

EPA's BEACH Report:

Northern Mariana Islands 2012 Swimming Season

September 2013

EPA 820-F-13-026

Introduction

The Beaches Environmental Assessment and Coastal Health (BEACH) Act of 2000 authorizes EPA to provide grants to coastal and Great Lakes states, territories, and eligible tribes to monitor their coastal beaches for bacteria that indicate the possible presence of disease-causing pathogens and to notify the public when there is a potential risk to public health. The BEACH Act requires that recipients of those grants report their coastal beach monitoring and notification data to EPA. This fact sheet highlights the data submitted to EPA by the Commonwealth of the Northern Mariana Islands for the 2012 swimming season.

2012 Swimming Season Monitoring and Notification Actions

Northern Mariana Islands monitored 76 coastal beaches on three islands during the 2012 swimming season (Figure 1 and Table 1). When monitoring results at swimming beaches show that levels of specific indicator bacteria in the water exceed applicable water quality standards, Northern Mariana Islands officials issue a beach advisory, warning people of possible risks of swimming for the next 48 hours.

How many beaches had notification actions?

In 2012, of the 76 coastal beaches that Northern Mariana Islands monitored, 69 (91 percent) had at least one notification action (Figure 2).

Figure 1. Monitored Northern Mariana Islands

Table 1. Number of monitored and unmonitored coastal beaches for 2012

Island	Total Beaches	Monitored	Not Monitored
ROTA	12	12	0
SAIPAN	54	54	0
TINIAN	10	10	0
TOTALS	76	76	0

Figure 2: Percent of beaches with one or more notification actions

Figure 3: Duration of beach notification actions in 2012

How many notification actions were issued and how long did they last?

Northern Mariana Islands issued 410 two-day notification actions during the 2012 swimming season (Figure 3). The Division of Environmental Quality is working to reduce the number of actions at recreational beaches by supporting programs to repair and improve sewage collection systems and managing cattle grazing in areas that impact beaches.

What percentage of days were beaches under a notification action?

EPA calculates the total available beach days and the number of beach days with notification actions to better track trends over time. Total available beach days are determined by multiplying the length of the beach season by the number of

Figure 4: Percent of beach days open and safe for swimming

beaches in the state. For 2012 EPA calculated that 27,740 beach days were associated with the swimming seasons of the 76 monitored Northern Mariana Islands beaches. Northern Mariana Islands reported notification actions on 820 days, meaning that beaches were open and safe for swimming 97 percent of the time. This continues the trend of consistently high percentages of open beach days at beaches in the Northern Mariana Islands (Figure 4).
