TRC Report No. 182129.0000.0000

Report Issued November 2011

REPORT CERTIFICATION

I certify that to the best of my knowledge:

- Testing data and all corresponding information have been checked for accuracy and completeness.
- Sampling and analysis have been conducted in accordance with the approved protocol and applicable reference methods (as applicable).
- All deviations, method modifications, or sampling and analytical anomalies are summarized in the appropriate report narrative(s).
- Total number of pages in this report - 2770

Michael J Krall
TRC Project Manager

December 14, 2011
Date

TRC was operating in conformance with the requirements of ASTM D7036-04 during this test program.

1.0 EXECUTIVE SUMMARY

ExxonMobil owns and operates a petroleum refinery in Baytown, Texas that is subject to the U.S. Clean Air Act (CAA) Sections 111 and 112. ExxonMobil collected emissions data from the delayed coking unit (DCU) to generate information to compare to a database from similar units and sources within the U.S. to inform future rulemaking under Sections 111 and 112. Based on U.S. EPA's guidance for the test procedures, methods, and reporting requirements for creating such databases, a test program was designed that provided a plan to conduct emissions sampling at the DCU. This report presents the results of the test program conducted July 14 through 17, 2011.

TRC of Austin, Texas was contracted by ExxonMobil to conduct the testing program. TRC performed the sampling and particulate matter analyses, while Enthalpy Analytical, Inc. (Enthalpy); First Analytical, Inc.; and Test America performed the remainder of the analyses of the samples. Tables 1-1 through 1-9 present a summary of the test results.

Table 1-1. Quality Assurance Summary

ICR Group	Parameter	EPA Method	Section of Report	Sampling and Analytical Anomalies	Discussion Points	Effects on Data Quality
a	Volatile Organic HAPs	EPA Method 18 (XAD)	4.2.1	Matrix Spike (pre-sampling spikes)	Matrix spike is a quality assurance tool. Unable to use spikes due to high background baseline.	Unknown
		EPA Method 18 (bag)		None	Methane/Ethane emissions are more than total hydrocarbon emissions, and higher than expected using PV=NRT calculation.	Unknown
		EPA Method 18 (MeOH)		None	None	None
	Semi-Volatile Organic HAPs	SW 846 Method 0010	4.2.2	Surrogate Spike (pre-analysis spikes)	Surrogate spike is a quality assurance tool. Unable to use spikes due to high background baseline.	Unknown
				Run 2's Moisture content was low enough to be considered an outlier (79% vs. average of 98%)	Results from Run 2 may be inaccurate due to low moisture content.	Run 2's results were not used in the average emission rate calculations.
				Isokinetic specifications not met-Run 1=64.4%, Run 2 (not used), Run 3=204%	Isokinetic should be 100% +/- 10%. Known anomaly going into testing due to high velocity and low amount of dry sample.	Unknown
	Aldehydes	SW 846 Method 0011	4.2.3	Sample split for analysis due to high sample volumes (3-4 liters)	Sample volume is normally 1 L but had 3 to 5 L of sample. Sample was homogenized prior to split and lab composited prior to analyzing.	None (method deviation)
				Isokinetic specifications not met-Run 1=54.5%, Run 2=223%, Run 3=264%.	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	Unknown

ICR Group	Parameter	EPA Method	Section of Report	Sampling and Analytical Anomalies	Discussion Points	Effects on Data Quality
a	Total Hydrocarbons	EPA Method 25A	4.2.4/4.2.5	None	Very high O2 at beginning of run and by the end of run was about 2%. System passed all leak checks. Methane/Ethane emissions are more than total hydrocarbon emissions.	Unknown
	Methane and Ethane	EPA Method 18	4.2.1	None	Very high O2 at beginning of run and by the end of run was about 2%. System passed all leak checks. Methane/Ethane emissions are more than total hydrocarbon emissions.	Unknown
	Carbon Monoxide	EPA Method 10	4.2.6	None	Very high O2 at beginning of run and by the end of the run was about 2%. System passed all leak checks.	Unknown
c	Acid Gases	EPA Method 26A	4.2.7	Isokinetic specifications not met-Run 1=78.3%, Run 2=208%, Run 3+238%	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	Unknown
	Hydrogen Sulfide, Carbonyl Sulfide, and Carbon Disulfide	EPA Method 15	4.2.4/4.2.8	None	Large variability in Baytown results which may be due to the GC cycle time of 8 minutes. Baytown Run 2 had the most sample analysis due to the duration of the vent cycle. Very high O2 at beginning of run and by the end of the run was about 2%. System passed all leak checks.	Unknown

ICR Group	Parameter	EPA Method	Section of Report	Sampling and Analytical Anomalies	Discussion Points	Effects on Data Quality
c	Total Reduced Sulfur	EPA Method 15	4.2.4/4.2.8	None	Very high O2 at beginning of run and by the end of the run was about 2%. System passed all leak checks.	Unknown
d	Mercury	ASTM D6784-02	4.2.9	Reagent Blank	Blank and sample concentrations are comparable	None
				Lack of color from KMnO4	Due to the amount of liquid sample going through the impinger probably diluted the KCl concentration	Spike recovery was 83%. Results possibly biased low but considered valid.
				Isokinetic specifications not met-Run 1=68.9, Run 2+226%, run 3=271%	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	Unknown
	Metals	EPA Method 29	4.2.10	Isokinetic specifications not met-Run 1=66.3%, Run 2=205%, run 3=232%	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	Unknown
	PM / PM2.5 filterable	EPA Method 5	4.2.11	Isokinetic specifications not met-Run 1=51.6%, Run 2=196%, run 3+215	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	Unknown
	PM2.5 Condensable	EPA Method 202	4.2.11	Isokinetic specifications no met-Run 1=51.6%, Run 2=196%, Run 3=215%	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	Unknown
	Oxides of Nitrogen	EPA Method 7E	4.2.13	None	Very high O2 at beginning of run and by the end of the run was about 2%. System passed all leak checks.	Unknown
	Sulfur Dioxide	EPA Method 6C	4.2.14	None	Very high O2 at beginning of run and by the end of the run was about 2%. System passed all leak checks.	Unknown

ICR Group	Parameter	EPA Method	Section of Report	Sampling and Analytical Anomalies	Discussion Points	Effects on Data Quality
a,c,d	Gas Flow Rate	EPA Method 2	4.2.12	The vent flow rate was extremely variable over the testing periods. Isokinetic sampling was not possible since the sampling rate was fixed at maximum vacuum settings.	Isokinetic should be 100% +/- 10%. Known anomaly due to high velocity and low amount of dry sample.	None
	Oxygen and Carbon Dioxide	EPA Method 3A	4.2.15	None	Very high O2 at beginning of run and by the end of the run was about 2%. System passed all leak checks	Unknown
	Moisture	EPA method 4	4.2.16	None. Standard combustion gas methods used on vent gas that was nearly 100% steam.	Run 2 of Semi-Volatile Organic HAPs was the only moisture sample result which was not within the expected concentrations. This sample was not used in the calculation of averages.	All sampling was adversely affected due to the method modifications necessary to manage the high water content.

Table 1-1A. Volatile Organic HAPs (by Bag Sampling) Summary of Results

***Average Flow Rate: 9,346 dscfh**	**3-Run Average Emissions**

2.0 INTRODUCTION

ExxonMobil owns and operates a petroleum refinery in Baytown, Texas that is subject to the U.S. Clean Air Act (CAA) Sections 111 and 112. ExxonMobil collected emissions data from the delayed coking unit (DCU) to generate information to compare to a database from similar units and sources within the U.S. to inform future rulemaking under Sections 111 and 112. Based on U.S. EPA's guidance for the test procedures, methods, and reporting requirements for creating such databases, a test program was designed that provided a plan to conduct emissions sampling at the DCU. This report presents the results of the test program conducted July 14 through 17, 2011.

TRC of Austin, Texas was contracted by ExxonMobil to conduct the testing program. TRC performed the sampling and particulate matter analyses, while Enthalpy Analytical, Inc. (Enthalpy), First Analytical, Inc. and Test America performed the remainder of the analyses of the samples. Table 2-1 presents the general facility and testing information for this test program.

Section 3.0 presents the complete findings of the test results. Section 4.0 presents the sampling and analytical procedures followed during the test program. Section 5.0 specifies the description of the Quality Assurance/Quality Control (QA/QC) procedures followed throughout the test program.

2.1 Process Description

The Delayed Coker Unit (DCU) is a thermal process used to upgrade bottom-of-the-barrel material, typically vacuum residuum, but also asphalt/bottoms from a deasphalter into higher value gas and liquid products and a byproduct, coke.

The feed material is heated in a furnace and sent to a coke drum under proper conditions to allow the feed to be converted to vapor and coke. The overall reaction is endothermic with the furnace supplying the necessary heat for vaporization and cracking. The DCU has a total of four coke drums, and the coke drums operate in pairs. While one drum is coking the other drum is out of service for cooling, draining, depressurizing, unheading and decoking. After all coke has been removed, the out of service drum is reheaded, air-freed; pressure tested, and warmed up to prepare it for coking service. On a regular scheduled cycle, feed is switched from the drum in coking service to the drum that is warming up.

Baytown tested one coke drum during the depressurization step. This drum would be representative of the other three coke drums. Figure 2-1 presents a schematic drawing of the DCU tested during this program.

3.0 DETAILED RESULTS

The test results are presented in this section. Tables 3-1 through 3-9 present the run-by-run detailed test results conducted on the DCU D603 Vent. Detailed data are located in the appendices along with field data and the analytical reports.

3.1 Data Qualifications

3.1.1 *Sample Moisture*

To calculate the mass rates for all parameters, the dry flow rates from the Ontario Hydro (OH) sampling data were used due to the consistency in the OH sampling train moisture content from run to run (lowest standard deviation), and the average OH flow rate was representative of the overall average from all the sampling trains (Run 2 of the semivolatile HAPs train was an outlier data point at 79% moisture and biased the overall average low). Since the velocity determinations for all sampling trains were taken from a single point in the duct and applied to all sampling trains, the moisture content of each individual train was the most significant factor in the dry flow rate calculations used to determine mass rates. Table 4-1 provides a statistical presentation of moisture content for all sampling trains and the justification for using the Ontario Hydro train's moisture data.

3.1.2 *CEMS Dilution Probe*

A dilution probe system was used for the measurement of O_2, CO_2, THC, NOx, SO_2, CO, and reduced sulfur compounds. This system was equipped with critical orifice technology to precisely meter the sample and nitrogen gas dilution gas and was used to reduce the high moisture content of the vent gas to allow the analyzers to accurately measure each parameter.

4.0 SAMPLING AND ANALYTICAL PROCEDURES

Method-specific quality assurance and control measures were generally followed as much as possible. All testing was performed following EPA protocols as outlined in the EPA's Information Collection Request (ICR), Component 4, Part VIII. "Test Procedures, Methods and Reporting Requirements for the Information Collection Request for Petroleum Refineries" and 40 CFR Part 60 unless detailed in the respective sections of the test plan.

This section briefly presents the sampling and analysis methods that were followed during the DCU D603 Vent test as well as any method deviations and/or problems encountered. A test plan was developed in May 2011 that included details specific to this test program. The testing was performed consistent with the ICR request to perform simultaneous sampling. The parameters measured were as follows:

- Speciated volatile organic HAPs
- Speciated semi-volatile organic HAPs
- Aldehydes
- Total hydrocarbons (THC);
- Methane/ethane;
- Carbon monoxide (CO);
- Acid gases (HCl, Cl2, HF, HCN);
- Hydrogen sulfide (H_2S)/carbonyl sulfide (COS)/carbon disulfide (CS_2);
- Total reduced sulfur (TRS)
- Particulate matter (PM);
- Mercury;
- Metals;
- Nitrogen oxides (NOx);
- Sulfur dioxide (SO_2);
- Flow rate
- Oxygen and Carbon Dioxide

In addition, during each test run, the DCU D603 Vent flow rate, gas composition (oxygen (O_2) and carbon dioxide (CO_2)), and moisture content was measured. Figure 4-1 presents a schematic drawing of the DCU D603 Vent sampling locations.

During the test, the DCU D603 was vented under normal conditions. Three test runs were performed that were at least 20 minutes in duration. Due to the short duration of the test runs, each sample was collected at a single point in the centroid of the stack.

The gas velocity values used for all of the measured parameters in this testing were measured using a Type-S pitot tube located at the middle of the 8-inch ID pipe manifold used for the testing. This gas velocity was used to calculate the dry standard cubic feet per hour flow rates used to determine all of the emission rates.

To correct the gas flow rate to a dry basis, the moisture determined from the Ontario Hydro mercury train was used. This train was chosen based on its consistent run-by-run moisture results. To provide a common basis for data reduction, it was decided to use a single moisture value for all corrections from wet to dry basis for those parameters that did not generate their own moisture value during the testing (dilution probe data). The Ontario Hydro train's moisture was also used to correct these parameters to a dry basis. These parameters include O_2, CO_2, CO, THC, SO_2, NOx and TRS.

Moisture results were generated from many of the sampling trains used during this testing. A summary of these results are shown in Table 4-1 below. This data can provide a means of evaluating the quality of each train's sample integrity. It appeared that the second run of the Method 0010 train may have had sample collection problems that were not detected by the standard pre and post-test leak check procedures. Based on the Dixon "Q" test, its moisture can be considered an outlier with a confidence level of 95%.

Table 4-1. Sampling Train Moisture Results

Port No.	Sampling Train	Moisture (%) Run 1	Run 2	Run 3	Average	Test Run Standard Deviation
1	Method 29 - Metals	96.7	98.3	99.1	98.0	1.22
2	Methods 5/202 – Particulate Matter	97.9	97.6	99.1	98.2	0.79
3	Method 0010 – Semivolatile HAPs	97.6	79.4([a])	98.5	98.1	10.78
4	Ontario Hydro – Mercury	97.7	97.6	98.4	97.9	0.44
5	Method 0011 - Aldehydes	98.1	97.2	98.9	98.1	0.85
6	Method 26A - Acid Gases	98.2	97.3	98.9	98.1	0.80

(a) This moisture value was rejected as being an outlier per the Dixon Outlier Test.

Overall Average Moisture **98.1**

Figure 4-1. ExxonMobil DCU D603 Vent – Sampling Location Schematic

Drawing below is a nominal 8”I.D. pipe.

Drawing below is a 15 ft straight run of pipe.

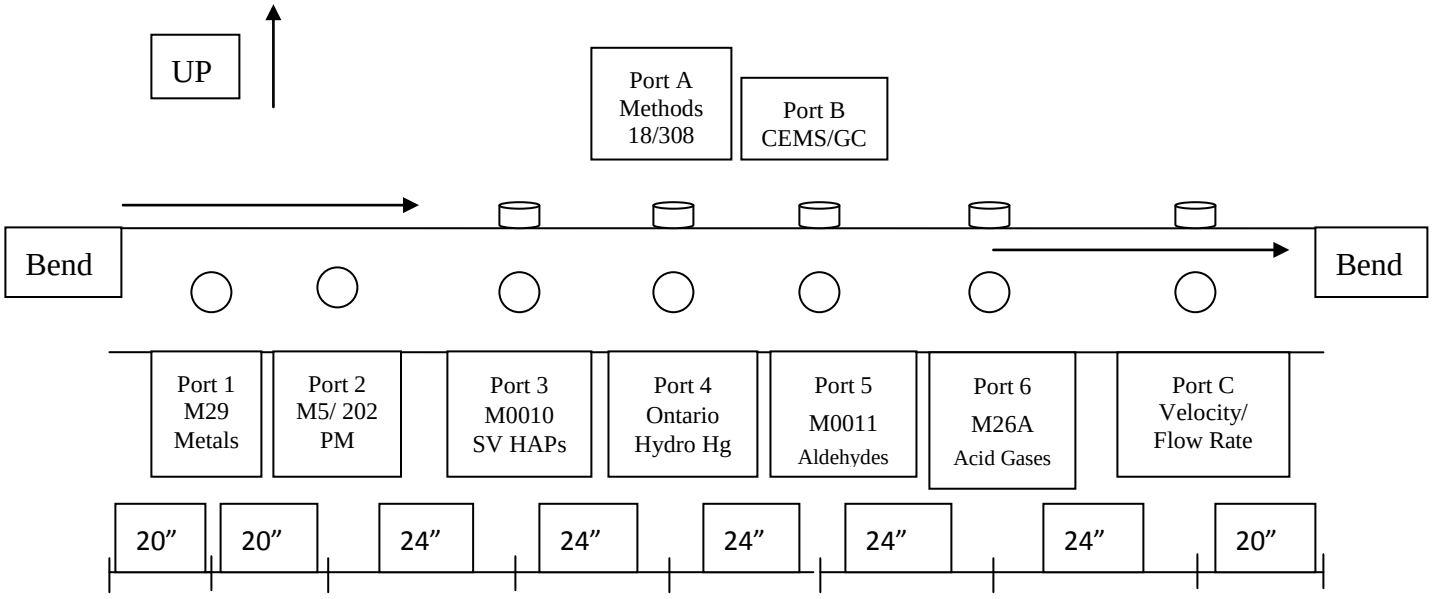
Port – 3”I.D. Flanged with gate valve (Installed packing glands to valves to seal sampling probes).

At least 16”(2 pipe diameters) upstream of each port to the nearest port or flow disturbance.

At least 4” (0.5 pipe diameters) downstream of each port to the nearest port or flow disturbance.

Ports 1 through 6 are isokinetic sampling locations.

Ports A though C are non-isokinetic sampling locations.



4.1 ICR Test

Three test runs for each parameter were performed to generate the emissions data. Three test runs were successfully completed on July 14, 16, and 17, 2011, respectively. ExxonMobil personnel continuously monitored and recorded process data during the testing. The process data is presented in the Appendix K of the report as confidential business information (CBI).

4.2 Sampling and Analysis

The following describes the sampling and analysis procedures that were used during the DCU D603 Vent test. Enthalpy Analytical, Inc. located in Durham, North Carolina performed the analyses for the speciated volatile HAPs, aldehydes, and acid gases. First Analytical, Inc. located in Raleigh, North Carolina performed the analyses for the metals and mercury. Test America located in Knoxville, Tennessee performed the analyses for the semi-volatile HAPs. TRC performed all other sampling and analyses.

As mentioned in Section 3.0, Table 4-1 provides a statistical presentation of moisture content for all sampling trains and the justification for using the OH data in the mass rates calculations for all parameters.

4.2.1 *Speciated Volatile HAPs and Methane/Ethane*

Volatile organic compounds from Table 1.3 of the ICR were collected and analyzed following the procedures of EPA Method 18 from 40 CFR Part 60, Appendix A. Figure 4-2 presents a schematic drawing of the volatiles sampling train. Due to the types of compounds included in the ICR table, samples were collected on three separate trains:

1) Train 1: EPA Method 18 Tedlar Bag
2) Train 2: EPA Method 18 XAD Adsorbent Tubes
3) Train 3: EPA Method 308

These trains were modified by the inclusion of a water-cooled condenser prior to the first impinger. Three test runs were performed at least 20 minutes duration with at least 1 liter of sample, one per normal vent cycle.

The tube sampling analysis included a separate analysis of each of the five fractions generated from each test run. These analyses often resulted in runs where one or more

fractions were below the detection or reporting limit for the analysis. The reported results from the lab for each run consisted of a single value. For the cases where any of the fractions had a result above the detection limit (aka a "hit"), the reported result is the sum of all the hits and the non-detects are ignored. For the cases where all the fraction were below the detection limits, the results were reported as less than the largest detection limit.

The Methane/Ethane results appear inflated since the calculated pounds/cycle is larger than what would have been calculated using the equation PV=NRT and results being larger than the total hydrocarbon results.

The standard QA/QC for the tube sampling method included matrix-spiked tubes to check for recovery of certain analytes. For many of these spikes the results were not useable due to the high concentration levels of organic compounds in the samples. These high compound levels overwhelmed spikes and made the spike detection indistinguishable. In other cases, the spike was not detectable due to the high background/baseline caused by the number of organic species collected on the tubes. From these results it may be concluded that the spike levels need to be much higher to be of any benefit in evaluating recoveries.

4.2.2 *Speciated Semi-volatile Organic HAPs*

The Method 0010 Modified Method 5 (MM5) sampling protocol from SW-846, "Test Methods for Evaluating Solid Waste," Third Edition; Volume One was used during the testing to collect samples of the SRU 28 stack gas for quantification of semi-volatile organic HAPs (analysis by SW-846 Method 8270C). The sampling train consisted of a flexible, heated probe, heated filter, Teflon transfer line, XAD-2 sorbent module, and pumping and metering unit. Figure 4-3 presents a schematic drawing of the Method 0010 (MM5) sampling train. Three test runs were performed at least 20 minutes duration with at least 0.5 cubic feet of sample, one per normal vent cycle.

Figure 4-2. Method 18 and 308 Sampling Train Manifold Schematic

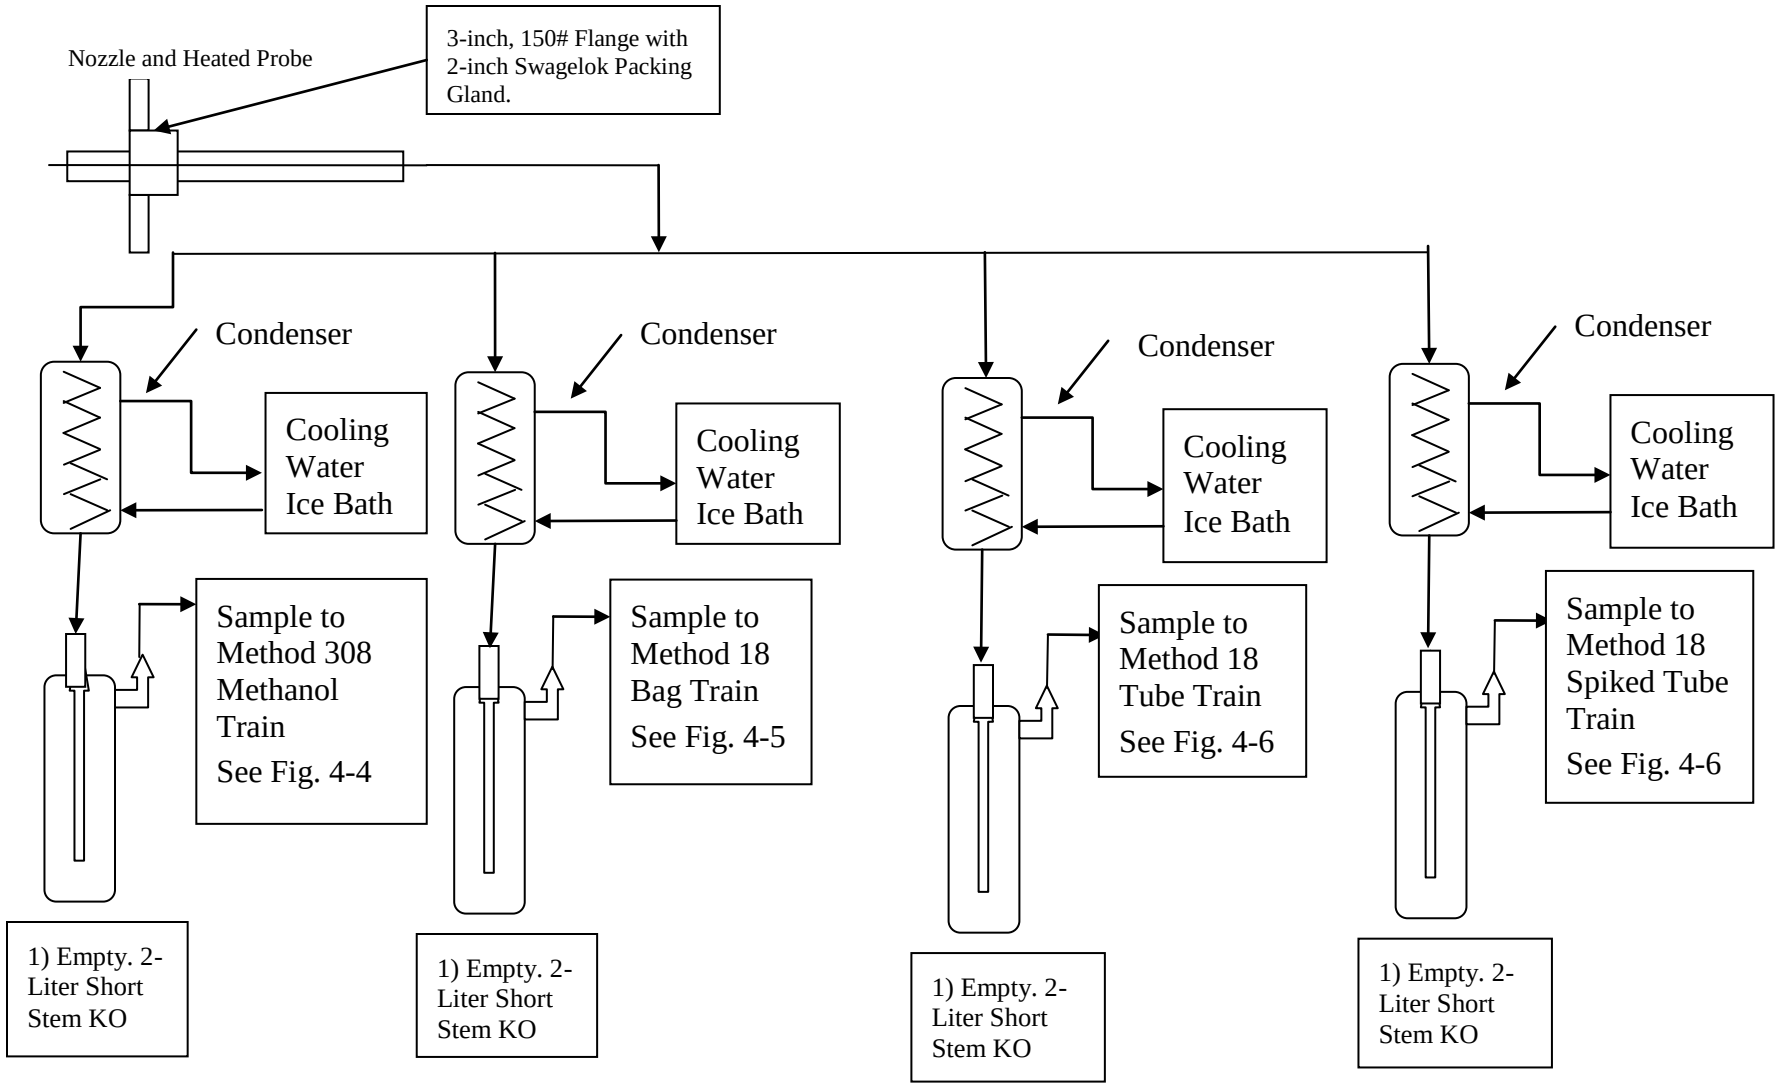


Figure 4-3. Method 308 Sampling Train Schematic

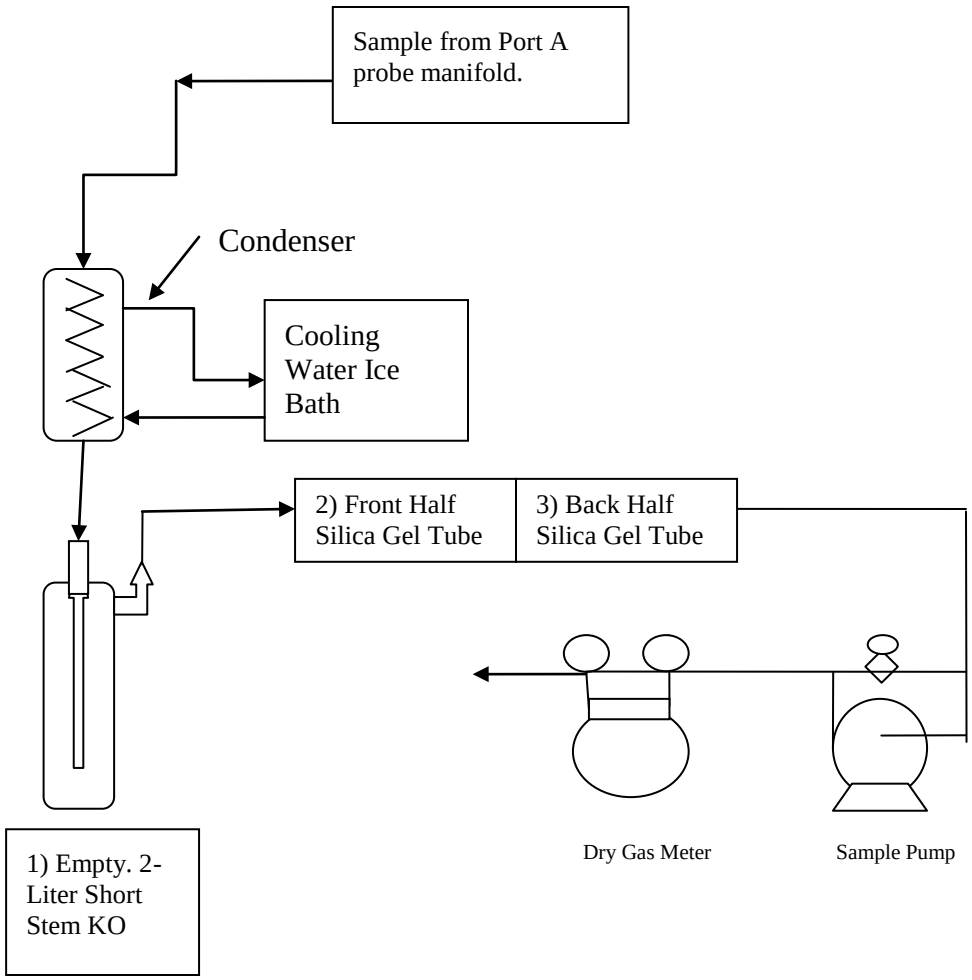

Method 308 Methanol

Sample Fractions:

1) Condensate
2) Silica gel tube front half
3) Silica gel tube back half

Figure 4-4. Method 18 Tube Sampling Train Schematic

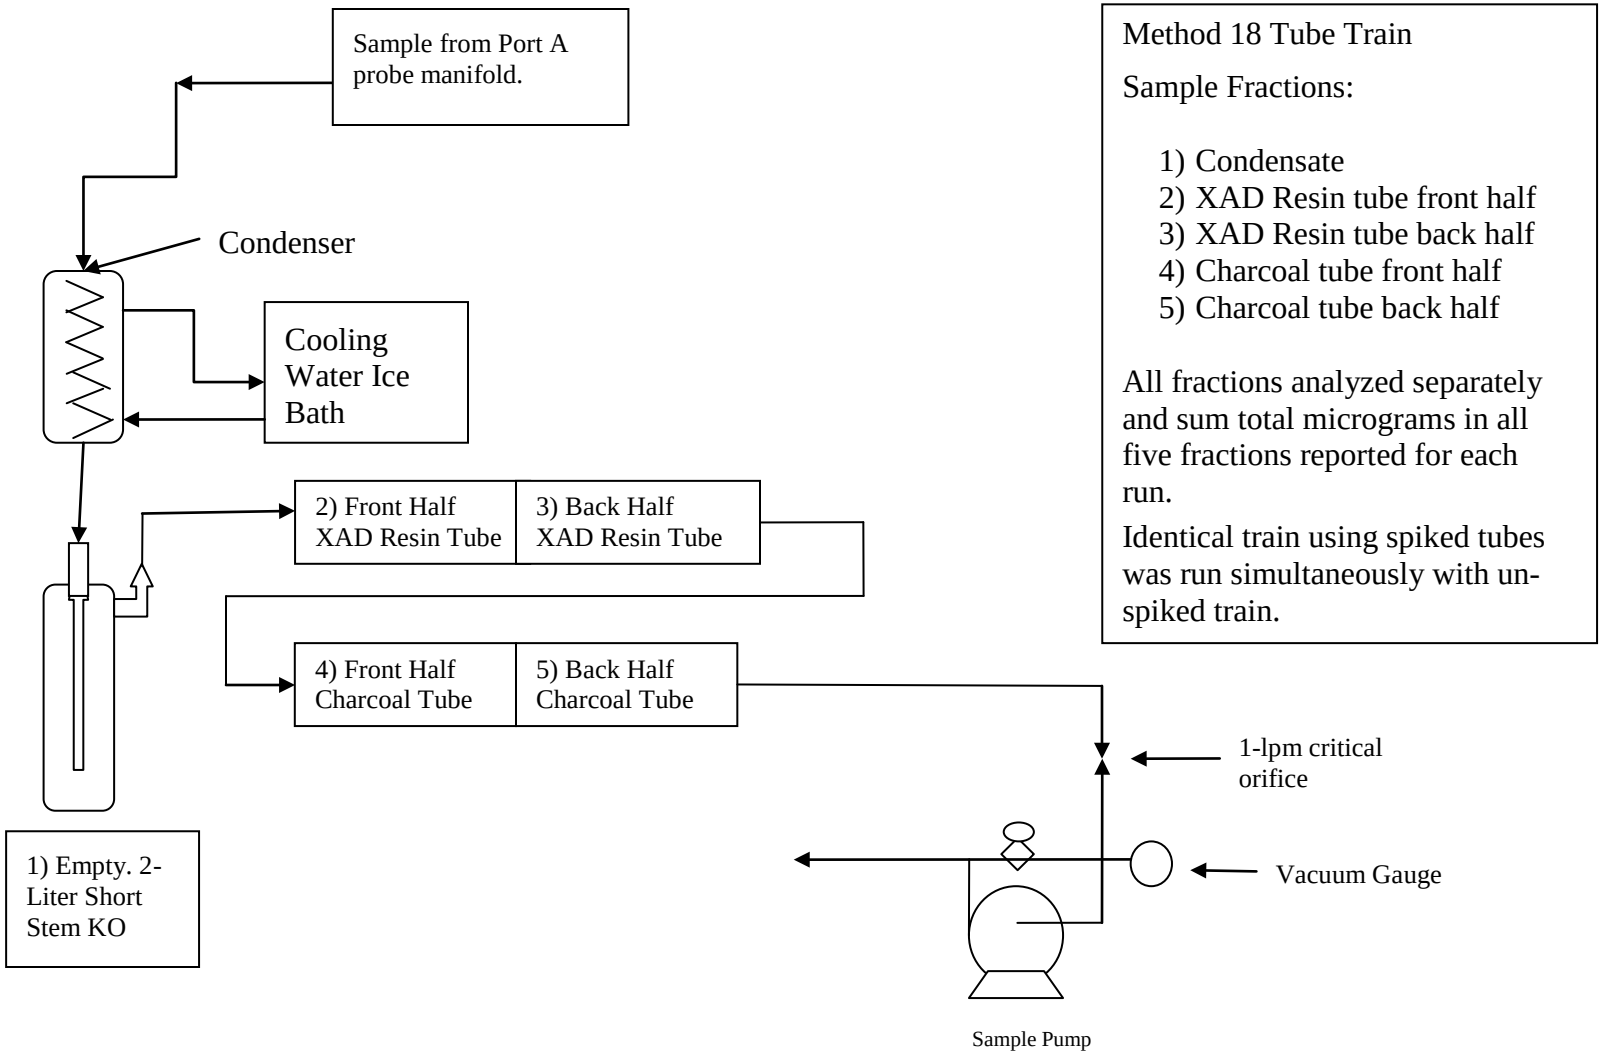

Figure 4-5. Method 18 Bag Sampling Train Schematic

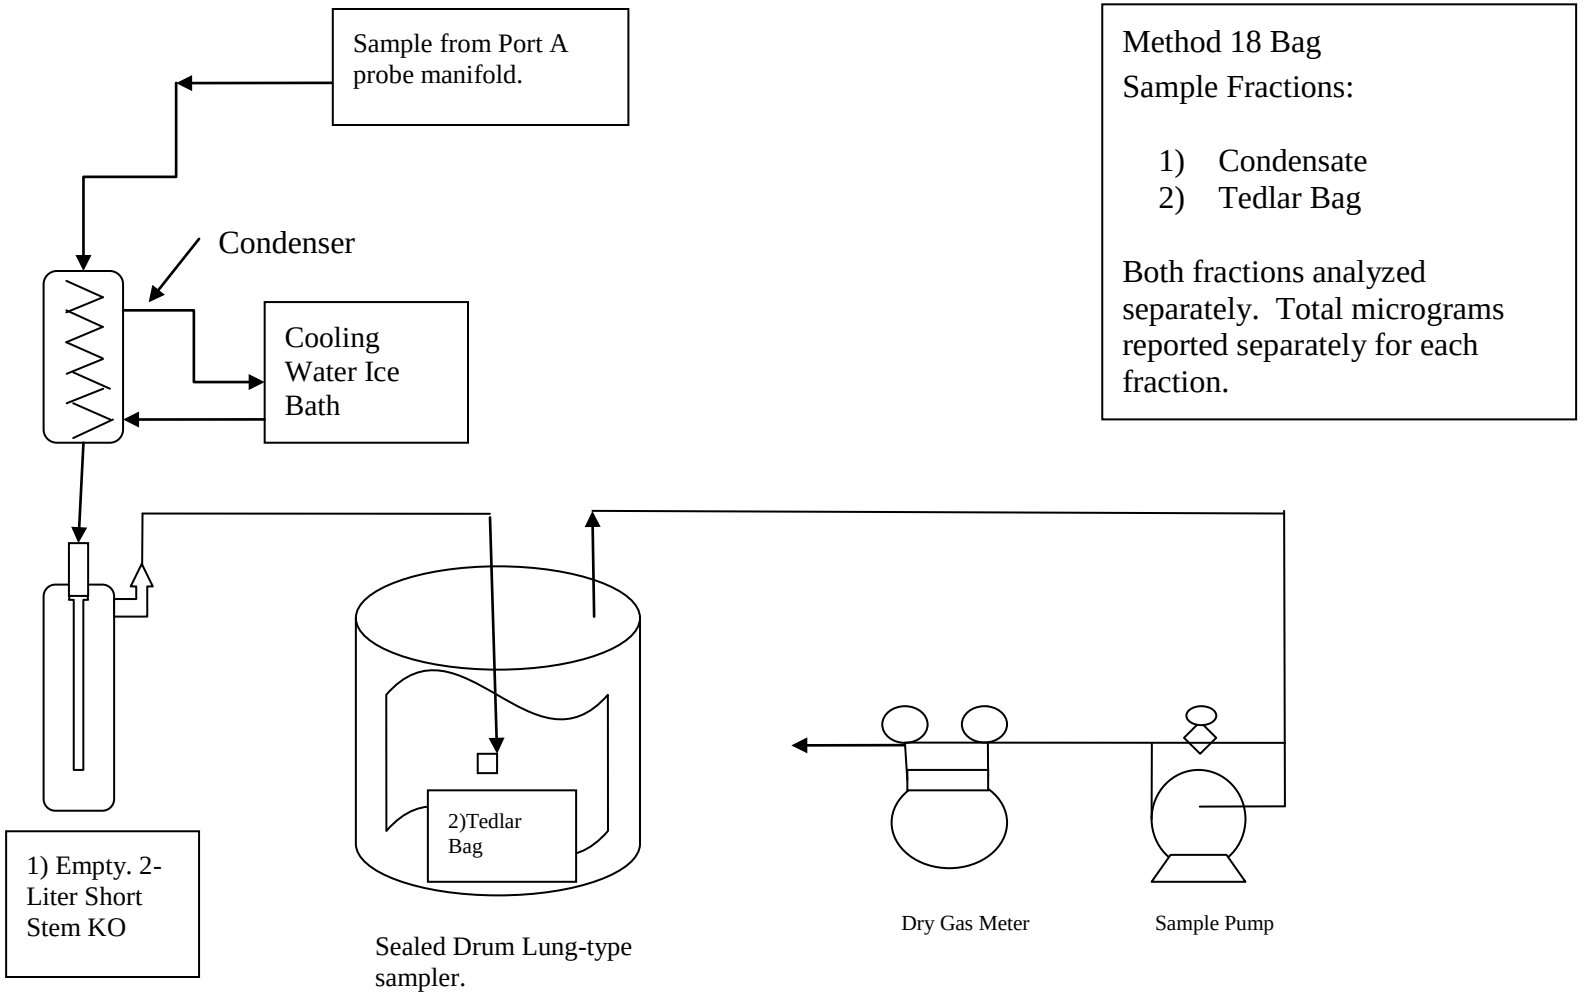

Figure 4-6. Method 0010 (MM5) Semi-Volatiles Sampling Train Schematic

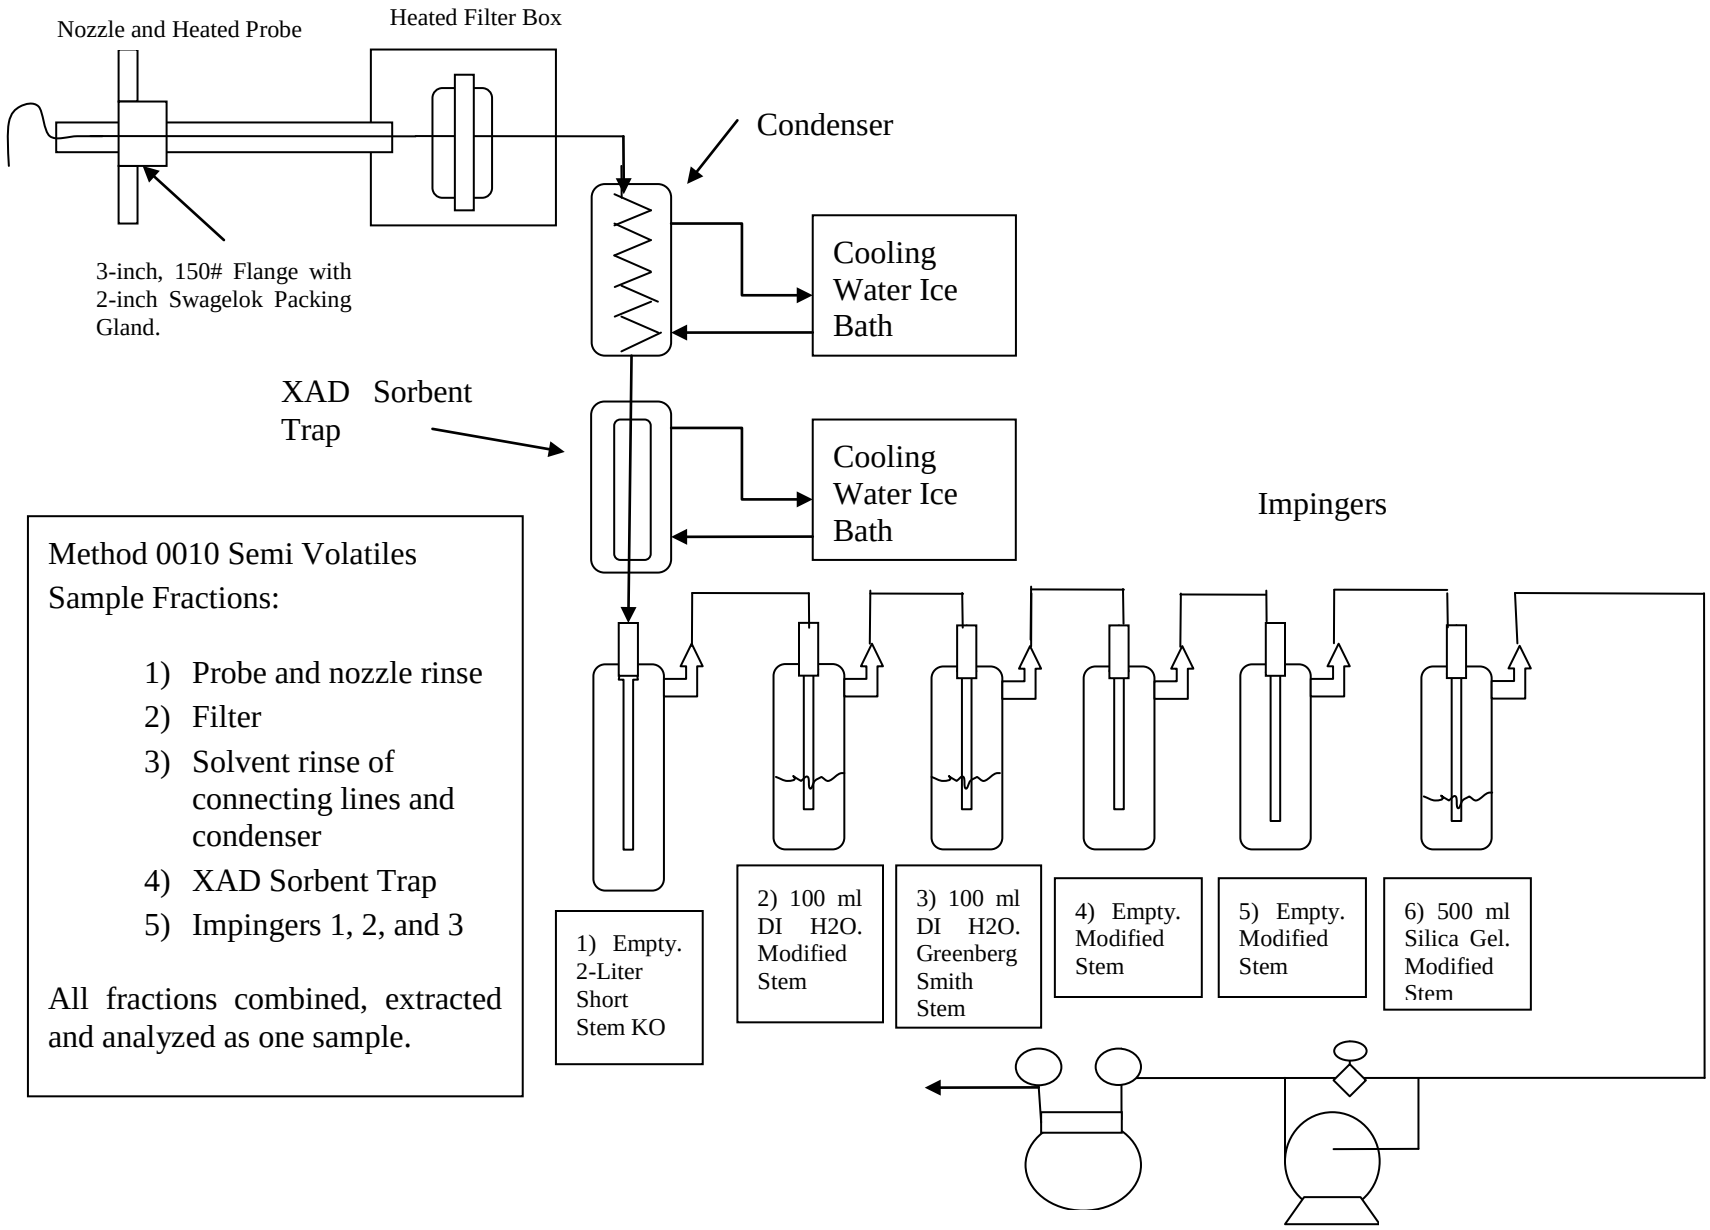


The standard QA/QC for the Method 0010 XAD sampling method included surrogate spikes to check for recovery of certain analytes. For many of these spikes the results were not useable due to the high concentration levels of actual target compounds in the samples. These high levels overwhelmed the spikes due to the native levels being many times higher than the spike levels making spike detection indistinguishable. In other cases, the spike was not detectable due to the high background/baseline caused by the number of organic species collected on the tubes. From these results it may be concluded that the spike levels need to be much higher to be of any benefit in evaluating recovery.

Method 0010 is designed to collect its sample at a rate within ±10% of 100% isokinetic conditions. These isokinetic sampling limits were not met. Since the sample gas was essentially steam, controlling the collection of the sample within these limits was not possible. The effect of non-isokinetic sampling is unknown.

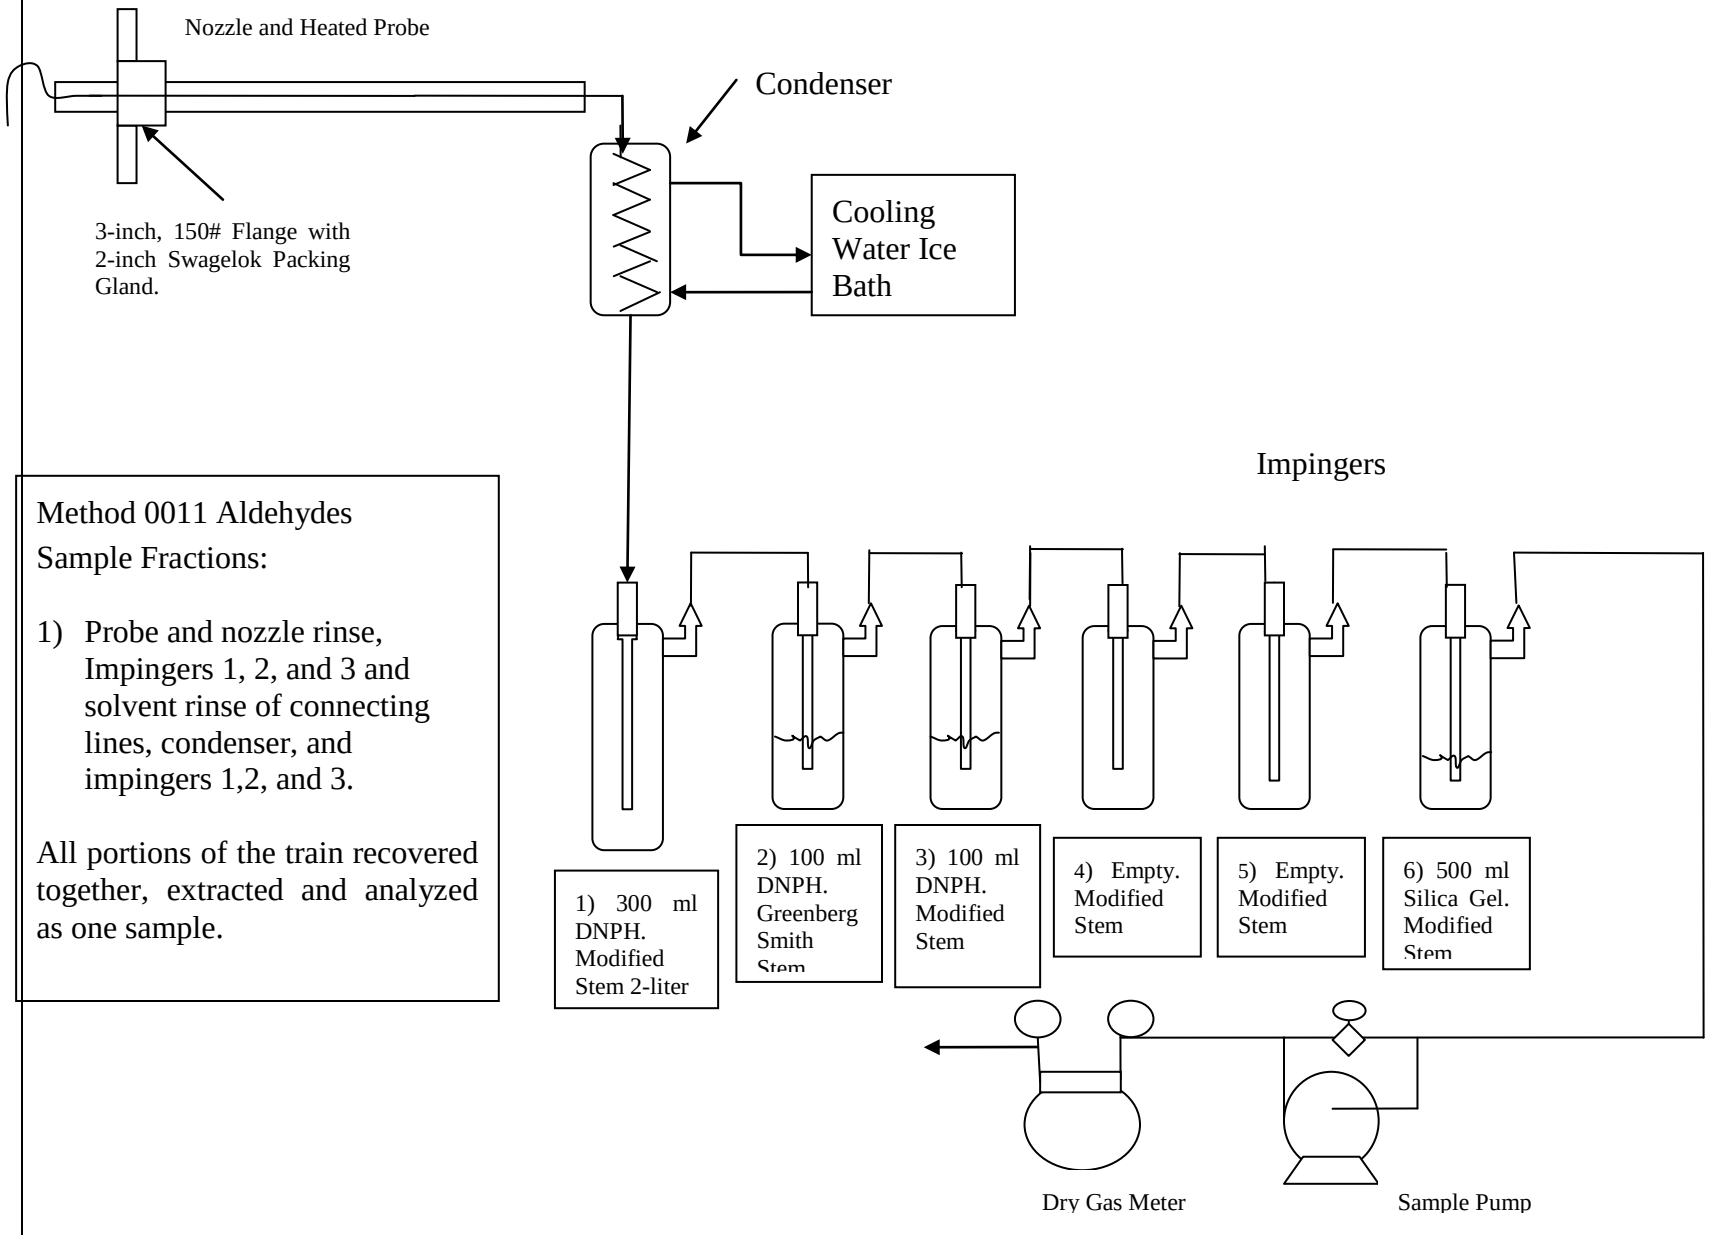
The results for all of the samples were reported with elevated reporting limits due to the complex sample matrix.

4.2.3 *Aldehydes (Acetaldehyde, Formaldehyde, Propionaldehyde)*

The DCU D603 Vent samples for determination of aldehydes were collected using SW-846 Method 0011 from SW-846, "Test Methods for Evaluating Solid Waste," Third Edition; Volume One. The Method 0011 impingers were filled with a carbonyl-specific derivatizing agent: 2,4-dinitro-phenylhydrazine (2,4-DNPH). 2,4-DNPH reacted with aldehydes to form a nonvolatile derivative which was measured by high performance liquid chromatography (HPLC, SW-846 Method 8315A). Figure 4-4 presents a schematic drawing of the Method 0011 sampling train. This train was modified by the inclusion of a water-cooled condenser prior to the first impinger. Three test runs were performed at least 20 minutes in duration with at least 0.5 cubic feet of sample, one per normal vent cycle.

Like all of the other sampling trains, the aldehydes train collected upwards of three liters of water during the run. The amount of water exceeds the amount of sample specified for a standard 0011 analysis (one liter). The Run 2 and 3 samples were therefore split in half to allow the standard sample preparation methodology to be used. Although this constituted a deviation from the method, it can be assumed that the samples were well mixed, single-phase liquids and separating an aliquot for analysis would not impact the quality of the data.

Figure 4-7. Method 0011 Aldehydes Sampling Train Schematic



Method 0011 is designed to collect its sample at a rate within ±10% of 100% isokinetic conditions. These isokinetic sampling limits were not met. Since the sample gas was essentially steam, controlling the collection of the sample within these limits was not possible. The effect of non-isokinetic sampling is unknown. The effect of non-isokinetic sampling is unknown.

4.2.4 *Dilution Probe*

For the measurement of O2, CO2, THC, NOx, SO2, CO, and sulfur compounds, an EPM brand dilution probe system, equipped with critical orifice technology to precisely meter the sample gas with nitrogen gas dilution, was used to mitigate the detrimental effects of the high moisture content of the vent gas on the analyzers to accurately measure each parameter. The probe was heated to 300 degrees F and configured to deliver a dilution ratio of approximately 50:1. The trailer housing the continuous monitors was located approximately 300 feet away from the sampling location. The diluted sample was transferred to the analyzers via unheated, ¼-inch Teflon line at a flow rate of approximately 5 liters/minute.

Prior to the test, the dilution system was calibrated using the manufacturer's specifications and EPA guidelines using dilution probes with CEMS. A dilution ratio of 51:1 was established. The dilution calibration is included in Appendix I. In addition to the calibrations, a shakedown run was performed on July 13, 2011 to trial the system. One vent cycle lasting approximately 50 minutes was measured with the CEMS on line. No obvious problems were noted and the CEMS QA/QC checks, pre- and post-, were within the acceptance criteria for each of the parameter methods.

Run 1 was conducted on July 14, 2011 and the vent cycle duration was 20 minutes. The CEMS QA/QC checks, both pre- and post-, were within the acceptance criteria for each of the parameter methods. The CEMS calibrations and bias checks are also included in Appendix I. No obvious problems were noted during Run 1 and the CEMS operation appeared to be optimal. Runs 2 and 3, conducted on July 16 and 17, 2011, respectively, followed. The CEMS QA/QC checks, both pre- and post-, were within the acceptance criteria for each of the parameter methods. No obvious problems were noted during the runs and the CEMS operation appeared to be optimal.

In the development and review of report results, the CEMS data was scrutinized to the extent of reviewing the minute by minute values for each parameter. It was noted that the CEMS parameters spiked at the beginning of each of the runs (with the exception of O_2 that was

at a level approximately 2-3%, adjusted for dilution) then dropped to nearly baseline levels for the first half of each run (with the exception of O_2 that was at a level approximately 20%, adjusted for dilution). Approximately at the halfway point of each run, the parameter values gradually trended up (O_2 trended down to approximately 2-3%, adjusted for dilution) and became consistent through the remainder of each run. This pattern was not obvious to the field personnel and the operation of the CEMS was acceptable based on the system compliance with the QA/QC criteria required in the methods.

Based on the system's compliance with each method's QA/QC acceptance criteria, the data appear valid for each run.

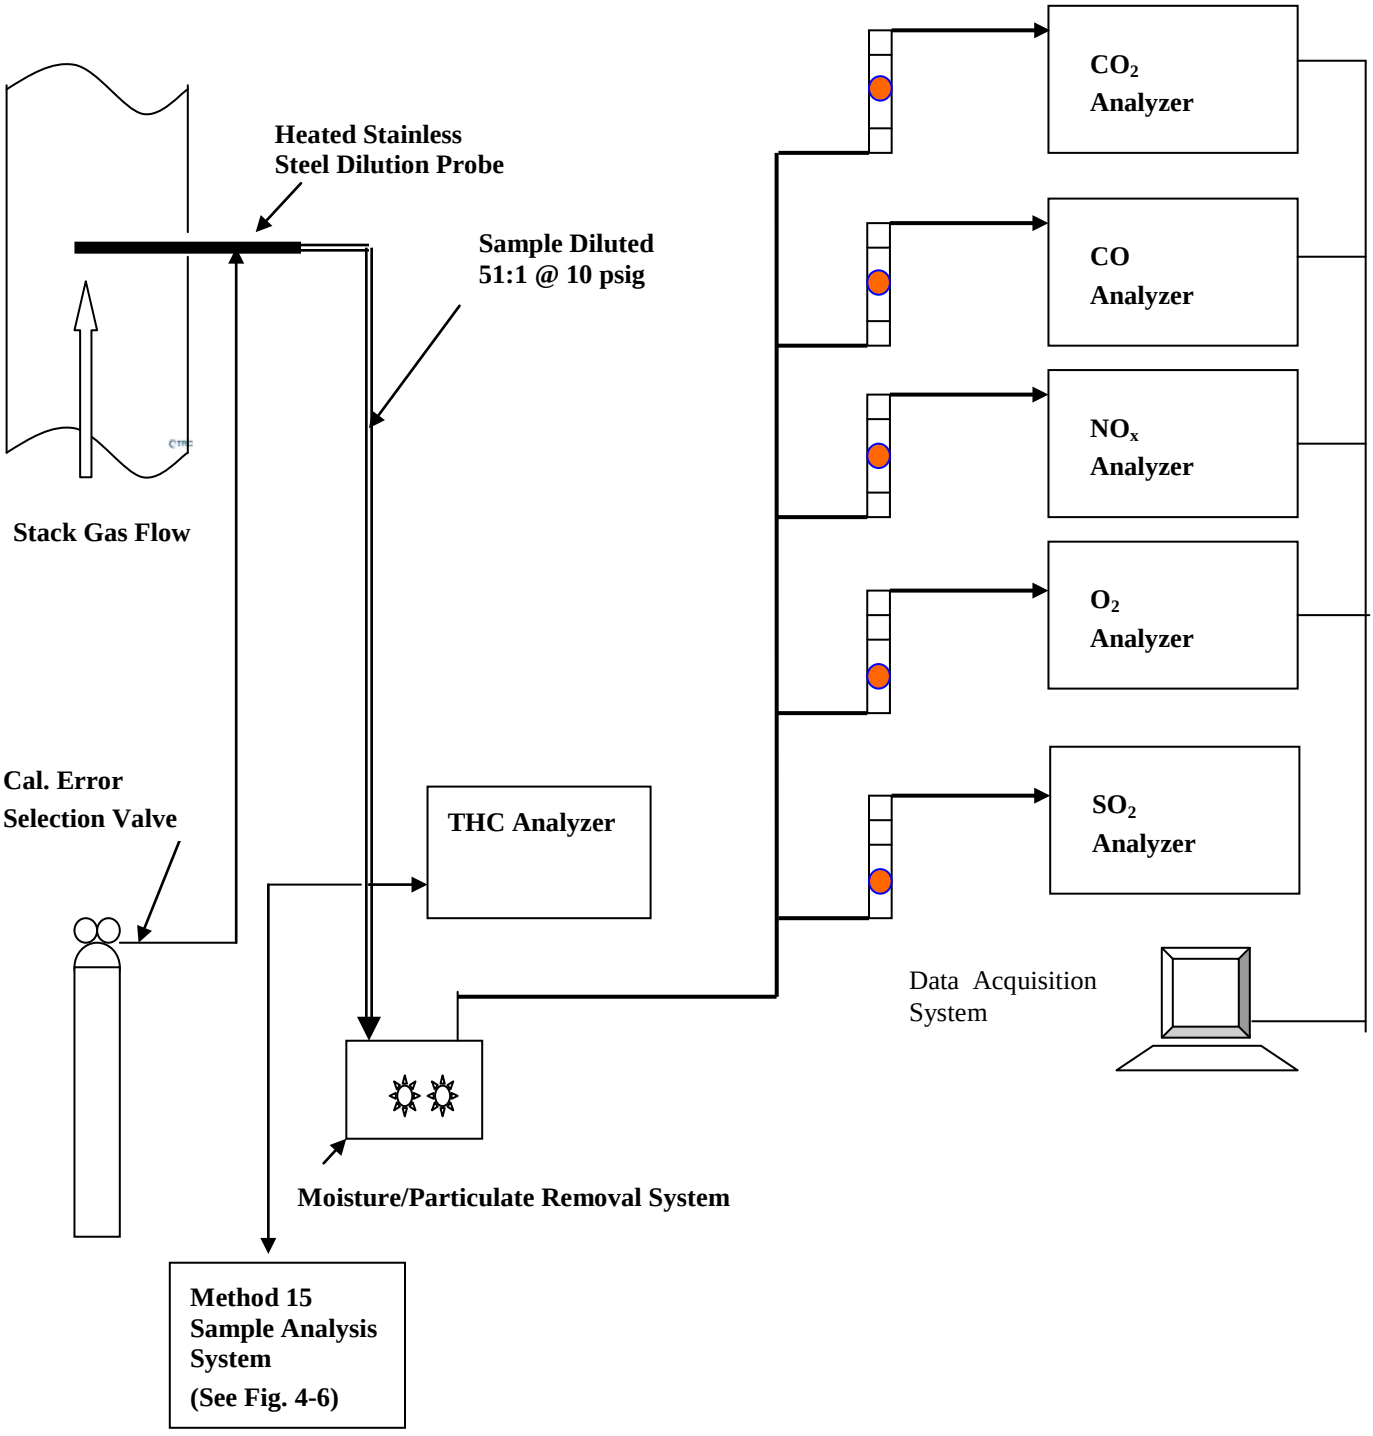
4.2.5 *Total Hydrocarbons (THC)*

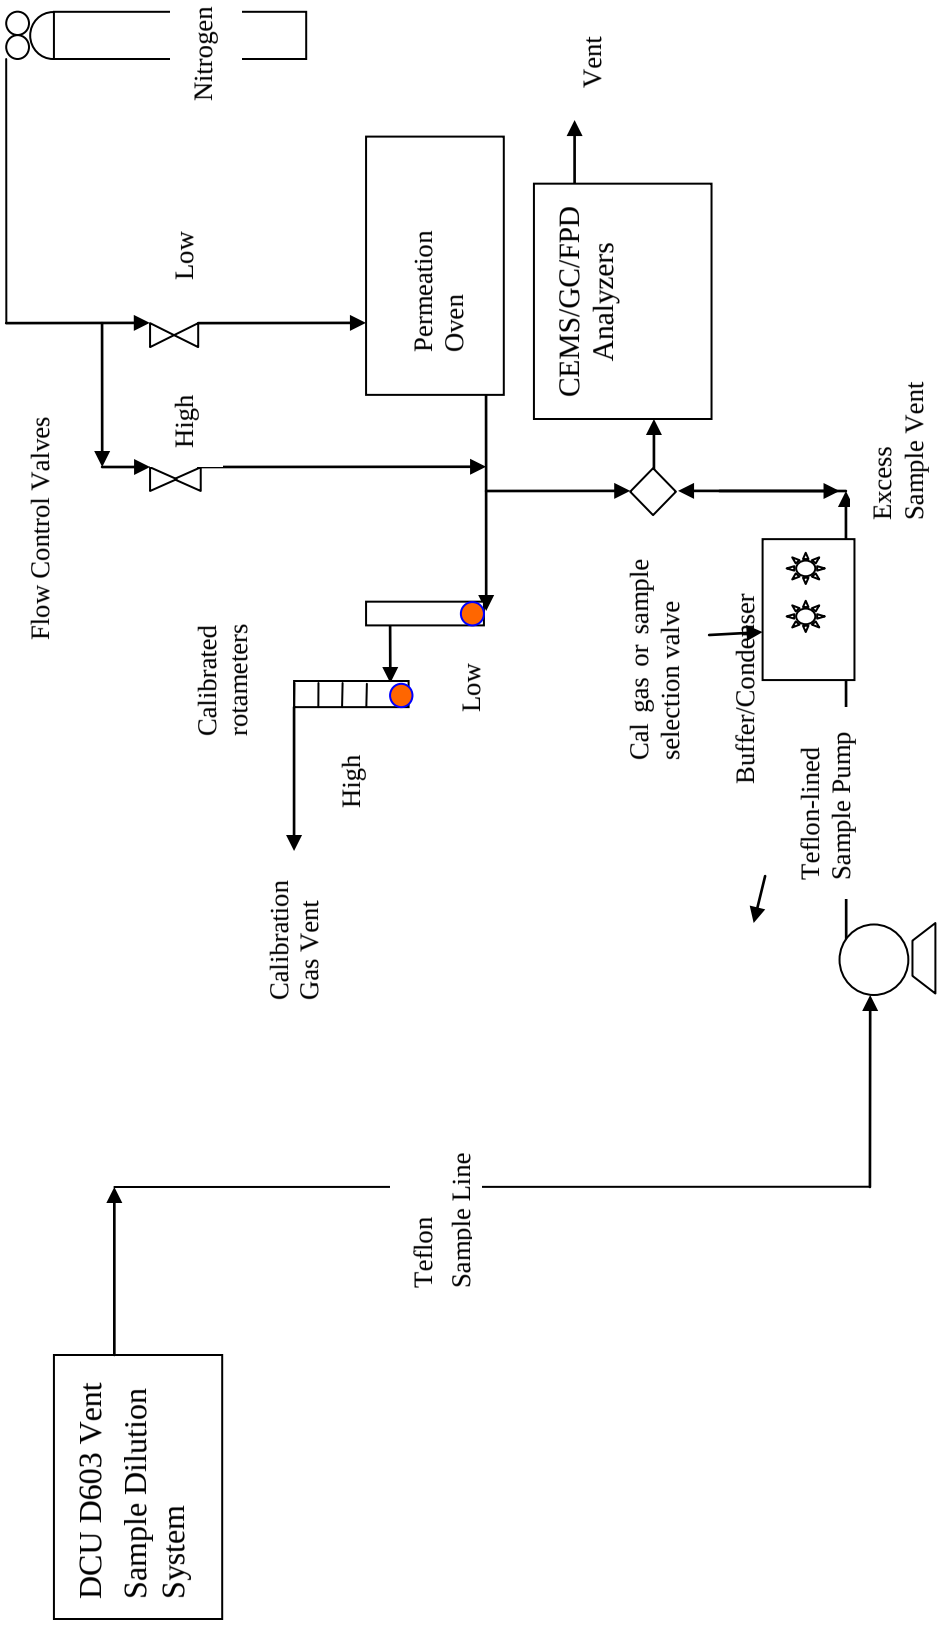
During each test run sampling was conducted for THC following EPA Method 25A from 40 CFR Part 60 Appendix A. A total hydrocarbon analyzer measured the stack gas continuously in propane equivalents. The analyzer was calibrated with propane standards following the requirements in the method. A 51:1 dilution system was used to mitigate the high moisture content. Figure 4-8 presents a schematic drawing of the Method 25A sampling system. Three test runs were performed that were at least 20 minutes in duration, one per normal vent cycle. Each sample was collected non-isokinetically at a single point in the centroid of the vent duct.

4.2.6 *Carbon Monoxide (CO)*

During each test run sampling was conducted for CO following EPA Method 10 from 40 CFR Part 60 Appendix A. A CO analyzer measured the vent gas continuously. The analyzer was calibrated with EPA protocol CO gas standards following the requirements in the method. A 51:1 dilution system was used to mitigate the high moisture content. Figure 4-8

Figure 4-8. CEMS Sample System Diagram





EM-BTRF-000054

Figure 4-9. TRS Method 15 Sample System Diagram

presents a schematic drawing of the Method 10 sampling system. Three test runs were performed that were at least 20 minutes in duration, one per normal vent cycle. Each sample was collected non-isokinetically at a single point in the centroid of the vent duct.

4.2.7 *HCl/Cl_2/HF/HCN*

During each test run, a combination sampling train from 40 CFR Part 60 Appendix A Method 26A and CTM-033, was utilized for the collection of hydrogen chloride (HCl), chlorine (Cl_2), hydrogen fluoride (HF), and hydrogen cyanide present in the DCU vent gas. The impinger catch from the first and second impingers, the sulfuric acid impingers, was analyzed for HCl, HF, and HCN. The impinger catch from the third and fourth impingers, the sodium hydroxide impingers, was analyzed for Cl_2 and HCN. Figure 4-10 presents a schematic drawing of the Method 26A sampling train. This train was modified by the inclusion of a water-cooled condenser prior to the first impinger. Three test runs were performed, one per normal vent cycle.

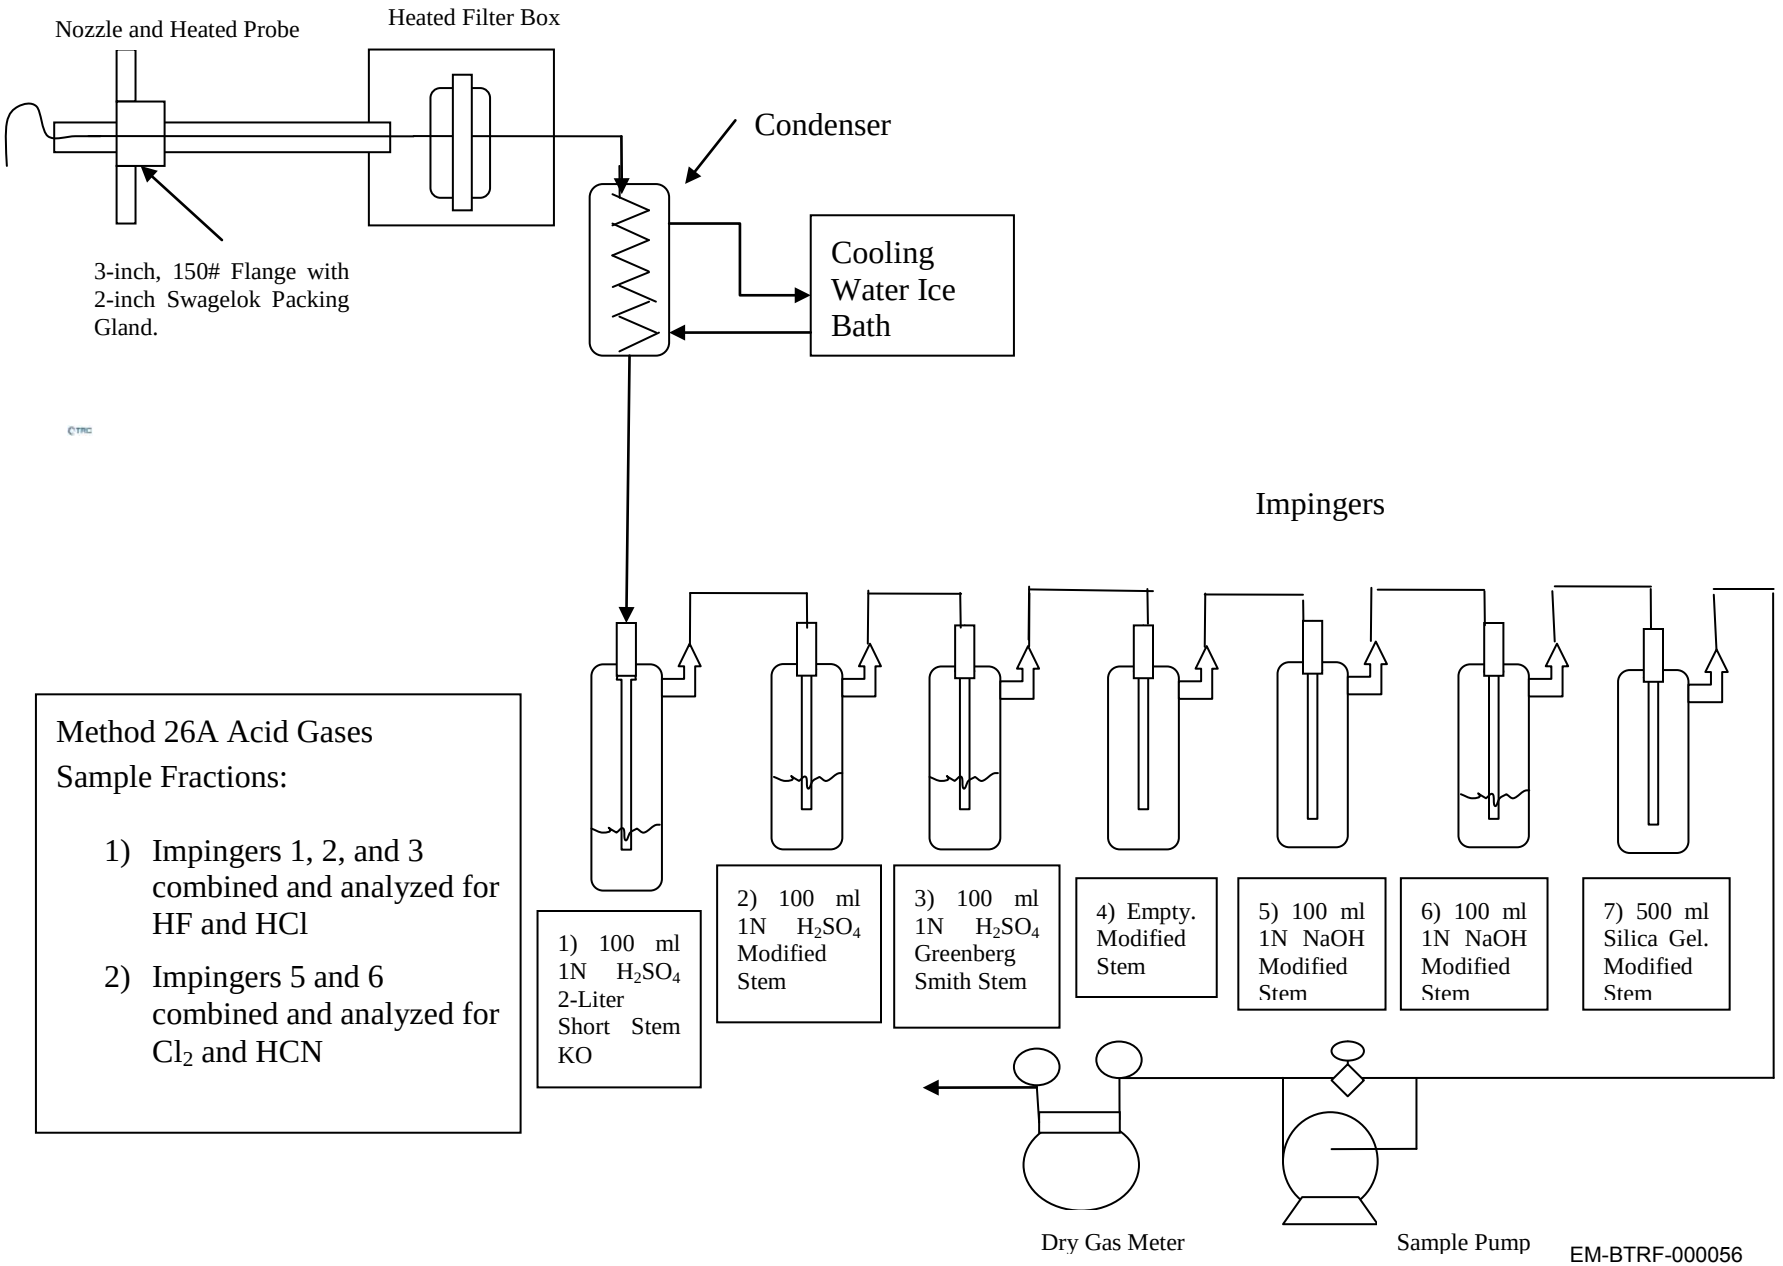
The standard CTM-033 HCN train does not include any impingers upstream of the NaOH impingers used to collect HCN. The HCN collection depends on maintaining a high pH (> 12) in the impingers. HCN was not expected to be retained in the highly acidic aqueous solution in the first impingers (1N H2SO4). Therefore the modified version of CTM-033 used for this sampling, where the NaOH impingers were after the acidic impingers, was considered to be an accurate way to collect HCN.

Method 26A is designed to collect its sample at a rate within ±10% of 100% isokinetic conditions. These isokinetic sampling limits were not met. Since the sample gas was essentially steam, controlling the collection of the sample within these limits was not possible.

4.2.8 *H_2S/COS/CS_2/TRS*

During each test run, sampling was conducted for H_2S/COS/CS_2/TRS following a combination of EPA Methods 15 and 16B from 40 CFR Part 60 Appendix A. A gas chromatograph (GC) equipped with a flame photometric detector (FPD) measured the stack gas semi-continuously every 5 minutes. The GC was calibrated with H_2S/COS/CS_2 gas standards following the requirements in the method. TRS was determined as the total

Figure 4-10. Method 26A Acid Gas Sampling Train Schematic



amount of the 3 reduced sulfur compounds. A 51:1 dilution system was used to mitigate the high moisture content. Figure 4-9 presents a schematic drawing of the Method 15 sampling system. Three test runs were performed that were at least 20 minutes in duration, one per normal vent cycle. Each sample was collected non-isokinetically at a single point in the centroid of the vent duct.

4.2.9 *Mercury (Hg)*

During each test run, the Ontario Hydro sampling train from ASTM Method D6784-02 (2008) was utilized for the collection of oxidized and elemental mercury forms present in the DCU D603 vent gas. The DCU vent gas was withdrawn through a probe/filter system, maintained at 300°F followed by a series of impingers in an ice bath. Particle-bound mercury was collected in the front half of the sampling train. Oxidized mercury was collected in impingers containing a chilled aqueous potassium chloride solution. Elemental mercury was collected in subsequent impingers (one impinger containing a chilled aqueous acidic solution of hydrogen peroxide and three impingers containing chilled aqueous acidic solutions of potassium permanganate). Samples were recovered, digested, and then analyzed for mercury using cold-vapor atomic absorption (CVAAS). Figure 4-11 presents a schematic drawing of the Ontario Hydro sampling train. This train was modified by the inclusion of a water-cooled condenser prior to the first impinger. Three test runs were performed, one per normal vent cycle.

Sample fraction number three (KCl) of all three trains was noted to have lost its purple color after sample collection. This loss of color was probably due to the large dilution of the KCl solution by the condensed water in the sample (300 mls was diluted to approximately 1900 mls). The spike recovery from this sample fraction did not exhibit acceptable recovery (83% recovery) due to a matrix interference. The results are still considered to be valid.

Also, the Fraction 5 sample ($4\%KMNO_4/10\%H_2SO_4$) from Run 2 did not retains its purple color after sampling. This was probably due to some carryover of the nitric acid/hydrogen peroxide reagent from the impingers immediately upstream of the Fraction 5 impingers. The matrix spike for all of the Fraction 5 samples exhibited acceptable recoveries so this loss of color did not affect the data quality.

The Ontario HydroMethod is designed to collect its sample at a rate within ±10% of 100% isokinetic conditions. These isokinetic sampling limits were not met. Since the sample gas was essentially steam, controlling the collection of the sample within these limits was not possible.

Figure 4-11. Ontario Hydro Method Mercury Sampling Train Schematic

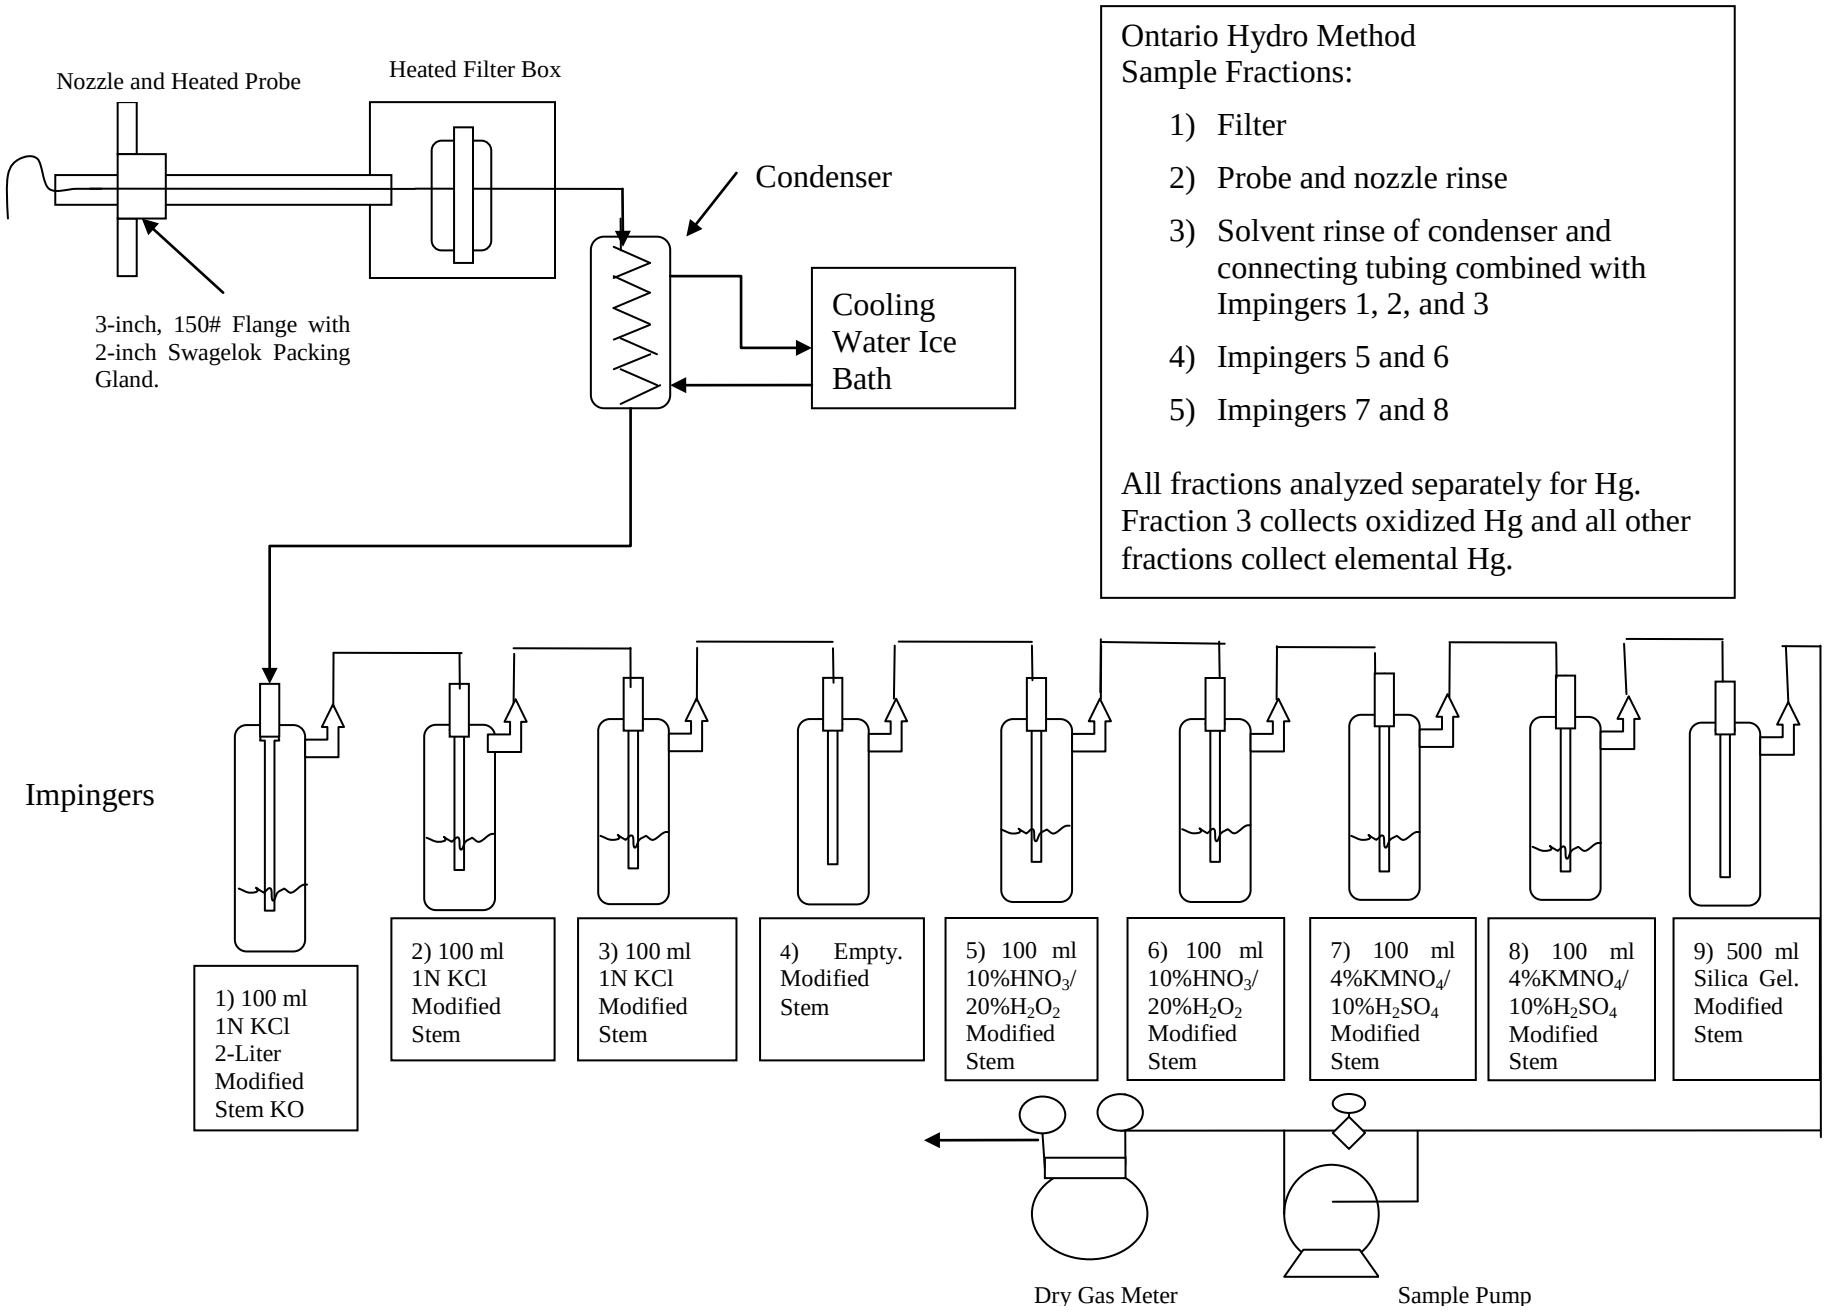


Figure 4-12. Method 29 Metals Sampling Train Schematic

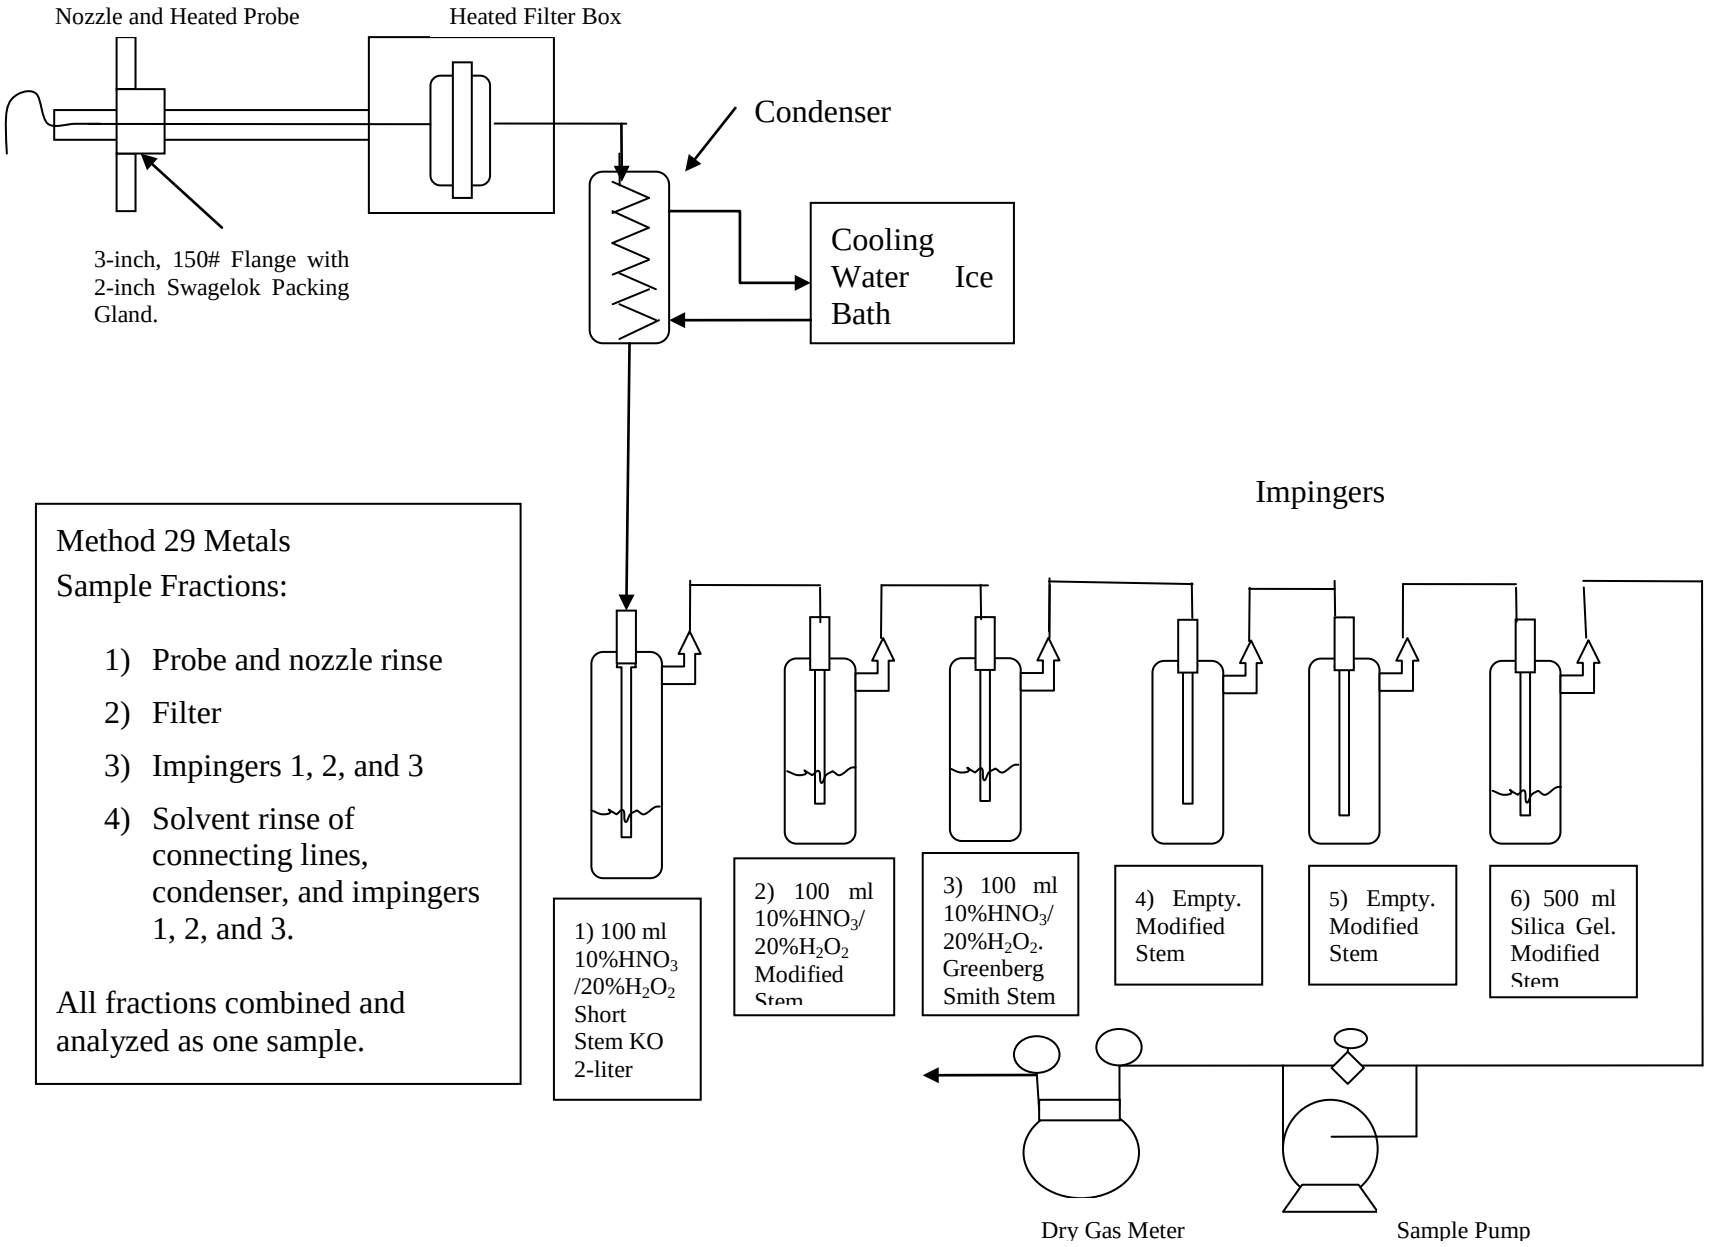


4.2.10 *Metals (except Hg)*

During each test run, the EPA Method 29 sampling train from 40 CFR Part 60 Appendix A was utilized for the collection of metals (except Hg) present in the DCU D603 vent gas. The Method 29 sampling train consisted of a nozzle/probe assembly, heated filter, three impingers with HNO_3/H_2O_2 solution, one empty impinger, and an impinger with silica gel dessicant. The front half of the sampling train (through to the filter) was rinsed with 0.1 N HNO_3 to recover the metals. The back half of the sampling train (through the HNO_3/H_2O_2 impingers) was recovered and analyzed for the metals. Trace inductively coupled argon plasma emission mass spectroscopy (TICAPEMS) was used for the metals analyses. Figure 4-12 presents a schematic drawing of the Method 29 sampling train. This train was modified by the inclusion of a water-cooled condenser prior to the first impinger. Three test runs were performed, one per normal vent cycle.

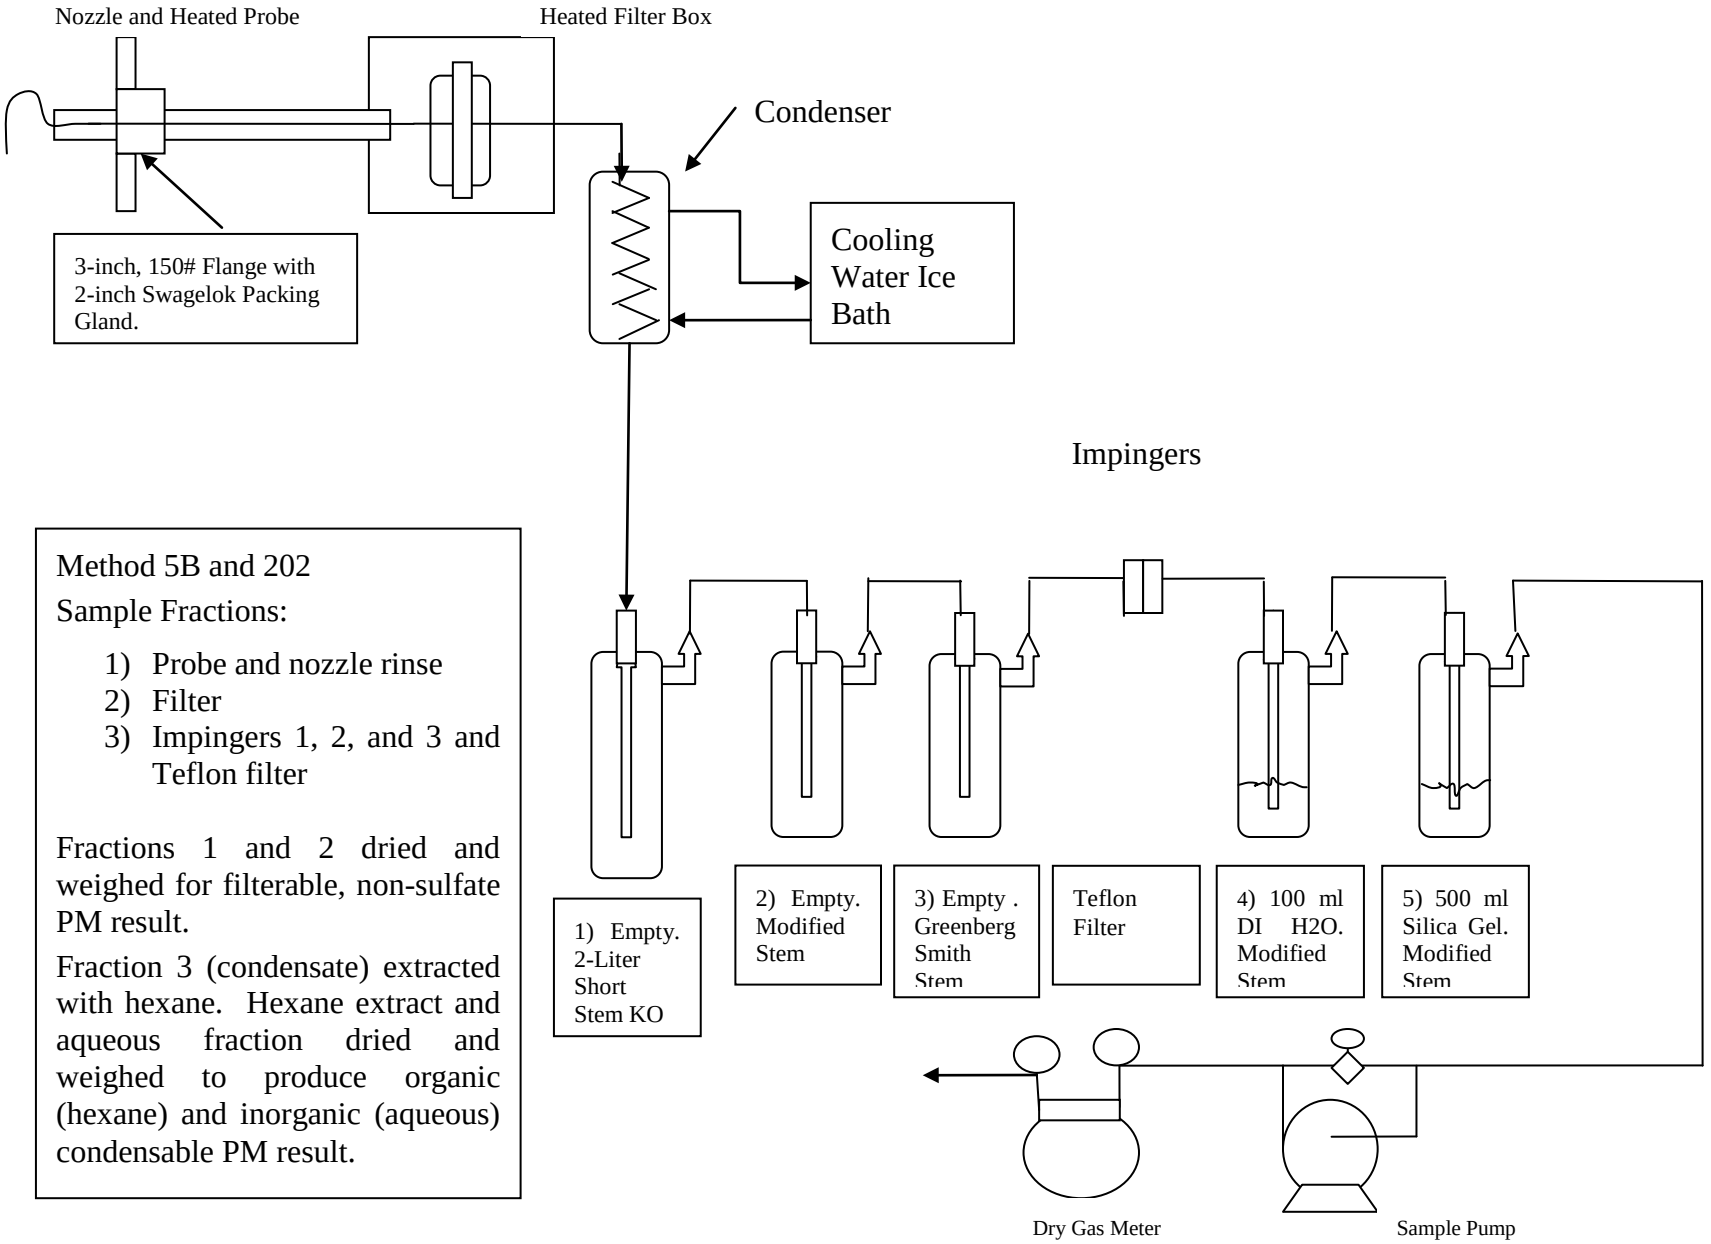
Method 29 is designed to collect its sample at a rate within ±10% of 100% isokinetic conditions. These isokinetic sampling limits were not met. Since the sample gas was essentially steam, controlling the collection of the sample within these limits was not possible.

4.2.11 *Particulate Matter (PM) / Condensable PM*

EPA Methods 5B/202 from 40 CFR Part 60 Appendix A were used for the determination of particulate concentration and emissions from the DCU D603 vent gas. This method is applicable for the determination of particulate matter in stack gases containing sulfur compounds. The sampling train consisted of a heated (>300^{o}F), pre-weighed glass fiber filter behind a heated probe followed by four impingers to collect moisture. The sampling system incorporated a nozzle, probe, heated oven (housing the filter holder), a condenser assembly, and a calibrated extraction system. The probe/nozzle rinse as well as the filter catch was gravimetrically analyzed for total PM. The first impinger catch was also collected and analyzed for condensable PM. For the purposes of this test program, PM2.5 emissions are reported using the total condensable PM measured concentrations. Figure 4-13 presents a schematic drawing of the Method 5B/202 sampling train. This train was modified by the inclusion of a water-cooled condenser prior to the first impinger. Three test runs were performed, one per normal vent cycle.

Method 5B is designed to collect its sample at a rate within ±10% of 100% isokinetic conditions. These isokinetic sampling limits were not met. Since the sample gas was essentially steam, controlling the collection of the sample within these limits was not possible.

Figure 4-13. Method 5B and 202 PM Sampling Train Schematic



Method 5B and 202

Sample Fractions:

1) Probe and nozzle rinse
2) Filter
3) Impingers 1, 2, and 3 and Teflon filter

Fractions 1 and 2 dried and weighed for filterable, non-sulfate PM result.

Fraction 3 (condensate) extracted with hexane. Hexane extract and aqueous fraction dried and weighed to produce organic (hexane) and inorganic (aqueous) condensable PM result.

4.2.12 *Vent Gas Velocity*

As part of each test run, sampling was conducted for DCU D603 vent gas velocity following EPA Method 2 from 40 CFR Part 60 Appendix A. Vent gas pressure differential was determined using an S-type pitot tube and Capsuhelic® while vent gas temperature was measured using a thermocouple. The vent gas velocity (in feet per second) was correlated with the 8-inch duct area to calculate the volumetric flow rate in actual cubic feet per minute (acfm). Three test runs were performed, one per normal vent cycle.

The vent gas velocity was characterized by a very large burst of flow at the beginning of the vent cycle that quickly tapered off to a much lower rate as the cycle progressed. The sample trains were not capable of sampling this change in velocity as the runs progressed. This impacted the isokinetic sampling inasmuch as there was no ongoing control of the isokinetic sampling rates due to the steam-like nature of the vent gas. This un-adjustable sampling rate may have biased the sampling results if the composition of the gas changed significantly as the velocity changed.

4.2.13 *Nitrogen Oxides (NOx)*

During each test run sampling was conducted for NOx following EPA Method 7E from 40 CFR Part 60 Appendix A. A stainless steel dilution probe was placed in the vent duct at a location near the centroid of the duct. The probe was connected to a Teflon sample line that ran from the duct platform area to the ground. A 51:1 dilution system was used to mitigate the high moisture content. The NOx analyzer measured the vent gas continuously using chemiluminescence analysis principles. The analyzer was calibrated with EPA protocol NOx gas standards following the requirements in the method. NO_2 in the sample is measured by the catalytic reduction of NO_2 to NO using a heated iron oxide catalyst. Passing the sample through the catalyst prior to the detector allows the total NO_x in the sample to be determined. The efficiency of the catalyst is determined on a daily basis as part of the test method as required by the method. Figure 4-8 presents a schematic drawing of the Method 7E sampling system. Three test runs were performed, one per normal vent cycle.

4.2.14 *Sulfur Dioxide (SO2)*

During each test run sampling was conducted for SO2 following EPA Method 6C from 40 CFR Part 60 Appendix A. A stainless steel dilution probe was placed in the vent duct at a location near the centroid of the duct. The probe was connected to a Teflon sample line that ran from the duct platform area to the ground. A 51:1 dilution system was used to mitigate the high

moisture content. The SO_2 analyzer measured the vent gas continuously using infrared analysis principles. The analyzer was calibrated with EPA protocol SO2 gas standards following the requirements in the method. Figure 4-8 presents a schematic drawing of the Method 6C sampling system. Three test runs were performed, one per normal vent cycle.

4.2.15 *Oxygen and Carbon Dioxide for Composition*

During each test run, sampling was conducted for oxygen and carbon dioxide following EPA Method 3A from 40 CFR Part 60 Appendix A. Stack gas oxygen was determined using a paramagnetic analyzer while stack gas carbon dioxide using an infrared analyzer. The analyzers measured the gas continuously during each test run. A stainless steel dilution probe was placed in the vent duct at a location near the centroid of the duct. The probe was connected to a Teflon sample line that ran from the duct platform area to the ground. A 51:1 dilution system was used to mitigate the high moisture content. Figure 4-8 presents a schematic drawing of the Method 3A sampling system. Three test runs were performed, one per normal vent cycle.

4.2.16 *Vent Gas Moisture*

As part of each isokinetic test run, sampling was conducted for DCU D603 Vent gas moisture content following EPA Method 4 from 40 CFR Part 60 Appendix A. The vent gas moisture weight gain in the sampling train impingers was determined gravimetrically and correlated to the sample volumes of each of the sampling trains. Three test runs were performed, one per normal vent cycle.

5.0 QUALITY ASSURANCE/QUALITY CONTROL

To ensure accurate results, strict quality assurance and control measures were followed. All testing was performed following standard EPA protocol. The test criteria was thoroughly documented and checked for completeness.

5.1 Sample System QA/QC

Before and after each test run, all sampling trains were leak checked. The CEMS sampling trains were likewise leak checked prior to and after each run. CEMS bias checks were performed per the test methods.

- A S-type pitot tube meeting the specifications in EPA Method 2 was used to measure the velocity head pressures. At the completion of testing, the pitot tube was inspected for damage following the procedures in EPA Method 2.
- The pitot tube/manometer system was leak checked before and after each run at a pressure higher than 3 in.H_2O and the results were stable for at least 15 seconds.
- The manometer was leveled and zeroed prior to each run.
- At the completion of testing, the K-type thermocouple systems used were checked for proper calibration following the procedures in EPA Method 2 and the results were acceptable at $\leq \pm 1.5\%$ of the reference value.
- The onsite barometer was checked for proper calibration following the procedures in EPA Method 2.
- During each run, emission gas was collected over a period consistent with of the ICR protocol at specific rates.
- The metering system used to determine the sample volumes was leak checked after each run at a vacuum equal to or higher than the operating vacuum observed during the run.

At the completion of testing, the dry gas meter's calibration was checked for proper calibration at a single orifice setting and the results were acceptable at $\leq \pm 5$ % of the yearly calibration factor.

The CEMS methods followed the QA procedures set out in their respective methods with the exception of the speciated volatile HAPs that employed specific spike cocktails (per ICR guidance) to assess laboratory collection and analysis efficiencies.

5.2 Analytical QA/QC

TRC, Enthalpy Analytical, Inc., First Analytical, Inc. and Test America performed the analysis of the samples and was responsible for providing pertinent QA/QC. The analytical reports, which also contain their QA/QC are provided in the appendix.

5.3 Data Reduction QA/QC

Data was checked for completeness and accuracy. The review is documented in the appendix.

5.4 External QA/QC

No test method performance audit samples were received from the administrator for this test program. No system audits were performed by the administrator onsite during the testing to determine the quality of instrument calibration, data validation, and field activities.

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: M-18 Volatile Organic HAPS (XAD)
Dates: July 14, 16, 17, 2011

Run No. 1 - 3

Dry Gas Volume, corrected to standard conditions, L - as per US EPA Method 5, Eq. 5-1

Run No. 1

$$V_{m(std)} = \frac{K_1 \times V_m \times Y \times (P_{bar} + (deltaH / 13.6))}{T_m}$$

K_1 = Constant	=	17.64	degR/in.Hg
V_m = Volume of gas sample, dry	=	9.500	L
Y = Dry gas meter calibration factor	=	1.000	
P_{bar} = Barometric pressure at the sampling site	=	29.77	in. Hg
deltaH=Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor		13.6	in. H_2O/in. Hg
Tm = Absolute average DGM temperature		528	degR

$$V_{m(std)} = \frac{17.64 \times 9.5 \times 1 \times (29.77 + (0 / 13.6))}{528}$$

$V_{m(std)}$ = 9.45

Run No. 2

$$V_{m(std)} = \frac{K_1 \times V_m \times Y \times (P_{bar} + (deltaH / 13.6))}{T_m}$$

K_1 = Constant	=	17.64	degR/in.Hg
V_m = Volume of gas sample, dry	=	13.250	L
Y = Dry gas meter calibration factor	=	1.000	
P_{bar} = Barometric pressure at the sampling site	=	29.77	in. Hg
deltaH=Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor		13.6	in. H_2O/in. Hg
Tm = Absolute average DGM temperature		528.0	degR

$$V_{m(std)} = \frac{17.64 \times 13.25 \times 1 \times (29.77 + (0 / 13.6))}{528}$$

$V_{m(std)}$ = 13.18

Run No. 3

$$V_{m(std)} = \frac{K_1 \times V_m \times Y \times (P_{bar} + (deltaH / 13.6))}{T_m}$$

K_1 = Constant	=	17.64	degR/in.Hg
V_m = Volume of gas sample, dry	=	8.250	L
Y = Dry gas meter calibration factor	=	1.000	
P_{bar} = Barometric pressure at the sampling site	=	29.77	in. Hg
deltaH=Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor		13.6	in. H_2O/in. Hg
Tm = Absolute average DGM temperature		528.0	degR

$$V_{m(std)} = \frac{17.64 \times 8.25 \times 1 \times (29.77 + (0 / 13.6))}{528}$$

$V_{m(std)}$ = 8.20

Analytical Report
(0711-64)

EPA Method 18 (Bags and Condensates)

1,3-Butadiene, Acetonitrile, Acrolein, Acetone, Acrylonitrile, Pentane, Methylene chloride, Hexane, Benzene, Trichloroethene, Toluene, 1,2-Dibromoethane, Tetrachloroethene, Carbon disulfide, Methane and Ethane

EPA Method 18 (Adsorbents)

Acetonitrile, Acrylonitrile, Methyl t-butyl ether (MTBE), 2-Nitropropane, Isooctane, Methyl isobutyl ketone (MIBK), Chlorobenzene, Ethylbenzene, m/p-Xylene, Styrene, o-Xylene, Cumene, and Nitrobenzene,

EPA Method 308

I certify that to the best of my knowledge all analytical data presented in this report:

- Have been checked for completeness
- Are accurate, error-free, and legible
- Have been conducted in accordance with approved protocol, and that all deviations and analytical problems are summarized in the appropriate narrative(s)

This analytical report was prepared in Portable Document Format (.PDF) and contains 1102 pages.

Narrative Summary

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp
Analyst	MGM
Parameters	EPA Method 18 Bags

Client #	182129.0000.0000
Job #	0711-64
# Samples	3 Bags & 2 S/R

Custody

Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at ambient temperature after being relinquished by TRC Environmental Corporation of Austin, TX. The bag samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The bag samples were analyzed for 1,3-butadiene, pentane, acrolein, acetonitrile, acetone, dichloromethane (methylene chloride), hexane, benzene, trichloroethene, toluene, tetrachloroethene, and 1,2-dibromoethane using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A).

All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. All target analytes were referenced to certified gas phase standards.

The Agilent Technologies Model 6890, Gas Chromatograph "Gummo" (S/N US00028451) was equipped with front and rear Flame Ionization Detectors, along with Restek Rtx-624 30m x 0.32mm (S/N 926828) and Rtx-1 30m x 0.32mm x 4.0um (S/N 869999) capillary columns, for these analyses.

Calibration

The calibration curves are included in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition method, GC114P165.M, is included in the Calibration Curve Chromatograms section of this report.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes

As required by the method, a recovery study was performed on a bag sample. The bag sample ***EM-R1-Bag-DCU*** was spiked with 1, 3 butadiene, acrolein, acetone, methylene chloride, hexane, benzene, trichloroethene, and toluene on 7/21/11 at 11:00 AM. The recovery efficiency values met the method-required limits of 70 to 130% for hexane, benzene, and toluene, only. The recovery efficiency values were used to adjust the results for hexane, benzene and toluene, only. Due to high concentations of, or interference from, target and non-target compounds, recoveries of the remaining compounds could not be determined. Bag sample ***EM-R2-Bag-DCU*** was also spiked and similar results were attained.

Because the collocated tube train was not spiked with acetonitrile and acryloniltrile, a baseline analyses was preformed on bag ***EM-R3-Bag-DC*** and it was subsequently spiked with methane, acetonitrile, acrylonitrile. The methane spike was not appropriate for the concentration of that compounds in the sample. The recovery efficiency values did not met recovery criteria for these compounds.

Reporting Notes

Included in the report are the analyses of all three spiked bags. The spike recovery values are presented in the Results section of the report for bags ***EM-R1-Bag-DCU*** and ***EM-R3-Bag-DC***. The results for the applicable spiked bag are presented on the individual compound results pages.

These analytical results are reported on a wet basis. The user of this report should determine the percent moisture in the sample and correct the reported value to ppmvd as appropriate.

The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp

Job #	0711-64
# Samples	3 Bags

Custody

Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/2011 at ambient temperature after being relinquished by TRC Environmental Corporation of Austin, TX. The bag samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The bag samples were analyzed for carbon disulfide using the Hewlett Packard Model 5890, Series II Gas Chromatograph "Zeppo" (S/N 3235A4448X) was equipped with a Flame Photometric Detector and a Restek Rtx-1 60m x 0.53mm x 5.0um (S/N 663119) capillary column.

All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. Carbon disulfide was referenced to gas phase standards prepared by certified permeation devices.

Calibration

The calibration curves are located in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition method, FPDTEST2.M, is included in the Calibration Curve Chromatograms section of this report.

QC Notes

None.

# Samples	3 Bags Condensates

Custody

Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at 5.8 °C after being relinquished by TRC Environmental Corporation of Austin, TX. The bag condensate samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for 1,3-butadiene, pentane, acrolein, acetone, dichloromethane, hexane, benzene, trichloroethene, toluene, tetrachloroethene, 1,2-dibromoethane, and carbon disulfide using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A).

All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. All target analytes were referenced to certified standards.

Analyses for all compounds except carbon disulfide, were preformed using the Agilent Technologies Model 6890N, Gas Chromatograph "Veronica" (S/N US10645052) was equipped with a Flame Ionization Detector and a Restek Rtx-624 105m x 0.53mm x 3.0um (S/N 1032767) capillary column.

The carbon disulfide analysis was performed using a Hewlett Packard Model 5890, Series II Gas Chromatograph "Oscar" (S/N 2938A2) equipped with a Flame Photometric Detector and a Restek Stabilwax 30m x 0.53mm x 1.5um (S/N 1033248) capillary column.

Calibration

The calibration curves are included in the Calibration Curve Chromatograms sections of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Enthalpy Analytical Narrative Summary
(continued)

Chromatographic Conditions	The acquisition methods GC118P140.M and GC118P46.M are included in the Calibration Curve Chromatograms sections of this report.
QC Notes	The analyses of the field blank contained no target compounds at concentrations greater than the detection limit.
	The analyses of the matrix spike prepared using aliquots for sample ***R1 Bag Cond*** exhibited recovery values ranging from 78.6 to 133%.
Reporting Notes	The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp
Analyst	KAM
Parameters	EPA Method 18 Adsorbents

Client #	182129.0000.0000
Job #	0711-64
# Samples	6 Runs & 2 blanks

Custody

Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at 5.8 °C after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received in good condition with the following exceptions. The XAD A and B tubes for ***R1*** and ***R3*** were received wet. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for acetonitrile, acrylonitrile, methyl t-butyl ether (MTBE), 2-nitropropane, isooctane, methyl isobutyl ketone (MIBK), chlorobenzene, ethylbenzene, m/p-xylene, styrene, o-xylene, cumene, and nitrobenzene using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A).

Each sample train consisted of a knockout impinger, a SKC Xad-4 (Cat# 226-93), and a SKC Charcoal (Cat# 226-16) sample tube. All sample tubes were divided into front half (FH) and back half (BH) fractions. Each fraction was desorbed using 5 mL of carbon disulfide.

The volume of one zero headspace vial was measured and recorded for the condensates. An 8 mL aliquot of each sample was removed and archived. The remaining sample was extracted with 5 mL of carbon disulfide. The carbon disulfide and aqueous layers were seperated and analyzed seperately. The aqueous fraction is termed the raffinate. The analyst noted that the carbon disulfide extracts were yellow and that their color increased in intensity from ***R1*** to ***R3***.

The Hewlett Packard Model 6890, Gas Chromatograph "Lucy" (S/N US00039147) was equipped with a Flame Ionization Detector and a Restek Rtx-1 30m x 0.32mm x 4.0um (S/N 450928) capillary column, for the analyses of the extract fractions.

Analysis (continued)

The Hewlett Packard Model 5890, Series II Gas Chromatograph "Teller" (S/N 3033A3174) was equipped with a Flame Ionization Detector and a Restek Stabilwax 30m x 0.53mm x 2.0um (S/N 808560) capillary column, for the analyses of the raffinate fractions.

Enthalpy Analytical Narrative Summary
(continued)

Calibration

The calibration curves are included in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition methods GC121P078.M and GC121P078B.M are included in the Calibration Curve Chromatograms section of this report.

QC Notes

The m/p-xylene results for samples ***R1A*** and ***R2A*** were flagged with "E", because the concentrations in the XAD FH fractions exceded the instrument's calibration range.

The large amount of unknown compound peaks caused an increase in the baseline which caused the precision between some triplicate injections of the samples to be greater than the method required 5% difference. The precision values are presented in the Results section of this report. In order to achieve the best integration of these samples, the slope sensitivity was increased causing an increase in the detection limit for this analysis.

A spike recovery study was performed for the compounds of interest during the field test. The laboratory provided aqueous spikes for acetonitrile and acrylonitrile, at 235 µg and 236 µg, respectively. The lab provided XAD-2 tubes spiked with the remaining compounds of interest. Each tube was spiked with 22.1 µg of MTBE, 29.1 µg of 2-nitropropane, 24.1 µg of isooctane, 23.9 µg of MIBK, 33.2 µg of chlorobenzene, 26.0 µg of ethylbenzene, 43.0 µg of p-xylene, 27.2 µg of styrene, 26.4 µg of o-xylene, 26.0 µg of cumene, and 36.1 µg of nitrobenzene.

Because of the low ratio of spike level to sample loading the recovery study was not useable. Spike recovery values for the laboratory control samples prepared from the retained spikes are presented in the Results section of this report.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)

The m- and p- xylene isomers are inseparable and indistinguishable with the equipment and conditions used for this analyis. These two isomers have virtually identical responses. Therefore the instrument was calibrated using p-xylene. Any results shown are accurate representatations of the total of m-xylene and p-xylene present in the sample. The asociated results have been labeled as both isomers.

Reporting Notes

The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Job #	0711-64
# Samples	3 Runs & 2 blanks

Custody

Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at 5.8 °C after being relinquished by TRC Environmental Corporation of Austin, TX. The silica gel tubes for samples ***R1*** and ***R3*** were received wet. The silica gel tube for ***R2*** was received broken. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for methanol using the analytical procedures in EPA Method 308, Procedure for Determination of Methanol Emission from Stationary Sources (40 CFR Part 63, Appendix A).

Although the silica gel tube for ***R2*** was broken it was also wet so most of the media remained adhered to the tube and to the outside of the condensate container. The analyst noted that more than 95% of the media contents were recovered and desorbed. All silica gel tubes were desorbed using 5.00 mL of a 3% n-propanol in deionized water solution.

The Hewlett Packard Model 5890, Series II Gas Chromatograph "Penn" (S/N 2750A17269) was equipped with front and rear Flame Ionization Detectors and two Restek Stabilwax 30m x 0.53mm x 2.0 um (S/N 810087 and S/N 808560) capillary columns, for these analyses.

Calibration

The calibration curves are included in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition methods GC120P139.M and GC120P150.M are included in the Calibration Curve Chromatograms section of this report.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes

Methanol was not detected at concentrations above the detection limit in the analyses of the field and laboratory blanks.

The analysis of the laboratory control sample desorbed with these samples exhibited a spike recovery of 82.2%.

Reporting Notes

The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, Inc. data reports, unless specifically noted otherwise.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.
- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.
- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.
- The letter ***J*** following a value indicates an analytical result between the MDL and the LOQ. A J flag indicates that the laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.
- The letter ***E*** following a value indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.
- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.
- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. This shows what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).
- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as an MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.
- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).
- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.
- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two extra spikes are prepared. The extras (randomly chosen) are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection and/or sample transport.

General Reporting Notes

(continued)

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits.
- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name.

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Semi Volatile Organic HAPS
Dates: July 14, 16, 17, 2011
Run No. 1

Barometric Pressure at Sampling Site, corrected for elevation

$$P_{bar(corr)} = P_{bar,meas} - (Elev \times 0.001)$$

$P_{bar,meas}$ = Barometric pressure as measured at ground level	=	29.65	in. Hg
Elev = elevation of sampling location relative to barometer	=	0	feet
0.001 = Conversion factor	=	0.00100	in. Hg/ft of elevation

$$Pbar(corr) = 29.65 - 0 \times 0.001$$

$$P_{bar(corr)} = 29.65 \text{ in Hg}$$

Absolute Stack Pressure, Corrected, in. Hg, as per EPA Method 2, Section 6.5

$$P_s = P_{bar(corr)} + (Pg/13.6)$$

$P_{bar(corr)}$ = Barometric pressure at the sampling site	=	29.65	in. Hg
P_g = Stack Static Pressure	=	1.10	in. H2O
13.6 = Conversion factor	=	13.6	in. H2O/in. Hg

$$P_s = 29.65 + \left(\frac{1.10}{13.6}\right)$$

$$P_s = 29.73 \text{ in Hg}$$

Absolute Stack Temperature, R

$$T_s = T + 460$$

T = Average Stack Temperatue	=	312.0	degF
460 = Conversion factor from deg F to R	=	460	

$$Ts = 312.0 + 460$$

$$Ts = 772.0 \text{ R}$$

Absolute Meter Temperature, R

$$Tm = T + 460$$

T = Average Meter Temperatue	=	80.3	degF
460 = Conversion factor from deg F to R	=	460	

$$Tm = 80.3 + 460$$

$$Tm = 540.3 \text{ R}$$

Volume of Water Vapor Condensed, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-2

$$V_{w(std)} = \frac{V_{lc} \times R_w \times R \times T_{std}}{M_w \times P_{std}}$$

V_{lc} = Total weight of liquid collected	=	813.6	g
R_w = Density of water	=	0.002201	lb/ml
R = Ideal Gas Constant	=	21.85	inHg - ft^3/degR - lbmole
T_{std} = Standard absolute temperature	=	528.00	degR
M_w = Molecular Weight of Water	=	18.00	lb/lbmole
P_{std} = Standard absolute pressure	=	29.92	inHg

$$V_{w(std)} = \frac{813.6 \times 0.002201 \times 21.85 \times 528}{18 \times 29.92}$$

$$V_{w(std)} = 38.36$$

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Semi Volatile Organic HAPS
Dates: July 14, 16, 17, 2011
Run No. 1

Dry Gas Volume, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-1

$$V_{m(std)} = V_m \times Y \times \frac{T_{std} \times (P_{bar} + (deltaH / 13.6))}{T_m \times P_{std}}$$

V_m = Volume of gas sample, dry	=	1.011	ft^3
Y = Dry gas meter calibration factor	=	0.972	
Tstd = Standard Temperature	=	528	R
P_{bar} = Barometric pressure at the sampling site	=	29.65	in. Hg
deltaH = Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor	=	13.6	in. H_2O/in. Hg
Tm = Absolute average DGM temperature	=	540.3	R
Pstd = Standard Pressure	=	29.92	in Hg

$$V_{m(std)} = \frac{1.01 \times 0.972 \times 528 \times (29.65 + (0.00 / 13.6))}{540.3 \times 29.92}$$

$V_{m(std)}$ = 0.952 dscf 0.02832 m3/ft3
$V_{m(std)}$ = 0.027 dscm

Moisture Content, proportion, by volume - as per US EPA Method 5, Eq. 5-3

$$\frac{V_{w(std)}}{V_{m(std)} + V_{w(std)}}$$

$V_{w(std)}$ = Volume of water vapor condensed	=	38.360	ft^3
$V_{m(std)}$ = Dry Gas Volume	=	0.952	ft^3

$$B_{ws} = \frac{38.360}{0.952 + 38.360}$$

B_{ws} = 0.9758

Moisture content at saturation

This calculated by polynomial fit: $(86.7222826792858 + T_s*(-0.645483277572566) + T_s^2*0.00181527101645074 + T_s^3 * (-2.28823297043421E-06) + (T_s)^4*1.09201445204276E-09)*100*29.92/P_s)$

Calibration Test Results		**Pass/Fail**
*** Average Y:**	**0.9721**	***PASS***
Ave. Y w/in 5% of previous value:		*YES*
0.95 >= Y <= 1.05:		*PASS*
**** Average dH:**	**1.707**	***PASS***

Criteria:

* Y- ratio of the reading of the calibration meter (critical orifice) to the Meter Box DGM. Acceptable tolerance of individual values from the average is +/- 0.02.

** dH- the orifice differential pressure in inches of H2O that equates to 0.75 cfm of air flow at 68 F and 29.92 in Hg, acceptable tolerance of individual values from the average

TRC Nozzle Calibration and Inspection Data Sheet

Company Name: ExxonMobil BTRF DCU ICR
Nozzle Number: SV - Glass - 1

Measure three diameters (in inches) as shown below. Average the diameters and calculate area according to the calculations below.

Calibration Measurement

*Diameter 1 (in):	0.121	**Date:** 7/12/2011
*Diameter 2 (in):	0.119	
*Diameter 3 (in):	0.119	
Average Diameter (in):	0.120	= (Sum of Diameters 1-3) / 3
Average Radius (in):	0.0600	= Average Diameter (in) / 2
Average Radius (ft):	0.00500	= Average Radius (in) / 12
Nozzle Area (ft2):	0.0000785	= π x radius (ft) ^2

*Maximum allowable difference between largest diameter and smallest diameter is 0.004 inches.

Nozzle is round, sharp-edged, free of nicks and dents

SAMPLE SUMMARY

H1G250406

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
MK5C3	001	EXM-DCU-M0010-R1-COMBINED	07/14/11	
MK5C5	002	EXM-DCU-M0010-R2-COMBINED	07/15/11	
MK5C6	003	EXM-DCU-M0010-R3-COMBINED	07/17/11	
MK5C7	004	EXM-DCU-M0010-RGTBLK-COMBINED	07/17/11	

NOTE(S):

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

PROJECT NARRATIVE
H1G250406

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

Custody seals were not present.

Sample RGTBLK-FLT was received, but was not listed on the chain of custody documentation.

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

Semivolatiles

The semivolatile organic sampling train components were extracted and analyzed using TestAmerica Knoxville standard operating procedures KNOX-OP-0009 and KNOX-MS-0016, based on the following methods:

- SW-846 3542, "Extraction of Semivolatile Analytes Collected Using Method 0010 (Modified Method 5 Sampling Train)"
- SW-846 8270C, "Semivolatile Organic Compounds by Gas Chromatography/ Mass Spectrometry (GC/MS)".

The sampling trains are prepared as one analytical fraction: The particulate filter and front half of the filter holder, nozzle and probe solvent rinses, XAD-2 resin trap and back half of the filter holder, coil condenser and connecting glassware solvent rinses are combined as a single sample.

The combined sample components are spiked with the method 8270C surrogates and Soxhlet extracted with methylene chloride. The extracts are concentrated to 1 mL and analyzed by GCMS.

Sample results were calculated using the following equation:

PROJECT NARRATIVE
H1G250406

$$\text{Result, ug} = (\text{On column concentration, ng/uL}) \times \left(\frac{\text{Volume final extract, uL}}{\text{1 Sample}} \right) \times \left(\frac{\text{1ug}}{\text{1000 ng}} \right) \times \text{DF} \times \text{SF}$$

Where: DF = Bench Dilution Factor
SF = Extraction Split Factor

The dilution factor reported on the sample result form represents a combination of factors (such as dilution, sample weight/volume adjustment, split ratio, etc.) used to adjust the reporting limits and method detection limits.

Samples EXM-DCU-M0010-R1-COMBINED, EXM-DCU-M0010-R2-COMBINED and EXM-DCU-M0010-R3-COMBINED were reported with elevated reporting limits for all analytes. Based on screening results, a dilution was necessary prior to analysis; the reporting limits were adjusted accordingly.

The concentration of naphthalene and/or 2-methylnaphthalene in samples EXM-DCU-M0010-R1-COMBINED EXM-DCU-M0010-R2-COMBINED and EXM-DCU-M0010-R3-COMBINED exceeded the calibration level of the instrument. The samples were analyzed at a dilution to bring the concentration of the compound into the instrument calibration range. The results for both analyses are reported in order to provide the lowest possible reporting limits.

SIM PAH

The labeled internal standards added prior to extraction serve both as a measure of extraction efficiency and as a measure of cleanup recovery.

Method 0010 Sampling Train Preparation and Analysis

The method 0010 sampling train components were extracted and analyzed for polyaromatic hydrocarbons (PAHs) using TestAmerica Knoxville standard operating procedures KNOX-OP-0009 and KNOX-ID-0016, based on the following methods:

- SW-846 3542, "Extraction of Semivolatile Analytes Collected Using Method 0010 (Modified Method 5 Sampling Train)"
- Method 429 - Determination of Polycyclic Aromatic Hydrocarbon (PAH) emissions from Stationary Sources, California Environmental Protection Agency Air Resources Board, Adopted: September 12, 1989, Amended: July 28, 1997.

The sampling trains are prepared as two analytical fractions and the extracts from these fractions are combined into a single sample for analysis. The first fraction consists of the particulate filter and the XAD-2 resin trap. The second fraction includes the condensate, impinger contents and their related glassware solvent rinses, as well as the front half and back half solvent rinses.

The filters and XAD components are spiked with SIM PAH internal standards and the components are Soxhlet extracted with methylene chloride. The condensates are extracted using a continuous liquid-liquid extractor. The extracts are combined and concentrated to 0.5 mL and analyzed by by SIM-HRGC/LRMS.

PROJECT NARRATIVE
H1G250406

Sample results were calculated using the following equation:

$$\text{Result, ng} = (\text{On column conc, ug/mL}) \times \left(\frac{\text{Nominal Vol final extract, (500 uL)}}{\text{1 Sample}} \right) \times \left(\frac{\text{1 mL}}{\text{1000 uL}} \right) \times \left(\frac{\text{1000 ng}}{\text{1 ug}} \right) \times \text{SF}$$

Where: SF = Extraction Split Factor

*If the entire sample is not extracted, the fractional amount of sample used is entered into the above equation.

Sampling surrogates fluorene-d_{10}, 13C_6-fluorene & terphenyl-d_{14} are added to the XAD by the laboratory prior to sampling. Their results appear with the "Internal Standard" percent recovery results. However these field surrogates were diluted out in samples EXM-DCU-M0010-R1-COMBINED, EXM-DCU-M0010-R2-COMBINED, and EXM-DCU-M0010-R3-COMBINED.

The dilution factor reported on the sample result form represents a combination of factors (such as dilution, sample weight/volume adjustment, split ratio, etc.) used to adjust the reporting limits and method detection limits.

All QC criteria were met with the following exceptions:

All sample extracts in the batch had internal standard recovery for benzo(a)anthracene-d12 that exceeded QC limits. As indicted by the referenced method, isotope dilution techniques produce results that are independent of internal standard recovery. The affected internal standards are flagged on the final result forms.

Samples EXM-DCU-M0010-R1-COMBINED, EXM-DCU-M0010-R2-COMBINED, and EXM-DCU-M0010-R3-COMBINED were reported with elevated reporting limits for all analytes due to the difficult sample matrix. These extracts were diluted and underwent an additional silica gel clean-up; then the extracts were further diluted and post-spiked with recovery and internal standards and the reporting limits were adjusted accordingly. The sample was analyzed with minimum dilution even though some analytes were outside of the calibration range. Compounds that exceeded calibration range were flagged with an "E" qualifier; please refer to the 8270 analysis for results of these compounds within calibration range.

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Lot Number: H162SD406

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **1a** Do not match COC ☐ **1b** Incomplete information ☐ **1c** Marking smeared ☐ **1d** Label torn ☐ **1e** No label ☐ **1f** COC not received ☐ **1g** Other:	4a 5a - RECEIVED "... RGTBLK-FILT" NOT ON COC
2. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C)	✓			☐ **2a** Temp Blank = _____ ☐ **2b** Cooler Temp = _____ ☐ **2c** Cooling initiated for recently collected samples, ice present.	
3. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **3a** Sample preservative =	
4. Were custody seals present/intact on cooler and/or containers?		✓		☑ **4a** Not present ☐ **4b** Not intact ☐ **4c** Other:	
5. Were all of the samples listed on the COC received?	✓			☑ **5a** Samples received-not on COC ☐ **5b** Samples not received-on COC	
6. Were all of the sample containers received intact?	✓			☐ **6a** Leaking ☐ **6b** Broken	
7. Were VOA samples received without headspace?			✓	☐ **7a** Headspace (VOA only)	
8. Were samples received in appropriate containers?	✓			☐ **8a** Improper container	
9. Did you check for residual chlorine, if necessary?			✓	☐ **9a** Could not be determined due to matrix interference	
10. Were samples received within holding time?	✓			☐ **10a** Holding time expired	
11. For rad samples, was sample activity info. provided?			✓	☐ Incomplete information	
12. For 1613B water samples is pH<9?			✓	If no, was pH adjusted to pH 7 - 9 with sulfuric acid? _____	
13. Are the shipping containers intact?	✓			☐ **13a** Leaking ☐ **13b** Other:	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **14a** Not relinquished	
15. Are tests/parameters listed for each sample?	✓			☐ **15a** Incomplete information	
16. Is the matrix of the samples noted?	✓			☐ **15a** Incomplete information	
17. Is the date/time of sample collection noted?	✓			☐ **15a** Incomplete information	
18. Is the client and project name/# identified?	✓			☐ **15a** Incomplete information	
19. Was the sampler identified on the COC?		✓

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Aldehydes
Dates: July 14, 16, 17, 2011
Run No. 1

Barometric Pressure at Sampling Site, corrected for elevation

$$P_{bar(corr)} = P_{bar,meas} - (Elev \times 0.001)$$

$P_{bar,meas}$ = Barometric pressure as measured at ground level	=	29.65	in. Hg
Elev = elevation of sampling location relative to barometer	=	0	feet
0.001 = Conversion factor	=	0.00100	in. Hg/ft of elevation

Pbar(corr) = 29.65 - 0 X 0.001

$P_{bar(corr)}$ = 29.65 in Hg

Absolute Stack Pressure, Corrected, in. Hg, as per EPA Method 2, Section 6.5

$$P_s = P_{bar(corr)} + (Pg/13.6)$$

$P_{bar(corr)}$ = Barometric pressure at the sampling site	=	29.65	in. Hg
P_g = Stack Static Pressure	=	1.10	in. H2O
13.6 = Conversion factor	=	13.6	in. H2O/in. Hg

$$P_s = 29.65 + \left(\frac{1.10}{13.6}\right)$$

P_s = 29.73 in Hg

Absolute Stack Temperature, R

$$T_s = T + 460$$

T = Average Stack Temperatue	=	320.6	degF
460 = Conversion factor from deg F to R	=	460	

Ts = 320.6 + 460

Ts = 780.6 R

Absolute Meter Temperature, R

$$Tm = T + 460$$

T = Average Meter Temperatue	=	89.1	degF
460 = Conversion factor from deg F to R	=	460	

Tm = 89.1 + 460

Tm = 549.1 R

Volume of Water Vapor Condensed, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-2

$$V_{w(std)} = \frac{V_{lc} \times R_w \times R \times T_{std}}{M_w \times P_{std}}$$

V_{lc} = Total weight of liquid collected	=	866.7	g
R_w = Density of water	=	0.002201	lb/ml
R = Ideal Gas Constant	=	21.85	inHg - ft^3/degR - lbmole
T_{std} = Standard absolute temperature	=	528.00	degR
M_w = Molecular Weight of Water	=	18.00	lb/lbmole
P_{std} = Standard absolute pressure	=	29.92	inHg

$$V_{w(std)} = \frac{866.7 \times 0.002201 \times 21.85 \times 528}{18 \times 29.92}$$

$V_{w(std)}$ = 40.86

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Aldehydes
Dates: July 14, 16, 17, 2011
Run No. 1

Dry Gas Volume, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-1

$$V_{m(std)} = V_m \times Y \times \frac{T_{std} \times (P_{bar} + (deltaH / 13.6))}{T_m \times P_{std}}$$

V_m = Volume of gas sample, dry	=	0.862	ft^3
Y = Dry gas meter calibration factor	=	0.989	
Tstd = Standard Temperature	=	528	R
P_{bar} = Barometric pressure at the sampling site	=	29.65	in. Hg
deltaH = Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor	=	13.6	in. H_2O/in. Hg
Tm = Absolute average DGM temperature	=	549.1	R
Pstd = Standard Pressure	=	29.92	in Hg

$$V_{m(std)} = \frac{0.86 \times 0.989 \times 528 \times (29.65 + (0.00 / 13.6))}{549.1 \times 29.92}$$

$V_{m(std)}$ = 0.813 dscf 0.02832 m3/ft3
$V_{m(std)}$ = 0.023 dscm

Moisture Content, proportion, by volume - as per US EPA Method 5, Eq. 5-3

$$\frac{V_{w(std)}}{V_{m(std)} + V_{w(std)}}$$

$V_{w(std)}$ = Volume of water vapor condensed	=	40.864	ft^3
$V_{m(std)}$ = Dry Gas Volume	=	0.813	ft^3

$$B_{ws} = \frac{40.864}{0.813 + 40.864}$$

B_{ws} = 0.9805

Moisture content at saturation

This calculated by polynomial fit: $(86.7222826792858 + T_s*(-0.645483277572566) + T_s^2*0.00181527101645074 + T_s^3 * (-2.28823297043421E-06) + (T_s)^4*1.09201445204276E-09)*100*29.92/P_s)$

B_{ws} = 0.9805 98.05 %

Dry Molecular Weight of Stack Gas, lb/lb-mole - as per US EPA Method 3, Eq. 3-1

$$M_d = MW_{CO}(\%CO) + MW_{CO2}(\%CO_2) + MW_{O2}(\%O_2) + MW_{H2}(\%H_2) + MW_{CH4}(\%CH_4) + MW_{N2}(\%N_2)$$

MW_{CO}= Molecular weight of CO, divided by 100	=	0.28	lb/lb-mole
%CO = Percent CO by volume, dry basis	=	0.0	%
MW_{CO2}= Molecular weight of CO_2, divided by 100	=	0.44	lb/lb-mole
$\%CO_2$ = Percent CO_2 by volume, dry basis	=	0.0	%
MW_{O2} = Molecular weight of O_2, divided by 100	=	0.32	lb/lb-mole
$\%O_2$ = Percent O_2 by volume, dry basis	=	14.0	%
MW_{H2} = Molecular weight of H_2, divided by 100	=	0.02	lb/lb-mole
$\%H_2$ = Percent H_2 by volume, dry basis	=	0.0	%
MW_{CH4} = Molecular weight of CH_4, divided by 100	=	0.16	lb/lb-mole
$\%CH_4$ = Percent CH_4 by volume, dry basis	=	0.0	%
MW_{N2} = Molecular weight of N2, divided by 100	=	0.28	lb/lb-mole
$\%N_2$ = 100% - %CO - $\%CO_2$ - $\%O_2$ - %H2 - %CH4	=	86.0	%

$$M_d = \frac{(0.28 \times 0.0) + (0.44 \times 0.0) + (0.32 \times 14.0) + (0.02 \times 0.0) + (0.16 \times 0.0) + (0.28 \times 86.0)}{}$$

M_d = 28.56 lb/lb-mole

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Aldehydes
Dates: July 14, 16, 17, 2011
Run No. 1

Molecular Weight of stack gas, lb/lb-mole - as per US EPA Method 2, Eq. 2-6

$$M_s = M_d (1-B_{ws}) + 18.0(B_{ws})$$

M_d= Dry molecular weight of stack gas	=	28.56	lb/lb-mole
B_{ws}= Proportion of water vapor, by volume	=	0.9805	proportion
18.0 = Molecular Weight of H_2O	=	18.00	lb/lb-mole

$$M_s = 28.56 \times (1 - 0.981) + (18.00 \times 0.981)$$
$$M_s = 18.21 \text{ lb/lb-mole}$$

Average Stack Gas Velocity, ft/sec - as per US EPA Method 2, Eq. 2-7

$$v_s = K_p \times C_p \times \text{deltaP}_{avg} \times \text{sqrt}(T_s/(P_s \times M_s))$$

K_p= Velocity equation constant	=	85.49	ft/sec[((lb/lb-mole)(in.Hg))/((degR)(in.H2O))]$^{1/2}$
C_p = S type pitot tube coefficient	=	0.84	
deltaP$_{avg}$=ave. sqrt. of the velocity head of stack gas	=	9.0291	in.H_2O
T_s = Absolute stack temperature	=	780.6	degR
P_s = Absolute stack pressure	=	29.73	in. Hg
M_s = Molecular Weight of stack gas	=	18.21	lb/lb-mole

$$v_s = 85.49 \times 0.84 \times 9.03 \times \left(\frac{780.6}{29.73 \times 18.21}\right)^{0.5}$$

v_s = 778.65 ft/sec 12.9776 ft/min
WAF = 1.00
v_s(WAF Adjusted)= 778.65 ft/sec

Stack Area

$$A = 3.14 \times (\text{Stack Diameter}/2)^2$$

3.1415927 = PI	=	3.14	
Stack Diameter		0.67	ft2

$$A = 3.14 \times \left(\frac{0.67}{2}\right)^2$$
$$A = 0.35 \text{ ft2}$$

Average Stack Gas Volumetric Flow Rate - Actual Conditions

$$Q_{actual} = vs \times A$$

v_s= Average stack gas velocity	=	778.65	ft/sec
A = Cross sectional area of stack	=	0.35	ft^2

$$Q_{actual} = 778.65 \times 0.35$$

Q_{actual} = 272 ft3/sec
Q_{actual} = 16,308 ft3/min
Q_{actual} = 978,485 ft3/hr

Average Stack Gas Dry Volumetric Flow Rate, dscf/hr - as per US EPA Method 2, Eq. 2-8

$$Q = \frac{3600 \times (1-B_{ws}) \times v_s \times A \times T_{std} \times P_s}{T_s \times P_{std}}$$

3600= Conversion factor	=	3600	sec/hr
B_{ws} = Proportion of water vapor, by volume	=	0.9805	proportion
v_s= Average stack gas velocity	=	778.65	ft/sec
A = Cross sectional area of stack	=	0.35	ft^2
T_{std} = Standard absolute temperature	=	528	degR
P_s = Absolute stack pressure	=	29.73	in. Hg
T_s = Absolute stack temperature	=	780.6	degR
P_{std} = Standard absolute pressure	=	29.92	in. Hg

$$Q = \frac{3600 \times (1 - 0.981)}{780.6} \times \frac{778.65 \times 0.349 \times 528 \times 29.73088}{29.92}$$

$$\frac{\text{Conversions}}{60 \text{ min/hr}}$$

$$\frac{1}{1000} \text{ k}$$

Q = 12,823 dscfh
Q = 214 dscfm

TRC Nozzle Calibration and Inspection Data Sheet

Company Name: ExxonMobil BTRF Duluth
Nozzle Number: ALD-Glass-1

Measure three diameters (in inches) as shown below. Average the diameters and calculate area according to the calculations below.

Calibration Measurement

*Diameter 1 (in):	0.120	Date: 7/12/2011
*Diameter 2 (in):	0.121	
*Diameter 3 (in):	0.120	
Average Diameter (in):	0.120	= (Sum of Diameters 1-3) / 3
Average Radius (in):	0.0600	= Average Diameter (in) / 2
Average Radius (ft):	0.00500	= Average Radius (in) / 12
Nozzle Area (ft2):	0.0000785	= π x radius (ft) ^2

*Maximum allowable difference between largest diameter and smallest diameter is 0.004 inches.

Nozzle is round, sharp-edged, free of nicks and dents

Narrative Summary

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp.
Analyst	KHB
Parameters	EPA SW-846 Method 0011

Client #	182129
Job #	0611-122
# Samples	3 Runs, 2 blanks, 1 spike

Custody

Thorne Gregory of Enthalpy Analytical, Inc. received the samples on 7/23/11 at 9.1°C after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for acetaldehyde, formaldehyde, and propionaldehyde using the analytical procedures in EPA SW-846 Method 0011, Sampling for Selected Aldehyde and Ketone Emissions from Stationary Sources.

Due to the large volume of DNPH, the sample, ***EXM-DCU – Run 3*** was split in half (both DNPH and MeCl2), extracted each with 100 mL of methylene chloride and then combined.

The Agilent Model 1100, High Performance Liquid Chromatograph ("Bart") was equipped with an Ultraviolet (UV) Detector operating at 360 nm and a Restek Ultra C18, 150 x 4 mm (S/N 100316P) column.

Calibration

The calibration curves are located in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition method 8315ICR.M is included in the Calibration Curve Chromatograms section of this report.

QC Notes

During sample preparation, ***EXM-DCU-R1*** was split in two equal halves. The first half was extracted and analyzed as ***EXM-DCU-R1***. The second half was extracted and analyzed as ***LD/ EXM-DCU-R1***. To determine the catch weights, this splitting is compensated for by use of the 'Aliquot Factor' (2) shown in the detailed results spreadsheet.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)

The percent difference value of the formaldehyde analysis from the initial result was within 9% for all target compounds.

A replicate injection was made of the sample ***EXM-DCU-R1*** and the difference between the results of the replicate was within 2% for all target compounds.

EXM-DCU-R2 was also split in half. The first half was analyzed as the sample, and has an aliquot factor of two. The remaining half was split in thirds for use as the Matrix Spike (MS), Matrix Spike Duplicate (MSD), and an archive fraction. These spikes do not have an aliquot factor, and their results are calculated on the basis of what was prepared. Therefore the native amount of the sample used in determining the spike recovery values was 1/6 the calculated final result for the sample itself. The MS and MSD exhibited recovery values of 87.9% and 86.4% for formaldehyde, 81.9% and 82.6% for acetaldehyde, and 94.4% and 87.7% for propionaldehyde.

Prior to sample collection, five aqueous spikes were prepared from a spike solution; three were shipped to the client. The spikes contained 1,002 µg of formaldehyde.

Reporting Notes

The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, Inc. data reports, unless specifically noted otherwise.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.
- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.
- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.
- The letter ***J*** following a value indicates an analytical result between the MDL and the LOQ. A J flag indicates that the laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.
- The letter ***E*** following a value indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.
- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.
- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. This shows what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).
- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as an MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.
- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).
- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.
- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two extra spikes are prepared. The extras (randomly chosen) are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection and/or sample transport.

General Reporting Notes

(continued)

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits.
- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name.

Calibration Test Results		**Pass/Fail**
*** Average Y:**	**0.9636**	***PASS***
Ave. Y w/in 5% of previous value:		*YES*
0.95 >= Y <= 1.05:		*PASS*
**** Average dH:**	**1.746**	***PASS***

Criteria:

* Y- ratio of the reading of the calibration meter (critical orifice) to the Meter Box DGM. Acceptable tolerance of individual values from the average is +/- 0.02.

** dH- the orifice differential pressure in inches of H2O that equates to 0.75 cfm of air flow at 68 F and 29.92 in Hg, acceptable tolerance of individual values from the averag

TRC Nozzle Calibration and Inspection Data Sheet

Company Name: ExxonMobil BTRF Duluth
Nozzle Number: M26A - Glass - 1

Measure three diameters (in inches) as shown below. Average the diameters and calculate area according to the calculations below.

Calibration Measurement

*Diameter 1 (in): 0.122 **Date:** 7/12/2011
*Diameter 2 (in): 0.122
*Diameter 3 (in): 0.125

Average Diameter (in): 0.123 = (Sum of Diameters 1-3) / 3

Average Radius (in): 0.0615 = Average Diameter (in) / 2
Average Radius (ft): 0.005125 = Average Radius (in) / 12

Nozzle Area (ft2): 0.0000825 = π x radius (ft) ^2

*Maximum allowable difference between largest diameter and smallest diameter is 0.004 inches.

Nozzle is round, sharp-edged, free of nicks and dents

Narrative Summary

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corporation - Austin
Analyst	EO
Parameters	EPA Method 26A

Client #	182129
Job #	0711-163
# Samples	3 Runs, 2 Blanks

Custody

Heather Tarjeft received the samples on 7/27/11 after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received at 16.7°C in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for hydrogen chloride (HCl), hydrogen fluoride (HF), and chloride using the analytical procedures in EPA Method 26A, Determination of Hydrogen Halide and Halogen Emissions from Stationary Sources Isokinetic Method (40 CFR Part 60, Appendix A).

The samples were analyzed following the procedures in Section 11.0, Analytical Procedures. All samples and standards are prepared, stored, and analyzed using high-density polyethylene containers.

The Metrohm 861 Compact IC ("Smithers" S/N 1861002007189) was equipped with a Metrohm 861 Conductivity Detector and a Metrosep A Supp 5 - 110/4.0mm column (S/N # 7908289).

Calibration

The calibration curve(s) is (are) located in the back of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Chromatographic Conditions

The acquisition method Metrohm.M is included in the Calibration Curve Chromatograms section of this report.

QC Notes

As required in Section 7.2.2, Absorbing Solution Blanks, client-provided reagent blanks were analyzed. Additionally, a quality control check sample was analyzed at the same time as the blanks and samples. All method required acceptance criteria were met.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)

HCl, HF, and chloride were not identified above the MDL in the analyses of the method blanks and run blanks.

A matrix spike and matrix spike duplicate (MS and MSD) were prepared using aliquots of the samples ***R1-H2SO4*** and ***R1-NaOH***. The recovery values were 108% and 108% for HF, 95.6% and 95.0% for HCl, and 98.7% and 98.8% for Cl.

A second source standard (hplc55pg192 #SS) was prepared and used as a Laboratory Control Sample and analyzed with the samples. The recovery values were 106% and 107% for HF and 97.2% and 98.2% for HCl.

All sample preparation and analytical holding times specified in the method were met. Section 13.2, Sample Stability, specifies an analytical holding time of four weeks.

Reporting Notes

The volumes as recorded on the chain of custody were used for the catch weight calculations, with the exception of the reagent blanks which were measured.

The H_2SO_4 matrix samples were analyzed for Cl^- and F^- but are reported as HCl and HF. The results were converted using an acid conversion factor of 1.028 for HCl and 1.053 for HF.

These analyses met the requirements of the NELAC Standard. Any deviations from the requirements of the reference method and/or the NELAC Standard have been previously noted in this narrative. The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp.
Analyst	AMP
Parameters	EPA OTM-29

Client #	182129
Job #	0711-163
# Samples	3 runs, 1 blank

Custody

Heather Tarjeft received the samples on 7/27/11 after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received at 16.7°C in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for hydrogen cyanide (HCN) using the analytical procedures in OTM-29, Sampling and Analysis of Hydrogen Cyanide Emissions from Stationary Sources.

The pH of the NaOH samples was 14.

The ICS-3000 Ion Chromatograph ("Flanders") was equipped with an Electrochemical Detector and a Dionex Ion Pac AS7, 4 x 250 mm (S/N 011640) column, for these analyses.

Calibration

The calibration curve is located in the back of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Some of the calibration check standards analyzed with the samples were not within the 10% method criteria. The recoveries of the check standards ranged from 49% to 105%.

Chromatographic Conditions

The acquisition method (HCN.Back) is included in the Calibration Curve Chromatograms section of this report.

QC Notes

Hydrogen cyanide was not detected in the field reagent blank or the laboratory reagent blank.

The samples were analyzed 34 days outside the method recommended holding time of 30 days.

A matrix spike was performed in duplicate (MS and MSD) on sample ***R1-NaOH***. The recovery values were 84.7% and 83.7%.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)

A second source standard (#SS) was prepared and used as a Laboratory Control Sample and analyzed with the samples. The recovery value was 111%.

Reporting Notes

The volumes as recorded on the chain of custody were used for the catch weight calculations, with the exception of the reagent blanks which were measured.

The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, Inc. data reports, unless specifically noted otherwise.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.
- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.
- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.
- The letter ***J*** following a value indicates an analytical result between the MDL and the LOQ. A J flag indicates that the laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.
- The letter ***E*** following a value indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.
- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.
- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. This shows what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).
- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as an MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.
- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).
- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.
- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two extra spikes are prepared. The extras (randomly chosen) are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection and/or sample transport.

General Reporting Notes

(continued)

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits.
- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name.

CERTIFICATE

The permeation rate of the DYNACAL® PERMEATION DEVICE listed below is certified traceable to N.I.S.T. standards.

Serial Number: 59-38917

Certification Date: Jun 15, 2011	Certificate Expires: Jul 31, 2011
Chemical: Carbonyl Sulfide	Part Number: 187-036-7600-F59-C35
Device Type: Dynacal Tube	Length: 3.60
Permeation Rate: 22495.90 ng/min	Temperature: 35 C
True Accuracy: +/- 0.08 %	Max Allowed Accuracy: +/- 2.00 %
Certification Method: Gravimetric	Order No: 106367
Customer: TRC ENVIRONMENTAL

TRACEABILITY OF CALIBRATIONS

Certification Number:	11-2086	9/1/2011
Dynacalibrator Model:	150-D	
Serial Number:	M-1840	

TEMPERATURE

Isotech model 93514-77/25 ohm Standard Platinum Resistance Thermometer
Serial Number 152

SPRT 152 was calibrated on March 24th 2011 by Valco.
SPRT 152 was checked using an ITS-90 TPW fixed point cell.

Temperatures were measured at a stem depth of 21 cm using ASL F700 Precision Thermometry Bridge.

Stem depth is the distance from the lip of chamber to the end of the SPRT.

EPA PROTOCOL GAS ANALYSIS

CYL NUMBER: SX50495
LAB REFERENCE #:
LOT NUMBER: 102-06-03398

COMPONENT NAME	MEAN CONCENTRATION
Hydrogen Sulfide	24.9 PPM +/-1% rel

SIZE: 1l CGA: 330
Volume: 140 cuft
Pressure: 2000 psig @ 70F

This mixture has been analyzed according to EPA Traceability Protocol for Assay and Certification of Gaseous Calibration Standards revised September 1997

Balance Gas: Nitrogen

PROCEDURE: G1/G2 ASSAY DATE: 8/24/10
EXPIRATION DATE: 8/24/11

NOTE: this mixture should not be used when the pressure falls below 150 psig.

Project Name: ExxonMobil ICR Test-DCU D603 Vent
Parameter: Mercury
Dates: July 14, 16, 17, 2011
Run No. 1

Barometric Pressure at Sampling Site, corrected for elevation

$$P_{bar(corr)} = P_{bar,meas} - (Elev \times 0.001)$$

$P_{bar,meas}$ = Barometric pressure as measured at ground level	=	29.65	in. Hg
Elev = elevation of sampling location relative to barometer	=	0	feet
0.001 = Conversion factor	=	0.00100	in. Hg/ft of elevation

Pbar(corr) = 29.65 - 0 X 0.001

$P_{bar(corr)}$ = 29.65 in Hg

Absolute Stack Pressure, Corrected, in. Hg, as per EPA Method 2, Section 6.5

$$P_s = P_{bar(corr)} + (Pg/13.6)$$

$P_{bar(corr)}$ = Barometric pressure at the sampling site	=	29.65	in. Hg
P_g = Stack Static Pressure	=	1.10	in. H2O
13.6 = Conversion factor	=	13.6	in. H2O/in. Hg

$$P_s = 29.65 + \left(\frac{1.10}{13.6}\right)$$

P_s = 29.73 in Hg

Absolute Stack Temperature, R

$$T_s = T + 460$$

T = Average Stack Temperatue	=	312.0	degF
460 = Conversion factor from deg F to R	=	460	

Ts = 312.0 + 460

Ts = 772.0 R

Absolute Meter Temperature, R

$$Tm = T + 460$$

T = Average Meter Temperatue	=	82.8	degF
460 = Conversion factor from deg F to R	=	460	

Tm = 82.8 + 460

Tm = 542.8 R

Volume of Water Vapor Condensed, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-2

$$V_{w(std)} = \frac{V_{1c} \times R_w \times R \times T_{std}}{M_w \times P_{std}}$$

V_{1c} = Total weight of liquid collected	=	887.0	g
R_w = Density of water	=	0.002201	lb/ml
R = Ideal Gas Constant	=	21.85	inHg - ft^3/degR - lbmole
T_{std} = Standard absolute temperature	=	528.00	degR
M_w = Molecular Weight of Water	=	18.00	lb/lbmole
P_{std} = Standard absolute pressure	=	29.92	inHg

$$V_{w(std)} = \frac{887.0 \times 0.002201 \times 21.85 \times 528}{18 \times 29.92}$$

$V_{w(std)}$ = 41.82

Example Calculations

Project Name: ExxonMobil ICR Test-DCU D603 Vent
Parameter: Mercury
Dates: July 14, 16, 17, 2011
Run No. 1

Dry Gas Volume, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-1

$$V_{m(std)} = V_m \times Y \times \frac{T_{std} \times (P_{bar} + (deltaH / 13.6))}{T_m \times P_{std}}$$

V_m = Volume of gas sample, dry	=	1.006	ft^3
Y = Dry gas meter calibration factor	=	1.009	
Tstd = Standard Temperature	=	528	R
P_{bar} = Barometric pressure at the sampling site	=	29.65	in. Hg
deltaH = Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor	=	13.6	In. H_2O/in. Hg
Tm = Absolute average DGM temperature	=	542.8	R
Pstd = Standard Pressure	=	29.92	in Hg

$$V_{m(std)} = \frac{1.01 \times 1.009 \times 528 \times (29.65 + (0.00 / 13.6))}{542.8 \times 29.92}$$

$V_{m(std)}$ = 0.978 dscf 0.02832 m3/ft3

$V_{m(std)}$ = 0.028 dscm

Moisture Content, proportion, by volume - as per US EPA Method 5, Eq. 5-3

$$\frac{V_{w(std)}}{V_{m(std)} + V_{w(std)}}$$

$V_{w(std)}$ = Volume of water vapor condensed	=	41.821	ft^3
$V_{m(std)}$ = Dry Gas Volume	=	0.978	ft^3

$$B_{ws} = \frac{41.821}{0.978 + 41.821}$$

B_{ws} = 0.9771

Moisture content at saturation

This calculated by polynomial fit: $(86.7222826792858 + T_s*(-0.645483277572566) + T_s^2*0.00181527101645074 + T_s^3 * (-2.28823297043421E-06) + (T_s)^4*1.09201445204276E-09)*100*29.92/P_s)$

TRC Nozzle Calibration and Inspection Data Sheet

Company Name: ExxonMobil BTRF Duluth
Nozzle Number: OTH - Glass - 1

Measure three diameters (in inches) as shown below. Average the diameters and calculate area according to the calculations below.

Calibration Measurement

*Diameter 1 (in): 0.119 **Date:** 7/12/2011
*Diameter 2 (in): 0.123
*Diameter 3 (in): 0.122

Average Diameter (in): 0.121 = (Sum of Diameters 1-3) / 3

Average Radius (in): 0.0605 = Average Diameter (in) / 2
Average Radius (ft): 0.00504 = Average Radius (in) / 12

Nozzle Area (ft2): 0.0000798 = π x radius (ft) ^2

*Maximum allowable difference between largest diameter and smallest diameter is 0.004 inches.

Nozzle is round, sharp-edged, free of nicks and dents

FAL FIRST ANALYTICAL

CASE NARRATIVE

FAL Project #: 110738 Report Date: 09-Aug-11
Client: TRC Environmental Corporation
Client Project ID: ExxonMobil DCU ICR #182129

Samples:

Four sets of samples were submitted, including a reagent blank, for the determination of mercury by the Ontario Hydro Method. The samples were received in good condition with no apparent leakage or damage, and custody seals intact. The Container 3 (KCl) samples did not retain any of their purple color after sampling. Run 2 from Container 5 ($KMnO_4$) samples also did not retain its purple color after sampling. An aliquot of each sample for Container 3 (KCl) was submitted since 1 to 3 liters were collected for this fraction.

All of the remaining amounts of the samples and digestates will be retained by the laboratory for six months and then discarded.

Preparation:

The Ontario Hydro mercury samples were prepared according to the ASTM Standard Test Method for *Elemental, Oxidized, Particle-Bound and Total Mercury in Flue Gas Generated from Coal-Fired Stationary Sources (Ontario Hydro Method)*. Many of the samples had a strong, fumy odor and an oily sheen.

Analysis:

Mercury was determined by Cold Vapor Atomic Absorption Spectroscopy (CVAA).

FAL FIRST ANALYTICAL

Results:

The mercury results are presented as total micrograms of mercury found for each analytical fraction listed. Mercury was not detected above the reporting limit for most of the samples.

Quality Control:

The matrix spike for a Container 3 (KCl) sample revealed a matrix interference so the spike was not within the acceptable limits. The other matrix spike for a Container 5 ($KMnO_4$) sample was within the acceptable limits of 90% to 110%. All of the samples were analyzed in triplicate. All of the replicates agreed within the normal limit of 10%. A matrix spike QC sample was analyzed after every 10 samples.

Barometric Pressure at Sampling Site, corrected for elevation

$$P_{bar(corr)} = P_{bar,meas} - (Elev \times 0.001)$$

$P_{bar,meas}$ = Barometric pressure as measured at ground level	=	29.65	in. Hg
Elev = elevation of sampling location relative to barometer	=	0	feet
0.001 = Conversion factor	=	0.00100	in. Hg/ft of elevation

Pbar(corr) = 29.65 - 0 X 0.001

$P_{bar(corr)}$ = 29.65 in Hg

Absolute Stack Pressure, Corrected, in. Hg, as per EPA Method 2, Section 6.5

$$P_s = P_{bar(corr)} + (Pg/13.6)$$

$P_{bar(corr)}$ = Barometric pressure at the sampling site	=	29.65	in. Hg
P_g = Stack Static Pressure	=	1.10	in. H2O
13.6 = Conversion factor	=	13.6	in. H2O/in. Hg

$$P_s = 29.65 + \left(\frac{1.10}{13.6}\right)$$

P_s = 29.73 in Hg

Absolute Stack Temperature, R

$$T_s = T + 460$$

T = Average Stack Temperatue	=	312.0	degF
460 = Conversion factor from deg F to R	=	460	

Ts = 312.0 + 460

Ts = 772.0 R

Absolute Meter Temperature, R

$$T_m = T + 460$$

T = Average Meter Temperatue	=	81.8	degF
460 = Conversion factor from deg F to R	=	460	

Tm = 81.8 + 460

Tm = 541.8 R

Volume of Water Vapor Condensed, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-2

$$V_{w(std)} = \frac{V_{lc} \times R_w \times R \times T_{std}}{M_w \times P_{std}}$$

V_{lc} = Total weight of liquid collected	=	841.0	g
R_w = Density of water	=	0.002201	lb/ml
R = Ideal Gas Constant	=	21.85	inHg - ft^3/degR - lbmole
T_{std} = Standard absolute temperature	=	528.00	degR
M_w = Molecular Weight of Water	=	18.00	lb/lbmole
P_{std} = Standard absolute pressure	=	29.92	inHg

$$V_{w(std)} = \frac{841.0 \times 0.002201 \times 21.85 \times 528}{18 \times 29.92}$$

$V_{w(std)}$ = 39.65

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Metals

TRC Nozzle Calibration and Inspection Data Sheet

Company Name: ExxonMobil BTRF Dock ICR
Nozzle Number: M29 - Glass - 1

Measure three diameters (in inches) as shown below. Average the diameters and calculate area according to the calculations below.

Calibration Measurement

*Diameter 1 (in): 0.120 **Date:** 7/12/2011
*Diameter 2 (in): 0.123
*Diameter 3 (in): 0.121

Average Diameter (in): 0.121 = (Sum of Diameters 1-3) / 3

Average Radius (in): 0.0605 = Average Diameter (in) / 2
Average Radius (ft): 0.00504 = Average Radius (in) / 12

Nozzle Area (ft2): 0.0000798 = π x radius (ft) ^2

*Maximum allowable difference between largest diameter and smallest diameter is 0.004 inches.

Nozzle is round, sharp-edged, free of nicks and dents

FAL FIRST ANALYTICAL

CASE NARRATIVE

Project #: 110737 **Report Date**: 09-Aug-11
Client: TRC Environmental Corporation
Client Project ID: ExxonMobil DCU ICR #182129

Samples:

Three sets of samples were submitted for Method 29. The target elements were antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, and selenium. The samples were received in good condition with no apparent leakage or damage. All of the remaining amounts of the samples and digestates will be retained by the laboratory for six months and then discarded.

Preparation:

The metals samples were prepared according to EPA Method 29, *Determination of Metals Emissions from Stationary Sources*. The front and back halves were analyzed separately. The samples had a strong odor and an oily sheen to them.

Analysis:

Antimony, arsenic, lead, and selenium were determined by Graphite Furnace Atomic Absorption Spectrometry (GFAA). Beryllium, cadmium, chromium, cobalt, manganese, and nickel were determined by Inductively Coupled Plasma – Optical Emission Spectrometry (ICP-OES).

Results:

The metals results are presented as total micrograms of each element present in the whole analytical fraction indicated. Antimony, arsenic and beryllium were not detected in any of the samples. All other elements of interest were detected in most of the runs. Manganese had the highest amounts that ranged from about 1.9 µg to about 226 µg.

Quality Control:

No elements of interest were detected in the Laboratory Blank. All of the elements for the Laboratory Control Spike were within the acceptance limits of 80% to 120%. All of the Matrix Spike recoveries were within the acceptance range of 75% to 125%. Arsenic and selenium back half samples revealed a matrix interference which required dilutions to get the spikes to pass. All of the required duplicate samples had a relative percent difference of 20% or less or did not have an applicable calculation due to the result being five times less than the detection limit. All of the samples were analyzed at least in duplicate.

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Particulate Matter
Dates: July 14, 16, 17, 2011
Run No. 1

Barometric Pressure at Sampling Site, corrected for elevation

$$P_{bar(corr)} = P_{bar,meas} - (Elev \times 0.001)$$

$P_{bar,meas}$ = Barometric pressure as measured at ground level	=	29.65	in. Hg
Elev = elevation of sampling location relative to barometer	=	0	feet
0.001 = Conversion factor	=	0.00100	in. Hg/ft of elevation

$$Pbar(corr) = 29.65 - 0 \times 0.001$$

$$P_{bar(corr)} = 29.65 \text{ in Hg}$$

Absolute Stack Pressure, Corrected, in. Hg, as per EPA Method 2, Section 6.5

$$P_s = P_{bar(corr)} + (Pg/13.6)$$

$P_{bar(corr)}$ = Barometric pressure at the sampling site	=	29.65	in. Hg
P_g = Stack Static Pressure	=	1.10	in. H2O
13.6 = Conversion factor	=	13.6	in. H2O/in. Hg

$$P_s = 29.65 + \left(\frac{1.10}{13.6}\right)$$

$$P_s = 29.73 \text{ in Hg}$$

Absolute Stack Temperature, R

$$T_s = T + 460$$

T = Average Stack Temperatue	=	312.0	degF
460 = Conversion factor from deg F to R	=	460	

$$Ts = 312.0 + 460$$

$$Ts = 772.0 \text{ R}$$

Absolute Meter Temperature, R

$$Tm = T + 460$$

T = Average Meter Temperatue	=	80.6	degF
460 = Conversion factor from deg F to R	=	460	

$$Tm = 80.6 + 460$$

$$Tm = 540.6 \text{ R}$$

Volume of Water Vapor Condensed, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-2

$$V_{w(std)} = \frac{V_{lc} \times R_w \times R \times T_{std}}{M_w \times P_{std}}$$

V_{lc} = Total weight of liquid collected	=	665.5	g
R_w = Density of water	=	0.002201	lb/ml
R = Ideal Gas Constant	=	21.85	inHg - ft^3/degR - lbmole
T_{std} = Standard absolute temperature	=	528.00	degR
M_w = Molecular Weight of Water	=	18.00	lb/lbmole
P_{std} = Standard absolute pressure	=	29.92	inHg

$$V_{w(std)} = \frac{665.5 \times 0.002201 \times 21.85 \times 528}{18 \times 29.92}$$

$$V_{w(std)} = 31.38$$

Example Calculations

Project Name: ExxonMobil ICR Test - DCU D603 Vent
Parameter: Particulate Matter
Dates: July 14, 16, 17, 2011
Run No. 1

Dry Gas Volume, corrected to standard conditions, ft^3 - as per US EPA Method 5, Eq. 5-1

$$V_{m(std)} = V_m \times Y \times \frac{T_{std} \times (P_{bar} + (deltaH / 13.6))}{T_m \times P_{std}}$$

V_m = Volume of gas sample, dry	=	0.687	ft^3
Y = Dry gas meter calibration factor	=	1.002	
Tstd = Standard Temperature	=	528	R
P_{bar} = Barometric pressure at the sampling site	=	29.65	in. Hg
deltaH = Average pressure differential across the orifice meter	=	0.00	in. H_2O
13.6 = Conversion factor	=	13.6	in. H_2O/in. Hg
Tm = Absolute average DGM temperature	=	540.6	R
Pstd = Standard Pressure	=	29.92	in Hg

$$V_{m(std)} = \frac{0.69 \times 1.002 \times 528 \times (29.65 + (0.00 / 13.6))}{540.6 \times 29.92}$$

$V_{m(std)}$ = 0.666 dscf 0.02832 m3/ft3
$V_{m(std)}$ = 0.019 dscm

Moisture Content, proportion, by volume - as per US EPA Method 5, Eq. 5-3

$$\frac{V_{w(std)}}{V_{m(std)} + V_{w(std)}}$$

$V_{w(std)}$ = Volume of water vapor condensed	=	31.378	ft^3
$V_{m(std)}$ = Dry Gas Volume	=	0.666	ft^3

$$B_{ws} = \frac{31.378}{0.666 + 31.378}$$

B_{ws} = 0.9792

Moisture content at saturation

This calculated by polynomial fit: $(86.7222826792858 + T_s*(-0.645483277572566) + T_s^2*0.00181527101645074 + T_s^3 * (-2.28823297043421E-06) + (T_s)^4*1.09201445204276E-09)*100*29.92/P_s)$

Calibration Test Results		**Pass/Fail**
* Average Y:	1.0015	*PASS*
Ave. Y w/in 5% of previous value:		*YES*
0.95 >= Y <= 1.05:		*PASS*
** Average dH:	1.688	*PASS*

Criteria:

* Y- ratio of the reading of the calibration meter (critical orifice) to the Meter Box DGM. Acceptable tolerance of individual values from the average is +/- 0.02.

** dH- the orifice differential pressure in inches of H2O that equates to 0.75 cfm of air flow at 68 F and 29.92 in Hg, acceptable tolerance of individual values from the average is +/- 0.2.

TRC Nozzle Calibration and Inspection Data Sheet

Company Name: ExxonMobil BTRF Duluth
Nozzle Number: PM-Glass-1

Measure three diameters (in inches) as shown below. Average the diameters and calculate area according to the calculations below.

Calibration Measurement

*Diameter 1 (in): 0.120 **Date:** 7/12/2011
*Diameter 2 (in): 0.121
*Diameter 3 (in): 0.121

Average Diameter (in): 0.121 = (Sum of Diameters 1-3) / 3

Average Radius (in): 0.0605 = Average Diameter (in) / 2
Average Radius (ft): 0.00504 = Average Radius (in) / 12

Nozzle Area (ft2): 0.0000798 = π x radius (ft) ^2

*Maximum allowable difference between largest diameter and smallest diameter is 0.004 inches.

Nozzle is round, sharp-edged, free of nicks and dents

Lab Analysis Report

Case Narrative

General Information

Company:	ExxonMobil-Baytown
Project #:	182129.0000.0000
Analysis Date:	Aug 5-18, 2011
Analyst:	Randall Monson

Analysis

Analytes:	Particulate Matter
Analytical Protocols:	EPA Methods 5B & 202
TRC SOP:	AM-205B & AM-880
Analytical Notes:	No problems were encountered during the analyses.
QA/QC Review:	All of the data have been reviewed for quality assurance. All of the quality control and sample specific information in this package is complete and meets or exceeds the minimum requirements for acceptability.
Comments:	If you have any questions or concerns regarding this analysis, please feel free to contact me.

Laboratory Statements: I certify that to the best of my knowledge:

- Test data and all corresponding information have been checked for accuracy and completeness.
- Analyses have been conducted in accordance with approved protocol, reference methods and the requirements of NELAC (as applicable).
- All deviations, method modifications, or analytical anomalies are summarized in the appropriate report narrative(s).
- Analysis results only represent that of the samples as received into the laboratory.
- This document contains a total of 22 pages.

This test report shall not be reproduced except in full, without the written approval of the laboratory.

[1] "Matrix" is a description of item being weighed (i.e., quartz filter, glass beaker, etc.)

[2] Desiccate filters for >24 hrs prior to initial weighing. Record additional readings at intervals of >6 hrs. *[EPA/600/R-94/038c, 09/94, F5-1]*

[3] Chamber temperature must be maintained at 20 +/- 5.6 °C (68 +/- 10 °F). During each weighing, sample exposure to laboratory atmosphere must be <2 minutes, with a relative humidity of <50 %. *[EPA/600/R-94/038c, September 1994, F5-1]*

[4] Record results to nearest 0.1 mg (0.0001 g). *[EPA/600/R-94/038c, September 1994, F5-1]*

[5] The average mass is achieved when two successive results are within +/- 0.5 mg (0.0005 g). Record the average of the two successive weights (if applicable) or indicate the page number where subsequent weights are recorded. *[EPA/600/R-94/038c, September 1994, F5-1]*

[6] The "Net Gain" is the arithmetic result of the ["Post-Test Average Mass" - "Pre-Test Average Mass"].

[7] Method 5B matrix must be heated for 6 hrs at 320 °F and then desiccated as per footnote 2.

[1] *The analytical balance is to be verified before and after each weighing session [TRC SOP AM-600]*

All calibration checks must be performed using certified ASTM Class 1 reference masses (or equivalent).

[2] Perform internal calibration as described in *"Calibrating the Balance", Operating Instructions, Mettler AE240 Dual Range Analytical Balance.*

[3] Measure responses to each of the two external calibration standard masses. Record results to the nearest 0.0001 g.

[4] Delta is the arithmetic result of the ***Measured - True Value*** [e.g., "100g Class-1 Standard Response" - 100.0000].

The result must be +/- 0.0020 g for the 100 g mass, +/- 0.0005 g for the 10 g mass and +/- 0.0002 g for the 0.2 g mass.

If the delta exceeds the tolerance, contact the Operations Manager and repair the balance before proceeding. *[TRC SOP AM-600]*

[1] The analytical balance is to be verified before and after each weighing session *[TRC SOP AM-600]*

All calibration checks must be performed using certified ASTM Class 1 reference masses (or equivalent).

[2] Perform internal calibration as described in *"Calibrating the Balance", Operating Instructions, Mettler AE240 Dual Range Analytical Balance.*

[3] Measure responses to each of the two external calibration standard masses. Record results to the nearest 0.0001 g.

[4] Delta is the arithmetic result of the ***Measured - True Value*** [e.g., "100g Class-1 Standard Response" - 100.0000].

The result must be +/- 0.0020 g for the 100 g mass, +/- 0.0005 g for the 10 g mass and +/- 0.0002 g for the 0.2 g mass.

If the delta exceeds the tolerance, contact the Operations Manager and repair the balance before proceeding. *[TRC SOP AM-600]*

Texas Commission on Environmental Quality

NELAP-Recognized Laboratory Accreditation is hereby awarded to

TRC Environmental Corporation

9225 US Highway 183 South
Austin, TX 78747-2058

in accordance with Texas Water Code Chapter 5, Subchapter R, Title 30 Texas Administrative Code Chapter 25, and the National Environmental Laboratory Accreditation Program.

The laboratory's scope of accreditation includes the fields of accreditation that accompany this certificate. Continued accreditation depends upon successful ongoing participation in the program. The Texas Commission on Environmental Quality urges customers to verify the laboratory's current accreditation status for particular methods and analyses.

Certificate Number: T104704369-11-2
Effective Date: 7/1/2011
Expiration Date: 6/30/2012

Executive Director Texas Commission on Environmental Quality

Part Number:	E04NI99E15A41H7	Reference Number:	83-124244061-15
Cylinder Number:	CC334116	Cylinder Volume:	144 Cu.Ft.
Laboratory:	ASG - Port Allen - LA	Cylinder Pressure:	2015 PSIG
PGVP Number:	B42011	Valve Outlet:	660
		Analysis Date:	Dec 15, 2010

Expiration Date: Dec 15, 2012

Certification performed in accordance with "EPA Traceability Protocol (Sept. 1997)" using the assay procedures listed. Analytical Methodology does not require correction for analytical interferences. This cylinder has a total analytical uncertainty as stated below with a confidence level of 95%. There are no significant impurities which affect the use of this calibration mixture. All concentrations are on a volume/volume basis unless otherwise noted.
Do Not Use This Cylinder below 150 psig.i.e. 1 Mega Pascal

ANALYTICAL RESULTS

Component	Requested Concentration	Actual Concentration	Protocol Method	Total Relative Uncertainty
CARBON MONOXIDE	200.0 PPM	201.8 PPM	G1	+/- 1% NIST Traceable
NITRIC OXIDE	200.0 PPM	195.0 PPM	G1	+/- 1% NIST Traceable
PROPANE	270.0 PPM	266.6 PPM	G1	+/- 1% NIST Traceable
NITROGEN	Balance			
Total oxides of nitrogen		196.2 PPM		For Reference Only

ANALYTICAL INFORMATION

This certification was performed according to EPA Traceability Protocol For Assay & Certification of Gaseous Calibration Standards; Procedure G-1; September, 1997.

Cylinder Number: CC116015 **Certification Date:** 21Dec2009 **Exp. Date:** 20Dec2012
Cylinder Pressure*:** 1950 PSIG

COMPONENT	CERTIFIED CONCENTRATION (Moles)		ANALYTICAL ACCURACY**	TRACEABILITY
PROPANE	4,460	PPM	+/- 1%	Direct NIST and VSL
AIR		BALANCE		

*** Do not use when cylinder pressure is below 150 psig.

** Analytical accuracy is based on the requirements of EPA Protocol Procedure G1, September 1997.

APPENDIX J: PRELIMINARY TEST DATA

ExxonMobil Delayed Coker Vent – Port location recommendations

Based on groups listed in Table 1.1 of the EPA's letter to ExxonMobil, TRC's estimate of number of ports needed to perform a single group (a,b,c, or d) test is:

1 – VOST/30B port (one horizontal port)

1 – CEMS / GC port (one horizontal port)

3 – Isokinetic Ports (two ports 90 deg apart – one horizontal and one vertical)

1 – extra Isokinetic Ports (two ports 90 deg apart – one horizontal and one vertical)

1 – Velocity Ports (two ports 90 deg apart – one horizontal and one vertical)

Ports should be horizontal (for locations with one port) / horizontal and vertical (for locations with two port– 90 deg apart)

Port – 3"I.D. Flanged with gate valve (TRC will install packing glands to valves to seal sampling probes)

Drawing below is based on a 15 ft straight run of pipe

Drawing below is based on an 8"I.D. pipe

Need at least 16"(2 pipe diameters) upstream of each port to the nearest port or flow disturbance.

Need at least 4" (0.5 pipe diameters) downstream of each port to the nearest port or flow disturbance.

Velocity port should be the furthest downstream port on the straight run.

VOST port should be the furthest upstream port on the straight run.

Austin, TX 78747

ExxonMobil - DCU, D603 Vent

Project # 182129.0000.0000

Analytical Report
(0711-64)

EPA Method 18 (Bags and Condensates)

1,3-Butadiene, Acetonitrile, Acrolein, Acetone, Acrylonitrile, Pentane, Methylene chloride, Hexane, Benzene, Trichloroethene, Toluene, 1,2-Dibromoethane, Tetrachloroethene, Carbon disulfide, Methane and Ethane

EPA Method 18 (Adsorbents)

Acetonitrile, Acrylonitrile, Methyl t-butyl ether (MTBE), 2-Nitropropane, Isooctane, Methyl isobutyl ketone (MIBK), Chlorobenzene, Ethylbenzene, m/p-Xylene, Styrene, o-Xylene, Cumene, and Nitrobenzene,

EPA Method 308

Methanol

Enthalpy Analytical, Inc.

Phone: (919) 850 - 4392 / Fax: (919) 850 - 9012 / www.enthalpy.com
2202 Ellis Road Durham, NC 27703 - 5518

I certify that to the best of my knowledge all analytical data presented in this report:

- Have been checked for completeness
- Are accurate, error-free, and legible
- Have been conducted in accordance with approved protocol, and that all deviations and analytical problems are summarized in the appropriate narrative(s)

This analytical report was prepared in Portable Document Format (.PDF) and contains 1102 pages.

Report Issued: 09/22/2011

Narrative Summary

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp
Analyst	MGM
Parameters	EPA Method 18 Bags

Client #	182129.0000.0000
Job #	0711-64
# Samples	3 Bags & 2 S/R

Custody	Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at ambient temperature after being relinquished by TRC Environmental Corporation of Austin, TX. The bag samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The bag samples were analyzed for 1,3-butadiene, pentane, acrolein, acetonitrile, acetone, dichloromethane (methylene chloride), hexane, benzene, trichloroethene, toluene, tetrachloroethene, and 1,2-dibromoethane using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A). All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. All target analytes were referenced to certified gas phase standards. The Agilent Technologies Model 6890, Gas Chromatograph "Gummo" (S/N US00028451) was equipped with front and rear Flame Ionization Detectors, along with Restek Rtx-624 30m x 0.32mm (S/N 926828) and Rtx-1 30m x 0.32mm x 4.0um (S/N 869999) capillary columns, for these analyses.
Calibration	The calibration curves are included in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition method, GC114P165.M, is included in the Calibration Curve Chromatograms section of this report.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes	As required by the method, a recovery study was performed on a bag sample. The bag sample ***EM-R1-Bag-DCU*** was spiked with 1, 3 butadiene, acrolein, acetone, methylene chloride, hexane, benzene, trichloroethene, and toluene on 7/21/11 at 11:00 AM. The recovery efficiency values met the method-required limits of 70 to 130% for hexane, benzene, and toluene, only. The recovery efficiency values were used to adjust the results for hexane, benzene and toluene, only. Due to high concentations of, or interference from, target and non-target compounds, recoveries of the remaining compounds could not be determined. Bag sample ***EM-R2-Bag-DCU*** was also spiked and similar results were attained. Because the collocated tube train was not spiked with acetonitrile and acryloniltrile, a baseline analyses was preformed on bag ***EM-R3-Bag-DC*** and it was subsequently spiked with methane, acetonitrile, acrylonitrile. The methane spike was not appropriate for the concentration of that compounds in the sample. The recovery efficiency values did not met recovery criteria for these compounds.
Reporting Notes	Included in the report are the analyses of all three spiked bags. The spike recovery values are presented in the Results section of the report for bags ***EM-R1-Bag-DCU*** and ***EM-R3-Bag-DC***. The results for the applicable spiked bag are presented on the individual compound results pages. These analytical results are reported on a wet basis. The user of this report should determine the percent moisture in the sample and correct the reported value to ppmvd as appropriate. The results presented in this report are representative of the samples as provided to the laboratory.

Custody	Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/2011 at ambient temperature after being relinquished by TRC Environmental Corporation of Austin, TX. The bag samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The bag samples were analyzed for carbon disulfide using the Hewlett Packard Model 5890, Series II Gas Chromatograph "Zeppo" (S/N 3235A4448X) was equipped with a Flame Photometric Detector and a Restek Rtx-1 60m x 0.53mm x 5.0um (S/N 663119) capillary column. All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. Carbon disulfide was referenced to gas phase standards prepared by certified permeation devices.
Calibration	The calibration curves are located in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition method, FPDTEST2.M, is included in the Calibration Curve Chromatograms section of this report.
QC Notes	None.

Enthalpy Analytical Narrative Summary
(continued)

Reporting Notes	These analytical results are reported on a wet basis. The user of this report should determine the percent moisture in the sample and correct the reported value to ppmvd as appropriate. The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp
Analyst	JBB
Parameters	EPA Method 18

Client #	182129.0000.0000
Job #	0711-64
# Samples	3 Bags Condensates

Custody

Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at 5.8 °C after being relinquished by TRC Environmental Corporation of Austin, TX. The bag condensate samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.

Analysis

The samples were analyzed for 1,3-butadiene, pentane, acrolein, acetone, dichloromethane, hexane, benzene, trichloroethene, toluene, tetrachloroethene, 1,2-dibromoethane, and carbon disulfide using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A).

All samples and standards were introduced directly to the column using an automated multi-port Valco gas sampling valve equipped with a stainless steel loop. All target analytes were referenced to certified standards.

Analyses for all compounds except carbon disulfide, were preformed using the Agilent Technologies Model 6890N, Gas Chromatograph "Veronica" (S/N US10645052) was equipped with a Flame Ionization Detector and a Restek Rtx-624 105m x 0.53mm x 3.0um (S/N 1032767) capillary column.

The carbon disulfide analysis was performed using a Hewlett Packard Model 5890, Series II Gas Chromatograph "Oscar" (S/N 2938A2) equipped with a Flame Photometric Detector and a Restek Stabilwax 30m x 0.53mm x 1.5um (S/N 1033248) capillary column.

Calibration

The calibration curves are included in the Calibration Curve Chromatograms sections of this report and referenced in the Analysis Method column on the Detailed Results page.

For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.

Enthalpy Analytical Narrative Summary
(continued)

Chromatographic Conditions	The acquisition methods GC118P140.M and GC118P46.M are included in the Calibration Curve Chromatograms sections of this report.
QC Notes	The analyses of the field blank contained no target compounds at concentrations greater than the detection limit.
	The analyses of the matrix spike prepared using aliquots for sample ***R1 Bag Cond*** exhibited recovery values ranging from 78.6 to 133%.
Reporting Notes	The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp	**Client #**	182129.0000.0000
Analyst	KAM	**Job #**	0711-64
Parameters	EPA Method 18 Adsorbents	**# Samples**	6 Runs & 2 blanks

Custody	Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at 5.8 °C after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received in good condition with the following exceptions. The XAD A and B tubes for ***R1*** and ***R3*** were received wet. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The samples were analyzed for acetonitrile, acrylonitrile, methyl t-butyl ether (MTBE), 2-nitropropane, isooctane, methyl isobutyl ketone (MIBK), chlorobenzene, ethylbenzene, m/p-xylene, styrene, o-xylene, cumene, and nitrobenzene using the analytical procedures in EPA Method 18, Measurement of Gaseous Organic Compound Emissions by Gas Chromatography (40 CFR Part 60, Appendix A). Each sample train consisted of a knockout impinger, a SKC Xad-4 (Cat# 226-93), and a SKC Charcoal (Cat# 226-16) sample tube. All sample tubes were divided into front half (FH) and back half (BH) fractions. Each fraction was desorbed using 5 mL of carbon disulfide. The volume of one zero headspace vial was measured and recorded for the condensates. An 8 mL aliquot of each sample was removed and archived. The remaining sample was extracted with 5 mL of carbon disulfide. The carbon disulfide and aqueous layers were seperated and analyzed seperately. The aqueous fraction is termed the raffinate. The analyst noted that the carbon disulfide extracts were yellow and that their color increased in intensity from ***R1*** to ***R3***. The Hewlett Packard Model 6890, Gas Chromatograph "Lucy" (S/N US00039147) was equipped with a Flame Ionization Detector and a Restek Rtx-1 30m x 0.32mm x 4.0um (S/N 450928) capillary column, for the analyses of the extract fractions.
Analysis (continued)	The Hewlett Packard Model 5890, Series II Gas Chromatograph "Teller" (S/N 3033A3174) was equipped with a Flame Ionization Detector and a Restek Stabilwax 30m x 0.53mm x 2.0um (S/N 808560) capillary column, for the analyses of the raffinate fractions.

Enthalpy Analytical Narrative Summary
(continued)

Calibration	The calibration curves are included in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition methods GC121P078.M and GC121P078B.M are included in the Calibration Curve Chromatograms section of this report.
QC Notes	The m/p-xylene results for samples ***R1A*** and ***R2A*** were flagged with "E", because the concentrations in the XAD FH fractions exceded the instrument's calibration range. The large amount of unknown compound peaks caused an increase in the baseline which caused the precision between some triplicate injections of the samples to be greater than the method required 5% difference. The precision values are presented in the Results section of this report. In order to achieve the best integration of these samples, the slope sensitivity was increased causing an increase in the detection limit for this analysis. A spike recovery study was performed for the compounds of interest during the field test. The laboratory provided aqueous spikes for acetonitrile and acrylonitrile, at 235 µg and 236 µg, respectively. The lab provided XAD-2 tubes spiked with the remaining compounds of interest. Each tube was spiked with 22.1 µg of MTBE, 29.1 µg of 2-nitropropane, 24.1 µg of isooctane, 23.9 µg of MIBK, 33.2 µg of chlorobenzene, 26.0 µg of ethylbenzene, 43.0 µg of p-xylene, 27.2 µg of styrene, 26.4 µg of o-xylene, 26.0 µg of cumene, and 36.1 µg of nitrobenzene. Because of the low ratio of spike level to sample loading the recovery study was not useable. Spike recovery values for the laboratory control samples prepared from the retained spikes are presented in the Results section of this report.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)	The m- and p- xylene isomers are inseparable and indistinguishable with the equipment and conditions used for this analyis. These two isomers have virtually identical responses. Therefore the instrument was calibrated using p-xylene. Any results shown are accurate representatations of the total of m-xylene and p-xylene present in the sample. The asociated results have been labeled as both isomers.
Reporting Notes	The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp	**Client #**	182129.0000.0000
Analyst	CLD	**Job #**	0711-64
Parameters	EPA Method 308	**# Samples**	3 Runs & 2 blanks

Custody	Lindsey Chatterton of Enthalpy Analytical, Inc. received the samples on 7/20/11 at 5.8 °C after being relinquished by TRC Environmental Corporation of Austin, TX. The silica gel tubes for samples ***R1*** and ***R3*** were received wet. The silica gel tube for ***R2*** was received broken. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The samples were analyzed for methanol using the analytical procedures in EPA Method 308, Procedure for Determination of Methanol Emission from Stationary Sources (40 CFR Part 63, Appendix A). Although the silica gel tube for ***R2*** was broken it was also wet so most of the media remained adhered to the tube and to the outside of the condensate container. The analyst noted that more than 95% of the media contents were recovered and desorbed. All silica gel tubes were desorbed using 5.00 mL of a 3% n-propanol in deionized water solution. The Hewlett Packard Model 5890, Series II Gas Chromatograph "Penn" (S/N 2750A17269) was equipped with front and rear Flame Ionization Detectors and two Restek Stabilwax 30m x 0.53mm x 2.0 um (S/N 810087 and S/N 808560) capillary columns, for these analyses.
Calibration	The calibration curves are included in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition methods GC120P139.M and GC120P150.M are included in the Calibration Curve Chromatograms section of this report.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes	Methanol was not detected at concentrations above the detection limit in the analyses of the field and laboratory blanks. The analysis of the laboratory control sample desorbed with these samples exhibited a spike recovery of 82.2%.
Reporting Notes	The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, Inc. data reports, unless specifically noted otherwise.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.
- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.
- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.
- The letter ***J*** following a value indicates an analytical result between the MDL and the LOQ. A J flag indicates that the laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.
- The letter ***E*** following a value indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.
- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.
- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. This shows what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).
- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as an MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.
- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).
- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.
- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two extra spikes are prepared. The extras (randomly chosen) are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection and/or sample transport.

General Reporting Notes

(continued)

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits.
- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name.

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : 6/6/2011 4:49:09 PM

Rel. Reference Window : 0.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.050 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

==========

6890 GC METHOD

==========

OVEN
- Initial temp: 35 'C (On)
- Initial time: 2.20 min
- Maximum temp: 250 'C
- Equilibration time: 0.20 min
- Ramps:

#	Rate	Final temp	Final time
1	15.00	70	0.07
2	30.00	250	1.00
3	0.0(Off)		

- Post temp: 50 'C
- Post time: 0.00 min
- Run time: 11.60 min

FRONT INLET (SPLIT/SPLITLESS)
- Mode: Split
- Initial temp: 160 'C (On)
- Pressure: 5.00 psi (On)
- Split ratio: 5:1
- Split flow: 10.6 mL/min
- Total flow: 18.9 mL/min
- Gas saver: Off
- Gas type: Hydrogen

BACK INLET (SPLIT/SPLITLESS)
- Mode: Split
- Initial temp: 160 'C (On)
- Pressure: 5.12 psi (On)
- Split ratio: 5:1
- Split flow: 10.3 mL/min
- Total flow: 18.7 mL/min
- Gas saver: Off
- Gas type: Hydrogen

COLUMN 1
- Capillary Column
- Model Number: Restek 10970
- Rtx-624 30m x 0.32mm x 1.8um SN 92682
- Max temperature: 240 'C
- Nominal length: 30.0 m
- Nominal diameter: 320.00 um
- Nominal film thickness: 1.80 um
- Mode: constant flow
- Initial flow: 2.1 mL/min
- Nominal init pressure: 5.00 psi
- Average velocity: 40 cm/sec
- Inlet: Front Inlet
- Outlet: Front Detector
- Outlet pressure: ambient

COLUMN 2
- Capillary Column
- Model Number: Restek 10198
- Rtx-1 30m x 0.32mm x 4.0um
- Max temperature: 280 'C
- Nominal length: 30.0 m
- Nominal diameter: 320.00 um
- Nominal film thickness: 4.00 um
- Mode: constant flow
- Initial flow: 2.1 mL/min
- Nominal init pressure: 5.12 psi
- Average velocity: 39 cm/sec
- Inlet: Back Inlet
- Outlet: Back Detector
- Outlet pressure: ambient

FRONT DETECTOR (FID)
- Temperature: 250 'C (On)
- Hydrogen flow: 40.0 mL/min (On)
- Air flow: 450.0 mL/min (On)
- Mode: Constant makeup flow
- Makeup flow: 45.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Flame: On
- Electrometer: On
- Lit offset: 2.0

BACK DETECTOR (FID)
- Temperature: 250 'C (On)
- Hydrogen flow: 40.0 mL/min (On)
- Air flow: 450.0 mL/min (On)
- Mode: Constant makeup flow
- Makeup flow: 45.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Flame: On
- Electrometer: On
- Lit offset: 2.0

SIGNAL 1
- Data rate: 50 Hz
- Type: front detector
- Save Data: On
- Zero: 0.0 (Off)
- Range: 0
- Fast Peaks: Off
- Attenuation: 0

SIGNAL 2
- Data rate: 50 Hz
- Type: back detector
- Save Data: On
- Zero: 0.0 (Off)
- Range: 0
- Fast Peaks: Off
- Attenuation: 0

method: G:\GC2010Q3\GUMMO\METHODS\GC114P165.M
Modified on: 7/14/2010 at 3:13:47 PM

COLUMN COMP 1
Derive from front detector

COLUMN COMP 2
Derive from back detector

THERMAL AUX 1
Use: Valve Box Heater
Description:
Initial temp: 50 'C (Off)
Initial time: 0.00 min

#	Rate	Final temp	Final time
1	0.0	(Off)	

VALVES
Valve 1 Gas Sampling
Description:
Loop Volume: 0.250 mL
Load Time: 0.50 min
Inject Time: 0.50 min
Inlet: Front Inlet
Valve 2 Gas Sampling
Description:
Loop Volume: 0.250 mL
Load Time: 0.50 min
Inject Time: 0.50 min
Inlet: Back Inlet
Valve 7 Multiposition 1
Description:
BCD input: inverted
Switch Time: 1.0 sec

POST RUN
Post Time: 0.00 min

TIME TABLE

Time	Specifier	Parameter & Setpoint	
0.10		Multi-Valve Position:	1

SPECIAL INFORMATION / ADDITIONAL COMMENTS

The product listed above and furnished under the referenced purchase order has been tested and found to contain the component concentration listed above. All values in mole/mole basis gas phase unless otherwise indicated. Matheson Tri-Gas Inc. warrants that the above product(s) conform at the time of shipment to the above description. Matheson Tri-Gas Inc. liability does not exceed the value of the product purchased.

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : 7/27/2011 11:35:05 AM

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Power
Origin : Ignored
Weight : Equal

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A,
Signal 2: FPD2 B,

Calibration Table

Calib. Data Modified : 7/29/2011 11:54:30 AM

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : Separately calculated (see below)
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Power
Origin : Ignored
Weight : Equal

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A,
Uncalibrated Peaks : not reported
Signal 2: FPD2 B,
Uncalibrated Peaks : using compound Methyl Mercaptan

Injection Source and Location

Injection Source: Valve

Injection Location: Dual

OVEN\DET

Runtime (min): 16.3

Zone Temperatures:

	State	Setpoint
Inl. A	ON	175 C.
Inl. B	ON	175 C.
Det. A	ON	250 C.
Det. B	ON	250 C.
Aux.	OFF	120 C.

Oven Zone:

Oven max	260 C.
Equib Time	0.30 Min.
Oven State	ON
Cryo State	OFF
Ambient	25 C.
Cryo Blast	OFF

Oven Program:

	Setpoint
Initial Temp.:	50 C.
Initial Time:	4.00 Min.

Level	Rate (C/min.)	Final Temp.(C)	Final Time (min)
1	30.0	180	8.00

InletA Pressure Program Information

Constant Flow:	On
Pressure:	0.0 psi
Temperature:	50 C

Pressure Program:

	Setpoint
Initial Pres.:	0.0 psi
Initial Time:	650.00 min.

Level	Rate (psi/min.)	Final Pres.(psi)	Final Time (min)
1	0.00	0.0	0.00
2(A)	0.00	0.0	0.00
3(B)	0.00	0.0	0.00

Total Program Time: 650.00

GC Pressure Units:psi

Entered Values:

Column Length: 30.00 m.

method: G:\GC2011Q3\ZEPPO\METHODS\FPDTEST2.M
Modified on: 7/8/2011 at 9:09:17 AM

Column Diameter:	0.320	mm.
Gas:	H2	
Vacuum Comp:	Off	

InletB Pressure Program Information

Constant Flow:	On
Pressure:	4.0 psi
Temperature:	40 C.

Pressure Program:

	Setpoint
Initial Pres.:	0.0 psi
Initial Time:	650.00 min.

Level	Rate (psi/min.)	Final Pres.(psi)	Final Time (min)
1	0.00	0.0	0.00
2(A)	0.00	0.0	0.00
3(B)	0.00	0.0	0.00

Total Program Time: 650.00

GC Pressure Units:psi

Entered Values:

Column Length:	60.00	m.
Column Diameter:	0.530	mm.
Gas:	H2	
Vacuum Comp:	Off	

Inlet A Packed Column Information

Equation:---

Pressure-Flow Relationship:

	Pres.	Flow(psi) (ml/min)
1	---	0.0
2	---	0.0
3	---	0.0

Last pressure calibration:---

Packed Column Flow Setting (ml/min):0.0

Inlet B Packed Column Information

Equation:---

Pressure-Flow Relationship:

	Pres.	Flow(psi) (ml/min)
1	---	0.0
2	---	0.0
3	---	0.0

Last pressure calibration:---

Packed Column Flow Setting (ml/min):0.0

Purge Valve Settings

Purge A/B

	Init Value	On Time (Min.)	Off Time (Min.)
A (Valve 3)	On	0.00	0.00
B (Valve 4)	On	0.00	0.00

A - Splitless Injection: No
B - Splitless Injection: No

EM-BTRF-001006

method: G:\GC2011Q3\ZEPPO\METHODS\FPDTEST2.M
Modified on: 7/8/2011 at 9:09:17 AM

Valves/Relays Information

Initial Setpoints:
5890 Valves:

Valve 1:	Off
Valve 2:	Off
Valve 3 (Purge A):	On
Valve 4 (Purge B):	On

Valve/Relay Time Table:

Time	Name	State	Comment
0.01	Valve1	On	
0.10	Valve1	Off	
1.00	Valve2	On	
1.10	Valve2	Off	

Detector Information

Detector A:

Type	FID
State	ON

Detector B:

Type	FPD
State	ON

Signal Information

Save Data:	Both

Signal 1:

Signal	Det. A
Data rate	20.000 Hz.
Peakwidth	0.013 min.
Start Time	0.00 min.
Stop Time	650.00 min.

Signal 2:

Signal	Det. B
Data rate	20.000 Hz.
Peakwidth	0.013 min.
Start Time	0.00 min.
Stop Time	650.00 min.

PHYSICAL PROPERTIES

Cylinder Size: A

Pressure: 2000 PSIG
Expiration Date: 15Dec2011

SPECIAL HANDLING INSTRUCTIONS

Do not use or store cylinder at or below the stated dew point temperature. Possible condensation of heavier components could result. In the event the cylinder has been exposed to temperatures at or below the dew point, place cylinder in heated area for 24 hours and then roll cylinder for 15 minutes to re-mix.

Use of calibration standards at or below dew point temperature may result in calibration error.

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : 8/8/2011 3:48:45 PM

Rel. Reference Window : 0.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

==========

6890 GC METHOD

==========

OVEN
- Initial temp: 40 'C (On)
- Initial time: 2.00 min
- Maximum temp: 300 'C
- Equilibration time: 1.00 min
- Ramps:

#	Rate	Final temp	Final time
1	25.00	240	2.00
2	0.0(Off)		

- Post temp: 50 'C
- Post time: 0.00 min
- Run time: 12.00 min

FRONT INLET (SPLIT/SPLITLESS)
- Mode: Splitless
- Initial temp: 225 'C (On)
- Pressure: 10.15 psi (On)
- Purge flow: 100.0 mL/min
- Purge time: 0.50 min
- Total flow: 116.6 mL/min
- Gas saver: On
- Saver flow: 20.0 mL/min
- Saver time: 5.00 min
- Gas type: Hydrogen

BACK INLET (SPLIT/SPLITLESS)
- Mode: Split
- Initial temp: 225 'C (On)
- Pressure: 5.13 psi (On)
- Split ratio: 1:1
- Split flow: 2.0 mL/min
- Total flow: 10.1 mL/min
- Gas saver: Off
- Gas type: Hydrogen

COLUMN 1
- Capillary Column
- Model Number: Restek 10975
- Rtx-624 105m x 0.53mm x 3.0um
- Max temperature: 240 'C
- Nominal length: 105.0 m
- Nominal diameter: 530.00 um
- Nominal film thickness: 3.00 um
- Mode: constant pressure
- Pressure: 10.15 psi
- Nominal initial flow: 10.4 mL/min
- Average velocity: 61 cm/sec
- Inlet: Front Inlet
- Outlet: Front Detector
- Outlet pressure: ambient

COLUMN 2
- Capillary Column
- Model Number: Restek 10198
- Rtx-1 30m x 0.32mm x 4.0um
- Max temperature: 350 'C
- Nominal length: 30.0 m
- Nominal diameter: 320.00 um
- Nominal film thickness: 4.00 um
- Mode: constant pressure
- Pressure: 5.13 psi
- Nominal initial flow: 2.0 mL/min
- Average velocity: 39 cm/sec
- Inlet: Back Inlet
- Outlet: Back Detector
- Outlet pressure: ambient

FRONT DETECTOR (FID)
- Temperature: 250 'C (On)
- Hydrogen flow: 40.0 mL/min (On)
- Air flow: 450.0 mL/min (On)
- Mode: Constant makeup flow
- Makeup flow: 45.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Flame: On
- Electrometer: On
- Lit offset: 2.0

BACK DETECTOR (FID)
- Temperature: 250 'C (On)
- Hydrogen flow: 40.0 mL/min (Off)
- Air flow: 450.0 mL/min (Off)
- Mode: Constant makeup flow
- Makeup flow: 45.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Flame: Off
- Electrometer: On
- Lit offset: 2.0

SIGNAL 1
- Data rate: 20 Hz
- Type: front detector
- Save Data: On
- Zero: 0.0 (Off)
- Range: 0
- Fast Peaks: Off
- Attenuation: 0

SIGNAL 2
- Data rate: 20 Hz
- Type: back detector
- Save Data: Off
- Zero: 0.0 (Off)
- Range: 0
- Fast Peaks: Off
- Attenuation: 0

method: C:\GC2011Q3\VERONICA\METHODS\GC118P140.M
Modified on: 8/6/2011 at 5:52:32 PM

COLUMN COMP 1
Derive from front detector

COLUMN COMP 2
Derive from back detector

POST RUN
Post Time: 0.00 min

TIME TABLE

Time	Specifier	Parameter & Setpoint

GC Injector

Front Injector:

Sample Washes	0
Sample Pumps	7
Injection Volume	0.20 microliters
Syringe Size	10.0 microliters
PreInj Solvent A Washes	0
PreInj Solvent B Washes	0
PostInj Solvent A Washes	3
PostInj Solvent B Washes	3
Viscosity Delay	2 seconds
Plunger Speed	Variable
Injection Speed	6000.00 microliters/minutes
Draw Speed	300.00 microliters/minutes
Dispense Speed	6000.00 microliters/minutes
PreInjection Dwell	0.00 minutes
PostInjection Dwell	0.00 minutes

Back Injector:
No parameters specified

Sequence: C:\GC2011Q3\VERONICA\SEQUENCE\gc118p140.txt

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : Tuesday, August 09, 2011 6:35:37 PM

Rel. Reference Window : 0.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.200 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear (some peaks differ, see below)
Origin : Connected (some peaks differ, see below)
Weight : Quadratic (Amnt) (some peaks differ, see below)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A,
Signal 2: FPD2 B,

RetTime [min]	Sig	Lvl	Amount	Area	Amt/Area	Ref Grp	Name
1.661	2	2	5.03000e-1	3.22331e4	1.56051e-5		Carbon disulfide
		3	1.00600	7.65855e4	1.31357e-5		
		4	2.00800	1.97205e5	1.01823e-5		
		5	4.98900	8.92069e5	5.59262e-6		
		6	9.88000	2.87746e6	3.43359e-6		

More compound-specific settings:

Compound: Carbon disulfide
Time Window : From 1.515 min To 1.761 min
Curve Type : Quadratic
Origin : Connected
Calibration Level Weights:/
Level 2 : 1
Level 3 : 0.25
Level 4 : 0.062749
Level 5 : 0.010165
Level 6 : 0.002592

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : 8/22/2011 2:55:31 PM

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.050 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Resp)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Calibration Table

Calib. Data Modified : Wednesday, August 03, 2011 11:27:10 AM

Rel. Reference Window : 0.000 %
Abs. Reference Window : 0.050 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Resp)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A,

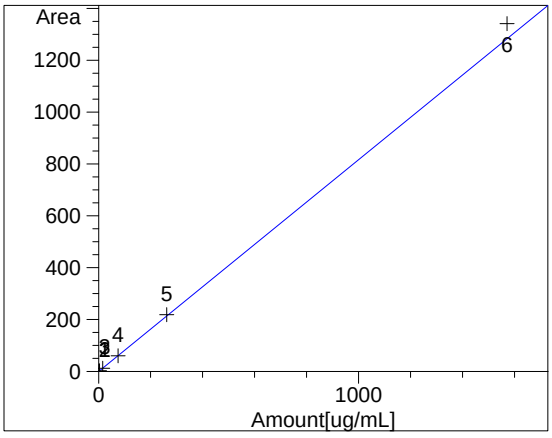
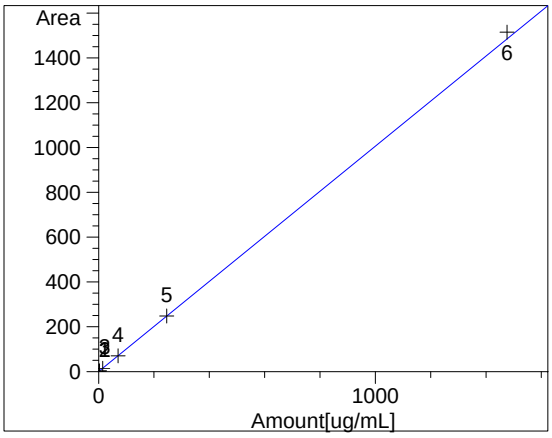
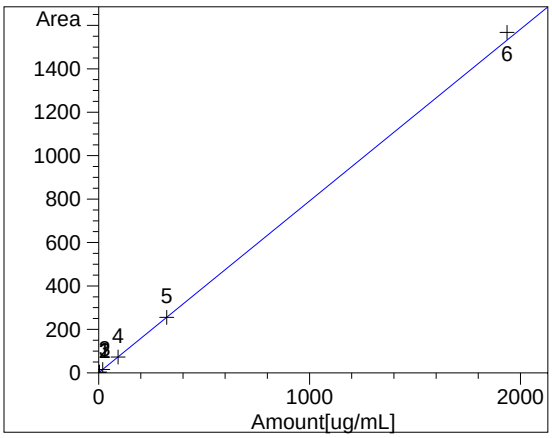
Acetonitrile at exp. RT: 2.703
FID1 A,
Correlation: 0.99620
Residual Std. Dev.: 6.40303
Formula: y = mx + b
m: 4.55785e-1
b: -1.25261e-1
x: Amount
y: Area
Calibration Level Weights:
Level 1 : 1
Level 2 : 0.277214
Level 3 : 0.008662
Level 4 : 0.000325
Level 5 : 0.000023



Acrylonitrile at exp. RT: 3.178
FID1 A,
Correlation: 0.99929
Residual Std. Dev.: 28.83872
Formula: y = mx + b
m: 8.17264e-1
b: -2.11328e-1
x: Amount
y: Area
Calibration Level Weights:
Level 1 : 1
Level 2 : 0.209096
Level 3 : 0.008252
Level 4 : 0.000319
Level 5 : 0.000024
Level 6 : 6.43699e-007



MTBE at exp. RT: 4.051
FID1 A,
Correlation: 0.99989
Residual Std. Dev.: 14.90969
Formula: y = mx + b
m: 1.00639
b: -2.48345e-2
x: Amount
y: Area
Calibration Level Weights:
Level 1 : 1
Level 2 : 0.245973
Level 3 : 0.010299
Level 4 : 0.000432
Level 5 : 0.000035
Level 6 : 9.29726e-007



2-Nitropropane at exp. RT: 5.279
FID1 A,
Correlation: 0.99987
Residual Std. Dev.: 17.40272
Formula: y = mx + b
m: 7.91568e-1
b: -3.72856e-2
x: Amount
y: Area
Calibration Level Weights:
Level 1 : 1
Level 2 : 0.255411

- Average velocity: 49 cm/sec
- Inlet: Front Inlet
- Outlet: Front Detector
- Outlet pressure: ambient

COLUMN 2
- (not installed)

FRONT DETECTOR (FID)
- Temperature: 300 'C (On)
- Hydrogen flow: 40.0 mL/min (On)
- Air flow: 450.0 mL/min (On)
- Mode: Constant makeup flow
- Makeup flow: 45.0 mL/min (On)
- Makeup Gas Type: Nitrogen
- Flame: On
- Electrometer: On
- Lit offset: 2.0

BACK DETECTOR (FID)
- Temperature: 300 'C (Off)
- Hydrogen flow: 40.0 mL/min (Off)
- Air flow: 450.0 mL/min (Off)
- Mode: Constant makeup flow
- Makeup flow: 45.0 mL/min (Off)
- Makeup Gas Type: Nitrogen
- Flame: Off
- Electrometer: Off
- Lit offset: 2.0

SIGNAL 1
- Data rate: 20 Hz
- Type: front detector
- Save Data: On
- Zero: 0.0 (Off)
- Range: 0
- Fast Peaks: Off
- Attenuation: 0

SIGNAL 2
- Data rate: 20 Hz
- Type: back detector
- Save Data: Off
- Zero: 0.0 (Off)
- Range: 0
- Fast Peaks: Off
- Attenuation: 0

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : 8/16/2011 6:20:02 PM

Rel. Reference Window : 0.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 0.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Resp)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : Monday, August 01, 2011 11:24:33 AM

Rel. Reference Window : 1.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 1.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A,
Signal 2: FID2 B,

Calibration Table

Calib. Data Modified : Thursday, August 25, 2011 1:46:58 PM

Rel. Reference Window : 5.000 %
Abs. Reference Window : 0.100 min
Rel. Non-ref. Window : 5.000 %
Abs. Non-ref. Window : 0.100 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Quadratic (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: FID1 A,
Signal 2: FID2 B,

SAMPLE SUMMARY

H1G250406

WO #	SAMPLE#	CLIENT SAMPLE ID	SAMPLED DATE	SAMP TIME
MK5C3	001	EXM-DCU-M0010-R1-COMBINED	07/14/11	
MK5C5	002	EXM-DCU-M0010-R2-COMBINED	07/15/11	
MK5C6	003	EXM-DCU-M0010-R3-COMBINED	07/17/11	
MK5C7	004	EXM-DCU-M0010-RGTBLK-COMBINED	07/17/11	

NOTE(S) :

- The analytical results of the samples listed above are presented on the following pages.
- All calculations are performed before rounding to avoid round-off errors in calculated results.
- Results noted as "ND" were not detected at or above the stated limit.
- This report must not be reproduced, except in full, without the written approval of the laboratory.
- Results for the following parameters are never reported on a dry weight basis: color, corrosivity, density, flashpoint, ignitability, layers, odor, paint filter test, pH, porosity pressure, reactivity, redox potential, specific gravity, spot tests, solids, solubility, temperature, viscosity, and weight.

PROJECT NARRATIVE
H1G250406

The results reported herein are applicable to the samples submitted for analysis only. If you have any questions about this report, please call (865) 291-3000 to speak with the TestAmerica project manager listed on the cover page.

This report shall not be reproduced except in full, without the written approval of the laboratory.

The original chain of custody documentation is included with this report.

Sample Receipt

Custody seals were not present.

Sample RGTBLK-FLT was received, but was not listed on the chain of custody documentation.

Quality Control and Data Interpretation

Unless otherwise noted, all holding times and QC criteria were met and the test results shown in this report meet all applicable NELAC requirements.

Semivolatiles

The semivolatile organic sampling train components were extracted and analyzed using TestAmerica Knoxville standard operating procedures KNOX-OP-0009 and KNOX-MS-0016, based on the following methods:

- SW-846 3542, "Extraction of Semivolatile Analytes Collected Using Method 0010 (Modified Method 5 Sampling Train)"
- SW-846 8270C, "Semivolatile Organic Compounds by Gas Chromatography/ Mass Spectrometry (GC/MS)".

The sampling trains are prepared as one analytical fraction: The particulate filter and front half of the filter holder, nozzle and probe solvent rinses, XAD-2 resin trap and back half of the filter holder, coil condenser and connecting glassware solvent rinses are combined as a single sample.

The combined sample components are spiked with the method 8270C surrogates and Soxhlet extracted with methylene chloride. The extracts are concentrated to 1 mL and analyzed by GCMS.

Sample results were calculated using the following equation:

PROJECT NARRATIVE
H1G250406

$$\text{Result, ug} = (\text{On column concentration, ng/uL}) \times \left(\frac{\text{Volume final extract, uL}}{\text{1 Sample}}\right) \times \left(\frac{\text{1ug}}{\text{1000 ng}}\right) \times \text{DF} \times \text{SF}$$

Where: DF = Bench Dilution Factor
SF = Extraction Split Factor

The dilution factor reported on the sample result form represents a combination of factors (such as dilution, sample weight/volume adjustment, split ratio, etc.) used to adjust the reporting limits and method detection limits.

Samples EXM-DCU-M0010-R1-COMBINED, EXM-DCU-M0010-R2-COMBINED and EXM-DCU-M0010-R3-COMBINED were reported with elevated reporting limits for all analytes. Based on screening results, a dilution was necessary prior to analysis; the reporting limits were adjusted accordingly.

The concentration of naphthalene and/or 2-methylnaphthalene in samples EXM-DCU-M0010-R1-COMBINED EXM-DCU-M0010-R2-COMBINED and EXM-DCU-M0010-R3-COMBINED exceeded the calibration level of the instrument. The samples were analyzed at a dilution to bring the concentration of the compound into the instrument calibration range. The results for both analyses are reported in order to provide the lowest possible reporting limits.

SIM PAH

The labeled internal standards added prior to extraction serve both as a measure of extraction efficiency and as a measure of cleanup recovery.

Method 0010 Sampling Train Preparation and Analysis

The method 0010 sampling train components were extracted and analyzed for polyaromatic hydrocarbons (PAHs) using TestAmerica Knoxville standard operating procedures KNOX-OP-0009 and KNOX-ID-0016, based on the following methods:

- SW-846 3542, "Extraction of Semivolatile Analytes Collected Using Method 0010 (Modified Method 5 Sampling Train)"
- Method 429 - Determination of Polycyclic Aromatic Hydrocarbon (PAH) emissions from Stationary Sources, California Environmental Protection Agency Air Resources Board, Adopted: September 12, 1989, Amended: July 28, 1997.

The sampling trains are prepared as two analytical fractions and the extracts from these fractions are combined into a single sample for analysis. The first fraction consists of the particulate filter and the XAD-2 resin trap. The second fraction includes the condensate, impinger contents and their related glassware solvent rinses, as well as the front half and back half solvent rinses.

The filters and XAD components are spiked with SIM PAH internal standards and the components are Soxhlet extracted with methylene chloride. The condensates are extracted using a continuous liquid-liquid extractor. The extracts are combined and concentrated to 0.5 mL and analyzed by by SIM-HRGC/LRMS.

PROJECT NARRATIVE
H1G250406

Sample results were calculated using the following equation:

$$\text{Result, ng} = (\text{On column conc, ug/mL}) \times \left(\frac{\text{Nominal Vol final extract, (500 uL)}}{\text{1 Sample}} \right) \times \left(\frac{\text{1 mL}}{\text{1000 uL}} \right) \times \left(\frac{\text{1000 ng}}{\text{1 ug}} \right) \times \text{SF}$$

Where: SF = Extraction Split Factor

*If the entire sample is not extracted, the fractional amount of sample used is entered into the above equation.

Sampling surrogates fluorene-d_{10}, $13C_6$-fluorene & terphenyl-d_{14} are added to the XAD by the laboratory prior to sampling. Their results appear with the "Internal Standard" percent recovery results. However these field surrogates were diluted out in samples EXM-DCU-M0010-R1-COMBINED, EXM-DCU-M0010-R2-COMBINED, and EXM-DCU-M0010-R3-COMBINED.

The dilution factor reported on the sample result form represents a combination of factors (such as dilution, sample weight/volume adjustment, split ratio, etc.) used to adjust the reporting limits and method detection limits.

All QC criteria were met with the following exceptions:

All sample extracts in the batch had internal standard recovery for benzo(a)anthracene-d12 that exceeded QC limits. As indicted by the referenced method, isotope dilution techniques produce results that are independent of internal standard recovery. The affected internal standards are flagged on the final result forms.

Samples EXM-DCU-M0010-R1-COMBINED, EXM-DCU-M0010-R2-COMBINED, and EXM-DCU-M0010-R3-COMBINED were reported with elevated reporting limits for all analytes due to the difficult sample matrix. These extracts were diluted and underwent an additional silica gel clean-up; then the extracts were further diluted and post-spiked with recovery and internal standards and the reporting limits were adjusted accordingly. The sample was analyzed with minimum dilution even though some analytes were outside of the calibration range. Compounds that exceeded calibration range were flagged with an "E" qualifier; please refer to the 8270 analysis for results of these compounds within calibration range.

EMSTRL-COC-1.4

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Lot Number: H162S0406

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **1a** Do not match COC ☐ **1b** Incomplete information ☐ **1c** Marking smeared ☐ **1d** Label torn ☐ **1e** No label ☐ **1f** COC not received ☐ **1g** Other:	4a 5a - RECEIVED "... RGTBLK-FILT" NOT ON COC
2. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C)	✓			☐ **2a** Temp Blank = _____ ☐ **2b** Cooler Temp = _____ ☐ **2c** Cooling initiated for recently collected samples, ice present.	
3. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **3a** Sample preservative =	
4. Were custody seals present/intact on cooler and/or containers?		✓		☑ **4a** Not present ☐ **4b** Not intact ☐ **4c** Other:	
5. Were all of the samples listed on the COC received?	✓			☑ **5a** Samples received-not on COC ☐ **5b** Samples not received-on COC	
6. Were all of the sample containers received intact?	✓			☐ **6a** Leaking ☐ **6b** Broken	
7. Were VOA samples received without headspace?			✓	☐ **7a** Headspace (VOA only)	
8. Were samples received in appropriate containers?	✓			☐ **8a** Improper container	
9. Did you check for residual chlorine, if necessary?			✓	☐ **9a** Could not be determined due to matrix interference	
10. Were samples received within holding time?	✓			☐ **10a** Holding time expired	
11. For rad samples, was sample activity info. provided?			✓	☐ Incomplete information	
12. For 1613B water samples is pH<9?			✓	If no, was pH adjusted to pH 7 - 9 with sulfuric acid? _____	
13. Are the shipping containers intact?	✓			☐ **13a** Leaking ☐ **13b** Other:	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **14a** Not relinquished	
15. Are tests/parameters listed for each sample?	✓			☐ **15a** Incomplete information	
16. Is the matrix of the samples noted?	✓			☐ **15a** Incomplete information	
17. Is the date/time of sample collection noted?	✓			☐ **15a** Incomplete information	
18. Is the client and project name/# identified?	✓			☐ **15a** Incomplete information	
19. Was the sampler identified on the COC?		✓

Date Sampled...: 07/14/11 **Date Received..:** 07/23/11
Prep Date.....: 07/26/11 **Analysis Date..:** 08/04/11
Prep Batch #...: 1207013
Dilution Factor: 200 **Method.....:** SW846 8270C

PARAMETER	RESULT	REPORTING LIMIT	UNITS	MDL
2-Methylnaphthalene	**22000 D**	**2000**	**ug**	**580**

SURROGATE	PERCENT RECOVERY	RECOVERY LIMITS
2-Fluorophenol	NC,DIL	(22 - 105)
Phenol-d5	NC,DIL	(48 - 118)
Nitrobenzene-d5	NC,DIL	(43 - 110)
2-Fluorobiphenyl	NC,DIL	(48 - 111)
2,4,6-Tribromophenol	NC,DIL	(34 - 125)

NOTE(S):

NC The recovery and/or RPD were not calculated.

DIL The concentration is estimated or not reported due to dilution or the presence of interfering analytes.

D Result was obtained from the analysis of a dilution.

QC Flag Legend

A - Target compound detected but, quantitated amount exceeded maximum amount.
R - Spike/Surrogate failed recovery limits.

Standards Data

TestAmerica Knoxville Semivolatile GC/MS Initial Calibration Data Review / Narrative Checklist
Method 8270C - KNOX-MS-0016, Rev 10 and Method TO-13A Mod – KNOX-MS-0017, Rev 4

Analysis Date:	7/25-26/11	Instrument:	MD	ICAL Batch/Scan Name:	D072611I	Scanned □

Review Items	*N/A*	*Yes*	*No*	*If No, why is data reportable?*	2nd □
1. Did DFTPP meet tune criteria?		✓			✓
2. Was DDT breakdown ≤20% & benzidine tailing ≤3 and PCP tailing ≤5?		✓			✓
3. Were all standards injected within 12 hr of DFTPP?		✓			✓
4. Was date/time of analysis verified between analysis header and logbook as correct?		✓			✓
5. Was the high point std. checked for saturation		✓			
6. Were ≥ 5 levels of each compound/surrogate analyzed?		✓			✓
7. Was low level standard at or below RL?		✓			✓
8. Are the average RFs for SPCCs ≥ 0.050? (8270C)		✓			✓
9. Do the RRFs meet minimum criteria? (TO-13A Mod)		✓			✓
10. Are %RSD ≤30% for CCCs? (8270C)		✓			✓
11. Are %RSD≤ 30% for all target analytes? (TO-13A Mod)		✓			✓
12. Was a linear fit or quadratic fit used for analytes >15% RSD?		✓			✓
13. If curves were used, is correlation coefficient ≥0.990?		✓			✓
14. At least 6 consecutive points used for quadratic curves?		✓			✓
15. For quadratic: is a tangent's slope to the curve entirely positive or negative and continuous.		✓			✓
16. Is the "Y" intercept less than ½ the RL for each curve?		✓			✓
17. RT for each IS ±20 sec avg. RT? (TO-13A)		✓			✓
18. Each analyte ±0.06 RRT of avg. RRT? (TO-13A)		✓			✓
19. If manual integrations were performed, are they clearly identified, initialed, dated and reason given?	✓			Reasons: 1)Corrected split peak; 2)Unresolved peak; 3)tailing; 4)RT shift; 5)wrong peak selected; 6)other	NA
20. Were all peaks identified automatically? *If not, list analytes:* _____		✓			✓
21. Are ICAL start and end dates/times correct on ICAL summary?		✓			✓
22. Elution order checked on isomeric pairs?					
• 1,4-dichlorobenzene-d4 / 1,2-dichlorobenzene-d4		✓			✓
• aniline / bis(2-chloroethyl)ether		✓			✓
• 1,3- , 1,4- , 1,2-dichlorobenzene		✓			✓
• benzyl alcohol / 2-methylphenol / 4-methylphenol		✓			✓
• 2,4,6- and 2,4,5-trichlorophenol		✓			✓
• phenanthrene / anthracene		✓			✓
• fluoranthene / pyrene		✓			✓
• benzo(a)anthracene / chrysene		✓			✓
• bis(2-ethylhexyl)/di-n-octyl phthalate		✓			✓
• benzo(b)fluoranthene / benzo(k)fluoranthene		✓			✓
• indeno(1,2,3-cd)pyrene / benzo(g,h,i)perylene		✓			✓
• safrole/1-chloronaphthalene/2- chloronaphthalene		✓			✓
• 1-/2-naphthylamine		✓			✓
23. If criteria were not met, was a NCM generated, approved by supervisor, and copy included in folder?	✓			NCM #: _____	NA
24. Does the ICAL folder contain **complete** data in the following order? Data review checklist, tune pass/fail page, m/z list, tune chromatogram, ICAL summary, curves, followed by Quant reports, chromatograms and manual integrations, in order from low to high standard.		✓			✓
25. Was the 2nd source calibration verification standard within ± 30% recovery and are results in ICAL folder?(~~20%DOD~~)		✓		1,3,5-TNBz @ 45%.	✓

TestAmerica Knoxville Semivolatile GC/MS Continuing Calibration Review / Narrative Checklist
Method 8270C - KNOX-MS-0016, Rev 11 and Method TO-13A Mod – KNOX-MS-0017, Rev 4

Analysis Date:	8/4/11	CCAL Batch/ Scan Name:	D080411	Instrument:	MD	ICAL Batch/ Scan Name:	D072611I	Scanned □

Review Items	N/A	Yes	No	If No, why is data reportable?	2nd □
1. Did DFTPP meet tune criteria?		✓			✓
2. Was DDT breakdown ≤20% & benzidine tailing ≤3 and PCP tailing ≤5?		✓			✓
3. Were all standards injected within 12 hr of DFTPP?		✓			✓
4. Was date/time of analysis verified between analysis header and logbook as correct?		✓			✓
5. Are the RFs for SPCCs ≥0.050? (8270C)		✓			✓
6. Do the RFs meet minimum criteria? (TO-13 A mod)		✓			✓
7. Is the %D or drift ≤20% for all CCCs? (8270C)		✓			✓
8. Is the %D or drift ≤30% for all target analytes? (TO-13A Mod)		✓			✓
9. Is the %D or drift ≤ 30% for all other compounds? [Up to 3 TCLs may have %D or drift ≤ 40%; any more and the calibration is INVALID; 3 add'l allowed for App IX and CLP 4.2].		✓		□ %D or drift > 30% for the following TCLs: _____ _____	✓
10. Are the internal standard responses within limits? (50-200% of the mid-level ICAL standard)		✓			✓
11. Are the internal standard retention times within limits? (30 seconds of the mid-level ICAL standard)		✓			✓
12. Were all peaks identified automatically? *If not, list analytes:* _____		✓			✓
13. If manual integrations were performed, are they clearly identified, initialed, dated and reason given?	✓			Reasons: 1)Corrected split peak; 2)Unresolved peak; 3)tailing; 4)RT shift; 5)wrong peak selected; 6)other	NA
14. Have alternate hits/manual integrations been verified as correct and are correct RFs listed in CCAL summary?	✓				NA
15. Was the correct ICAL used for quantitation? (Verify date & time of ICAL is documented correctly on CCAL.)		✓			✓
16. Is the first IS documented correctly on the log?		✓			✓
17. Elution order checked on isomeric pairs/coeluters?		✓			✓
• 1,4-dichlorobenzene-d4 / 1,2-dichlorobenzene-d4		✓			✓
• aniline / bis(2-chloroethyl)ether		✓			✓
• 1,3- , 1,4- , 1,2-dichlorobenzene		✓			✓
• benzyl alcohol / 2-methylphenol / 4-methylphenol		✓			✓
• 2,4,6- and 2,4,5-trichlorophenol		✓			✓
• phenanthrene / anthracene		✓			✓
• fluoranthene / pyrene		✓			✓
• benzo(a)anthracene / chrysene		✓			✓
• bis(2-ethylhexyl)/di-n-octyl phthalate		✓			✓
• benzo(b)fluoranthene / benzo(k)fluoranthene		✓			✓
• indeno(1,2,3-cd)pyrene / benzo(g,h,i)perylene		✓			✓
• safrole/1-chloronaphthalene/2- chloronaphthalene		✓			✓
• 1-/2-naphthylamine		✓			✓
18. If criteria were not met, was a NCM generated, approved by supervisor, and copy included in folder?	✓			NCM #: _____	NA
19. Does the CCAL folder contain **complete** data in the following order? Data review checklist, tune pass/fail page, m/z list, tune chromatogram, Target CCAL summary, Quant report, chromatogram and manual integrations.		✓			✓

Instrument:	MD					
Scanned File Names:	D072611I					
	D080411					

Review Items **A. Tune / Calibration**	N/A	Yes	No	If No, why is data reportable?	2nd ☐
1. Were all samples injected within 12 hr of DFTPP?		✓			✓
2. Has a Continuing Calibration Checklist been completed for each analytical batch?		✓			✓
3. Was the correct ICAL used for quantitation?		✓			✓
B. Client Sample and QC Sample Results					
1. Were all special project requirements met?		✓			✓
2. Were prep/dilution/split factors & header information verified?		✓			✓
3. Was date/time of analysis verified between analysis header and logbook as correct?		✓			✓
4. Were the analytes that were not automatically identified in the CCAL searched for manually in the samples?		✓			
5. Sample prep and analyses done within preparation and analytical holding time (HT)? *If no, list samples and NCM #:* _____		✓		☐ [ht1] HT expired upon receipt. ☐ *[ht2] Client requested analysis after HT expired.** ☐ **Re-extraction done after HT expired. See [sur4] or[sur2]**	✓
6. Are surrogates and internal standards within QC limits? *If no, list samples, reason (e.g.,* **sur1***) and NCM #:* _____ Sample / Reason / Sample / Reason		✓		☐ [sur1] MS/MSD surr.%R demonstrated same effect. ☐ [sur2] Re-extraction demonstrated same effect. ☐ **[sur3] Not enough sample for re-extraction.** ☐ **[sur4] Re-extraction done outside HT. Rerun shows original %R were wrong; both data reported.** ☐ **[sur5] Upon client approval, data was flagged as estimated & released without further investigation.*** ☐ [sur7] Obvious matrix interference. Explain: _____ ☐ **[hydr1] H-D exchange; sample reextracted.** ☐ **[hydr2] H-D exchange; affected analytes reported on diluted analysis** ☐ **[sur12] Surr.%R high and all targets ND.** ☐ **[sur13] Surr.%R low. Sample consumed.** ☐ **[sur14] Surr.%R high. Sample consumed.** ☐ [isc1] Samples bracketed by acceptable runs.	✓
6. Are internal standards <0.5min of last CCAL?		✓			✓
7. Were positive hits evaluated using qualitative identification criteria and technical judgment?		✓			✓
8. Are positive results within calibration range? *If no, list samples:* _____		✓		☐ [dil5] At client's request, sample was analyzed with minimum dilution even though some analytes were outside of calibration range.*	✓
9. For initial analysis that's a dilution, was the largest analyte > 20% of calibration range? *List diluted samples and reason (e.g.,* **elev1***):* Sample(s) / Reason 001, 002, 003 > elev4		✓		☐ [elev1] Elevated RL for (ANALYTE) due to sample matrix interferences. ☐ [elev2] Elevated RL for (ANALYTE) due to interfering analyte. ☐ [elev3] Elevated RLs for all analytes due to difficult sample matrix. ☑ [elev4] Diluted based on screening results. ☐ [elev5] Elevated RLs for all analytes due to presence of non-target compounds.	✓

* Such action must be taken in consultation with client. MS029r24.doc, 071111

NOTE: Nonconformance memos are required for **bold** and *italicized* autotext statements: **Bold** = deficiency, *italicized* = anomoly.

Method 8270C - KNOX-MS-0016, Rev 11 & Method TO-13A Mod – KNOX-MS-0017, Rev 4 Page 2 of 2

B. Client Sample and QC Sample Results	N/A	Yes	No	If No, why is data reportable?	2nd ☐
10. If amount extracted was < 80% of nominal amount, were the RLs/MDLs adjusted? List samples:	✓			☐ [elev6] Elevated RLs for all analytes due to insufficient sample amount received.	MS
11. If samples were split, are the dilution factores & prep factors applied properly & MDL/RLs adjusted?		✓		☑ [elev7] Elevated RLs for all analytes due to split; list samples: All samples	✓
12. For secondary diluted analyses to bring compounds in calibration range, was the largest analyte targeted to be above 50% of calibration range? *List diluted samples and reason (e.g.,* **dil1***):* Sample / Reason / Sample / Reason: 001, 002, 003 > dil3		✓		☐ [dil1] Conc. of (ANALYTE) > calibration range. RLs adjusted accordingly. ☐ [dil2] Conc. of several compounds > calibration range. RLs adjusted accordingly. ☑ [dil3] Conc. of (ANALYTE) > calibration range. Both analyses reported to provide lowest RLs. ☐ [dil4] Conc. of several compounds > calibration range. Both analyses reported to provide lowest RLs.	✓
13. If manual integrations were performed, are they clearly identified, initialed, dated and reason given?		✓		Reasons: 1)Corrected split peak; 2)Unresolved peak; 3)tailing; 4)RT shift; 5)wrong peak selected; 6)other	✓
14. Have alternate hits and manual integrations been verified as correct?		✓			✓
C. Preparation/Matrix QC					
1. 8270: LCS done per batch and meet criteria with a limited # marginal exceedences allowed (see table) and no two consecutive MEs. --For TO-13: LCS done per batch within method QC limits		✓		☐ **[lcs2] Insufficient sample for reanalysis.*** ☐ **[lcs3] LCS %R high and all analyte(s) were <RL in associated samples.** ☐ **[lcs4] Entire sample consumed.** ☐ [lcs5] LCS outside marginal exceedences high, but analytes were not detected ☐ [lcs6] LCS analyte(s) flagged as being outside control limits but within marginal limits o **[lcs RPD] RPD out, BUT % R OK.**	✓
2. Method blank done per prep batch and method blank or instrument blank analyzed with each sequence?		✓			✓
3. Method blank surrogate recoveries within QC limits?		✓		☐ **[mb1] Sample surrogates OK and there is no analyte >RL in samples associated with blank.*** ☐ **[mb7] Entire sample consumed.**	✓
4. Are all analytes present in the method blank < RL? *If no, list blank ID and NCM #:*		✓		☐ **[mb3] No analyte > RL in associated samples.*** ☐ **[mb4] Sample results > 20x higher than blank.** ☐ **[mb5] Insufficient sample for reanalysis.*** ☐ **[mb8] Entire sample consumed.**	✓
5. MS/MSD (or LCSD for TO13A) done per batch? Batch:			✓	☑ [lcsd] Insufficient sample. LCS/LCSD analyzed. ☐ [lcsd1]LCS/LCSD ana for method precision(TO-13)	✓
6. If MS/MSD was done on this client's sample or for reported batch QC, were the MS/MSD recoveries and RPDs within laboratory generated QC limits? *If no, list MS/MSD ID:*	✓			☐ [ms1] LCS acceptable - sample matrix effects. ☐ [ms2] LCS acceptable. High native analyte concentration relative to spike level. ☐ [rpd] LCS acceptable. RPD out due to lack of sample homogeneity.	MS
7. Were MS run #'s assigned correctly?	✓				MS
D. Other					
1.Final report acceptable? (Results correct, RLs calculated correctly, units correct, surrogate %R correct, appropriate flags used, dilution factor correct, and extraction/ analysis dates correct.)		✓			✓
2.Are all nonconformances documented appropriately and copy included with deliverable?	✓				MS
3.Are the correct scanned file names listed at the top of the data review checklist?		✓			✓
4.Were the standards scanned properly with runlogs?					✓
5.Was a narrative prepared and all deviations noted?		✓			✓

TestAmerica Knoxville Prep Batch Review Checklist

Batch # 1207013

Review Items	N/A	Yes	No	If No, why is data reportable?	2nd Level
1. Were the samples extracted within the required holding times?		✓		If No, NCM #: _____	✓
2. Are the final extracts free of water, precipitates, multiple phases, and for HRMS - color?		✓			✓
3. Were all project specific requirements met as noted on the Lot Checklists (L40) and the Sample List report?		✓			✓
4. Were MS Run numbers assigned properly?	✓				✓
5. Were the correct weights and volumes entered into QuantIMS for all samples and QC?		✓			✓
6. Was the correct completion date entered into QuantIMS?		✓			✓
7. Were the spike IDs and volumes entered correctly into QuantIMS?		✓			✓
8. Were all appropriate notes and observations recorded on the extraction benchsheet and in QuantIMS?		✓			✓
9. Was the extraction batch reviewed in QuantIMS using LIM L21?		✓			✓
10. Does the prep batch paperwork package contain all required documentation which has been properly and completely filled out, including: • Extraction Benchsheet • QuantIMS Benchsheet • Lot Checklists (L40) for all lots in batch • Sample List • Compound List Report • SOG Sample Tracking Sheet	✓	✓ ✓ ✓ ✓ ✓ ✓			✓
11. Are all nonconformances documented appropriately and copy included with deliverable?	✓			If Yes, NCM#: _____	✓

Als bottle: 6
Dil Factor: 1250.00000
Integrator: HP RTE Compound Sublist: pah.sub
Target Version: 3.50
Processing Host: qmidhp01

Concentration Formula: Amt * DF * Sf*Vt/Vo * CpndVariable

Name	Value	Description
DF	1250.00000	Dilution Factor
Sf	2.00000	Split factor
Vt	500.00000	Volume of final extract (uL)
Vo	1.00000	Volume of sample extracted (sample)

NOTE(S):

* Surrogate recovery is outside stated control limits.

DIL The concentration is estimated or not reported due to dilution or the presence of interfering analytes.

E Estimated result. Result concentration exceeds the calibration range.

J Estimated result. Result is less than RL.

NC The recovery and/or RPD were not calculated.

NOTE(S):

* Surrogate recovery is outside stated control limits.

DIL The concentration is estimated or not reported due to dilution or the presence of interfering analytes.

E Estimated result. Result concentration exceeds the calibration range.

J Estimated result. Result is less than RL.

NC The recovery and/or RPD were not calculated.

Standards Data

TestAmerica Knoxville GC/MS-SIM Initial Calibration Data Review / Narrative Checklist
Method: PAHs and Selected SVOCs - KNOX-ID-0016, Revision 8

Analysis Date:	8/1/11	Instrument::	MP	ICAL Batch/Scan Name:	P080111E	Scanned ☐

A. Review Items	N/A	Yes	No	Why is data reportable?	2nd √
1. Were all standards injected within 12 hr of first calibration standard?		✓			✓
2. Was date/time of analysis verified between header and logbook?		✓			✓
3. Are peak integrations appropriate?		✓			✓
4. Were ≥ 5 levels of each analyte/IS analyzed?		✓			✓
5. Was the high point standard checked for saturation?		✓			✓
6. Was low level standard at or below RL?		✓			✓
7. Are all %RSD ≤30% ?		✓			✓
8. Are the MID descriptors properly set?		✓			✓
9. Are correct RFs listed in ICAL summary?		✓			✓
10. Was ICAL summary form processed using the correct method?		✓			✓
11. Are the ICAL start and end dates/times correct on ICAL summary?		✓			✓
12. Elution order checked on isomeric pairs?					
• 2-methylnaphthalene before 1-methylnaphthalene (& d10 isomers)		✓			✓
• acenaphthylene before acenaphthene (& d10 isomers)		✓			✓
• dibenzothiophene before anthracene		✓			✓
• phenanthrene before anthracene (& d10 isomers)		✓			✓
• fluoranthene before pyrene (& d10 isomers)		✓			✓
• benzo(a)anthracene before chrysene (& d12 isomers)		✓			✓
• benzo(b)fluoranthene before benzo(k)fluoranthene (& d12 isomers)		✓			✓
• benzo(e)pyrene before benzo(a)pyrene benzo(a)pyrene before perylene (& d12 isomers)		✓			✓
• Indeno(1,2,3-cd)pyrene before benzo(g,h,I)perylene (& d12 isomers)		✓			✓
13. Is the 2nd source ICV with +/- 30% of the expected value?		✓			✓
14. Are the Alkyl RFs correct (i.e., same as the parent RF)?		✓			✓
15. If criteria were not met, was a NCM generated and approved by supervisor?	✓				NA
16. Does the ICAL folder contain **complete** data in the following order? ICAL data review checklist, runlog, Target Initial Calibration Report, followed by the quan report and chromatograms for all calibration and 2nd source standards.		✓			✓

TestAmerica Knoxville GC/MS-SIM Continuing Calibration Review / Narrative Checklist
Method: LRPAH PAHs and Selected SVOCs - KNOX-ID-0016, Revision 8

Analysis Date:	8/3/11	CCAL Batch/ Scan Name:	P080311	Instrument:	MP	ICAL Batch/ Scan Name:	P080111E	Scanned ✓

A. Review Items	N/A	Yes	No	Why is data reportable?	2nd √
1. Were all injections in sequence within 12 hr of CCAL?		✓			✓
2. Was date/time of analysis verified between header and logbook?		✓			✓
3. Are peak integrations appropriate?		✓			✓
4. Is the %D or drift <30% for all analytes		✓			✓
5. Are the recovery standards within 50-200% of the ICAL CS4 level?		✓			✓
6. Are the MID descriptors properly set?		✓			✓
7. Are correct RFs listed in CCAL summary?		✓			✓
8. Was the correct ICAL used for quantitation? (Verify 1 RF.)		✓			✓
9. Elution order checked on isomeric pairs/coeluters?					
• 2-methylnaphthalene before 1-methylnaphthalene (& d10 isomers)		✓			✓
• acenaphthylene before acenaphthene (& d10 isomers)		✓			✓
• dibenzothiophene before anthracene		✓			✓
• phenanthrene before anthracene (& d10 isomers)		✓			✓
• fluoranthene before pyrene (& d10 isomers)		✓			✓
• benzo(a)anthracene before chrysene (& d12 isomers)		✓			✓
• benzo(b)fluoranthene before benzo(k)fluoranthene (& d12 isomers)		✓			✓
• benzo(e)pyrene before benzo(a)pyrene benzo(a)pyrene before perylene (& d12 isomers)		✓			✓
• Indeno(1,2,3-cd)pyrene before benzo(g,h,i)perylene (& d12 isomers)		✓			✓
10. Were the first/last RTs for each alkyl PAH homologue group properly identified and indicated on the chromatogram?	✓				NA
11. If criteria were not met, was a NCM generated and approved by supervisor?	✓	8/4/11 ✓			NA
12. Does the CCAL folder contain complete data in the following order? CCAL data review checklist, runlog, Target Continuing Calibration Report, followed by the quan report and chromatograms for the CCAL and window standard.		✓			✓

TestAmerica Knoxville GC/MS-SIM Continuing Calibration Review / Narrative Checklist
Method: LRPAH PAHs and Selected SVOCs - KNOX-ID-0016, Revision 8

Analysis Date:	8/14/11	CCAL Batch/ Scan Name:	P081411	Instrument:	MP	ICAL Batch/ Scan Name:	P080111F	Scanned ☐ ✓

A. Review Items	N/A	Yes	No	Why is data reportable?	2nd √
1. Were all injections in sequence within 12 hr of CCAL?		✓			✓
2. Was date/time of analysis verified between header and logbook?		✓			✓
3. Are peak integrations appropriate?		✓			✓
4. Is the %D or drift <30% for all analytes		✓			✓
5. Are the recovery standards within 50-200% of the ICAL CS4 level?		✓			✓
6. Are the MID descriptors properly set?		✓			✓
7. Are correct RFs listed in CCAL summary?		✓			✓
8. Was the correct ICAL used for quantitation? (Verify 1 RF.)		✓			✓
9. Elution order checked on isomeric pairs/coeluters?					
• 2-methylnaphthalene before 1-methylnaphthalene (& d10 isomers)		✓			✓
• acenaphthylene before acenaphthene (& d10 isomers)		✓			✓
• dibenzothiophene before anthracene		✓			✓
• phenanthrene before anthracene (& d10 isomers)		✓			✓
• fluoranthene before pyrene (& d10 isomers)		✓			✓
• benzo(a)anthracene before chrysene (& d12 isomers)		✓			✓
• benzo(b)fluoranthene before benzo(k)fluoranthene (& d12 isomers)		✓			✓
• benzo(e)pyrene before benzo(a)pyrene benzo(a)pyrene before perylene (& d12 isomers)		✓			✓
• Indeno(1,2,3-cd)pyrene before benzo(g,h,i)perylene (& d12 isomers)		✓			✓
10. Were the first/last RTs for each alkyl PAH homologue group properly identified and indicated on the chromatogram?	✓				NA
11. If criteria were not met, was a NCM generated and approved by supervisor?	✓				NA
12. Does the CCAL folder contain complete data in the following order? CCAL data review checklist, runlog, Target Continuing Calibration Report, followed by the quan report and chromatograms for the CCAL and window standard.		✓			✓

Miscellaneous Data

TestAmerica Knoxville GC/MS-SIM Data Review / Narrative Checklist
Method: LRPAH PAHs and Selected SVOCs - KNOX-ID-0016, Revision 8

Lot Number:	H1G250406		Instrument:	MP	
Scanned Filenames:	P080111.D				
	P080311				
	P081911				

A. Tune / Calibration	N/A	Yes	No	Why is data reportable?	2nd √
1. Were all samples injected within 12 hr of CCAL?		✓			✓
2. Was the correct ICAL used for quantitation? (Check 1 RF per sample/QC sample.)		✓			✓
B. Sample Results	**N/A**	**Yes**	**No**	**Why is data reportable?**	**2nd √**
1. Were all special project requirements met?		✓			✓
2. Were sample preparation and analytical HTs met? If no, list NCM#_____		✓		☐ [ht1] HT expired upon receipt. ☐ [ht2] Client requested analysis after HT expired.* ☐ Re-extraction done after HT expired.	✓
3. Was prep info (sample amount, final vol, split factors, units, prep dates/times) verified?		✓			✓
4. For sediment samples, were the RLs and MDLs adjusted for % moisture using QuantIMS DF?	✓				NA
5. Was date/time of analysis verified between header and logbook?		✓			✓
6. Was header information (WO#, data file, initial wt/vol, extract vol, DF) verified?		✓			✓
7. Were peaks properly identified?		✓			✓
8. Are peak integrations appropriate?		✓			✓
9. Were alkyl group start/end times and patterns verified?	✓				NA
10. Are internal standards & alternate standards (30-120% R), sampling surrogates (50-150% R) within QC limits for samples and matrix spikes? Sample / Reason / Sample / Reason: MK5C31AC ISI; MK5C51AC ↓; MK5C61AC ↓; MK5C71AC			✓	☑ [is1] IS above QC limits. ☐ [is2] IS below QC limts. ☐ [sur1] Surrogates outside QC limits.	NO
11. If amount extracted was <80% of nominal amount, were the RLs/MDLs adjusted? List samples:_____	✓	✓ 2nd 8.18.11		☐ [elev6] Elevated RLs for all analytes due to insufficient sample amount received.	NA
12. For initial analysis that's a dilution, was the largest analyte >20% of calibration range? List dilutated samples and reason (e.g elev1). Sample / Reason / Sample / Reason: MK5C31AC ELEV1; MK5C51AC ↓; MK5C61AC ↓		✓		☑ [elev1] Elevated RL for (ANALYTE) due to sample matrix interferences. ☐ [elev2] Elevated RL for (ANALYTE) due to interfering analyte. ☐ [elev3] Elevated RLs for all analytes due to difficult sample matrix. ☐ [elev4] Diluted based on screening results. ☐ [elev5] Elevated RLs for all analytes due to presence of non-target compounds. See comments.*	✓

781

Lot Number:	HIG1504dc				
13. If bench dilutions were required, were results within calibration range? Sample / Reason / Sample / Reason _____ 7/28/11 dc			✓	☐ [E1] 1 g reprep performed. ☐ [E2] 1 g multi-spike reprep performed. ☑ [E3] Post-extraction spike performed. ☐ [E4] E values reported per client. E values reported w/o further dilution see 8270 for results w/in cal range	NO ✓
14. For secondary diluted analyses to bring compounds in calibration range, was the largest analyte targeted to be above 50% of calibration range? List diluted samples and reason (e.g., dil1): Sample / Reason / Sample / Reason _____	✓			☐ [dil1] Conc. of (ANALYTE) > calibration range. RLs adjusted accordingly. ☑ [dil2] Conc. of several compounds > calibration range. RLs adjusted accordingly. ☐ [dil3] Conc. of (ANALYTE) > calibration range. Both analyses reported to provide lowest RLs. ☐ [dil4] Conc. of several compounds > calibration range. Both analyses reported to provide lowest RLs.	(dil2) ✓
15. Was the upper calibration range (UCL) calculated correctly and were hits >UCL flagged with "E"?		✓			✓
16. If manual integrations were performed, are they clearly identified, initialed, dated and reason given?		✓		Reasons: 1) Corrected split peak; 2) Unresolved peak; 3) Tailing; 4) RT shift; 5) Wrong peak selected; 6) Other	✓
17. Have alternate hits and manual integrations been verified as correct?		✓			✓
C. Preparation/Matrix QC Results	N/A	Yes	No	Why is data reportable?	2nd ✓
1. LCS native analyte %R within QC limits (60-140%)? If no, list NCM#:: _____		✓		☐ [lcs1] Insufficient sample for reanalysis. ☐ [lcs2] Samples consumed during prep. ☐ [lcs3] LCS %R high but analyte <RL in associated samples.	✓
2. LCS IS %R within QC limits (60-140%)?		✓		☐ [is3] IS above QC limits. ☐ [is4] IS below QC limts.	✓
3. Method blank done per prep batch and method blank or instrument blank analyzed with each sequence?		✓			✓
4. Method blank IS %R within QC limits (60-140%)?.		✓		☐ [is5] IS above QC limits. ☐ [is6] IS below QC limts.	✓
5. Are all analytes present in the method blank ≤ RL?		✓		☐ [mb1] Reported blank after client consultation. ☐ [mb3] Analyte < RL in associated samples. ☐ [mb4] Sample results >10x blank. ☐ [mb5] Insufficient sample for reanalysis. ☐ [mb7] Samples consumed during prep.	✓
6. Were MS run #'s assigned correctly?	✓				NA
7. Are MS/MSD recoveries and RPDs within QC limits?	✓			☐ [ms1] LCS acceptable. High native analyte concentration relative to spike level and/or lack of sample homogeneity.	NA
D. Final Report	N/A	Yes	No	Why is data reportable?	2nd ✓
1. Final report acceptable? (Results correct, RLs calculated correctly, units correct, IS %R correct, appropriate flags used, dilution factor correct, and extraction/ analysis dates correct.)		✓			✓

Lot Number:	HG 250406				
2. If samples were split, are the dilution factors & prep factors applied properly & MDL/RLs adjusted		✓		☑ [elev7] Elevated RLs for all analytes due to split; list samples: All	✓
3. For alkyl PAHs, are hits fagged with EST?	✓				NA
4. Were all non-associated internal standards turned to 'NA'?		✓			✓
5. Was a narrative prepared and all deviations noted?		✓			✓
6. Are all non-conformances documented appropriately and copy included with deliverable?		✓		.10461 (post-dil spk) -10459 (b(a)A-diz high)	✓
7. Are the correct scanned file names listed?		✓			✓
8. Were all CCALs and window standards scanned?		✓			✓

1st Level Reviewer: [signature] Date: 8/15/11

Comments:

All client samples: MK5C31AC, MK5C51AC, MK5C61AC & MK5C71AC had benzo(a)anthracene/chrysene outside QC limits (high) MCM # 10459

Samples MK5C31AC, MK5C51AC, MK5C61AC were analyzed post spike. Sample extracts were given to prep @ DI:50 in 500ul final volume and were put back through a silica gel cleanup. Samples were concentrated back down to 500ul. Samples were further diluted and post spiked prior to analysis.

(3AC) MK5C31AC: 25ul of Recovery Std (PAH0293), 12.5ul of IS (PAH0252), sample extract 20ul to 500ul (DI:25)
(3AC) MK5C51AC: " " " " sample extract 10ul to 500ul (DI:50)
(3AC) MK5C61AC: " " " " sample extract 50ul to 500ul (DI:10)

TestAmerica Knoxville Prep Batch Review Checklist

Batch # 1207014

Review Items	N/A	Yes	No	If No, why is data reportable?	2nd Level
1. Were the samples extracted within the required holding times?		✓		If No, NCM #: _____	✓
2. Are the final extracts free of water, precipitates, multiple phases, and for HRMS - color?		✓			✓
3. Were all project specific requirements met as noted on the Lot Checklists (L40) and the Sample List report?		✓			✓
4. Were MS Run numbers assigned properly?	✓				✓
5. Were the correct weights and volumes entered into QuantIMS for all samples and QC?		✓			✓
6. Was the correct completion date entered into QuantIMS?		✓			✓
7. Were the spike IDs and volumes entered correctly into QuantIMS?		✓			
8. Were all appropriate notes and observations recorded on the extraction benchsheet and in QuantIMS?		✓			✓
9. Was the extraction batch reviewed in QuantIMS using LIM L21?		✓			✓
10. Does the prep batch paperwork package contain all required documentation which has been properly and completely filled out, including: • Extraction Benchsheet • QuantIMS Benchsheet • Lot Checklists (L40) for all lots in batch • Sample List • Compound List Report • SOG Sample Tracking Sheet		✓			✓
11. Are all nonconformances documented appropriately and copy included with deliverable?	✓			If Yes, NCM#: _____	✓

TESTAMERICA KNOXVILLE SAMPLE RECEIPT/CONDITION UPON RECEIPT ANOMALY CHECKLIST

Lot Number: H1625040 6

Review Items	Yes	No	NA	If No, what was the problem?	Comments/Actions Taken
1. Do sample container labels match COC? (IDs, Dates, Times)	✓			☐ **1a** Do not match COC ☐ **1b** Incomplete information ☐ **1c** Marking smeared ☐ **1d** Label torn ☐ **1e** No label ☐ **1f** COC not received ☐ **1g** Other:	4a 5a - RECEIVED '... RGTBLK-FILT' NOT ON COC
2. Is the cooler temperature within limits? (> freezing temp. of water to 6 °C, VOST: 10°C)	✓			☐ **2a** Temp Blank = _____ ☐ **2b** Cooler Temp = _____ ☐ **2c** Cooling initiated for recently collected samples, ice present.	
3. Were samples received with correct chemical preservative (excluding Encore)?			✓	☐ **3a** Sample preservative =	
4. Were custody seals present/intact on cooler and/or containers?		✓		☐ **4a** Not present ☐ **4b** Not intact ☐ **4c** Other:	
5. Were all of the samples listed on the COC received?	✓			☑ **5a** Samples received-not on COC ☐ **5b** Samples not received-on COC	
6. Were all of the sample containers received intact?	✓			☐ **6a** Leaking ☐ **6b** Broken	
7. Were VOA samples received without headspace?			✓	☐ **7a** Headspace (VOA only)	
8. Were samples received in appropriate containers?	✓			☐ **8a** Improper container	
9. Did you check for residual chlorine, if necessary?			✓	☐ **9a** Could not be determined due to matrix interference	
10. Were samples received within holding time?	✓			☐ **10a** Holding time expired	
11. For rad samples, was sample activity info. provided?			✓	☐ Incomplete information	
12. For 1613B water samples is pH<9?			✓	If no, was pH adjusted to pH 7 - 9 with sulfuric acid? _____	
13. Are the shipping containers intact?	✓			☐ **13a** Leaking ☐ **13b** Other:	
14. Was COC relinquished? (Signed/Dated/Timed)	✓			☐ **14a** Not relinquished	
15. Are tests/parameters listed for each sample?	✓			☐ **15a** Incomplete information	
16. Is the matrix of the samples noted?	✓			☐ **15a** Incomplete information	
17. Is the date/time of sample collection noted?	✓			☐ **15a** Incomplete information	
18. Is the client and project name/# identified?	✓			☐ **15a** Incomplete information	
19. Was the sampler identified on the COC?		✓

Narrative Summary

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp.	**Client #**	182129
Analyst	KHB	**Job #**	0611-122
Parameters	EPA SW-846 Method 0011	**# Samples**	3 Runs, 2 blanks, 1 spike

Custody	Thorne Gregory of Enthalpy Analytical, Inc. received the samples on 7/23/11 at 9.1°C after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The samples were analyzed for acetaldehyde, formaldehyde, and propionaldehyde using the analytical procedures in EPA SW-846 Method 0011, Sampling for Selected Aldehyde and Ketone Emissions from Stationary Sources. Due to the large volume of DNPH, the sample, ***EXM-DCU – Run 3*** was split in half (both DNPH and MeCl2), extracted each with 100 mL of methylene chloride and then combined. The Agilent Model 1100, High Performance Liquid Chromatograph ("Bart") was equipped with an Ultraviolet (UV) Detector operating at 360 nm and a Restek Ultra C18, 150 x 4 mm (S/N 100316P) column.
Calibration	The calibration curves are located in the Calibration Curve Chromatograms section of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition method 8315ICR.M is included in the Calibration Curve Chromatograms section of this report.
QC Notes	During sample preparation, ***EXM-DCU-R1*** was split in two equal halves. The first half was extracted and analyzed as ***EXM-DCU-R1***. The second half was extracted and analyzed as ***LD/ EXM-DCU-R1***. To determine the catch weights, this splitting is compensated for by use of the 'Aliquot Factor' (2) shown in the detailed results spreadsheet.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)	The percent difference value of the formaldehyde analysis from the initial result was within 9% for all target compounds. A replicate injection was made of the sample ***EXM-DCU-R1*** and the difference between the results of the replicate was within 2% for all target compounds. ***EXM-DCU-R2*** was also split in half. The first half was analyzed as the sample, and has an aliquot factor of two. The remaining half was split in thirds for use as the Matrix Spike (MS), Matrix Spike Duplicate (MSD), and an archive fraction. These spikes do not have an aliquot factor, and their results are calculated on the basis of what was prepared. Therefore the native amount of the sample used in determining the spike recovery values was 1/6 the calculated final result for the sample itself. The MS and MSD exhibited recovery values of 87.9% and 86.4% for formaldehyde, 81.9% and 82.6% for acetaldehyde, and 94.4% and 87.7% for propionaldehyde. Prior to sample collection, five aqueous spikes were prepared from a spike solution; three were shipped to the client. The spikes contained 1,002 µg of formaldehyde.
Reporting Notes	The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, Inc. data reports, unless specifically noted otherwise.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.
- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.
- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.
- The letter ***J*** following a value indicates an analytical result between the MDL and the LOQ. A J flag indicates that the laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.
- The letter ***E*** following a value indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.
- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.
- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. This shows what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).
- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as an MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.
- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).
- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.
- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two extra spikes are prepared. The extras (randomly chosen) are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection and/or sample transport.

General Reporting Notes

(continued)

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits.
- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name.

Method Information

Method: H:\HPLC2011Q2\BART\METHODS\8315ICR.M
Modified: 5/27/2011 at 3:16:54 PM

Column: Restek Ultra C18, 4*150mm
Mobile Phase: 59:30:10:1 DIUF H2O:ACN:THF:IPA to 100% ACN on a gradient
Flow rate: 1.2 mL/min
UV Detection at 360 nm

method: H:\HPLC2011Q2\BART\METHODS\8315ICR.M
Modified on: 5/27/2011 at 3:16:54 PM

Agilent 1100/1200 Quaternary Pump 1

Control

Column Flow	:	1.200 ml/min
Stoptime	:	17.00 min
Posttime	:	3.00 min

Solvents

Solvent A	:	100.0 % (59:30:10:1 DI:ACN:THF:IPA)
Solvent B	:	0.0 % (100% ACN)
Solvent C	:	Off
Solvent D	:	Off

PressureLimits

Minimum Pressure	:	0 bar
Maximum Pressure	:	400 bar

Auxiliary

Maximal Flow Ramp	:	100.00 ml/min^2
Primary Channel	:	Auto
Compressibility	:	83*10^-6/bar
Minimal Stroke	:	Auto

Store Parameters

Store Ratio A	:	Yes
Store Ratio B	:	Yes
Store Ratio C	:	Yes
Store Ratio D	:	Yes
Store Flow	:	Yes
Store Pressure	:	Yes

APPENDIX O: ACID GASES LAB REPORT

TRC Environmental Corporation

9225 US Hwy 183 S
Austin, TX 78747

ExxonMobil - DCU ICR

Project #182129

Analytical Report (0711-163)

EPA Method 26A

Hydrogen chloride, Hydrogen fluoride
Chloride

EPA OTM 29

Hydrogen cyanide

Enthalpy Analytical, Inc.

Phone: (919) 850 - 4392 / Fax: (919) 850 - 9012 / www.enthalpy.com
800-1 Capitola Drive Durham, NC 27713

I certify that to the best of my knowledge all analytical data presented in this report:

- Have been checked for completeness
- Are accurate, error-free, and legible
- Have been conducted in accordance with approved protocol, and that all deviations and analytical problems are summarized in the appropriate narrative(s)

This analytical report was prepared in Portable Document Format (.PDF) and contains 135 pages.

Report Issued: 09/20/2011

Summary of Results

Company	TRC Environmental Corp.

Narrative Summary

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corporation - Austin
Analyst	EO
Parameters	EPA Method 26A

Client #	182129
Job #	0711-163
# Samples	3 Runs, 2 Blanks

Custody	Heather Tarjeft received the samples on 7/27/11 after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received at 16.7°C in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The samples were analyzed for hydrogen chloride (HCl), hydrogen fluoride (HF), and chloride using the analytical procedures in EPA Method 26A, Determination of Hydrogen Halide and Halogen Emissions from Stationary Sources Isokinetic Method (40 CFR Part 60, Appendix A). The samples were analyzed following the procedures in Section 11.0, Analytical Procedures. All samples and standards are prepared, stored, and analyzed using high-density polyethylene containers. The Metrohm 861 Compact IC ("Smithers" S/N 1861002007189) was equipped with a Metrohm 861 Conductivity Detector and a Metrosep A Supp 5 - 110/4.0mm column (S/N # 7908289).
Calibration	The calibration curve(s) is (are) located in the back of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound.
Chromatographic Conditions	The acquisition method Metrohm.M is included in the Calibration Curve Chromatograms section of this report.
QC Notes	As required in Section 7.2.2, Absorbing Solution Blanks, client-provided reagent blanks were analyzed. Additionally, a quality control check sample was analyzed at the same time as the blanks and samples. All method required acceptance criteria were met.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)	HCl, HF, and chloride were not identified above the MDL in the analyses of the method blanks and run blanks. A matrix spike and matrix spike duplicate (MS and MSD) were prepared using aliquots of the samples ***R1-H2SO4*** and ***R1-NaOH***. The recovery values were 108% and 108% for HF, 95.6% and 95.0% for HCl, and 98.7% and 98.8% for Cl. A second source standard (hplc55pg192 #SS) was prepared and used as a Laboratory Control Sample and analyzed with the samples. The recovery values were 106% and 107% for HF and 97.2% and 98.2% for HCl. All sample preparation and analytical holding times specified in the method were met. Section 13.2, Sample Stability, specifies an analytical holding time of four weeks.
Reporting Notes	The volumes as recorded on the chain of custody were used for the catch weight calculations, with the exception of the reagent blanks which were measured. The H_2SO_4 matrix samples were analyzed for Cl^- and F^- but are reported as HCl and HF. The results were converted using an acid conversion factor of 1.028 for HCl and 1.053 for HF. These analyses met the requirements of the NELAC Standard. Any deviations from the requirements of the reference method and/or the NELAC Standard have been previously noted in this narrative. The results presented in this report are representative of the samples as provided to the laboratory.

Enthalpy Analytical Narrative Summary

Company	TRC Environmental Corp.
Analyst	AMP
Parameters	EPA OTM-29

Client #	182129
Job #	0711-163
# Samples	3 runs, 1 blank

Custody	Heather Tarjeft received the samples on 7/27/11 after being relinquished by TRC Environmental Corporation of Austin, TX. The samples were received at 16.7°C in good condition. Prior to, during, and after analysis, the samples were kept under lock with access only to authorized personnel by Enthalpy Analytical, Inc.
Analysis	The samples were analyzed for hydrogen cyanide (HCN) using the analytical procedures in OTM-29, Sampling and Analysis of Hydrogen Cyanide Emissions from Stationary Sources. The pH of the NaOH samples was 14. The ICS-3000 Ion Chromatograph ("Flanders") was equipped with an Electrochemical Detector and a Dionex Ion Pac AS7, 4 x 250 mm (S/N 011640) column, for these analyses.
Calibration	The calibration curve is located in the back of this report and referenced in the Analysis Method column on the Detailed Results page. For each calibration curve used, the first page of the curve contains all method specific parameters (i.e., curve type, origin, weight, etc.) used to quantify the samples. The calibration curve section also includes a table with the Retention Time (RetTime), Level (Lvl), Amount (corresponding units), Area, Response Factor (Amt/Area) and the analyte Name. The calibration table is used to identify (by retention time) and quantify each target compound. Some of the calibration check standards analyzed with the samples were not within the 10% method criteria. The recoveries of the check standards ranged from 49% to 105%.
Chromatographic Conditions	The acquisition method (HCN.Back) is included in the Calibration Curve Chromatograms section of this report.
QC Notes	Hydrogen cyanide was not detected in the field reagent blank or the laboratory reagent blank. The samples were analyzed 34 days outside the method recommended holding time of 30 days. A matrix spike was performed in duplicate (MS and MSD) on sample ***R1-NaOH***. The recovery values were 84.7% and 83.7%.

Enthalpy Analytical Narrative Summary
(continued)

QC Notes (continued)	A second source standard (#SS) was prepared and used as a Laboratory Control Sample and analyzed with the samples. The recovery value was 111%.
Reporting Notes	The volumes as recorded on the chain of custody were used for the catch weight calculations, with the exception of the reagent blanks which were measured. The results presented in this report are representative of the samples as provided to the laboratory.

General Reporting Notes

The following are general reporting notes that are applicable to all Enthalpy Analytical, Inc. data reports, unless specifically noted otherwise.

- The acronym ***MDL*** represents the Minimum Detection Limit. Below this value the laboratory cannot determine the presence of the analyte of interest reliably.
- The acronym ***LOQ*** represents the Limit of Quantification. Below this value the laboratory cannot quantitate the analyte of interest within the criteria of the method.
- The acronym ***ND*** following a value indicates a non-detect or analytical result below the MDL.
- The letter ***J*** following a value indicates an analytical result between the MDL and the LOQ. A J flag indicates that the laboratory can positively identify the analyte of interest as present, but the value should be considered an estimate.
- The letter ***E*** following a value indicates an analytical result exceeding 100% of the highest calibration point. The associated value should be considered as an estimate.
- The acronym ***DF*** represents Dilution Factor. This number represents dilution of the sample during the preparation and/or analysis process. The analytical result taken from a laboratory instrument is multiplied by the DF to determine the final undiluted sample results.
- The addition of ***MS*** to the Sample ID represents a Matrix Spike. An aliquot of an actual sample is spiked with a known amount of analyte so that a percent recovery value can be determined. This shows what effect the sample matrix may have on the target analyte, i.e. whether or not anything in the sample matrix interferes with the analysis of the analyte(s).
- The addition of ***MSD*** to the Sample ID represents a Matrix Spike Duplicate. Prepared in the same manner as an MS, the use of duplicate matrix spikes allows further confirmation of laboratory quality by showing the consistency of results gained by performing the same steps multiple times.
- The addition of ***LD*** to the Sample ID represents a Laboratory Duplicate. The analyst prepares an additional aliquot of sample for testing and the results of the duplicate analysis are compared to the initial result. The result should have a difference value of within 10% of the initial result (if the results of the original analysis are greater than the LOQ).
- The addition of ***AD*** to the Sample ID represents an Alternate Dilution. The analyst prepares an additional aliquot at a different dilution factor (usually double the initial factor). This analysis helps confirm that no additional compound is present and coeluting or sharing absorbance with the analyte of interest, as they would have a different response/absorbance than the analyte of interest.
- The Sample ID ***LCS*** represents a Laboratory Control Sample. Clean matrix, similar to the client sample matrix, prepared and analyzed by the laboratory using the same reagents, spiking standards and procedures used for the client samples. The LCS is used to assess the control of the laboratory's analytical system. Whenever spikes are prepared for our client projects, two extra spikes are prepared. The extras (randomly chosen) are labeled with the associated project number and kept in-house at the appropriate temperature conditions. When the project samples are received for analysis, the LCSs are analyzed to confirm that the analyte could be recovered from the media, separate from the samples which were used on the project and which may have been affected by source matrix, sample collection and/or sample transport.

General Reporting Notes

(continued)

- **Significant Figures**: Where the reported value is much greater than unity (1.00) in the units expressed, the number is rounded to a whole number of units, rather than to 3 significant figures. For example, a value of 10,456.45 ug catch is rounded to 10,456 ug. There are five significant digits displayed, but no confidence should be placed on more than two significant digits.
- **Manual Integration**: The data systems used for processing will flag manually integrated peaks with an "M". There are several reasons a peak may be manually integrated. These reasons will be identified by the following two letter designations. The peak was ***not integrated*** by the software **"NI"**, the peak was ***integrated incorrectly*** by the software **"II"** or the ***wrong peak*** was integrated by the software **"WP"**. These codes will accompany the analyst's manual integration stamp placed next to the compound name.

Calibration Curve Chromatograms

Calibration Table

Calib. Data Modified : Wednesday, August 10, 2011 10:33:40 AM

Rel. Reference Window : 10.000 %
Abs. Reference Window : 0.000 min
Rel. Non-ref. Window : 10.000 %
Abs. Non-ref. Window : 0.000 min
Uncalibrated Peaks : not reported
Partial Calibration : Yes, identified peaks are recalibrated
Correct All Ret. Times: No, only for identified peaks

Curve Type : Linear
Origin : Connected
Weight : Linear (Amnt)

Recalibration Settings:
Average Response : Average all calibrations
Average Retention Time: Floating Average New 75%

Calibration Report Options :
Printout of recalibrations within a sequence:
Calibration Table after Recalibration
Normal Report after Recalibration
If the sequence is done with bracketing:
Results of first cycle (ending previous bracket)

Signal 1: ADC1 A, ADC1 CHANNEL A

ANALOG DIGITAL CONVERTER

	Signal 1
Description:	ADC1 A, Metrohm
Source:	Signal
Unit:	mAU
Units/Volt:	100.000
Peakwidth (Data Rate):	0.027 Min (10.00 Hz)
Stop Time:	No Limit
Data Storage:	All

Start Signal Source: External Device Will Start 35900

Timed Event Table:
<no events>

Sequence Table:

This report meets the requirements of LAC33/NELAP.

CASE NARRATIVE

Project #: 110737 **Report Date**: 09-Aug-11
Client: TRC Environmental Corporation
Client Project ID: ExxonMobil DCU ICR #182129

Samples:

Three sets of samples were submitted for Method 29. The target elements were antimony, arsenic, beryllium, cadmium, chromium, cobalt, lead, manganese, nickel, and selenium. The samples were received in good condition with no apparent leakage or damage. All of the remaining amounts of the samples and digestates will be retained by the laboratory for six months and then discarded.

Preparation:

The metals samples were prepared according to EPA Method 29, *Determination of Metals Emissions from Stationary Sources*. The front and back halves were analyzed separately. The samples had a strong odor and an oily sheen to them.

Analysis:

Antimony, arsenic, lead, and selenium were determined by Graphite Furnace Atomic Absorption Spectrometry (GFAA). Beryllium, cadmium, chromium, cobalt, manganese, and nickel were determined by Inductively Coupled Plasma – Optical Emission Spectrometry (ICP-OES).

Results:

The metals results are presented as total micrograms of each element present in the whole analytical fraction indicated. Antimony, arsenic and beryllium were not detected in any of the samples. All other elements of interest were detected in most of the runs. Manganese had the highest amounts that ranged from about 1.9 µg to about 226 µg.

Quality Control:

No elements of interest were detected in the Laboratory Blank. All of the elements for the Laboratory Control Spike were within the acceptance limits of 80% to 120%. All of the Matrix Spike recoveries were within the acceptance range of 75% to 125%. Arsenic and selenium back half samples revealed a matrix interference which required dilutions to get the spikes to pass. All of the required duplicate samples had a relative percent difference of 20% or less or did not have an applicable calculation due to the result being five times less than the detection limit. All of the samples were analyzed at least in duplicate.

CASE NARRATIVE

FAL Project #: 110738 Report Date: 09-Aug-11
Client: TRC Environmental Corporation
Client Project ID: ExxonMobil DCU ICR #182129

Samples:

Four sets of samples were submitted, including a reagent blank, for the determination of mercury by the Ontario Hydro Method. The samples were received in good condition with no apparent leakage or damage, and custody seals intact. The Container 3 (KCl) samples did not retain any of their purple color after sampling. Run 2 from Container 5 ($KMnO_4$) samples also did not retain its purple color after sampling. An aliquot of each sample for Container 3 (KCl) was submitted since 1 to 3 liters were collected for this fraction.

All of the remaining amounts of the samples and digestates will be retained by the laboratory for six months and then discarded.

Preparation:

The Ontario Hydro mercury samples were prepared according to the ASTM Standard Test Method for *Elemental, Oxidized, Particle-Bound and Total Mercury in Flue Gas Generated from Coal-Fired Stationary Sources (Ontario Hydro Method)*. Many of the samples had a strong, fumy odor and an oily sheen.

Analysis:

Mercury was determined by Cold Vapor Atomic Absorption Spectroscopy (CVAA).

Results:

The mercury results are presented as total micrograms of mercury found for each analytical fraction listed. Mercury was not detected above the reporting limit for most of the samples.

Quality Control:

The matrix spike for a Container 3 (KCl) sample revealed a matrix interference so the spike was not within the acceptable limits. The other matrix spike for a Container 5 ($KMnO_4$) sample was within the acceptable limits of 90% to 110%. All of the samples were analyzed in triplicate. All of the replicates agreed within the normal limit of 10%. A matrix spike QC sample was analyzed after every 10 samples.
