MEMORANDUM

FROM: Elliott P. Laws, Assistant Administrator

TO: Waste Management Division Directors, Regions I - X

I. Introduction

A. Purpose

This memorandum sets out a Statement of Policy under the Resource Conservation and Recovery Act (RCRA) clarifying the application of the Land Disposal Restrictions (LDR) prohibition on dilution (see 40 CFR § 268.3) to combustion of certain inorganic metal-bearing hazardous wastes. Because combustion normally does not represent effective treatment of these wastes, such burning can be considered impermissible dilution. In such cases, these hazardous metal-bearing wastes cannot be combusted legally. This Policy Statement clarifies the general situation regarding combustion of these metal-bearing hazardous wastes, but application of this policy will vary depending on particular circumstances.

B. Regulatory Background

Under RCRA, the LDR prohibition on dilution states generally that no person "shall in any way dilute a restricted waste ... as a substitute for adequate treatment to achieve compliance with [a treatment standard for that waste]". 40 CFR 268.3(a). This prohibition implements the requirement of section 3004(a) of RCRA, which requires that hazardous constituents in hazardous wastes be destroyed, removed or immobilized before these wastes can be land disposed. Hazardous constituents are not destroyed, removed or immobilized if they are diluted. Chemical Waste Management v. EPA, 976 F.2d 2, 16, 17, 19-20 (D.C. Cir. 1992),

Combustion for purposes of this memo does not include metal recovery units engaged in metal reclamation or vitrification units engaged in metal stabilization.
Consistent with these authorities, the Agency has stated that the dilution prohibition serves one chief purpose -- "to ensure that prohibited wastes are treated by methods that are appropriate for that type of waste." 55 FR at 22532 (June 1, 1990). Impermissible dilution can occur under a number of circumstances. The most obvious is when solid wastes are added to a prohibited waste to reduce concentrations but not volumes of hazardous constituents, or to mask their presence. Impermissible dilution also may occur when wastes not amenable to treatment by a certain method (i.e., treated very ineffectively by that treatment method) are nevertheless 'treated' by that method. 55 FR 22666 (June 1, 1990) (biological treatment does not effectively remove toxic metals from wastes; therefore, prohibited wastes with treatment standards for metals ordinarily would be impermissibly diluted if managed in biological treatment systems providing no separate treatment for the metals). See also 52 FR at 25778-79 (July 8, 1987) (impoundments which primarily evaporate hazardous constituents do not qualify as section 3005(j)(11) impoundments which may receive otherwise-prohibited hazardous wastes that have not met the treatment standard).

EPA is providing guidance today clarifying how the LDR dilution prohibition could apply to certain inorganic metal-bearing hazardous wastes that may be placed in combustion units, other than metal recovery furnaces.

II. General Distinction Between "Adequate Treatment" and Potential Violations of the Dilution Prohibition

This memorandum deals with the question of whether combustion of prohibited inorganic hazardous wastes can be a type of impermissible dilution. An "inorganic hazardous waste" is one for which EPA has established treatment standards for metal hazardous constituents, and which does not otherwise contain significant organic or cyanide content (see further discussion, last paragraph page 3, clarifying what constitutes an insignificant organic or cyanide content).

---

2 A "prohibited" hazardous waste is one which is actually subject to a prohibition on land disposal without first being treated, or disposed in a no-migration unit. See 54 FR 36968 (Sept. 6, 1989).
The Agency has evaluated the listed wastes and has determined that 44 of the RCRA listed wastes (as set forth in 40 CFR § 261) typically appear to be such inorganic hazardous wastes; i.e., they typically do not contain organics, or contain only insignificant amounts of organics, and are not regulated for organics (see Appendix A to this memorandum for a list of these wastes). The Best Demonstrated Available Technology (BDAT) for these inorganic, metal-bearing listed wastes is metal recovery or stabilization. Thus, impermissible dilution may result when these wastes are combusted.

There are eight characteristic metal waste codes; however, only wastes that exhibit both the toxicity characteristic (TC) and the extraction procedure (EP) for D004 - D011 are prohibited now (see 55 FR 22660-02, June 1, 1990). Characteristic wastes, of course, cannot be generically characterized as easily as listed wastes because they can be generated from many different types of processes. For example, although some characteristic metal wastes do not contain organics or cyanide or contain only insignificant amounts, others may have organics or cyanide present which justify combustion, such as a used oil exhibiting the TC characteristic for a metal. Thus, it is difficult to say which D004-D011 wastes would be impermissibly diluted when combusted, beyond stating that as a general matter, impermissible dilution would occur if the D004-D011 waste does not have significant organic or cyanide content but is nevertheless combusted.

EPA ordinarily would not consider the following hazardous wastes to be strictly inorganic (or to contain "significant organic or cyanide content") for which combustion would otherwise be impermissible dilution. Combustion of the following wastes is therefore not prohibited under the LDR dilution prohibition: (1) any of the 44 listed wastes and 8 characteristic wastes in Appendix A that, at point of generation, or after any bona fide treatment such as cyanide destruction prior to combustion, contain hazardous organic constituents or cyanide at levels exceeding the constituent-specific treatment standard for PO39, which represents a compilation of numerical limits for hazardous constituents; (2) organic, debris-like materials (e.g., wood, paper, plastic, or cloth) contaminated with an inorganic metal-bearing hazardous waste; and (3) any of the 44 listed wastes and 8 characteristic wastes that, at point of generation, have reasonable heating value such as greater than or equal to 5000 Btu (see 48 FR 11157 (March 16, 1983)). The foregoing three categories of waste typically would contain sufficient organic

---

To the extent that these wastes or residues of these wastes (i.e., biological treatment sludges) contain significant organic content, combustion may be an appropriate treatment technology. See later discussion regarding this point.
content to indicate that combustion can be a reasonable means of treating the wastes prior to land disposal. However, as noted above, mixing practices such as fuel blending to add organics to inorganic metal-bearing hazardous wastes ordinarily would be considered to be impermissible dilution. This is because the dilution prohibition applies at the point a hazardous waste is generated. Chemical Waste Management v. EPA, 976 F.2d at 22-3; also 48 FR 11158, 11159 and nn. 2 and 4 (March 16, 1983); 53 FR at 522 (Jan. 8, 1988) (determinations of legitimacy of recycling are made on a waste-by-waste basis before any blending occurs).

This Policy Statement is also reflective of the Agency's concerns about the hazard presented by toxic metals in the environment. When an inorganic metal-bearing hazardous waste with insignificant organics is placed in a combustion unit, legitimate treatment for purposes of LDR ordinarily is not occurring. No treatment of the inorganic component occurs during combustion, and therefore, metals are not destroyed, removed, or immobilized. Since there are no significant concentrations of organic compounds in inorganic metal-bearing hazardous wastes, it cannot be maintained that the waste is being properly or effectively treated via combustion (i.e., thermally treated or destroyed, removed, or immobilized).

In terms of the dilution prohibition, if combustion is allowed as a method to achieve a treatment standard for these wastes, metals in these wastes will be dispersed to the ambient air and will be diluted by being mixed in with combustion ash from other waste streams. Adequate treatment (stabilization or metal recovery to meet LDR treatment standards) has not been performed and dilution has occurred. It is also inappropriate to regard eventual stabilizing of such combustion ash as providing adequate treatment for purposes of the LDRs. Simply meeting the numerical BDAT standards for the ash fails to account for metals in the original waste stream that were emitted to the air and for reductions achieved by dilution with other materials in the ash. (In most cases, of course, the metal-bearing wastes will have been mixed with other wastes before combustion, which mixing itself could be viewed as impermissible dilution).

These inorganic, metal-bearing hazardous wastes should be and are usually treated by metal recovery or stabilization technologies. These technologies remove hazardous constituents through recovery in products, or immobilize them, and are therefore permissible BDAT treatment methods. However, EPA believes that this statement of policy clarifying application of LDR dilution prohibition is needed because we have observed that some of these wastes may be going to conventional combustion devices such as incinerators or cement kilns. For example, some owners/operators may be willing to accept inorganic lead wastes with insignificant organics at their combustion facilities (which can still apparently meet their air emissions limits at the
As explained above, land disposal of combustion residuals from these facilities would typically violate the land disposal restrictions prohibition on dilution. Combustion is not usually an appropriate treatment for these wastes because hazardous constituents are not removed, destroyed, or immobilized.

Consequently, the general principles set out in this memorandum, subject to appropriate consideration of individual circumstances, are: (1) that a prohibited inorganic metal-containing hazardous waste (listed in Appendix A to this memorandum) without significant organic content can be considered to be diluted impermissibly when combusted (even if the treatment standards for metals are achieved in part by subsequent treatment of combustion ash); and (2) that the determination of whether a waste is an inorganic metal-bearing hazardous waste is made at the point of generation. This means that, ordinarily, such a waste would be considered to be diluted impermissibly even if it is blended with organic wastes for which combustion would otherwise be an appropriate treatment method.

---

4 This is the point at which the waste becomes hazardous. (See 45 FR 33095-33096, May 19, 1980).

ENVIRONMENTAL PROTECTION AGENCY
40 CFR Part 268

Land Disposal Restrictions; Clarification of the Dilution Prohibition and Combustion of Inorganic Metal-Bearing Hazardous Wastes

AGENCY: Environmental Protection Agency (EPA, the Agency).

ACTION: Notice of availability.

SUMMARY: The Environmental Protection Agency announces the availability of a memorandum setting out EPA's policy on the application of the Land Disposal Restrictions (LDR) dilution prohibition to the combustion of inorganic metal-bearing hazardous wastes. Under the existing LDR dilution prohibition, burning inorganic metal-bearing hazardous wastes can be a form of impermissible dilution. The Agency believes it is appropriate to make this information available to the public to emphasize that in individual cases and according to specific circumstances, burning inorganic metal-bearing hazardous wastes may constitute a violation of the LDR dilution prohibition.

ADDRESSES: Copies of the memorandum may be obtained by calling or visiting the RCRA docket. The RCRA docket is located in room M2616 at EPA Headquarters, 401 M. Street, S.W., Washington, D.C. 20460. The RCRA docket is available for viewing from 9:00 a.m. to 4:00 p.m., Monday through Friday, except on federal holidays.
Requests for obtaining the memorandum may be made by calling (202) 260-9327. Copies cost $0.15 per page; however charges under $25.00 are waived.

FOR FURTHER INFORMATION CONTACT: For general information, contact the RCRA Hotline at (800) 424-9346 (toll-free); (800) 424-9346 (hearing impaired); or (703) 412-9810 (Washington, D.C. metropolitan area). For technical information, contact Sherri Stevens, Waste Treatment Branch, Office of Solid Waste (mail code 5302-W), U.S. Environmental Protection Agency, 401 M Street, S.W., Washington, D.C. 20460, (703) 308-8467.
