HAWQS
Hydrologic and Water Quality System

The Hydrologic and Water Quality System (HAWQS) is a web-based interactive water quantity and quality modeling system that employs as its core modeling engine the Soil and Water Assessment Tool (SWAT), an internationally-recognized public domain model. HAWQS provides users with interactive web interfaces and maps; pre-loaded input data; outputs that include tables, charts, and raw output data; a user guide; and online development, execution, and storage of a user's modeling projects.

HAWQS substantially enhances the usability of SWAT to simulate the effects of management practices based on an extensive array of crops, soils, natural vegetation types, land uses, and climate change scenarios for hydrology and the following water quality parameters:

- Sediment
- Pathogens
- Nutrients
- Biological oxygen demand
- Dissolved oxygen
- Pesticides
- Water temperature

HAWQS users can select from three watershed scales, or hydrologic unit codes (HUCs) — 8-digit ~700mi^2, 10-digit ~227 mi^2, 12-digit ~40mi^2 — to run simulations. HAWQS allows for further aggregation and scalability of daily, monthly, and annual estimates of water quality across large geographic areas up to and including the continental United States.

The United States Environmental Protection Agency (USEPA) Office of Water supports and provides project management and funding for HAWQS. The Texas A&M University Spatial Sciences Laboratory and EPA subject matter experts provide ongoing technical support including system design, modeling, and software development. The United States Department of Agriculture (USDA) and Texas A&M University jointly developed SWAT and have actively supported the model for more than 25 years.

HAWQS Beta was released in June 2016. Future versions will be released based on user needs.

HAWQS is capable of modeling very large river basins like the Mississippi River Basin shown below.
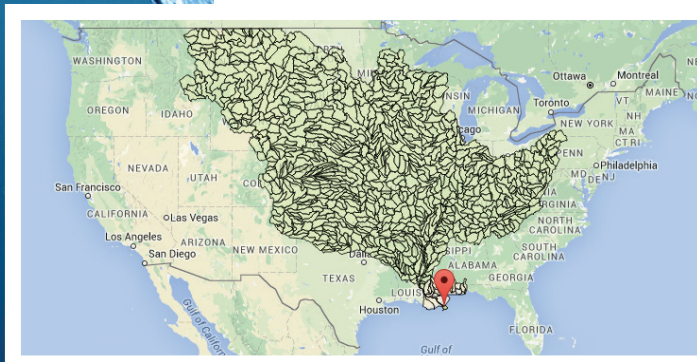

HAWQS

HAWQS Beta, June 2016, flyer version 1.0

How HAWQS Works

- The user creates a project for a modeling scenario and changes variables and inputs using web interfaces.
- To run the simulation, HAWQS connects with the latest version of the SWAT Model to process the inputs, data and other information for the scenario.
- SWAT finishes processing and generates outputs; HAWQS stores outputs centrally.
- Users can view results through a web interface, save results, and run additional scenarios.
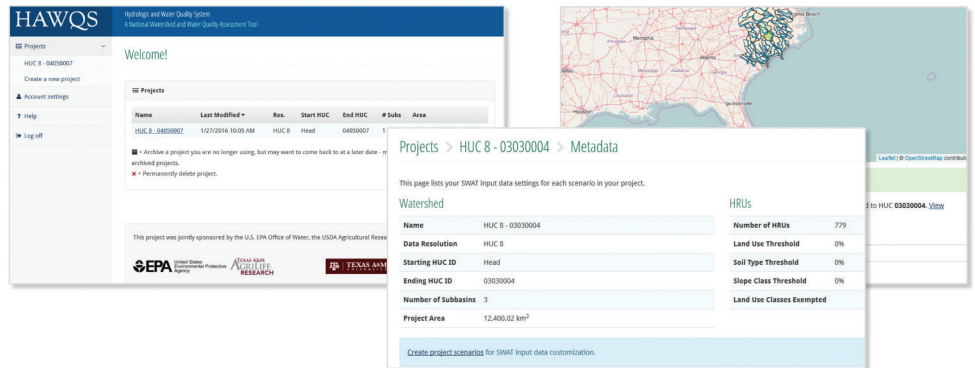

Examples of the HAWQS interactive interface

Why Use HAWQS?

- HAWQS is seamlessly integrated with the latest version of the SWAT Model. SWAT, with more than 2,500 peer-reviewed publications, has been in use for more than 25 years.
- HAWQS integrates SWAT Check to identify potential model problems.
- Scenarios can be run at three different watershed scales.
- HAWQS deploys pre-loaded input data—no need to prepare input data such as point source, land use, and/or agricultural practices. Users can also load custom input data when necessary.
- Modeling projects are performed through a web browser. Projects, scenarios, input data, and output data are centrally stored, reducing users' computing requirements.
- Users can download results in commonly used tabular and chart formats (csv, txt, jpg, png).
