Overview

A. Growth in Southwest Lake Charles, Moss Bluff, and Carlyss Areas of Calcasieu Parish

According to Calcasieu Parish Census 2010 results, the population of the area was approximately 192,768 people. From 2000 to 2010, the Calcasieu Parish population growth percentage was 5.0% (or from 183,577 people to 192,768 people).

Areas grew in population increases by means of expansion and also growth, but some declines in the 2010 Census are evident from the 2000 Census. The areas with increases could be mainly equated to the housing explosion prior to Hurricane Rita of 2005. Moss Bluff/Gillis and Southwest Lake Charles continue to depict a stronger growth pattern adding to this region. Carlyss, Sulphur, and north Sulphur continue to have some increase in this region with additional growth. The state experienced an increase in population by 1.4% totally, while continuing to remain about 50% urban and 50% rural.

The area is composed of a mixture of land uses ranging from woodlands, marshes, swamps and vacant land to strip commercial uses, highly residential subdivisions, municipal buildings, and heavy industrial uses. Residential areas comprise a large portion of the land uses in this metropolitan area. Certain social and economic characteristics of the population are important links to understanding the transportation needs of the metropolitan area. The increases in ozone levels across the area coincide with growth in population and associated developments that are spreading out from the parish centers.

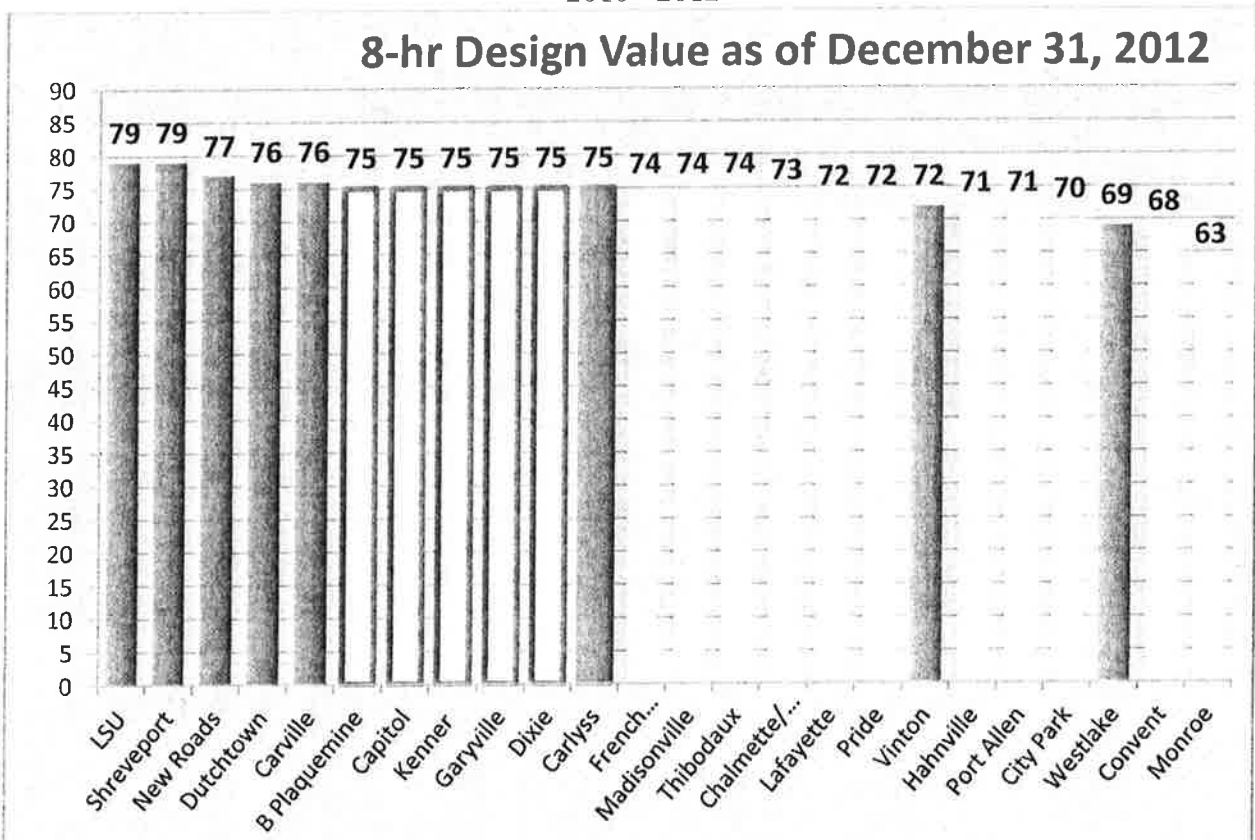

B. Ozone Chemistry

Ozone is formed when NO_x and VOCs found in the emissions from cars, power plants, and other sources react in the presence of sunlight. Hotter temperatures and increased sunlight during summer months create the perfect conditions for this reaction to occur.

How is attainment determined? The 3-year average of the fourth-highest daily maximum 8-hour average ozone concentration measured at each monitor within an area provides an ozone “design value or DV” for each monitor. The monitor with the highest DV becomes the DV for the area. The 8-hour primary ozone standard is 75 parts per billion (ppb). With these standards, air quality determinations are becoming more regional in character with the impacts of key pollutants like ozone and particulate matter pollution. See the graphs below for a view of how our ozone design values have changed over the past several years.

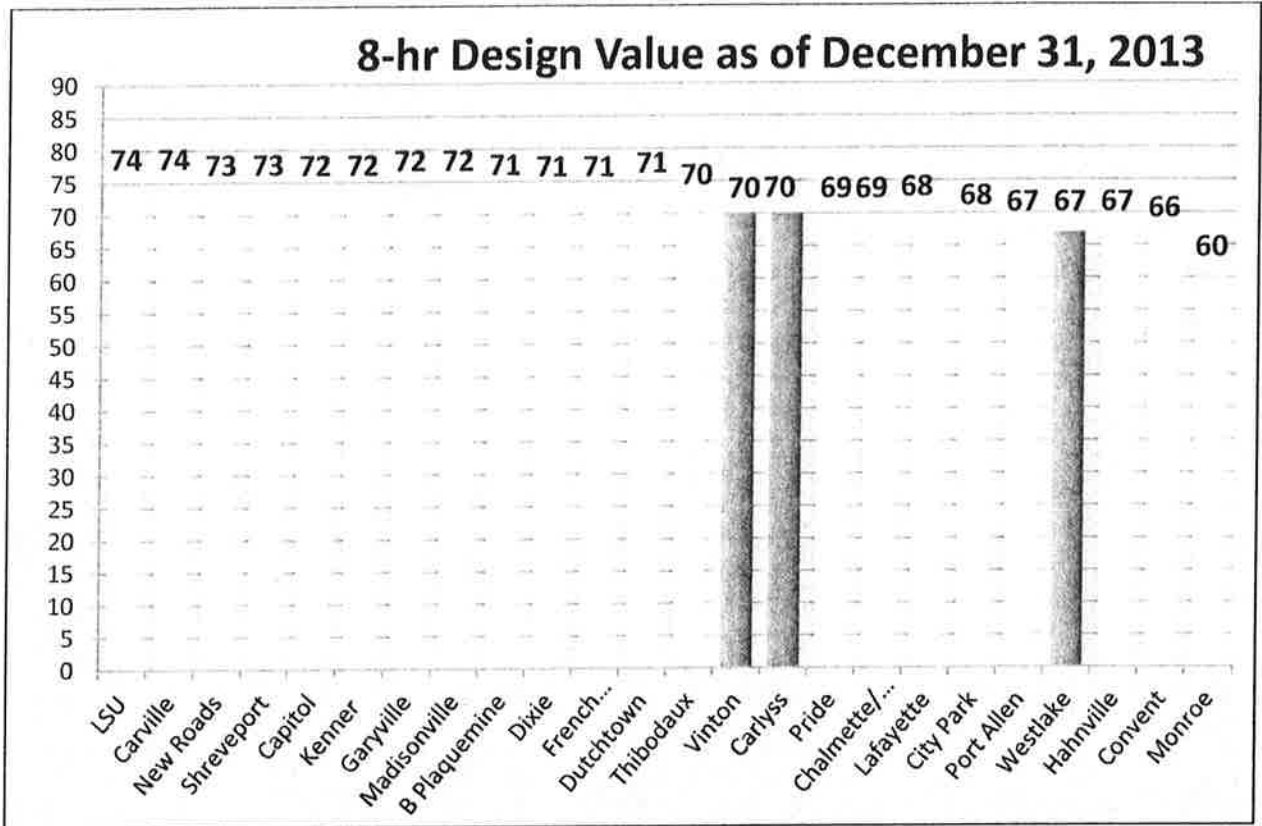

The graphs below show recent decline in the three area monitors in the region (Carlyss, Vinton, and Westlake):

2010 - 2012

Source: DEQ

2011 - 2013

Reductions in Ozone formation

To address the ozone problem the prudent approach is to seek reductions in the overall pollution burden, including potential reductions of NO_x and VOCs, the ozone precursors. A variety of studies have shown that both major precursors should be controlled to effectively reduce ozone pollution, their amounts based on local meteorological conditions and the chemistry of ozone formation.

As part of its efforts to better understand ozone formation in Louisiana, the DEQ completed its Technical Support Document (TSD) that documents current and modeled future emissions across the entire state. That document is available at http://www.deq.louisiana.gov/portal/Portals/0/AirQualityAssessment/Engineering/Ozone/LDEQ_TSD_4Oct13.pdf.

Because ozone formation is so dependent on local concentrations of the precursors VOCs and NO_x (which vary spatially and temporally) as well as meteorological effects that affect mixing rates, a more detailed review of the TSD will be necessary to determine the appropriate controls necessary to achieve broad reductions over a wide area such as the Southwest Louisiana region.

Ozone Pollution in the Context of a Changing Climate

The formation of ozone is impacted by climate. The atmospheric chemical processes that control the production of ozone are determined largely by the volume of ozone-forming contaminants together with temperature and other factors such as sunlight and relative humidity. As the temperature and other meteorological factors change, production of air pollutants also will be affected. For example, as temperatures increase with larger amounts of sunlight, ozone levels also will rise. Strategies for improving air quality traditionally have been assessed by examining the relative benefits of different emission reduction strategies and assuming that changes in climate were not a factor. As predictions of changes in the climate over the next few decades are being increasingly acknowledged by the scientific community, the impacts of these changes in temperature and other meteorological factors on air quality needs to be factored into air quality assessments. Many studies are already demonstrating the impacts of climate change on future air quality, in particular the anticipated increases in ozone and particulate pollution production in many areas.

C. Particulate Matter (Air Pollutants)

The Air Quality Task Force also agreed to work toward reviewing and developing actions for PM. Canada and the United States continue to work toward instituting regulatory programs for reducing PM. The current NAAQS for Particulate Matter is 12 µg/m³. The Lake Charles area Design Value has been below 12 µg/m³ for the past several years. The Air Quality Task Force will continue to monitor these numbers very closely and will also continue to develop strategies for reducing PM pollution. The next section lays out possible strategies.

II. Reduction Strategies

A. List of Innovative Pollution Mitigation Strategies

Alternative Energy

- Use of Renewable Energy in the Residential and Commercial Sector
- On-Road Fleet Vehicle Retrofitting/Alternative Energy Incentive Program
- Off-Road Vehicle Retrofitting/Alternative Energy Incentive Program (e.g. Tug Boats, Locomotives)
- Incentive Program for Use of Alternative Energy/Clean Fuels in Non-Road Source Category (e.g. Construction)
- Truck Idle Emission Reductions
- Locomotives Idle Emission Reductions
- Waste to Energy
- Tax Credit for Purchase of Alternative Fuel On-road Vehicles for Non-Commercial Use
- Renewable/Cleaner Energy in Oil and Gas Industries

Energy Efficiency/Renewable Energy

- Green Buildings
- Building Energy Management
- Energy Efficient Lighting
- Energy Star Program
- Combined Heat and Power (CHP)
- State EERS Standards
- Indirect Source Mitigation
- Public Outreach/Education
- Weatherization of Older Homes in Low Income Areas
- Expanded Research, Development, and Demonstration (RD&D)
- Indirect Source Mitigation for Mobile Sources

Episodic Controls

- Electric Demand Days (HEDD) Program
- Traffic Congestion Mitigation and Reduction
- Delay of Low priority Activities
- Use of Low Emission Fuel High

Urban Heat Island

- Reflective Roofs
- Increase in Vegetative and Tree Canopy Cover
- Environment Surface Albedo Changes – Public Sector
- Environment Surface Albedo Changes – Private Sector

B. Reduction of Vehicle Emissions

Clean Car Campaign

The Clean Cars Campaign is an informal alliance of dozens of state, local and national health and environmental organizations working together to promote cleaner motor vehicles, including vehicles that emit fewer greenhouse gas emissions. Each member organization has its own governing board and sets its own policies. Member groups do not pay to participate in the campaign. Currently Louisiana is not participating in this Campaign.

Anti-Idling Ordinances, Financial Incentives and Voluntary Measures

Measures to Reduce Truck Idling

EPA estimates that idling trucks consume, annually, over 950 million gallons of diesel fuel, and emit approximately 200,000 tons of NO_x and over 10 million tons of carbon dioxide (CO₂). The average emissions per a heavy duty diesel truck are 12 grams per hour of HC, 140 grams per hour of NO_x and 8200 grams per hour of CO₂. Heavy duty diesel trucks are also considerable fuel-guzzlers, consuming about 0.80 gallons per hour of idling. There are a number of ways to reduce truck idling: anti-idling regulation; voluntary measures; and financial incentive programs.

Anti-Idling ordinances can play an important role in reducing truck idling and emissions. The trucking industry has identified inconsistency in state and local idling laws as a barrier to greater implementation of idle reduction technologies and strategies. Approximately fifteen states and dozens of local jurisdictions currently have idling laws. Anti-Idling ordinances from other areas are being evaluated to determine their usefulness in this area.

A significant portion of the trucking industry has embraced various idling technology to save fuel and decrease emissions. A survey of local trucking companies and businesses with fleets will be contacted and encouraged to join the effort to reduce emissions.

Numerous technologies are currently available to help companies reduce fuel consumption and install idling technology. However, one of the major barriers to widespread adoption of retrofits, auxiliary power units (APUs) and other voluntary measures is a lack of investment capital. State loan programs can greatly assist trucking companies interested in doing the right thing to attain their idling reduction goals. State loan programs are being investigated to reduce investment capital requirements for small and medium firms. The National Clean Diesel Program offers a variety of funding sources to reduce diesel emissions. More information can be found at <http://www.epa.gov/cleandiesel/index.htm>.

Employer Trip Reduction Program

Employer-Based Trip Reduction Programs are designed to reduce vehicle miles traveled by single-occupancy commuters traveling to and from their place of employment. Through the program, large employers develop a “trip reduction program” and an annual report documenting methods

they have adopted for reducing single occupancy vehicle commuting commensurate with a pre-defined level. Local industries and businesses will be contacted for possible participation.

Actions included in the trip reduction plan can include but are not limited to the following:

- Subsidized bus passes
- Rideshare matching programs
- Vanpool leasing programs
- Telecommuting programs
- Compressed work week schedule programs and flexible work schedule programs
- Work site parking fee programs
- Preferential parking for rideshare participants
- Transportation for business related activities
- A guaranteed ride home program
- On-site facility improvements
- Soliciting feedback from employees
- On-site daycare facilities
- Coordination with local transit authorities for improved mass transit service and information on mass transit programs
- Recognition and rewards for employee participation

Consumer Incentive Programs

The public's awareness of the importance of issues such as climate change and ozone pollution is on the rise. Accordingly, programs that provide the public with relatively easy and inexpensive ways to reduce ozone pollution and help the environment are likely to be successful and cost effective.

Some such programs may include:

- Voluntary usage of electric lawn mowers and garden equipment during hot summer days or on weekends;
- Local store cash rebates or vouchers for the purchase of electric lawn mowers and garden equipment;
- Local tax breaks and energy efficiency rebates for the purchase of electric lawn mowers and garden equipment;
- Green certification for lawn care companies that primarily use electric and low-emission gas equipment and mowers;

Expanded Transit Alternatives

Reducing ozone precursors from on-road mobile sources can be accomplished through tightening vehicle emissions standards, emissions inspection programs, fuel reformulation, and reducing vehicle miles traveled (VMT). VMT reduction is perhaps the most challenging strategy yet brings important ozone and transit improvements that have multi-pollutant benefits. Given the challenge of developing a durable blueprint to restore healthy air, transportation plans designed to minimize on-road emissions are critical. Lake Charles Transit will be asked to review the following items and determine if they are applicable to their system

Neighborhood ECO-Pass Program

Transit Agencies could provide a deeply discounted annual bus pass to neighborhood organization for all members of participating households. Eco-Pass is a photo ID bus pass that entitles residents to one year of unlimited travel on all fixed transit routes. For example, this program has been implemented in the City of Boulder since 2005. To date, 24 neighborhoods in Boulder offer the Neighborhood Eco Pass (NECO) Pass to nearly 4,430 residents. With additional subsidies provided by the City of Boulder, the annual cost for this pass is \$56 to \$128 per household.

Free Rides on High Pollution Days

Offering a free ride can increase bus ridership on potentially high pollution days. This was the operating principle for transportation officials across Northern Virginia. Local bus routes across Fairfax, Arlington, and Loudon Counties offered free bus service on high pollution days through mid-September 2007. Free ride days can increase awareness of unhealthy air quality conditions and encourage more people to be aware of when high pollution day alerts are called. It would also introduce people who usually drive to the bus system so they will be more likely to use it in the future.

Local transit could consider offering three free passes to anyone who pledges to use alternative transportation at least once a week through the through a campaign initiative called something like "Drive Smart Day"

Alternatively, this program could be enhanced to provide bus passes to pledge participants that could be used for free rides on high pollution days during the summer.

Bus Smart Card

Smart Cards reduce the amount of time bus users have to wait in line, eliminate the need for correct change, and encourage ridership. Though costly, this action could substantially increase the ridership and allow more flexibility in billing structures.

One such card, being installed in the U.K., the "No W card" features a photograph of the holder and is loaded with data, which identifies the concessionary fare entitlement of the holder. When the holder presents his No W card to the ticket machine on the bus for the first time, the smart card automatically prompts the ticket machine to calculate the relevant

fare and any other incentives such as age or employer programs. Through this \$9 million program, 300,000 No W cards have already been issued with the aim of having all 1,800 buses in the region operating the smart ticketing technology by the autumn of 2007.

III. Initiatives Area Wide

A. Municipalities/Government Agencies

- Forming strategies to move to alternative fueled vehicles
- Purchasing propane fueled mowers
 - Lake Charles and Sulphur
- Education and information by emails to employees
 - LAIA (Members listed in Attachment III)
- EPA School Flag Program beginning Fall 2014
(http://airnow.gov/index.cfm?action=school_flag_program.index)
 - Episcopal Day School
 - J. I. Watson
 - Town of Iowa
- Educational curriculum made for elementary to middle school made available
- Making presentations to local civic groups
 - Rotary
 - Kiwanis
 - Lions, etc.

B. Industry

- Informing employees by email on Ozone Action Days
 - LAIA (see Attachment III for complete list of members)
- Energy efficiency programs
- Promoting the use of EnviroFlash

C. Citizens

- IMCAL and Chamber Southwest websites offer tips
- Promoting the use of EnviroFlash
- Promoting trip chaining
- Promoting fueling vehicles at cooler times of the day
- Promoting using small gasoline engines during cooler times of the day

D. Other Initiatives

- IMCAL and Chamber Southwest websites
- Articles in local magazines, newspaper, and television
 - *Jambalya* – April 18, 2013
 - *Thrive* – March 2013

- American Press
 - August 11, 2013
 - July 10, 2014
 - August 23, 2014; Senator David Vitter Briefing-IMCAL testified
 - August 25, 2014; Calcasieu School Board considers alternative fuel buses
 - August 25, 2014; Lake Charles buying alternative fuel mowers
- Presented Action Plan and Awareness Presentations to:
 - Cameron Parish Police Jury: July 1, 2014
 - City of Sulphur City Council: June 9, 2014
 - City of Dequincy City Council: July 14, 2014
 - City of Lake Charles City Council: July 8, 2014
 - City of Vinton City Council: July 15, 2014
 - KPLC TV Sunrise -- April 30, 2014
- Promoted National Air Quality Month in May
 - KPLC TV Sunrise -- April 30, 2014
- Local television station agrees to place Ozone Action Day info during weather cast
 - KPLC TV will place on scroll bar when ozone is expected to be >100

IV. Action Plan

The Action Plan largely consists of educating our members and the public of the local air quality issues, promoting awareness and strategies to reduce ozone and particulate matter. The following strategies will be used as a guide and will be continually updated as new ideas are formulated.

To address particulate matter, the air pollutant most commonly associated with premature mortality, based on comparable regulatory regimes in the two parishes.

Action Item 1: Review of Science

The first six months will focus on foundational work to develop and decide upon options for updating the scientific analysis of transboundary and to identify these MSA related regulatory actions. Additionally, technical review of regulatory development will take place along with regular information sharing among experts. Within 6 to 12 months, both sides under the auspices of the AQTF will assess and discuss possible scope and nature of commitments under the Advance program, including potential regulatory actions that could be considered as a basis.

- Beginning January 1, 2014: Within AQTF, select an option for updating the analysis and initiate technical review of the science assessment on boundary movement of PM, including:
 - a. Identification of sources
 - b. Magnitude and pattern of boundary flows
 - c. Health impact assessments.
 - d. Six to 12 months: Ongoing science assessment, and data-sharing
 - e. Assessment of boundary PM

- f. Report progress and key findings to AQTF
- g. 12 to 18 months: Finalize science assessment
- h. AQTF recommendation on science elements of the Annex.

Action Item 2: Parishes Regulatory Actions to Reduce PM

- Beginning January 1, 2014: Within AQTF, identify parishes' PM-related regulatory actions
- Technical review and information sharing between experts on regulatory development in both parishes
- Six to 12 months: Assessment of potential regulatory actions, including timelines, entry into force and impacts on emissions.
- Within the AQTF, initiate discussion on possible scope and nature of commitments under the PM Annex.

Action Item 3: Engagement

- Beginning January 1, 2014: Information sharing on initiatives.
- Six to 12 months: Stakeholder updates and debriefs, as appropriate.
- 12 to 18 months: Stakeholder updates and debriefs, as appropriate.
- Beyond 18 months: Stakeholder updates and debriefs, as appropriate.

The work outlined above will be conducted by the relevant members of the Air Quality Task Force, who nominally constitute the Working Group. Both parishes envision that these members will conduct the work in their roles on the task force within the process. The following strategies will be used by the task force as part of their educational toolkit when engaging the public.

Limit Your Driving

- Avoid driving during peak traffic periods when stop-and-go traffic is at its worst.
- Try not to drive at all, especially during the morning and early afternoon.
- Plan ahead, organize your trips. Combine several errands into one trip.
- Take your lunch to work to avoid lunch trips.
- Consider other commute options such as public transit, shared-ride, and/or telecommuting.

Drive Emission Wise

- If you must drive, use the least polluting of your vehicles.
- Where available, use clean fuels. Avoid excessive idling, and areas of congestion.
- Stop and start evenly.
- Drive at a steady speed. Drive at medium speeds. Use your air conditioner wisely.
- Travel light.
- Consider fuel efficiency and emissions when buying a new car.

Refuel Carefully

- Refuel after 6:00 p.m., if possible and avoid spills. Try not to top off your gas tank.

Maintain Your Vehicle

- Engine performance, emission control systems, and tire inflation are important.
- Do not remove or tamper with pollution controls. Comply with the local auto inspection and emissions testing program.
- Follow your owner's manual.
- Get regular engine tune-ups and car maintenance checks.
- Use an energy-conserving (EC) grade of motor oil. An EC multi-grade can improve your mileage by 2-4 percent. Source: <http://www.articlesbase.com/cars-articles/using-synthetic-oil-to-improve-fuel-economy-569043.html>

Live Emissions Wise

- Buy low emission household products.
- Buy electric or fuel-efficient motorized equipment.
- Conserve electricity.
- Avoid spilling gas when refueling gasoline-powered lawn, garden, farm, and construction equipment and boats.
- Recycle waste. Team Green of Southwest Louisiana's mission is to enhance the appearance and quality of the environment in Southwest Louisiana. More information about materials they collect and drop-off sites can be found at <https://www.cityoflakecharles.com/departments/board.php?fDD=6-47>.
- Seal containers tightly.
- Reduce waste.

Delay or Reschedule Lawn care

- Reschedule or delay lawn care employing gas-powered equipment until after 6:00 p.m. An old 2-cycle gas-powered lawn mower produces as much pollution as 70 new running cars.
- Consider trading your gas-powered lawn mower for a reel push mower – they are easy to push and great exercise. How about trading the gas-powered leaf blower for a broom and a rake?

Postpone Oil-Based Paint and Solvent Use

- Where possible, use aqueous (water) based products.
- Avoid oil-based paint and solvent use on days when elevated ozone levels are expected.
- Many zero- and low-VOC paints and solvents are readily available in local hardware and paint stores.

Barbecue with Electric or Chimney Starters

- Avoid the use of lighter fluid, since it vaporizes into the air and can contribute to ozone formation.
- Your food will also taste better.

Conserve Energy in Your Home

- Conserving electricity reduces air pollution caused by power plants.
- Purchase energy efficient heating and air-conditioning systems.
- Purchase energy efficient appliances.
- Make sure your home is well insulated.
- Be mindful of energy conservation when you set your thermostat.
- Purchase energy efficient lighting.
- When purchasing appliances and/or electronic office equipment, consider the Energy Star qualified products. Information about Energy Star appliances is located at http://www.energystar.gov/index.cfm?fuseaction=find_a_product.
- Where available, participate in your local energy conservation programs.

Spread the Word

- Learn about local efforts and issues.
- Learn what you can do to help clear the air.
- Share what you learn.
- Let people know you care.
- Join a community group that is working to improve air quality.
- Improve air quality through voluntary actions.
- Create a public awareness and promote individual responsibility through education.
- Provide credible measures of air quality improvement efforts.

V. Conclusion

Ozone and PM pollution are serious public health and environmental problems. Our community is working to reduce these pollutants while expanding the quality of life in our area.

As the clean air strategies examined in this plan demonstrate, there are many available measures to reduce ozone. With a collective coalition of Southwest Louisiana local officials and concerned citizens, our

Advance Program can win the fight against these pollutants and their concomitant adverse human health and environmental impacts, provided we act with determination and immediacy.
