facts about: *Skin Cancer*

EPA   CDC
CENTERS FOR DISEASE CONTROL AND PREVENTION

NEW HAMPSHIRE

Skin cancer is the most common cancer diagnosed in the United States.[1-4] This fact sheet presents statistics about skin cancer for New Hampshire and the United States as a whole.

small state: *Big Problem*

■ **Sunburns.** A 2004 survey found that 43.8% of white adults in New Hampshire had at least one sunburn in the past year.[5] Sunburns are a significant risk factor for the development of skin cancer.[6-8]

■ **New Cases of Melanoma.** New Hampshire had the second highest rate of new melanoma diagnoses in the U.S. from 2001-2005, 61% higher than the national average.[9,10] In 2008, an estimated 400 state residents were diagnosed with melanoma, which is responsible for 75% of all skin cancer deaths.[2]

   ▪ Grafton County has the highest rate of melanoma diagnoses in the state, 160% above the national average.[9]

■ **Deaths from Melanoma.** More than 40 people in New Hampshire die of melanoma every year.[11] New Hampshire had the 7th highest melanoma death rate nationally from 2001-2005—18.5% higher than the U.S. average.[12]

   ▪ Grafton County has the highest melanoma death rate in the state, 63% higher than the national average.[11]

survivor story: *Tina Mangold*

Growing up, I spent a lot of time in the sun and received quite a few blistering sunburns. I also used tanning beds as a teenager. That UV exposure caught up with me in 2007 when I noticed a mole on my hand was changing color. Fortunately, I already had a dermatology appointment scheduled a few weeks later. The day after the biopsy, I got the news: I had melanoma.

The melanoma was removed from my hand, and two inches of skin were replaced with a graft from my abdomen. The surgeon also checked for spread of the melanoma by taking a sentinel lymph node from my armpit. Because the melanoma was detected early, it had not yet spread to my lymph nodes. I've been cancer-free now for a year and a half.
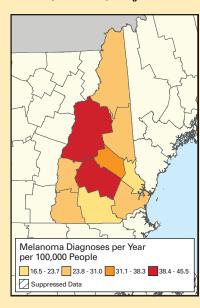

It's so important to be safe in the sun and to keep your children protected. Now I always wear a wide-brimmed hat, sunscreen, and sun-protective clothing, and keep out of the midday sun. I make sure my kids do the same!

Tina Mangold, a Franconia, New Hampshire resident, was 40 years old when she was diagnosed with melanoma.

Melanoma Death Rates, 2001–2005[11]
All Races, Both Sexes, All Ages

Melanoma Deaths per Year per 100,000 People
☐ 2.8 - 3.1   ☐ 3.2 - 3.6   ☐ 3.7 - 4.0   ☐ 4.1 - 4.4

facts about: *Skin Cancer*

The Cost of Skin Cancer

In the U.S., medical costs to treat skin cancer are estimated at almost $2 billion annually.[13-14]

statistics: *Cause for Concern*

■ **In 2008, more than 1 million people were diagnosed with skin cancer, making it the most common of all cancers.**[1-4] More people were diagnosed with skin cancer in 2008 than with breast, prostate, lung, and colon cancer combined.[2] About **1 in 5 Americans will develop skin cancer during their lifetime.**[16]

■ **One American dies of melanoma almost every hour.**[2]

■ **Melanoma is the second most common form of cancer for adolescents and young adults (15-29 years old).**[17]

■ **For people born in 2005, 1 in 55 will be diagnosed with melanoma**[12]**— nearly 30 times the rate for people born in 1930.**[18]

National Annual Rate of New Melanoma Diagnoses, 2001–2005[15]
All Races, Both Sexes, All Ages, Age-adjusted Rates

Melanoma Diagnoses per Year per 100,000 People
7.7–14.2 | 14.3–17.2 | 17.3–18.4 | 18.5–21.7 | 21.8–28.6
Bottom quintile* → Top quintile*
Data Not Available

* Please note that delays in reporting melanoma cases to cancer registries are more common since they are usually diagnosed and treated in non-hospital settings such as physician offices. States are grouped into quintiles based on rates of melanoma diagnoses. A quintile is a statistical "block" representing 20% of a total. Because data are available for only 45 states and D.C., four quintiles include nine states, and one includes 10. For example, the ten states with the highest melanoma rates—21.8 to 28.6 diagnoses per 100,000 residents every year—are in the top quintile.

what works: *An Ounce of Prevention*

■ **Unprotected exposure to ultraviolet light—a known human carcinogen—is the most preventable risk factor for skin cancer.**[6,16,19-23] Taking simple steps as early in life as possible can reduce one's risk.[2-4, 24,25]

■ **Early detection of melanoma can save one's life.**[26-32] Skin examinations may be the best way to detect skin cancer early.[2, 33-37]

■ The CDC found evidence that **education and policy approaches in primary schools (for children) and in recreational or tourism settings (for adults) can improve sun safety behaviors.**[38-39]

■ Student self-reported data[40]—collected as part of the U.S. EPA's SunWise Program—showed that **teachers using the SunWise Tool Kit for 1-2 hours yearly can spur increases in students' sun safety knowledge and attitudes and small to modest improvements in short-term sun safety behaviors.**[41]

  ■ Using the data mentioned above, published modeling results show SunWise teaching between 1999 and 2015 could prevent more than 50 premature deaths and 11,000 future cases of skin cancer, saving the country more than $30 million in medical costs and productivity losses.[41]

skin cancer prevention: *Action Steps*

■ **Do Not Burn.** Overexposure to the sun is the most preventable risk factor for skin cancer.

■ **Avoid Sun Tanning and Tanning Beds.** UV light from tanning beds and the sun causes skin cancer and wrinkling.

■ **Use Sunscreen.** Generously apply a broad spectrum sunscreen with an SPF of 15 or higher. Reapply at least every two hours, and after swimming or sweating.

■ **Cover Up.** Wear protective clothing, such as a long-sleeved shirt, pants, a wide-brimmed hat, and sunglasses with 99-100% UVA/UVB protection, when possible.

■ **Seek Shade.** Seek shade when the sun's UV rays are most intense between 10 a.m. and 4 p.m.

■ **Watch for the UV Index.** Pay attention to the UV Index when planning outdoor activities to prevent overexposure to the sun.
