Boston, MA 02109-3912

RE: Comments on 2014 DRAFT Massachusetts MS4 Permit

Dear Mr. Tedder:

On behalf of the 495/MetroWest Partnership, we very much appreciated your willingness to present the 2014 Draft Massachusetts MS4 Permit permit to our constituents in October 2014, as well as the subsequent extension of the comment period. Please accept the following as the Partnership's formal commentary on the 2014 Draft Massachusetts MS4 Permit.

The 495/MetroWest Partnership is a non-profit regional economic development organization serving thirty-four communities, over half a million residents, and an employment base of approximately $19 billion/year. The Partnership seeks to address regional needs through public-private collaboration by working to enhance economic vitality, improve quality of life and sustain natural resources. The Partnership focuses on helping to alleviate regional constraints and limitations, and conducts numerous initiatives on transportation, workforce housing, brownfields, and water resources.

The Partnership has a consistent record of educating our public and private sector constituents on topics related to water infrastructure, resources, and regulations both on a state and federal level through our Water Resources Committee. We have historically advocated for sustainable solutions to both environmental and economic challenges within our region and it is with the same objective that we submit these comments. While our comments will no doubt reflect those you will receive from many municipalities, we represent both public and private sector interests and are concerned about the impact the Permit will have on our thirty-four communities and on the continued economic success of our region.

The Partnership appreciates the amount of time and attention the EPA has spent reviewing comments from the 2010 Draft, but we remain concerned about the requirements and timelines in the 2014 Draft, the costs associated with those requirements, as well as unintended consequences of the newly drafted MS4 permit.

- **Requirements**
  - There appears to be a theme of different requirements for different communities depending on pollutant loads, approved TMDLs, etc. We are concerned that this does not create a standardized or watershed based approach. Costly community by community solutions will result rather than a more efficient, cost effective regional or watershed based solutions.

495/MetroWest Partnership
200 Friberg Parkway, Suite 1003, Westborough, MA 01581

www.495partnership.org

- The pollutant reduction requirements for impaired waters present a serious constraint on redevelopments and new developments where on-site stormwater mitigation is not feasible. With no mechanisms in place to for credits or off-site trading, how will property owners meet such high requirements for pollutant load reductions?
- Pollutant reduction requirements also seem contradictory within the draft Permit, in some cases requiring new and redevelopment to "optimize" pollutant removal (Appendix F) vs. allowing no net increase pollutant loads to certain impaired waters (Section 2.2.2.b). We are concerned about not only the mixed message but the potentially paralyzing impact on new and redevelopments in the Commonwealth if no net increase is the requirement.
- The wet weather sampling requirements, while improved to focus more on areas of concern, are still burdensome and costly. Given that there is no cost/benefit analysis to demonstrate the effectiveness of wet weather sampling, it seems more beneficial for communities to put their time and resources into BMPs for source controls.
- The educational portion of the Permit puts the onus on communities rather than on the one organization best equipped to conduct public education and outreach, namely the EPA. We would recommend creating a *StormwaterSense* campaign similar to the successful *WaterSense* initiative to educate the public on why they should care, how they can help and how the EPA is now requiring their towns to manage stormwater. Expecting the towns to educate the public while also looking for resources to address stormwater management is unreasonable and expecting the public to accept such knowledge from the very group who is also likely to ask them for funding is illogical. Given that there is no source of federal funding identified in the Permit, it seems the least the EPA could do is take on the responsibility of education and outreach to alleviate some of the burden on the MS4 communities. Further, to ensure a unified, consistent and effective message, the EPA should conduct the public education campaign.

- **Timelines**
  - The number of plans, submittals and tasks that need to be completed in the first year of the Permit is seemingly unattainable given the lack of resources in most communities. We ask that the EPA consider extending the time frame to two years for completion of the O&M Plans, Pollutant Source ID Plans, SWPPP preparation, and the outfall/interconnection inventory and condition assessment.
  - Similarly, we are concerned about the 90-day turn-around for the new electronic Notice of Intent Form. The success of this Permit is dependent upon its implementation, therefore the timelines need to be realistic. It seems impractical and premature to require specific listings of proposed BMPs that might be used to meet water quality based effluent limitation requirements. Please consider requiring only preliminary information relative to the 6 minimum measures and allowing more than a year for developing potential BMPs.
  - The requirement for an extensive outfall /interconnection inventory of the entire MS4 system to be completed in the first year is a monumental task particularly combined with the other first year requirements and given the lack of both financial and personnel resources in our communities. An extended timeframe should be considered for this task unless the EPA is reconsidering providing resources to the MS4 communities.

- **Costs**
  - Credits for existing BMPs should be given further consideration such as those on properties discharging directly to a waterbody vs. to a storm drain.The credits for street sweeping are too low; at the very least there needs to be an incentive for communities to invest in street sweeping as an effective pollutant source control method.
  - We appreciate recognition of the Massachusetts law, Chapter 262 of the Acts of 2012, *An Act Relative to the Regulation of Plant Nutrients,* by including non-structural BMP credits for "No application of fertilizers containing phosphorus" (Attachment 2 to Appendix F). We are concerned by the language referencing a need for a "permittee...to adopt" the law. We would suggest that the credits be automatic, given the MA law and pending statewide regulations rather than requiring an extra step for permittees to adopt the law.
  - The most common concern among the communities in our region is the overall cost to meeting the requirements within the given timelines. The number of tasks to be completed by each community is substantial and there is no funding source whatsoever. While a stormwater utility may seem to be an easy solution to the revenue challenge it is not always feasible when considering Town Meeting forms of governance. The fact that there are so few examples of Stormwater Utilities in MA speaks to this point. Stormwater Utilies are more common in states where there is some level of county government to provide for more efficient and regional solutions to addressing stormwater.

In addition to the above comments, we are concerned about a potential unintended consequence, one that has been brought to our attention by many constituencies. The Permit requirement to either retain or treat the first one inch of runoff from all impervious surfaces when creating and/or reconstructing one or more acre of impervious surface will have negative and potentially costly impacts to roadway maintenance in our communities. Transportation infrastructure has been a top priority of the Partnership and we can see no useful outcome pitting one type of infrastructure investment against another. If roadway maintenance becomes unaffordable, how are communities expected to comply with the additionally unaffordable and time consuming stormwater regulations?

Moreover, we are equally concerned about the effect this Permit will have on the Complete Streets initiative. In addition to the Massachusetts Department of Transportation (MassDOT) adopting a Complete Streets Policy, several of the Partnership's communities have adopted or are considering adoption of Complete Streets policies, guidelines or resolutions. Such a policy should be seen as complementary to the EPA's overall goals rather than in competition with them. Please give further consideration to how the impervious pavement requirements effect similarly worthy Green initiatives by other agencies. We would encourage some level of coordination with Federal Highway and MassDOT going forward.

Given the significant workloads expected of communities in the currently drafted timeframes, we ask the EPA to recognize the lack of any funding and adjust requirements and timelines as outlined above.

The Partnership appreciates the open dialogue we have had with the EPA Region 1 office through both the MS4 and RDA draft permits and processes. The Partnership recognizes the relevance of this Permit to our mission of ensuring the region's quality of life and economic prosperity. We urge you to give strong consideration to not only our comments but to those of our MS4 communities in the 495/MetroWest region.

Sincerely,

Paul F. Matthews
Executive Director

RE: Draft NPDES General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. The concerns enumerated below constitute "reasonably ascertainable issues" developed on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), and practical experience implementing the program over the preceding eleven (11) years of the existing permit term. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit. The initial comments refer to conditions associated with "Requirements to Reduce Pollutants to the Maximum Extent Practicable" (the six Minimum Control Measures [MCM]); the latter comments refer to conditions related to "Water Quality Based Effluent Limitations (WQBELs)." General comments follow thereafter.

Comments

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **MCM 1 – Public Education and Outreach**: Although not explicitly required under the permit, EPA has repeatedly suggested that introducing stormwater quality-related topics in school curricula would be an appropriate and cost-effective means of achieving MCM-1 objectives. Experience has demonstrated that statutory subject requirements within most school systems makes it very difficult to introduce non-mandatory (or non-MCAS related) material. Cost estimates related to achieving the minimum requirements of this MCM appear to be under-representing the broad audience targets and should not assume school programs as the basis for cost estimates.

conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification:* Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

3. **MCM 3 - Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties under separate permit programs in the event of an SSO excursion. *Proposed Modification:* Elimination of this requirement.
4. **Affordability; Estimated Program Cost Increases**: EPA directs MS4 owners to the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report for reference regarding anticipated program cost increases (administrative, operating and capital) under a variety of scenarios. This document, and subsequent evaluations conducted for other Upper Charles River watershed communities, indicates that program administrative/operational costs alone will range from double to quadruple existing expenditures. More recent updates to these figures for the communities that were the subject of EPA's detailed analysis indicate that, if anything, these estimates are under-representing the magnitude of cost increases. Capital costs to comply with the TMDL requirements embedded in the permit are estimated in the tens of millions of dollars. The enormous gains in water quality under the Clean Water Act in the first two decades after passage were achieved through a locally affordable program aimed at primarily wastewater-related point source discharges, and underwritten by state and federal funding equivalent in many cases to 90% of the program capital cost. Stormwater-related pollutant contributions to receiving water bodies are much more difficult to control and will achieve an incremental water quality improvement compared to the wastewater discharges that were the target of initial infrastructure investments. It is inconceivable that the estimated costs of this MS4 program can be affordably sustained by a limited number of property owners within communities subject to the most stringent pollutant reductions. Water quality improvements have local, state and national benefits. A

2. **MCM 3 - IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm drain and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification:* Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.
    b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification:* Wet weather screening of catchments should be

program that EPA and other environmental organizations (regulatory, advocacy/non-profit or commercial) recognize as this important should have some kind of legislative or Congressional support that provides adequate funding to promote programs that can achieve water quality improvements in a more equitable and financially sustainable manner.

5. **Regional or Alternative Implementation Opportunities**: Many of the sustainable funding alternatives explored in the 2011 report refer to opportunities for working with designated dischargers (DD) in some capacity. The Residual Designation Authority (RDA) Draft Permit has not progressed in some time, and there is little information available as to the likelihood of this permit ever becoming final. In addition, under current conditions, it applies to a very small number of communities (Bellingham, Franklin and Milford). Private properties are a major contributor of pollutants to MS4 discharges, however, this RDA mechanism is an unwieldy approach to incorporating private activity into pollutant control. If the permit were to be finalized as it currently stands, these three communities are likely to experience detrimental economic development impacts due to the additional cost of operating in their towns compared to immediately abutting communities. Without passage, however, private property owners have no incentive to collaborate with local authorities regarding operation of sites that were designed and constructed in accordance with local stormwater regulations in place at the time of development. It is unrealistic to include any of the funding scenarios that include cooperation or collaboration with a group of designated dischargers that do not exist today, are unlikely to be designated in the near future, and are unlikely to voluntarily engage in a complex and costly program without measurable benefit to them directly.
6. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the

framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

7. **Definitions – Redevelopment**: The term "redevelopment" is nowhere defined in the permit or appendices. Given that EPA is requiring "redevelopment" projects to meet the new development design guidelines for stormwater management (and particularly in reference to the one-inch retention/treatment provision), it is important to know what constitutes redevelopment versus rehabilitation, restoration, maintenance or repair projects. This is particularly of concern as it relates to transportation-related projects such as pavement programs (full depth reconstruction, pavement overlays, chipping, etc.), and the possibility that routine maintenance could trigger requirements for significant drainage improvements that would not otherwise be appropriate or necessary for operational purposes. *Proposed Modification*: Define redevelopment to exclude roadway projects that do not add significant new paved acreage.
8. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.
9. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.
10. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MassDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MassDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.
11. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not

consistent with the MassDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.

12. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b),the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in it's best interest.
13. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO Long Term Control Plan programs.

Water Quality Based Effluent Limitations (WQBELs)

14. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.
15. **Interest in Phosphorus Requirements:** The Town of Abington is not currently subject to Phosphorus TMDL requirements, however, there are phosphorus impaired waters in Town and a TMDL may be possible in the future, which is the basis for our comments on the Phosphorus TMDL requirements. In addition, in Appendix H. II (1)(a)(i)(3), obligations associated with municipal operations where there are phosphorus impaired waters, to which the Town is subject, state that street sweeping must be increased to a minimum of twice per year throughout the community. This obligation should be restricted to the catchment areas contributing to the impaired waters.
16. **Phosphorus Load Export Rates – Appropriate Use:** Regarding Appendix F and attachments, the Phosphorus Load Export Rates (PLERs) are general and approximate at best. The composite PLERs are good for screening / planning purposes or comparative purposes. They are not accurate for determining hard design of control measures. For example, they can be used to evaluate whether a proposed change in land use is expected to increase or decrease pollutant loads. But to use a PLER to conclude that the loading rate is actually X lbs/yr, or will change from Y lbs/yr to Z lbs/yr with land use or other changes, is not a recommended technical practice. Loading rates are ordinal rather than cardinal, i.e., they can tell you if one is higher than another, but not exactly how much higher one is than another. It appears that EPA assumes that over the entire Commonwealth of Massachusetts, using PLERs will represent the average condition. That may be true, but EPA is requiring that the PLERs be used to make decisions on a much smaller watershed and sub watershed scale, which is inappropriate.
17. **PLERs - Derivation:** It is not clear how the values for PLERs in the EPA documents are derived, however, a literature search shows that there is a large range of values for any

given land use. For example, the PLER for medium density residential is given as 0.55 lb/ac/yr in Table 1-1 (App. F Attachment 1), but the range of PLERs for medium density residential in the scientific literature can be an order of magnitude around the value. Please provide further information regarding derivation of the PLERs since these values have significant impact on program implementation for regulated communities.

18. **PLERs – Blanket vs. Site Specific:** PLERs found in older literature generally do not reflect the presence of stormwater BMPs, low impact development (LID) planning, etc., and therefore may overestimate pollutant loads for current land uses. In addition, composite PLERs are a particular concern for communities that have previously instituted stricter local development standards for stormwater management many years ago (in some cases, decades) where assumed PLERs may be much greater than actual conditions. *Proposed Modification:* Rather than limiting appeals of assumed baseline watershed phosphorus loading to updates of land use information, allow permittees the option to develop their own alternative methodology for determining baseline phosphorus loads and reduction requirements based on more detailed data and/or site specific information.
19. **Phosphorus Contribution of Illicit Discharge:** It is not clear in either the permit or the fact sheet what method was employed to calculate estimated contribution of phosphorus load through illicit discharges, and consequently the load reduction that would be achieved through elimination of IDDE. Since this calculation figures into the total overall phosphorus load reduction allocated to each Charles River community, it is impossible to comment on how equitable this approach can be. Please provide further documentation regarding the method used to complete this calculation.
20. **Ambiguity in Determining Contributing Drainage Area:** It is not clear in Appendix F and its pertaining attachments whether the permittee will be using the impervious area or the directly connected impervious area (DCIA) in the PLER calculations, which includes factoring in DCIA in determining PCP area. The phosphorous loads should be determined from the DCIA of a target catchment, but this is not explicitly mentioned in either Appendix F or its attachments. The only explicit mention on DCIA is in Appendix F under sections "Phosphorous Source Identification Report" and "Nitrogen Source Identification Report" which simply state that the source identification report should include the "Impervious area and DCIA for the target catchment." There is no mention of how this DCIA information needs to be used, for example, in determining either the PCP area, total development area, impervious area (IA) for calculating phosphorous reduction credits for non-structural BMPs, or in distributing the total drainage area into impervious area for BMP load and volume calculations. In all the above instances, DCIA should be considered, rather than total impervious area. This needs to be clarified in the new permit.
21. **Determining Infiltration Rate for Structural BMPs:** Attachment 3 of Appendix F specifies identification of infiltration rate for a particular BMP when determining the design volume of a structural BMP to achieve a known phosphorous load reduction

target from a contributing drainage area. However, it is not clear how the infiltration rate needs to be determined. It is stated that the infiltration rates represent the saturated hydraulic conductivity of the soils. Since saturated hydraulic conductivity of soils is a function of its hydrologic soil group, it is important to mention how this rate needs to be determined for a combination of soil types. Please provide further guidance to determine infiltration rates for an infiltration type structural BMP, such as an infiltration trench or infiltration basin.

22. **Choosing BMP Performance Curve for Multiple Combination of BMPs:** Attachment 3 of Appendix F provides several BMP performance curves for different types of structural BMPs. However, the permittee may choose a combination of BMPs to achieve a desired phosphorous load reduction. It has been noted through literature search that a combination of BMPs may be more effective in capturing larger storms, and hence will be more effective in providing desired phosphorous load reductions from these storm events. For example, if a bio-retention system is coupled with a secondary spillway to a porous pavement, it has been found from literature that this combination is effective in capturing the first 1" rain (first flush) and higher flows, respectively. In such a situation, it is not clear what BMP performance curve should be referenced and how the curve(s) need to be used by the permittee. Please provide further documentation regarding the method to determine BMP performance curves for a combination of BMPs.
23. **Appendix H. II (1)(a)(i)(3) Additional /Enhanced BMPs for Phosphorus-Impaired Waters:** Under the Good House Keeping requirement, it requires permitees to increase frequency of street sweeping at least twice a year for **all municipal streets and parking lots.** This requirement should be related exclusively to those streets within the impaired catchment, not all streets/ parking lots in the Town. It might be what was intended, but that is not how the language reads and should be modified.

Other Issues

24. **Non-Stormwater Discharges**: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." Explicit guidance is necessary regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges.
25. **Town Administration Outreach**: In most communities responsibility for permit compliance resides with Public Works or similar agency officials. Boards of Selectmen and/or Town Managers are often not involved in program administration outside of procurement or appropriation processes for identified projects. Their lack of understanding and support to local implementing agencies has been a continuing challenge. EPA and/or DEP must increase their involvement in educating Town officials about the extent, costs, operational impacts and policy determinations incumbent on

program administrators to ensure continued organizational support, particularly for funding strategies.

26. **Floor Drain Inventory:** It is appropriate and appreciated that this requirement has been removed from the Draft Permit.
27. **Errors:** A number of errors in referencing were noted in the document. The ones we noticed are listed below, there may be more. Please carefully check all cross references in the preparation of the Final Permit and correct the following errors:

- Page 12 – change references from Table F-5 to Table F-6
- Page 14 – change references from Table F-6 to Table F-8
- Page 14 lists reference to Buzzards Bay but there is no Nitrogen TMDL for Buzzards Bay watershed on DEP's website
- Page 14 list does not include Wareham although Wareham is in Buzzards Bay watershed
- Page 15 change reference from Table F-7 to F-9
- Page 17 – reference to Table F-10 is incorrect (that is a table of Assabet towns)
- Appendix F page 5 of 53 – footnote No. 4 incorrectly references Table F-2 for PCP area scope inclusive of MS4 only (should be Table F3) and references Table F-1 for jurisdiction-wide PCP area (should be F-2)

Sincerely,

Town of Abington, MA

Richard LaFond
Town Manager

Subject: ACEC/MA Comments on Draft Small MS4 Permit
Attachments: removed.txt

General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems

February 27, 2015

ACEC/MA Comments

On behalf of the American Council of Engineering Companies of Massachusetts (ACEC/MA), I am submitting comments to EPA on the Draft Small MS4 Permit.

ACEC/MA members include over 120 firms that employs engineers and scientists engaged in stormwater systems designs, construction, permitting and performance. We, as an organization, and our member firms have met on several occasions with EPA and MA DEP staff responsible for the preparation and enforcement of stormwater permit requirements.

While we recognize the need to continue the work started during the initial permitting period, there are several issues that require clarification in the draft permit. We ask that EPA closely review the timeframes included in the draft permit to complete all of the added requirements including the impact on limited available municipal staff and budgets, as well as the ability to address certain time and weather dependent monitoring. Certain of these requirements may not be logistically capable of being addressed by the MS4.

Several of the comments listed below may have been addressed by us with and on behalf of our clients. We have attempted to provide comments that would apply to the draft permit. As such we have requested clarifications to several requirements without reference to specific municipalities or site-specific water quality concerns and improvements. Our comments are as follows:

1. Comment: Section 1.10.3, Page 9. It is anticipated that there will be some new permittees based on the 2010 Census. Please consider extending the timeframes needed for those communities to "catch up" to those communities who have completed considerable work since the original permit issuance, especially drainage system mapping and other labor-intensive requirements.
2. Comment: Section 2.1.1, Page 10. Please clarify the reference to "….tributaries in some cases". Is the MS4 subject to the same requirements as if it were discharging directly to the impaired waterbody if the tributary is not listed in the MA Integrated List of Impaired Waters as being impaired? ,
3. Comment: Section 2.3.4.5, Page 27. Please clarify if permittees are required to repeat the outfall inventory, even if the previous inventory was conducted using the minimum accuracy listed in the permit.
4. Comment: Section 2.3.4.7.d.iv. Page 32. Please review the limitation on when wet-weather screening should take place ("March to June") for IDDE. Although wet-weather screening is intended to identify illicit discharges that only occur during peak flows, whether it should be performed in conjunction with high or low groundwater is determined by the System Vulnerability Factors (SVFs). It is suggested that the permit be revised to state that wet-weather sampling should be performed during conditions appropriate for the identified SVFs for each catchment area, and provide examples to assist MS4s in making an informed decision about when to sample.
5. Comment: Section 2.3.4.7.d.iv. Page 32. Please provide details on requirements related to wet-weather monitoring. Inspection must be performed during wet weather, defined as sufficient intensity to produce a

discharge. However, it is not clear whether a discharge must be observed at every outfall to achieve compliance. Is the permittee required to repeat outfall inspections until a discharge is observed, even if it was monitored during a substantial rainfall event?

6. Comment: Section 2.3.4.7.e. Page 34. The System Vulnerability Factor (SVF) for "any sanitary sewer and storm drain infrastructure greater than 40 years old in medium and densely developed areas" appears arbitrary and overly inclusive. Infrastructure age, by itself, is not an indicator of illicit potential. It is typically other factors, such as poor structural condition, that are the source of elevated illicit potential, not solely the age of the infrastructure. Please consider revising this SVF to include only those sewers and drains that are known to have specific concerns, not all sewers/drains older than an arbitrarily selected age.
7. Comment: Section 2.3.4.7.e. Page 33. The SVF for "crossing of storm and sanitary sewer alignments" is too inclusive. On streets with both sanitary sewers and storm drains, the likelihood that a catch basin connection crosses a sanitary sewer or a sanitary sewer service connection crosses a storm drain is extremely high. This would mean that nearly all catchments would trigger this vulnerability factor and therefore require wet weather sampling. Please consider revising this SVF to include only those catchments that are known to have specific concerns, not all catchments where storm and sanitary sewer alignments cross.
8. Comment: Section 2.3.4.7.e. Page 34. The SVF for "any sanitary sewer infrastructure defects such as leaking service laterals, cracked, broken or offset sanitary infrastructure...or other vulnerability factors identified through Infiltration/Inflow Analyses, Sanitary Sewer Evaluation Surveys, or other infrastructure investigations" also appears to be too inclusive. Again, most sewers have minor defects, which again would mean that nearly all catchments would trigger this SVF and therefore require wet weather sampling. In most cases, individual sewer defects do not result in illicit connections.
9. Comment: Section 2.3.4.8.c. Page 36. The draft permit requires that the IDDE Catchment Investigation Procedure be implemented in "every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges." If there is no evidence of any sewer input at an outfall, we suggest that that outfall screening or sampling, whichever is appropriate, should be repeated only to confirm there is no sewer input. If no sewer input is confirmed during dry and wet weather screening or sampling, IDDE field investigation will not be required.
10. Comment: Section 2.3.6.a.ii.a. Page 40. The requirement to retain/treat the first one inch of rainfall applies to "runoff from all impervious surfaces on site." Without a clear definition for the term "site", this implies runoff from the entire parcel on which the one acre, or more, disturbance occurs. It may be cost-feasible to require a large parcel to treat runoff from "all impervious surfaces" on that parcel when they disturb only a small portion of it.
11. Comment: Section 2.3.6.a.ii. Page 40. This section sets different standards than those existing in the MassDEP's Storm water Policy and associated handbooks. Having two sets different sets of standards will cause conflicts for MS4s and developers and will likely subject communities to legal action. In addition, the ordinances/bylaws of most Massachusetts MS4s reference the MA Stormwater Standards. If more stringent standards are proposed, it is suggested that this be done through working with the MassDEP to affect changes to existing State regulations instead of enacting a second, different, and conflicting set of requirements through the MS4 permit.
12. Comment: Appendix A. Please provide clear definitions for several critical terms: Directly Connected Impervious Area, Disturbance, Illicit Discharge, Increased Discharger, Redevelopment, and Site. Interpretation of these terms could be a significant source of disagreement, especially for local approving authorities charged with the implementation of the requirements for new development and redevelopment.

Thank you for the opportunity to provide our input to the process. We look forward to continuing to assist you in the future. Please feel free to contact me if you have any questions.

Re: **Comments on the Draft NPDES General Permit for Stormwater Discharges from Small MS4 communities in Massachusetts**

Dear Mr. Tedder:
The Town of North Andover has prepared the following comments, both general and specifically referenced by permit section number. We believe our comments reference areas where there is substantial need for improvement to allow feasible, cost effective implementation of the Clean Water Act and NPDES program goals.

1. **<u>New MS 4 areas have been added</u> – due to data collected in the 2010 census**
   This would not be the case if permit had been renewed on time.

2. **<u>Non Delegated State Status</u> – MA. DEP should draft the permit not the EPA**
   a. MA. is one of only 4 states that is having EPA draft the new permit regulations.
   b. MA. DEP regulations contradict proposed EPA thresholds for treatment and infiltration
   c. MA. DEP regulations contradict proposed EPA requirements for stormwater management in new developments
   Two separate entities with jurisdiction over the same areas create redundancy, contradiction, conflicts, inconsistency and confusion.

3. **<u>Overall Cost</u> – this is an unfunded mandate**
   a. The permit regulations contain 59 pages with 9 separate appendices; there are 250 administrative requirements proposed. EPA's own estimate is that the compliance will cost between $80,000 and $800,000 per year depending on the community. North Andover's costs for compliance will probably be in the $200,000 to $300,000 dollars per year.
   There is no source of funding identified for compliance.

4. **Budgeting - Time to Implementation - Part 1.7.4.c**
   a. There should be sufficient time between the adoption of the new permit regulations and their implementation for municipalities to be able to budget adequately based on the various fiscal year start dates.
   Municipalities should have clear requirements before they pass their annual budget.

5. **Illicit Discharge Detection and Elimination (IDDE) Program – is financially burdensome - Part 2.3.4.7.e.ii.**
   a. Part 2.3.4.7.e.ii. requires additionally testing key manholes
      1. "…investigation of each key junction manhole within the MS4, even where no evidence of an illicit discharge is observed at the outfall."
   Manholes should only be investigated if its outfall shows evidence of a discharge.
   b. North Andover has over 900 outfalls. Required costs for testing (labor & lab costs) are estimated at $500 per outfall. Estimated budget for outfall testing alone is $450,000.
   Testing is very expensive.

6. **Waterways with Approved Total Maximum Daily Loads (TMDL) – Part 2.2.1.**
   a. North Andover has been listed as discharging to waterways with TMDL's for: Bacteria, Phosphorous, and Turbidity
   It is unclear what documents govern the interpretation of TMDL.

7. **Public Education and Outreach – is inefficient - Part 2.3.2.e**
   a. requires: "…evidence that progress toward the defined educational goals of the program has been achieved."
   Effectiveness is regional. It cannot be efficiently measured on a municipal level.

8. **Outfall/Interconnection Inventory – is overly burdensome – Part 2.3.4.5.**

North Andover has over 900 outfalls.

   a. The permittee should have more than "one (1) year to complete its outfall and interconnection inventory".
   b. Inclusion of "the inventory in each annual report" should not be mandated.
   c. The inventory shall be updated annually to include data collected in connection with the dry weather screening under Part 2.3.4.7.d. and other relevant inspections conducted by the permittee.

The permittee should not have to "physically label all MS4 outfall pipes (excluding interconnections) with their unique identifier".

1. **Many of the areas are covered in snow for 1/3 of the year.**

9. **Ranking of Catchments - is arbitrary and unfair - Part 2.3.4.7.c.ii.**

"Age of surrounding development and infrastructure – Industrial areas greater than 40 years old and areas where the sanitary sewer system is more than 40 years old will probably have a high illicit discharge potential".

Virtually 100% of older, highly urbanized, communities' infrastructures fall into this category.

10. **Catchment Investigation Procedure - absence of bacteria - is unrealisitc –Part 2.3.4.7.d and Appendix I**
    a. Presence of chlorine at "detectable levels" should not cause a catchment area to be ranked as a "High Priority Catchment".
    A catchment without the presence of bacteria should not be "High Priority".

11. **Catchment Investigation Procedure Wet weather - is overly burdensome –Part 2.3.4.7.e.ii.b**
    a. System Vulnerability Factors – describe nearly all catchment areas.
    b. Due to potential numbers of wet weather events and North Andover's 900 outfalls, monitoring per proposed regs would be impossible.
    Some reasonable cap should be placed on deadlines and number of locations per year.

12. **IDDE goals and Milestones – Are unmanageable – Part 2.3.4.8.c**
    There should be an annual cap of 5% of vulnerable outfalls for wet weather testing
        1. **Dry weather testing indicating a presence of discharge should be prioritized.**
        2. **The balance of outfalls should be ranked/tested by vulnerability factors.**

13. **Testing for Select Pharmaceuticals and Personal Care Products - is impractical – Appendix I**
    a. These products are ubiquitous in nature.
    b. Lab requirements for testing make them financially impossible.
    This should not be a priority for this MS 4 permit.

14. **Stormwater Management – this is redundant - Part 2.3.6.a.ii**
    a. Regulation already exists in MA
    b. The Commonwealth has created a handbook for this.
        a. This handbook is a product of an extensive public process
        b. Has flexibilities not allowed for redevelopment without which would preclude this redevelopment.
    c. The proposed regulation of treatment for the first 1" of runoff will preclude many roadway projects
    Local stormwater ordinances have already been adopted as part of the original MS 4 permit.

15. **Stormwater Management Directly Connected Impervious Area – annual reporting is irrelevant - Part 2.3.6.d.i**
    a. Annual tracking and reporting is difficult, time consuming and expensive
    b. Annual changes have marginal impact of water quality.
    Net change in impervious areas covered should be tracked over the life of the permit.

16. **Good Housekeeping – compliance sump cleaning regulation is unfeasible – Part2.3.7.a.iii(b)**
    a. The town does not have the depth below pipe inverts out for catch basin sumps
    b. Determining the trigger for cleaning "50% full" is impossible.
    A set distance below inverts out should be established.

Thank you for the opportunity to comment on the draft Massachusetts Small MS4 General Permit. Please contact me with any questions at 978-685-0950 ext 44021 or email at gwillis@townofnorthandover.com

RE: Comments on 2014 Draft NPDES General Permit for MS4 Systems in Massachusetts

Dear Mr. Tedder:

The Town of Andover has reviewed the above draft permit and wish to submit comments regarding the permit requirements. This letter outlines the comments and concerns as follows:

1. Page 7, Section 1.10.c states "The permittee is encouraged to maintain an adequate funding source for this program." It also provides reference to funding information available on the EPA website; this information recommends creating a Stormwater Utility in order to provide a funding source. Also, on page 23 of the Fact Sheet, it states" EPA recognizes that compliance with this permit will require substantial investment… and we note that many communities within Massachusetts have made the necessary investments that the Clean Water Act requires by funding a stormwater program through a utility or other means." It further states on page 24 "Stormwater utilities are beginning to appear in the Northeast, including seven in Massachusetts alone." We agree that the work will require substantial investment, however with the current economy; any additional fees requested such as a stormwater utility fee will be extremely difficult for taxpayer approval. The fact that very few communities in Massachusetts have been able to create a utility supports the difficulty that can be expected trying to establish this method of funding. These permit requirements should be revised and reduced until the Federal and State governments make other sources of funding available.
2. Page 32, Section 2.3.4.7.d.iii. includes procedures for dry weather outfall screening and sampling. The procedure states "if no flow is observed (on the first visit), but evidence of dry weather flow exists, the permittee shall revisit the outfall" to perform a second dry weather screening and sampling. This is very confusing; it is unknown how evidence of dry weather flow can be detected if there is no flow during dry weather. Are we expected

to visit each outfall more than once to see if there is any dry weather flow? Clarification is needed.

3. Page 35, Section 2.3.4.7.e.ii.(b) wet weather investigation at all outfalls where the presence of one or more System Vulnerability Factors exists is excessive; very labor intensive and expensive work when required if much of the existing sanitary sewer system is over 40 years old. Funding is problematic as written above in comment 1.
4. Page 40, Section 2.3.6.a.ii.(a) requires that the first one inch of runoff from all impervious surfaces be retained on site when a project disturbs one acre or more. This requirement makes it very difficult and much more expensive to perform routine roadway pavement work such as reclamation of existing roadway pavement when the roadway area exceeds one acre. It may be necessary to purchase/take extra land to construct required stormwater treatment areas, which will exhaust already deficient road maintenance budgets even further. There must be an exemption for pavement maintenance projects of this type. If a new road is being constructed or an existing road is being significantly widened, then the proposed requirements should apply, however if it is only maintenance such as reclamation of existing roadway pavement, this should not apply.
5. Page 45, Section 2.3.7.a.iii.(e), requires the procedure be established and implemented to minimize the use of sodium chloride and other salts and evaluate opportunities for use of alternative materials for winter road maintenance. Reducing salt usage is a goal that will provide environmental benefit but at what cost to safety. Roads are expected to be cleared and made safe for travel in the winter so that motorists are not exposed to hazardous driving conditions. The cost of road salt and deicers are a large portion of the winter storm budget and other alternatives can be much more expensive. The application of salt is based on the weather and conditions of the road and it always is the intention to apply the least amount of salt to achieve safe travel, so it is already being minimized and further reduction of salt use would be irresponsible to providing safe travel conditions.

It is understood that the goal of the permit is to help clean our waters. The town has worked diligently towards this goal to meet the requirements under the 2003 permit. We will continue to work towards this goal; however this has placed a burden on our staff and resources, which have been affected severely by budget cuts and layoffs in the difficult economic times which we are currently experiencing. The current budget situation is causing serious restrictions and the economic outlook for the near future is not expected to improve, making it very difficult to meet many of the proposed schedules and requirements of the new permit. Please consider eliminating or relaxing the requirements relative to these comments in issuing the final permit decision.

Sincerely,

Brian W. Moore

Re: APCC comments on draft MS4 Stormwater Permit for Massachusetts

Dear Mr. Tedder:

On behalf of the Association to Preserve Cape Cod (APCC), I am pleased to provide our comments on the draft MS4 Stormwater Permit for Massachusetts.

The Association to Preserve Cape Cod (APCC) was founded in 1968 to promote policies and programs that foster preservation of Cape Cod's natural resources. APCC is a regional non-profit environmental organization with more than 5,000 members Cape-wide. Our goals include protection of groundwater, surface water, and wetland resources; preservation of open space; promotion of responsible, planned growth; and the achievement of an environmental ethic. To achieve these goals, we provide technical assistance, outreach, advocacy, science-based policies and facilitation, working with communities, organizations, municipalities and agencies at the local, regional, state and federal levels. Our website at http://www.apcc.org describes many of our programs and achievements.

Many of our achievements relate to water resources and building community capacity to protect and restore the Cape's water and watersheds. Examples include:

- Designation of Cape Cod as a sole source aquifer;
- Designation of 15,000 acres of the Massachusetts Military Reservation as the Upper Cape Water Supply Reserve;
- Creation of the Barnstable County Water Protection Collaborative agency;
- Passage of the 1990 Cape Cod Commission Act establishing a regional planning agency with regulatory authority to manage growth;
- Passage of the Cape Cod Land Bank Act to fund purchase of open space;
- Formation and support of the Cape Cod Business Roundtable, a group of civic leaders who promote management of wastewater and growth;
- Hosting the Cape Cod regional coordinator for the Massachusetts Bays Program, which helps communities to protect and restore coastal ecosystems of Massachusetts and Cape Cod Bays,
- Helping to designate No Discharge Areas for boat sewage for Cape Cod Bay, Nantucket Sound and Vineyard Sounds.

3010 Main Street, P.O. Box 398, Barnstable, MA 02630-0398
Ph: 508-362-4226 Email: info@apcc.org Website: www.apcc.org
A non-profit organization. Dues and contributions tax-deductible as provided by law.

Our experience in working with communities to promote stormwater management includes the following:

- Providing staff support for the Barnstable County Coastal Resources Committee, a County advisory committee on coastal issues and the local governance committee for the Massachusetts Bays National Estuary Program. The CRC includes representatives from all 15 towns as well as regional, state and federal agencies involved in coastal management. The CRC assisted by APCC staff have organized a new "Cape Cod Stormwater Managers Group", an ad hoc group of municipal stormwater managers seeking to share information and outreach and exploring cost-effective approaches to stormwater management;

- Provided a Stormwater Utility Outreach Program for Cape Cod which included public workshops and training materials that led to one town (Yarmouth) undertaking a "Does It Make Sense?" or DIMS study for stormwater utilities.

- Led the advocacy effort that led to Congressional approval of the Cape Cod Water Resources Restoration Project, a 10-year NRCS watershed program to restore 7,300 acres of shellfish beds by remediating stormwater discharges, restoring 1,500 acres of degraded salt marsh and 4,200 acres of anadromous fish spawning habitat. By Fall 2013, 26 projects were completed, including 13 stormwater construction projects and 7 stormwater design projects. APCC staff continue to advocate for additional funding and are working with towns to identify the next round of stormwater projects.

- Providing technical support to towns and agencies, including identifying stormwater remediation projects and funding sources, providing grant-writing assistance, and conducting a survey of Cape Cod municipal stormwater managers to learn their needs and challenges.

Thus our comments are based upon our experience in working with communities to achieve results in the areas of water, wastewater, watershed restoration, stormwater outreach and project planning. Our comments are as follows:

1) The issuance of the draft MS4 permit for Massachusetts marks an important milestone in stormwater management. By setting a schedule for the issuance of the final permit, uncertainty is reduced, making it possible for municipalities, agencies, utilities and others to better plan for stormwater management over a longer period of time.

2) The draft MS4 permit addresses the fact that Cape Cod has a number of TMDLs for nutrients and/or bacteria. Cape Cod's primary environmental issue is eutrophication of our coastal embayments and ponds and lakes, caused by nutrient loading due mainly to septic systems but also including a component (estimated at 8% Cape-wide and in some locations as high as 22%) due to untreated stormwater runoff. Communities have developed or are developing wastewater management plans to

3010 Main Street, P.O. Box 398, Barnstable, MA 02630-0398
Ph: 508-362-4226 Email: info@apcc.org Website: www.apcc.org
A non-profit organization. Dues and contributions tax-deductible as provided by law.

reduce wastewater pollution, but implementation of these plans will be costly and will take time. Addressing this source of water pollution must remain a priority for Cape Cod communities.

The Clean Water Act Section 208 plan is a comprehensive areawide plan for improving and protecting water quality. The primary focus of the 208 plan is wastewater pollution but stormwater runoff is also one component. Coordination between the MS4 permit, the 208 plan, and individual town's stormwater permits and comprehensive wastewater plans is greatly needed in order to minimize bureaucracy and provide cost-effective management of water resources. EPA should actively work with communities to promote a streamlined coordinated cost-effective approach to managing stormwater, wastewater, drinking water and wetlands. Otherwise, the MS4 permit will represent yet another silo among many regulatory requirements, fostering public frustration, compartmentalized "not my job" responses, poor coordination and increased costs due to redundancies.

3) Cape Cod municipalities have a long history of managing stormwater runoff to reduce bacterial pollution of shellfish beds, swimming beaches, and recreational water bodies. Maintaining these resources is important for the Cape's coastal economy. These efforts and achievements began in the mid-1990s, demonstrating that Cape Cod municipalities are invested in clean water provided that appropriate technologies are available to effectively treat stormwater runoff.

4) EPA needs to allocate sufficient resources to adequately manage and enforce the MS4 permit program. If municipalities strive to meet their permit requirements, they should receive prompt feedback or guidance from EPA. To date EPA has treated stormwater permitting and management as much more a paper exercise of reporting and not a program to attenuate nutrients, pathogens and pollutants from stormwater. Because something looks good on paper does not mean water quality is necessarily improving. Cape Cod needs more change on the ground and less change in filing cabinets.

5) APCC is concerned that most Cape Cod towns will not have sufficient resources to adequately address all of the new permitting requirements. Municipalities, particularly smaller ones, will find the permit requirements very difficult to meet due to lack of funding. Small municipalities, such as those on Cape Cod, face stringent budget limitations. Despite EPA's assertion that a Proposition 2½ override is possible, overrides are infrequent and cannot be relied upon. The 2010 US Census showed the Cape's population has decreased since the last census, and reflects an older population, often on fixed incomes. Municipalities rely on property taxes for general funds. Funding for routine maintenance of stormwater infrastructure is an even more daunting fiscal challenge. EPA has been encouraging communities to adopt stormwater utilities to fund municipal stormwater programs. Based on our experience in providing public outreach on stormwater utilities, professional municipal staff support for such utilities may be high but public support for paying for stormwater management is low. EPA is in a difficult position to require so much

3010 Main Street, P.O. Box 398, Barnstable, MA 02630-0398
Ph: 508-362-4226 Email: info@apcc.org Website: www.apcc.org
A non-profit organization. Dues and contributions tax-deductible as provided by law.

and pay for so little. EPA must do a better job of educating citizens on the value of improved stormwater management.

6) In addition to lacking the financial resources, most Cape Cod towns lack the technical resources to adequately implement and operate a viable stormwater management program. In many respects the new permit asks country doctors to step up and perform brain surgery with no additional affordable training. EPA needs to do more in providing training and technical assistance to municipalities, particularly related to managing nutrients in stormwater.

7) EPA has also been slow to adopt and incorporate best management practices (BMPs) into permits. This is most apparent in snow removal and management references of the draft permit. It can be described as a "keep your powder dry" warning without incorporating known best management practices. Snow operations introduce salts, other deicing chemicals and sediment into both the surface water and groundwater. EPA should be at the forefront of advancing BMPs in this area of road maintenance.

8) EPA must improve priorities in the permit. It is critical to prioritize meaningful actions that result in improved water quality. The top priorities should be promoting stormwater implementation projects that include installation of suitable BMPs and elimination of illicit discharges.

9) Municipalities often receive stormwater runoff from properties owned by federal, state and/or regional agencies. This places a burden on municipalities to manage runoff from all of these sources as well as runoff from municipal, private and commercial properties. Federal, state and regional agencies which own impervious areas should be required to manage stormwater runoff to meet the same water quality goals as municipalities. In particular, the Massachusetts Department of Transportation (MassDOT) should be required to manage and treat runoff from state roads to the same degree or more advanced degree as municipalities.

10) Public/ private utilities and railroads which utilize pesticides for treatment of right-of-ways should be subject to stormwater standards to protect water quality.

11) While there are numerous stormwater BMPs that target bacteria, there are far fewer BMPs that address nutrients. EPA should continue to invest in research, development and monitoring of effective methods of treating nutrients and multiple pollutants using stormwater BMPs . While green infrastructure offers much promise, in coastal environments such as the Cape there are additional challenges such as high groundwater, limited land area in which to install retrofits, storm surges, and rising sea levels to contend with.

In summary, while we praise EPA for producing a draft MS4 permit that reduces uncertainty and promotes long-range planning, the substantial and extensive requirements of the MS4 permit should be better prioritized to emphasize implementation of solutions and closer coordination of multiple federal, state, regional and local permits and plans that together

3010 Main Street, P.O. Box 398, Barnstable, MA 02630-0398
Ph: 508-362-4226 Email: info@apcc.org Website: www.apcc.org
A non-profit organization. Dues and contributions tax-deductible as provided by law.

promote improvement of water quality. APCC has observed firsthand that delays and expressed uncertainty by EPA in this area have actually set stormwater management back. Local communities need certainty and time to plan. Stormwater is not an area where communities are unwilling to improve. It is an area where they have been unable to improve because of the cost of complying with federal mandates and uncertainty as to what those mandates actually are. Submitting notices of intent, permits and reports and never receiving feedback adds to the uncertainty. This is not a time to take a giant step. Progress must be continuous and incremental.

Thank you for the opportunity to provide comments. Please feel free to contact me at (508) 362-4226 ext. 13 if you have any questions or wish to discuss our comments.

Sincerely,

Edward DeWitt
Executive Director

Subject: EPA Stormwater Rules for MS4 Permit/Public Comment

Dear Mr Tedder,

Please enter this correspondence into the official public comment component of the rules implementation procedure.

I live in Southwick MA. I currently serve on the town's Finance Committee. I am a former Selectman and Board of Health member.

Within our physical borders lie three large lakes, the Congamond Lakes. Underneath us is a large aquifer which supplies our public drinking water supply. The Town takes very seriously the protection of these and other valuable water resources. The Town has historically undertaken many projects to identify and mitigate point source pollution. An extensive public sewering project and utilization of many "319" grants as well as ongoing efforts to mitigate stormwater pollution through our Planning Board and Conservation Commission and Zoning Bylaws all demonstrate our Community"s commitment to protecting our valuable water resources.

The taxpayers of Southwick currently face a significant financial burden from current regulatory mandates in regards to Education, Public Safety, American Disability Act, and Enviromental issues and are committed to complying with these mandates even as the cost of all aspects of local government rapidly rise. The new MS4 rules will place yet another, more onerous financial burden on our Townspeople.

The current Draft Regulation is an unfunded mandate. No amount of "dancing around with semantics" will change any public official's mind about this aspect of the Rules.

EPA regulators need to consider allowing MS4 communities the opportunity to comply over an extended period of time, up to 20 years if necessary, through the development and implementation of a plan which is specific to each town or city. This will allow communities, which value clean water, to realize that outcome in a responsible and affordable way.

Thank you for your consideration.

Art Pinell

Re: Comments on the Draft MS4 NPDES General Permit for Stormwater Discharges in Massachusetts

Dear Mr. Tedder,

As Auburn's Town Manager I am pleased to have an opportunity to submit comments to the Environmental Protection Agency (EPA) regarding the National Pollutant Discharge Elimination System (NPDES) Draft General Permit (Draft Permit) for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts. I thank you for the opportunity to provide these comments. I will also note that the Auburn Department of Public Works will be submitting a separate comment letter. I am submitting these comments in an effort to bring to light the substantial impacts this draft permit will have on our community.

The Town of Auburn is a community of approximately 16,000 people and is host to Massachusetts State Routes 12, 20, I-90, I-290, and I-395.

The Town of Auburn strongly supports the goal of ensuring that the Waters of the United States are clean and are protected from untreated stormwater runoff. Since the introduction of the original Phase II MS4 General Permit in 2003, the Town has supported the underlying goal of improving the quality of the Waters of the United States located in the Town. The Town has worked diligently and successfully to implement the requirements of the original 2003 Small MS4 Permit. The Town was one of the thirteen (13) original members of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). The Town continues to be a member of the CMRSWC, and works with its partner towns to develop a common message and framework for dealing with stormwater runoff.

I write to you to express the Town's concerns with the extremely large and overreaching burden that the Draft Permit will inflict upon the Town of Auburn, as well as other cities and towns in Massachusetts. The Draft Permit as currently constituted will result in large increases in compliance costs related to administratively focused tasks, studies, and reports that will create no quantifiable increase in water quality in the Town's receiving waters. Other facets of the Draft Permit impose tasks upon the Town that it would be unsuitable to perform. Further, the Draft Permit imposes strict conditions on development and redevelopment projects that are in conflict with current Massachusetts Stormwater Standards, as well as existing local bylaws and regulations.

102 Central Street
Auburn, MA 01501
Telephone: (508) 832-7720 Fax: (508) 832-6145
Email: townmgr@town.auburn.ma.us
Web site: www.auburnguide.com

For instance, the Draft Permit requires the Town to craft a number of different stormwater educational messages, each tailored to a specific audience. While not an entirely unreasonable requirement, the Draft Permit then requires the Town to develop and implement ways to measure the effectiveness of those messages on the intended audience. The Draft Permit provides no suggestion as to how this should be done, but it is clear from the Draft Permit language that simply keeping track of the number of pamphlets distributed, or the number of web page views, for instance, will not be considered an adequate way of measuring effectiveness. This requirement will force the Town to hire a public relations company to design the messages, as well as to conduct surveys to determine if they are effective or not. This type of activity is simply not a good way to spend limited money on stormwater cleanup, and will provide no indication of an improvement in water quality. The EPA should remove the requirements for determining the effectiveness of the public education measures. Additionally, the EPA should work to develop a common educational campaign for the State as a whole, either working through the Massachusetts Department of Environmental Protection (MADEP), the DCR, and/or with other environmentally focused non-profit organizations. While regional efforts such as the CMRSWC will certainly help with meeting this condition of the Draft Permit, an overall state wide coordinated stormwater messaging campaign would be much more effective than numerous individual stormwater campaigns.

The Town is also concerned with the impediments to land re-development costs that the Draft Permit appears to impose. In the sections of the permit dealing with new and redevelopment land projects, the Draft Permit appears to require the upgrading of the stormwater management system of an entire site, even if only a portion of the site is actually undergoing redevelopment. Further, the requirement of the Draft Permit to treat the first 1-inch of stormwater runoff is in conflict with the MADEP Stormwater Standards, which requires the 1-inch treatment volume only for discharges to critical environmental areas. The imposition of both the 1-inch treatment volume for all new land development projects, as well as the retrofitting of the entirety of a site undergoing land redevelopment activities will greatly increase the cost of construction of both types of projects. For redevelopment projects, this requirement may make a project no longer cost effective. While the Town certainly does not encourage unchecked land development activities, the added construction costs due to the Draft Permit must be weighed against the general economic harm that may occur from those added costs. Massachusetts already has some of the highest construction costs in the United States, and these costs have had a dramatic impact upon the ability of cities and towns in the State to provide affordable housing for its citizens. We urge the EPA to reassess this requirement to treat the 1-inch stormwater runoff on the entirety of a redevelopment site. We further urge the EPA to consider the conflict created between the Draft Permit and the existing Massachusetts Stormwater Standards and other local land development bylaws and regulations. The EPA should be working conjointly with the MADEP to determine what is best for Massachusetts in term of stormwater standards for new and redevelopment projects.

The current Draft Permit provides a level of detail of the activities to be completed to achieve permit compliance that has been previously not seen. For instance, there are at least 250 different actionable items that the Town has to demonstrate compliance with. Additionally, the Draft Permit lists criminal penalties for failure to comply with these items. Many of these items are of limited benefit. For instance, requiring the Town to sweep streets a second time in the year, primarily in order to collect leaves is unreasonable. We believe the EPA needs to re-examine this list of activities. We urge the EPA to craft permit requirements that are based on quantifiable improvements in stormwater runoff quality, rather than mandating a set of actions that may or may not result in any appreciable improvement in runoff quality.

There are number of areas within the permit where it appears the EPA is using cities and towns to act as data collection surrogates for the EPA. Collecting data on volume of street sweepings, catch basins cleanings, amount of directly connected impervious areas (DCIA), and wet weather sampling serves little purpose in increasing stormwater runoff quality. While this data may be interesting to collect for research purposes, there is a cost associated with the collection efforts. The cost in money and time to collect this data should not be borne by the Town, as there is no appreciable benefit to runoff quality. It is simply an academic exercise. If the EPA is interested in collecting these types of information for further research and analysis,

102 Central Street
Auburn, MA 01501
Telephone: (508) 832-7720 Fax: (508) 832-6145
Email: townmgr@town.auburn.ma.us
Web site: www.auburnguide.com

then it should bear the burden and cost of collecting the information. It should not simply be required of the Town to perform this type of work on the behalf of the EPA.

Finally, of particular concern to the Town is the overall projected cost of compliance with the Draft Permit. The Town currently spends approximately $295,000 per year on stormwater related measures. With the requirements within the current Draft permit, the Town could expect new annual costs to be approximately $260,000 per year, or an increase of 88-percent above current costs. Further, this new annual cost does not include funds necessary to perform structural retrofits on existing Town owned stormwater management systems.

The Town has been a strong supporter of improving stormwater quality, and has consistently funded the activities needed to comply with the 2003 MS4 permit. The Town did expect that the Draft Permit would require an increased expenditure of money related to new stormwater compliance costs. However, the amount of the projected increase is unreasonable, especially given the limited benefit of many of the items that are driving the increased costs, and the lack of quantifiable improvements to runoff quality. The EPA must examine further the cost implications of the Draft Permit, and work to find ways to reduce this additional burden to cities and towns. While the EPA has indicated that it understands that there will be additional permit compliance costs, it has not sought out ways to reduce that burden. Rather, the EPA champions the establishment of stormwater utilities to raise dedicated funding for stormwater management. While a stormwater utility is one way to raise money for stormwater management, such a utility simply represents a way to levy an additional tax or fee on the residents and business owners of the Town. A stormwater utility may raise money, but it does nothing to limit the amount of money that is needed by the Town to comply with the Draft Permit. The Town of Auburn proposed the formation of a stormwater utility in 2010 and encountered significant opposition by businesses, residents, and the Board of Selectmen, and was ultimately rejected. We strongly urge the EPA to examine all of the new mandates that it is requiring cities and towns to comply with in the Draft Permit.

In conclusion, the Town of Auburn is quite concerned with the large expansion of the EPA's involvement in the Town's stormwater management program. The EPA is mandating a number of activities that will be expensive to implement, are not within the core function of a municipality in Massachusetts, and will have no readily apparent increase in stormwater runoff quality. The Town of Auburn is a strong and consistent advocate for clean water, whether it is drinking water, stormwater, or wastewater. However, any increases in costs due to permit compliance must be balanced against the financial capability of Auburn, and other cities and towns to absorb those additional costs. The Town of Auburn expected that permit compliance costs would go up under the Draft Permit. However, the scale of the cost increases, as well as the reasons for those increases, is not something that can be easily defended or explained to the general public. If the EPA wishes to increase stormwater runoff quality, they must adopt a more cooperative approach to the problem, and work with the cities and towns of Massachusetts to create a permit with more realistic requirements that create measurable improvements in stormwater runoff quality. Until such time that occurs, or until the Federal and/or State governments step forward with the additional funding necessary to gain permit compliance, cities and towns will be stuck in an adversarial relationship with the EPA, and will be unable to adequately fund their stormwater management programs.

On behalf of the Town of Auburn, I thank the EPA for providing this opportunity to comment on the Draft Permit, and we look forward to working with the EPA in the future to create a more practical and cost effective stormwater permit.

Sincerely,

Julie A. Jacobson

Re: Comments on the Draft MS4 NPDES General Permit for Stormwater Discharges in Massachusetts

Dear Mr. Tedder,

The Town of Auburn Department of Public Works (DPW) has reviewed the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts (Draft Permit). We thank you for the opportunity to provide comments and we note that the Auburn Town Manager, will be submitting comments separately.

The Town of Auburn is a community of approximately 16,000 people and is host to Massachusetts State Routes 12, 20, I-90, I-290,and I- 395.

The DPW supports the underlying goal of the Draft Permit, which is to improve the water quality of the United States. The DPW is the implementing agency for the Town of the 2003 Phase II MS4 General Permit (2003 Permit) and we have worked diligently and successfully to implement the requirements of the 2003 Permit. To date, the Town has spent approximately $295,000 per year for compliance with the 2003 Permit.

Based on the EPA's cost estimates for complying with the Draft Permit's requirements, provided on page 76 of the Fact Sheet, the cost of compliance for the Draft Permit could vary from $78,000 to $829,000 per year, depending on the size of the municipality. The Town currently spends approximately $295,000 per year on stormwater related measures. With the requirements within the current Draft permit indicates that the Town could expect new annual costs to be approximately $260,000 per year, or an increase of 88-percent above current costs. The increased cost is substantially a result of requiring written plans, procedures, reports, policies, protocols, inventories and redundant sampling which creates a paperwork burden on the Town that does not contribute to the goal of reducing the discharge of pollutants to the waters of the United States. Further, this new annual cost does not include monies necessary to perform structural retrofits on existing Town owned stormwater management systems.

The following comments are intended to highlight the concerns that the Town has with a variety of requirements in the Draft Permit that will cause the Town to incur unnecessary costs for tasks that provide little to no appreciable increases in stormwater runoff quality. Additionally, Draft Permit items that create

5 Millbury Street
Auburn, MA 01501
Telephone: (508) 832-7814
Fax: (508) 832-2173
Email: wcoyle@town.auburn.ma.us
Web site: www.auburnguide.com

an undo regulatory burden upon the Town in terms of administrative filings, data collection, studies, etc. are discussed:

1. Within the Town of Auburn, similar to other cities in towns in Massachusetts, there are several traditional and non-traditional publicly owned MS4 systems. The Town has no responsibility for, or legal authority over, these other MS4s. However, the outreach to these other regulated entities to inform them of their responsibilities under the Draft Permit has appeared to be non-existent. We ask that the EPA reach out directly to these other regulated entities and not rely on the Town to do this work on the EPA's behalf.

2. The Notice of Intent (NOI) requires a significant amount of work that cannot be reasonably and accurately performed in the 90 days mandated in Part 1.7.2 of the Draft Permit. We note that per Part 1.7.4, the NOI will be posted and allowed to be publicly commented upon. It is important that cities and towns have an appropriate amount of time to collect the requested information in the NOI, to determine what Best Management Practices (BMPs) will be used to comply with the Draft Permit, and to determine what Town Department will be responsible for implementing the BMPs. It is assumed that the EPA and the members of the public that will be reviewing the NOI will want the NOI to be as complete and accurate as possible. In addition, Part 1.7.2. requires the Town's appropriate official to sign the NOI under the pains and penalties of perjury, and to certify that the NOI is "...true, accurate, and complete." We request that the time allowed to submit a NOI from the date of release of the Final Permit be at least 180 calendar days. This 180 calendar day schedule is similar to that provided to municipalities under the 2003 MS4 permit, and we do not see any reason why it should not be provided for this Draft Permit.

3. The public education program requires to show evidence that progress towards the defined education goals has been achieved. We request that EPA provides specific measures/methods to show evidence for achieving the educational goals. Efforts spend on designing/evaluating measures to evaluate the effectiveness of the educational program create a burden to the Town as personnel are not specialized on public relations. It does not encourage the best use of Town's resources and does not contribute to the goal of increasing knowledge.

4. It is required that all outfall and interconnections be inventory. The Town has approximately 320 outfalls and expects that adding interconnections will double or triple this number. The Town agrees that adding information such as material, size, shape, and condition to the inventory of outfalls is beneficial. However, we request that inventory of all interconnections be removed from Part 2.3.4.5.b, there is no benefit to inventorying all interconnections if the point of discharge (outfall), downstream from the interconnection, is being monitored, sampled and investigated. Inventorying the physical conditions of interconnections will create a burden to the Town by duplicating efforts unnecessarily. Additionally, we believe one year is not enough time to gather all of this information and request that the update to the inventory of outfalls be completed throughout the duration of the permit.

5. A more detailed map than the 2003 Permit is required. The new stormwater system map requires substantially more information, including but not limited to adding pipes, and catchment delineations, and the time frame to complete it is two years. The Town requests that additional time be provided for the completion of this requirement. We request that the new system map be completed throughout the duration of the permit, this will allow for a practical usage of Town resources to complete this requirement.

6. In Auburn various departments and divisions have and/or share specific responsibilities within the 2003 Permit. The draft permit requires writing a description of each department's responsibilities in a report. We believe a report that stays on the shelf, hardly gets use and creates paperwork burden is not an efficient way to create awareness. We recommend that EPA strives to outreach to more Town

5 Millbury Street
Auburn, MA 01501
Telephone: (508) 832-7814
Fax: (508) 832-2173
Email: wcoyle@town.auburn.ma.us
Web site: www.auburnguide.com

agencies/departments to increase awareness and convey the importance of implementing the Illicit Discharge Detection and Elimination (IDDE) program.

7. Outfall dry and wet weather screening and sampling requires at a minimum sampling of 7 parameters (ammonia, chlorine, conductivity, salinity, ecoli/enterococcus, surfactants and temperature) for any flowing outfall. We believe this is excessive and request that a visual screening for flowing outfalls should be allowed and sampling should be required only if visible signs of pollutants exists. This will allow the Town to focus efforts on finding/eliminating sources of non-stormwater discharges instead of potentially sampling locations where high ground water table may exist.

8. The catchment investigation (system vulnerability) consisting of dry and wet weather key junction manhole investigations seems to be repetitive to the outfall screening requirement. We agree to conduct upstream investigations if the outfall shows signs of pollutants but not to all upstream key junctions. Dry weather key junction manhole inspections should allow for a visual assessment and not require screening of 3 parameters (ammonia, chlorine and surfactants) to all catchments. We recommend that wet weather investigations be required only if the outfall/interconnection screening shows signs of pollutants, known contributions of illicit discharges exist, or where system vulnerability exists. This will allow the Town to focus efforts on finding/eliminating sources of non-stormwater discharge and will avoid expending efforts and funds where unnecessary.

9. Under Part 2.3.4.8.a, we request that completion of the screening of each outfall be extended to the duration of the permit and not to 3 years.

10. Under Part 2.3.4.9, we request that EPA provides specific guidance on reporting the IDDE program effectiveness and develops tracking indicators. Requiring permittees to identify and define tracking mechanism creates a burden to the Town by requesting a task that may be better suited to the organization receiving updates from each Town/City on compliance to the IDDE program.

11. Part 2.3.5, writing procedures for site plan review and inspection and enforcement creates a lot of paperwork burden that hardly gets used. This requirement creates additional paperwork burden, standard procedures should be provided by EPA to all permittees and the Town should continue to focus on the implementation of the site plan review and inspection and enforcement.

12. The requirement for new development and redevelopment related to retain or treat the first inch of runoff from impervious surfaces is in disagreement with and abrogates the Massachusetts Stormwater Handbook standards. We request that Part 2.3.6.a.ii.(a) be made consistent with the Massachusetts Stormwater Handbook Standards.

13. Part 2.3.6.b requires writing an assessment of current street design and parking lot guidelines to determine if changes can be made to support low impact development (LID) options. This imposes a burden to the Town by spending efforts on designing roadway standards instead of focusing on reducing the discharge of pollutants. The Town has, where appropriate, been implementing and supported LID techniques as recommended in the Massachusetts Stormwater Handbook. We recommend that additional information on LID design and impacts be provided to the Towns for its use as feasible.

14. Part 2.3.6.c requires writing an assessment of local regulations to determine the feasibility of allowing greener practices and providing a schedule for implementation. Similar to Comment 16, this creates a burden to the Town by spending efforts on Land Use Development. We recommend that this assessment be done at a larger scale and not by individual Towns.

15. To estimate the annual increase or decrease in the number of acres of impervious areas (IA) and directly connected impervious areas (DCIA) imposes a burden to the Town by spending efforts on calculations

5 Millbury Street
Auburn, MA 01501
Telephone: (508) 832-7814
Fax: (508) 832-2173
Email: wcoyle@town.auburn.ma.us
Web site: www.auburnguide.com

that do not provide a reduction of pollutants discharged through stormwater. The Town requests that this requirement be removed from the permit and recommends that EPA takes on the challenge to maintain this database.

16. The draft permit requires the inventory and priority ranking of Town-owned properties to implement a retrofitting program after Year 5 of the permit. It is unrealistic to expect that the Town will be able to spend money on retrofitting its properties to include a BMP after 5 years of the permit. Many of the Town owned properties are within areas where adding a structural BMP is nearly unfeasible. To meet this requirement, the Town will be obligated to hire an outside consultant to assess the possibility of modifying the existing infrastructure. This can be cost prohibited. The Town request that this requirement be changed to implement structural BMPs where feasible.

17. The draft permit requires to annually report the volume or mass of material removed from each catch basin draining to water quality limited waters and the total volume or mass of material removed from all catch basins. This requirement creates a burden to the Town by spending efforts on estimates that are hard to obtain with accuracy. This calculation does not prevent or reduce the pollutant runoff from town-owned operations. The Town requests that this requirement be removed.

18. The draft permit requires to annually report on the number of miles of street cleaned and volume or mass of material removed. This requirement creates a burden to the Town by spending efforts on estimates that are hard to obtain with accuracy. This calculation does not prevent or reduce the pollutant runoff from town-owned operations. The Town requests that this requirement be removed.

19. The standard permit conditions included in the draft permit are much different than the standard conditions included on other NPDES permits. It includes criminal penalties which were not listed before. The Town has and plans to continue to implement the requirements of the MS4 permit, but disagrees with the new language included in this Appendix.

20. The Town requests guidance on the allowable uses for the street sweepings and catch basin cleaning material that may not create a financial and/or paper burden to the Town.

As described above we believe there are a number of proposals found with this draft permit that are either: 1) impractical to implement, 2) add little to negligible benefit to the environment; 3) are cost prohibited; and 4) some combination thereof. We believe that a number of changes must be made to the draft permit, in order to create a regulation that will work. We believe that many of the requirements of this draft permit are best instituted on a nationwide or statewide level, given the greater amount of resources available to EPA and DEP. Without an infusion of a large amount of state and federal fiscal resources, as currently designed, this draft permit sets up small towns and cities for failure, as the required fiscal resources are simply not available to them. We strongly suggest that the draft permit be pared back to better reflect the resources available to all levels of government.

We thank EPA for providing the opportunity to comment, and look forward to working with you to create a more practical and easy to implement general permit. If you have additional questions regarding these comments feel free to contact me at 508-832-7814 or via email at wcoyle@town.auburn.ma.us.

Sincerely,

W. Coyle

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity for Berkshire Environmental Action Team, Inc. (BEAT) to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. BEAT has been working with our communities for more than 10 years to protect the environment for wildlife in support of the natural systems that sustain us all.

Polluted stormwater is the most serious water pollution problem in Massachusetts today. EPA Region 1 has found that stormwater causes or contributes to at least 55% of the violations of water quality standards in the state's rivers, streams, and lakes. Climate change presents an additional, important reason to improve stormwater management. Most scientists expect the recent cycles of flooding and drought to become more pronounced, and Massachusetts communities need to maintain or upgrade their aging infrastructures, to safeguard both public safety and the environment into the future. **This permit is an important step in promoting these urgently-needed changes, and we strongly support its promulgation.**

The 2014 permit represents a significant improvement over the 2003 permit, and is likely to be much more effective in reducing pollution, flooding and erosion caused by stormwater in urbanized areas.

- The permit incorporates **water-quality requirements** that directly address the pollutants that are actually causing specific Water Quality Standard violations in each town.

- The permit provides **more specific requirements and deadlines** in many cases, which should result in better compliance than was achieved under 2003 permit.

- The permit gives towns **adequate time and substantial flexibility** in choosing approaches to compliance that are most appropriate for local conditions. In response to comments on the 2010 proposed permit, EPA eliminated some requirements that were believed to be overly prescriptive.

- **Permit requirements for greater public access and opportunities to comment** on towns' stormwater management programs will increase public support for these programs, which is essential if towns are to raise the resources necessary to deal with

polluted stormwater. Greater public scrutiny will also encourage more effective plans and more consistent implementation.

- **The post-construction requirements for new development and redevelopment will prevent future projects from continuing the poor stormwater management practices of the past.** EPA has chosen a balanced and effective strategy, setting a high standard for infiltration of stormwater (the most cost-effective way of removing pollutants from stormwater), providing a safety valve where site conditions make meeting that standard infeasible.

In short, the permit requirements ask municipalities to do better monitoring and planning, to improve implementation, to raise public awareness of stormwater issues, and to design and maintain better stormwater management measures. If successful, the permit **will result in major improvements in the management of urban stormwater in Massachusetts, and we will see the results in cleaner, healthier, rivers, streams, lakes, bonds, and coastal waters**.

We also note that good planning **can help towns reduce compliance costs and fund the required investments in stormwater programs and infrastructure**. Towns can take advantage of help and support from EPA, MassDEP, watershed groups and regional planning agencies; work regionally (including through storm water consortiums) to achieve economies of scale, develop and fund stormwater utilities, and ensure that private entities assume their share of the responsibility for stormwater management.

Finally, while we strongly endorse the overall approach and requirements of this permit, we **have identified some areas where improvements are needed:**

- **The stormwater bylaw requirements should apply to projects as small as a quarter of an acre.** Most urbanized towns, at least in the Boston area, have very few large development and redevelopment projects, and projects under an acre would not be required to employ *any* stormwater management measures unless they are located in wetland resource areas. This will make it exceedingly difficult for many towns to comply with the proposed prohibition against new and increased stormwater discharges from MS4s.

- In addition to conducting an annual evaluation of BMP compliance and effectiveness, **permittees should be required to take corrective action** where the evaluation shows that goals and objectives are not being met. An effective iterative approach to improving stormwater management requires that problems be addressed, and not simply identified.

- **MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements**. This includes requiring new development and redevelopment projects and retrofits on town-owned property to implement BMPs that are most effective at reducing bacteria where the waters they discharge to (via an MS4) do not meet bacteria Water Quality Standards. These requirements are consistent with the proposed requirements for other stormwater pollutants.

- **The new requirements proposed for projects discharging to water impaired for chloride should apply to all MS4s.** While relatively few water bodies have been assessed for chloride, evidence suggests that this is a significant problem in most, if not all, urbanized areas.

We appreciate the careful work EPA has done to improve on the 2003 permit and the 2010 proposals, based on experience with the 2003 permit and comments on the 2010 proposals. However, the process has taken a very long time. We **strongly support prompt issuance of the final permit**, to end a long period of drift and uncertainty associated with delay in issuing this permit. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date

Thank you for considering our comments on this very important permit.

Sincerely,

Jane Winn, Executive Director

Re: Comments Regarding Proposed draft Massachusetts new EPA Storm Phase 2 regulations

Dear Mr. Tedder:

The following is a list of the most troubling portions of the proposed new Stormwater Phase Two regulations.

1) Pavement maintenance work triggers retaining first inch of stormwater or stormwater treatment. Under the new regulations, when one disturbs more than 1 acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) or more which will include road reclamation projects, the new regulations require that the first inch of storm water be retained or all the stormwater must be treated. This essentially means one now not only has to resurface the road one has to completely redesign and re-construct the entire stormwater collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for stormwater storage or pay for the expense of stormwater treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way.

   As everyone is aware, the funds available for pavement maintenance are less than half of what are needed to simply preserve the condition of the current infrastructure. This means that Massachusetts roads are falling apart faster than they can be repaired. The above added costs will compound the problem and create more failing roads and more erosion. Municipalities will be forced to use the wrong pavement rehabilitation technique at the wrong time which will squander the available limited pavement maintenance resources.

   There must be an exemption for pavement maintenance projects. The above regulations should not be applied to maintenance projects. If a new road is being constructed or a lane is being added, these stormwater management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should not trigger rebuilding the world.

2) Chloride Reduction. Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW

director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to legal action. Yes, usage of chlorides could all stop tomorrow, but at what cost to human life. If the EPA will protect an endangered salamander, it should be equally as concerned with the loss of human life. The chloride reduction regulations should be limited to recommending that municipalities follow the latest accepted Best Management Practices.

3) Requirement for tracking impervious area. The EPA in its permit guidance documents implicitly admits that the simple presence of impervious areas is not a direct correlation to stormwater quality. Sites with paved areas can store/detain or treat stormwater so that the presence of paved areas on stormwater quality is mitigated. Similarly, the MaDEP considers roof water runoff "clean" and can be infiltrated into the ground without pre treatment. Tracking the amount of impervious areas does not have a direct correlation to water quality; therefore the MS4's should not have to expend resources tracking changes in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities. Any attempt at limiting /restricting development through the veiled attempt at controlling impervious area is outside the purview of the Clean Water Act.

4) Cost of implementation. An article published in Construction Outlook a publication of UCANE recently published EPA cost estimates of compliance between $70,000 and $829,000 per year depending on population and size. This is very troubling because they have been known to significantly under-estimate the actual cost. At the meeting, Newton Tedder from the EPA commented that he believes most cities and towns will have to pass a stormwater utility in order to pay for the costs to comply with the new Storm Phase Two regulations. Obviously, the EPA is admitting that the new regulations are an undue burden and so costly that the municipalities cannot afford them with existing revenues. It seems unlikely that the intent of Congress in passing the Clean Water Act was to authorize the EPA to mandate additional taxes and create its own hidden tax structure to accomplish its charge of cleaning the water. The EPA was charged with cleaning the water and operating within its budget as set by Congress. The States and local cities and towns must do the same. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to capriciously raise the cost of compliance with the new regulations. The local governments will be happy to work with the EPA to achieve progress on storm water. However, the heavy handed, adversarial and punishing regulations as proposed will not encourage cooperation from state and municipal partners.

The Congress of the United States should act to restrain the EPA from imposing uncontrolled and expensive tax burdens on the subjects it regulates. Taking reasonable actions to improve water quality is one thing, but being mandated to accomplish everything overnight is unfathomable. All levels of government must be cognizant of costs. The regulations, reporting

requirements and the overall implementation costs must be reduced to a sustainable and rational level.

5) Signage at outfalls: Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources. The signs will encourage theft or vandalism and will provide little to no use in management of the stormdrain system. All regulated organizations are required to have maps with locations of all outfalls. The availability of low cost GPS devices makes these outfalls easily located by just about anyone.

Preliminary Draft

I am not sure how informed you our representatives in the State House, and Congress and House of Representatives in Washington of the revised regulations that the USEPA Region 1 is about to initiate. I realize you must have a thousand issues to deal with and simply want to make you aware of this program that it appears will have significant and inequitable impact on some towns in eastern Massachusetts and southern New Hampshire.

The proposed Municipal Separate Storm Sewer System (MS4) regulator changes were published for comment and for the second time of September 30, 2014. A previous draft was published in 2010 and retracted. It is an extensive technical document and I have sent my comments regarding the technical aspects directly to the USEPA Region 1 staff.
This letter does not get into the technical aspects, but tries very briefly summarize and express my concerns on the economic impacts, inequality, and fairness issues.

To very briefly summarize the regulations, cities and towns included in the region affected are required to step up their stormwater quality related procedures. The key cost elements are abbreviated into three areas. First is extensive study and monitory of stormwater systems and discharge pipes. Second is expansion of maintenance programs (street sweeping, catch basin cleaning, and the like). Third is a capital program to build stormwater treatment systems. My greatest concern is due to the fact that Bellingham is in the Charles River basin and therefore required to do more than many other cities or towns not in the basin.

The three elements do not sound terribly imposing until the dollars they will cost are added to the discussion.

The USEPA funded a study published in August 2011("Sustainable Stormwater Funding Evaluation for the Upper Charles River Communities of Bellingham Franklin & Milford MA", by Horsley Witten Group. It looked at the cost impacts for three towns. Therefore, we have a better idea of the cost than many other Charles River basin communities. Bellingham's anticipated annual operating cost increase for stormwater related activities (addressing the first and second elements noted above) is estimated to be $660,000, which is a 285% increase over current expenses. The third element or the cost of building stormwater system in Bellingham is $29.7 Million. In rough numbers the annual cost increase would amount to cost per home of about $110, and the borrowing cost for a the capital program would raise taxes by approximately $200 per year for the average homeowner. Three hundred and ten dollars is approximately equivalent to 50% of a current average water bill. This is a very costly program.

In an attempt at brevity I will summarize my concerns.

- It is a lot of money to ask just the local residents of Charles River basin municipalities to pay. It is not applied to all cities or towns; therefore, it is an economic disincentive for towns within the basin. Why move your business in Bellingham or any town with the stormwater fees, when no such fee would exists in neighboring towns Blackstone or Woonsocket RI.
- What is the direct benefit Bellingham residents will see from this new expense? I am sure Bellingham and many municipalities within the river basin will see little if any noticeable river water quality improvement within their borders. In Bellingham the Charles is a brook, meandering swamp with no clear channel, and roaring but non-navigable river. Other than a small pond with contaminated sediment (Box Pond) there is no recreational use of the river in Bellingham. Therefore, the only motivation is "pay or we will be fined".
- How will taxpayers be convinced to take on the added costs? Taxpayers have trouble enough funding new schools they can see and touch. I think it will be impossible to secure funding for a program that has a main tangible result will be to enhance fish habitat, and only motivation is fines. This program will probably trigger sizable expenses to battles against the program requirements and delay stormwater quality enhancements.
- The rules have been changed in midstream. Business owners and municipalities developed their sites in accordance with design standard at the time are now being impacted by revised regulations. The $29.7 Million cost is what is needed to retrofit impervious service for parking areas and roads (build treatment and recharge structures). Businesses will be driven out, abandon their properties leaving vacant parcels with little chance of sale. This pushes the problems to the municipality, who first lose the tax revenue when businesses leave, and are still required to retrofit impervious surface to achieve phosphorus reduction numbers.
- How are Massachusetts municipalities going to come up with these extra funds? Proposition two and a half prevents additional tax revenue without an override. Bellingham has never approved an override. That leaves cuts in other programs or creating a stormwater utility. Cuts in other programs are unlikely. Road repairs are an estimated $35 million behind; school, police, fire need are very unlikely to be trumped by stormwater. The USEPA makes it sound like an easy proposition to accept a Stormwater Utility, but taxpayers will need to vote to raise their own fees by $310 per year.
- Bellingham is also saddled with an additional complication. Only have of the Town lies within the Charles River basin. We have not even started to consider the problem this presents, but can imagine an additional battle against the appropriation of funding for this program.
- The only solution that I believe will get stormwater enhancements constructed is an extensive grant program. Surface water quality is a national concern and should be a national program. I argue that if the EPA cannot convince Congress and State Legislature of the importance of this program, local officials will have no chance to convince taxpayers.

The scope of this program is not dissimilar to that of the wastewater program of the seventies and eighties. EPA and the Clean Water Act included a $60 billion construction grants program. That program provided federal and state assistance and in the many cases amounted to 90% grants. At the ten cents on the dollar cost, the wastewater treatment and collection projects were a great success. Before the wastewater program, rivers were terribly polluted and some actually capable of supporting fire. The elimination of dumping raw sewage into our waters made sense to everyone. The elimination of untreated rain water from enters our waters is a much harder sell.

Congress reauthorized the Clean Water Act in 1987 and added the mention of stormwater. It is hard to believe that that if that Congress knew the economic impact of stormwater regulations

currently proposed, they would have included grant funding program. The EPA is using the basic language in a nearly thirty year old act to impose what will likely be crippling costs on some geographic areas. Everyone should be paying a share of the cost. The only way that works is to have the federal government fund the program. I urge our elected officials to scrap this program until such time a grant funding program can be put in place that makes it affordable.

In conclusion, I have neither the expertise nor desire to argue against the science or reports the USEPA is using to push this massive regulatory revision. I have little doubt that the program proposed would be beneficial to river vegetation and wildlife and enhance groundwater recharge. However, it is way too costly to expect just the cities and towns located in the Charles River basin to fund. This may be a great program for the environment, but it seems doomed unless a significant grant assistance program is added to the equation.

RE: Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts – Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. The concerns noted below were developed on the basis of review of the draft General Permit with assistance from a consultant regarding many technical aspects. These issues are significant.

Comments

General

The first minimum control measure is Public Education and Outreach. The EPA should take on this responsibility before moving any revision to the regulations forward. The education of the local, state, and federal elected officials of the merit of this program should be a primary task of the EPA. If the elected officials are not strong supporters of this program it will be doomed. The EPA assumes that public works and local governments will be able to convince taxpayers to contribute significant funds to a program that is widely regarded as a special interest driven, unfunded mandate to improve the health of the river's wildlife. The program has huge costs and unclear benefit for those paying the bill. Current perception is that local officials will fight rather than inflict a huge extra cost on taxpayers. Town stormwater management programs will likely be unfunded, widespread non-compliance, lead to an endless stream law suites and do nothing to improve water quality. *Proposed Modification*: Retract the draft until such time as the EPA and

MassDEP have instituted an education program directed at elected officials and convinced them that the cost is worth the benefit.

Minimum Control Measures (MCM) / Maximum Extent Practicable Requirements

1. **MCM 1 – Public Education and Outreach**: Although not explicitly required under the permit, EPA has repeatedly suggested that introducing stormwater quality-related topics in school curricula would be an appropriate and cost-effective means of achieving MCM-1 objectives. Experience has demonstrated that statutory subject requirements within most school systems makes it very difficult to introduce non-mandatory (or non-MCAS related) material. Cost estimates related to achieving the minimum requirements of this MCM appear to be under-representing the broad audience targets and should not assume school programs as the basis for cost estimates.

2. **Public Education and Outreach by the EPA**: The education of the public and public officials of the merit of this program should be a primary task of the EPA and MassDEP. The EPA and MassDEP should initiate an extensive public information campaign clearly stating the costs and benefits of the program. This education should extend to our representatives in Washington.

3. **MCM 3 - IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm drain and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification*: Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a

prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.

b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification*: Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification*: Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

4. **MCM 3 - Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties under separate permit programs in the event of an SSO excursion. *Proposed Modification*: Elimination of this requirement.

5. **Affordability; Estimated Program Cost Increases**: The EPA funded Horsley Whitten Group August 2011 Report "Sustainable Stormwater Funding Evaluation" indicates a cost to the Town of Bellingham of a million dollars a year in additional annual stormwater maintenance activities. In addition, it estimates a capital project program of approximately 30 Million. The enormous gains in water quality under the Clean Water Act in the first two decades after passage were achieved through a locally affordable program aimed at primarily wastewater-related point source discharges, and underwritten by state and federal funding equivalent in many cases to 90% of the program capital cost. Stormwater-related pollutant contributions to receiving water bodies are much more difficult to control and will achieve an incremental water quality improvement compared

to the wastewater discharges that were the target of initial infrastructure investments. It is inconceivable that the estimated costs of this MS4 program can be affordably sustained by a limited number of property owners within communities subject to the most stringent pollutant reductions. Water quality improvements have local, state and national benefits. A program that EPA and other environmental organizations (regulatory, advocacy/non-profit or commercial) recognize as this important should have some kind of legislative or Congressional support that provides adequate funding to promote programs that can achieve water quality improvements in a more equitable and financially sustainable manner. *Proposed Modification*: Retract the draft until such time as the EPA has convinced Congress of the merits of a stormwater program and secured a funding that makes it affordable for local communities.

6. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

7. **Definitions – Redevelopment**: The term "redevelopment" is nowhere defined in the permit or appendices. Given that EPA is requiring "redevelopment" projects to meet the new development design guidelines for stormwater management (and particularly in reference to the one-inch retention/treatment provision), it is important to know what constitutes redevelopment versus rehabilitation, restoration, maintenance or repair projects. This is particularly of concern as it relates to transportation-related projects such as pavement programs (full depth reconstruction, pavement overlays, chip sealing, etc.), and the possibility that routine maintenance could trigger requirements for significant drainage improvements that would not otherwise be appropriate or necessary for operational purposes. *Proposed Modification*: Define redevelopment to exclude roadway projects that do not add significant impervious area.

8. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment of roadway runoff. *Proposed Modification*: For roadway projects, add an exemption, waiver, or flexible requirements (reduction of one inch of runoff retained requirement) for this permit condition.

9. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." *Request Clarification*: We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.

10. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MassDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MassDEP stormwater standards and complicates compliance for regulated entities. *Request Revision*: We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.

11. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MassDEP stormwater management standards and creates further confusion relative to application of development standards. *Request Revision*: We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.

12. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b), the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of

punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in its best interest.

13. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The Horsley Whitten Group August 2011 Report "Sustainable Stormwater Funding Evaluation" analyzed these costs. Bellingham's additional cost is estimated to be approximately $750,000 more per year effectively increasing the annual expense by a factor of four. In addition, applying the formulas in Appendix F to all Town roadways would amount to a very minimal reduction in phosphorus load. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* We request that EPA include an affordability and cost effective component into the MS4 Permit.

Water Quality Based Effluent Limitations (WQBELs)

1. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. *Request Clarification*: Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.

2. **Phosphorus Load Export Rates – Appropriate Use:** Regarding Appendix F and attachments, the Phosphorus Load Export Rates (PLERs) are general and approximate at best. The composite PLERs are good for screening / planning purposes or comparative purposes. They are not accurate for determining hard design of control measures. For example, they can be used to evaluate whether a proposed change in land use is expected

to increase or decrease pollutant loads. But to use a PLER to conclude that the loading rate is actually X lbs/yr, or will change from Y lbs/yr to Z lbs/yr with land use or other changes, is not a recommended technical practice. Loading rates are ordinal rather than cardinal, i.e., they can tell you if one is higher than another, but not exactly how much higher one is than another. It appears that EPA assumes that over the entire Commonwealth of Massachusetts, using PLERs will represent the average condition. That may be true, but EPA is requiring that the PLERs be used to make decisions on a much smaller watershed and sub watershed scale, which is inappropriate. *Proposed Modification*: Revise the draft to allow significant flexibility in the design of control measure and related phosphorus reduction calculations.

3. **PLERs - Derivation:** It is not clear how the values for PLERs in the EPA documents are derived, however, a literature search shows that there is a large range of values for any given land use. For example, the PLER for medium density residential is given as 0.55 lb/ac/yr in Table 1-1 (App. F Attachment 1), but the range of PLERs for medium density residential in the scientific literature can be an order of magnitude around the value. *Request Clarification*: Please provide further information regarding derivation of the PLERs since these values have significant impact on program implementation for regulated communities.

4. **PLERs – Blanket vs. Site Specific:** PLERs found in older literature generally do not reflect the presence of stormwater BMPs, low impact development (LID) planning, etc., and therefore may overestimate pollutant loads for current land uses. In addition, composite PLERs are a particular concern for communities that have previously instituted stricter local development standards for stormwater management many years ago (in some cases, decades) where assumed PLERs may be much greater than actual conditions. *Proposed Modification:* Rather than limiting appeals of assumed baseline watershed phosphorus loading to updates of land use information, allow permittees the option to develop their own alternative methodology for determining baseline phosphorus loads and reduction requirements based on more detailed data and/or site specific information.

5. **Phosphorus Contribution of Illicit Discharge:** It is not clear in either the permit or the fact sheet what method was employed to calculate estimated contribution of phosphorus load through illicit discharges, and consequently the load reduction that would be achieved through elimination of IDDE. Since this calculation figures into the total overall phosphorus load reduction allocated to each Charles River community, it is impossible to comment on how equitable this approach can be. *Request Clarification*: Please provide further documentation regarding the method used to complete this calculation.

6. **Ambiguity in Determining Contributing Drainage Area:** It is not clear in Appendix F and its pertaining attachments whether the permittee will be using the impervious area or the directly connected impervious area (DCIA) in the PLER calculations, which includes factoring in DCIA in determining PCP area. The phosphorous loads should be determined from the DCIA of a target catchment, but this is not explicitly mentioned in either Appendix F or its attachments. The only explicit mention on DCIA is in Appendix

F under sections "Phosphorous Source Identification Report" and "Nitrogen Source Identification Report" which simply state that the source identification report should include the "Impervious area and DCIA for the target catchment." There is no mention of how this DCIA information needs to be used, for example, in determining either the PCP area, total development area, impervious area (IA) for calculating phosphorous reduction credits for non-structural BMPs, or in distributing the total drainage area into impervious area for BMP load and volume calculations. *Suggested Modification:* In all the above instances, DCIA should be considered, rather than total impervious area.

7. **Determining Infiltration Rate for Structural BMPs:** Attachment 3 of Appendix F specifies identification of infiltration rate for a particular BMP when determining the design volume of a structural BMP to achieve a known phosphorous load reduction target from a contributing drainage area. However, it is not clear how the infiltration rate needs to be determined. It is stated that the infiltration rates represent the saturated hydraulic conductivity of the soils. Since saturated hydraulic conductivity of soils is a function of its hydrologic soil group, it is important to mention how this rate needs to be determined for a combination of soil types. *Request Clarification*: Please provide further guidance to determine infiltration rates for an infiltration type structural BMP, such as an infiltration trench or infiltration basin**.**

8. **Choosing BMP Performance Curve for Multiple Combination of BMPs**: Attachment 3 of Appendix F provides several BMP performance curves for different types of structural BMPs. However, the permittee may choose a combination of BMPs to achieve a desired phosphorous load reduction. It has been noted through literature search that a combination of BMPs may be more effective in capturing larger storms, and hence will be more effective in providing desired phosphorous load reductions from these storm events. For example, if a bio-retention system is coupled with a secondary spillway to a porous pavement, it has been found from literature that this combination is effective in capturing the first 1" rain (first flush) and higher flows, respectively. In such a situation, it is not clear what BMP performance curve should be referenced and how the curve(s) need to be used by the permittee. *Request Clarification*: Please provide further documentation regarding the method to determine BMP performance curves for a combination of BMPs.

9. **Appendix H. II (1)(a)(i)(3) Additional /Enhanced BMPs for Phosphorus-Impaired Waters**: Under the Good House Keeping requirement, it requires permittees to increase frequency of street sweeping at least twice a year for all municipal streets and parking lots. This requirement should be related exclusively to those streets within the impaired catchment, not all streets and parking lots in the Town. It might be what was intended, but that is not how the language reads and should be modified. *Suggested Modification:* Revise to require semiannual sweeping only within impaired catchment areas.

Other Issues

1. **Non-Stormwater Discharges**: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." *Suggested*

Modification: Add Explicit guidance regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges.

2. **Legal Analysis for PCP:** EPA and MassDEP should provide greater guidance related to this requirement. This analysis is likely to have many common components from municipality to municipality and appears to be an appropriate area for regulators to expand upon the examples provided in the fact sheet and a likely topic for model by-laws/ordinances. In addition, the permit and fact sheet regularly cite the cost-benefit of regional or collaborative effort to implement many of the MS4 requirements. As such, model Inter-municipal Agreements or other legal vehicles to achieve mutual objectives should be developed and shared with regulated communities. I feel that the EPA missed a great opportunity to move the regional approach forward during the RDD Pilot. If the EPA had brought forward a sufficiently funded Pilot program to analyze a regional approach to phosphorus reduction some good experience could have been gained. The Pilot got bogged down when it tried to impose new regulations with sizable economic impacts on three isolated Towns. *Suggestion:* The EPA should go to Congress, obtain the funds needed, and proceed with to do a true Pilot of regional phosphorous reduction trading. To be an effective Pilot, it must include design and construction funding. Again, EPA must convince the Congress of the merits of this program and to provide funding assistance.

3. **Funding Source Assessment for PCP:** The language associated with this required component of the PCP is ambiguous. Although the permit does not require adoption of a stormwater utility, all of the components of this program clearly are driving the regulated community to that EPA-preferred solution. The funding source assessment does not, in fact, make an explicit connection between cost-estimates required elsewhere in the PCP and the manner by which the "funding plan" will meet those costs. This "assessment" only requires a community to identify the means through which they intend to fund the program – adequately funded or not. The "estimated cost for implementing Phase I of the PCP" requirement states that the "estimate can be used to assess the validity of the funding source assessment…." This is a circular reference that doesn't spell out what enforcement mechanism EPA will use to ensure that the "funding plan" and the "cost estimates for implementation" are essentially equivalent. It is disingenuous for EPA's fact sheet to state that "a municipality should choose the option that is right for it" when both EPA and the regulated community have expressed the recognition that traditional funding methods (e.g. General Funds) will not be adequate to meet the program demands. The permit must be definitive around the issue of costs vs. funding so that communities understand the regulatory liability associated with an inadequately funded program.

Errors: A number of errors in referencing were noted in the document. The ones we noticed are listed below, there may be more. Please carefully check all cross references in the preparation of the Final Permit and correct the following errors:

- Page 12 – change references from Table F-5 to Table F-6
- Page 14 – change references from Table F-6 to Table F-8

- Page 14 lists reference to Buzzards Bay but there is no Nitrogen TMDL for Buzzards Bay watershed on DEP's website
- Page 14 list does not include Wareham although Wareham is in Buzzards Bay watershed
- Page 15 change reference from Table F-7 to F-9
- Page 17 – reference to Table F-10 is incorrect (that is a table of Assabet towns)
- Appendix F page 5 of 53 – footnote No. 4 incorrectly references Table F-2 for PCP area scope inclusive of MS4 only (should be Table F3) and references Table F-1 for jurisdiction-wide PCP area (should be F-2)
- Appendix F Attachment 2 – Phosphorus Reduction Efficiency Factor incorrect reference in Example 2-1 (Page 5) and Example 2-4 (Page 9) table reference notes 2-2 but should be 2.3

Re: Town of Bellingham – Supplementary Comments
Draft MS4 Permit

Dear Mr. Tedder:

I am the duly appointed and authorized Town Administrator for the Town of Bellingham. In that capacity, I am writing to offer additional comments regarding the proposed MS4 Permit.

As you know, on February 18, 2015, the Bellingham DPW Director, Donald DiMartino, submitted written comments on behalf of the Town. I hereby endorse Mr. DiMartino's comments. To that end, I must emphasize the financial impact the proposed permit would have on the Town. The materials published by the EPA appear to assume that funding is in place for the implementation of the permit. However, any such assumption is faulty. Massachusetts is a *home-rule* State wherein each city and town is responsible for its own annual budget. Simply stated, the Town's budget has not approved and cannot accommodate the massive expense of complying with the permit. Furthermore, Bellingham, like most other small towns affected by the MS4 Permit, has Town Meeting form of government. That is, the citizens of the Town of Bellingham must vote to approve the expense that the MS4 Permit would foist upon them. Given the still-challenging economic climate, I cannot fathom that such approval will be forthcoming.

Additionally, there are elements of the MS4 Permit that appear to represent a significant overreach by the EPA. As you are aware, in 2013, in the case of Virginia DOT v. EPA, the US District Court sharply curtailed the EPA's attempted regulation of storm water. While continued analysis of the application of such case to the proposed MS4 Permit is ongoing, there can be little doubt that the Federal Court has issued a sharp caution as to the EPA's overreach on the regulation of storm water. Accordingly, before any final Permit is issued, it is imperative that the EPA examine whether the regulations contained therein will survive scrutiny in the likely event of an appeal thereof. It would be a shame if the respective stakeholders (Massachusetts municipalities and the EPA) were compelled to expend time and money on litigation rather than the common sense and feasible regulation of storm water.

Thank you for your consideration of the above comments.

Sincerely,

Denis C. Fraine

RE: Comments on the 2014 Draft Small MS4 General Permit

Dear Ms. Murphy:

This letter details some of the City of Beverly's comments and concerns regarding the 2014 Draft Small MS4 General Permit.

We recognize the importance of stormwater management to the environmental health of waterways within the Commonwealth. The regulatory agencies and the regulated communities share a common mission – to ensure that our cities and towns maintain the health and quality of our natural resources. In order to accomplish these evolving goals, environmental programs must be balanced with other existing needs and community responsibilities. Since the 2003 NPDES Phase II: Small MS4 Permit, the City of Beverly has been very diligent in achieving goals and surpassing the initial 2003 BMP requirements.

Specifically, we offer the following comments on the draft regulations being promulgated:

<u>Sampling</u>

The City of Beverly in addition to the North Coastal Watershed discharges to the Ipswich River Watershed. Of the total land area 76% drains to the North Coastal Watershed. The balance drains to the Ipswich River Watershed and of this total, 59% drains to the Miles River sub-basin. The North Coastal and Miles River Sub-Basins are Category 4A and 5 respectfully. Miles River sub-basin is impaired or threatened for one or more uses and requiring a TMDL and per the October 25, 2012 "Approval of the Final Pathogen TMDL for

CITY of BEVERLY
DEPARTMENT of PUBLIC SERVICES
and ENGINEERING
191 Cabot Street
Beverly, Massachusetts 01915
Phone (978) 921-6000
Fax (978) 921-6003

the North Coastal Watershed" the North Coastal is impaired with TMDL. Therefore, 90% of the City land area discharges to a "Pathogen Impaired Segment" and subject to screening pursuant to Part 2.3.4.7.d and investigation pursuant to Part 2.3.4.7.e of the Draft permit. A related section (2.3.4.7.c) would require the City to prioritize this area as a "Problem Catchment".

To provide a sense of the impact of these sections to the City of Beverly, we can provide some Storm Sewer statistics below based upon the City's own comprehensive Storm Sewer GIS, where in addition to discharge points (outfalls) we have catch basins, manholes, gravity mains, laterals, sub-pump mains, and general features like detention basins, particle separators etc. This system also includes a feature class we label as network connector that are natural features, open channels, that convey storm water from a localized area to the larger sub-basin (catchment). From our GIS, the City has a total of 558 discharge points. If we consider just the North Coastal Watershed that discharges to a Category 4A federal waterway the following GIS data is relevant:

For North Coastal Watershed we have a total of 393 discharge points:

- Federal Outfalls account for 37 of the 393 discharge points. We define a federal outfall as where the discharge point is to a major water way (Danvers River), or Ocean,
- Local Outfalls account for 108 of the 393 discharge points. We define a local outfall as where the discharge point is an inland wetland or a non-named seasonal stream,
- Culvert Ends include 93 of the 393 discharge points. We define this as the typical culvert under a street, but also where a collection or system of drainage inlets and catch basins discharge to an open channel or non-resource area,
- Pipe Ends include 6 of the 393 discharge points. We define pipe end as a very limited number of catch basins discharging to a general land area,

It now appears to the City, based on a recent EPA meeting, that what we call Local Outfalls and Pipe Ends may also be included in the sampling program. We believe the majority of these location should be considered private outfalls, excluded from the MS4, however, per the draft permit the City may be required to sample 238 discharge points. In addition, as these discharge points may then be classified as "Problem Catchments", the City would be required to wet weather sample 80% or 190 discharge points within the first 3 years. Wet weather sampling must be done between March and June when the groundwater is relatively high, and during "first flush". This task is impossible with limited resources. The draft permit should extend the time line beyond the five year permit and limit testing to the extent practicable.

CITY of BEVERLY
DEPARTMENT of PUBLIC SERVICES
and ENGINEERING
191 Cabot Street
Beverly, Massachusetts 01915

Fax (978) 921-6003

Stormwater Retention/Treatment

The Draft Permit requires that when a project disturbs one or more acres, or is less than one acre but as part of a larger common project that disturbs more than an acre, stormwater management facilities for new development and redevelopment projects shall be designed to either retain the first one inch of runoff from all impervious surfaces or treat that stormwater.

The City has approximately 152 miles of street, of which about 133 miles are maintained by the City. In fiscal 2016 the City has budgeted 4 Million Dollars for street re-paving and at an average cost of re-paving at $200/linear foot, the City anticipates re-paving 3.79 miles. The City has inspected and rated all streets to define a priority for re-paving. A street segment with a rating of 60 or less is in need of re-paving and currently the City has 65.2 miles with a rating 60 or less. Because of the urban nature of Beverly it is not viable for the City to retain the first one inch of runoff without massive eminent domain takings to provide a location for all of these facilities. This would result in a re-paving dollars being reallocated to eminent domain takings significantly reducing actual street paving. The draft permit should be revised to exclude road paving.

Tracking of Impervious Area

The Draft Permit requires that a community estimate the annual increase or decrease in the number of acres of impervious area and directly connected impervious area. Tracking of impervious area is a burdensome requirement. This is especially burdensome based on the fact that Beverly is generally a "built out" community. Tracking changes in impervious area on private property (driveways, roofs and walkways) is not practical and does nothing to improve water quality. Tracking changes in impervious area associated with municipal facilities, large commercial and industrial projects, and roadways is a more viable alternative, but again diverts resources from improving water quality.

Increased Discharges-Section 2.1.2

New and additional stormwater flow to impaired waters regardless of concentration would be prohibited under this draft permit. As noted earlier about 90% of the Beverly land area discharges to a Category 4a or 5 water resource area. This requirement could only be overcome by demonstrating that the pollutant of concern is not present in the new/increased discharge or that the total load of pollutants to the impaired waters will not increase. Even the most innocuous "new discharge", say a new single family home with a driveway and stormwater minimizing design, will produce some pollution and will add some additional load, be it insignificant, to receiving water. The language in this section could thus be interpreted to mean no new development in MS4 areas draining to impaired waters. This section could effectively preclude new construction in 90% of Beverly. That is an impact that goes far beyond EPA and federal authority. This language must be modified to stipulate thresholds on new/additional pollutant loads being significant and not merely all new loads. Regulations should be designed to agree with the Massachusetts Stormwater Management Handbook for consistency in implementation.

Fax (978) 921-6003

Public Education and Outreach

While EPA provides more time to conduct the public education program in this draft of the permit, it is important to keep in mind that the majority of the public does not understand how stormwater can become polluted and how it can contribute to water quality issues. Most of the public still believes that catchbasins in their roads transport stormwater to a treatment facility prior to discharge. In addition, most people do not understand the concept of a watershed, or the concepts related to the water cycle (rainfall, runoff, infiltration, and evapotranspiration). A significant amount of awareness-raising must be done across the United States prior to an individual community education/outreach campaign in order to truly stimulate behavior changes in the general public. Beverly sees a large influx of visitors during the tourist season and is a "College Town" and thus education must extend well beyond the immediate locality to be truly effective. Stormwater education is a national need and should be spearheaded by EPA nationally through a consistent education campaign and not simply left to municipalities.

We urge the EPA to amend your approach to consider goals that are more realistically attainable and within the financial constraints of the current economic climate, or wait until adequate federal funding is available to ensure that these requirements do not translate into a harmful unfunded mandate to Massachusetts Cities and Towns.

Sincerely,

Gregory M. St. Louis, PE
Beverly City Engineer

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. The Blackstone River Coalition heartily supports the speedy issuance of the proposed Massachusetts Small MS4 Permit. Time is of the essence in getting this permit out. It is already ten years behind schedule, and the lack of a timely follow up to the first round of the Phase 2 Stormwater Permits has weakened the performance of the Towns to comply with the first permit. It would appear that the Towns are waiting to implement stormwater efforts until they know EPA is serious enough to go to the next stage. Well, EPA needs to demonstrate the seriousness of excess nutrients coming from stormwater outfall pipes all over the Commonwealth.

The good news is that with the recently issued permits for Treatment Plants that include stringent nutrient standards, we will begin to see a decline in Phosphorous levels in the River and its impoundments.. The bad news is that the eutrophication problems in and along the Blackstone River won't be solved until we control the heavy load of nutrients from stormwater, especially phosphorous, that cause excessive vegetation and low oxygen levels in the many impoundments along the river and its tributaries.While Phosphorous is the main culprit in freshwater eutrophication, it is also critically important to address the nitrogen levels coming from Massachusetts rivers & streams adding to the eutrophocation of the saline Narragansett Bay. The Draft permit calls for Phosphorus Control Plans to be developed by the Towns, then gives them quite some time to develop & implement those plans. This work needs to start as soon as possible.

In order to be successful, this permit should also be co-issued by the State of Massachusetts. The Towns need to know that these regulations will be consistent across the Commonwealth and that it is not just EPA with their limited staff that will be there to work with the Towns on the critical issue of stormwater impacts on our water resources.

In our 12 years of synoptic testing for nutrients at more than 76 sites across the Blackstone watershed, we see the need to limit phosphorous from entering all our streams, not just the main stem and its impoundments. Even with

existing TMDL's for Phosphorous around several lakes in the Upper Blackstone, without an effective stormwater permit requiring local action there is no traction for local efforts to implement stormwater improvements. Please do all in your power to issue this permit, jointly with the State and in a timely manner.

Thank you for the efforts of your Agency to enforce the Clean Water Act that will help us in our Campaign for a Fishable/Swimmable Blackstone!

RE: Draft NPDES General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. The concerns enumerated below constitute "reasonably ascertainable issues" developed on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), ad practical experience implementing the program over the preceding eleven (11) years of the existing permit term. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit. The initial comments refer to conditions associated with "Requirements to Reduce Pollutants to the Maximum Extent Practicable" (the six Minimum Control Measures [MCM]); the latter comments refer to conditions related to "Water Quality Based Effluent Limitations (WQBELs)." General comments follow thereafter.

Comments

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm sewer and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations

that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification:* Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.

b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification:* Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification:* Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

2. **IDDE Mapping:** New mapping requirements relating to sewer infrastructure under the IDDE MCM are a significant concern, as they not only require mapping of all storm drain components, but

now must include sanitary sewer infrastructure "where available" and knowledge of asset conditions relative to both storm and sewer systems in order to implement procedures related to prioritization and execution of catchment investigations on the basis of the System Vulnerability Factors. This level of asset inventory, condition assessment, mapping and documentation represents an effort that could take much longer than the two (2) year deadline in the permit. Based on the dynamic and cumulative documentation relative to investigations and program progress, it is also clear that communities are virtually required to develop this mapping and condition assessment as part of a GIS database. For communities that have not begun or are in early stages of GIS development, two years is certainly an inadequate amount of time. The "where available" language relative to sewer mapping (Section 2.3.4.6 (a) (ii)) is itself problematic because it is not clear to what extent the MS4 operator, who may be different than the sanitary sewer system operator, is required to obtain, develop or update sanitary sewer mapping elements that could influence catchment prioritization or wet weather screening obligations through the course of the permit term. *Proposed Modification*: Extend deadlines for storm system mapping requirements to Years 4 or 5 and make all sanitary sewer mapping voluntary or "recommended" rather than required.

3. **Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties under separate permit programs in the event of an SSO excursion. *Proposed Modification*: Elimination of this requirement.
4. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

5. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.
6. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.
7. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MaDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MaDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MaDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MaDEP surface water discharge regulations.
8. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MaDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.
9. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b),the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in it's best interest.
10. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities,

these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO programs.

Water Quality Based Effluent Limitations (WQBELs)

11. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.

Other Issues

12. **Brewster and the Pleasant Bay Nitrogen TMDL:** The only Cape Cod nitrogen TMDL currently relating to Brewster is the Pleasant Bay Nitrogen TMDL. The Pleasant Bay TMDL states that stormwater is an insignificant portion of the nitrogen load to the Bay. Furthermore, Brewster's MS4 does not discharge to Pleasant Bay. The requirements of Appendix F Part IV, do not apply to Brewster, therefore, it is appropriate that Brewster is not listed on Table F-9 in Appendix F. Brewster is however incorrectly listed on Table on Page 14 of the Permit in reference to Appendix F.
13. **Floor Drain Inventory:** It is appropriate and appreciated that this requirement has been removed from the Draft Permit.

14. **Errors:** A number of errors in referencing were noted in the document. The ones we noticed are listed below, there may be more. Please carefully check all cross references in the preparation of the Final Permit and correct the following errors:
    - Page 12 – change references from Table F-5 to Table F-6
    - Page 14 – change references from Table F-6 to Table F-8
    - Page 14 lists reference to Buzzards Bay but there is no Nitrogen TMDL for Buzzards Bay watershed on DEP's website
    - Page 14 list does not include Wareham although Wareham is in Buzzards Bay watershed
    - Page 15 change reference from Table F-7 to F-9
    - Page 17 – reference to Table F-10 is incorrect (that is a table of Assabet towns)
    - The table on page 14 lists Brewster, but Brewster is not listed in Table F-9 subject to a nitrogen TMDL. It is appropriate that Brewster is omitted from Table F-9 and requirements thereof (see Comment 12 above). Please remove reference to Brewster from Table 14.

Sincerely,

Charles L. Sumner

Subject: Draft Massachusetts Small MS4 General Permit

The City of Brockton is in receipt of the 2014 Draft Massachusetts Small MS4 General Permit and appreciates this opportunity to provide comments. We recognize the importance of communicating with the Environmental Protection Agency (EPA) and Massachusetts Department of Environmental Protection (MassDEP) on issues concerning stormwater pollution reduction in our shared water resources. Following a review of the draft permit, we respectfully submit the following comments regarding the scope and time availability for tasks:

2.3.4.4 – Sanitary Sewer Overflows
Records of historic SSO discharges are spotty, and may not include the amount of information outlined in the listed inventory. This list of information should be shown as a recommendation, but not necessarily a requirement.

2.3.4.5 – Outfall/Interconnection Inventory & 2.3.4.6 – System Mapping
The draft permit requires significant sampling and monitoring tasks to be completed within an aggressive time limit. Sections 2.3.4.5 and 2.3.4.6 state that the Outfall and Interconnection Inventory and System mapping shall be completed within one (1) year and two (2) years, respectively, from the effective date of the permit. Given the size, scope, and age of our drainage system, the development of a GIS layer with this information represents a massive undertaking that will require substantial employee effort; gathering this data requires devoted time to manually field investigate every drainage structure, perform substantial research into record drawings, and obtain the expertise needed to build the GIS system. The strain on funds and resources from this endeavor is exacerbated by other required MS4 tasks with similar needs and timelines. The expenditure of resources, as well of the quality of the data being produced, would benefit from a more-realistic schedule that considers the magnitude of the task.

Section 2.3.4.7 – Written Illicit Discharge Detection and Elimination Program
Section 2.3.4.7.c states that an assessment and priority ranking of catchments must be finished as part of the written IDDE program, which must be completed at the end of year one. However, system mapping as part of Section 2.3.4.6 will take at a minimum the two years required in the general permit. Since mapping will not be completed, an accurate ranking of catchments will not be feasible in time for this deadline.

Section 2.3.4.8 – IDDE Program Implementation Goals and Milestones
Section 2.3.4.8 states that dry weather screening and sampling of every MS4 outfall and interconnection will be completed no later than three years from the permit effective date. The time allotted does not consider that this task must be implemented after the Interconnection Inventory has been finalized, and is highly seasonal and weather dependent. Setbacks in funding sources or unfavorable weather patterns could easily make it unlikely that all of the required sampling is performed. With the current economic environment it is difficult to find immediate funding for the sampling costs and employee time for the sampling program outlined. While grants and other sources of funding are available, the competition for receiving said funds are fierce, especially considering the amount of municipalities who are under the general permit jurisdiction.

Section 2.3.6 - Stormwater Management in New Development and Redevelopment
Section 2.3.6.b states that the permittee shall develop a report outlining current street design, parking lot guidelines and other local requirements that affect the creation of impervious cover. The EPA and/or MassDEP should provide guidelines for recommendations on the steps in this evaluation, along with examples of possible improvements.

Within Section 2.3.6.d, given the rate of development, it is our opinion that the number of acres of impervious area and directly connected impervious area (DCIA) will not necessarily change substantially on a year-to-year basis. At a minimum, we would request the frequency of reporting of changes in the DCIA be reduced.

Section 2.3.7 – Good House Keeping and Pollution Prevention for Permittee Owned Operations
Section 2.3.7.a.iii.(b) states that the volume of mass removed from each cleaned catch basin shall be recorded. This is a cumbersome task that would require additional, time consuming steps taken in the field.

Conclusion
The City of Brockton commends the EPA and MassDEP for the planning and long-term goals that were put into the draft general permit. The sustainability of stormwater systems in the Commonwealth will ultimately see improvements as a result of our combined efforts. However, we urge that consideration be given to modifications of the deadlines assigned to certain tasks outlined above. Given the magnitude and variability of funding needed, flexibility in goals would ultimately result in a higher quality product with less short-term budgetary strain on our citizens.

Sincerely,

Lawrence Rowley,
Interim DPW Commissioner

RE: Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder:

The Berkshire Regional Planning Commission (BRPC) respectfully submits these comments on the draft Massachusetts Small MS4 General Permit. BRPC serves the thirty-two cities and towns within Berkshire County, nine (9) of which are regulated under the draft permit. Three (3) of the regulated communities are newly impacted while the remaining six (6) have been subject to the 2003 permit or were granted waivers. BRPC agrees with the intent and goal of the Clean Water Act (CWA); however, we have serious concerns with regard to the schedule and associated costs to comply with the permit. BRPC takes its role as a steward of the environment for the region extremely seriously and applauds the efforts of the EPA to clean up the waters of the Commonwealth Although BRPC agrees with the intent of the draft permit, the result is an added burden to communities that are already struggling to provide necessary services.

BRPC encourages EPA to develop an appropriate program that will address stormwater and water quality concerns while balancing local needs and economic considerations. It is a mandate to municipalities without state or federal funding subsidies, which leaves the burden to comply entirely on the shoulders of the regulated communities. In these troubling economic times, many municipalities have been faced with potential cuts to vital services. For this reason, it is a very difficult time to meet the addition mandates required by the draft General Permit. Regardless of timing, the requirements are such that most of the small towns in Berkshire County that are affected by the permit do not have the staff or funding to fully comply with the permit as drafted.

Funding

In the 1970s, programs and funding were available to build wastewater treatment facilities when the Federal Water Pollution Control laws surfaced. BRPC suggests that similar funding from the state and federal governments be created to ensure the success of this program. As drafted, the regulations require professional engineering and administrative services which cannot be met

solely by municipal employees and cannot be complied with through the volunteer members of local commissions or interested and concerned citizens.

Schedule

In addition to the issue of cost, BRPC is concerned with the schedule for compliance with the general permit. The majority of the regulated communities within Berkshire County have small staffs and constrained budgets. Logistically, the schedule simply involves too much, too soon, within the same timeframe for the affected municipalities within the region to comply. It is understood and appreciated that revisions were made from the 2011 Draft Permit that allow additional time before the permit goes into effect and before the written Stormwater Management Program is due. However, municipal budgets and warrant articles are typically prepared between December and March for approval at Annual Town Meeting in May/June. In addition, many of the requirements cannot be met without hiring additional staff and/or subcontractors to perform the necessary work. Even if adequate funding was available, the addition of new staff and/or procurement for subcontractual services require long lead times to comply with hiring and bidding laws. BRPC suggests that no item in the permit be required to be completed during the first permit year except for the preparation of the Stormwater Management Plan (SWMP) in order to allow sufficient time to prepare appropriate budget requests, hire additional staff and/or procure consulting services.

Specific examples of how the schedule involves too much, too soon and within the same timeframe include, but are not limited to, the following:

- Inventory all sanitary sewer overflows within 60 days;
- Inventory all permittee-owned parks and open spaces, buildings and facilities (including storm drains), and vehicles and equipment within 6 months;
- Establish and implement a program for repair and rehabilitation of MS4 infrastructure within 6 months;
- Inventory outfalls in first year;
- Prepare written IDDE program within first year;
- Develop site inspection and enforcement of Erosion and Sediment Control measures within first year;
- Develop site plan review procedures within first year;
- Create written O&M procedures for parks and open spaces, buidlings and facilities, and vehicles and equipment within first year; and
- Prepare a Stormwater Pollution Prevention Plan (SWPPP) for maintenance garages, transfer stations and other waste-handling facilities.

Maximum Extent Practicable (MEP)

In a document prepared by AMEC Earth & Environmental, Inc. found on EPA's website, Maximum Extent Practicable (MEP) is defined as meaning addressing and mitigating all the ways pollutants get into the system including dirty stormwater, and doing so to one's maximum ability. The document further states that the MEP consists of the mix of Best Management Practices (BMPs) and measurable goals that will attain reduction of pollution to attain water quality standards as described in 40 CFR 68754, Dec. 8th, 1999, as follows:

> *The pollutant reductions that represent MEP may be different for each small MS4, given the unique local hydrologic and geologic concerns that may exist and the differing possible pollutant control strategies. Therefore, each permittee will determine appropriate BMPs to satisfy each of the six minimum control measures through an evaluative process. EPA envisions application of the MEP standard as an iterative process. MEP should continually adapt to current conditions and BMP effectiveness and should strive to attain water quality standards. Successive iterations of the mix of*

BMPs and measurable goals will be driven by the objective of assuring maintenance of water quality standards. If, after implementing the six minimum control measures there is still water quality impairment associated with discharges from the MS4, after successive permit terms the permittee will need to expand or better tailor its BMPs within the scope of the six minimum control measures for each subsequent permit. EPA envisions that this process may take two to three permit terms.

MEP should be utilized to allow regulated communities to propose a strategy to comply with the permit to their maximum ability. Proposed strategies could be subject to EPA and/or DEP approval. Customized approaches appropriate to each community may take limited financial resources, limited staffing, and the nature of the community (i.e. size, rural) into consideration as well as the nature of the watershed and water quality impairments. In addition a phased approach that becomes progressively more vigorous could be utilized to achieve the goals of the program over the five year permit. The 2003 Permit has been administratively continued by EPA for seven (7) years. With that duration of time having passed, it is unclear that it is necessary to address (or begin to address) the majority of the permit requirements within the first year of the permit. A phased approach is reasonable and may, in fact, increase compliance and result in greater water quality improvements.

Examples of specific concerns where an individually tailored program appropriate to each community should be considered include data collection and treating rainfall. Data collection for individual catch basin inspection and maintenance is very time-consuming and costly. Individualized approaches should be able to be developed with focused data collection with regard to documented water quality impairments. Treating and retaining the first 1" of rainfall on all projects 1 acre or greater is not feasible financially or practically (due to availability of land). This requirement should not be applied to *all* projects including road maintenance. As written, many towns will have no choice but to forego maintenance so as to not be in violation of this permit. Additional flexibility should be provided to road maintenance projects, rural roads, and areas with limited land available to support the treatment or retention of the first 1" of rainfall.

Streamlined Approach

A streamlined approach could be employed with regard to certain components of the draft permit rather than duplicating efforts and expense in multiple communities. The "paper burden" of the permit is staggering; the Notice of Intent (NOI), Stormwater Management Program (SWMP), Illicit Discharge Detection and Elimination Program (IDDE), Stormwater Pollution Prevention Plan (SWPPP), in addition to reporting requirements. Having streamlined, generic, preformatted templates generated by one agency instead of the many individual communities working independently would standardize and expedite the permit process. Many of the data collection tasks relate to regional or state-wide efforts, such as water quality classifications, identified impairments and endangered species habitats. This data should be made available to all regulated communities rather than imposing a highly redundant effort on individual communities.

Additional examples of ways in which to ease the burden of permit requirements are as follows:

- Provide flow charts or other graphs to guide laypeople through the permit process;
- Provide technical assistance, via phone or web;
- Provide templates, models or examples of the required plans, procedures, reports, etc.;
- Provide guidance regarding acceptable methodologies - for example, methods used to evaluate the effectiveness of educational messages and overall education as well as to demonstrate that a defined goal has been achieved.
- Provide regional or state-wide resources to support NOI submission: endangered species, historic properties, impaired water bodies, etc.; and

- Provide training resources and classes to meet the training requirements for in-house personnel– live classes, webinar training programs, or pre-recorded video.

Urbanized Area

We recognize that the method of designation is not necessarily an issue that can be addressed through the Draft Permit, but it should be of concern to the program. We believe that utilizing the U.S. Census derived urbanized areas to determine regulated communities is a flawed approach. The regulated areas do not correlate well to the areas that are most likely to generate significant stormwater discharges. MS4 area identification appears to rely too heavily on data with regard to people and not enough on the existence of concentrated areas of impervious surface. The validity of the MS4 program is undermined in the minds of some local officials because of this poor correlation - where large areas of commercial strip development are outside the MS4 area, yet relatively benign areas of low and moderate density residential development are included. We would urge EPA to consider a more refined method of MS4 area determination - and going forward, include a mechanism or process for municipalities, with adequate rationale, to modify their MS4 boundaries.

BRPC is dedicated to improving the quality of stormwater runoff and only seek to ensure that the permit requirements will result in a successful and effective program. It appears that the proposed program will have many issues with regard to compliance and that many of the towns and cities in Massachusetts will not be able to fully comply by the end of the five year permit period unless this program has some subsidies provided for it on the state and federal levels. In the absence of, or in addition to subsidies, modifying the schedule and increasing the flexibility may ease the burden and increase the level of compliance. We respectfully request that the EPA give more consideration as to how this permit can both preserve the environment and use limited, local resources wisely and provide an additional opportunity for public comment.

Sincerely,

Nathaniel W. Karns, AICP

Re: Draft National Pollution Discharge Elimination System ("NPDES") General Permit for stormwater discharges from small Municipal Separate Storm Sewer Systems ("MS4s") in Massachusetts

Dear Mr. Tedder:

The Campus Consortium for Environmental Excellence ("C2E2") appreciates the opportunity to comment on the Draft NPDES General Permit for stormwater discharges from small MS4s in Massachusetts ("draft permit")

C2E2 was formed in the mid-1990s, and is comprised of 20 colleges and universities, predominately from the Northeast but with some members from other parts of the country. The mission of C2E2 is to support the continued improvement of environmental performance in higher education through environmental professional networking, information exchange, the development of professional resources and tools, and the advancement of innovative regulatory models.

Environmental performance includes campus regulatory compliance, environmental management, and sustainability initiatives. Stormwater is an increasingly complex issue for the C2E2 membership and other institutions of higher education.

C2E2 would like to highlight the following issues in the draft permit and bring them to the attention of EPA.

1. **Due to the considerable differences between colleges and universities ("C/U") and other regulated entities, C2E2 requests that EPA consider C/U separately in the requirements that the stormwater permit will impose and how those requirements will need to be implemented.**

The first comment focuses on the nature and structure of C/U that can make complying with permit requirements different from other entities. The C/U sector is fundamentally different from industrial and commercial entities in several key ways:

a. Unlike industrial and commercial entities, which generally own fairly small pieces of property and whose properties are usually largely developed with buildings and paved areas, C/U own large areas of land and the property is often partially developed and partially undeveloped.

b. Unlike industrial and commercial entities, which generally conduct one type of industrial activity, or a set of closely related activities at a facility, C/U conduct a wide variety of educational and recreational activities, and often provide housing and athletic fields. Unlike industrial and commercial entities, which are generally in one building or in a small number of buildings near each other, most C/U own or operate large numbers of buildings and parking areas of varying sizes, spread out over a considerable area.

c. Years ago, EPA recognized the special challenges schools face that are different from other entities and created a separate compliance assistance center to help C/U. In addition, in the context of RCRA hazardous waste compliance, EPA recognized that laboratories are quite different from industrial facilities and adopted RCRA Subpart K to provide an alternative framework for complying with RCRA. C2E2 is willing to partner with EPA to implement a similar compliance initiative.

2. There is a new emphasis on non-traditional MS4s such as State Colleges and Universities, which poses significant compliance challenges. C2E2 requests a deadline extension for comments to review impacts of the new regulations, as well as an extension for illicit discharge detection and elimination program (IDDE) implementation.

Traditional and non-traditional MS4s have interconnected drainage structures. C2E2 requests clarification on how the division of responsibilities are allocated for traditional and non-traditional MS4s specifically as it relates to the following:

- TMDL/Impaired Water implementation plans and other applicable requirement;
- Regulations and permitting, inspections, recordkeeping and enforcement for construction site runoff and general stormwater runoff; and
- In Section 5.1.4, "new dischargers" provisions may be applicable to many university storm water discharges and require application for an individual permit as opposed to a general permit. This section should be clarified for non-traditional MS4s. EPA should provide outreach specific to new permittees and non-traditional MS4s on whether they will be able to obtain coverage under the general permit.

In addition, C2E2 requests clarification on the following:

- In Section 1.10.2, the permit requires that the Storm Water Management Plan (SWMP) to be submitted in Year 1 shall contain a "listing of all interconnected MS4s," but system wide mapping, which would include detailed pipe connectivity mapping necessary for interconnection identification, is not required until the end of Year 2. C2E2 asks that this requirement should be clarified. C2E2 also requests an extension on this requirement because C/U will require more time to complete this interconnectivity mapping to coincide with updated mapping efforts of the municipalities in which non-traditional MS4s are located;
- In Section 2.3.4.7.c.iii, there is a requirement to conduct the assessment and priority ranking of all catchment areas within one year. This provision is inconsistent with other mapping requirements, where two years is the given timeframe. Catchment delineation requires detailed infrastructure mapping. C2E2 suggests that EPA offer flexibility in how colleges and universities prioritize catchment areas and illicit discharge detection and elimination efforts as land use is quite different on campuses than within traditional municipalities; and
- In Section 2.3.6., a specific definition of "Redevelopment" is not included in the permit and should be added. Also, the reference in this section to "retain" is assumed to mean equivalent to infiltration of the first one inch of runoff. C2E2 requests that this be clarified.

3. **C2E2 requests that EPA insert a provision into the permit that municipalities be required to engage C/U and work together in the development and implementation of the comprehensive stormwater management program (SWMP).**

The draft permit requires small MS4s to develop and implement a SWMP. C/U are often among the largest landowners in those municipalities where they are located. They also are often among the largest employers, and owners of buildings, parking facilities, and outdoor athletic/recreational facilities. The current draft permit does not specify how municipalities need to develop and implement their SWMPs.

4. **C2E2 strongly supports the inclusion of a water quality trading program as part of the proposed permit and volunteers to partner with EPA to pilot a program for C/U.**

The fourth comment concerns a possible credit system as a means of making the proposed stormwater protection program more efficient and effective. Stormwater programs in various locations have included or considered a credit system that provides entities with the ability to obtain credit for stormwater measures that they implement. Credits may encourage institutions to implement both a greater number of stormwater measures and a greater scope or breadth to the measures. The C2E2 membership is well organized and can mobilize quickly to pilot a program in Massachusetts.

5. **C2E2 strongly supports allowing stormwater compliance options to adjust as technology and an understanding of addressing stormwater issues evolves.**

The fifth comment concerns the evolving technology and approaches to addressing storm water concerns. Technology constantly evolves and allows for improvements in how to reduce the amount of pollutants in storm water, and improvements in how to measure and track pollutants. C/U are studying and developing new approaches to address concerns involving storm water and other environmental issues. It is important that the Permit allow for regulated entities to adjust their efforts to comply with the storm water permit as technology evolves and as information and understanding of issues concerning storm water change.

In Section 2.3.6., the requirement to retain the first one (1) inch of runoff for new or redeveloped areas is a good goal but the requirement to have pollutant removal equivalent to that of a bio-filtration system should be removed; a “one size fits all” requirement for pollutant removal is too restrictive and is not consistent with emerging technologies. A campus setting also provides the opportunity for stormwater master planning where site by site development of stormwater treatment systems may be inefficient and less effective than system treatment options. Infiltration in redevelopment areas may be limited by site characteristics, particularly on urban campuses, and the “maximum extent practicable” principle should be applied in this instance.

The provisions in Section 4.1 b are helpful in providing the flexibility that C2E2 considers to be necessary and appropriate.

Thank you for the opportunity to comment. C2E2 looks forward to continued dialogue with EPA and MS4 permittees concerning the best approaches to improve the effectiveness of stormwater regulatory programs, with the goal of restoring and maintaining New England’s waters.

Sincerely,

Peter T. Kelly-Joseph, President
C2E2

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. The Chicopee 4Rivers Watershed Council is a new voice for rivers in the central portion of Massachusetts. We have reviewed the draft MS4 permit and comments of similar watershed organizations and we too wish to voice our support of these improved protections for rivers and streams. We concur with the following statements:

Polluted stormwater is the most serious water pollution problem in Massachusetts today. EPA Region 1 has found that stormwater causes or contributes to at least 55% of the violations of water quality standards in the state's rivers, streams, and lakes. Climate change presents an additional, important reason to improve stormwater management. Most scientists expect the recent cycles of flooding and drought to become more pronounced, and Massachusetts communities need to maintain or upgrade their aging infrastructures, to safeguard both public safety and the environment into the future. **This permit is an important step in promoting these genuinely-needed changes, and we strongly support its promulgation.**

The 2014 permit represents a significant improvement over the 2003 permit, and is likely to be much more effective in reducing pollution, flooding and erosion caused by stormwater in urbanized areas.

- The permit incorporates **water-quality requirements** that directly address the pollutants that are actually causing specific Water Quality Standard violations in each town.
- The permit provides **more specific requirements and deadlines** in many cases, which should result in better compliance than was achieved under 2003 permit.
- The permit gives towns **adequate time and substantial flexibility** in choosing approaches to compliance that are most appropriate for local conditions.
- **Permit requirements for greater public access and opportunities to comment** on towns' stormwater management programs will increase public support for these programs, which is essential if towns are to raise the resources necessary to deal with polluted stormwater.
- **The post-construction requirements for new development and redevelopment will prevent future projects from continuing the poor stormwater management practices of the past.** EPA has chosen a balanced and effective strategy, setting a high standard for

infiltration of stormwater providing a safety valve where site conditions make meeting that standard infeasible.

In short, the permit requirements ask municipalities to do better monitoring and planning, to improve implementation, to raise public awareness of stormwater issues, and to design and maintain better stormwater management measures. If successful, the permit **will result in major improvements in the management of urban stormwater in Massachusetts, and we will see the results in cleaner, healthier, rivers, streams, lakes, bonds, and coastal waters**.

We also note that good planning **can help towns reduce compliance costs and fund the required investments in stormwater programs and infrastructure**. Towns can take advantage of help and support from EPA, MassDEP, watershed groups and regional planning agencies; work regionally (including through storm water consortiums) to achieve economies of scale, develop and fund stormwater utilities, and ensure that private entities assume their share of the responsibility for stormwater management.

Finally, while we endorse the overall approach and requirements of this permit, we **have identified some areas where improvements would offer more water resource protections:**

- **The stormwater bylaw requirements should apply to projects as small as a quarter or half an acre.** Most urbanized towns have very few large development and redevelopment projects, and projects under an acre would not be required to employ *any* stormwater management measures unless they are located in wetland resource areas. This will make it exceedingly difficult for many towns to comply with the proposed prohibition against new and increased stormwater discharges from MS4s.
- In addition to conducting an annual evaluation of BMP compliance and effectiveness, **permittees should be required to take corrective action** where the evaluation shows that goals and objectives are not being met. An effective approach to improving stormwater management requires that problems be addressed, and not simply identified.
- **MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements**. This includes requiring new development and redevelopment projects and retrofits on town-owned property to implement BMPs that are most effective at reducing bacteria where the waters they discharge to (via an MS4) do not meet bacteria Water Quality Standards.
- **The new requirements proposed for projects discharging to water impaired for chloride should apply to all MS4s.** While relatively few water bodies have been assessed for chloride, evidence suggests that this is a significant problem in most, if not all, urbanized areas.

We appreciate the careful work EPA has done to improve on the 2003 permit and the 2010 proposals. We **support prompt issuance of the final permit**. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date

Thank you for considering our comments on this important permit.

RE: Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder,

The City of Cambridge appreciates the opportunity to comment on the Environmental Protection Agency's (EPA) Draft National Pollution Discharge Elimination System (NPDES) General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts. We also acknowledge and appreciate the modifications made to the previous draft permit that are aimed at simplifying compliance with respect to annual reporting and Notice of Intent filing.

We would like to express our strong support for some of the changes included in this draft of the MS4 General Permit, specifically:

- Extended schedule for implementation. The requirements for the permit are extensive and it will take time to implement them in a comprehensive and thoughtful way. The 20-year schedule provides the opportunity for communities to develop an appropriate plan for their individual circumstances.
- Allowing all BMPs installed to date (p. 40 of the Fact Sheet) to count towards the phosphorous reduction requirements. Cambridge has been implementing a significant number of BMPs and supports having these clearly work towards the phosphorous reduction requirements.
- EPA's commitment to developing tools to help permittees track the BMPs installed to date and the associated phosphorous removal. It will be important that these be in place as soon as possible so as to allow communities to begin planning.

We would like to provide comments and suggestions for some of other provisions of the Draft MS4 General Permit, specifically:

- Section 2.1.2 Increased Discharges: how will newly separated stormwater from combined sewer areas be viewed under this permit? If stormwater is considered an "increased discharge" to an impaired receiving water listed on the MA Integrated Report of waters pursuant to the Clean Water Act section 303(d), then it will be virtually impossible to move forward with sewer separation projects in an existing developed urban area and meet anti-degradation standards. It is important that the permit does not discourage or prohibit sewer separation projects.

- Section 2.3.6 Stormwater Management in New Development and Redevelopment:
    - How is a "common plan of development or redevelopment" defined? The provision to require projects that disturb less than one acre if the project is part of a " larger common plan of development or redevelopment which disturbs one or more acres" to retain (or treat) the first one inch of runoff from all impervious areas is unclear and potentially prohibitive, if the stormwater management system requirements are not broken up over the phasing of the "common plan" or redevelopment program.

    - The requirement to store or treat one inch of runoff from street and roadway reconstruction projects is prohibitive for projects that are necessary to maintain safe and accessible rights of way. Recently Cambridge designed and is nearing completion of a sewer separation project where struggled to achieve treatment of 1/2" of runoff with biobasins and porous pavement due to poor soil conditions, high groundwater and potential negative groundwater mounding impacts to existing structures. A requirement to treat the full one inch of runoff would not have been feasible. The requirement needs to provide flexibility for projects that cannot store or treat one inch of runoff due to site conditions such as high ground water table, contaminated soils, and soil conditions.

- Section 2.3.7.iii (b) Good House Keeping and Pollution Prevention for Permittee Owned Operations: Prioritization of areas for cleaning and maintaining catch basins should be based upon land use and other factors best determined by the local municipality and not on the depth of debris in a sump. A more effective measure would be remaining free space in catch basin. For example, if the desire is to retain 2' of sump, a 6' sump basin would be required to be clean when it is 2/3 full, instead of ½.

Sump	Sediment when ½ full	Remaining Sump when ½ Full
4'	2'	2'
6'	3'	3'

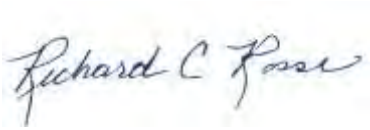
- Appendix F Requirements for Discharge to Impaired Waters with an Approved TMDL, Section A.I: While adjustments were made to the phosphorous loading baseline to account for illicit discharges, we believe the reduction associated will illicit discharges should be greater than the proposed 3,009 Kg/yr detailed in Appendix F. Please see the attached examples.

- Appendix F Requirements for Discharge to Impaired Waters with an Approved TMDL, Attachment 3: Cambridge has implemented a progressive program to require private developments to treat phosphorous through various structural Best Management Practices. Several of these methods (such as as Imbrium "jelly fish") are not included in the listed Structural Best Management Practices and thus would require "Alternative Methods" to calculate phosphorous load reductions. It would be beneficial if more methods could be included in the list.

- It is critical that communities be allowed to take credit for all BMPs implemented to date, as these were not accounted for in the budget allocations and it is important to incentivize their on-going maintenance.

Thank you for the opportunity to comment on this important regulation. Please feel free to contact Katherine F. Watkins, City Engineer, kwatkins@cambridgema.gov / 617-349-4751, for any additional information.

Sincerely,



Richard C. Rossi
City Manager

Attachment (1)

ATTACHMENT 1

Baseline Adjustment TP Loading Associated With Illicit Connections:

It is the City of Cambridge's opinion that the portion of phosphorous associated with illicit connections (10%) is likely understated. The TP loading baseline reduction should be greater than the proposed 3,009 Kg/yr.

A few examples and sample calculations of illicit connections that have been removed in Cambridge are provided below:

A. Example of Illicit Connection Removals between 2002 and 2014:

It was discovered during the renovation of the Rindge- Latin High School in 2005 that the sanitary flows from this building were connected to the storm drain system discharging to the Quincy Street storm outlet. Upon discovery this illicit connection was immediately corrected. The estimated annual TP loading reduction to the Charles River is calculated as follows:

Annual TP loading reduction = $1{,}784\ people \times \frac{20gal}{person \times day} \times \frac{3.78L}{1gal} \times \frac{7mgTP}{L} \times \frac{1Kg}{10^6 mg} \times \frac{250\ days}{1\ school\ year} = 236Kg/year$

B. Example of Defective Common Manhole (CMH) Removals between 2002 and 2014:

In 1999 MassDEP filed a Court Order against Cambridge for excessive wet weather communication of CMHs in the 496 acre Cambridgeport storm drainage area (extending up to Main Street). At the same time the City and MIT desired to improve surface /underground infrastructure on Sidney Street. Between the period of July 2000 – April 2001 MWH inspected 104 CMHs as part of the design effort. Forty nine CMHs (47%) had severe plate misalignments (ajar) and 21 CMH (20%) had missing plates. Altogether 67% of all CMHs would transfer sewage to storm drains during wet periods.

Since both sewer and storm systems were shallow and vertically close to each other it was assumed that at least 20% of the total 496 acre catchment system would communicate for storms larger than 0.5in. In reality this percentage is probably higher.

In order to compute the annual TP load removed due to common manhole separation the following was computed or assumed:

1. The sanitary sewage TP generation for commercial/industrial/high residential loading for Cambridge is approximately 65kg/ha-yr
2. The time in a year with storms exceeding 0.5 inches is approximately 27 days.
3. Fifty percent of the sanitary flow is transferred to the storm flow during these storms.
4. Twenty percent of the 496 acres in Cambridgeport had common manholes that transferred flows to the storm system. This equates to 99 acres.

Therefore, the annual TP loading reduction from removal of these common manholes is computed as follows:

$$\text{Annual TP loading reduction} = \frac{65Kg}{ha \times yr} \times \frac{0.4\ ha}{1\ acre} \times 99\ acres \times \frac{1yr}{365\ days} \times 27 days \times 0.5 = 95Kg/yr$$

Repair of the CMH obvious problems were performed in 2003-2004 during construction of the Sidney St program. Between 2004-2010 the City has removed all CMHs within this area.

C. **Example of TP reduction due to roofs draining to the ground:** Assuming institutional and other buildings within Cambridge draining to the ground have a total roof area of 50 acres (assumed value) and assuming a TP export ratio of 0.56Kg/ha-yr (medium density residential), the following annual reduction would be achieved:

$$\text{Annual TP loading reduction} = \frac{0.56Kg}{ha \times yr} \times \frac{0.4Ha}{1acre} \times 50\ acres = 11.2\ kg/Year$$

CONCLUSION

Adding A+B+C = 236KG/y + 95Kg/y + 11.2Kg/y = 342.2Kg/yr in TP loading reduction is achieved with just these three examples. The proposed TP EPA associates with all illicit connections in the watershed, 3,009 kg/yr, would appear too low. It is critical that EPA continue to evaluate the illicit load reduction and update permits accordingly.

RE: Draft NPDES General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. The concerns enumerated below constitute "reasonably ascertainable issues" developed on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), ad practical experience implementing the program over the preceding eleven (11) years of the existing permit term. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit. The initial comments refer to conditions associated with "Requirements to Reduce Pollutants to the Maximum Extent Practicable" (the six Minimum Control Measures [MCM]); the latter comments refer to conditions related to "Water Quality Based Effluent Limitations (WQBELs)." General comments follow thereafter.

Comments

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm sewer and

sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification:* Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.

b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification:* Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point

of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification:* Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

2. **IDDE Mapping:** New mapping requirements relating to sewer infrastructure under the IDDE MCM are a significant concern, as they not only require mapping of all storm drain components, but now must include sanitary sewer infrastructure "where available" and knowledge of asset conditions relative to both storm and sewer systems in order to implement procedures related to prioritization and execution of catchment investigations on the basis of the System Vulnerability Factors. This level of asset inventory, condition assessment, mapping and documentation represents an effort that could take much longer than the two (2) year deadline in the permit. Based on the dynamic and cumulative documentation relative to investigations and program progress, it is also clear that communities are virtually required to develop this mapping and condition assessment as part of a GIS database. For communities that have not begun or are in early stages of GIS development, two years is certainly an inadequate amount of time. The "where available" language relative to sewer mapping (Section 2.3.4.6 (a) (ii)) is itself problematic because it is not clear to what extent the MS4 operator, who may be different than the sanitary sewer system operator, is required to obtain, develop or update sanitary sewer mapping elements that could influence catchment prioritization or wet weather screening obligations through the course of the permit term. *Proposed Modification:* Extend deadlines for storm system mapping requirements to Years 4 or 5 and make all sanitary sewer mapping voluntary or "recommended" rather than required.
3. **Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties under separate permit programs in the event of an SSO excursion. *Proposed Modification:* Elimination of this requirement.
4. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management

approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

5. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.
6. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.
7. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MaDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MaDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MaDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MaDEP surface water discharge regulations.
8. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MaDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.

9. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b), the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in it's best interest.
10. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO programs.

Water Quality Based Effluent Limitations (WQBELs)

11. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.
12. **Phosphorus Load Export Rates – Appropriate Use:** Regarding Appendix F and attachments, the Phosphorus Load Export Rates (PLERs) are general and approximate at best. The composite PLERs are good for screening / planning purposes or comparative purposes. They are not accurate for determining hard design of control measures. For example, they can be used to evaluate whether a proposed change in land use is expected to increase or decrease pollutant loads. But to use a PLER to conclude that the loading rate is actually X lbs/yr, or will change from Y lbs/yr to Z lbs/yr with land use or other changes, is not a recommended technical practice. Loading rates are ordinal rather than cardinal, i.e., they can tell you if one is higher than another, but not exactly how much higher one is than another. It appears that EPA assumes that over the entire Commonwealth of Massachusetts, using PLERs will represent the average condition. That may be true, but EPA is requiring that the PLERs be used to make decisions on a much smaller watershed and sub watershed scale, which is inappropriate.
13. **PLERs - Derivation:** It is not clear how the values for PLERs in the EPA documents are derived, however, a literature search shows that there is a large range of values for any given land use. For example, the PLER for medium density residential is given as 0.55 lb/ac/yr in Table 1-1 (App. F Attachment 1), but the range of PLERs for medium density residential in the scientific literature can be an order of magnitude around the value. Please provide further information regarding derivation of the PLERs since these values have significant impact on program implementation for regulated communities.
14. **PLERs – Blanket vs. Site Specific:** PLERs found in older literature generally do not reflect the presence of stormwater BMPs, low impact development (LID) planning, etc., and therefore may overestimate pollutant loads for current land uses. In addition, composite PLERs are a particular concern for communities that have previously instituted stricter local development standards for stormwater management many years ago (in some cases, decades) where assumed PLERs may be much greater than actual

conditions. *Proposed Modification:* Rather than limiting appeals of assumed baseline watershed phosphorus loading to updates of land use information, allow permittees the option to develop their own alternative methodology for determining baseline phosphorus loads and reduction requirements based on more detailed data and/or site specific information.

15. **Phosphorus Contribution of Illicit Discharge:** It is not clear in either the permit or the fact sheet what method was employed to calculate estimated contribution of phosphorus load through illicit discharges, and consequently the load reduction that would be achieved through elimination of IDDE. Since this calculation figures into the total overall phosphorus load reduction allocated to each Charles River community, it is impossible to comment on how equitable this approach can be. Please provide further documentation regarding the method used to complete this calculation.

Other Issues

Non-Stormwater Discharges: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." Explicit guidance regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges is necessary.

Public Education: In most communities responsibility for permit compliance resides with Public Works or similar agency officials. Boards of Selectmen and/or Town Managers are often not involved in program administration outside of procurement or appropriation processes for identified projects. Their lack of understanding and support to implementing agencies has been a continuing challenge. EPA and/or DEP must increase their involvement in educating Town officials about the extent, costs, operational impacts and policy determinations incumbent on program administrators to ensure continued organizational support, particularly for funding strategies.

Sincerely,

Victor D. Del Vecchio,
Chairman

Re: Comments on Draft MS4 General Permit for Massachusetts
Submitted by the Town of Canton, Massachusetts

Dear Mr. Tedder:

On behalf of the Town of Canton, we submit the following comments on the draft "General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts" and Appendices F and H. These comments are being submitted prior to the close of the extended public comment period on February 27, 2015 and reflect the numerous concerns that the Town of Canton has with the proposed permit conditions. Our comments are referenced by permit section where appropriate.

Section 1.10.2: the permit requires that the SWMP (to be submitted in 1 year) shall contain "listing of all interconnected MS4s" but system wide mapping which would include detailed pipe connectivity necessary for interconnection identification is not required until the end of Year 2. The Town of Canton received stormwater flow from numerous MS4 permittees outside of our municipal control. These include the Town of Milton, the Town of Sharon, the Town of Randolph, MDOT, CDR, and the MBTA / Amtrak Commuter Rail. We request clearer language and responsibilities regarding upstream MS4s outside the control of the permittee. Discharges from these upstream entities should not become the responsibility of the Town of Canton.

Section 1.10.3: the extended deadlines for some of the permit elements for new permittees (those not part of the 2003 permit) are warranted and USEPA should reach out to those communities to provide financial and technical assistance in the MS4 permitting process. We have found the USEPA a source of mandates and penalties, rather than assistance on most matters. The annual budgetary impact for minimal compliance may exceed $150,000 per year, excluding capital projects and other increased efforts possibly to be mandated as the permit period evolves (see next comment).

Section 2.0: the permit is based upon meeting "Maximum Extent Practicable" (MEP) goals; we encourage USEPA to provide further definition of MEP as it can be viewed differently by many people and should be defined as clearly as possible. The Town of Canton will continue to perform stormwater management activities to the maximum extent practicable, which accounts for the available technical, manpower, and financial resources; however, the USEPA's

definition of "practicable" may be overly broad and financially unsustainable. The Town of Canton has endure significant cost and delays on projects because of differing definitions / interpretations and conflicting permit conditions between Federal regulators and State regulators. Clarify on terms such as "Maximum Extent Practicable" is imperative.

Section 2.1.2...: the "Increased Discharges" provision appears to require the Town to obtain authorization of increased discharges from MassDEP. It is not clear what this "authorization" will entail. Furthermore, as written, this provision would essentially end any new construction or redevelopment within Cantons impaired watersheds (Category 5 or 4b). Without historic benchmarks, is not possible to measure increased discharge of pollutants from re-developed land in our Town. Please consider modifying this provision to include assumptions that permittee meeting provisions of this permit will be assumed to meet antidegradation provisions through pollutant load reductions across the Town of Canton.

Section 2.3.4.4.b.: the permittee is required to identify all past SSOs over the previous 5-year period within 120 days; the Town of Canton already reports all SSO's to the USEPA and MassDEP in accordance with current MassDEP and USEPA guidelines. We see no value in looking backwards on these previously events already properly documented to your agency.

Section 2.3.4.4.c.: 24-hour oral notice to USEPA of an SSO is required; We recommend that this provision be rewritten and consistent with current MassDEP requirements for SSO reporting as stated here: http://www.mass.gov/eea/agencies/massdep/service/approvals/sanitary-sewer-overflow-bypass-backup-notification.html These procedures for reporting are well established and allow both verbal or email notification. We see little value to creating a new methodology.

Section 2.3.4.5.b.: the physical labeling of all outfalls within 5 years is problematic for the Town of Canton given outfall locations and the potential safety risks of adding a bronze plate to pipes located in inaccessible and unobservable locations. We fail to see the value of such physical labeling.

Section 2.3.4.7.c.iii: the Town will require more than the proposed one year for the assessment and priority ranking of all catchment areas, as catchment delineation requires mapping. We also feel that this provision is inconsistent with mapping requirements, which are required within two years.

Section 2.3.4.7.e: wet weather sampling is required if only one "vulnerability factor" is triggered; the list of vulnerability factors is overly broad and we believe that a majority of our stormwater system contains at least one triggering factor, thus requiring all of the Town's outfalls to be sampled for a wet weather events. We suggest programmatic wet weather sampling be conducted in two priority catchment areas per year, rather than one-time random wet weather sampling across the Town. This approach facilitates incremental and targeted improvements.

Section 2.3.6.: better define redevelopment in the permit definitions. The requirement to have pollutant removal equivalent to that of a bio-filtration system must be removed as a "one size fits all" model for pollutant removal is too restrictive. A "MEP" principle is more appropriate so long as properly defined. For example, the Town's annual roadway reclamation or re-surfacing projects do not fit into the "one inch recharge" scenario as all are typically greater than one acre of disturbance requirement. Meeting the proposed infiltration goals is not practical. We request a better definition of the requirements for roadwork in a new appendix and clarity on lateral projects that do not fit cleanly into the post-construction arena.

Section 2.3.6.d.iii: The requirement to inventory all Town owned properties for possible recharge areas is not practical. At most, the Town can select five priority sites to evaluate which will result in a better assessment of viable sites.

Section 2.3.7.b: The Town suggests that one, single comprehensive SWPPP be allowed for all municipal properties and operations. Requiring individual SWPPPs for each municipal site is repetitive and overly burdensome.

Section 5 (and fact sheet): the discussion of "Non-Traditional" MS4's is very limited and does not provide sufficient information for Canton to determine which federal or state facilities within or adjacent to the Town may be "Non-Traditional" MS4s.

Appendix H-section I.2: the element to demonstrate that an outfall having no nitrogen would require at least 30 discrete sampling events over a 2-3 year period; such an effort seems beyond practical efforts and should be removed from the appendix.

Very Truly Yours,

James Donovan, P.E.
Town Engineer

Re: Draft MS4 permit

Dear Mr. Tedder:

Thank you for the opportunity to provide comment on the pending Draft MS4 permit and its requirements. As Director of the Cape Cod Commission, the regional planning agency tasked with updating the Section 208 Areawide Water Quality Management Plan for Cape Cod (the "208 Plan Update", or "Plan"), I have some suggestions which may assist in our shared goal of improved water quality on Cape Cod.

The Section 208 Areawide Water Quality Management Plan for Cape Cod

The 208 Plan Update is primarily focused on non-point sources of nitrogen that have caused eutrophication of many Cape Cod marine embayments. Because stormwater runoff is one of three "controllable" nitrogen sources to the impaired watersheds on Cape Cod, the Plan promotes stormwater management opportunities to achieve TMDL compliance. The Plan recommends that towns receive a "nitrogen-credit" as a result of the efforts that they undertake to manage stormwater including compliance with the Small MS4 general permit. The nitrogen credit can be used to off-set the extent of other structural approaches to reduce watershed nitrogen loads. This credit can be applied via a Massachusetts Department of Environmental Protection "Watershed Permit" recently authorized by changes to Massachusetts General Laws, Chapter 21. The Watershed Permit will allow credits for structural and non-structural technologies, so long as monitoring confirms nitrogen reductions in the watershed. We suggest that stormwater management efforts aimed at achieving MS4 standards may earn stormwater reduction credits through the Watershed Permit, authorizing reduction in nitrogen loading. This emerging regulatory approach will allow for more comprehensive planning and enforcement to achieve water quality goals on Cape Cod.

Nitrogen Reduction in Watersheds With a Final TMDL

The draft general permit does not require nitrogen reductions from stormwater waste load allocations from MS4s. Instead of requiring reduction to current loads, the draft permit only ensures that current nitrogen loads from MS4 stormwater runoff does not increase. Because stormwater is specifically identified in Cape Cod Nitrogen TMDLs as a source of nitrogen to impaired bodies, the draft permit should require reducing current nitrogen loads from MS4s if discharges occur to TMDL water bodies.

Nitrogen Reduction in Watersheds Without a Final TMDL

The draft general permit proposes to require compliance when a TMDL has been adopted by the EPA. Many impaired watersheds without a final TMDL have been identified as nitrogen sensitive through Massachusetts Estuaries Project (MEP) Technical Reports. We recommend that the general permit recognize and incorporate the nitrogen thresholds from MEP Technical Reports. Stormwater management efforts in these watersheds should also be able to obtain reduction credits towards the Watershed Permit.

Regional Support of Municipal Compliance

Most Cape municipalities participated in several regional stormwater project initiatives to partially achieve compliance with the 2003 Small MS4 permit. I anticipate similar regional opportunities to assist towns in the formulation and dissemination of materials to support the new permit's required public education and outreach to the required audiences.

The Commission can assist the towns by developing model bylaws, regulations, design guidelines, and site plan review requirements consistent with the new permit requirements. These models might include procedures for proper sediment and erosion control management practices, LID principles and technologies, and green infrastructure options for new development and redevelopment.

In the area of illicit discharge detection and catchment rankings, the Cape Cod Commission conducted a regional flyover of the Cape, which could assist with Capewide mapping of catchment areas; this could assist with tracking and screening purposes for the required IDDE permit actions.

I note that AmeriCorps Cape Cod, in its 16th year of providing environmental and disaster preparedness services to Cape Cod, may be in a position to assist communities with implementing the MS4 permit. The grant which supports AmeriCorps Cape Cod requires that the program support community environmental management goals. There is potential for AmeriCorps members assisting with stormwater education and monitoring activities, possibly also mobilizing volunteers to assist with these tasks.

MassDOT NPDES Stormwater Management

On a related note, EPA is expected to release a separate Small MS4 Permit for MassDOT. According to MassDOT's most recent MS4 Annual Permit Report (NPDES Phase II Small MS4 General Permit Annual Report – Permit Year 11), MassDOT has not yet considered its stormwater contributions to nitrogen-impaired embayments on Cape Cod. Review by MassDOT has focused primarily on phosphorous and pathogen-impaired waters elsewhere in the state and has not included review of any waters on Cape Cod with nitrogen impairments and/or nitrogen TMDLs.

We respectfully suggest that the MassDOT MS4 Draft Permit should take into consideration the nature and extent of nitrogen sensitivity in the Cape Cod region. We understand that MassDOT is working with EPA to develop a methodology for assessing its stormwater contributions to water bodies with a nitrogen TMDL. The Commission is presently preparing the Cape Cod Regional Transportation Plan in which water resources staff is developing specific guidance to highlight roadways where stormwater management and treatment is necessary due to nutrient sensitive marine and fresh water resources, including drinking water. We respectfully request that EPA include Commission technical staff directly in these discussions in order to ensure full coordination of EPA permit requirements and the 208 Plan Update.

Thank you for the opportunity to provide comment on this important issue.

Sincerely,

Paul Niedzwiecki
Executive Director
Cape Cod Commission

Connecticut Fund for the Environment ("CFE") is a non-profit environmental organization with over 5,500 members in Connecticut and New York. The mission of CFE, and its bi-state program Save the Sound, is to protect and improve the land, air and water of Connecticut and Long Island Sound. We use legal and scientific expertise and bring people together to achieve results that benefit our environment for current and future generations.

Save The Bay represents thousands of members and supporters committed to preserving, restoring, and protecting the ecological integrity and value of Narragansett Bay and coastal Rhode Island. Our mission is to protect and improve Narragansett Bay and to create a swimmable, fishable, healthy Narragansett Bay accessible to everyone.

We are pleased to submit the following comments on Environment Protection Agency ("EPA") Region 1's, Draft General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts, Permit Nos. MAR041000, MAR042000, MAR043000 ("Draft MS4 Permits"). These permits will authorize discharges from Small MS4s regulated under section 402(p) of the Clean Water Act and relevant federal and state regulations.

Summary of Recommended Permit Changes

We ask that EPA Region 1 strengthen the permit to include, inter alia, (1) clear green infrastructure retrofit standards and requisite goals for implementation; (2) a specified maximum time from the date of discovery, by which all illicit discharges and sanitary sewer overflows ("SSOs") must be eliminated; (3) a more extensive list of low impact development ("LID") measures, as specific as possible, that permittees must incorporate into their local codes, and; (4) more robust public participation in the development of Stormwater Management Plans ("SWMPs") including an extended comment period and the opportunity for a public hearing.

Stormwater Impacts to the Waters of Long Island Sound and Narragansett Bay

Stormwater runoff is one of the most serious problems facing water quality in New England today. Every time it rains, water runs off impervious surfaces such as roofs, driveways, roads, and parking lots, collecting pollutants. This polluted runoff flows through storm sewers into streams, lakes, and tributaries, many of which lead into downstream states, and eventually into Long Island Sound or Narragansett Bay, degrading water quality in each. Stormwater has been identified by EPA as "contribut[ing] to poor surface water quality, including altered flow regime (shoreline erosion and stream channel alteration), the presence of pollutants, and the destruction of healthy populations of fish and other aquatic life." [1] Stormwater pollution leads to waterbodies that cannot adequately sustain fish and other marine life, closed beaches and shellfish beds, and an unhealthy Long Island Sound.

As EPA is aware, much of the tidal and coastal waters of Long Island, Long Island Sound and Narragansett Bay are identified on the relevant state Section 303(d) list as waters impaired by nitrogen or pathogens. Moreover, all of Long Island Sound is subject to a nitrogen TMDL for dissolved oxygen. Finally, most of the Connecticut coastal and tidal reaches are the subject of bacterial TMDLs. In Long Island Sound, nearly 70% of our fresh water inputs are delivered by the Connecticut River, the Thames River and the Farmington River. These rivers have substantial watersheds located in Massachusetts, the pollution of which impacts our rivers downstream and the Long Island Sound receiving waters.

Over 60% of the Narragansett Bay watershed is in the state of Massachusetts, and the largest contributors of fresh water to the Bay are the Taunton and Blackstone Rivers. The upper Bay watersheds of the Palmer and Kickemuit Rivers are subject to a phosphorus TMDL, and other waters in the Blackstone River and Mount Hope Bay are subject to a TMDL for pathogens. These waters are also impaired by nitrogen. Following a devastating fish kill in the Bay in 2003, the Rhode Island General Assembly passed legislation that set a goal of reducing nitrogen from Upper Narragansett Bay wastewater treatment plants by 50% in 10 years. We are close to achieving that goal, but reductions are still needed in riverine inputs from the upper watershed.

In the Taunton watershed specifically, recently-released draft NPDES permits for wastewater treatment plants in Taunton, Bridgewater and Brockton state that there is a 51% reduction in nitrogen needed to meet water quality standards in Mount Hope Bay. In the permit fact sheet, EPA states that a reduction of 20% from non-point sources of pollution is a reasonably aggressive target, leaving the remaining reduction to come from municipal wastewater treatment

upgrades. The needed reduction in non-point source load, according to EPA calculations, would be 286 lbs/day from the Taunton watershed. Without a program to retrofit existing directly connected impervious areas, it will be unlikely that this target can be met. In addition, any clearly identified illicit discharges or sanitary sewer overflows should be eliminated in a timely matter, on a schedule set forth in the permit.

Implementing a strong General MS4 Permit is a vital step to protecting these waters. The current Draft MS4 Permit is should be strengthened to protect of Massachusetts' and downstream states' valuable natural resources. We offer the following comments to improve the Draft MS4 Permit and ensure that it fulfills the requirements of both state and federal laws and regulations.

Specific Recommendations

1. Develop and require clear green infrastructure retrofit standards focused on deploying proven "green infrastructure" retrofit technologies to capture, infiltrate, and treat stormwater in urbanized areas that would otherwise discharge to waters impaired for nutrients and bacteria.

CFE/Save the Sound has retained nationally known stormwater expert, Richard Claytor, PE (President, Horsley Witten Group) to provide expert testimony to the ongoing Connecticut MS4 General Permit proceeding. While his written comments are focused on the Connecticut MS4 permit, many of his comments are equally applicable to the Massachusetts Draft MS4 Permits. A relevant portion of his testimony, quoted below, highlights the need for specific green infrastructure retrofit applications to existing impervious surfaces, in order to improve water quality.

> It is now widely accepted that in order to ultimately restore water quality in water bodies for which nitrogen or phosphorus is the stormwater pollutant of concern, runoff from existing development that was built prior to modern stormwater control techniques must be effectively managed through a stormwater retrofitting program. In order for these programs to be effective and enforceable, the methods for retrofitting must be defined, the amount of existing development requiring management must be defined, and the timeframe for implementation must be specified. Examples of jurisdictions where this is being required include:
>
> - Maryland's MS4 permit program requires municipalities to implement a retrofit program for 20% of their impervious cover over the permit term.
> - Vermont's MS4 General Permit requires the development of flow restoration plans and retrofitting for 12 watersheds where TMDLs have been approved to manage uncontrolled stormwater runoff.
> - Long Creek in southern Maine is in its fifth year of an aggressive retrofit program in an attempt to meet water quality standards by 2020. Long Creek is being restored through a cooperative agreement through its Watershed Management District, and is now being viewed as a model for other communities.

Mr. Claytor offers the following general comments regarding the value of green infrastructure retrofits in removing bacterial (pathogen) pollutants:

> Waters impaired for which Bacteria is a stormwater pollutant of concern will also benefit from a concentrated stormwater retrofit program for existing development, but the important of source controls are doubly important. Bacteria are difficult to reduce or remove from stormwater using most stormwater treatment practices at the

high levels necessary to meet water quality standards. Only infiltration practices offer consistently robust removal capabilities for bacteria.

The Draft MS4 General Permit appropriately distinguishes between requirements for MS4s that discharge into non-impaired waters versus water quality impaired waters, both with and without TMDLs and directly references currently-in-place TMDLs. Section 2.1.1 of the permit also requires that "the permittee shall reduce the discharge of pollutants such that the discharge from the MS4 do not cause or contribute to an exceedance of water quality standards."

However, we believe that to be meaningful or enforceable, EPA must be clearer as to how a permittee shall meet the requirement of Section 2.1.1. Where an MS4 discharges a pollutant to a waterbody impaired for that pollutant, it has contributed to the impairment. Therefore the only reasonable interpretation is that the MS4 must be required to discharge "no net pollutants"—meaning that they must account for any of the pollutant that they cannot eliminate before the end of the pipe and provide means to eliminate the same pollutant in other ways.

Consistent with Mr. Claytor's expert opinion above and the requirement that the permittee not cause or contribute to the exceedance or water quality standards, CFE/Save the Sound and Save the Bay request that permittees be required to develop, fund, and implement a green infrastructure retrofitting program to meet TMDL requirements within a specified timeframe and to use control practices documented to reduce or eliminate the pollutant of concern. Like Maryland, the permit must identify the amount of impervious surfaces that must be retrofitted and the standards to which they must be retrofitted.

The Draft MS4 General Permit does not require either a clear impervious surface treatment mandate or a clear timeframe to achieve this goal. We request that this permit include such a requirement for urbanized localities containing high impervious surface coverage draining into water bodies associated with either an impairment for or TMDL associated with nutrients or bacteria. We recommend that the permit indicate an initial standard at least ten percent (half as stringent as the Maryland permit's requirement). Therefore we recommend that appropriate and up-to-date stormwater retrofit design standards be identified and that the permit require that at least ten percent of the impervious surfaces within the applicable permittee's location be retrofitted to such standards within the five year permit cycle.

2. Specify a maximum time from the date of discovery, by which all illicit discharges and SSOs must be eliminated, require ongoing "rolling" outfall and interconnection inspections, regularly test known dry weather flows that do not trigger elimination procedures, and mandate the development of a mechanism for acting upon citizen reports.

In general, we are pleased by the IDDE control measures included in the MS4 General Permit, specifically by the outfall and catchment sampling and investigation procedures, but we offer comment on specific areas where these programs could be strengthened, especially the inclusion of a maximum time from the date of discovery, by which all illicit discharges and SSOs must be eliminated.

The Draft MS4 Permit makes it clear that permittees shall diligently pursue elimination of *all* illicit discharges. (Section 2.3.4.2.) The permits requires an inventory of all outfalls and interconnections within one year of the effective date of the permit. (Section 2.3.4.5.) It requires system mapping be developed within two years of the effective date of the permit. (Section 2.3.4.6.) And it requires that permittees complete dry weather screening and sampling of every MS4 outfall and interconnection no later than three years from the effective date of the permit.

(Section 2.3.4.8.) We believe that this is a reasonable procedure and timeframe for inspecting outfalls and interconnections the first time through the process. We ask that EPA include some discussion of ongoing outfall and interconnection monitoring, such as requiring that one third of the outfalls and interconnections be similarly investigated every year under the program. This sort of "rolling" investigatory procedure would be more likely to discover illicit discharges by completing two passes through the entire MS4 every six years rather than a program that completes a single pass during each five-year permit cycle.

The Draft MS4 Permit states that the permittee shall eliminate illicit discharges "as expeditiously as possible," and then provides that any such discharge that cannot be eliminated within 60 days requires "an expeditious schedule." (Section 2.3.4.2.) Similarly, "upon detection of an SSO, the permittee shall eliminate it as expeditiously as possible." (Section 2.3.4.4.) While the intent is clear, this language allows significant uncertainty and no certain end-date. Many illicit discharges probably will not be eliminated in the first 60 days which means many will be subject to unique schedules. We would rather have a more realistic time frame with more consistency and enforceability. We recommend a set maximum of 180 days from the date of discovery to eliminate either an illicit discharge or an SSO. This provides more time to the permittee, but also an enforceable, consistent end-date.

This permit should clarify the procedures for regular testing of known dry weather flows that do not trigger elimination procedures when discovered under Section 2.3.4.3. Since the Draft MS4 Permit allows certain discharges of non-stormwater to the MS4, dry weather flows cannot be assumed to be prohibited. However, when dry weather flows are discovered and tests do not indicate that the discharge requires immediate action, regular testing ought to be required to ensure that illicit discharges are not occurring. We recommend this testing occur semi-annually.

This permit should also require that permittees implement a mechanism for acting on citizen reports. Citizens that use waterways frequently – such as CFE/Save the Sound members who engage in numerous water-related activities, including fishing, sailing, rowing, sightseeing, hiking, and wildlife watching – are in a position to identify and report illicit or suspicious discharges. Currently there is no mandate for the permittee to investigate or respond to these reports. Each permittee should be required to respond to citizen reports through investigation and determinations as to whether the reported discharge is illicit (and if so, enforcement). We suggest the following language be added to the permit:

> "The permittee shall maintain a website with clear instructions for the public describing how citizens can submit an overflow report. The website shall provide an email address and/or a phone number for submissions. The permittee shall affirmatively investigate and eliminate any dry weather flow reported to it by any citizen or organization, provided that such report incorporates at least a time and location of an observed overflow. The permittee shall commence inspection of such a reported outfall or manhole within 5 business days of receiving such a report, and incorporate those reported outfalls into its IDDE program subject to all provisions of Section 2.3.4. All citizen reports and the responses to those reports shall be included in the Annual Report."

3. Include a more extensive list of low impact development ("LID") and runoff reduction measures that permittees must incorporate into their local building codes or ordinances, and be as specific as possible about what is required.

Section 2.3.6 of the Draft MS4 Permit contains requirements for stormwater management in new development and redevelopment. This section lays out the skeleton of a good LID program with

the goal of reducing the amount of runoff from developed areas, and requires retaining or filtering the first inch of rainfall. However, we again recommend that the permit be more specific in what exactly is required and leave less up to the discretion of the permittee. In addition, we suggest some specific measures that should be included to strengthen the program.

One of the primary tools of a successful LID program is the minimization of impervious surfaces. Section 2.3.6 (b) of the draft permit requires permittees to develop a report to assess the impact of existing street design and parking lots and implementation of the report's recommendations. But the permit does not provide specific guidelines, guidance, or mandates to ensure that permittees actually reduce runoff. It leaves too much up to the discretion of the permittee. It also leaves out other impervious surfaces, such as rooftops, sidewalks, recreational surfaces such as basketball or tennis courts, and paved courtyards or forums to name a few. Elsewhere in the section, it mentions green roofs, rain garden, and pervious pavement but contains no real, nor enforceable mandate that permittees change local codes and ordinances to affirmatively require these.

The West Virginia (WV) Small MS4 Permit offers a prime example of an approach that goes beyond Massachusetts's Draft MS4 Permit to ensure that permittees develop a true LID program. The West Virginia model combines "watershed protection elements," such as:

- Requirements to minimize the creation of impervious cover from parking lots, paved road, and rooftops;
- Provisions to preserve, protect, create, and restore ecologically sensitive areas that provide water quality benefits and serve critical watershed functions;
- Implementation of stormwater management practices that prevent or reduce thermal impacts to streams, including requiring vegetated buffers along waterways, and disconnecting discharges to surface waters from impervious surfaces such as parking lots;
- Measures to avoid or prevent hydromodification of streams and other water bodies caused by development, including roads, highways, and bridges;
- Implementation of standards to protect trees and other vegetation with important evapotranspirative qualities; and
- Implementation of policies to protect native soils, prevent topsoil stripping, and prevent compaction of soils.

The WV model requires permittees to incorporate the above provisions, among others into their local ordinances within specified timeframes. Furthermore, the WV permit requires permittees to incorporate "site and neighborhood design measures" to be implemented in tandem with the watershed protection elements identified above.

Finally, it is not enough to simply require permittees to establish a local code that "requires or allows the use of runoff reduction and LID practices." Instead, the final permit must provide specific language that identifies what runoff reduction and LID practices must be required.[ii] The permit and resulting building codes should tie certain common development practices to required runoff retention or infiltration techniques.

4. Include in the Draft MS4 Permit the Full Opportunity for the Public to Provide Comment and to Request a Public Hearing on NOIs and SWMPs.

EPA must provide a full opportunity for public to submit comments and request hearings on NOIs and SWMPs before permit coverage is granted. The Draft MS4 Permit does contemplate an opportunity for the public to comment on submitted material. However, the time allowed is

severely insufficient. Although most permittees must submit registration materials 90 days before the effective date of permit, the public is given an unreasonably short period of a minimum of 30 days from submission in which to review and comment to DEEP upon all of these submissions. In light of the length of time that DEEP has a permittees' registration materials, citizens can and should be provided more than 30 days to provide full and thoughtful comments.

While the Draft MS4 Permit allows for limited public comment, it fully fails to provide the public with a hearing on registrations and SWMPs, or any other forum for response to those comments, as is required under the Clean Water Act's public participation provisions.[iii] DEEP should include in an opportunity for public hearings on registration materials before permit coverage is granted.

Thank you for this opportunity to comment on these important matters. We look forward to engaging in a discussion.

Sincerely,

Dear Mr. Tedder,

At the December 15, 2014 Board of Selectmen meeting, it was unanimously voted to endorse the letter submitted to you by the Chelmsford Department of Public Works, dated December 9, 2014, which included comments on the 2014 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts.

We encourage the EPA to consider the points made in that letter. As noted, the Town of Chelmsford would be unable to meet the new requirements as outlined, while still providing necessary local services, without significantly increasing the allocation of resources, which is not practical or possible at this time. We appreciate the intent of the new regulations; however, we ask that implementation rules be modified to allow a more reasonable plan for achieving the desired results.

Thank you in advance for your attention to this matter.

Sincerely,

Pat Wojtas

RE: Town of Chelmsford, MA Comments on the 2014 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

The Town of Chelmsford appreciates the opportunity to review and comment on the 2014 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts.

The Town of Chelmsford would like to express gratitude to the EPA for taking the time to clarify many of the issues raised in the first draft permit in 2010. The revisions have made it easier to identify which municipalities have discharges to water quality limited water bodies. The Town also appreciates that the new permit allows up to 90 days to submit the NOI after the effective date of the permit.

On a different note, it was expected that the requirements of the 2010 permit would be reduced for the 2014 permit. This was not the case. The funds required to meet the permit, and to continue the maintenance required greatly exceed The Town's resources. More flexibility should be allowed to each town to use their existing resources to achieve the permit requirements to the maximum extent practicable.

In this letter, we have outlined our major concerns and offer suggestions that we feel could make this permit more manageable and effective at removing illicit discharges.

Reporting requirements

- The level of reporting required in the 2014 Draft permit is time consuming and does not benefit the Town of Chelmsford. The new permit will not only continue to require the current 2003 permit reporting and record keeping standards but in addition requires the preparation of extensive supporting documentation that will need to be included in annual reports to demonstrate permit compliance. These additional requirements will burden our existing staff. The resulting annual reports are expected to be more than ten times the size of current annual reports. Consider reducing or eliminating the need to include extensive supporting documents with annual reports. A summary should be adequate for municipalities to confirm compliance within each report. Additional required data and information does not add value.
- Provide guidance documents to help municipalities fully understand and meet the increased reporting and record keeping requirements of the new permit and to better understand EPA's permit expectations. Documents that would provide better guidance and direction for municipalities include: a summary table of major changes between the current and draft permits (this was provided following the previous draft permit), a simplified summary of permit requirements (this was also provided following the previous draft permit), permit checklists, standardize reporting and record keeping templates, examples of completed forms and reports to show level of detail expected and FAQ sheets.

Impervious Area

- The requirements to measure and monitor changes in impervious area provides little benefit to the municipality. Most of the development in Chelmsford is redevelopment. The Massachusetts DEP Stormwater Standards are being followed in the design of these projects. This results in significantly lower rates of change in impervious area and directly connected impervious area. This exercise will be burdensome and will take staff away from more valuable functions. The EPA should consider utilizing satellite imagery, and estimating the amount of impervious area every ten years and track it on their own. Municipalities should not be charged with gathering data that does not provide them with useful information.

Stormwater Standards

- We are concerned about the requirement to infiltrate the first 1-inch of runoff from impervious surfaces on new and redevelopment sites. Compliance is difficult to achieve. Our current stormwater regulations (required in the 2003 Permit) references the MA DEP Stormwater Standards. Many developments, including municipal improvements, have been designed, reviewed and built while complying with the Stormwater Standards. For consistency, the new MS4 permit should follow the DEP Stormwater Standards.
- The permit is unclear about whether or not roadway reconstruction projects greater than one acre would be required to provide storage and/or treatment for the first inch of stormwater runoff. This needs clarification.

- Consider municipal roadway projects. In most cases, municipalities are disturbing less than one acre of roadway per project, however there are many projects going on concurrently. Please clarify if roadway projects less than one acre are to be considered part of a jurisdiction's "common plan" for maintenance. Clarify the types of projects that trigger this requirement. Consider making linear projects exempt.

Outfall Inventory

- We are required to do an outfall inventory and physically visit each outfall within one year of the permit. This timeline is not reasonable. Chelmsford has over 600 outfalls. It will take at least 2-3 years to visit all the outfalls. Consideration should be given to allow 3 years for the completion of the inventory.

Mapping

- The permit requires a full map of our drain system to be completed in two years. It is our opinion that we will need at least five years to fully map our system given that many structures will need to be located or uncovered. Consideration should be given to allow five years for the full map of the drain system to be completed.
- For similar reasons, the full map of the sanitary sewer system will also take five years to be completed. Some of the recommended elements are unrealistic. We gather our information from as-built plans. In many cases, these do not have seasonal high water table elevations. Consideration should be given to revising this requirement to be completed in five years.

Catchment mapping

- Catchment mapping is time consuming. The EPA has contradicted itself by saying that municipalities may use the MASS GIS catchments but also need to map their own catchments to outfalls. The MASS GIS catchments are approximate areas, and do not take into consideration new development and infrastructure. The only way to accurately map catchments is by hand. To do so, the municipality must already have their entire drainage system mapped. Mapping the entire drainage system was not a requirement of the 2003 Permit. It will take one full-time staff member months to map the catchments after the drainage system is completed. This task will take time away from other tasks. Before Municipalities spend countless hours and funds on mapping catchments, consider including this as a "recommended element" and removing it from being a "required" element. Allow each municipality to determine the best method for isolating catchments to potential illicit discharges.
- Mapping the catchments will be inaccurate until the field inspections are completed. If the goal is to eliminate illicit discharges, consider revising the permit to allow municipalities to map the catchments as they are being inspected. It will yield a more accurate catchment map, which in turn, will provide more accurate ranking of catchments.
- Catchment mapping is not necessary in all circumstances. If the outfall inspections yield a clean result, the outfall should be exempt from the catchment mapping requirement. Consider revising the permit to require catchment mapping only for High Priority outfalls.

Illicit Discharge Program

- Written IDDE Program – Section 2.3.4.7.c.ii. - We disagree that *Catchments that were once serviced by septic systems, but have been converted to sewer connections may have a high illicit discharge potential.* Once properties are properly connected to sewer, the illicit discharges are eliminated. For example, properties that once discharged their laundry wash water to the back yard are now connecting them to sewer. This includes our entire town, where the sewers are all less than 30 years old. Consider eliminating this comment.

Water Quality Sampling

- The System Vulnerability Factors for Wet Weather Sampling encompass most, if not all, of our outfalls (over 600). Please consider revising the Vulnerability Factors to have less factors, or different levels of factors. For instance, group them by sensitivity.
  - Level 1 factors = Catchments with at least 1 of the factors
  - Level 2 factors = Catchments with at least 2 of the factors
  - And so on…

Good Housekeeping

- The permit requirements will more than double our time spent on Catch Basin cleaning and street sweeping.
- The requirement to clean all catch basins when they are 50 percent full is difficult to quantify and difficult to execute. Town departments responsible for catch basin cleaning strive to maximize efficiency in light of local budgets and staff shortages. For the roadways, it is most efficient to clean the catch basins by following a path along a road. The cost to clean only a select few in spots all over town will be more than twice that of conventional cleaning methods. Cleaning catch basins when they become 50 percent full is not an efficient use of staff and funds, and cannot be implemented in a practical way. Consider allowing more flexibility in this requirement.
- The requirement to maintain a record and report on the volume of material removed from catch basins does not benefit the municipalities. This not only drives up the cost to clean catch basins, it also creates more paperwork. It is difficult to execute and not an effective use of staff time. Consideration should be given to eliminate this requirement.
- Appendix H – Requiring municipalities to increase street sweeping to twice a year will require additional resources and staff.
  - It is our concern that some municipalities may eliminate street trees in an effort to reduce the amount of leaves. In addition, proposals for planting street trees may be denied. Trees are important to the environment.
  - Contrary to what the Permit states, the street sweepers will not pick up all of the leaves on the side of the road in the fall. Sweeping in the fall will be costly and it is not an effective method for removing the leaves.
  - Consideration should be given to eliminating this requirement or offering a more effective and economical method of leaf removal.

- The Permit requires quarterly inspection of facilities under a Stormwater Pollution Prevention Plan (SWPPP). This requirement is inefficient and wasteful. Chelmsford has 30 buildings. Quarterly inspections could require a full-time staff member. The Town recommends one annual inspection of facilities.

General Comments

- EPA and MassDEP regulations need to be more aligned. We recommend that MassDEP co-issue the permit with EPA.
- We recommend that EPA reach out to other Town officials to better educate them on the interdepartmental coordination required under the new permit.

Please understand that Chelmsford cares about the quality of water, however, as outlined in this letter, we are limited by our budget. We understand the need for some of the permit requirements, but we are concerned that the cost to implement the new permit will far exceed our capabilities. In particular, the costs associated with water quality sampling, catchment investigations, mapping, good housekeeping, and reporting may be extensive. Please consider revising the permit to make it possible for municipalities to execute while maintaining the core principles of the permit.

Sincerely,

Christina Papadopoulos, E.I.T.

Re: Massachusetts Draft EPA Storm Phase 2 Regulations
Dear Mr. Tedder,
The City of Chicopee Department of Public Works is writing to provide our concerns regarding the proposed new Storm water Phase Two regulations. The following is a list of the most troubling portions of the proposed new Storm water Phase Two regulations.

1) Pavement maintenance work triggers retaining first inch of storm water or storm water treatment. Under the new regulations, when one disturbs more than one acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) or more which will include road reclamation projects, the new regulations require that the first inch of storm water be retained or all the storm water must be treated. This essentially means one now not only has to resurface the road one has to completely redesign and re-construct the entire storm water collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for storm water storage or pay for the expense of storm water treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way.

   As everyone is aware, the funds available for pavement maintenance are less than half of what are needed to simply preserve the condition of the current infrastructure. This means that Massachusetts roads are falling apart faster than they can be repaired. The above added costs will compound the problem and create more failing roads and more erosion. Municipalities will be forced

to use the wrong pavement rehabilitation technique at the wrong time which will squander the available limited pavement maintenance resources. There must be an exemption for pavement maintenance projects. The above regulations should not be applied to maintenance projects. If a new road is being constructed or a lane is being added, these stormwater management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should not trigger rebuilding the world.

2) Chloride Reduction. Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to legal action. Yes, usage of chlorides could all stop tomorrow, but at what cost to human life. If the EPA will protect an endangered salamander, it should be equally as concerned with the loss of human life. The chloride reduction regulations should be limited to recommending that municipalities follow the latest accepted Best Management Practices.

3) Requirement for tracking impervious area. The EPA in its permit guidance documents implicitly admits that the simple presence of impervious areas is not a direct correlation to storm water quality. Sites with paved areas can store/detain or treat storm water so that the presence of paved areas on storm water quality is mitigated. Similarly, the MaDEP considers roof water runoff "clean" and can be infiltrated into the ground without pretreatment. Tracking the amount of impervious areas does not have a direct correlation to water quality; therefore the MS4's should not have to expend resources tracking changes in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities. Any attempt at limiting /restricting development through the veiled attempt at controlling impervious area is outside the purview of the Clean Water Act.

4) Cost of implementation. An article published in Construction Outlook a publication of UCANE recently published EPA cost estimates of compliance between $70,000 and $829,000 per year depending on population and size. This is very troubling because they have been known to significantly under-estimate the actual cost. At the meeting, Newton Tedder from the EPA commented that he believes most cities and towns will have to pass a storm water utility in order to pay for the costs to comply with the new Storm Phase Two regulations. Obviously, the EPA is admitting that the new regulations

are an undue burden and so costly that the municipalities cannot afford them with existing revenues. It seems unlikely that the intent of Congress in passing the Clean Water Act was to authorize the EPA to mandate additional taxes and create its own hidden tax structure to accomplish its charge of cleaning the water. The EPA was charged with cleaning the water and operating within its budget as set by Congress. The States and local cities and towns must do the same. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to capriciously raise the cost of compliance with the new regulations. The local governments will be happy to work with the EPA to achieve progress on storm water. However, the heavy handed, adversarial and punishing regulations as proposed will not encourage cooperation from state and municipal partners.

The Congress of the United States should act to restrain the EPA from imposing uncontrolled and expensive tax burdens on the subjects it regulates. Taking reasonable actions to improve water quality is one thing, but being mandated to accomplish everything overnight is unfathomable. All levels of government must be cognizant of costs. The regulations, reporting requirements and the overall implementation costs must be reduced to a sustainable and rational level. The taxpayers and the country cannot be bankrupted by an attempt to reach unrealistic goals set by a bloated out of touch federal bureaucracy.

5) Signage at outfalls. Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources. The signs will encourage theft or vandalism and will provide little to no use in management of the storm drain system. All regulated organizations are required to have maps with locations of all outfalls. The availability of low cost GPS devices makes these outfalls easily located by just about anyone.

Thank you for your consideration, if you would like additional information, please contact me at jneece@chicopeema.gov or (413) 594-3557.

Sincerely,

Re: Draft General Permit for Small Municipal Storm Sewer System for Massachusetts North Coastal Watersheds

Dear Ms. Murphy:

The Conservation Law Foundation ("CLF") appreciates the opportunity to comment on the Small Municipal Separate Storm Sewer System Draft General Permit for Massachusetts North Coastal Watersheds ("draft permit").

Founded in 1966, the Conservation Law Foundation ("CLF") is a member-supported environmental advocacy organization that works to solve the problems threatening our natural resources and communities in Massachusetts and throughout New England. Among those problems, CLF has worked, and continues to work, to promote effective regulations and strategies to reduce and minimize the significant impacts of stormwater pollution.

I. General Comments

"Stormwater runoff is one of the most significant sources of pollution in the nation, 'at times comparable to, if not greater than, contamination from industrial and sewage sources."[1] As the U.S. Environmental Protection Agency (EPA) acknowledged in 1999, "[s]torm water runoff from lands modified by human activity can harm surface water

resources and, in turn, cause or contribute to an exceedance of water quality standards by changing natural hydrologic patterns, accelerating stream flows, destroying aquatic habitat, and elevating pollutant concentrations and loading." 64 Fed. Reg. 68,724 (Dec. 8, 1999). This is no less true in Massachusetts. Stormwater has been cited as the primary cause of water quality impairment in the Commonwealth, and municipal small separate storm sewer systems ("MS4s") are a significant contributor to those problems.[2]

An enhanced Small Municipal Storm Sewer ("MS4") permit program for Massachusetts with meaningful standards, clear milestones, and strong enforcement is necessary as part of the overall effort to restore degraded rivers, streams, and ponds and maintain fishable, swimmable water quality in the state's waterways. The North Coastal Draft Permit represents a substantial step forward in this direction, and we recognize the work EPA Region 1 ("EPA") has undertaken to evaluate the effectiveness of the 2003 permit and to involve stakeholders in discussions about the permit reissuance. However, from CLF's perspective there are a number of areas where the permit must be strengthened in order to fully reflect legal requirements and to accomplish the objectives of the MS4 program.

Compliance with the Massachusetts MS4 permit, and success at achieving water quality outcomes, has varied widely across the permittees under the 2000 permit.[3] EPA's own review of the MA MS4 program revealed that only 163 of 238 towns submitted their annual report for Year 6 (2008-09). Only 25% of Communities reported they were doing outfall inspection and monitoring. And 30% still had not completed outfall mapping. These are baseline requirements, that municipalities have been aware of since the 1999,[4] and that form the building blocks of the program. These monitoring, planning and assessment steps are prerequisites to the full achievement of what this permit program requires, which is a systematic analysis of impervious area, the creation and implementation of a plan to retrofit existing infrastructure to meet water quality standards, and incorporation of LID into all new development.

Although achieving these objectives, and compliance with the Clean Water Act, will require a sustained commitment of resources, EPA and the entities regulated under the Phase II program must not lose sight of the fact that there are significant costs associated with

[3] MassHighway, for example, failed to submit an NOI meeting even basic authorization requirements until CLF, the Charles River Watershed Association, and the Leominster Land Trust sued the Commonwealth in federal court in 2006. CLF v. Patrick, Case No. 06-11295wgy (U.S. District Court for the District of Massachusetts).

[4] 64 Fed. Reg. 68722 (Dec. 8, 1999). Had these requirements been meaningfully considered by the permittees from the outset, there was ample time to incorporate infrastructure improvements into annual and multi-annual budgeting and capital planning processes, and to establish funding mechanisms to ensure the financial resources for management of stormwater. Newton, for example, has implemented a stormwater utility.

continued stormwater pollution – such as ongoing and increasing degradation of water quality, loss of recreational value, adverse impacts on water supplies, and declining property values – that can only be reduced and avoided by improved stormwater regulation and management.[5] Low Impact Development ("LID") and green infrastructure practices that restore the natural hydrological cycle and reduce the demand on piped infrastructure can be, in the long run, more cost-effective to implement and maintain than conventional stormwater infrastructure.[6] Thus, in addition to improving and protecting water quality, the increased use of LID and green infrastructure has the potential to generate financial benefits and more livable communities.

II. Water Quality-Based Requirements

A central tenet of the Clean Water Act (CWA) as well as the small MS4 program is the principle that NPDES permits ensure compliance with water quality standards.[7] This concept is reiterated in the CWA, its regulations, case law, and the Small-MS4 General Permit. In enacting the CWA, one of Congress' principal goals was to "recognize, preserve, and protect the primary responsibilities and rights of States to prevent, reduce, and eliminate pollution, [and] to plan the development and use (including restoration, preservation, and enhancement) of land and water resources."[8] In accordance with this goal, the CWA is clear that all provisions in a NPDES permit must comply with state water quality standards.[9] Federal case law has also underscored EPA's authority to include in stormwater permits all conditions and limitations necessary to assure the attainment water quality standards are met.[10]

[5] See, e.g., "How Much Value Does the City of Philadelphia Receive from its Park and Recreation System? A Report by The Trust for Public Land's Center for City Park Excellence for the Philadelphia Parks Alliance," June 2008 at 3-4 (estimating that Philadelphia's 10,000 acres of parks save $5.9 million annually in stormwater management costs).

[6] Reducing Stormwater Costs through Low Impact Development (LID) Strategies and Practices, U.S. EPA, Nonpoint Source Control Branch (4503T), Washington, D.C., Dec. 2007 (EPA 841-F-07-006). This EPA report on seventeen LID case studies found that in the majority of the LID projects "significant savings were realized due to reduced costs for site grading and preparation, stormwater infrastructure, site paving, and landscaping." LID projects resulted in up to 80% total capital cost savings. Furthermore, additional benefits, such as improved aesthetics and faster sales, were not factored into these savings figures. The case studies included redevelopment projects (for example, green roofs in Toronto) as well as new development.

[9] *See* 33 U.S.C. § 1370 (allowing state water quality standards to be more stringent than federal technology-based standards); 33 U.S.C. § 1341(a) (requiring compliance with water quality standards of both the state where the discharge originates and of any state affected by the discharge). The requirement that permits comply with state water quality standards allows no exceptions for cost or technological feasibility. *In re City of Fayetteville, Ark.*, 2 E.A.D. 594, 600-01 (CJO 1988) (interpreting the language of section 301(b)(1)(C) to require "unequivocal compliance with applicable water quality standards," and prohibit "exceptions for cost or technological feasibility"), *aff'd sub nom*. Arkansas v. Oklahoma, 503 U.S. 91 (1992).

[10] *Defenders of Wildlife v Browner* affirmed EPA's authority to include in small and medium MS4 permits controls and limitations necessary to ensure water quality standards are met. 191 F.3d 1159, 1166-67, (9th Cir. 1999) *See also* 33 U.S.C. 1312(p)(3)(b)(iii) (as cited in Fact Sheet, at 4).

The implementation of the MS4 program to date, and analysis done in connection with the Charles River Watershed phosphorus TMDLs, indicates that retrofits of existing infrastructure will be needed to ensure water quality standards are met in urban and suburban waterways. CLF encourages EPA to more clearly state where stormwater retrofits and new structural BMPs are expected as the result of the minimum control measures and Section 2. As described more fully below, LID-based performance standards are warranted in this permit, as it is not clear the permit's objectives can be met without them.

Section 1.3(k), providing that discharges that cause or contribute to instream exceedances of water quality standards are not authorized under the permit, should be retained in the final permit as an expression of EPA's responsibility and authority to ensure water quality standards are met.

CLF recognizes that EPA has taken steps to clarify the relationship between water quality-related requirements and the six minimum measures (and that both sets of requirements are applicable), which is generally a beneficial change. However, the language still raises some significant concerns and could be further clarified and strengthened.

a. Section 2.1.1, Requirement to Meet Water Quality Standards.

CLF objects to the "presumptive approach" set forth in the permit and fact sheet, in which discharges are presumed to satisfy water quality requirements if minimum measures are implemented. (*See* Fact Sheet, at 29).

Section 2.1.1 is problematic in that it attempts to create the presumption that water quality standards are met if permittee "fully satisfies" all other permit requirements,' and allows permittees a 60-day "grace period" to correct instream exceedances after they are brought to the permittee's attention. The presumption that "in the absence of information stuggesting otherwise, discharges will be presumed to meet the applicable water quality standards . . . " is contrary to the permit itself (Section 1.3(b)) as well as the Clean Water Act and the Phase II regulatory scheme, which establish that the burden is on the discharger to demonstrate that water quality standards are met. This presumption should be removed in the final permit. The 60-day period could be construed to create a "safe harbor" for dischargers once an illegal discharge is discovered. EPA should remove this provision from the permit and use other means to communicate its expectations as to how a municipality should respond to the discovery instream exceedances, and would retain the ability to exercise its enforcement discretion on a case-by-case basis. Both the presumption and the grace period also appear to attempt to generate an illegal hurdle to citizen enforcement of the permit that contravenes the right of citizens under Section 505 of the Clean Water Act, 33 U.S.C. § 1605.

The Fact Sheet cites language in the 1999 Federal Register notice that announced the MS4 program as support for this presumption, but neglects to point out the text immediately following, which reiterates the ongoing obligation to modify the SWMP to meet water quality standards.

> As discussed further below, however, small MS4 permittees should modify their programs if and when available information indicates that water

> quality considerations warrant greater attention or prescriptiveness in specific components of the municipal program. If the program is inadequate to protect water quality, including water quality standards, then the permit will need to be modified to include any more stringent limitations necessary to protect water quality.

64 Fed. Reg. 68722, 68753 (Dec. 8, 1999) (emphasis added).

CLF does not concede that the phrase "if and when available information indicates…" in the Phase II rule allows permittees to wait for citizens or regulatory agencies to notify them that a discharge is causing or contributing to water quality problems.[11] The burden is more properly on the discharger to actively assess and monitor their discharges, and to immediately correct problems, whether discovered through their own assessment or by others.

b. 2.2.1 – Discharges to Impaired Waterways With an Approved TMDL

- CLF objects to the draft permit language stating that approved TMDLs are those that have been approved as of the effective date. As new TMDLs are approved during the permit term, they ought to be considered approved TMDLs. This better reflects the reality that new TMDLs will be issued throughout the permit term. Incorporating new TMDLs would ensure that their implementation will not be held up by the MS4 permit reissuance.

- Section 2.2.1(b) refers to Appendix G, in which EPA has done some 'translating' of what the TMDLs mean in terms of requirements for MS4s. This chart is a helpful addition to the permit, as the prior permit term revealed that there was a gap in some permittees' understanding of or acceptance of responsibility for loading reductions. There are additional TMDLs that identify stormwater-related pollutants as a source of impairment although their WLAs may not be as explicit in relation to MS4s. CLF encourages EPA to consider adding TMDLs to this appendix.

- The draft permit also reflects a helpful clarification in 2.2.1(c) that TMDL is not a license to pollute – that discharges to impaired waters must also comply with Section 2.1, the prohibition on causing or contributing to instream exceedance of water quality standards. CLF strongly recommends this be retained in the final permit.

- CLF disagrees with the approach to documenting compliance with TMDLs reflected in the fact sheet, that "the permittee's demonstration of meeting the requirements of the WLA should focus on evidence that shows that the BMPs are implemented properly and adequately maintained." A quantitative approach should be used where the permittee estimates or its overall pollutant loading and the expected reduction if BMPs are properly maintained, as well as the expected impacts on water quality. This estimation should then be verified by real world information.

[11] *See* 64 Fed. Reg. 68722, 68753 (Dec. 8, 1999) ("[p]ermittees should modify their programs if and when available information indicates that water quality considerations warrant greater attention or prescriptiveness in specific components of the municipal program.")

- **CLF strongly supports the provisions of Section 2.2.1(d) that municipalities develop a Phosphorous Control Plan describing measures necessary "to achieve consistency with the wasteload allocation ("WLA") in the Lower Charles TMDL, and urges that these provisions be further strengthened to ensure the TMDL loading reductions are timely achieved.**

    - CLF supports the language specifically walking the permittee through the process of estimating its phosphorus ("P") reduction over its 2000 P load. There appears to be an implicit trading provision - "In Lieu of Developing a 2010 MS4-only Phosphorus Load, the MS4 may decide in the PCP to plan and implement municipal-wide P reductions in areas tributary to the Charles, to achieve consistency with the WLA." This provision needs clarification, because as drafted, it implies that the town can 'describe' some type of trading, but does not require objective measures to account for the reductions. If in fact a trading program is envisioned, metrics must be required to document and track the reductions.

    - CLF has major concerns about the implementation timeframes for the Phosphorus Control Plan. The draft permit states that permittees in the Charles must develop and "begin implementing" a Phosphorus Control Plan within 4 years. CLF objects to four years as the length of time for the development of the PCP. A much shorter timeframe should be feasible, given the extent to which supporting data and modeling is already available from EPA and MassDEP (as highlighted in the fact sheet). A strong starting point is already reflected on line as of today's date in the impervious acreage estimates on the EPA Region 1 website for this permit,[12] and in the precise loading reduction targets calculated for each town in Appendix G to this permit.

    - The draft permit allows permittees ten years to complete implementation. The 10 year compliance timeframe is too long, from both a practical and legal standpoint. EPA does not have the authority under the Clean Water Act and NPDES regulations to include ten year compliance schedules. The term of any NPDES permit may not extend beyond five years.[13] In addition, both the NPDES regulations and the MassDEP regulations specify that permits shall require compliance "at the earliest practicable time."[14] Ten years is well beyond the earliest practicable time for the installation of stormwater retrofits, and may actually make the process more challenging.[15]

---

[12] http://www.epa.gov/ne/npdes/stormwater/ma.html

[13] 40 C.F.R. §§ 122.46(a)-(b). Furthermore, CLF does not concede that the limited conditions in which compliance schedules are allowable under the Massachusetts surface water regulations are met in this instance. Compliance schedules are not permissible for water quality-based effluent limitations unless based on "new, newly revised or interpreted water quality standards that became effective after both issuance of initial permit for discharge and 1977." 314 Code Mass. Regs. 4.03(1)(b).

[14] 314 Code Mass. Regs. 4.03(1)(b).

[15] To extend this requirement over such a long period of time would likely make the implementation *less* practicable. The remote end date would make it difficult for local officials and town staff to

- EPA should to alter this provision in the final permit to reflect a compliance timeframe of no more than one to two years to complete the phosphorus control plan and the remaining permit term (for a total of no more than five years) to implement the plan. In addition, EPA should include enforceable interim milestones that will facilitate planning and budgeting at the town level. This would be consistent with 40 C.F.R. § 122.47(a)(3) (directing NPDES permitting authorities to require interim milestones no more than one year apart when a permit establishes a schedule of compliance beyond the effective date of the permit) and with MassDEP regulations.[16]

c. 2.3.1.1-2 – New or Increased Discharges to Impaired Waters

- The Draft Permit's requirement that new or increased discharges to impaired waters are disclosed and offset are critical on both a legal and practical level. Over half of Massachusetts waterways are already impaired for stormwater-related pollutants. Preventing polluted stormwater discharges from new impervious area (which EPA finds is typically the source of new or increased discharge)[17] represents the most straightforward opportunity to prevent further inputs of pollution into these degraded waterways. As EPA points out, MS4 permittees are already obligated to control their discharges to the point where they are not causing or contributing to instream exceedances of water quality standards.[18] Therefore, where new outfalls , higher pollutant loadings, or increased stormwater volume are proposed, 40 C.F.R. § 122.4(i) requires no less.

- CLF agrees generally that any new or increased discharges to impaired waters must be evaluated by the permittee before they occur, in relation to TMDLs and water quality standards. CLF supports the requirement that permittees give prior notice and receive approval from EPA before a new discharge will commence into a water with a TMDL, and strongly encourage EPA to require this information is made available to the public in real time. The draft permit does not appear to provide for any notice to EPA or the public prior to increased discharges, or prior to new discharges in impaired waters without a TMDL. CLF recommends this provision be changed in the final permit. It is critical that citizens, as well as regulatory agencies, have the opportunity to be informed *before* any new or increased discharge is permitted, to ensure that full dialogue occurs in the municipality as to how stormwater will be managed, and so that EPA and the public can make sure that the offsets or promised infrastructure are, in fact implemented. Merely requiring a statement in the annual report is not enough -- for example if a development or infrastructure project has been completed nearly a year ago and no offsets actually occurred as part of the project, or the project was changed from the initial design, it

---

justify taking quick interim actions. In the meantime, land uses may change and phosphorus pollutants will accumulate in sediment and impoundments, unneccessarily adding to the challenges of achieving the applicable water quality standards for phosphorus.

[16] Under Massachusetts regulations, where schedules of compliance are issued, they "shall include dates for specified tasks or activities leading to compliance and may include interim effluent limitations, as the Department deems appropriate." 314 Code Mass. Regs. 4.03(1)(b).

[17] Fact Sheet, at 39.

[18] Fact Sheet, at 40.

would be more difficult and costly to go back and mitigate the new or increased discharge after the fact. The spirit of this important permit provision would not be served by self-reporting on an annual basis.

- EPA should clarify who "new permittees" are. It is not immediately apparent why there needs to be a category of dischargers that were not subject to the 2003 permit but who are covered under the draft permit, and the fact sheet offers insufficient justification for why additional time for compliance is appropriate. Presumably, the entity (a town or nontraditional MS4) could have planned to be able to meet its requirements at the time it became covered under the permit. Allowing extra time would send the wrong message – that regulated entities need not prepare for environmental permit requirements triggered by their own development.

- The draft permit represents an improvement over the 2003 permit in that "increased discharge" is defined, and that this situation is addressed more explicitly.[19] CLF agrees with EPA that no net increase in pollutant loading should be allowed from increased discharges to impaired waters, and that offsets need to be documented before construction begins. However, the application of the term "new discharger" is inappropriately proscribed due to EPA's overly broad reading of the term "new discharge," relying on an objectionable interpretation of the term "site"[20] to include an entire MS4 system. *See* 40 C.F.R. 122.2 (definitions). As a result, many discharges that should properly be treated as "new discharges" are considered to be "increased discharges."

- Functionally, this accomplishes an end run around the requirements of 122.4(i), as interpreted in the *Pinto Creek* decision, that "no permit may be issued to a new discharger if the discharge will contribute to the violation of water quality standards." A narrow exception to this prohibition is carved out for situations where a TMDL has been calculated, if the discharger can show, before the end of the comment period, that "there are sufficient remaining pollutant load allocations to allow for the discharge and that the existing dischargers into that segment are subject to compliance schedules designed to bring the segment into compliance with applicable water quality standards."[21] CLF does not agree that new impervious area or new stormwater outfalls created by a municipality are properly defined as "increased discharges" rather than "new discharges" or "new dischargers" for purposes of triggering the Pinto Creek analysis. Any new stormwater outfalls

[19] "Increased discharge" is defined in the draft permit as a discharge "directly into the MS4 or from the MS4 that commences after the effective date of this permit and results from creation of one or more acres of new impervious surface." Draft permit, § 2.3.1.

[20] The term "site" is defined to mean "the land or water area where any 'facility or activity' is physically located or conducted including adjacent land used in connection with the facility or activity." 40 C.F.R. 122.2. EPA appears to have inserted the term "contiguous" into the discussion in the fact sheet as part of the broadening of the definition.

[21] 40 C.F.R. 122.4(i); *Friends of Pinto Creek v. EPA*, Slip Op. No. 05-70785, 13505, 13515 (9th Cir., Oct. 4, 2007). The rationale for this section of the regulations is that it "corresponds to the stated objectives of the Clean Water Act 'to restore and maintain the chemical, physical, and biological integrity of the nation's waters.' 33 U.S.C. § 1251(a) (1987). And that 'it is the national policy that the discharge of toxic pollutants in toxic amounts be prohibited.' 33 U.S.C. § 1251(a)(3) (1987)." *Pinto Creek,* at 13515 (9th Cir. 2007).

created by an MS4 discharger into an impaired waterbody would contribute to the violation of water quality standards, and should be subject to the Pinto Creek requirements. We recommend this provision be changed in the final permit.

- Under the draft permit, "increased discharges" must provide for a net decrease in pollutant loading through enhanced control or offsets.[22] Without conceding that these discharges can be allowed under the permit, absent a TMDL and a demonstration that compliance schedules are in place for other point sources, CLF agrees agree that that a net decrease in pollutant loading should be required for any increased discharges to impaired waters. More specificity is needed as to what kinds of measures are an appropriate offset (for example, structural BMPs installed and functioning, and verified by the permittee to accomplish a particular pollutant loading, mass or volume reduction). Quantitative analysis and verification should be required to document the pollutant reduction and that the discharge will not contribute to water quality standards exceedances.

- Regarding Section 2.3.1.2, the "increased discharge" analysis and verification for TMDL waterways is not sufficient to ensure consistency with TMDLs. Step "a" is appropriate, and permittees should be required to calculate their loading contribution in this circumstance. However, steps "b" and "c" are too vague and leave an impermissible degree of discretion to the permittee. A better defined quantitative approach should be required, and the permittee should be required to certify as to the measures that have been taken on the ground and that they are achieving the necessary pollution reductions.

2.3.3 - Antidegradation Requirements.

- In general, the draft permit contains more thorough descriptions of the elements the antidegradation analysis must include than did the prior permit. This is an improvement over the prior permit, but this section is still not sufficiently clear and prescriptive to ensure the state's antidegradation policy is carried out.

- A second general concern is that the antidegradation provisions of the permit are too narrow in their application; antidegradation should be an ongoing and prospective analysis that applies to all permitted activities. This is because all NPDES permits must meet the non-degradation standard throughout the lifespan of the permit. *See* 40 C.F.R. 131.12.

- Section 2.3.3(b)(1) appears to create a de minimis exception, but this is not explained in the Fact Sheet. We do not agree that there is any de minimis threshold in the

[22] The Draft Permit provides that increased discharges are only eligible for General Permit coverage if the permittee identifies and estimates a load for each pollutant of concern, implements structural BMPs, and identifies the BMPs it has implemented such that the MS4 will not cause or contribute to exceedences of water quality standards or, in the case of a TMDL waterbody, will be consistent with the TMDL. Draft Permit, Sections 2.3.1.1 – 2.3.1.2.

state's anti-degradation regulations at 314 Code Mass. Regs. 4.04, and therefore this should be removed.[23]

- The "Tier II" provisions in Section 2.3.3(b) are problematic, in that section 2.3.3(b) creates a subjective "out" on a number of grounds that are not consistent with 40 C.F.R. 131.12. The permittee can claim the discharge is "not significant because it is temporary in nature and that upon completion of the discharge period the existing water uses . . . will be equal to or better than . . . prior to commencing the discharge," or that "the effluent will be of a better quality than the existing water quality of the receiving water." These categories are too subjective to be enforceable, and at a minimum are susceptible to overly generous interpretation by permittees. This type of subjective self-regulation was struck down in *Environmental Defense Center v. Browner.*[24] In addition, allowing for a discharge that is "temporary in nature" implies that water quality standards during particular periods or events, which appears contrary to the water-quality based requirements of the MS4 program.[25]

- Section 2.3.3(f) provides that new or increased discharges to Outstanding Resource Waters require an individual permit. EPA should meaningfully enforce this provision. Given the wide range of waterways receiving discharges from the Department of Transportation roads and infrastructure, including public water supply areas,[26] DOT should be required to obtain an individual permit on this basis alone.

III. Performance Standards Reflecting Low-Impact Development and Green Infrastructure

CLF strongly urges EPA to include in the permit performance standards that reflect Low-Impact Development or "green infrastructure" stormwater management practices. These practices are widely available, well proven, are generally more effective than conventional infrastructure at pollutant removal and volume reduction, and confer additional benefits to the community and environment. As detailed in attachments A,B,C, and D1-75 to this comment letter, **LID/green infrastructure is the current expression of controlling polluted stormwater runoff to the "maximum extent practicable" ("MEP").** Furthermore, the attached documents demonstrate that the permit cannot effectively ensure that water quality standards will be met *without* inclusion of such LID/green infrastructure-based performance standards. Performance standards based on LID/green

---

[23] If this is a reference to 314 Code Mass. Regs. 4.04(5), it appears to be mischaracterized. That section requires a four part analysis to be performed by the applicant to demonstrate that a number of substantive criteria are met before *"limited degradation"* (i.e. a new or increased discharge) is allowed to a high quality water. 4.04(5) would not be properly characterized as a de minimis threshold.

[24] *Environmental Defense Center v. Browner,* 344 F.3d 832, 840 (9th Cir. 2003), *cert. denied*, 124 S.Ct. 2811 (2004).

[25] *See* 40 C.F.R. § 122.4.

[26] including the Hobbs Brook Reservoir, which is listed as a Class A, Outstanding Resource Water. *See* 314 Code Mass. Regs. 4.06, Figures, available at http://www.mass.gov/dep/water/laws/tblfig.pdf.

infrastructure should be included in this permit.[27] In particular, performance standards for LID/ green infrastructure should be included in Section 2.4.5, the Post-Construction bylaw, and should be required as the means by which permittees fulfill water-quality based requirements under Section 2.

From the outset, EPA has made clear the expectations that technologies would evolve, and that the Maximum Extent Practicable standard in the second round of small MS4 permits would reflect what was learned about the effectiveness of the BMP implemented during the first round. The need to meet water quality standards was to drive the evolution of the MEP standard, itself, because the ultimate objective of all BMPs is to ensure the attainment of water quality standards. As EPA expressed in the MS4 Final Rule:

> [The Maximum Extent Practicable standard] should continually adapt to current conditions and BMP effectiveness and should strive to attain water quality standards. Successive iterations of the mix of BMPs and measurable goals will be driven by the objective of assuring maintenance of water quality standards. If, after implementing the six minimum control measures there is still water quality impairment associated with discharges from the MS4, after successive permit terms the permittee will need to expand or better tailor its BMPs within the scope of the six minimum control measures for each subsequent permit.

64 Fed. Reg. 68722, 68754 (Dec. 8, 1999) (EPA Stormwater Phase II Final Rule).

EPA anticipated that "the NPDES permitting authority may ask the permittee to revise their mix of BMPs, for example, to better reflect the MEP pollution reduction requirement." 64 Fed. Reg. 68722, 68754 (Dec. 8, 1999) (EPA Stormwater Phase II Final Rule). **At this juncture, ten years after the Small MS4 program was first enacted, and given the wealth of data generated in the interim, it would be inappropriate for EPA Region 1 *not* to include LID-based performance standards and revise the scope of required BMPs to reflect LID/green infrastructure.**

Comments by Dr. Robert Roseen, Director of the University of New Hampshire Stormwater Center on the draft permit (Attachment A) and Dr. Stephanie Hurley's Statement on Low-Impact Development (Attachment B) confirm that Low-Impact Development and green infrastructure is well tested, effective at stormwater volume reduction and pollutant removal, suitable for New England, and confers ancillary benefits.

Dr. Roseen's professional opinion is that "LID stormwater management works effectively throughout multiple seasons including challenging winter conditions. Data shows that it works better for water quality than conventional stormwater management."[28] He also confirms that studies have shown LID to be cost effective and in some cases to result in cost savings.[29] Furthermore, Dr. Roseen cautions that "with the raising of the standards for

---

[27] Whether an expression of technology-based effluent limitations, water-quality based effluent limitations, or both, such performance standards are timely and necessary for the reasons described above.

[28] Attachment A, at 1.

[29] *Id.* at 2.

MEP . . . certain practices should be *disallowed* for usage. Practices that have been demonstrated to be contributing to the water quality failures should be eliminated . . . ."[30]

Dr. Hurley's professional opinion regarding LID is that it "offers a more ecological, flexible, and context-sensitive stormwater management approach—and more readily meets water quality and hydrologic performance standards—than conventional stormwater management."[31] Furthermore, Dr. Hurley has personally evaluated LID implementation sites at various locations throughout the U.S. and internationally, and confirms that "the principles of LID design can be successfully applied in various topographies, geographies, and climates" including New England, and at a variety of scales.[32] Her conclusion is that LID represents the maximum extent practicable for stormwater treatment.[33]

The direct testimony of Richard Horner, before the Pollution Control Hearings Board for the State of Washington in the matter of the Seattle Phase I stormwater permit (Attachment D3) affirmed that LID techniques are " unquestionably 'known' and 'available' techniques. In many cases, implementation of LID for new or redevelopment is less costly than conventional BMPs, and offers other economic benefits such as improved property values or reduced water use."[34] Dr. Horner further asserted that the Seattle Phase I permit at issue did not "use all known available and reasonable methods" to control stormwater from new and redevelopment, and it was "highly unlikely" that compliance with water quality standards could be achieved using conventional techniques.[35] Further, he asserted that "LID approaches are far more protective of water quality than the conventional BMPs" and that the permit did not reflect the maximum extent practicable standard.[36]

The direct testimony of Dr. Derek Booth in the same matter asserted that "the [Seattle Phase I] Permit . . . does not protect rivers and streams, beneficial uses, or aquatic life. Continued reliance on such a [flow-based] standard for new development in western Washington will not prevent serious and significant additional degradation to these resources," and in his professional opinion, "a more protective performance standard that more closely matches natural hydrology . . . is readily achievable without sacrificing opportunities for future development. Achieving a more protective standard would rely on site- and basin-level LID BMPs that are in my opinion, sufficiently well known, understood, available and economically and technologically feasible that they can be implemented throughout western Washington."[37]

Thomas Holz, an experienced civil engineer, testified that

> "LID approaches are generally more effective at protecting water quality and beneficial uses than the engineered, end-of-pipe standards embraced in the 2005 [Washington] Manual and Permit. They are known, available, and

[30] *Id.* at 1 (emphasis added).

[36] *Id.*
[37] Attachment D2, at ¶ 33.

> reasonable (as well as "practicable") in virtually all new and redevelopment situations.

(Attachment D1, at ¶ 33.)

In addition, a wealth of technical articles, case studies, litigation documents, and federal government guidance documents and fact sheets summarized in Attachment C and included as Attachments D4-75 all demonstrate these principles.

The greater adoption of LID, spurred by regulatory approaches including the MS4 permit, will benefit Massachusetts communities by keeping pollutants and concentrated pulses of stormwater out of our rivers, ponds and streams, generating increased green space, cooling urban areas, and relieving some of the cost and maintenance burden on aging municipal stormwater infrastructure.

IV. Six Minimum Measures

One theme that emerged from the implementation of the 2003 MA Small MS4 permit was the need for additional clarity, and greater enforceability of requirements under the six minimum measures. CLF recognizes that EPA has significantly clarified a number of these requirements in the draft permit, and generally supports these changes. The permittees' inconsistent progress toward improved water quality also indicates that additional best management practices are needed, in addition to clarification of the requirements.

a. IDDE and System Mapping

The requirement at Section 2.4.4.3 that IDDE be continued is important, and CLF supports the continued inclusion of IDDE requirements in the MS4 permit. Illicit connections can contain extremely high levels of bacteria as well as substantial nutrient loads, and should continue to be a core element of compliance with the permit.

CLF strongly supports the requirement for enhanced mapping of the sewer infrastructure and affected waterways in Section 2.4.4.6. As referenced above, complete mapping of sewer infrastructure, outfalls, and adjacent waterways, is a prerequisite to the full engagement of all stakeholders in better stormwater management. It is also necessary for meaningful consideration by permittees as to where increased BMPs will be installed to meet water-quality based requirements of the permit.

b. Impervious area/ DCIA mapping

CLF supports the new requirements in the draft permit that towns track impervious cover[38] and "Directly Connected Impervious Area," ("DCIA"), assess possible locations for LID retrofits (presumably so that trading can occur), and assess the possibility of requiring LID town-wide for new construction. . The link between impervious cover and stream degradation has been well established since before the issuance of the 2000 permit.[39]

[38] (hard surfaces such as roadways, sidewalks, driveways, parking lots, and rooftops)
[39] 64 Fed. Reg. 68722, 68725 (Dec. 8, 1999); *see id.* at 68726-8.

Tracking overall impervious cover as well as DCIA will allow communities to fully account for the causes of waterway impairment, and is an important step towards the deployment of Low-Impact Development on a broader scale

c. Post-Construction LID Ordinance

CLF strongly supports the requirement that permittees institute a post-construction ordinance, as one of the core minimum measures laid out in the initial Phase II rule. Permittees covered under the 2003 permit were required to pass an ordinance addressing post-construction stormwater discharges, and to "develop, implement and enforce a program to address storm water runoff from new development and redevelopment projects that disturb greater than one acre and discharge into the municipal system." The adjustment of the ordinance to reflect the use of LID should be mandatory, and should not require a great deal of additional time to be put into place.

Rather than merely requiring that municipalities "assess the possibility of" requiring LID town-wide for new contruction, EPA should go one step farther and require that a LID-based performance standard is met. LID technologies are now well proven, widely available, demonstrated to be as effective or more effective as conventional technologies, while conferring additional benefits, and necessary to ensure the attainment of water quality standards.

As drafted, the Permit requires municipalities to enact an ordinance that tracks certain requirements of the Massachusetts Stormwater Standards. We support the requirement that permittees enact ordinances requiring stormwater controls from new and redevelopment. For the reasons detailed above and in the Attachments to CLF's comments), the final permit should require that Low-Impact Development or "green infrastructure" stormwater management techniques are used, including on-site infiltration of stormwater. The Massachusetts Stormwater Standards may not equate to meeting water quality standards in all areas.

Therefore, we recommend that EPA implement a more protective standard. An alternative is the standard reflected in the EPA Technical Guidance on Implementing the Stormwater Runoff Requirements for Federal Projects under Section 438 of the Energy Independence and Security Act ("EPA Federal Facilities Guidance"), The guidance was enacted pursuant to Executive Order 13514, and requires that facilities of a certain size either treat stormwater on-site sufficiently to infiltrate the 95th percentile storm event, or implement measures that will restore or maintain pre-development hydrology on a site-specific basis. This standard has been determined to be feasible and cost-effective in the context of federal facility building standards.[40] In issuing the Federal Facilities Guidance, EPA relied on the testimony of Derek Booth, Thomas Holtz and Richard Horner regarding LID in the Seattle MS4 litigation (Attachments D1-D3).[41]

In heavily urbanized areas including the Boston metropolitan area, the typical parcel size is smaller than one acre. Consequently, a one-acre threshold for post-construction

[40] Attachment D67, EPA Federal Facilities Guidance (Dec. 2009).
[41] *See* Attachment D67, EPA Federal Facilities Guidance, at 55 (Dec. 2009).

stormwater management is too high to capture a significant portion of development. For the reasons EPA has already identified, a post-construction stormwater bylaw is important to controlling inputs into the MS4 system, and the threshold should be lower than one acre. One half acre would be a more appropriate threshold in urban areas. Dr. Robert Roseen's comments on the draft permit have also identified this as a concern. (*See* Attachment A).

V. Monitoring and Assessment, and Public Participation

Monitoring and assessment are critical to assessing whether the measures municipalities have chosen to implement are, in fact, working to accomplish the objectives of the Permit, and to guide decisions about what additional measures can and should be taken in each community. That is why CLF supports strong provisions for outfall monitoring, GIS mapping, tracking of Directly Connected Impervious Area in the Final Permit, as well as requirements to report all of the above data and information.

a. Monitoring

- CLF strongly supports increased monitoring, in both wet and dry weather, as a critical component of this permit. The outfall monitoring requirements in the draft permit will yield important information about current water quality, sources of pollution, and over the span of the permit, will reveal long-term trends, and where strategies employed by municipalities are effective or ineffective. Outfall monitoring is important for numerous reasons beyond merely supporting the illicit detection and elimination program. It provides a baseline that can then be compared to discharges in future years. Monitoring data indicates whether the BMPs a permittee has chosen to use are sufficiently effective at reducing pollution. The data can also shed light on trends that are outside of the permittee's control, but that should inform choices made about stormwater BMPs.

- For these reasons, the Permit should require more than one wet and one dry sample of each outfall within the five-year term. Three samples at each outfall during the permit term would better characterize conditions in light of the variability of stormwater discharges. CLF's experience has been that outfalls near interconnections between permittees are an important place for attention to be focused, and we support the requirement that these areas be sampled.

- Given the importance of monitoring data, CLF is concerned about the scope of the exemptions, framed as a "permittee-specific monitoring plan" in Sections 3.1.4 and urges EPA to remove these exemptions so they do not undermine the rule.

- In particular, 3.3.1 is problematic because it is important that permittees continually assess the effectiveness of their BMPs at controlling pollutants. It is not clear under what circumstances a permittee would have completed outfall monitoring under the 2003 permit that would be equivalent to the outfall monitoring required under this permit. Section 3.1.4.2, which allows an opt-out if the outfall is associated with a Problem Catchment, seems counter-intuitive. It would seem even more important and relevant to have data on outfalls where high pollutant loadings are detected, whether or not the source is suspected to be known. Section 3.1.4.3

allows an opt-out if the amount of impervious cover discharging through an outfall is less than 10 percent of the catchment area. Water quality impacts can occur from less than ten percent impervious cover, so EPA should consider lowering this threshold.

- Section 3.1.4.5 appears to allow the permittee to opt out of monitoring if "the permittee has conducted or will conduct in its permittee-specific monitoring plan wet and dry weather in-stream monitoring which is representative of one or more discharges to the same water body." If this provision is kept, EPA should clarify that the permittee must affirmatively certify and describe why the outfalls are representative of others, and the use of this opt-out should be limited to a certain proportion of outfalls overall, to ensure that adequate monitoring is done throughout the MS4 system during the span of the permit.

- Instream monitoring of receiving waters is also an important component of evaluating the overall relationship between MS4 discharges and water quality, and can inform the appropriate level of stormwater controls – in some cases directly indicating impacts from particular MS4 drainage areas, and in some cases yielding a more general understanding of the types and levels of contaminants found under given conditions. CLF recommends that EPA consider including targeted instream monitoring requirements in the final permit. It is noteworthy that stormwater expert Derek Booth testified in the litigation over the sufficiency Seattle's Phase I stormwater permit that monitoring was critical. (Attachment D1, at 97-99). Rather than relying on presumptions as to the effect of particular BMPs, he maintained that "if you want to know the condition of this water body, you have to go measure that condition in that water body." (Attachment D#, at 99).

b. Transparency and Public Participation

The importance of public participation to the MS4 program was recognized at the outset of the program, when a federal appeals court found that EPA's failure to make Notices of Intent for coverage under the MS4 permits available to the public for comment contravened the Clean Water Act.[42] The experience to date under the Small MS4 permit in Massachusetts confirms that public participation is vital to successful implementation of this permit. Transparency and public participation are an effective means to augment EPA's enforcement, and to foster stronger support for town decision-makers to dedicate resources to stormwater management. In instances where municipalities are falling short due to capacity or resource constraints, watershed groups can step forward to call needed attention to overlooked issues, help to secure resources, and supplement existing data and information about outfalls and the condition of waterways. However, this is only possible when information is publicly available about the municipality's efforts, the location of infrastructure and outfalls, and the condition of local waterways. Residents and community- or watershed-based organizations are in a unique position to enhance the efforts of municipalities through the MS4 program, but without full access to information, citizens are less able to assist in these ways.

[42] *Environmental Defense Center v. EPA*, 344 F.3d 832, 856-859 (9th Cir. 2003).

CLF strongly supports the provision in the Draft permit requiring SWMPs to be made available to the public, and urges EPA to additionally require that all SWMPs, storm sewer infrastructure system maps, annual reports, Phosphorus Control Plans, monitoring plans, and monitoring data are placed on line in real time. Given modern technology, this need not be burdensome for the permittees, while it adds a great deal of value to the information collected by making it more accessible and usable to a wider range of stakeholders.

We support the provision in the draft permit that a comment period will occur for NOIs. This is legally required as per federal case law and will have the benefits described above.

VI. Enforceability

In some cases, the flexibility EPA afforded under the 2003 Massachusetts Small MS4 permit was abused. Our waterways are now exhibiting the effects of that neglect, and it is important going forward that all permit requirements are expressed in clear terms with enforceable parameters. The draft permit generally reflects clearer requirements and terminology, and this letter points out a number of instances where the requirements must be strengthened in order to be enforceable, or could be clarified for the benefit of permittees and the public.

VII. State Transportation Agencies

High pollutant loadings from roads and highways are well documented.[43] Highways are specifically referenced in a number of TMDLs in Massachusetts as a significant contributor and a source that must be controlled in order to achieve the needed pollutant loading reductions in that waterway.[44] MassDOT should be required to (1) identify and prioritize outfalls in water in TMDL, also identify where cross headwater streams, with low flows, (2) identify areas where highways cross sensitive habitat, (3) develop a prioritization for stormwater retrofits for those areas, and (4) develop a retrofit plan for its entire system as needed to comply with TMDLs and to correct its cause of and contribution to instream exceedances of water quality standards. "Storm water discharges from State DOTs in Phase 1 areas should already be regulated under Phase I. The preamble to Phase 1 clearly states that "all systems within a geographical area including highways and flood control districts will be covered."[45]

---

[43] *See e.g.* National Academy of Sciences, Urban Stormwater in the United States: Report in Brief, at 4 (2009) ("[f]reeway, industrial, and commercial areas can be very significant sources of heavy metals, and their discharge significance is usually much greater than their land area indicates") (available at http://dels.nas.edu/dels/rpt_briefs/stormwater_discharge_final.pdf); 64 Fed. Reg. 68722, 68727 (Dec. 8, 2009) (Stormwater Phase II Final Rule); Expert Report of Vladimir Novotny, P.E., Docket No. 55-6, Feb. 7, 2008, CLF v. Deval Patrick et. al.,case no. 11295wgy, U.S. District Court for the District of Massachusetts.

[44] *See e.g.* TMDLs for Boston Harbor/Neponset River (bacteria), Buzzards' Bay watershed (bacteria), Blackstone Lakes (nutrients), Chicopee Basin Lakes (nutrients), Cape Cod (pathogens and nutrients), Charles River (phosphorus), French Basin (phosphorus), Shawsheen River (bacteria) available at MassDEP website, http://www.mass.gov/dep/water/resources/tmdls.htm.

[45] Phase II Final Rule, 64 Fed. Reg. 68722 (Dec. 8, 1999).

MassDOT expressed the view in the public hearing for this permit that DOT should not be subject to the same requirements as municipalities in the MS4 permit as proposed.

The Commonwealth is no less accountable to the requirements of the Clean Water Act than other public entities, and in fact has a greater responsibility to demonstrate leadership in protecting the resources that support the state's economy and the health of its citizens. Other highway departments are implementing LID and system-wide retrofit plans, which demonstrates that compliance is feasible.

An individual permit would more appropriately reflect the high pollutant loads from highways, and would allow for a more transparent accounting of the BMPs currently used, and that are available and appropriate, and should be deployed, throughout the highway system.

For these reasons, we strongly urge EPA to issue an individual permit to state transportation agencies, including the Department of Transportation.

To the extent state agencies remain within the General Permit, CLF strongly objects to the language in Sections 6.0-6.3 and 7.0-7.3 of the draft permit appearing to weaken the permit's requirements as applicable to state agencies. CLF does not agree with the apparent assumption that it is not possible for state agencies to comply fully with the requirements of the permit. For example, state agencies appear to be excused from Section 2.4.6.7 of the permit, which requires an assessment of current street design and parking lot guidelines and other local requirements that affect the creation of impervious cover . . . to determine if changes to design standards…can be made." The essence of this requirement – evaluating codes and design standards that affect creation of impervious cover, and identifying changes that can be made, is entirely applicable and appropriate for the Department of Transportation or other state agencies. For example, in addition to being directed to assess "facilities," parking areas and walkways, the DOT should be directed to assess its entire highway system for opportunities to reduce impervious area. A specific timeframe should be provided for this analysis, and the results should be disclosed to EPA and the public.

The same is true for Section 2.4.6.8, requiring an assessment of existing local regulations to determine the feasibility of making LID and green infrastructure practices "at a minimum . . . allowable." Again, in its essence, this is exactly the type of action EPA should be requiring of all permittees – to analyze the internal policies, regulations, or design standards that are barriers to LID, and to take action to remove them. While a state agency may or may not have its own "regulations," there are doubtless statewide regulations, internal agency policies, design guides, or standards that can and should be evaluated and changed to allow for LID.[46] EPA does not appear to have offered any legitimate rationale in

[46] In particular, the Mass Department of Transportation, Highway Division's design guide is in need of updating to reflect LID.

the fact sheet or otherwise for state agencies to be excused from these requirements.

VIII. Additional Requirements

A. State Water Quality Certification

It is notable that no draft state water quality certification (pursuant to Section 401 of the Clean Water Act) was noticed with the Draft Permit. The fact sheet indicates that a certification is being prepared. A draft Section 401 Water Quality Certification was made public along with the draft 2003 MS4 permit. It is important that the public have an opportunity to understand how MassDEP is viewing the draft permit conditions, and whether any additional requirements will be added through the certification to ensure state water quality standards are met. We request that EPA clarify the status of the state water quality certification.

B. Snow and Ice Removal and Chlorides

Research has indicated that, in the Northeast, chloride concentrations are increasing at a rate that threatens freshwater in the region.[47] Indeed, a 2001 article in *Stormwater* magazine ranked Massachusetts as having the highest annual road salt loadings in the United States. Chlorides TMDLs completed in New Hampshire confirm that stormwater runoff from roadways is a significant contributor to impairment, due to the high concentrations of chlorides, metals, and other additives in road salt that are washed into nearby waterways. Comments of Dr. Robert Roseen, Director of the NH Stormwater Center on the draft permit (Attachment A) highlight the potential of porous pavements to reduce salt application rates. Porous pavement and pervious concrete, both considered LID practices, require reduced de-icing application because water typically infiltrates rather than pooling on the surface.[48]

EPA should include in the final permit more robust requirements to address this growing threat to our freshwater bodies and drinking water supplies, including through LID and green infrastructure.

CLF recommends EPA add a requirement that permittees' salt storage facilities be enclosed, not merely covered (as the draft permit requires). We also support the requirement that salt storage be located away from drinking water supplies. The final permit should be more specific as to what constitutes a safe distance between salt storage and water supplies.

CLF strongly supports the requirement in Section 3 of the draft permit that permittees conduct outfall monitoring for conductivity and chlorine, as this will help to identify locations where road salt is impacting water quality. Only after any impacts to water

Re: Draft General Permit for Small Municipal Storm Sewer Systems ("MS4") for Massachusetts South Coastal, Merrimack, and Interstate South-Flowing Watersheds

Dear Ms. Renahan:

The Conservation Law Foundation ("CLF") appreciates the opportunity to comment on the Small Municipal Separate Storm Sewer System Draft General Permit for Massachusetts South Coastal, Merrimack, and Interstate South-Flowing Watersheds Watersheds ("Draft Permit").

Founded in 1966, the Conservation Law Foundation ("CLF") is a member-supported environmental advocacy organization that works to solve the problems threatening our natural resources and communities in Massachusetts and throughout New England. Among those problems, CLF has worked, and continues to work, to promote effective regulations and strategies to reduce and minimize the significant impacts of stormwater pollution.

I. General Comments

"Stormwater runoff is one of the most significant sources of pollution in the nation, 'at times comparable to, if not greater than, contamination from industrial and sewage sources."[1] As the U.S. Environmental Protection Agency (EPA) acknowledged in 1999, "[s]torm water runoff from lands modified by human activity can harm surface water resources and, in turn, cause or contribute to an exceedance of water quality standards by changing natural hydrologic patterns, accelerating stream flows, destroying aquatic habitat, and elevating pollutant concentrations and loading." 64 Fed. Reg. 68,724 (Dec. 8, 1999). This is no less true in

[1] *Environmental Defense Center v. Browner*, 344 F.3d 832, 840 (9th Cir. 2003), *cert. denied*, 124 S.Ct. 2811 (2004) (*citing* Richard G. Cohn-Lee and Diane M. Cameron, *Urban Stormwater Runoff Contamination of the Chesapeake Bay: Sources and Mitigation,* THE ENVIRONMENTAL PROFESSIONAL, Vol. 14, p. 10, at 10 (1992) and *Natural Res. Def. Council v. EPA*, 966 F.2d 1292, 1295 (9th Cir. 1992)).

clf
conservation law foundation

Massachusetts. Stormwater has been cited as the primary cause of water quality impairment in the Commonwealth, and municipal small separate storm sewer systems ("MS4s") are a significant contributor to those problems.[2]

An enhanced Small Municipal Storm Sewer ("MS4") permit program for Massachusetts with meaningful standards, clear milestones, and strong enforcement is necessary as part of the overall effort to restore degraded rivers, streams, and ponds and maintain fishable, swimmable water quality in the state's waterways. The Draft Permit represents a substantial step forward in this direction, and we recognize the work EPA Region 1 ("EPA") has undertaken to evaluate the effectiveness of the 2003 permit and to involve stakeholders in discussions about the permit reissuance. However, from CLF's perspective there are a number of areas where the permit must be strengthened in order to fully reflect legal requirements and to accomplish the objectives of the MS4 program.

Compliance with the Massachusetts MS4 permit, and success at achieving water quality outcomes, has varied widely across the permittees under the 2000 permit.[3] EPA's own review of the MA MS4 program revealed that only 171 of 240 towns submitted their annual report for Year 7 (2009-10).[4] In compliance Year 6 (2008-09), only 25% of Communities reported they were doing outfall inspection and monitoring, and 30% still had not completed outfall mapping. These are baseline requirements that municipalities have been aware of since the 1999,[5] and that form the building blocks of the program. These monitoring, planning and assessment steps are prerequisites to the full achievement of what this permit program requires, which is a systematic analysis of impervious area, the creation and implementation of a plan to retrofit existing infrastructure to meet water quality standards, and incorporation of LID into all new development.

[3] MassHighway, for example, failed to submit an NOI meeting even basic authorization requirements until CLF, the Charles River Watershed Association, and the Leominster Land Trust sued the Commonwealth in federal court in 2006. CLF v. Patrick, Case No. 06-11295wgy (U.S. District Court for the District of Massachusetts).

[4] *See* EPA NPDES Phase II Small MS4 Permit Program – Massachusetts Annual reports summary Permit Year 7 (2009-2010), *available at* http://www.epa.gov/ne/npdes/stormwater/assets/pdfs/MA-SWMP-Summaries-Metrics-Yr-7.pdf.

[5] 64 Fed. Reg. 68722 (Dec. 8, 1999). Had these requirements been meaningfully considered by the permittees from the outset, there was ample time to incorporate infrastructure improvements into annual and multi-annual budgeting and capital planning processes, and to establish funding mechanisms to ensure the financial resources for management of stormwater. Newton, for example, has implemented a stormwater utility.

clf
conservation law foundation

Although achieving these objectives, and compliance with the Clean Water Act, will require a sustained commitment of resources, EPA and the entities regulated under the Phase II program must not lose sight of the fact that there are significant costs associated with continued stormwater pollution – such as ongoing and increasing degradation of water quality, loss of recreational value, adverse impacts on water supplies, and declining property values – that can only be reduced and avoided by improved stormwater regulation and management.[6] Low Impact Development ("LID") and green infrastructure practices that restore the natural hydrological cycle and reduce the demand on piped infrastructure can be, in the long run, more cost-effective to implement and maintain than conventional stormwater infrastructure.[7] Thus, in addition to improving and protecting water quality, the increased use of LID and green infrastructure has the potential to generate financial benefits and more livable communities.

A recent (2010) EPA report found that:

> Communities across the nation are increasingly recognizing the potential for green infrastructure to address social and economic, as well as water quality concerns. Green infrastructure can reduce infrastructure costs, promote economic growth, and provide opportunities for outdoor reflection and recreation. As interest in green infrastructure becomes more widespread, the demand for related job skills continues to rise. These skills are required not only for the initial design and installation of green infrastructure practices, but for long-term operation and maintenance as well.
>
> Research indicates that the potential economic benefits of widespread green infrastructure implementation are substantial. According to a study by American Rivers, NRDC, and other groups, 153 water-related green infrastructure projects worth $1.025 billion are ready to be implemented within 6 to 9 months in communities across the country.

[6] See, e.g., "How Much Value Does the City of Philadelphia Receive from its Park and Recreation System? A Report by The Trust for Public Land's Center for City Park Excellence for the Philadelphia Parks Alliance," June 2008 at 3-4 (estimating that Philadelphia's 10,000 acres of parks save $5.9 million annually in stormwater management costs).

[7] Reducing Stormwater Costs through Low Impact Development (LID) Strategies and Practices, U.S. EPA, Nonpoint Source Control Branch (4503T), Washington, D.C., Dec. 2007 (EPA 841-F-07-006). This EPA report on seventeen LID case studies found that in the majority of the LID projects "significant savings were realized due to reduced costs for site grading and preparation, stormwater infrastructure, site paving, and landscaping." LID projects resulted in up to 80% total capital cost savings. Furthermore, additional benefits, such as improved aesthetics and faster sales, were not factored into these savings figures. The case studies included redevelopment projects (for example, green roofs in Toronto) as well as new development.

U.S. EPA, Managing Wet Weather with Green Infrastructure: Green Jobs Training: A Catalog of Training Opportunities for Green Infrastructure Technologies, at i (Sept. 2010).[8]

II. Water Quality-Based Requirements

A central tenet of the Clean Water Act (CWA) as well as the small MS4 program is the principle that NPDES permits ensure compliance with water quality standards.[9] This concept is reiterated in the CWA, its regulations, case law, and the Small-MS4 General Permit. In enacting the CWA, one of Congress' principal goals was to "recognize, preserve, and protect the primary responsibilities and rights of States to prevent, reduce, and eliminate pollution, [and] to plan the development and use (including restoration, preservation, and enhancement) of land and water resources."[10] In accordance with this goal, the CWA is clear that all provisions in a NPDES permit must comply with state water quality standards.[11] Federal case law has also underscored EPA's authority to include in stormwater permits all conditions and limitations necessary to assure the attainment water quality standards are met.[12]

The implementation of the MS4 program to date, and analysis done in connection with the Charles River Watershed phosphorus TMDLs, indicates that retrofits of existing infrastructure will be needed to ensure water quality standards are met in urban and suburban waterways. CLF encourages EPA to more clearly state where stormwater retrofits and new structural BMPs are expected as the result of the minimum control measures and Section 2. As described more fully below, LID-based performance standards are warranted in this permit, as it is not clear the permit's objectives can be met without them.

Section 1.3(k), providing that discharges that cause or contribute to instream exceedances of water quality standards are not authorized under the permit, should be retained in the final

[11] *See* 33 U.S.C. § 1370 (allowing state water quality standards to be more stringent than federal technology-based standards); 33 U.S.C. § 1341(a) (requiring compliance with water quality standards of both the state where the discharge originates and of any state affected by the discharge). The requirement that permits comply with state water quality standards allows no exceptions for cost or technological feasibility. *In re City of Fayetteville, Ark.*, 2 E.A.D. 594, 600-01 (CJO 1988) (interpreting the language of section 301(b)(1)(C) to require "unequivocal compliance with applicable water quality standards," and prohibit "exceptions for cost or technological feasibility"), *aff'd sub nom.* Arkansas v. Oklahoma, 503 U.S. 91 (1992).

[12] *Defenders of Wildlife v Browner* affirmed EPA's authority to include in small and medium MS4 permits controls and limitations necessary to ensure water quality standards are met. 191 F.3d 1159, 1166-67, (9th Cir. 1999) *See also* 33 U.S.C. 1312(p)(3)(b)(iii) (as cited in Fact Sheet, at 4).

permit as an expression of EPA's responsibility and authority to ensure water quality standards are met.

Today, more than ten years since the commencement of the Small MS4 Program, and in light of current agency policy, EPA should be including numeric effluent limitations and performance standards in this permit that are clear, objective, enforceable, and reflect the state of the art, which is low-impact development ("LID") and "green infrastructure." The Draft Permit is an improvement over the 2003 permit in this regard, but does not go far enough toward this standard. As stated in a 2010 EPA guidance document:

> EPA now recognizes that where the NPDES authority determines that MS4 discharges and/or small construction storm water discharges have the reasonable potential to cause or contribute to water quality standards excursions, permits for MS4s and/or small construction stormwater discharges should contain numeric effluent limitations where feasible to do so. EPA recommends that NPDES permitting authorities use numeric effluent limitations where feasible as these types of effluent limitations create objective and accountable means for controlling stormwater discharges.

EPA Memorandum, James Hanlon to Regional Administrators, Nov. 10, 2010, "Revisions to the November 22, 2002 Memorandum 'Establishing Total Maximum Daily Load (TMDL) Waste Load Allocations (WLAs) for Stonm Water Sources and NPDES Permits Based on Those WLAs." The substantial body of water quality data collected in Massachusetts since 2003 shows that MS4 discharges not only have the reasonable potential to cause water quality standards exceedances, they *are* causing and contributing to exceedances of standards.[13]

CLF recognizes that EPA has taken steps to clarify the relationship between water quality-related requirements and the six minimum measures (and that both sets of requirements are applicable), which is generally a beneficial change. However, the Draft Permit still raises significant concerns and should be further clarified and strengthened.

a. Section 2.1.1, Requirement to Meet Water Quality Standards.

[13] See footnote 2, supra (citing MassDEP assessment that 60% of impairments are associated with stormwater pollution); . Massachusetts Integrated List of Impaired Waters, updated 2008 and 2010, available at http://www.mass.gov/dep/water/resources/tmdls.htm; MassDEP Mystic River Water Quality Assessment Report 2004-2008, at xi, *available at* http://www.mass.gov/dep/water/resources/71wqar09.pdf. The U.S. District Court for Massachusetts found that MassHighway was causing and contributing to instream exceedances of water quality standards at three locations. Case No. 06-cv-11295WGY, electronic order May 30, 2008; Order, May 11, 2010.

clf
conservation law foundation

CLF objects to the "presumptive approach" set forth in the Draft Permit and Fact Sheet, in which discharges are presumed to satisfy water quality requirements if minimum measures are implemented. (*See* Fact Sheet, at 30).

Section 2.1.1 is problematic in that it attempts to create the presumption that water quality standards are met if permittee "fully satisfies" all other permit requirements.' The presumption that "in the absence of information suggesting otherwise, discharges will be presumed to meet the applicable water quality standards . . . " is contrary to the permit itself (Section 1.3(b)) as well as the Clean Water Act and the Phase II regulatory scheme, which establish that the burden is on the discharger to demonstrate that water quality standards are met. This presumption should be removed in the final permit. CLF supports EPA's clarification that the 60-day period for the permittee to cure the exceedance is not create grace period and that EPA retains the ability to undertake any enforcement action allowed under the CWA. EPA should further clarify that this presumption and the 60-day period do not create any obstacle to the right of citizen enforcement conferred by Section 505 of the Clean Water Act, 33 U.S.C. § 1605, which would be illegal.

The Fact Sheet cites language in the 1999 Federal Register notice anticipated the ongoing obligation of the permittee to modify the SWMP to meet water quality standards.

> As discussed further below, however, small MS4 permittees should modify their programs if and when available information indicates that water quality considerations warrant greater attention or prescriptiveness in specific components of the municipal program. If the program is inadequate to protect water quality, including water quality standards, then the permit will need to be modified to include any more stringent limitations necessary to protect water quality.

64 Fed. Reg. 68722, 68753 (Dec. 8, 1999) (emphasis added).

CLF does not concede that the phrase "if and when available information indicates…" in the Phase II rule allows permittees to wait for citizens or regulatory agencies to notify them that a discharge is causing or contributing to water quality problems.[14] The burden is more properly on the discharger to actively assess and monitor their discharges, and to immediately correct problems, whether discovered through their own assessment or by others.

[14] *See* 64 Fed. Reg. 68722, 68753 (Dec. 8, 1999) ("[p]ermittees should modify their programs if and when available information indicates that water quality considerations warrant greater attention or prescriptiveness in specific components of the municipal program.")

clf
conservation law foundation

b. 2.2.1 – Discharges to Impaired Waterways With an Approved TMDL

CLF objects to the draft permit language stating that approved TMDLs are those that have been approved as of the effective date. As new TMDLs are approved during the permit term, they ought to be considered approved TMDLs. This better reflects the reality that new TMDLs will be issued throughout the permit term. Incorporating new TMDLs would ensure that their implementation will not be held up by the MS4 permit reissuance.

Section 2.2.1(b) refers to Appendix G, in which EPA has done some 'translating' of what the TMDLs mean in terms of requirements for MS4s. In general, this type of chart is a helpful addition to the permit, as the prior permit term revealed that there was a gap in some permittees' understanding of and acceptance of responsibility for loading reductions. The draft permit also reflects an important clarification in 2.2.2 that TMDL is not a license to pollute – that discharges to impaired waters must also comply with Part 2.1.1, the prohibition on causing or contributing to instream exceedance

CLF supports EPA's inclusion of specific requirements from TMDLs in Appendix G of the permit. However, certain of the assumptions that have been made in translating the TMDLs to requirements in Table G are objectionable and result in less stringent requirements in the Permit than are appropriate. There are numerous TMDLs in Massachusetts that clearly identify stormwater from impervious areas as a contributor to the impairment although the LA and WLA may not explicitly ascribe a specific percentage reductions to the MS4 system. TMDLs of this nature should be included in this appendix.

Table G2 sets forth TMDL requirements for Long Island Sound, and appropriately requires a 10% reduction from existing levels, as this reflects the approved Load Allocation for urban and agricultural loads for out-of-basin sources. This target is an important element of the TMDL, as other loading allocations are predicated on this nitrogen removal from out of basin sources. EPA should change the language in the fact sheet that could create the impression that MS4 permittees need not actually achieve and document this reduction.

Table G4, TMDLs for Buzzards' Bay and Cape Cod TMDLs, states that in many Cape Cod municipalities with an approved nitrogen TMDL, the approved TMDL allocation for nitrogen is "negligible." This is unsupported by the Cape Cod TMDLs[15] and their underlying technical

[15] Stage Harbor, Sulphur Springs, Taylors Pond, Bassing Harbor and Muddy Creek (Chatham) TMDLs for Total Nitrogen, approved by EPA Region 1 on June 21, 2006; Quashnet River, Hamblin Pond, Little River, Jehu Pond, and Great River (Waquoit Bay System) TMDLs for Total Nitrogen, approved by EPA Region 1 on Nov. 7, 2007; Great, Green, and Bournes Pond Embayment Systems TMDLs for Total Nitrogen, approved by EPA Region 1 on July 18, 2007; Popponesset Bay TMDLs for Total Nitrogen, approved by EPA Region 1 on Jan. 22, 2008; Pleasant Bay System

reports for several reasons. First, CLF disagrees with EPA's statement in the fact sheet that "The TMDLs for nitrogen do not identify MS4 sources as significant contributors of nitrogen." In fact, the TMDLs consistently identify stormwater runoff from impervious areas as substantial proportion of the "controllable" load reduction – as high as 30%.[16] In addition, it is well documented that nitrogen in stormwater runoff from impervious areas and roads contributes substantially to pollution of waterways.[17]

Second, the entire stormwater contributions of nitrogen from MS4 systems should properly be accounted for and placed in the WLA of the TMDLs and accordingly in Table G4. Municipal stormwater systems on Cape Cod that collect and convey stormwater to surface waters are "municipal separate storm sewer systems" as that term is defined in EPA's regulations, and are therefore point sources under the CWA that must be included in the WLA as a matter of law. 40 C.F.R. §§ 122.26(b)(16) & 122.32(a)(1); see also, 64 Fed. Reg. 68722, 68818-19 (Dec. 8, 1999). This is the case whether the MS4 conveys and discharges pollutants via groundwater aquifers, surface flow through discrete conveyances such as ditches or swales, direct piped discharges, or a combination of these conveyances. *See* CWA § 502(14), 33 U.S.C. § 1362(14) ("point source.") The TMDLs draw an arbitrary distinction between impervious area more or less than 200 feet from surface water bodies,[18] which is contrary to EPA's own mapping of MS4 areas of coverage for various municipalities associated with this MS4 permit reissuance. *See*

TMDLs for Total Nitrogen, approved by EPA Region 1 on Oct. 24, 2007; Three Bays System TMDLs for Total Nitrogen, approved by EPA Region 1 on Feb. 13, 2008; Centerville River – East Bay System TMDLs for Total Nitrogen, approved by EPA Region 1 on Dec. 20, 2007; West Falmouth Harbor Embayment System TMDLs for Total Nitrogen, approved by EPA Region 1 on May 5, 2008; Phinney's Harbor Embayment System TMDLs for Total Nitrogen, approved by EPA Region 1 on Feb. 5, 2008; Little Pond Embayment System TMDLs for Total Nitrogen, approved by EPA Region 1 on Mar. 3, 2008; Oyster Pond Embayment System TMDLs for Total Nitrogen, approved by EPA Region 1 on May 5, 2008; Nantucket Harbor Bay System TMDL for Total Nitrogen, approved by EPA Region 1 on May 12, 2009, and Stage Harbor/Oyster Pond, Sulphur Springs/Bucks Creek, Taylors Pond/Mill Creek (Chatham Southern Embayments) TMDL Re-Evaluations for Total Nitrogen, approved by EPA Region 1 on June 22, 2009.

[16] See, e.g., Chatham Draft TMDL, 2008, at v. ("fertilizer and runoff" account for **12%** of the controllable load reduction); Centerville Final TMDL ("land use" accounts for **19%** of controllable load and 16% of overall load); Pleasant Bay Final TMDL ("land use" accounts for **30%** of controllable load, and 9% of overall load); Three Bays Final TMDL ("land use" accounts for **23%** of controllable load and 17% of overall load); Phinneys' Harbor Final TMDL ("land use" accounts for **25%** of controllable load and 15% of overall load).

[17] *See* Attachments D1-D81 (LID documents); see e.g. Project Report No.515: Contamination of Soil and Groundwater Due to Stormwater Infiltration Practices: A Literature Review by Peter T. Weiss, Greg LeFevre and John S. Gulliver of the University of Minnesota Stormwater Assessment Project, prepared for the Minnesota Pollution Control Agency (June 23, 2010), at ii, 6, 7 ("In areas with traditional development (i.e. no LID), nitrate export was found to increase logarithmically with increased impervious area. In LID areas, nitrate export did not correlate with impervious surface area"). *Available at* http://www.safl.umn.edu/.

[18] The TMDLs are predicated on the assumption that nitrogen from MS4 stormwater discharges beyond 200' from surface water bodies is presumed to infiltrate and therefore not to reach the receiving waters covered by the TMDLs. See, e.g. Centerville River TMDL, at 18.

http://www.epa.gov/ne/npdes/stormwater/ma.html. To the extent that EPA's statement in Table G4 that nitrogen contribution is "negligible" based on this distinction, the permit and the table should be changed to reflect nitrogen reductions commensurate with the full extent of the MS4 contribution.

Third, Appendix G should clarify that the Cape Cod Nitrogen TMDLs provide no allocation for new growth. Thus, if any new MS4 impervious area is created, the additional nitrogen loading must be removed or offset on that basis alone. *See, e.g., Centerville TMDL, at 18.* TMDLs.

Finally, the chart is confusing, inconsistent, and apparently incorrect in that for some waterbodies with approved TMDLs, nitrogen is not listed in the column of approved TMDL components (while other pollutants are listed in this column), or the word "negligible" appears but the word nitrogen does not.

CLF disagrees with the approach to documenting compliance with TMDLs reflected in the Fact Sheet, that "the permittee's demonstration of meeting the requirements of the WLA should focus on evidence that shows that the BMPs are implemented properly and adequately maintained."[19] A quantitative approach should be used where the permittee estimates or its overall pollutant loading and the expected reduction if BMPs are properly maintained, as well as the expected impacts on water quality. This estimation should then be verified by real world information.

c. 2.3.1.1-2 – New or Increased Discharges to Impaired Waters

- The Draft Permit's requirement that new or increased discharges to impaired waters are disclosed and offset are critical on both a legal and practical level. Over half of Massachusetts waterways are already impaired for stormwater-related pollutants. Preventing polluted stormwater discharges from new impervious area represents the most straightforward opportunity to prevent further inputs of pollution into these degraded waterways. MS4 permittees are already obligated to control their discharges to the point where they are not causing or contributing to instream exceedances of water quality standards. Therefore, where new outfalls , higher pollutant loadings, or increased stormwater volume are proposed, 40 C.F.R. § 122.4(i) requires no less.

- CLF agrees generally that any new or increased discharges to impaired waters must be evaluated by the permittee before they occur, in relation to TMDLs and water quality standards. CLF supports the requirement that permittees give prior notice and receive approval from EPA before a new discharge will commence into a water with a TMDL,

[19] Fact Sheet, at 33.

and strongly encourage EPA to require this information is made available to the public in real time. The draft permit does not appear to provide for any notice to EPA or the public prior to increased discharges, or prior to new discharges in impaired waters without a TMDL. CLF recommends this provision be changed in the final permit. It is critical that citizens, as well as regulatory agencies, have the opportunity to be informed *before* any new or increased discharge is permitted, to ensure that full dialogue occurs in the municipality as to how stormwater will be managed, and so that EPA and the public can make sure that the offsets or promised infrastructure are, in fact implemented. Merely requiring a statement in the annual report is not enough -- for example if a development or infrastructure project has been completed nearly a year ago and no offsets actually occurred as part of the project, or the project was changed from the initial design, it would be more difficult and costly to go back and mitigate the new or increased discharge after the fact. The spirit of this important permit provision would not be served by self-reporting on an annual basis.

- The draft permit represents an improvement over the 2003 permit in that "increased discharge" is defined, and that this situation is addressed more explicitly. [20] CLF agrees with EPA that no net increase in pollutant loading should be allowed from increased discharges to impaired waters, and that offsets need to be documented before construction begins. However, the application of the term "new discharger" is inappropriately proscribed due to EPA's overly broad reading of the term "new discharge," relying on an objectionable interpretation of the term "site"[21] to include an entire MS4 system. *See* 40 C.F.R. 122.2 (definitions). As a result, many discharges that should properly be treated as "new discharges" are considered to be "increased discharges."

- Functionally, this accomplishes an end run around the requirements of 122.4(i), as interpreted in the *Pinto Creek* decision, that "no permit may be issued to a new discharger if the discharge will contribute to the violation of water quality standards." A narrow exception to this prohibition is carved out for situations where a TMDL has been calculated, if the discharger can show, before the end of the comment period, that "there are sufficient remaining pollutant load allocations to allow for the discharge and that the existing dischargers into that segment are subject to compliance schedules designed to bring the segment into compliance with applicable water quality

[20] "Increased discharge" is defined in the draft permit as a discharge "directly into the MS4 or from the MS4 that commences after the effective date of this permit and results from creation of one or more acres of new impervious surface." Draft permit, § 2.3.1.

[21] The term "site" is defined to mean "the land or water area where any 'facility or activity' is physically located or conducted including adjacent land used in connection with the facility or activity." 40 C.F.R. 122.2.

standards."[22] CLF does not agree that new impervious area or new stormwater outfalls created by a municipality are properly defined as "increased discharges" rather than "new discharges" or "new dischargers" for purposes of triggering the Pinto Creek analysis. Any new stormwater outfalls created by an MS4 discharger into an impaired waterbody would contribute to the violation of water quality standards, and should be subject to the Pinto Creek requirements. We recommend this provision be changed in the final permit.

- Under the draft permit, "increased discharges" must provide for a net decrease in pollutant loading through enhanced control or offsets.[23] Without conceding that these discharges can be allowed under the permit, absent a TMDL and a demonstration that compliance schedules are in place for other point sources, CLF agrees agree that that a net decrease in pollutant loading should be required for any increased discharges to impaired waters. More specificity is needed as to what kinds of measures are an appropriate offset (for example, structural BMPs installed and functioning, and verified by the permittee to accomplish a particular pollutant loading, mass or volume reduction). Quantitative analysis and verification should be required to document the pollutant reduction and that the discharge will not contribute to water quality standards exceedances.

- Regarding Section 2.3.1.2, the "increased discharge" analysis and verification for TMDL waterways is not sufficient to ensure consistency with TMDLs. Step "a" is appropriate, and permittees should be required to calculate their loading contribution in this circumstance. However, steps "b" and "c" are too vague and leave an impermissible degree of discretion to the permittee. A better defined quantitative approach should be required, and the permittee should be required to certify as to the measures that have been taken on the ground and that they are achieving the necessary pollution reductions.

d. **2.3.3** - Antidegradation Requirements.

[22] 40 C.F.R. 122.4(i); *Friends of Pinto Creek v. EPA*, Slip Op. No. 05-70785, 13505, 13515 (9th Cir., Oct. 4, 2007). The rationale for this section of the regulations is that it "corresponds to the stated objectives of the Clean Water Act 'to restore and maintain the chemical, physical, and biological integrity of the nation's waters.' 33 U.S.C. § 1251(a) (1987). And that 'it is the national policy that the discharge of toxic pollutants in toxic amounts be prohibited.' 33 U.S.C. § 1251(a)(3) (1987)." *Pinto Creek,* at 13515 (9th Cir. 2007).

[23] The Draft Permit provides that increased discharges are only eligible for General Permit coverage if the permittee identifies and estimates a load for each pollutant of concern, implements structural BMPs, and identifies the BMPs it has implemented such that the MS4 will not cause or contribute to exceedences of water quality standards or, in the case of a TMDL waterbody, will be consistent with the TMDL. Draft Permit, Sections 2.3.1.1 – 2.3.1.2.

- In general, the draft permit contains more thorough descriptions of the elements the antidegradation analysis must include than did the prior permit. This is an improvement over the prior permit, but this section is still not sufficiently clear and prescriptive to ensure the state's antidegradation policy is carried out.

- A second general concern is that the antidegradation provisions of the permit are too narrow in their application; antidegradation should be an ongoing and prospective analysis that applies to all permitted activities. This is because all NPDES permits must meet the non-degradation standard throughout the lifespan of the permit. *See* 40 C.F.R. 131.12.

- Section 2.3.3(b)(1) appears to create a de minimis exception, but this is not explained in the Fact Sheet. We do not agree that there is any de minimis threshold in the state's anti-degradation regulations at 314 Code Mass. Regs. 4.04, and therefore this should be removed.[24]

- The "Tier II" provisions in Section 2.3.3(b) are problematic, in that section 2.3.3(b) creates a subjective "out" on a number of grounds that are not consistent with 40 C.F.R. 131.12. The permittee can claim the discharge is "not significant because it is temporary in nature and that upon completion of the discharge period the existing water uses . . . will be equal to or better than . . . prior to commencing the discharge," or that "the effluent will be of a better quality than the existing water quality of the receiving water." These categories are too subjective to be enforceable, and at a minimum are susceptible to overly generous interpretation by permittees. This type of subjective self-regulation was struck down in *Environmental Defense Center v. Browner.*[25] In addition, allowing for a discharge that is "temporary in nature" implies that water quality standards during particular periods or events, which appears contrary to the water-quality based requirements of the MS4 program.[26]

- Section 2.3.3(f) provides that new or increased discharges to Outstanding Resource Waters require an individual permit. EPA should meaningfully enforce this provision. Given the wide range of waterways receiving discharges from the Department of

[24] If this is a reference to 314 Code Mass. Regs. 4.04(5), it appears to be mischaracterized. That section requires a four part analysis to be performed by the applicant to demonstrate that a number of substantive criteria are met before *"limited degradation"* (i.e. a new or increased discharge) is allowed to a high quality water. 4.04(5) would not be properly characterized as a de minimis threshold.

[25] *Environmental Defense Center v. Browner,* 344 F.3d 832, 840 (9th Cir. 2003), *cert. denied*, 124 S.Ct. 2811 (2004).

[26] *See* 40 C.F.R. § 122.4.

Transportation roads and infrastructure, including public water supply areas,[27] DOT should be required to obtain an individual permit on this basis alone.

III. Performance Standards Reflecting Low-Impact Development and Green Infrastructure

CLF strongly urges EPA to include in the permit performance standards that reflect Low-Impact Development or "green infrastructure" stormwater management practices, and/or numeric effluent limitations that are commensurate with such standards. These practices are widely available, well proven, are generally more effective than conventional infrastructure at pollutant removal and volume reduction, and confer additional benefits to the community and environment. As detailed in attachments A,B,C, and D1-75 to this comment letter, **LID/green infrastructure is the current expression of controlling polluted stormwater runoff to the "maximum extent practicable" ("MEP").** Furthermore, the attached documents demonstrate that the permit cannot effectively ensure that water quality standards will be met *without* inclusion of such LID/green infrastructure-based performance standards. Performance standards based on LID/green infrastructure should be included in this permit.[28] In particular, performance standards for LID/ green infrastructure should be included in Section 2.4.5, the Post-Construction bylaw, and should be required as the means by which permittees fulfill water-quality based requirements under Section 2.

From the outset, EPA has made clear the expectations that technologies would evolve, and that the Maximum Extent Practicable standard in the second round of small MS4 permits would reflect what was learned about the effectiveness of the BMP implemented during the first round. The need to meet water quality standards was to drive the evolution of the MEP standard, itself, because the ultimate objective of all BMPs is to ensure the attainment of water quality standards. As EPA expressed in the MS4 Final Rule:

> [The Maximum Extent Practicable standard] should continually adapt to current conditions and BMP effectiveness and should strive to attain water quality standards. Successive iterations of the mix of BMPs and measurable goals will be driven by the objective of assuring maintenance of water quality standards. If, after implementing the six minimum control measures there is still water quality impairment associated with discharges from the MS4, after successive permit terms

[27] including the Hobbs Brook Reservoir, which is listed as a Class A, Outstanding Resource Water. *See* 314 Code Mass. Regs. 4.06, Figures, available at http://www.mass.gov/dep/water/laws/tblfig.pdf.

[28] Whether an expression of technology-based effluent limitations, water-quality based effluent limitations, or both, such performance standards are timely and necessary for the reasons described above.

> the permittee will need to expand or better tailor its BMPs within the scope of the six minimum control measures for each subsequent permit.

64 Fed. Reg. 68722, 68754 (Dec. 8, 1999) (EPA Stormwater Phase II Final Rule).

EPA anticipated that "the NPDES permitting authority may ask the permittee to revise their mix of BMPs, for example, to better reflect the MEP pollution reduction requirement." 64 Fed. Reg. 68722, 68754 (Dec. 8, 1999) (EPA Stormwater Phase II Final Rule). Even more recent (2010) EPA guidance on this issue -- the establishment of water-quality based effluent limitations in stormwater permits -- stated that "[i]mproved knowledge of BMP effectiveness gained since 2002 should be reflected in the demonstration and supporting rationale that implementation of the BMPs will attain water quality standards and WLAs."[29] **At this juncture, ten years after the Small MS4 program was first enacted, and given the wealth of data generated in the interim, it would be inappropriate for EPA Region 1 *not* to include LID-based performance standards and revise the scope of required BMPs to reflect LID/green infrastructure.**

Comments by Dr. Robert Roseen, Director of the University of New Hampshire Stormwater Center on the North Coastal MS4 Draft permit (Attachment A) and Dr. Stephanie Hurley's Statement on Low-Impact Development, included with CLF's Comments on the North Coastal MS4 Draft Permit (Attachment B) confirm that Low-Impact Development and green infrastructure is well tested, effective at stormwater volume reduction and pollutant removal, suitable for New England, and confers ancillary benefits.

Dr. Roseen's professional opinion is that "LID stormwater management works effectively throughout multiple seasons including challenging winter conditions. Data shows that it works better for water quality than conventional stormwater management."[30] He also confirms that studies have shown LID to be cost effective and in some cases to result in cost savings.[31] Furthermore, Dr. Roseen cautions that "with the raising of the standards for MEP . . . certain practices should be *disallowed* for usage. Practices that have been demonstrated to be contributing to the water quality failures should be eliminated . . . ."[32]

Dr. Hurley's professional opinion regarding LID is that it "offers a more ecological, flexible, and context-sensitive stormwater management approach—and more readily meets water quality

[29] EPA Memorandum, James Hanlon to Regional Administrators, Nov. 10, 2010, "Revisions to the November 22, 2002 Memorandum 'Establishing Total Maximum Daily Load (TMDL) Waste d Allocations (WLAs) for Stonm Water Sources and NPDES Permits Based on Those WLAs', at 4.
[30] Attachment A, at 1.
[31] *Id.* at 2.
[32] *Id.* at 1 (emphasis added).

and hydrologic performance standards—than conventional stormwater management."[33] Furthermore, Dr. Hurley has personally evaluated LID implementation sites at various locations throughout the U.S. and internationally, and confirms that "the principles of LID design can be successfully applied in various topographies, geographies, and climates" including New England, and at a variety of scales.[34] Her conclusion is that LID represents the maximum extent practicable for stormwater treatment.[35]

The direct testimony of Richard Horner, before the Pollution Control Hearings Board for the State of Washington in the matter of the Seattle Phase I stormwater permit (Attachment D3) affirmed that LID techniques are " unquestionably 'known' and 'available' techniques. In many cases, implementation of LID for new or redevelopment is less costly than conventional BMPs, and offers other economic benefits such as improved property values or reduced water use."[36] Dr. Horner further asserted that the Seattle Phase I permit at issue did not "use all known available and reasonable methods" to control stormwater from new and redevelopment, and it was "highly unlikely" that compliance with water quality standards could be achieved using conventional techniques.[37] Further, he asserted that "LID approaches are far more protective of water quality than the conventional BMPs" and that the permit did not reflect the maximum extent practicable standard.[38]

The direct testimony of Dr. Derek Booth in the same matter asserted that "the [Seattle Phase I] Permit . . . does not protect rivers and streams, beneficial uses, or aquatic life. Continued reliance on such a [flow-based] standard for new development in western Washington will not prevent serious and significant additional degradation to these resources," and in his professional opinion, "a more protective performance standard that more closely matches natural hydrology . . . is readily achievable without sacrificing opportunities for future development. Achieving a more protective standard would rely on site- and basin-level LID BMPs that are in my opinion, sufficiently well known, understood, available and economically and technologically feasible that they can be implemented throughout western Washington."[39]

Thomas Holz, an experienced civil engineer, testified that

> "LID approaches are generally more effective at protecting water quality and beneficial uses than the engineered, end-of-pipe standards embraced in the

[33] Attachment B, at 2.

> 2005 [Washington] Manual and Permit. They are known, available, and reasonable (as well as "practicable") in virtually all new and redevelopment situations.

(Attachment D1, at ¶ 33.)

In addition, a wealth of technical articles, case studies, litigation documents, and federal government guidance documents and fact sheets summarized in Attachment C and included as Attachments D4-81 all demonstrate these principles.

The greater adoption of LID, spurred by regulatory approaches including the MS4 permit, will benefit Massachusetts communities by keeping pollutants and concentrated pulses of stormwater out of our rivers, ponds and streams, generating increased green space, cooling urban areas, and relieving some of the cost and maintenance burden on aging municipal stormwater infrastructure.

IV. Six Minimum Measures

One theme that emerged from the implementation of the 2003 MA Small MS4 permit was the need for additional clarity, and greater enforceability of requirements under the six minimum measures. CLF recognizes that EPA has significantly clarified a number of these requirements in the draft permit, and generally supports these changes. The permittees' inconsistent progress toward improved water quality also indicates that additional best management practices are needed, in addition to clarification of the requirements.

a. IDDE and System Mapping

The requirement at Section 2.4. that IDDE be continued is important, and CLF supports the continued inclusion of IDDE requirements in the MS4 permit. Illicit connections can contain extremely high levels of bacteria as well as substantial nutrient loads, and should continue to be a core element of compliance with the permit.

CLF strongly supports the requirement for enhanced mapping of the sewer infrastructure and affected waterways in Section 2.4.4.6. As referenced above, complete mapping of sewer infrastructure, outfalls, and adjacent waterways, is a prerequisite to the full engagement of all stakeholders in better stormwater management. It is also necessary for meaningful consideration by permittees as to where increased BMPs will be installed to meet water-quality based requirements of the permit.

clf
conservation law foundation

Sanitary Sewer Overflows ("SSOs") are illegal, and CLF concurs that the permit should so state. CLF urges EPA to require that MS4 permittees provide real time public notification of SSOs in addition to notification to MassDEP and EPA. This would better ensure that citizens can make informed decisions about their own health and safety during and after SSO events and that the public can accurately understand the scope of overflows before deciding on investment of public resources to cure the problems.

b. Impervious area/ DCIA mapping

CLF supports the new requirements in the draft permit that towns track impervious cover[40] and "Directly Connected Impervious Area," ("DCIA"), assess possible locations for LID retrofits (presumably so that trading can occur), and assess the possibility of requiring LID town-wide for new construction. . The link between impervious cover and stream degradation has been well established since before the issuance of the 2000 permit.[41] Tracking overall impervious cover as well as DCIA will allow communities to fully account for the causes of waterway impairment, and is an important step towards the deployment of Low-Impact Development on a broader scale

c. Post-Construction LID Ordinance

CLF strongly supports the requirement that permittees institute a post-construction ordinance, as one of the core minimum measures laid out in the initial Phase II rule. Permittees covered under the 2003 permit were required to pass an ordinance addressing post-construction stormwater discharges, and to "develop, implement and enforce a program to address storm water runoff from new development and redevelopment projects that disturb greater than one acre and discharge into the municipal system." The adjustment of the ordinance to reflect the use of LID should be mandatory, and should not require a great deal of additional time to be put into place.

Rather than merely requiring that municipalities "assess the possibility of" requiring LID town-wide for new contruction, EPA should go one step farther and require that a LID-based performance standard is met. LID technologies are now well proven, widely available, demonstrated to be as effective or more effective as conventional technologies, while conferring additional benefits, and necessary to ensure the attainment of water quality standards.

[40] (hard surfaces such as roadways, sidewalks, driveways, parking lots, and rooftops)
[41] 64 Fed. Reg. 68722, 68725 (Dec. 8, 1999); *see id*. at 68726-8.

As drafted, the Permit requires municipalities to enact an ordinance that tracks certain requirements of the Massachusetts Stormwater Standards. CLF supports the requirement that permittees enact ordinances requiring stormwater controls from new and redevelopment. For the reasons detailed above and in the Attachments to CLF's comments), the final permit should require that Low-Impact Development or "green infrastructure" stormwater management techniques are used, including on-site infiltration of stormwater. The Massachusetts Stormwater Standards may not equate to meeting water quality standards in all areas.

Therefore, we recommend that EPA implement a more protective standard. An alternative is the standard reflected in the EPA Technical Guidance on Implementing the Stormwater Runoff Requirements for Federal Projects under Section 438 of the Energy Independence and Security Act ("EPA Federal Facilities Guidance"), The guidance was enacted pursuant to Executive Order 13514, and requires that facilities of a certain size either treat stormwater on-site sufficiently to infiltrate the 95th percentile storm event, or implement measures that will restore or maintain pre-development hydrology on a site-specific basis. This standard has been determined to be feasible and cost-effective in the context of federal facility building standards.[42] In issuing the Federal Facilities Guidance, EPA relied on the testimony of Derek Booth, Thomas Holtz and Richard Horner regarding LID in the Seattle MS4 litigation (Attachments D1-D3).[43]

In heavily urbanized areas including the Boston metropolitan area, the typical parcel size is smaller than one acre. Consequently, a one-acre threshold for post-construction stormwater management is too high to capture a significant portion of development. For the reasons EPA has already identified, a post-construction stormwater bylaw is important to controlling inputs into the MS4 system, and the threshold should be lower than one acre. One half acre would be a more appropriate threshold in urban areas. Dr. Robert Roseen's comments on the draft permit have also identified this as a concern. (*See* Attachment A).

V. Monitoring and Assessment, and Public Participation

Monitoring and assessment are critical to assessing whether the measures municipalities have chosen to implement are, in fact, working to accomplish the objectives of the Permit, and to guide decisions about what additional measures can and should be taken in each community. That is why CLF supports strong provisions for outfall monitoring, GIS mapping, tracking of Directly Connected Impervious Area in the Final Permit, as well as requirements to report all of the above data and information.

[42] Attachment D67, EPA Federal Facilities Guidance (Dec. 2009).
[43] *See* Attachment D67, EPA Federal Facilities Guidance, at 55 (Dec. 2009).

clf
conservation law foundation

a. Monitoring

- CLF strongly supports increased monitoring, in both wet and dry weather, as a critical component of this permit. The outfall monitoring requirements in the draft permit will yield important information about current water quality, sources of pollution, and over the span of the permit, will reveal long-term trends, and where strategies employed by municipalities are effective or ineffective. Outfall monitoring is important for numerous reasons beyond merely supporting the illicit detection and elimination program. It provides a baseline that can then be compared to discharges in future years. Monitoring data indicates whether the BMPs a permittee has chosen to use are sufficiently effective at reducing pollution. The data can also shed light on trends that are outside of the permittee's control, but that should inform choices made about stormwater BMPs.

- For these reasons, the Permit should require more than one wet and one dry sample of each outfall within the five-year term. Three samples at each outfall during the permit term would better characterize conditions in light of the variability of stormwater discharges. CLF's experience has been that outfalls near interconnections between permittees are an important place for attention to be focused, and we support the requirement that these areas be sampled.

- Given the importance of monitoring data, CLF is concerned about the scope of the exemptions, framed as a "permittee-specific monitoring plan" in Sections 3.1.4 and urges EPA to remove these exemptions so they do not undermine the rule.

- In particular, 3.1.4.1 is problematic because it is important that permittees continually assess the effectiveness of their BMPs at controlling pollutants. It is not clear under what circumstances a permittee would have completed outfall monitoring under the 2003 permit that would be equivalent to the outfall monitoring required under this permit. Section 3.1.4.2, which allows an opt-out if the outfall is associated with a Problem Catchment, seems counter-intuitive. It would seem even more important and relevant to have data on outfalls where high pollutant loadings are detected, whether or not the source is suspected to be known. Section 3.1.4.3 allows an opt-out if the amount of impervious cover discharging through an outfall is less than 10 percent of the catchment area. Water quality impacts can occur from less than ten percent impervious cover, so EPA should consider lowering this threshold.

- Section 3.1.4.5 appears to allow the permittee to opt out of monitoring if "the permittee has conducted or will conduct in its permittee-specific monitoring plan wet

and dry weather in-stream monitoring which is representative of one or more discharges to the same water body." If this provision is kept, EPA should clarify that the permittee must affirmatively certify and describe why the outfalls are representative of others, and the use of this opt-out should be limited to a certain proportion of outfalls overall, to ensure that adequate monitoring is done throughout the MS4 system during the span of the permit.

- Instream monitoring of receiving waters is also an important component of evaluating the overall relationship between MS4 discharges and water quality, and can inform the appropriate level of stormwater controls – in some cases directly indicating impacts from particular MS4 drainage areas, and in some cases yielding a more general understanding of the types and levels of contaminants found under given conditions. CLF recommends that EPA consider including targeted instream monitoring requirements in the final permit. It is noteworthy that stormwater expert Derek Booth testified in the litigation over the sufficiency Seattle's Phase I stormwater permit that monitoring was critical. (Attachment D1, at 97-99). Rather than relying on presumptions as to the effect of particular BMPs, he maintained that "if you want to know the condition of this water body, you have to go measure that condition in that water body." (Attachment D1, at 99).

b. Transparency and Public Participation

The importance of public participation to the MS4 program was recognized at the outset of the program, when a federal appeals court found that EPA's failure to make Notices of Intent for coverage under the MS4 permits available to the public for comment contravened the Clean Water Act.[44] The experience to date under the Small MS4 permit in Massachusetts confirms that public participation is vital to successful implementation of this permit. Transparency and public participation are an effective means to augment EPA's enforcement, and to foster stronger support for town decision-makers to dedicate resources to stormwater management. In instances where municipalities are falling short due to capacity or resource constraints, watershed groups can step forward to call needed attention to overlooked issues, help to secure resources, and supplement existing data and information about outfalls and the condition of waterways. However, this is only possible when information is publicly available about the municipality's efforts, the location of infrastructure and outfalls, and the condition of local waterways. Residents and community- or watershed-based organizations are in a unique position to enhance the efforts of municipalities through the MS4 program, but without full access to information, citizens are less able to assist in these ways.

[44] *Environmental Defense Center v. EPA*, 344 F.3d 832, 856-859 (9th Cir. 2003).

CLF strongly supports the provision in the Draft permit requiring SWMPs to be made available to the public, and urges EPA to additionally require that all SWMPs, storm sewer infrastructure system maps, annual reports, Phosphorus Control Plans, monitoring plans, and monitoring data be required to be made available, and more specifically that they are placed on line in real time. Given modern technology, this need not be burdensome for the permittees, while it adds a great deal of value to the information collected by making it more accessible and usable to a wider range of stakeholders.

We support the provision in the draft permit that a comment period will occur for NOIs. This is legally required as per federal case law and will have the benefits described above. In addition, CLF encourages EPA to provide for a comment opportunity on the content of SWMPs.

VI. Enforceability

In some cases, the flexibility EPA afforded under the 2003 Massachusetts Small MS4 permit was abused. Our waterways are now exhibiting the effects of that neglect, and it is important going forward that all permit requirements are expressed in clear terms with enforceable parameters. The draft permit generally reflects clearer requirements and terminology, and this letter points out a number of instances where the requirements must be strengthened in order to be enforceable, or could be clarified for the benefit of permittees and the public.

CLF has reviewed many of the annual reports under the 2003 MS4 permit. The annual reporting form template is an opportunity for EPA to ensure clear expectations and accountability for permit requirements. In part because the 2003 form was so general, MS4 annual reporting has been less effective than it could have been over the last 8 years as a compliance tracking tool. In addition to clarifying requirements in the body of the permit, EPA should make Appendix F to the Draft Permit, the Annual Reporting form spreadsheet, more specific so that the reports will be comparable across municipalities. EPA should prescribe in the permit and reflect in this template *standard numeric metrics for each BMP and water-quality based or technology-based effluent limitation* that every MS4 must report – i.e. outfalls sampled, illicit connections removed, acres of impervious cover retrofitted, number of new BMPs installed, pounds of pollution removed – instead of leaving complete discretion to the permittee. EPA should also require clear "yes or no" answers as to the status of compliance with requirements like enacting a post-construction ordinance. This will allow the EPA, MassDEP, and other stakeholders to track progress, and will allow MS4s to target their own resources when preparing reports.

VII. State Transportation Agencies

High pollutant loadings from roads and highways are well documented.[45] Highways are specifically referenced in a number of TMDLs in Massachusetts as a significant contributor and a source that must be controlled in order to achieve the needed pollutant loading reductions in that waterway.[46] MassDOT should be required to (1) identify and prioritize outfalls in water in TMDL, also identify where cross headwater streams, with low flows, (2) identify areas where highways cross sensitive habitat, (3) develop a prioritization for stormwater retrofits for those areas, and (4) develop a retrofit plan for its entire system as needed to comply with TMDLs and to correct its cause of and contribution to instream exceedances of water quality standards. "Storm water discharges from State DOTs in Phase 1 areas should already be regulated under Phase I. The preamble to Phase 1 clearly states that "all systems within a geographical area including highways and flood control districts will be covered."[47]

MassDOT expressed the view in the public hearing on the North Coastal MS4 Permit (in 2010) that DOT should not be subject to the same requirements as municipalities in the MS4 permit as proposed.

The Commonwealth is no less accountable to the requirements of the Clean Water Act than other public entities, and in fact has a greater responsibility to demonstrate leadership in protecting the resources that support the state's economy and the health of its citizens. Other highway departments are implementing LID and system-wide retrofit plans, which demonstrates that compliance is feasible.

An individual permit would more appropriately reflect the high pollutant loads from highways, and would allow for a more transparent accounting of the BMPs currently used, and that are available and appropriate, and should be deployed, throughout the highway system.

For these reasons, we strongly urge EPA to issue an individual permit to state transportation agencies, including the Department of Transportation.

National Academy of Sciences, Urban Stormwater in the United States: Report in Brief, at 4 (2009) ("[f]reeway, industrial, and commercial areas can be very significant sources of heavy metals, and their discharge significance is usually much greater than their land area indicates") (available at http://dels.nas.edu/dels/rpt_briefs/stormwater_discharge_final.pdf); 64 Fed. Reg. 68722, 68727 (Dec. 8, 2009) (Stormwater Phase II Final Rule); Expert Report of Vladimir Novotny, P.E., Docket No. 55-6, Feb. 7, 2008, CLF v. Deval Patrick et. al.,case no. 11295wgy, U.S. District Court for the District of Massachusetts.

[46] *See e.g.* TMDLs for Boston Harbor/Neponset River (bacteria), Buzzards' Bay watershed (bacteria), Blackstone Lakes (nutrients), Chicopee Basin Lakes (nutrients), Cape Cod (pathogens and nutrients), Charles River (phosphorus), French Basin (phosphorus), Shawsheen River (bacteria) available at MassDEP website, http://www.mass.gov/dep/water/resources/tmdls.htm.

[47] Phase II Final Rule, 64 Fed. Reg. 68722 (Dec. 8, 1999).

To the extent state agencies remain within the General Permit, CLF strongly objects to the language in Sections 6.0-6.3 and 7.0-7.3 of the draft permit appearing to weaken the permit's requirements as applicable to state agencies. CLF does not agree with the apparent assumption that it is not possible for state agencies to comply fully with the requirements of the permit. For example, state agencies appear to be excused from Section 2.4.6.7 of the permit, which requires an assessment of current street design and parking lot guidelines and other local requirements that affect the creation of impervious cover . . . to determine if changes to design standards…can be made." The essence of this requirement – evaluating codes and design standards that affect creation of impervious cover, and identifying changes that can be made, is entirely applicable and appropriate for the Department of Transportation or other state agencies. For example, in addition to being directed to assess "facilities," parking areas and walkways, the DOT should be directed to assess its entire highway system for opportunities to reduce impervious area. A specific timeframe should be provided for this analysis, and the results should be disclosed to EPA and the public.

The same is true for Section 2.4.6.8, requiring an assessment of existing local regulations to determine the feasibility of making LID and green infrastructure practices "at a minimum . . . allowable." Again, in its essence, this is exactly the type of action EPA should be requiring of all permittees – to analyze the internal policies, regulations, or design standards that are barriers to LID, and to take action to remove them. While a state agency may or may not have its own "regulations," there are doubtless statewide regulations, internal agency policies, design guides, or standards that can and should be evaluated and changed to allow for LID.[48] EPA does not appear to have offered any legitimate rationale in the fact sheet or otherwise for state agencies to be excused from these requirements.

VIII. Additional Requirements

A. State Water Quality Certification

It is notable that no draft state water quality certification (pursuant to Section 401 of the Clean Water Act) was noticed with the Draft Permit. The fact sheet indicates that the certification process is "underway." A draft Section 401 Water Quality Certification was made public along with the draft 2003 Massachusetts MS4 permit. It is important that the public have an opportunity to understand how MassDEP is viewing the draft permit conditions, and whether any additional requirements will be added through the certification to ensure state water quality standards are met. We request that EPA and MassDEP clarify the status of the state water quality certification.

[48] In particular, the Mass Department of Transportation, Highway Division's design guide is in need of updating to reflect LID.

clf
conservation law foundation

B. Snow and Ice Removal and Chlorides

Research has indicated that, in the Northeast, chloride concentrations are increasing at a rate that threatens freshwater in the region.[49] Indeed, a 2001 article in *Stormwater* magazine ranked Massachusetts as having the highest annual road salt loadings in the United States. Chlorides TMDLs completed in New Hampshire confirm that stormwater runoff from roadways is a significant contributor to impairment, due to the high concentrations of chlorides, metals, and other additives in road salt that are washed into nearby waterways. Comments of Dr. Robert Roseen, Director of the NH Stormwater Center on the draft permit (Attachment A) highlight the potential of porous pavements to reduce salt application rates. Porous pavement and pervious concrete, both considered LID practices, require reduced de-icing application because water typically infiltrates rather than pooling on the surface.[50]

EPA should include in the final permit more robust requirements to address this growing threat to our freshwater bodies and drinking water supplies, including through LID and green infrastructure. Reducing the need for deicing agents through LID, making fully informed choices about the de-icing agents used, and maximizing efficiency of de-icing applications can allow MS4s to achieve the same benefits with less pollution to waterways.

CLF recommends EPA add a requirement that permittees' salt storage facilities be enclosed, not merely covered (as the draft permit requires). We also support the requirement that salt storage be located away from drinking water supplies. The final permit should be more specific as to what constitutes a safe distance between salt storage and water supplies.

CLF strongly supports the requirement in Section 3 of the draft permit that permittees conduct outfall monitoring for conductivity and chlorine, as this will help to identify locations where road salt is impacting water quality. In addition, CLF encourages EPA to require disclosure by MS4s of the types and quantities of de-icing agents they are using, and to require MS4 permittees to carry out targeted *monitoring* for pollutants commonly found in road salt (toxic metals and ferrocyanide) and other de-icing chemicals such as propylene glycol, in receiving waters of MS4 systems where they are used, to more accurately determine the degree of their impact on waterways and to establish a baseline to track whether conditions are improving or worsening over time. Only after any impacts to water resources have been brought to light can the state, municipalities, and citizens can make fully informed decisions about how to approach winter road maintenance.

Re: DRAFT General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

The Conservation Law Foundation ("CLF") appreciates the opportunity to comment on the 2014 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems ("MS4") in Massachusetts ("Draft Permit").

Founded in 1966, CLF is a member-supported environmental advocacy organization that works to solve the problems threatening our natural resources and communities in Massachusetts and throughout New England. For years, CLF has been deeply engaged with the problems posed by stormwater runoff in Massachusetts and across New England, and CLF continues to work toward a solution for the stormwater runoff issue.

On March 31, 2010, CLF filed comments with EPA ("CLF 2010 Letter") concerning the previous draft of this permit for MA North Coastal Watersheds. On March 11, 2011, CLF filed comments with EPA ("CLF 2011 Letter") concerning the previous draft of this permit for MA Interstate, Merrimack, and South Coastal Watersheds. A copy of both comment letters are attached for reference, as is a copy of CLF's August 12, 2013 comment letter regarding the New Hampshire Small MS4 Draft General Permit ("CLF 2013 Letter"). CLF hereby incorporates the CLF 2010, 2011, and 2013 Letters and their attachments into this comment letter as if fully set forth herein.

clf
conservation law foundation

The following are brief comments regarding general principles and particular sections of the current Draft Permit.

- **§2.1.1 Requirement to meet Water Quality Standards.** CLF applauds the strong language of §2.1.1(a) requiring reduction of discharges to meet water quality standards. In order to effectuate this requirement, EPA should remove the final sentences of §2.1.1(b) & (c) and the entirety of §2.1.1(d). These sections provide a hurdle to citizen enforcement of water quality standard violations from individual discharges. EPA should also reinstate the language in the 2010 and 2011 Draft Permits at §1.3(k) expressly stating that the permit does not allow discharges that cause or contribute to an instream exceedance of water quality standards. *See* CLF 2010 Letter at 3-5; CLF 2011 Letter at 4-6.
- **§ 2.3 MEP Low Impact Development performance standards.** As CLF has amply documented in its prior MA MS4 Draft Permit comment letters, low impact development/green infrastructure ("LID/GI") practices continue to represent the expression of controlling polluted stormwater runoff to the maximum extent practicable ("MEP"), and this Permit will be deficient in its responsibility to ensure achievement of water quality standards under the Clean Water Act without LID/GI-based performance standards. This is particularly important given the potential for LID and GI practices to be effective climate change resiliency measures, helping communities deal with flooding from storm surges and severe rain and snow events. *See* CLF 2010 Letter at 10-13, CLF 2011 Letter at 13-16, CLF 2013 Letter at 4-9.[1]

[1] EPA itself has released several documents since CLF's last MA comment letters were submitted highlighting the stormwater reduction and economic benefits from LID/GI. *See, e.g.*, Enhancing Sustainable Communities With Green Infrastructure: A guide to help communities better manage stormwater while achieving other environmental, public health, social, and economic benefits (2014) http://www.epa.gov/smartgrowth/pdf/gi-guidebook/gi-guidebook.pdf; Getting to the Green: Paying for Green Infrastructure -- Financing Options and Resources for Local Decision Makers (2014) http://www2.epa.gov/sites/production/files/2015-02/documents/gi_financing_options_12-2014_4.pdf; Case Studies Analyzing the Economic Benefits of Low Impact Development and Green Infrastructure Programs (2013) http://water.epa.gov/polwaste/green/upload/lid-gi-programs_report_8-6-13_combined.pdf.

- **§ 2.3.6(d) DCIA mapping.** CLF continues to support this requirement as an essential element of both transparency and progress toward broad deployment of low impact development. *See* CLF 2010 Letter at 13, CLF 2011 Letter at 17.
- **§2.3.6(a) Area size threshold.** This section should apply to projects of at least one half acre, if not one quarter-acre size. A one acre threshold is inappropriate and insufficiently protective in urbanized areas. *See* CLF 2010 Letter at 14-15, CLF 2011 Letter at 18.
- **Appx H. Road Salt control measures.** Given the ubiquity and harm of road salt application, chloride control measures should be required for all permittees unless discharge modeling shows an absence of chloride. *See* CLF 2010 Letter at 19, CLF 2011 Letter at 24.
- **Transparency and Public Participation.** CLF continues to urge real time online accessibility of all relevant maps, reports, and plans. *See* CLF 2010 Letter at 17, CLF 2011 Letter at 20, CLF 2013 Letter at 10-11.
- **Appx. F Charles River phosphorus compliance period.** CLF urges EPA to require a more efficient timeline for action in waters subject to the Charles River phosphorus TMDL than that laid out in Appendix F. The Additional Enhanced BMPs described in Appendix H for phosphorus-impaired waters related to Public Outreach and Education, Stormwater Management for New Development and Redevelopment, implementation of nonstructural BMPs, and Good Housekeeping and Pollution Prevention for Permittee-Owned Operations should be required during the first two years of the permit period for MS4s discharging to waters with phosphorus TMDLs, and compliance with the TMDL should be required within 10 years.
- **Permit flexibility.** As a general matter, CLF urges clear and enforceable standards in place of flexible requirements. *See* CLF 2010 Letter at 17, CLF 2011 Letter at 21.

Attention: Comments on the 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

Dear Mr. Tedder;
The Central Massachusetts Regional Stormwater Coalition (CMRSWC) is a group of 28 towns, most of which are regulated under the United States Environmental Protection Agency's (the Agency's) 2003 NPDES Phase II Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit. The CMRSWC was formed in 2011 as a regional partnership to manage stormwater programs and ensure the long-term protection of water resources. Working as a group has allowed the CMRSWC to develop tools to expand our stormwater management practices, collectively protect shared resources, and meet the requirements of the 2003 Massachusetts MS4 Permit in an efficient and cost-effective manner.

This coalition has also created an effective forum for collaboration, communication, and discussion among the municipal representatives that attend the regular meetings of our Steering Committee and with other stormwater collaboratives in the Commonwealth of Massachusetts and New England. It is at several of these meetings and at related events that the CMRSWC has discussed the proposed Draft 2014 Massachusetts MS4 Permit that was released for public comment by the Agency on September 30, 2014, hereafter referred to as "the proposed Permit".

The following pages outline the concerns that members of the CMRSWC have with the proposed Permit. Our comments have been organized into two sections: ***General*** (which describes overarching concerns and concepts); and ***Specific*** (which apply to unique sections of the proposed Permit). For the latter, we have provided the section and page number of text for ease of reference. Where appropriate, we have provided suggestions for replacement language (or clarification) that would better align the proposed Permit with other MS4 Permits in New England, or have outlined provisions, concepts, or metrics we believe are more suitable or feasible (for in-the-field implementation).

General Comments

1. The members of the CMRSWC are supportive of proposed Permit provisions that will directly result in improved water quality, but object to those that are administrative or arbitrary, and that will not have a direct bearing on water quality. We have outlined specific objections as much as possible in our Specific Comments, below.

2. We encourage the Agency to update its own guidelines about how regulated communities are expected to balance compliance with the Permit (in its final form) with the ability to afford that compliance without experiencing economic hardship. Since 1997, the Agency has generally considered a maximum combined annual water and wastewater bill of 4.5% of mean household income (MHI)- 2% for drinking water and 2.5% for wastewater services- to be affordable. In their May 2013 "Affordability Assessment Tool for Federal Water Mandates" report, the United States Conference of Mayors, the American Water Works Association, and the Water Environment Federation (see *Attachment A*) argue that MHI is a poor indicator of economic distress, bears little relationship to poverty within the community, does not capture variation across diverse populations, and does not account "for the historical and future trends of a community's economic, demographic, and/or social conditions", especially during recessions and recovery from them, such as Massachusetts is presently experiencing. Municipal revenues are decreasing, and further restrictions on development or redevelopment are not in the best interest of communities struggling to maintain the level of service expected by residents.

   Even so, if we were to use MHI as the basis for evaluating a community's ability to afford a stormwater management program to comply with the proposed Permit, the 4.5% MHI cap would easily be exceeded if stormwater costs were included- along with drinking water and wastewater- in the calculation. This is true whether a community funds its program traditionally through the tax base or has developed a sustainable funding mechanism such as a stormwater utility or stormwater enterprise fund. In some rural Massachusetts towns, the cost of stormwater compliance will exceed the cost of wastewater compliance and the total cost for compliance with water regulations may well be closer to 10% of MHI. Leaders and administrators in these towns will have a difficult task, indeed, to convince their residents and business owners that some of the provisions in this proposed Permit will result in water quality improvements commensurate with the expense.

   Finally, several members of our community have calculated (or begun the process of calculating) their increased cost of compliance with the proposed Permit as compared to the 2003 MS4 Permit. In 2014, as part of an ongoing partnership between the CMRSWC, the Massachusetts Department of Environmental Protection (MassDEP), and the Worcester Polytechnic Institute's Integrated Qualifying Project (IQP) program, three of our member communities (Holden, Millbury, and Southbridge) participated in a project to quantify current and projected stormwater program costs (see *Attachment B*). The IQP report team assumed that provisions of the proposed Permit would be implemented as drafted, and evaluated the cost of new and expanded provisions as well as maintaining compliance with other Permit provisions. Among the conclusions, the IQP report team calculated the annual costs for implementation of the proposed Permit for the towns of Holden ($258,790), Millbury ($753,173), and Southbridge ($343,008). These projected costs represent increases of 39%, 30%, and 28% over current annual stormwater program budgets, respectively, and do not include other one-time or intermittent costs (such as capital expenditures like equipment), or the costs of design and construction of projects that may be required to eliminate illicit discharges. Even allowing for the imprecision inherent in a project of this scale, the consistency in comparative relative increases calculated for three three communities tells a story that will be repeated across the Commonwealth.

   We all agree that clean water supports our communities in many, many ways; notwithstanding this, the absence of guidance on how to best afford the increased costs of stormwater management cannot be ignored.

3. We encourage the Agency to include flexibility in the final Permit with respect to the date on which the Permit in its final form will become effective in each community. Flexibility in setting the effective date will allow each town the opportunity to budget for Year 1 and Year 2 tasks, specifically, within the municipal budget cycle, which will likely be out of sync with the Permit cycle. In the last few years, many communities have been telling their leaders and residents that the new Permit would be out "soon" based on updates from the Agency, with the target

issue date moving over the course of several municipal budget cycles. Many of these leaders will face reluctance, skepticism, and frustration when proposing increased stormwater program budgets, and will need to re-educate their decision makers about why these increases are required.

4. We believe that many provisions in the proposed Permit do not lend themselves to implementation over a five-year Permit term, at least in a way that is affordable for the regulated communities and that results in meaningful improvements to water quality. Instead, we propose that the Agency extend the schedule for several specific provisions, such as development and implementation of a catchment delineation, over a ten-year period. The Commonwealth of Massachusetts has in place a statutory framework that allows for such an extended timeline as a Compliance Schedule within a NPDES Permit. Indeed, the Agency has taken advantage of this extended schedule in the proposed Permit for the Catchment Investigation Procedure (see Section 2.3.4.8(c)(iii), IDDE Program Implementation Goals and Milestones, Page 37). This compromise will comply with Clean Water Act 402(b)(1)(B) while providing flexibility for the regulated communities. Where we believe this extended schedule is appropriate, we hereafter refer to it in subsequent comments as a "10-year Compliance Schedule".

5. When describing dry weather and wet weather screening and sampling and outfall/interconnection screening, the proposed Permit frequently refers to "detectable levels of chlorine". It should be noted that chlorine is detectable in most if not all outfalls and at the perimeter of many of Massachusetts' surface water bodies using many field kits available today, and this detection limit is likely to become lower (identifying smaller and smaller concentrations of chlorine) as technology improves. Treated drinking water entering a stormwater system is the potential source the chlorine indicator is intended to highlight. However, chlorine in drinking water is highly volatile, and decomposes quickly once discharged to a surface water body and exposed to sunlight and the ambient atmosphere. If all outfall samples would demonstrate "detectable levels of chlorine", but the chlorine will degrade quickly within a water body, this parameter ceases to be useful as a screening tool.

   We request that the chlorine parameter either be removed from all sections discussing screening methodologies, or that a numeric threshold be established- based on peer-reviewed data- that can correlate a specific elevated detected chlorine concentration to a potential illicit discharge, such as a grey water connection (or the absence of elevated bacteria) or a cross-connection (in the presence of elevated bacteria).

6. We have observed that many provisions in the proposed Permit include the development of a written program, written inventory, written report, written procedures, or other "written" documentation. These proposed provisions counter a shift on the part of many regulated communities to cloud-based infrastructure management systems, such as the online mapping and inspection platform used by our 28 members. Many communities use these cloud-based tools because they work with mobile devices, reduce paperwork, and allow data to be added to a management system in real-time. These tools reduce the amount of inefficient administrative time to enter information into a form or spreadsheet and typically allow towns to create work orders from the field for follow-up or maintenance activities. The data is every bit as useful and accessible and can be readily queried into reports to provide summaries and snapshots.

   Managing operations and maintenance procedures through cloud-based systems such as the one the CMRSWC uses is also more effective- if a change is made to a procedure or form on our platform, that change is available immediately to all users in all 28 communities without the need to print new forms, distribute them to all members, and inform our many, many users that the new form shall be used. These workflow improvements should be considered to be enhancements, and encouraged as they are consistent with federal efforts to reduce paperwork and not "overburden the public with federally sponsored data collections", mentioned as the goal of the Paperwork Reduction Act.

   We also know that many regulatory agencies like municipalities to maintain hard copies of documents at multiple locations, even though this practice does not lead to improved use of these documents. The *absence* of large volumes of paperwork doesn't mean that a community isn't implementing something any more than the *presence* of many binders means that a community is effectively utilizing the programs in them. Decreasing the use of paper in our work environment is also environmentally preferable.

It is important for both the Agency and the public to realize that increased use of technology and cloud-based tools allows local governments to work more efficiently and respond to their needs and requests more efficiently.

This modernization should be encouraged, and we request the Agency to incorporate flexibility for many of the "written" submittals requested to be implemented as modules within asset management platforms, and allow the permittee to demonstrate by other methods that these procedures, inventories, etc… exist and are being utilized.

7. We strongly encourage the Agency to engage in conversations and workshops that lead to development of a Final MS4 Permit that MassDEP is willing to sign onto. The alternative to a joint Permit, outlined by the Agency's Thelma Murphy at a meeting of the Northern Middlesex Stormwater Collaborative in Lowell, MA on December 4, 2014, would be two separate Massachusetts MS4 Permits: the current 2003 Massachusetts MS4 Permit would continue to be enforced by MassDEP, and the new Final Massachusetts MS4 Permit would be enforced by the Agency. Mayhem would ensue due to administration, operations and maintenance, and coordination duplication resulting from each of the Commonwealth's regulated communities being subject to two separate, parallel MS4 Permits. In practice, progress toward improving water quality would likely stop as legal challenges were filed, which is not in the best interest of any party involved.

   This coordination should begin as soon as possible to reach a version of the permit agreeable to both organizations and compliant with the Clean Water Act, Massachusetts' Surface Water Quality Standards, and associated supporting documentation, so that water quality improvement activities across the Commonwealth can be focused and consistent.

Specific Comments

1. Part 1.10(a), Stormwater Management Program (SWMP), (Page 7). The SWMP is required to describe the specific activities that will be taken, and the schedule for each activity or Best Management Practice (BMP), for the duration of the permit term. This document cannot be developed without thorough coordination of multiple departments and persons within each regulated community, and without each of these departments and persons committing the resources (both time and financial) needed for those activities and BMPs to be completed on the schedule proposed.

   The SWMP is arguably the most complicated and detailed submittal in the proposed Permit.

   We therefore request that the proposed Permit be revised to require an in-person coordination meeting between the Agency (and MassDEP, ideally) and the regulated community one year after the effective date to review the draft SWMP, with the Final SWMP due one year after that coordination meeting. This gives the regulated community an opportunity to receive intermediate feedback from the Agency and MassDEP, and for corrections to be made, if needed, to ensure that Final SWMP will be acceptable to all parties, reducing revision efforts. This coordination meeting would provide many communities with feedback on their current compliance status (which has not routinely been provided to this point), and allow them to adjust proposed investments in any Minimum Control Measure or TMDL-driven provision that they intend to incorporate into the SWMP.

2. Part 2.1, Water Quality Based Effluent Limitations (Page 9). This section references Clean Water Act 402(p)(3)(B)(iii), stating that this section of the Clean Water Act prohibits discharges that "cause or contribute to an exceedance of water quality standards". However, the referenced section of the Clean Water Act actually states that Municipal discharge Permits shall require "controls to reduce the discharge of pollutants to the maximum extent practicable", commonly known as MEP.

   MEP has long been the statutory standard that governs the level to which municipalities are responsible for limiting and reducing pollution in stormwater, and has been interpreted in many decisions as being subject to certain limitations, including the limits of technology and cost/benefit analyses.

For example, if a community spends $1 billion dollars on a stormwater treatment project for Pollutant X and continues to contribute 0.01% of the loading of Pollutant X to a receiving water that does not meet water quality standards for that pollutant, that community would be considered to have *satisfied the MEP standard* but would *not comply with the narrative limit* ("contribute to…") proposed in this section. The Agency implies that language in the proposed Permit would ***overrule MEP as the accepted standard***, an authority that the Agency does not have over water quality standards in the Commonwealth of Massachusetts.

To eliminate this inconsistency, we strongly request that language in this and other parts of the proposed Permit be revised to clearly establish that MEP standard shall be applied throughout the proposed Permit.

3. Part 2.1.2, Increased Discharges (Page 10): The Agency has been asked at a number of public meetings to provide additional clarification of the meaning of "increased discharge" and "increased loading". Many communities in Massachusetts are presently designing combined sewer overflow (CSO) or other sewer-related improvement projects in compliance with NPDES Permits other than the MS4 Permit. When Long Term Control Plans, inflow and infiltration studies, or other planning documents approved by the Agency require that a community implement methods likes sewer separation to reduce the burden on a treatment facility during wet weather events, the loading of a stormwater pollutant may shift from being delivered to a water body by un- or partially-treated wastewater to being delivered by the engineered stormwater system (albeit with load reduction). Even if we assume that all new stormwater projects are being designed in compliance with post-construction stormwater management, there may be a change in the volume or nature of the discharge of this pollutant. It is also possible that once the project is complete, the pollutant may be discharged to a different water body than the one that received the original CSO bypass.

   We realize that the MS4 isn't discouraging progress toward CSO abatement and sewer improvement projects, as these are done to further improvements in water quality. There is, nevertheless, a challenge in demonstrating in the MS4 Permit that the discharge or loading hasn't increased due to the implementation of those projects. The goal of fully integrated planning and permitting has not yet fully materialized, meaning that Towns can't fully "credit" themselves by demonstrating loading reductions to one water body by a project completed in another, nor are the same Agency personnel reviewing proposed projects and reports for the wastewater and stormwater NPDES permits- consistency that otherwise would provide confidence that one NPDES program is not competing or conflicting with another.

   To resolve this challenge, please clarify that CSO abatement and sewer improvement projects that have been approved by the Agency (and/or the MassDEP) are exempt from being captured by the definition of "increased discharge" or "increased loading".

4. Part 2.2.1, Discharges Subject to Requirements Related to an Approved TMDL (Pages 11-17). For the first time, many water bodies in our community have been identified as contributing to phosphorus impairments of the Charles River Watershed (Part 2.2.1(b)(i)), phosphorus impairments identified in the "Lakes and Ponds" TMDL (Part 2.2.1(b)(ii)), bacteria or pathogen impairments of multiple water bodies (Part 2.2.1(b)(iii)), phosphorus impairments in the Assabet River Watershed (Part 2.2.1(b)(v)), and/or nitrogen impairments in the Long Island Sound (Part 2.2.1(c)). A cost/benefit analysis of implementing the prescribed corrective waste load reduction actions outlined in Appendix F (and its attachments) has not been completed, nor has an evaluation been performed that models the expected impact of these waste load reductions. This is partially true because the data sets upon which many of these TMDLs was based were very small, used single grab samples, used generic land loadings to calculate watershed contributions, includes some sample data that did not receive full peer review or QA/QC. TMDL authors acknowledged that substantial gaps about influence of stormwater on water quality influenced error. We have not attached these TMDL reports to these comments: we consider these TMDLs to already be part of the public record, as they are referenced within the proposed Permit.

   We and many other groups question the validity of basing such an expensive and administratively complex component of the proposed Permit on TMDL reports that are not widely accepted. We request a continued focus on BMPs, both non-structural and structural (at the discretion of the regulated community) as the preferred method

to meet the Maximum Extent Practicable standard in addressing discharges from the MS4 to any of the impaired waters with a TMDL noted above, subject to future updates of these TMDL reports.

5. Part 2.2.2, Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements (Pages 17-22). Similar to Specific Comment #4, for the first time, many water bodies in our communities have been identified as contributing to both nitrogen (Part 2.2.2(a)) and phosphorus impairments (Part 2.2.2(b)). For both of these impairments, no Total Maximum Daily Loading (TMDL) has been established, and no specific pollutant reduction target has been proposed.

   We request a continued focus on BMPs, both non-structural and structural (at the discretion of the regulated community) as the preferred method to meet the Maximum Extent Practicable standard in addressing discharges from the MS4 to any of the impaired waters noted above.

6. Part 2.3.2, Public Education and Outreach (Pages 22-24). As noted previously, flexibility in the Permit will result in the most substantial improvements to water quality. This also applies to a Permittee's authority to direct education and outreach messages to targets it has determined are the priorities for their specific community, rather than mandated messages to mandated audiences. This flexibility is present in most other MS4 Permits in New England, for example Maine's MS4 Permit (effective July 2013, administered by the Maine Department of Environmental Protection; see *Attachment C*) and the 2014 Draft Connecticut MS4 Permit (administered by the Connecticut Department of Energy and Environmental Protection; see *Attachment D*). We request the same flexibility, and the following modifications:

   a. In (b), replace "shall" with "should", to enable the Permittee to focus messages on the types of properties it has already determined- through its efforts under the 2003 MS4 Permit- to be the highest priority. The Agency should encourage the Permittee to evaluate whether it should target a new audience, but not all audiences exist in regulated communities. Increased flexibility to direct messages to priority targets (rather than to mandated audiences) will result in the most substantial improvements to water quality.

   b. In (c), replace:

      "…shall distribute a minimum of two (2) educational messages over the permit term to each audience identified in Part 2.3.2.b. (The permittee shall distribute at least eight educational messages during the permit term)."

      with

      "…shall distribute a minimum of eight (8) educational messages over the permit term."

   c. In (e), (f), and (g), eliminate the mandate to quantify the effectiveness of each message, each distribution technique, and the overall program. These requirements aim to compel technical and administrative personnel in each regulated community to function as marketing or public relations specialists, where they have not been trained to do so. If and when a community tries a new message delivery mechanism, encourage- but do not mandate- that they report on how well it worked. Towns are not in the habit of sending good money after bad, and will not continue to pay for services or products that it knows are ineffective.

      The inclusion of these elements in the final Permit, however well-intentioned, will have the effect of siphoning off a portion of a town's funding to a third party for implementation, losing the connection within the community. Instead, we encourage the Agency to actively share the resources that have been developed (and continue to be developed) within Massachusetts by our group and others, as ways to reduce the burden on individual communities to developing its outreach and education programs.

7. Part 2.3.4.5(c), Outfall/Interconnection Inventory (Page 27). The proposed Permit asks the Permittee to physically label all MS4 outfall pipes. This proposed provision is related to public education, not inventory of the system, and should not be included in Part 2.3.4.5. The Agency is already proposing that regulated communities capture information such as pipe and open channel discharge locations under Part 2.3.4.6 (System Mapping, Page 27-28), with the goal of being able to readily locate and mobilize at these locations to perform illicit discharge activities. As such, the Town is already required to maintain outfall location information in the way most useful to it.

   Placement of physical labels, such as signs, will be costly and provide no additional benefit to Permittee personnel over and above the system mapping.

   We recommend that placement of such signage be considered a potential delivery mechanism in Part 2.3.2 (Public Education and Outreach, Page 22-24) on a location-by-location basis - that is, if the community determines that the placement of such signage in an area would increase the public's understanding of stormwater services provided or help resolve a chronic illicit discharge issue, such as illegal dumping, in that area.

8. Part 2.3.4.6(a)(i), System Mapping (Page 27-28). The number of required mapping elements (ten) and detail to be provided for each far exceeds the system mapping provisions included (or proposed) in any other New England state. For example, the 2014 Draft Connecticut MS4 Permit proposes to require only the type, material, size and location (coordinates) for pipes, swales/ditches/channelized flow, and outfalls, and is considering scaling this list back. The Connecticut permit does not include catch basins, drain manholes, BMPs, interconnections with other systems, or catchment delineations, nor does it require *or even recommend* that the Permittee map any sanitary sewer infrastructure, unless there is a history of illicit discharges or cross connections in a specific area. We understand the value in documenting the location of many kinds of points of interest within stormwater system infrastructure, but request that this Part be scaled back to focus mandatory future mapping only on outfalls, pipes, catch basins, and drain manholes, with other information to be collected as the Permittee's discretion.

   Further, the definition of catchment provided in this section ("the area that drains to an individual outfall or interconnection") differs from the Agency's responses to questions on this provision at public meetings. For example, at a meeting in Lowell, an Agency representative stated the opinion that two catch basins connected to a single outfall pipe would not need to be delineated; in fact the proposed Permit does not include an exemptions for a "small" catchment like this one. We encourage the Agency to define, in the final Permit, some types and configurations of catchments that could be exempt from the delineation requirement, such as this example.

   Regardless, inconsistent information such as this example will lead to different interpretations, and data provided by Permittees will not be evaluated on a level playing field. The Agency's ability to provide specific examples of how a community should implement the catchment delineation provision, with visual examples and sample documentation (suitable for a community that does not have GIS capability) would go a long way to providing the needed consistency.

9. Part 2.3.4.7(c,), Assessment and Priority Ranking of Catchments (Page 30): We request clarification of the identifying parameters for sewer input based on sampling results. The permit language states that Problem Catchments and High Priority Catchments be categorized by ammonia $\geq$ 0.5 mg/l, surfactants $\geq$ 0.25 mg/l and bacteria levels greater than the water quality criteria applicable to the receiving water; or ammonia $\geq$ 0.5 mg/l, surfactants $\geq$ 0.25 mg/l and detectable limits of chlorine.

   Based on these requirement detection limits, *all three parameters* must be above levels for prioritization into one of these categories. We do not believe this is the intent of the Agency and request clarification on the threshold of these parameters.

10. Part 2.3.4.7(c)(i), Assessment and Priority Ranking of Catchments (Page 30). The definition of Low Priority Catchment should allow for categorization based on either the outfall/interconnection screening (Part 2.3.4.7(d)) or the catchment characteristics assessment (Part 2.3.4.7.(c)(ii)), but not both.

For example, if a catchment has no history of complaints or reports, has good dry weather water quality (per screening kits), has low development density, contains no industrial or commercial properties, consists of new infrastructure, and is located within a recently-sewered area, then there is hardly justification to require the full scope of screening and sampling outlined in 2.3.4.7(d). The community should be able to consider this example to be a Low Priority Catchment without going to extraordinary efforts, which is the very purpose of defining this category between the Excluded and High Priority categories.

11. Part 2.3.4.7(c)(iii), Reporting dates for Assessment and Priority Ranking of Catchments (Page 31). The level of effort required for the Assessment and Priority Ranking of Catchments is substantial and will require far more than one year from the effective date to implement. We request that this provision have a submittal milestone closer to 60% of the Permit term (i.e., Year 3 of a five-year permit term or Year 6 of a 10-year Compliance Schedule).

12. Part 2.3.4.7(e)(i), Catchment Investigation Procedure (Pages 33-34). This section outlines the System Vulnerability Factors that indicate "a risk of sanitary or septic system inputs to the MS4" under some conditions. These Factors include information that is either subject to the separate NPDES permit for the permittee's publicly owned treatment work (POTW), or is not applicable (for communities that aren't sewered). In either case, the core concept outlined by the Agency in listing these factors is that there needs to be increased cooperation between the entity primarily responsible for the operation of the regulated community's POTW (e.g., Town wastewater department or local sewer district) or subsurface wastewater discharge program (e.g., Board of Health or Code Enforcement Officer) and the entities primarily responsible for compliance with the MS4 Permit (e.g., Public Works Department, Conservation Agent/Commission, or Town Engineer).

    The information outlined in the Factors includes data and occurrences that are already routinely tracked by the POTW/subsurface system operator(s). As such, it is much more efficient to require these Factors to be discussed during the development of the SWMP early in the process and reviewed with the Agency at the one year coordination meeting (see Specific Comment #1) than to mandate that the permittee duplicate that substantial effort with a mid-permit term submittal.

13. Part 2.3.4.8(a), IDDE Program Implementation Goals and Milestones (Page 36). The level of effort required to complete the dry weather screening and sampling is substantial and will require far more than three years from the effective date. We request that this provision have a submittal milestone at Year 6 of a 10-year Compliance Schedule, or, alternately, that the Permittee be required to begin this task by Year 3 (of a 5 or 10-year Compliance Schedule).

14. Part 2.3.4.8(c), IDDE Program Implementation Goals and Milestones (Page 36-37). We request that the first sentence be deleted. As noted in Specific Comment #10, if a catchment characteristics assessment satisfies all criteria in Part 2.3.4.7.(c)(ii)), there is hardly justification to require the full scope of screening and sampling included in the Catchment Investigation Procedure.

    Further, the progress milestones for Problem, High Priority, and "all" catchments outlined in (i) through (iii) of this Part are not realistic, given the effort required in performing the Catchment Investigation Procedure, even if Low Priority catchments are excluded. We request that the Agency revisit these progress milestones based on a ten-year Compliance Schedule.

15. Part 2.3.6(a), Post-Construction Stormwater Runoff from New Development and Redevelopment (Page 39): The Agency has been asked at a number of public meetings to clarify the intent of the requirement to retain (or provide treatment for) the first inch of runoff from new and re-developed sites that disturb one or more acres and discharge to the MS4.

    We similarly request that the Agency confirm that projects such as roadway maintenance projects - including surface overlay, milling followed by overlay, and full-depth reclamation that does not expose the roadway sub-base - are not included in the definition of "disturb". That is, if a community is implementing a maintenance project on an existing roadway, without increasing the area of impervious surface, that no stormwater retention or treatment is

required. The potential unintended result of the alternative interpretation is the crippling of existing pavement maintenance projects- already underfunded- as new stormwater conveyance, storage, and treatment infrastructure is designed, for very little water quality benefit. Another potential unintended result of the alternative interpretation is discouraging redevelopment of urban/brownfields parcels with existing infrastructure in favor of focusing on a previously undeveloped parcel, which would ultimately increase, not decrease impervious area.

Finally, the Agency has acknowledged at public meetings that it is not authorized to supersede a state's water quality-based limits and has previously deferred to the antidegradation policy set forth in Massachusetts' Surface Water Quality Standards, 314 CMR 4.00. Nevertheless, tools for calculating removal efficiencies in this Part are inconsistent with the Massachusetts Stormwater Handbook. Please clarify that the Agency does not intend to challenge or rewrite guidance for design of stormwater treatment BMPs included in the Massachusetts Stormwater Handbook.

16. Part 2.3.6(d), Directly Connected Impervious Area (Page 42): The proposed Permit asks each Permittee to report on impervious area (IA) and directly connected impervious area (DCIA) each year of permit coverage, with the goal of reducing both metrics each year of permit coverage. The Agency has indicated that it will provide a benchmark for measurement of these metrics through maps located on its Massachusetts NPDES website and implies that these maps reflect "subbasins" that are hydraulically connected to a point of discharge. A review of these draft maps shows that development data are not only outdated (e.g., GIS layers dated 2000 through 2010) but also that the subbasins delineated by the Agency do not reflect development. The subbasins shown on these maps are inconsistent with the definition of "catchment delineation" in the proposed Permit (see: Section 2.3.4.6(a)(i), Page 28). That is, the subbasins on maps referenced by the Agency are of undeveloped topography, ignoring the engineered infrastructure and roadway elevations that convey stormwater across a reference area to a point of discharge. In fact, a single subbasin as shown on the Agency's map may include multiple hydraulic catchments.

    The value of using IA and DCIA as a surrogate for stormwater pollution is not yet proven, and we believe the Agency, not the regulated communities, should take the lead on gathering data on the correlation between the two. To allow the Agency to develop meaningful IA and DCIA benchmarks, we encourage that the IA and DCIA reporting measure be moved from a Year 2 start date to milestone closer to 80% of the Permit term (i.e., Year 4 of a five-year permit term or Year 8 of a 10-year Compliance Schedule). As a result of this shift, the deadline for submittal of the inventory and priority ranking for installation of BMPs should be shifted appropriately (or deleted entirely, as discussed in other comments we've provided).

17. Part 2.3.7, Good House Keeping and Pollution Prevention for Permittee Owned Operations (Pages 43-49). This Part has expanded substantially from the 2003 version, and with good reason: pollution prevention and good housekeeping are a very effective non-structural BMP for reducing stormwater pollution. Having said that, some sections of this part lack the flexibility inherent in other state MS4 Permits. Some provisions focus too strongly on the specific steps to be taken to reach an objective instead of the objective itself. As an example: Part 2.3.7(a)(ii)(a) includes specific procedures to be implemented for "Parks and open space". One mandated procedure outlined in this section is to establish "pet waste handling collection and disposal location at all parks and open space including the placing of proper signage concerning the proper collection and disposal of pet waste". This specific procedure is inappropriate for a community that has already banned dogs from public parks and open spaces and has successfully enforced that ban. In this case, the mandated placement of pet waste collection stations would work *against* the implemented dog ban by providing visitors with a disposal location of waste from animals that shouldn't be there, sending mixed signals! This example community is already accomplishing the objective (reducing bacteria and nutrient runoff from a park) through an alternative approach that they decided was most appropriate, and should be permitted the flexibility to stay on the course they have chosen while the goal continues to be achieved. An improvement for our example community could be to encourage (not mandate) them to place signage informing visitors about improvements to water quality in the park (or adjacent water bodies) that have been observed since the pet ban went into effect. We request that this Part of the proposed Permit be revised to focus on the end point or objective rather than the prescriptive steps to reach it.

Further, the progress milestones under all sections of this Part are not realistic, given the effort required in evaluating the range of activities and potential pollution sources across a wide spectrum of permittee-owned facilities and operations. We request that the Agency revisit these progress milestones based on a ten-year Compliance Schedule with the Permit.

18. Part 2.3.7(a)(iii)(b), Infrastructure Operations and Maintenance- Catch Basins (Pages 44-45). A catch basin sump being no more than 50 percent full is described as the threshold for proper function of the basin. This may be accurate, but the inclusion of this metric is arbitrary and not in and of itself protective of water quality. As many commenters will likely note, most Massachusetts regulated communities are already familiar with locations within their MS4 where catch basins receive higher debris and sediment loading and require more frequent cleaning. Most of these communities already inspect and clean these basins more frequently, and include these activities in Annual Reports to the Agency.

    Use of the "no more than 50 percent full" metric is preferred over the "twice a year, minimum" metric that has appeared in previous versions of this and related permits. However, if a permittee is mandated to use the "no more than 50 percent full" metric as the threshold for additional cleaning and/or investigation of areas not previously considered a priority, then it's inevitable that other areas will suffer as a result. The end result is that, given current wording, the permittee can be considered non-compliant if a single basin in the system has a sump more than 50 percent full, regardless of whatever increased investment was made in cleaning and inspection activities or net improvements to water quality.

    We request that the Agency replace "shall" with more permissive language like "should" in this section, maintaining the "no more than 50 percent full" metric as an ideal to strive for but not a provision that can lead to noncompliance.

    Finally, the last bullet in this section asks the permittee to report "the volume or mass of material removed from each catch basin draining to water quality limited waters and the total volume or mass of material removed from all catch basins". The latter part of this provision is feasible, although will require thorough recordkeeping and tedious summaries. The first part, however, is not feasible: regardless of the methodology by which the volume or mass is calculated, the numbers reported would not match reality. No catch basin cleaning technology can remove 100% of the sediment and material in a sump and material density varies, so a calculated volume/mass isn't realistic: at the end of the day, the calculated mass/volume from cleaning X catch basins would not be equal to the mass/volume of material in the truck that cleaned X catch basins. Manifests would never match estimated, reported removal mass/volume and would be flagged in an audit. The potential for a truck to return to the Public Works yard (or other location) after cleaning a single catch basin to be re-weighed (allowing for documentation of the actual mass removed from that basin) is also not realistic. This provision has good intentions, but is not feasible from a boots-on-the-ground perspective. It may be possible for some communities to plan cleaning routes to be watershed- or catchment-specific (allowing a total volume or mass to be quantified for that water body), although in other communities this may be highly inefficient. We request that this bullet be modified to eliminate the "each catch basin" provision.

19. Part 2.3.7(a)(iii)(b), Infrastructure Operations and Maintenance- Street Sweeping (Page 45). The proposed Permit describes each street (with some limitations) being swept a minimum of once per year as the threshold for reduction of sediment loads to surface waters. This may be accurate, but the inclusion of this metric is arbitrary and not in and of itself protective of water quality. Parallel to the argument in Specific Comment #18, most Massachusetts regulated communities are already familiar with locations within their MS4 where streets may contribute higher sediment loading and therefore require more frequent sweeping. Most of these communities already sweep these roadways more frequently than once a year, and include these activities in Annual Reports to the Agency.

    We request that the Agency replace:

"...shall be swept and/or cleaned a minimum of once per year in the spring (following winter activities such as sanding)."

with

"...should be evaluated in the spring (following winter activities such as sanding) for the need to be swept and/or cleaned."

This more permissive language maintains the annual evaluation metric as an ideal to strive for, but eliminates a single provision that can lead to noncompliance.

20. Appendix F, Attachment 2. The inclusion of phosphorus reduction credits for an "Enhanced Sweeping Program" or the weekly collection of "Organic Waste and Leaf Litter" from areas that discharge to the TMDL waterbody is self-defeating. Particulate deposition from fossil fuels burned (and brake dust and other pollution) from the equipment needed to implement these collection programs will far outweigh the benefits of the potential phosphorus removed from impervious surfaces. The capital costs for communities to purchase approved, highly-efficient sweeping/vacuum equipment or to set up an appropriate leaf mulching or composting program will make these credits not worth the effort invested.

    Further, many of our members that have increased the frequency of street sweeping activities have observed that residents often view these expanded services as an invitation to dispose of trash, leaves, and other materials in roadways. In this way, enhanced street sweeping actually works against litter-prevention efforts.

    Finally, as observed at a number of the meetings the Agency hosted during the public comment period, the portion of leaf litter that could be collected from municipal-owned property and impervious surfaces through sweeping activities represents a very small fraction of the leaf litter in the community watershed, as a whole. Efforts to capture this small portion do not represent a strong value compared to other non-structural BMPs our communities are implementing.

These comments have been approved by the CMRSWC's Steering Committee and are strongly supported by our member communities. Attached to these comments (as *Attachment E*) are Statements of Support from our member communities, many of which are also submitting individual comments to the Agency.

We appreciate the opportunity to comment on this proposed Permit, and look forward to the additional protections and clarifications afforded by its consistency.

Sincerely,

Adam Gaudette
Town Administrator; Spencer, MA

Chapter 1

Assessing the Affordability of Federal Water Mandates

Communities and the water agencies that serve them have limited resources, so the investments they make need to address the most important risks to public health and the environment and deliver maximum benefits at a cost that is affordable. This Water Mandates Affordability Assessment Tool (Assessment Tool) is the result of a collaborative effort by the United States Conference of Mayors (USCM), the American Water Works Association (AWWA), and the Water Environment Federation (WEF). Its purpose is to raise issues, provoke discussion and provide alternative ways to view the affordability of federal water mandates in any given community. It does not represent the official policy of the sponsoring organizations or their members.

This chapter summarizes the U.S. Environmental Protection Agency's (EPA's) methods for analyzing the affordability of federal mandates stemming from the Clean Water Act (CWA) and Safe Drinking Water Act (SDWA). It describes the Agency's current policies, offers a critique, and identifies a number of alternatives that might be more suitable for analyzing the affordability of water and wastewater mandates on American communities. Finally, this chapter notes the importance of weighing benefits as well as costs when considering federal water mandates. As the reader will note, the term "water" is used throughout the Assessment Tool to mean drinking water, wastewater, and stormwater, unless otherwise noted.

Background

Investment to meet federal water and wastewater requirements can impose significant financial hardships on households, businesses, and the broader communities in which they are located. When communities face large—and sometimes multiple—federal water mandates, the combined impact of the required expenditures can be extremely expensive for everyone in that community who pays a water or wastewater bill (most consumers get one combined bill for water and wastewater services). For the utility, the cumulative suite of required investments not only strains fiscal capacity but may also displace other important investments, including critical but nonmandatory capital improvement and infrastructure renewal projects. For the greater community, mandatory investments may also squeeze out other important priorities, such as social safety net programs and economic development efforts. For the residents and businesses in affected communities, the capital and operating expenses associated with federal mandates are often reflected in water and wastewater bills that must grow faster than household incomes and the general rate of inflation. Very significant affordability challenges are often created, particularly for lower-income households.

With the intention of providing a mechanism for relieving undue economic stress in the face of wastewater-related mandates, EPA has developed "affordability" criteria to indicate when such mandates would cause substantial and widespread economic distress in the community. In the case of undue economic stress caused by wastewater requirements, the Agency might be willing to exercise some flexibility in the mandate by allowing a longer timeframe to achieve compliance or by relaxing compliance standards. The affordability of drinking water requirements is handled differently and can—at least in theory and case-by-case—affect the kind of technology that must be deployed in some small communities.

If EPA affordability criteria functioned properly, the economic hardship imposed on lower-income households might be alleviated in many communities. Unfortunately, there are several critical limitations to how EPA defines affordability and applies its assessment criteria. This is due in part to EPA's reliance on metrics such as median household income (MHI), which is highly misleading as an indicator of a community's ability to pay. As a result, regulatory relief is not provided in many communities where substantial and widespread economic hardships are indeed being created.

EPA's Two-level Affordability Screening Analysis for Wastewater and Combined Sewer Overflow (CSO) Controls

In 1995, EPA published its first set of affordability-related guidelines: The Interim Economic Guidance for Water Quality Standards. The 1995 Guidance contains a detailed discussion of the analyses a municipality should undertake to evaluate the economic impact of complying with water quality standards (WQS) under the CWA. In 1997, EPA published Guidance for Financial Capability Assessment and Schedule Development using a nearly identical approach to assess whether an extended compliance schedule might be granted to a community facing affordability problems. The analyses put forth in these guidance documents are divided into two parts:

1. The preliminary screen examines affordability using a factor called the Residential Indicator (RI). The RI weighs the average per household cost of wastewater bills relative to median household income in the service area. Ultimately, an RI of 2% or greater is deemed to signal a "large economic impact" on residents, meaning that the community is likely to experience economic hardship in complying with federal water quality standards.

2. A secondary screen examines metrics related to the financial capability of the impacted community. This screen applies a Financial Capability Indicator (FCI) reflecting the average of six economic indicators. Those indicators include the community's bond rating, its net debt, its MHI, the local unemployment rate, the service area's property tax burden, and its property tax collection rate. Each indicator is assigned a score of 1 to 3, based on EPA-established benchmarks. Lower FCI scores imply weaker economic conditions and thus an increased likelihood the mandate would cause substantial and widespread economic impact on the community or service area.

The results of the RI and the FCI are ultimately combined into an overall rating based on EPA's Financial Capability Matrix. This rating is intended to demonstrate the overall level of financial burden imposed on a community by compliance with CWA mandates.

EPA's Assessment of Affordability for Drinking Water Regulations

Whereas EPA's consideration of affordability for wastewater and CSO compliance is aimed at assessing an individual community's ability to comply with regulatory mandates and schedules, EPA's consideration of affordability in the context of potable water supply is limited to assessing the national-level affordability of regulatory options for small communities. EPA does not consider the affordability of drinking water requirements in any manner that pertains to individual utilities (even small ones), or to the category of medium and large utilities.

EPA has stated that it would consider a National Primary Drinking Water Regulation to be unaffordable to small communities (those with populations under 10,000) if the standard would result in a household drinking water bill in excess of 2.5% of the national MHI in such communities. In this context, MHI is evaluated based on all small community water systems collectively (i.e., MHI is not considered for any individual utility, but for all small utilities lumped together). To date, EPA has never determined that a drinking water regulation is unaffordable for small systems. If EPA were to make such a finding, it would be required to identify technologies for small systems that might not result in meeting a particular drinking water standard but are found to protect public health. Then, on a case-by-case basis, states may approve the use of such affordable small system technologies (called a variance) or approve an extended deadline for compliance (called an exemption). States cannot approve both a variance and an exemption for the same standard in the same community. Variances are subject to review and approval by EPA. States have allowed very few variances and exemptions because they can be difficult and expensive to issue.

EPA's stated view on potable water—that it is affordable if it costs less than 2.5% of small community MHI—influences the perceived affordability of combined water and wastewater bills. Specifically, it is commonly inferred that EPA would consider a combined annual water and wastewater bill of less than 4.5% of MHI to be affordable (2.5% for water, plus 2% for wastewater services and CSO controls).

Limitations of EPA's Preliminary Screening Approach

A central issue in assessing affordability of federal water mandates is the reasonableness of community-wide MHI as a primary yardstick. MHI can be a highly misleading indicator of a community's ability to pay for several reasons.

• MHI is a poor indicator of economic distress and bears little relationship to poverty or other measures of economic need within a community. For example, consider an analysis of MHI and poverty data for the 100 largest cities in the United States. It shows that for 21 cities identified as having an MHI within $3,000 of the 2010 national MHI ($50,046), there is no discernible relationship between MHI and the incidence of poverty. Statistical analysis confirms that the correlation between MHI and poverty among these cities is not meaningful, with a correlation coefficient (r) of 0.024. Indeed, within these 21 cities, the poverty rate ranges from a low of 14.1% to a high of 23.3%.

• MHI does not capture impacts across diverse populations. In many cities, income levels are not clustered around the median, but are spread over a wide income range or concentrated at either end of the income spectrum. This tendency for the income distribution to spread away from the middle has been increasing and may well continue to increase in the future, making MHI an even less meaningful metric. In addition, income distribution and other economic measures can vary widely across different districts and neighborhoods within a city. Thus, the economic hardship associated with increasing water and wastewater bills can be concentrated in a few lower-income neighborhoods. This will compound the economic hardship within the community and may raise issues of environmental justice (EJ). These impacts are not captured with the use of service area MHI as a sole indicator.

• MHI provides a "snapshot" that does not account for the historical and future trends of a community's economic, demographic, and/or social conditions. This is particularly relevant in areas that may be experiencing economic declines or population losses (which will result in the costs of water and wastewater programs being spread across fewer residents). Without consideration of these and other economic and demographic trends, the affordability determination will overestimate the ability of residents to tolerate rate increases over time.

• MHI does not capture impacts to landlords and public housing agencies. Many renters do not receive water bills because water and wastewater service is included in the cost of rent. The same is true of many residents in public housing. In cities with a high percentage of renters and/or public housing residents, use of MHI and RI does not capture impacts to landlords and public housing agencies, which must often absorb the cost of increased water and wastewater bills. In many cases, higher water bills mean that public housing authorities will be required to reduce the number of needy renters they serve, unless there can be offsetting increases in public housing budgets.

• The RI does not fully capture household economic burdens. Economic burdens are commonly measured by comparing the costs of particular necessities to available household income. The RI is such a measure in that it is used to evaluate the economic burden from water bills by comparing those bills to MHI. However, there can be situations where the economic burdens in a community are substantially different from those typically associated with its RI. For example, a community may experience unusually high costs of basic necessities or may have a distribution of household income that differs significantly from that in most communities. In these cases, the standard application of EPA's RI would be insufficient on its own to distinguish between higher and lower levels of economic impact.

Alternative Household Affordability Metrics: Moving Beyond EPA's Criteria

Given the limitations of the RI, and in particular the use of MHI as a primary indicator of household affordability, it is important to consider the use of alternative metrics to gauge the affordability of federal water, wastewater, and stormwater-related mandates. For example, impacts on customer bills can be assessed as follows:

• Across the income distribution. Given the relatively large percentage of households in the lower portions of the income distribution in many cities, it is important to examine the effect of rising water bills across the entire income distribution—and especially at the lower end—rather than simply at the median. For example, a key indicator could include the analysis of average water and wastewater bills as a percentage of the household income for each income quintile. Table 1-1 demonstrates that this percentage would be much higher for lower income quintiles in Atlanta compared to national levels (e.g., the income level that defines the upper end of the lowest quintile—lowest 20% of income earners—in Atlanta is $12,294; this compares to $20,585 nationally).

Table 1-1 Household Income Quintile Upper Limits in Atlanta, Georgia, and the United States (2011$)

	Atlanta, Ga.	United States
Lowest quintile	12,294	20,585
Second quintile	31,873	39,466
Third quintile	59,043	63,001
Fourth quintile	104,233	101,685
Lower limit of top 5%	246,335	187,087

Source: U.S. Census Bureau American Community Survey, 2012.

EPA's "Guidance for Preparing Economic Analyses" (240-R-00-003) recognizes the legitimacy of assessing impacts to all households across the income distribution, though EPA has not provided information on how such analyses have been conducted in the past or how they've been used in enforcement actions.

• Across household types. Average water and wastewater bills can be examined as a percentage of income for potentially vulnerable populations (e.g., renters and elderly households).

• Across neighborhoods or similar geographic units, such as Census tracts, or Public Use Microdata Areas (PUMAs). Poverty rates and households located in poverty areas can be considered to identify portions of communities that are economically at risk. Alternative measures of poverty, such as the Supplemental Poverty Measure (SPM) recently developed by the U.S. Census Bureau , can be especially useful in this respect. The analysis could capture affordability issues in particular parts of a community or service area that may be masked when looking at the area as a whole.

Other indicators of economic need and widespread impacts can also be considered for the community or parts of the community[2]. These might include:

• The unemployment rate.

• The percentage of households receiving public assistance such as food stamps or living below the poverty level.

• The percentage of households meeting Home Energy Assistance Program requirements.

• The percentage of customers eligible for water affordability programs.

• The percentage of households paying high housing costs—for example the percentage of households with housing costs in excess of 35% of income.

• Other household cost burdens such as nondiscretionary spending as a percentage of household income for households within each income quintile (Rubin 2003).

EPA's Secondary Screening Analysis: Limitations and Alternative Indicators

Just as the RI falls short of its intended purpose, so too does the FCI. The FCI that makes up EPA's secondary screening analysis does not adequately reflect a community's ability to finance investments associated with federal water mandates. This measure fails to fully capture financial capability because:

• EPA uses property tax revenues as a percentage of full market property value (FMPV) as its sole measure of local tax effort. Focusing solely on property taxes—while ignoring income, sales, business taxes, and user fees typically charged for city services—inevitably understates the tax effort in cities that rely on multiple forms of taxation. As an alternative, EPA should allow municipalities to use total local tax and fee revenues as a percentage of gross taxable resources. This would provide a better measure of the extent to which a municipality is already using the full range of its taxable resources.

• The secondary screening analysis includes measures of local MHI and unemployment levels compared to the national average. By focusing on how these measures compare with national levels, EPA fails to acknowledge the profound impact of the absolute levels themselves. For example, if the national unemployment rate is 9%, a community with an unemployment rate of 10% is considered by EPA as having only a "mid-range" unemployment problem. In fact, a community with a 10% unemployment rate is all-but-certain to be experiencing significant distress, regardless of the national average.

  o In addition to supplemental measures for MHI (as previously described), EPA should consider a metric that compares a municipality's current unemployment rate with the long-term state and national average (the national average was 5.8% between 1991 and 2010). Use of the long-term state and national averages as a benchmark would provide a more insightful socioeconomic indicator than a single current number. A community's long-term unemployment rate (for example, the share of the labor force continuously unemployed for one-half year or more) could also be evaluated.

  o In addition to broadening the range of labor market indicators it considers in assessing local financial capabilities, EPA should consider other measures of local economic distress, such as foreclosure rates. At the national level, foreclosure rates rose from 5.8 per 1,000 households in 2006 to 22.2 per 1,000 in 2010 (Office of the State Comptroller, 2011). In many communities, high foreclosure rates have had a significant impact on the financial condition of local governments and their ability to finance capital improvements.

• The FCI does not take into account the recent deterioration of many local governments' ability to finance major capital improvements, as evidenced in municipal capital markets. EPA should consider adding a measure of local government revenue growth or decline to the FCI matrix,

The SPM includes changes in the measure of available household resources (e.g., using after-tax income instead of pretax income and taking into account income received through food stamps and other forms of public assistance) and also recognizes some nondiscretionary expenses that such households bear. The SPM also adjusts for different housing status (e.g., renters versus owners). Additional details can be found in the U.S. Census Bureau's Supplemental Poverty Measure (2011a).

2 EPA's 1995 Interim Economic Guidance for Water Quality Standards provides a good list of these indicators, and also includes economic losses, impacts on property values, decreases in tax revenues, and potential for future job losses, among others.

with a decline in real revenues over some period taken as a sign of weakened financial capacity.

• EPA's methodology for assessing municipalities' financial capabilities takes into account formal debt burden, but it does not consider what for many cities is an even greater liability: unfunded pension and health care commitments to retirees. These are generally not reflected in formal debt.

• Community or utility revenues are not considered in the secondary screening analysis. This creates a significant weakness, especially in areas that are experiencing economic difficulties, delinquency in water and wastewater payments, declining water usage, shrinking revenues, or a growing number of older customers on fixed or declining incomes. EPA should consider the addition of more appropriate measures of revenue collection, such as current delinquency rates, the agency's ability to enforce collection, and its likelihood of recovering these costs.

• EPA's secondary screening analysis does not take into account the fact that many communities have a legal debt ceiling. Debt limitations have the potential to severely limit a community's ability to finance unfunded mandates absent an extended schedule.

• Finally, EPA does not consider the longer-term needs facing many municipalities for reinvestment and renewal of water and wastewater infrastructure due to the current system's age and condition. As documented by AWWA's Buried No Longer report (covering buried drinking water infrastructure only), these needs add up to at least $1 trillion over the next 25 years. Wastewater needs are at least as great, not counting CSO costs. The need for this investment is real and urgent.

Weighing the Benefits of Additional Mandate-Driven Expenditures

Federal Clean Water Act and the Safe Drinking Water Act mandates are intended to provide better public health protection, water quality enhancements, and other benefits. However, not all drinking water and wastewater mandates are the same. Some provide greater benefits than others, or provide benefits sooner than others, or generate benefits to different groups of people or ecosystems.

When communities face expensive water mandates and associated deadlines, the impact of the required expenditures can be extremely difficult for all who pay water bills, but particularly for those with lower incomes. In such communities, the expected benefits of the mandate should be carefully weighed against:

• Compliance deadlines (which might be amended)

• Permit limits (which might be adjusted)

• Required compliance technologies and strategies (some of which are more expensive than others)

• Other factors that influence the magnitude and timing of required investments

When the costs of meeting a regulatory mandate are high, the affordability implications and the benefit of the activity should each be evaluated in concert with the other. The most important questions include:

1. Are the added benefits of more rapid and/or stringent mandates warranted given the added costs and adverse impacts on affordability, when compared to less stringent, perhaps less expensive alternatives?

2. Are projects with lower public health or environmental benefits driving out projects that might be of greater value to the community or the nation?

3. Are the households that will realize most of the benefits different than those who will bear most of the costs?

4. Are those bearing the greatest burden economically disadvantaged and thus worthy of environmental justice consideration?

EPA's proposed Integrated Planning and Permit Policy (IPPP) provides one potential avenue by which the costs and benefits of all federal water mandates could be addressed. The IPPP process could be used to set priorities, make adjustments in requirements, and set reasonable timetables. Such adjustments would help ensure that local resources are used to secure the greatest public health and environmental benefits at an affordable cost. Moving the IPPP process forward as suggested offers important potential advantages:

• Comparing the environmental, social, and financial benefits of all water-related obligations would allow municipalities to develop priorities that reflect the totality of trade-offs and commitments facing the community.

• Considering all water-related obligations together, and assessing financial capability in light of total water-related obligations, would focus local resources where the community will get the greatest total environmental, public health, and other benefits.

It should be noted that EPA does not include drinking water mandates in the Integrated Municipal Stormwater and

Wastewater Planning process, even though drinking water investments must be carried on the same customer bill as investments needed to comply with wastewater and CSO mandates. The USCM, AWWA, and WEF have recommended that EPA include consideration of drinking water investments in the Integrated Planning and Permit Program. The program should also consider necessary but nonmandatory investments in the ongoing rehabilitation of water and wastewater infrastructure.

Chapter 2

Guidance for Developing EPA's Residential Indicator

This chapter provides an overview of the methods outlined in EPA's 1997 Guidance for Financial Capability Assessment and Schedule Development (U.S. EPA, 1997), which EPA uses for completing the preliminary screening analysis (i.e., calculating the RI). More specific instructions and worksheets developed by EPA for this purpose are included in this Assessment Tool as Workbook 1, an Excel spreadsheet.

EPA's RI is intended to provide a measure of the financial impact of current and proposed wastewater treatment (WWT) and CSO controls on residential users. The calculation of the RI involves the following steps:

• Determine the average annual cost per household (CPH) associated with WWT- and CSO-related programs and services in a given community. CPH is based on the total costs for these programs, the percentage of wastewater flow attributable to residential users, and the number of households in the service area, as further explained below.

• Determine the MHI for the service-area based on data from the U.S. Census Bureau.

• Divide the CPH by the service area MHI to calculate the RI.

• Compare the RI to financial impact ranges established by EPA to determine whether unfunded mandates will produce a possible high, mid-range, or low financial impact on residential users.

It is important to note that although EPA's 1997 Guidance was developed within the context WWT and CSO controls, this Assessment Tool is focused on the affordability of both water supply and WWT (including CSO and stormwater) programs. For comparison purposes, water and wastewater utilities can calculate the average annual CPH for both types of services using the methodology outlined below.

Step 1: Develop the CPH Estimate

In its 1997 Guidance, EPA outlines the following steps for determining the average annual CPH of existing and proposed WWT and CSO control costs:

• Determine total WWT and CSO (and stormwater) costs by adding together the current costs for existing WWT operations and projected costs for any proposed controls.

  o Current WWT costs are defined as "current annual wastewater operating and maintenance (O&M) expenses (excluding depreciation) plus current annual debt service (principal and interest)" (1997 Guidance, p. 12).

  o EPA Guidance states that O&M expenses and debt service costs should also be estimated for all proposed projects and adjusted to current year dollars (i.e., deflated) using the average annual national Consumer Price Index (CPI) inflation rate for the last five years. Workbook 1 includes specific instructions for applying the CPI and determining annualized debt service costs.

• Calculate the residential share of the total WWT and CSO costs.

  o The residential share of total costs is computed by multiplying the percent of total wastewater flow (including infiltration and inflow) attributable to residential users by the total costs.

• Calculate the CPH by dividing the residential share of the total WWT and CSO costs by the number of households within the service area.

The sources of data necessary for calculating CPH will vary somewhat by utility/municipality. Table 2-1 provides a summary of typical data sources.

Step 2: Determine Service-area MHI

The second step in developing the RI is to determine MHI for your service area (or general service area boundaries if the service area does not exactly follow Census-designated areas). In its 1997 Guidance, EPA recommends using the MHI from the latest census year and adjusting it to current year dollars using the average CPI inflation rate. However, the Decennial Census no longer includes MHI as a statistic. MHI is reported annually as part of the U.S. Census Bureau American Community Survey (ACS), which can be accessed via the American FactFinder (AFF) website at factfinder.

Table 2-1 Typical data sources for calculating EPA's Cost per Household

Component of CPH	Data source
Current annual WWT, CSO, or stormwater costs	Utility/municipality financial reports (in some states these are available from central records kept by the state auditor or other state offices)
Projected annual WWT, CSO, or stormwater costs	Utility/municipal planning documents
CPI	Bureau of Labor Statistics (USDOL BLS, 2012)
Percent of total wastewater flow attributable to residential users	Utility billing data
Number of households in service area	Utility/municipal planning documents, U.S. Census Bureau ACS single-year estimates for most recent year[a]

aU.S. Census Bureau ACS data can be used if service area boundaries follow Census divisions (e.g., county, city, Census tracts, metropolitan statistical areas). Chapter 5 provides additional detail on ACS data.

census.gov/faces/nav/jsf/pages/index.xhtml. Additional detail and instructions for accessing ACS data are included in chapter 5, as well as in Workbooks 2, 3, and 4 that are included with this Assessment Tool.

EPA's 1997 Guidance also states that if the service area includes more than one jurisdiction, a weighted MHI should be developed based on the number of households within each area. In addition, if MHI is unavailable for a specific service area or jurisdiction, EPA suggests that the surrounding county's MHI may be sufficient.

Step 3: Calculate and Analyze the RI

To calculate the RI, the annual CPH is divided by the MHI of the service area. The RI indicator is then compared to financial impact ranges established by EPA to determine whether unfunded mandates will produce a possible high, mid-range, or low financial impact on residential users. In the context of wastewater, CSO, and stormwater controls, the RI is categorized as low if it is less than 1%, mid-range if it is between 1% and 2%, and high if it is greater than 2%. For drinking water, an RI of greater than 2.5% is considered to represent a high financial impact.

In its 1997 Guidance, EPA suggests that if the wastewater RI is classified as "mid-range" or "high", then the community should perform a secondary screening analysis (i.e., calculate the FCI) to assess the utility's financial capability to afford additional programs. Results from the preliminary and secondary screening analyses are ultimately combined into EPA's Financial Capability Matrix to determine whether a community should be granted a longer compliance schedule for meeting regulatory obligations, or provided another form of relief.

Chapter 3

Primary Data Sources for Developing Alternative Measures of Household Affordability

This chapter provides an overview of the data sources that can be used to develop the metrics outlined in the subsequent chapters (4 and 5), including:

1. U.S. Census Bureau American Community Survey (ACS, the primary data source)

2. U.S. Census Bureau Integrated Public Use Microdata Series (IPUMS)

3. Additional national, state, and local sources.

Use these data sources to develop alternative measures of household affordability (i.e., beyond EPA's RI). Such alternative measures include a series of socioeconomic indicators, such as income distribution and poverty rates within a community, as well as specific affordability metrics for different household types.

Workbooks 2 and 3 provide more information and step-by-step instructions for accessing and analyzing this data.

U.S. Census Bureau ACS

The U.S. Census Bureau ACS serves as the primary source of data used to develop the affordability measures recommend in this Assessment Tool. The ACS is a household survey conducted by the U.S. Census Bureau with a current annual sample size of approximately 3.5 million households. The ACS replaced sample (long-form) data from the Census and is now the only source of data on income, poverty status, education, employment, and most housing characteristics. ACS estimates are released annually (for geographic areas with a population of 65,000 or more), as a three-year average (for geographic areas with a population of 20,000 or more), and as a five-year average (for all geographies, down to the Census Block Group level). The ACS is considered the most reliable source of detailed socioeconomic data currently available, and is the only source of data available for small geographies.

ACS datasets can be used to access socioeconomic data that will allow better examination of economic need within a community, including:

- Income levels and income distribution
- Poverty rates
- Unemployment rates
- Households receiving public assistance
- Some information on housing costs and housing burden

ACS data are also used in this Assessment Tool to develop specific affordability metrics, such as comparing average household water and wastewater bills to the MHI for each income quintile, and examining EPA's RI at the census tract level to identify potentially vulnerable communities.

ACS data are available on the U.S. Census Bureau's American FactFinder website. One-year estimates are typically released for the previous year every September, three-year estimates in October, and five-year estimates in December. As of December 1, 2012, the U.S. Census Bureau has released one-year estimates for 2011 and three-year estimates for 2009-2011. Five-year average estimates are scheduled for release on December 6, 2012.

Throughout this Assessment Tool, USCM, AWWA, and WEF recommend using the ACS to collect socioeconomic data at the city (or service area) level (i.e., using single-year or three-year average ACS estimates), as well as at smaller geographic scales (e.g., at the Census tract level, using five-year average ACS estimates). Analysis of these data on a smaller-scale (such as a Census tract or neighborhood) can help to identify vulnerable populations and assess potential EJ concerns.

Workbooks 2 and 3 provide additional information and step-by-step instructions for accessing, reporting, and mapping both one-year and five-year average ACS estimates. This includes guidance on navigating the AFF website, specific source tables for socioeconomic data, and selecting the correct geographic area (e.g., place within a state, county, metropolitan service area) for your service area.

U.S. Census Bureau IPUMS

In addition to ACS data, more in-depth analyses can be performed using the U.S. Census Bureau's IPUMS. IPUMS can be used to analyze socioeconomic characteristics across different types of households (e.g., renter-occupied versus owner-occupied households, multi-family versus single-family) or to run queries or cross tabs at the city- or PUMA-level. PUMAs are statistical geographic areas that have been defined for the tabulation and dissemination of IPUMS data. PUMAs are made up of clusters of Census tracts and have a population of at least 100,000.

IPUMS consists of more than 50 high-precision samples of the American population drawn from 15 federal Censuses and 2000–2010 ACS data. IPUMS is composed of microdata, meaning that each record is a person. In most samples, persons are organized into households, making it possible to study the characteristics of people in the context of their families or other co-residents. Because IPUMS uses census results from individuals, it is possible to drill down into much deeper detail than possible with ACS summaries. For example, IPUMS data can be used to determine the percentage of people at certain income levels in different areas of a city or community (e.g., the percentage of residents with incomes greater than the 2% affordability threshold income).

The use of PUMS data presents several obstacles for water and wastewater utilities. Most importantly, because the data are individuals and not tables, researchers must use advanced statistical packages (such as SPSS, SAS, S-plus, or R software programs) to analyze the millions of records in the database. In addition, the large size of the PUMAs (100,000 people) is a potential problem for smaller cities. Further, because PUMAs must include 100,000 people, some PUMA boundaries are arbitrary and do not always follow political or common geographical delineations.

For these reasons, this Assessment Tool does not provide in-depth detail on how to access and analyze IPUMS data. However, the use of these data by water and wastewater utilities may be performed in-house or by consultants with relevant knowledge. More information on IPUMS can be found at www.census.gov/acs/www/data_documentation/public_use_microdata_sample/.

Throughout the remainder of this Assessment Tool, places where IPUMS data would serve to augment household affordability assessments are noted; however, the Assessment Tool and analyses focus on more accessible and user-friendly data sources.

Supplemental Data Sources

In addition to U.S. Census Bureau surveys, state and local data sources can also provide a wealth of relevant information. The availability of these sources will vary across utilities/municipalities and may include information from states' labor departments (e.g., particularly for unemployment data), economic development and local government agencies, and other local agencies and organizations.

Another source of supplemental data may include datasets that provide information on nondiscretionary spending and housing costs within a city compared to the national average, or some other benchmark. This information can help to demonstrate the burden that these costs place on different types of households and can provide insight into the potential effects of water and wastewater rate increases. For example, in larger communities where the cost of living is high and incomes are commensurate with the national average, the American Chamber of Commerce Research Association (ACCRA) Cost of Living Index (COLI) database might serve as an important measure of existing household burdens. The ACCRA COLI database provides a measure of differences in the cost of living among urban areas in the United States relative to price levels for consumer goods and services in participating areas. Data from the BLS Consumer Expenditure Survey (CES) can also be used to assess economic burdens within different types of communities, including both urban and rural communities. More information on the ACCRA COLI is available at www.coli.org/.

Chapter 4

Guidance for Analyzing Socioeconomic Indicators of Household Affordability for Your Community

There is no single piece of information that can definitively indicate whether a community is at risk of being unable to afford increased water and wastewater costs. However, relevant socioeconomic indicators can help to provide a more complete picture of a community's economic and social characteristics (and thus, its ability to afford rate increases associated with unfunded mandates). This Assessment Tool (and associated templates) focuses on the following indicators of social and economic need[1]:

- Income levels
- Income distribution
- Poverty rates
- Household economic burdens and nondiscretionary spending
- Supplemental indicators, including households receiving public assistance and unemployment rates within a community.

The following sections provide an overview of the socioeconomic indicators described above, as well as general guidance for accessing and analyzing specific socioeconomic data. We do not propose specific affordability thresholds for these indicators, rather, they are intended to provide context and to help "build the case" for why a community may merit additional consideration for regulatory relief.

Throughout this Assessment Tool, graphs and tables for specific indicators are presented, drawing upon data from various U.S. cities as examples. Workbook 2, "Assessing American Community Survey Data at the Community, National, and Census-Tract Levels," includes step-by-step instructions for accessing the ACS data necessary for analyzing each indicator. Workbook 3 provides templates for developing specific analyses for your community[2].

Income Levels

Although not useful as a sole indicator of household affordability, MHI data will serve as an important component of your household affordability assessment. In addition to providing an indication of economic need, MHI data will be used to develop specific affordability measures (e.g., evaluating water and wastewater rates as a percentage of MHI by Census tract or within each income quintile).

The first order of business is to document MHI for your community for the most recent year available, compared to the national MHI for the same year (in 2011, the MHI in the United States was $50,502). Citywide or service area-wide income data are easily obtained via American FactFinder (AFF) using the ACS single-year, three-year average, or five-year average dataset, depending on the size of your community. See Workbooks 2 and 3 with this Assessment Tool.

To identify specific areas in your community with high concentrations of low-income households, MHI data should also be analyzed at the Census tract level. These data will be based on five-year average estimates from the ACS because single-year data are not available at this smaller geographic scale (5-year average estimates are available for all geographies). These data should be downloaded via AFF into Excel spreadsheets for further analysis.

1 There are other indicators that localities and utilities may want to consider, particularly those listed in the EPA 1995 Interim Economic Guidance for Water Quality Standards Workbook as part of the widespread economic impact analysis; these indicators include: losses to local economy; increases in unemployment; impacts on property values or community development potential; decreases in tax revenues; loss of future jobs or personal income. See this EPA guidance for a complete list.

2 ACS estimates are released annually (for geographic areas with a population of 65,000 or more), as a three-year average (for geographic areas with a population of 20,000 or more), and as a five-year average (for all geographies, down to the Census Block Group level).

Figure 4-1 MHI by Census tract, 2011, developed using American Fact Finder website
Source: U.S. Census Bureau ACS, 2011a, 2006–2010 five-year average estimates

The AFF website provides options for developing maps of income and other socioeconomic data by Census tract. Tract-level data can also be analyzed and mapped using geographic information systems (GIS), depending on the resources and capabilities within your utility. With the use of GIS, utilities have the options for further analyzing the data and conducting more in-depth analyses (e.g., developing maps showing Census tracts where the average household water and wastewater costs exceed specific percentages of MHI). Workbook 3, "Socioeconomic Indicators" provides specific instructions for accessing Census tract-level data and developing the corresponding maps.

Figures 4-1 and 4-2 provide examples of Census tract MHI maps for the City of Philadelphia developed on the AFF website and using GIS, respectively. These maps demonstrate significant variation across census tracts, in terms of MHI. Workbook 2 includes specific instructions for downloading and mapping Census tract level data.

To identify potentially vulnerable populations, income levels should also be analyzed across different types of households. For example, in some communities there may be considerable differences between income levels for renter-occupied and owner-occupied households, as well as between multi-family and single-family households, or between elderly and non-elderly households. Income data for renter and owner-occupied households and for elderly residents can be downloaded from the 2011 (or relevant year) ACS single-year dataset. However, income data for multi-family and single-family households can only be accessed through IPUMS.

Table 4-1 shows how MHI can vary significantly across different types of households, using Kansas City, Kansas as an example.

In addition, in recent years income levels in many cities have been declining. Where this happens it has important affordability implications because it means that increases in water and wastewater bills will not be offset by similar increases in incomes. Income data can be downloaded from single-year ACS databases from 2005 through the current year. When comparing MHI across years, it is important to adjust for inflation (using the CPI) so that all data points are compared using the same year value. For smaller communities, it will be necessary to look at changes in three-year or five-year average ACS estimates.

Continuing with Kansas City as an example, Figure 4-3 presents a graph of citywide MHI for 2005 through 2011. As shown, Kansas City has followed the trend of many cities in the United States, with real MHI declining by about $1,150 from 2005 to 2011. When compared to average increasing annual household water and wastewater costs, this graph can serve as a useful tool to show how increasing water and wastewater bills are outpacing real increases in household

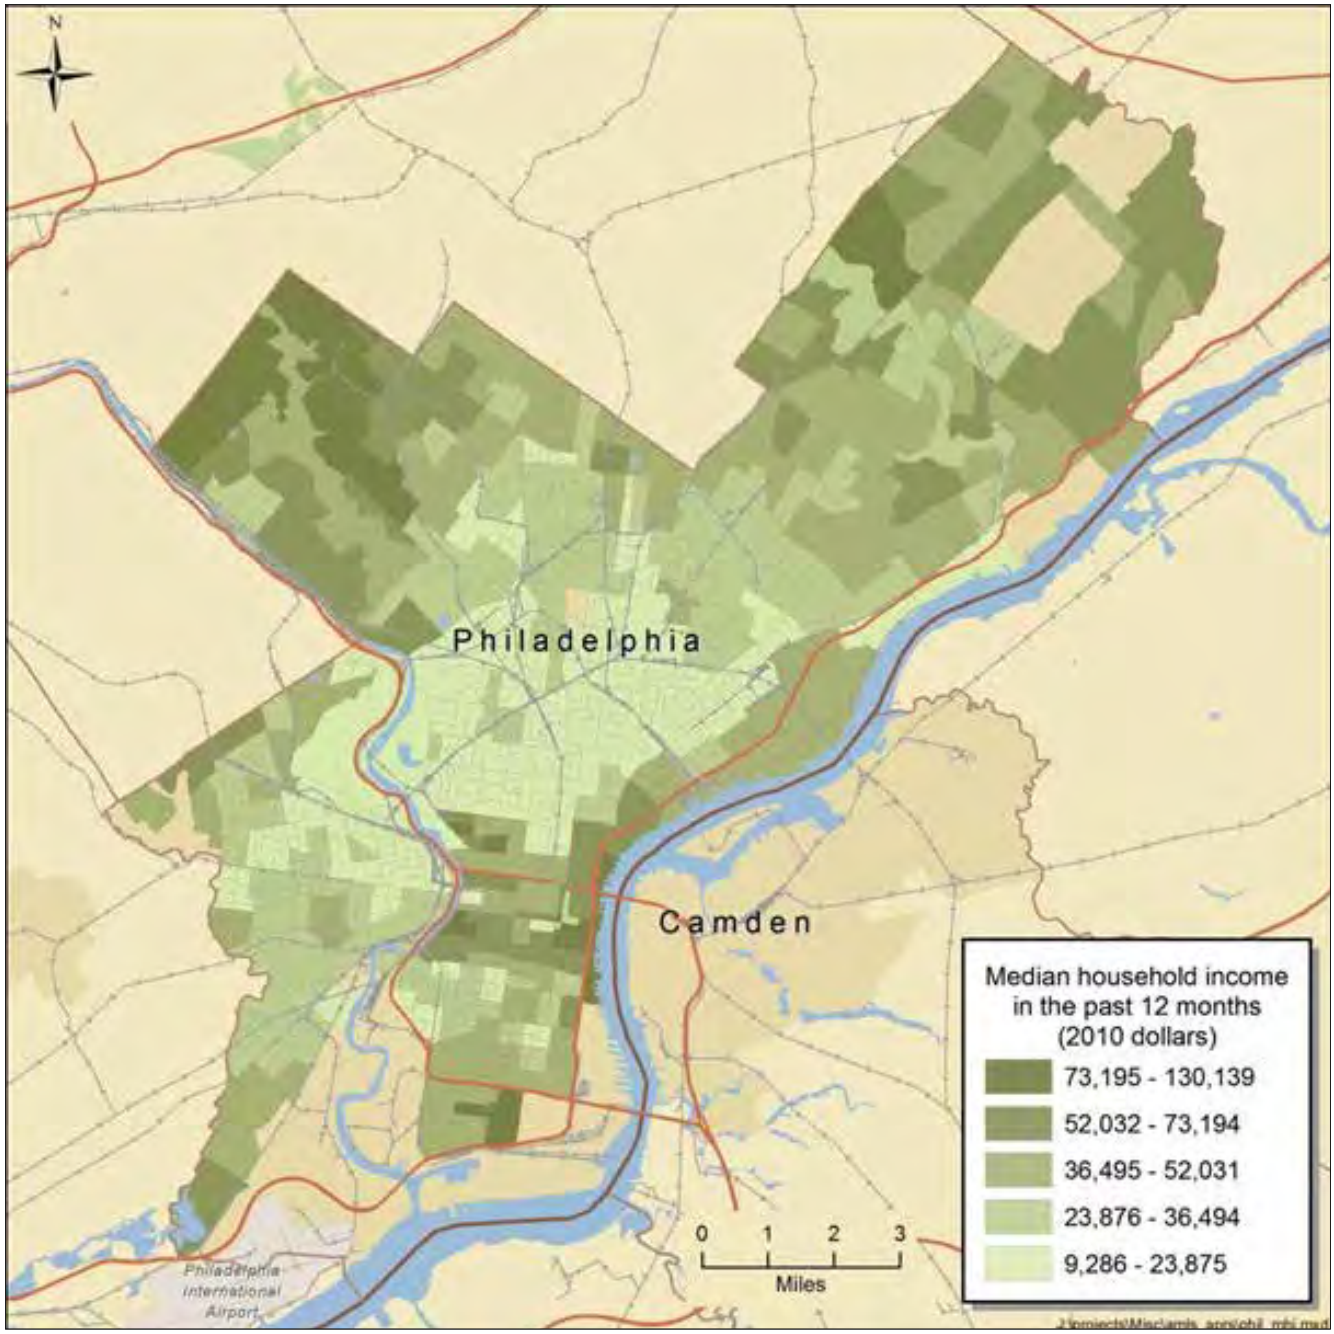

Figure 4-2 MHI by Census tract, 2011, developed using in-house GIS capabilities
Source: U.S. Census Bureau ACS, 2011a, 2006–2010 five-year average estimates

incomes (e.g., annual average household water and wastewater costs can be graphed on the secondary y axis).

Table 4-1 MHI by household type, Kansas City, Kansas

Household type	MHI (2011$)
All households	37,036
Elderly households	27,955
Renter-occupied	24,898
Owner-occupied	47,272

Source: U.S. Census Bureau ACS, 2012, 2011 single-year estimates

Workbook 3 (an Excel spreadsheet) provides the specific ACS data tables you will need to obtain the information presented above for your community. The spreadsheet also provides templates for presenting these indicators as graphs and tables (see spreadsheet tabs MHI, MHI_HHType, and ServiceArea_MHI_2005-2011).

Income Distribution

In many cities, incomes are less centered on the median compared to incomes in the United States as a whole. This has important implications for affordability because

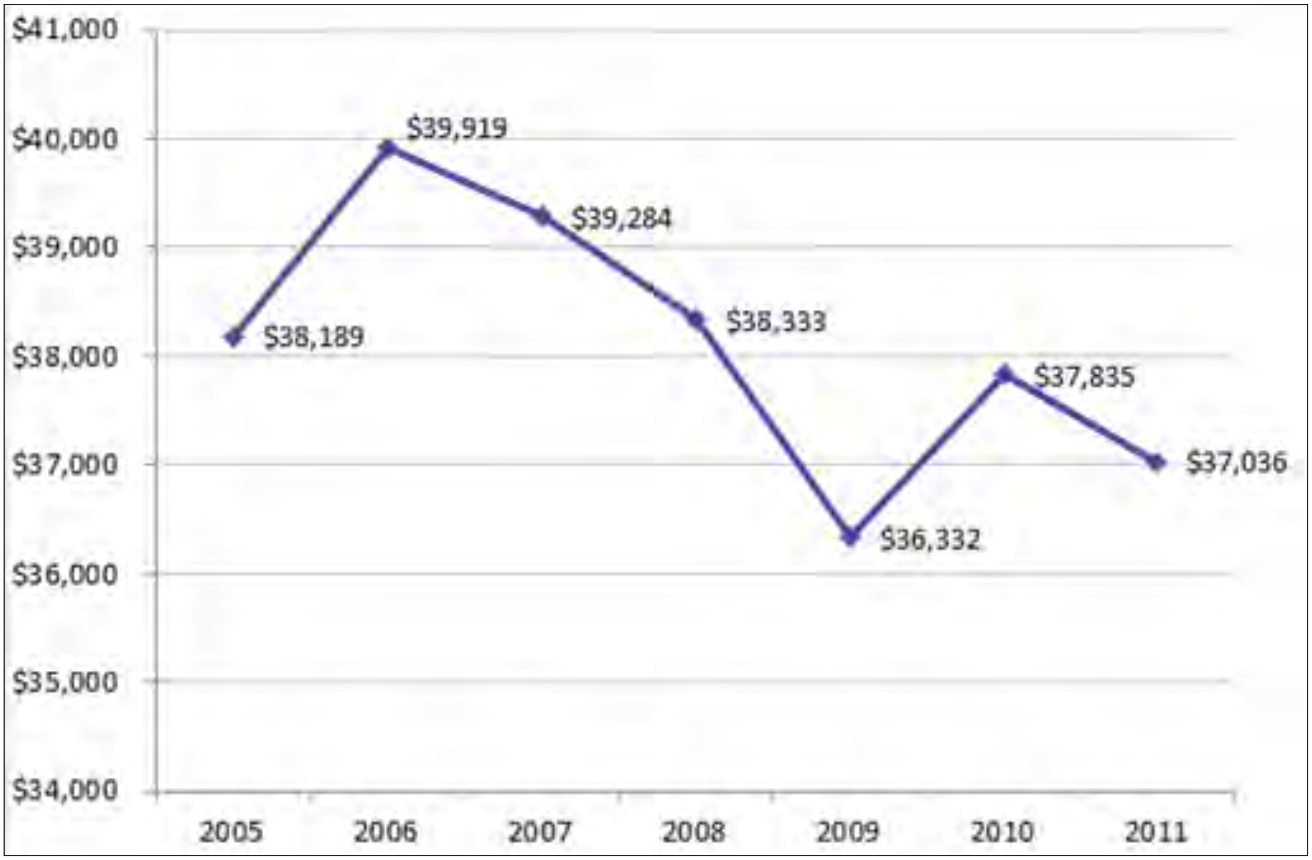

Figure 4-3 Kansas City MHI, 2005–2011, adjusted to 2011 dollars using CPI
Sources: U.S. Census Bureau ACS, 2006, 2007, 2008, 2009, 2010, 2011b, 2012 (2006-2010 single-year estimates).

it means that a higher percentage of households within these communities may be adversely impacted by water and wastewater rate increases compared to what might be expected under a more equal distribution of income. Although this is the case in many larger urban communities, Rubin (2001b) shows that this is also the case for many rural/nonmetropolitan communities, which tend to have a higher percentage of households in lower-income categories compared to the national average.

Income distribution can be examined with ACS data in different ways, including by income quintile, as well as by 10- and 16-category distributions. Table 4-2 shows the upper limits of household income quintiles for Atlanta, Georgia, compared to the United States as a whole. As shown, the lowest-income quintiles in Atlanta are substantially lower than those for the United States. This indicates that a greater percentage of Atlanta households are at the lower end of the income spectrum compared to the national average (e.g., the upper limits for the lowest quintile indicate that in the United States, the lowest 20% of households earn less than $20,585 per year, while in Atlanta, the lowest 20% of households earn less than $12,294 per year). Conversely, the lower limits for the upper quintiles are greater in Atlanta than for the United States overall.

Table 4-2 Household income quintile upper limits, Atlanta, Georgia and the United States (2011$)

	Atlanta, GA	United States
Lowest quintile	12,294	20,585
Second quintile	31,873	39,466
Third quintile	59,043	63,001
Fourth quintile	104,233	101,685
Lower limit of top 5%	246,335	187,087

Source: U.S. Census Bureau ACS, 2012.

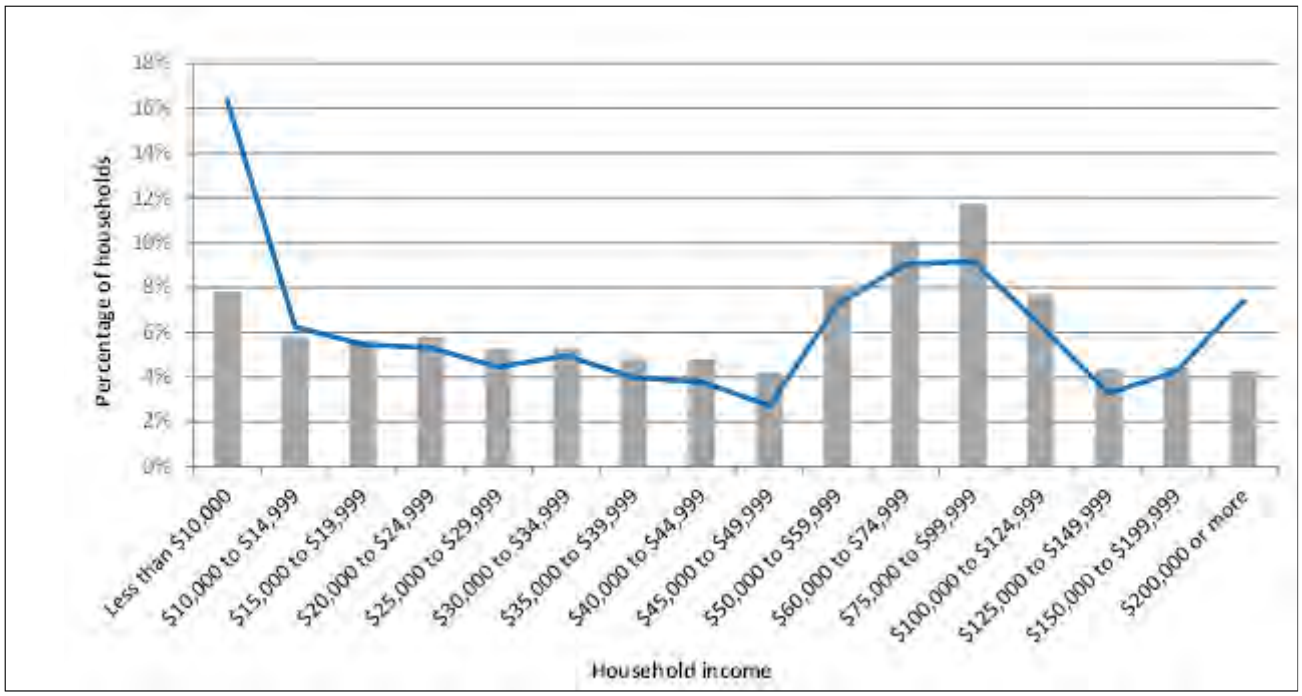

Figure 4-4 Income distribution in Atlanta, Georgia and the United States
Source: U.S. Census Bureau ACS, 2012 (2011 single-year estimates).

Figure 4-4 graphically portrays that the income levels in Atlanta are more concentrated toward the ends of the income spectrum compared to the national average. Indeed, the figure reveals that the income bracket containing Atlanta's MHI ($43,903 in 2011) is one of the least-populated income classes in the entire city. Thus, it is evident that in Atlanta (and in many other cities in the United States), citywide MHI does not reflect a "typical" household. Further, a much higher percentage of residents would be adversely impacted by increased water and wastewater bills compared to communities with a more equal and centrally clustered income distribution.

The evaluation of income distribution across different household types can help to identify vulnerable populations within a community. Continuing with Atlanta, Georgia, as an example, Figure 4-5 shows the income distribution across elderly households (i.e., the head of the household is 65 years or older) compared to the income distribution citywide. As shown, the majority of elderly households (52%) have a reported income of less than $25,000. This compares to about 33% of households citywide.

As demonstrated in Table 4-1, a second population of potentially vulnerable households includes renter-occupied households, which often have lower incomes than owner-occupied households. Figure 4-6 shows the income distribution for renter- and owner-occupied households in Atlanta, Georgia, where 55% of all households are renter occupied. As shown, there is a much higher percentage of renter-occupied households in the lower-income categories, with close to 40% of all renters earning less than $20,000 per year.

Workbook 3 provides the specific ACS data tables that you will need to obtain income distribution data for your community. The spreadsheet also provides templates for presenting these indicators as graphs and tables (see spreadsheet tabs Inc._quintiles; Inc._dist; Elderly_Inc_dist;, and Renter_Owner_Inc_dist).

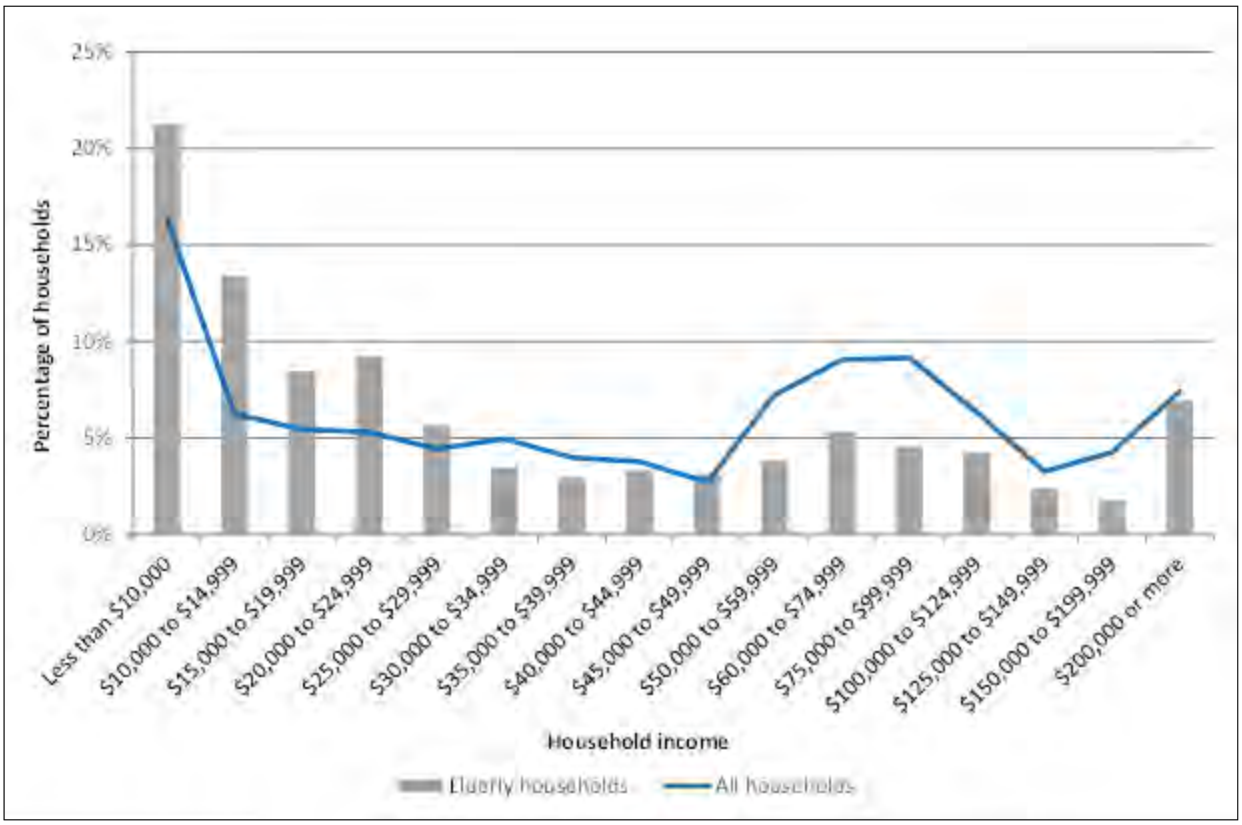

Figure 4-5 Income distribution in Atlanta, Georgia, elderly households and citywide
Source: U.S. Census Bureau ACS, 2012 (2011 single-year estimates)

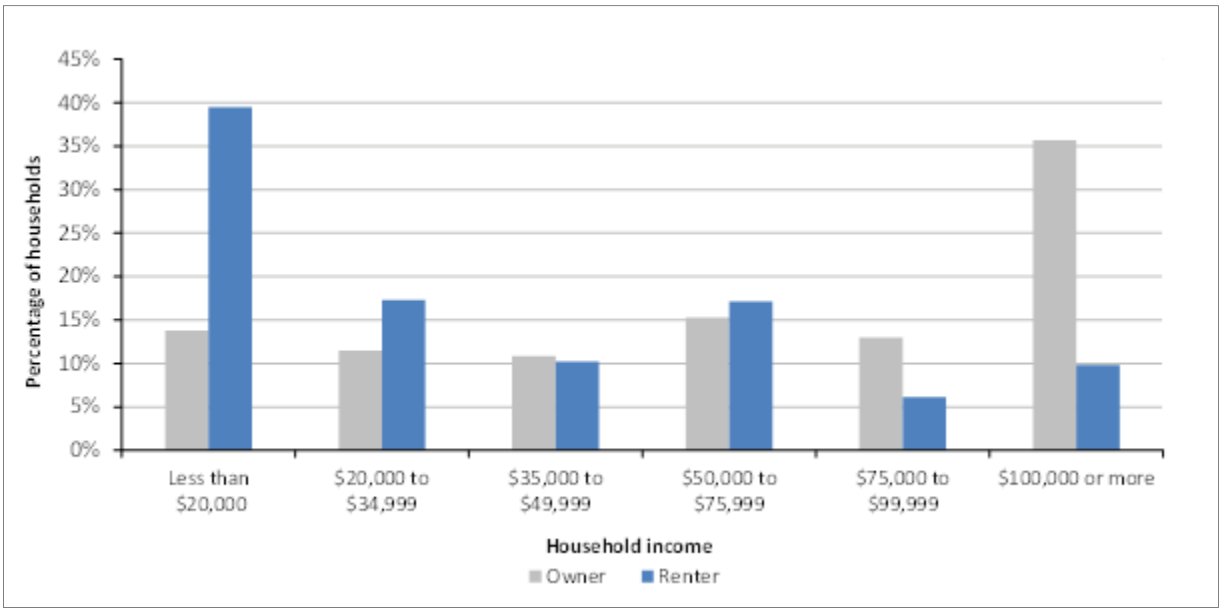

Figure 4-6 Atlanta, Georgia income distribution, renter- and owner-occupied households
Source: U.S. Census Bureau ACS, 2012 (2011 single-year estimates)

Poverty Rates

In addition to income levels and income distribution, poverty rates serve as an important indicator of economic need. In 2011, 15.9% of people in the United States were living below the federal poverty line. This percentage provides a benchmark for assessing poverty levels within your community, which can be obtained using ACS single-year and three-year average estimates (depending on the size of your service area). Data on the percentage of elderly residents and children living below the federal poverty line are also available through ACS. These data can help to identify vulnerable populations.

Similar to income levels, poverty rates can be examined at the Census tract level using five-year average ACS estimates. Once these data are downloaded, they can be used to identify "poverty areas," where 20% or more of the households in that Census tract have incomes below the federal poverty level. Again, these data can be mapped using AFF or with GIS capabilities at your utility.

In terms of affordability, identifying areas where poverty is more concentrated may have important implications for public health. In essence, the effective reduction in disposable income among low-income households could adversely affect those households' ability to pay for needed food, heat, and medical care (Crawford-Brown et al., 2009; Raucher et al., 2011). Care should be taken to ensure that public policies (including well-intentioned environmental mandates) do not impose costs that may further exacerbate the health challenges faced by households in such low-income neighborhoods.

Many have argued that the official (i.e., federal) poverty rate does not provide an accurate measure of the number of households truly living in poverty conditions. Indeed, various studies have emphasized that households with incomes that are significantly higher than the poverty level often experience severe hardships, including hunger, lack of needed heating and cooling, and the inability to afford medical care (Boushey et al., 2001).

To obtain a more accurate measure of households living in poverty conditions, the U.S. Census Bureau developed a Supplemental Poverty Measure (SPM) in 2010. The SPM factors in public assistance and financial support offered to low-income households (e.g., housing subsidies, low-income home energy assistance) and also recognizes some nondiscretionary expenses that such households bear (e.g., taxes, out-of-pocket medical expenses, and geographic adjustments for differences in housing costs) (U.S. Census Bureau, 2011a).

At the national level, for a two- adult, two-child household in 2010, the SPM income threshold was set at $24,343. This compares to the official poverty threshold of $22,113. Nationwide, the SPM indicates[4] that there are 5.35% more people in poverty than the official poverty threshold would indicate. The SPM also indicates that inside Metropolitan Statistical Areas the difference is 11.2%, and within "principal cities," the SPM-implied number of people in poverty is 5.94% higher than the official poverty measure indicates. Although the SPM is not yet available at the city/community level, these general rules can help to identify additional households that may be adversely impacted by increased water and wastewater rates.

Workbook 3 provides the specific ACS data table that you will need to obtain poverty data for your community. The spreadsheet also provides templates for presenting these indicators as graphs and tables (see spreadsheet tab "Poverty").

Housing Burdens and Nondiscretionary Spending

As noted in chapter 1, EPA's residential indicator does not capture existing household economic burdens beyond those associated with water and wastewater bills. Economic burdens are commonly measured by comparing the cost of particular necessities to the resources (e.g., income) available to a household or community. EPA's RI is such a measure in that it is used to evaluate the economic burden from wastewater charges by comparing those charges to MHI. However, wastewater service is just one of a set of basic necessities whose costs influence the overall economic burden on a community's households.

Household economic burdens can be a significant factor for large urban communities where the cost of living is much higher than the national average, as well as in smaller rural communities where MHIs are often lower than the national MHI but nondiscretionary costs are not. Analysis of household economic burdens and nondiscretionary spending requirements can provide an indication of how difficult it is for both low- and middle-income households in your community to make ends meet, and how increases in water and wastewater costs will impact different types of households.

Housing burden is the most common measure of household economic burden. Most government agencies consider housing costs of between 30% and 50% of household income to be a moderate burden in terms of affordability; while costs greater than 50% of household income are considered

4 The SPM also adjusts for different housing status (e.g., renters versus owners). Additional details can be found in the U.S. Census Bureau (2011).

a severe burden. The ACS provides information on monthly housing costs for both owner-occupied and renter-occupied households, as well as by income level. These data can be divided by the MHI for these different groups to calculate housing burden. Additional analyses can be performed using IPUMS data (e.g., IPUMS can be used to determine the exact number of households with a moderate or severe housing burden, while ACS summary files can only provide average costs as a percentage of MHI for a limited number of household types).

Workbook 3 provides the specific ACS data tables you will need to access to obtain housing burden data for your community. The spreadsheet also provides templates for presenting different housing burden indicators as graphs and tables (see spreadsheet tab "Housing_burden").

Sources of nondiscretionary spending data can help to provide insight into additional household economic burdens. Key sources for these data include the Bureau of Labor Statistics CES, the ACCRA COLI, and any additional local data sources prepared by government agencies or organizations. The BLS CES contains detailed demographic, income, and monthly expenditure data at the PUMA level. These data can provide insight on relative consumer spending within your community compared to different types of communities (e.g., urban vs. rural). CES data are accessed in the same way that IPUMS data are accessed, and require a thorough knowledge of a statistical software package such as SAS, SPSS, or STATA.

ACCRA COLI data are another source of nondiscretionary spending data. The ACCRA COLI provides a measure of differences in the cost of living among urban areas in the United States. The ACCRA COLI measures relative price levels for consumer goods and services in participating areas. The average for all participating places, both metropolitan and nonmetropolitan, equals 100 and each participant's index is read as a percentage of this average. The ACCRA COLI dataset is updated quarterly for approximately 305 cities within the United States, and includes data for different income quintiles. This data can be useful if your community is one of the participating areas.

Additional Socioeconomic Indicators

There are several additional measures of economic need that can help to examine the ability of households to afford water and wastewater rate increases, including:

1. Percentage of residents receiving public assistance income and/or food stamps

2. Average annual unemployment rates

3. Number/percentage of households that are delinquent in paying their water bills

4. Number/percentage of households enrolled in utility low-income assistance programs.

Workbook 2 describes the specific ACS source tables that contain information related to the percentage of residents receiving public assistance income and/or food stamps and average annual unemployment. Information on delinquency rates and low-income assistance programs should be available through your utility.

Chapter 5

Guidance for Developing Alternative Measures of Household Affordability

This chapter provides additional guidance for assessing water and wastewater affordability at the household level (i.e., going beyond EPA's RI). This includes the development of utility-specific affordability measures, such as comparing current average wastewater bills to household income levels across the income distribution in your service area or community. The following sections provide an overview of recommended approaches for assessing affordability and communicating results, while more detailed instructions and templates for developing these alternative metrics are included in Workbook 4.

Remember that EPA may consider the affordability of water and CSO mandates using your community's MHI. However, throughout the following sections, water and/or wastewater bills are compared to household income levels, drawing upon data from selected communities throughout the United States. For the purpose of this Assessment Tool, hypothetical average household water and wastewater costs of $300 and $450, respectively, are used for a combined average annual bill of $750. It is important to keep in mind that these analyses can be conducted using current water and/or wastewater costs, as well as household water and wastewater costs that take into account planned rate increases. This chapter also provides additional detail on conducting affordability analyses for future years.

Average Water and Wastewater Bills

Throughout this chapter, the comparison of average household water and wastewater bills to household income levels are discussed. It is important to note that the use of the term "bill" is intended to reflect the estimated average costs of water and/or wastewater service based on current rates and average household consumption. If data are available, a weighted average can be determined based on the number of single- and multi-family homes in the community and their respective average household consumption levels.

With this approach, average household water and wastewater costs are based on your utility's existing rate models, as reflected in the current rates. This provides a more realistic assessment of current household costs and should allow you to easily evaluate household affordability in future years under planned rate increases. This approach should also allow you to examine household affordability under a series of "what if" scenarios (e.g., examining affordability with and without the impact of a potential mandated or nonmandated investment, or under different assumptions regarding interest rates and financing costs).

Water and Wastewater Bills and Household Income Comparisons

As a first step to developing your affordability indicators, compare average annual water and wastewater bills to household incomes for different types of households and across geographic areas. At the citywide level, this calculation essentially represents EPA's RI (although it can include water costs in addition to wastewater costs). The RI calculation should also be evaluated at the Census tract level (if your community is large enough to include several Census tracts) to identify areas where average household costs may have a "mid-range" to "large" economic impact (e.g., as defined by EPA for wastewater).

Continuing with our analysis of MHI by Census tract for the City of Philadelphia (see chapter 4), Figure 5-1 shows average annual household wastewater costs (using our hypothetical average bill of $450) as a percentage of Census tract MHI. This map demonstrates how an increase in wastewater rates would impact communities within Philadelphia differently.

The Census tracts outlined in black in Figure 5-1 illustrate an important point for analyzing household affordability at the Census tract level. These Census tracts are highlighted because they have fewer than 750 people in them (the average number of people per Census tract is about 4,000). Thus, although a map may show several Census tracts where the average household water and/or wastewater bill amounts to a relatively high percentage of MHI, it is important to evaluate what this means in terms of the overall population of your service area (in the case of Philadelphia, about 1.5 million people). To account for this,

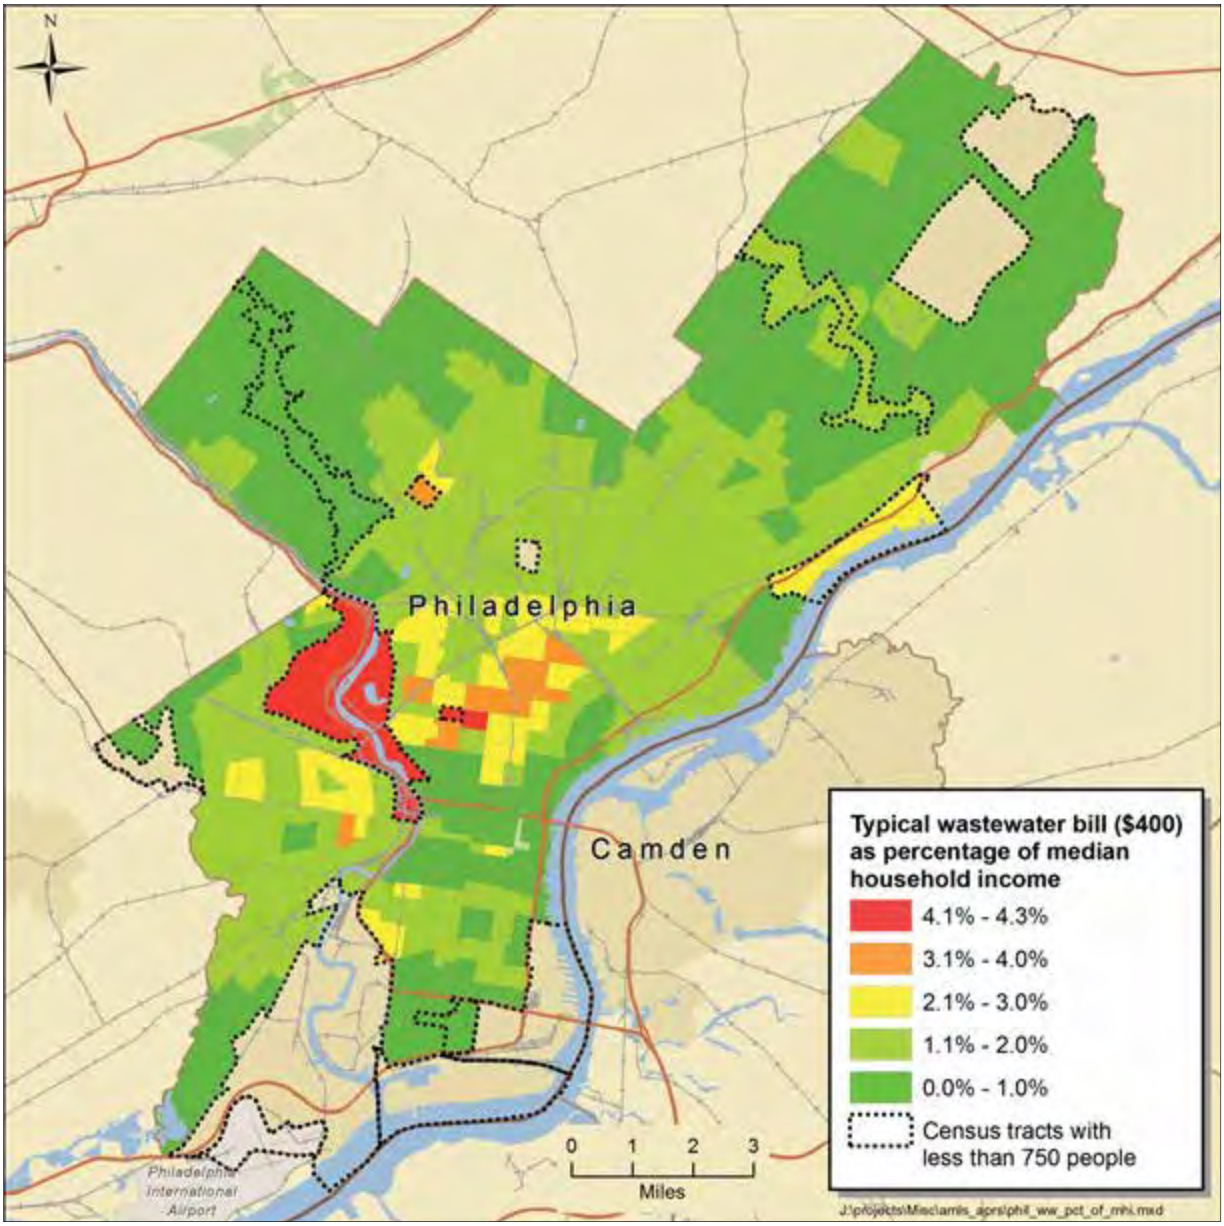

Figure 5-1 Hypothetical average annual wastewater bill as a percentage of Census tract MHI, Philadelphia, Pennsylvania

Source: U.S. Census Bureau ACS, 2011a, 2005–2010 five-year average estimates

it is important to examine variables that provide context (e.g., population, number of households) when downloading Census tract data for specific analyses. These data can be easily downloaded by Census tract via AFF using ACS five-year average estimates.

In many communities, the estimated average household wastewater bill and total combined (water and wastewater) bill may not exceed 2% and 4.5%, respectively, of MHI in most Census tracts; however, a number of households have incomes well below the MHI for their community. Many of these households may already be paying more than 2% of their income for wastewater services, or more than 4.5% of their income for combined water and wastewater services.

This can be easily examined using income distribution data from the ACS. For example, Figure 5-2 shows the percentage of households within Sacramento, California, at different levels of affordability (i.e., the percentage of households spending certain percentages of their income

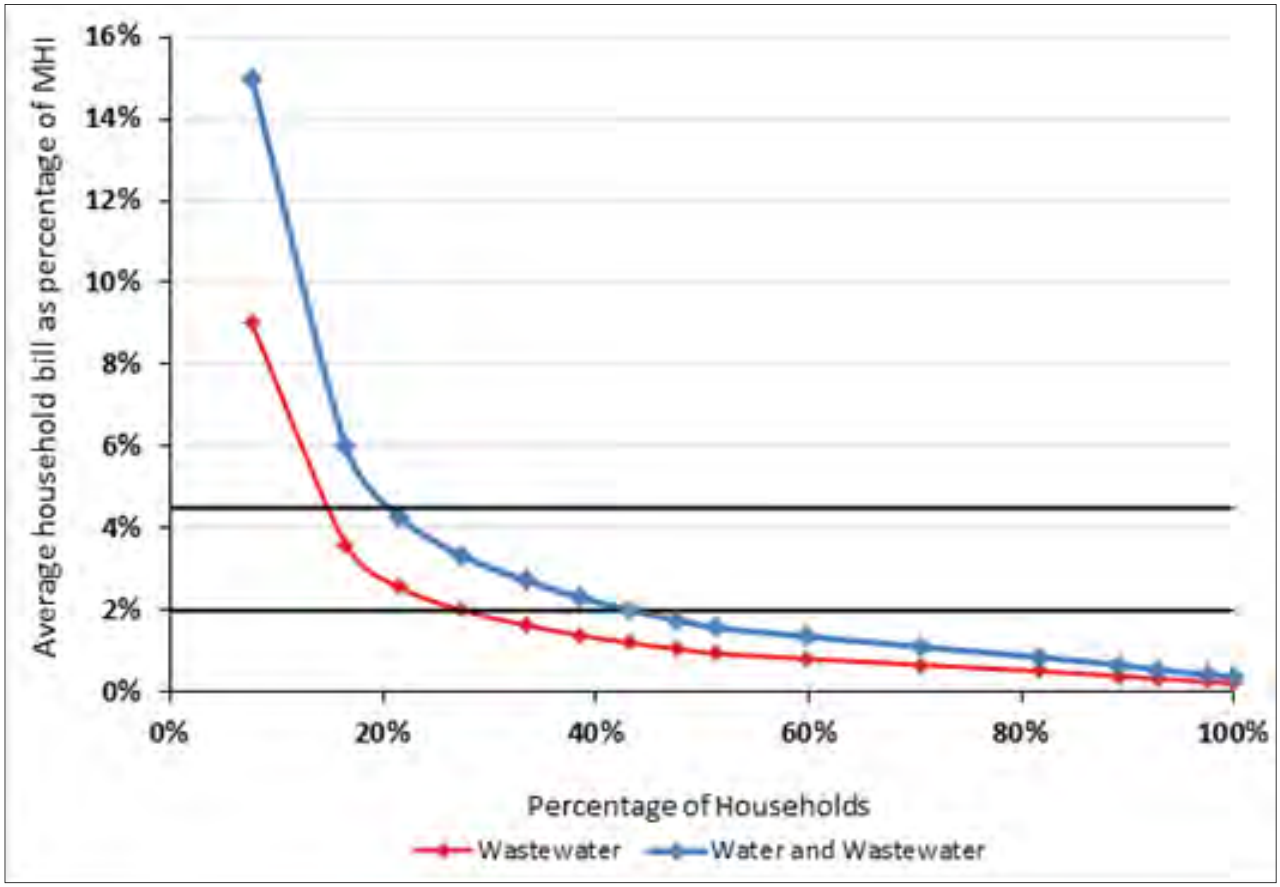

Figure 5-2 Hypothetical annual average wastewater and combined water and wastewater bills as a percentage of household income, Sacramento, California

on water and wastewater services). This analysis is based on the percentage of households within each of 16 Census-defined income categories and evaluates the average wastewater and total combined water and wastewater bill as a percentage of the mid-point income within each category. As shown, it appears that with average household costs of $300 and $450 for water and wastewater services, respectively, close to 30% of households in Sacramento, would pay more than 2% of their income for wastewater services, and about 20% pay more than 4.5% of their income for combined water and wastewater services.

IPUMS data can be used to conduct further analysis on the number of households that may be unable to afford significant water and/or wastewater rate increases. For example, based on the estimated average household water and wastewater cost of $750, households earning less than $16,667 would pay more than 4.5% of their income for water and wastewater services. IPUMS can be queried to determine the exact number of households within your community (and within each PUMA in your community), that make less than this amount (and therefore would have paid more than 2% of their income for their estimated average wastewater bill).

Table 5-1 Hypothetical annual average wastewater bill as percentage of MHI by income category, Butte, Montana

Income category	Percentage of households	MHI within income quintile	Average estimated wastewater bill as a percentage of MHI
Less than $20,000	24%	$10,000	7.50%
$20,000 to $39,999	26%	$29,999	2.50%
$40,000 to $74,999	30%	$57,499	1.30%
$75,000 to $99,999	8%	$87,499	0.86%
$100,000 to $199,999	10%	$149,999	0.50%

Three-year average ACS estimates were used due to the small size of Butte; one-year estimates are unavailable.

Table 5-2 Hypothetical annual average wastewater bill as a percentage of federal poverty threshold incomes

Household or family size	Poverty threshold	Average water and wastewater bill (example) ($)	Estimated average household bill as a percentage of poverty level income (%)
1	$11,170	284	2.54%
2	$15,130	568	3.76%
3	$19,090	852	4.46%
4	$23,050	1,136	4.93%
5	$27,010	1,420	5.26%
6	$30,970	1,705	5.50%
7	$34,930	1,989	5.69%
8	$38,890	2,273	5.84%

Table 5-1 presents another way to evaluate impacts to low-income households within your community. Based on the hypothetical average water and wastewater bill of $750, Table 5-1 shows average annual water and wastewater costs as a percentage of MHI for different income categories, using Butte, Montana, as an example. As shown, average water and wastewater bills already amount to more than 7.5% of MHI for households in the lowest-income category (approximately 24% of the 14,836 households in Butte). This analysis assumes that MHI within each income quintile is the mid-point. However, IPUMS data can be used to determine the true median.

Examining the average wastewater bill as a percentage of poverty level income also provides insight into the number of people facing unaffordable water and wastewater bills. Poverty threshold incomes vary depending on the number of people living in the household. For example, in 2010, the official federal poverty threshold for a household or family of 2 was $15,130; for a family of 4, the poverty threshold was $23,050.

Table 5-2 shows the hypothetical average water and wastewater bill of $750 as a percentage of poverty threshold incomes by household size. To conduct this analysis, the combined water and wastewater bill of $750 were adjusted to account for differences in household size, based on the average U.S. household size of 2.64 in 2011 (i.e., each person in the household adds about $284 to the average bill). As shown in Table 5-2, the hypothetical average bill of $750 ranges from 2.5% to 5.8% of poverty threshold incomes.

Finally, as discussed in chapter 4, in many communities, incomes vary considerably between renter-occupied and owner-occupied households, as well as for elderly households. Drawing upon our analysis of MHI for different types of households in Kansas City, Kansas (see chapter 4), Table 5-3 shows an average total water and wastewater bill of $750 as a percentage of MHI across these different household types. As shown, in Kansas City renter-occupied households have much lower incomes than all other household types. On average, these households would pay 3.01% of their income for water and wastewater services with an average annual bill of $750.

Table 5-3 Hypothetical annual average total household water and wastewater bill as a percentage of MHI by household type, Kansas City, Kansas

Household type	MHI (2011$)	Average household water and wastewater cost as a percentage of MHI
All households	37,036	2.03%
Elderly households	27,955	2.68%
Renter-occupied	24,898	3.01%
Owner-occupied	47,272	1.59%

Source: U.S. Census Bureau ACS, 2012 (2011 single-year estimates).

IPUMS data can also be used to estimate average household water and wastewater costs as a percentage of MHI for multi-family and single-family homes. For this analysis, the average estimated water and wastewater bill can be based on actual average consumption for these different types of households.

Workbook 4 provides specific instructions and templates for developing the affordability metrics (including graphs and tables) presented in this section. The "Overview" tab is this spreadsheet contains a table of contents that links spreadsheets in the Excel worksheet to specific figures and tables in this section.

Income Distribution: Implications for Wastewater Affordability

As noted throughout this report, EPA's 1997 Guidance suggests that wastewater bills equal to 2% of MHI are considered affordable for a community. In 1997 (when the Guidance was developed), the most recent income and poverty data available would have been from 1996. In 1996, the national MHI was $35,492 (U.S. Census Bureau, 1997). Thus, an average annual wastewater bill equal to 2% of national MHI would have equated to $710. Based on national income distribution data, in 1996 the lowest quintile (20th percentile) of household income was 42% of the median income, or approximately $14,900 (U.S. Census Bureau, 1997). That is, the lowest 20% of households in the United States made $14,900 or less. At that income level, a bill of $710 would have equated to 4.75% of household income. In other words, the MHI threshold of 2% would be equivalent to having 20% of households in a community pay 4.75% (or more) of their income for wastewater service.

Using the national income distribution data for 2012, a bill equal to 2% of national MHI would be $1,010 per year. That bill would represent 4.9% (or more) of income for the lowest 20% of U.S. households, which is relatively similar to the 1996 level. In many communities, however, a wastewater bill of 2% of MHI would have a much more severe impact on low-income households. For example, in New York City, 2% of the city's MHI of $49,461 would be $989 per year. This would represent 5.9% at the upper limit of the city's lowest income quintile ($16,824), meaning that at least one-fifth of the city's households would be paying 5.9% of their income (or more) for wastewater services—a burden that is 20% greater than would be expected from the national income distribution.

In this example for New York City, in order to keep the impact on low-income households consistent with that expected from national income distributions—that is, to ensure that no more than 20% of households face sewer bills of 4.8% (or more) of income—then wastewater bills would need to be no more than $807 per year, or 4.8% of the upper limit for the lowest income quintile. This amounts to 1.63% of the city's MHI. This reveals the extent to which the 2% of MHI metric does not reflect burdens on the poorest 20% of households in the community, and that an MHI-based metric of affordability for New York City of about 1.6 would be more equivalent to 1996 measures for reflecting impacts on the lowest-income quintile.

This analysis can be easily applied to your community in the context of water and/or wastewater services using ACS data related to income quintiles and MHI.

Assessment of Affordability in Future Years

Finally, in addition to analyzing affordability impacts associated with current water and wastewater rates, it is also important to examine how affordability will change over time. Many utilities have the capability to estimate rate increases for future years, based on estimated costs associated with planned projects and programs. Using these data, it is relatively straightforward to calculate the estimated average household water and wastewater bill for future years. However, this calculation will need to take into account any assumed changes in household water consumption over time, such as whether your utility expects average household use to decline. You may also want to conduct sensitivity analyses to examine the effect of your assumptions (e.g., regarding O&M costs for planned projects or project financing costs and interest rates).

In order to compare average water and wastewater bills to household income levels, it will also be necessary to make some assumptions about how income levels will change over time. In the past, we would have recommended that you simply assume incomes will increase at the same rate as the CPI. However, as demonstrated in chapter 6, in recent years income levels have not kept pace with the CPI, and have even declined in many communities. This can make it difficult to project MHI for your community going forward.

One approach for projecting future income levels is to examine how income levels have changed in recent years in comparison to the CPI. For example, over the past five years national income levels have increased at a rate of approximately 60% of the increase in CPI. Given the recent economic crisis and recovery process, it seems reasonable to assume that this trend will likely continue, at least for the near future. Thus, to project MHI over the next several years, you may wish to assume that incomes will increase by about 60% (or rate at which your community's MHI has increased relative to CPI) of the forecasted change in CPI (as developed by the Congressional Budget Office). Beyond the next several years, it may be reasonable to assume that incomes will again begin to increase at the same rate as the CPI. Although this analysis is not exact, it does provide a general idea of how income levels may change.

Communicating the Results

Given the wealth of information and analyses described in chapters 4 and 5 of this Assessment Tool, it can be difficult to imagine how to best synthesize and communicate the results of your affordability assessment. As noted in chapter 4, we do not propose any specific thresholds that would indicate that a community is at risk of being unable to afford significant increases in water and wastewater costs. The analyses conducted here are intended to go beyond EPA's RI to provide a more comprehensive assessment of household affordability.

Depending on your community, you may want to focus on specific aspects of the Assessment Tool suggested (e.g., EJ concerns, elderly households, impacts to low-income households). The graphs and tables portrayed in this Assessment Tool are also provided as templates in the guidance documents and can be used to analyze and present results.

Chapter 6

Guidance for Assessing Utility Financial Capability: EPA's Secondary Screening Analysis and Alternative Measures

This chapter provides guidance for completing EPA's secondary screening analysis (i.e., developing the FCI), as well as for developing alternative measures of utility financial capability. First, we overview the methods outlined in EPA's 1997 Guidance for completing the secondary screening analysis. Next, we provide guidance for developing alternative financial indicators (such as those outlined in chapter 4). More specific instructions and templates are included in Workbook 5.

Again, it is important to note that although EPA's 1997 Guidance was developed within the context of waste water and CSO controls, our Assessment Tool is focused on the affordability of water supply, wastewater, CSO, and stormwater) programs.

Calculating EPA's FCI Metrics

EPA's secondary screening analysis includes a series of economic indicators used to evaluate a utility's financial capability to implement mandated wastewater, CSO, and/or stormwater controls. These indicators include:

- Bond rating
- Overall net debt as a percentage of full market property value (FMPV)
- Unemployment rate
- MHI
- Property tax revenues as a percentage of FMPV
- Property tax revenue collection rate.

Table 6-1 Permittee FCI benchmarks and their ratings: EPA Guidance

Financial capability metric	Strong (score = 3)	Mid-range (score = 2)	Weak (score = 1)
Debt indicators			
Bond rating GO bonds	AAA-A (S&P) Aaa-A (Moody's)	BBB (S&P) Baa (Moody's)	BB-D (S&P) Ba-C (Moody's)
Bond rating (revenue bonds)	AAA-A (S&P) Aaa-A (Moody's)	BBB (S&P) Baa (Moody's)	BB-D (S&P) Ba-C (Moody's)
Overall net debt as percentage of FMPV	Below 2%	2–5%	Above 5%
Socioeconomic indicators			
Unemployment rate	More than 1 percentage point below the national average	+/- 1 percentage average point of national average	More than 1 percentage of national average
MHI	More than 25% above adjusted national MHI	+/- 25% of adjusted national MHI	More than 25% below adjusted national MHI
Financial management indicators			
Property tax revenues as percentage of FMPV	Below 2%	2–4%	Above 4%
Property tax revenue collection rate	Above 98%	94–98%	Below 94%

GO: general obligation.

S&P: Standard & Poor's.

As part of the screening analysis, each indicator is "scored" on a scale of 1 (weak) to 3 (strong). The average of these scores represents the overall FCI. The following sections describe the methods and data sources used to determine each indicator. Table 6-1 shows the ratings and scores for each indicator, as outlined in EPA's guidance documents.

Bond rating

The first financial benchmark included in EPA's secondary screening analysis is a municipality's bond rating for both GO and revenue bonds. GO bonds are bonds issued by a local government and repaid with taxes (usually property taxes). GO bond ratings reflect financial and socioeconomic conditions experienced by the community as a whole. Revenue bond ratings, by comparison, reflect the financial conditions and management capability of a water/wastewater utility. They are repaid with revenues generated from user fees.

There are currently three major rating agencies for municipal bonds: Moody's Investors Services, S&P, and Fitch Ratings. Of the three rating agencies, Moody's and S&P's rate over 80% of all municipal and corporate bonds (these are also the only two rating agencies included in EPA's 1997 Guidance). Municipal bond reports from these agencies can be accessed at:

- Moody's Investors rating service: www.moodys.com
- S&P rating service: www.standardandpoors.com

Table 6-1 shows how ratings from these agencies translate into "strong," "mid-range," and "weak" scores in terms of the FCI.

In its 1997 Guidance, EPA notes that there are many small- and medium-sized communities that have not used debt financing and therefore have no bond rating. EPA states that when a bond rating is unavailable, this indicator can be excluded from the secondary screening analysis. However, this will effectively place a greater reliance on scores for the socioeconomic and financial management indicators.

Net debt as a percentage of Fair Market Property Value (FMPV)

The second financial benchmark measures a municipality's outstanding GO debt as a percentage of FMPV. This indicator is intended to provide a measure of debt burden on residents within your service area/community, as well as a measure of the ability of your local government to issue additional debt.

To calculate net debt as a percentage of FMPV, it is first necessary to identify the direct net debt of your community, as well as your community's share of debt from overlapping entities. EPA defines overall net debt as debt repaid by property taxes within a utility/municipality's service area. It excludes debt that is repaid by special user fees (e.g., revenue bonds). The percentage of your community's share of debt from overlapping entities is the amount charged to persons or property with your service area (based on the estimated FMPV of real property of each overlapping jurisdictions).

Debt information is typically available from your community's annual financial statements. FMPV data should be available through your community or State assessor's office (EPA's 1997 Guidance states that as long as your service area boundaries generally conform to one or more community boundaries, it is not necessary to prorate the FMPV).

In some communities, the tax assessed property value will not reflect FMPV. This occurs when the tax assessment ratio is less than one. In such cases, FMPV can be computed by dividing the total tax assessment value by the assessment ratio (i.e., the percentage of the FMPV that is taxed at the established tax rate).

If the net debt for your community is greater than 5% of the FMPV, you would receive a "weak" rating for this indicator, based on EPA's scoring methodology. A net debt of 2% to 5% of FMPV is considered "mid-range," while below 2% is considered "strong."

Unemployment rate

The unemployment rate is defined as the percentage of the total labor force that is unemployed but actively seeking employment and willing to work. Monthly and annual average unemployment rates are available through the BLS Local Area Unemployment Statistics (LAUS) program. LAUS is a federal-state cooperative effort that maintains employment statistics for Census regions and divisions (e.g., counties and metropolitan statistical areas), cities of 25,000 population or more, and other areas. EPA Guidance does not specify whether monthly or annual data should be used, however, we recommend using the annual average unemployment rate. For more information and to access LAUS data, visit www.bls.gov/lau/data.htm.

For the purposes of calculating the overall FCI, local unemployment rates are compared to the national average as a benchmark (also available through BLS). Areas with an unemployment rate of more than 1% above the national average are rated as "weak" in this area. Areas with unem-

ployment rates within 1% of the national average is considered "mid-range" and those with unemployment rates more than one percentage point below the national average are considered "strong."

MHI

The MHI benchmark compares your community's MHI to the national MHI. As detailed in previous chapters, this information can be easily accessed from the U.S. Census Bureau ACS via AFF. Depending on the size of your community, you will need to use single-year, three-year average, or five-year average ACS estimates. These estimates are adjusted for inflation by the ACS.

In terms of the overall FCI, a community is considered weak for this indicator if MHI is more than 25% below the national MHI, mid-range if MHI is within 25% of the national MHI, and strong if MHI is more than 25% above the national MHI.

Tax revenues as a percentage of FMPV

This indicator, which EPA also refers to as the "property tax burden," is intended to measure the funding capacity available to support debt based on the wealth of the community, as well as the effectiveness of management in providing community services (1997 Guidance).

FMPV data should be readily available through the community or state's assessor office, while property tax revenues are typically available in a community's annual financial statements. If a community's property tax revenues are greater than 4% of FMPV, a "weak" rating is assigned for this indicator; between 2% and 4% is considered mid-range; and below 2% is considered strong.

Property tax collection rate

The property tax collection rate is intended to measure of the efficiency of the tax collection system and the acceptability of tax levels to residents. To determine the collection rate, you will need to divide property tax revenues by the property taxes levied. However, be aware that this metric may understate the effort your community is making if it relies less than the typical community on property taxes and more on, say, sales taxes, user fees, special fees, and assessments. See the following section for more on this issue.

To calculate property taxes levied, multiply the assessed value of real property within your community/service area by the property tax rate. This information should be available through your community or state assessor's office. Property tax revenues are typically available in your community's annual financial statements.

For this indicator, if the property tax collection rate in your community is below 94%, you will receive a "weak" rating; between 94% and 98% is considered mid-range; and above 98% is considered "strong."

Alternative Measures of Utility Financial Capability

Chapter 1 of this Assessment Tool provides several suggestions for supplemental measures that would help to provide a better assessment of utility financial capability. The following sections provide instructions for developing and analyzing these measures.

It is important to note that the measures suggested below may not necessarily apply to your community, and that there may be additional financial indicators not reflected here that may be particularly relevant for your community. In developing evidence to support a determination on whether your utility has the financial capability to implement regulatory mandates, it is important to investigate relevant measures and metrics specific to your community.

Local tax revenues as a percent of gross taxable resources

As discussed previously, EPA uses property tax revenues as a percentage of FMPV as its sole measure of local tax burden. However, in cities that rely on multiple forms of taxation, focusing solely on property taxes inevitably understates a city's current tax effort. To account for multiple forms of taxation, total local tax revenues as a percentage of gross taxable resources should be included as a supplemental measure in EPA's FCI (in addition to real property taxes as a percentage of FMPV). This would provide a better measure of the extent to which a municipality is already using the full range of its taxable resources.

Gross taxable resources are the combined dollar amount of resident household incomes and business surpluses (income less employee compensation) within a community (NYC Independent Budget Office, 2007). Tax effort is the ratio of direct and overlapping government tax collections to taxable resources. In 2007, the NYC Independent Budget Office developed a report comparing state and local taxes in large U.S. cities (NYC Independent Budget Office, 2007). This report provides a methodology for determining a city/municipality's total taxable resources and is available at

www.ibo.nyc.ny.us/iboreports/CSALTFINAL.pdf. Total tax revenues should be available within your community's annual financial reports.

Measuring the severity of unemployment

Chapter 1 of this Assessment Tool discusses the limitations associated with the application of current annual average unemployment as a key indicator of utility financial capability. To provide a more accurate measure of whether local economic problems are severe enough to warrant relief from EPA mandates, the following measures are suggested:

• The current and long-term average unemployment rate in your community compared to the long-term national average. Between 1991 and 2011, the national unemployment rate averaged 5.8%. Use of the long-term average level of unemployment as a benchmark anchors the national unemployment rate as a comparison measure. For example, in 2010 a community with an unemployment rate of 10.1% would be classified as having only a mid-range unemployment problem simply because it was within 1% of the national average of 9.1% in that year.

• Long-term unemployment compared to national long-term unemployment. The annual average unemployment rate does not reflect trends in long-term unemployment (defined as the share of the labor force continuously unemployed for one half year or more). Use of the long-term unemployment rate provides an additional measure of economic distress within a community.

In addition to broadening the range of labor market indicators, other measures of local economic distress, such as foreclosure rates and annual migration/population data, can provide insight into the financial capability of a community or utility to fund mandated programs. In many communities, high foreclosure rates have had a significant impact on the financial condition of local governments, and their ability to finance capital improvements. In addition, chronic joblessness leads working-age residents to migrate to areas where they have a better chance of finding a job. This kind of migration does not show up in unemployment rates, but it can permanently affect a community's ability to support investments in water and wastewater systems.

The deterioration of local government financial capabilities

To take into account the erosion of local government finances, a measure of local government revenue growth or decline can be included in EPA's FCI matrix, with an absolute decline in real revenues over some period taken as a sign of weakened financial capacity. Revenue growth or decline should be measured over a long enough period of time to ascertain a trend (e.g., the last 3 to 5 years). This information should be available from your local government's annual financial reports.

Ignoring other long-term liabilities

EPA's methodology for assessing municipalities' financing capacity takes into account their formal debt burden (measured by the ratio of net debt to underlying property values). But it does not consider a burden that for a growing number of municipalities is greater than the burden of formal debt—unfunded pension liabilities and other commitments to retirees, as well as other long-term contractual commitments. The value of unfunded long-term liabilities over time should be included as a supplemental measure of utility financial capability (e.g., in comparison to available resources for meeting these commitments).

Abstract

Stormwater runoff is one of the leading causes of water pollution in the United States. The MS4 permit reduces pollution by regulating the runoff of pollutants into stormwater drains. With the assistance of the MassDEP and the Worcester Community Project Center, we sought to provide the Massachusetts towns of Southbridge, Holden, and Millbury with a cost analysis for implementation of the 2014 draft MS4 permit. In order to achieve this goal, we learned the details of the 2003 permit and 2014 draft permit, interviewed town officials, and performed water quality sampling. After creating our cost analysis, we provided our subject towns with findings and recommendations assessing the feasibility of implementing the permit, and suggestions for best practices each town uses to manage stormwater.

Acknowledgements

We would like to thank our sponsor, the Massachusetts Department of Environmental Protection, for their support and assistance throughout our project. In particular, we would like to thank Frederick Civian, Andrea Briggs, Stella Tamul, and Cheryl Poirier. We would especially like to thank Frederick Civian for his ongoing commitment to answer any questions we had, for helping us produce our cost sheet, and for appearing in our video.

Next, we would like to thank the representatives from Holden, Millbury, and Southbridge, who were extremely generous in allowing us to interview them and perform outfall tests. From Holden, we would like to thank Isabel McCauley, John Woodsmall, and Pamela Harding. We are especially grateful to John Woodsmall for appearing in our video, and to Isabel McCauley for taking us out to all of the outfalls we tested. From Millbury, we would like to thank Robert McNeil and Cindy Allard for allowing us to interview them, and for showing us a smoke test demonstration. From Southbridge, we would like to thank Heather Blakeley, Ken Pickerin, and Mark DiFronzo for allowing us to conduct our interviews and sampling.

Additionally, we would like to thank Robert Lowell and Larry Pistrang from the Department of Conservation and Recreation (DCR) for allowing us to interview them and gain from their experience. We would also like to thank Kelley Freda from the DCR, for contributing a detailed cost estimation.

We would also like to thank the Central Massachusetts Regional Stormwater Coalition, in particular Aubrey Strause and Matthew St. Pierre for giving us data, answering our questions, and allowing us to attend steering committee meetings.

Finally, we would like to thank our advisors Corey Dehner and Anne Ogilvie for their ongoing support and dedication to the success of our projects. Thank you for pushing us to

perform to the best of our ability no matter what happened during the term. We would also like to thank you for the various donuts, pizzas, and coffee to keep us going along the way.

Executive Summary

Background

Water Pollution affects an enormous number of water bodies in the United States. "In 2006, there were over 15,000 beach closings or swimming advisories issued due to bacterial levels exceeding health and safety standards" (Council, 2008). Much of this pollution is due to stormwater runoff. Stormwater runoff occurs when water becomes displaced by weather and flows over impervious surfaces, such as roads and roofs. When stormwater flows over these surfaces, it often collects pollutants such as oils, nutrients, ammonia, sediments, and heavy metals (EPA, 2012). These pollutants can have environmental, aesthetic, and economic ramifications on surface bodies of water. In order to combat stormwater runoff, the United States Environmental Protection Agency (USEPA) has created a system to move stormwater runoff into nearby bodies of water through what is known as Municipal Separate Storm Sewer Systems (MS4). Unfortunately, while these systems are useful for draining stormwater runoff, they are also very effective at directing pollutants into water bodies.

Before 1972, stormwater runoff and sewage drained through the same pipe, which led to frequent overflows (Robert B. Stegmaier, 1942). These overflows led to the pollution of topsoil, and the need for a better solution became apparent. This situation led to the creation of the Clean Water Act (CWA) in 1972 (Andreen, 2003a). In 1990, the USEPA first released the MS4 permit as part of the CWA. The MS4 permit allows municipalities to regulate the discharge of pollutants into stormwater drains. The MS4 permit defines six minimum control measures to reduce pollution caused by stormwater runoff. These control measures are:

1) Public Education
2) Public Involvement and Participation
3) Illicit Discharge Detection and Elimination (IDDE)
4) Construction Site Runoff Control

5) Post-Construction Runoff Control
6) Pollution Prevention and Good Housekeeping

Municipalities fulfill these control measures with Best Management Practices (BMPs). These BMPs can include street sweeping, waste collection, and outfall sampling. The implementation of these BMPs cost municipalities money. Massachusetts has been regulated under the same MS4 permit since 2003. Even though this permit expired in 2008, the USEPA continued to administer it indefinitely until they were able to release a new permit. On September 30, 2014, the USEPA released the 2014 draft MS4 permit. This new draft permit is much more detailed than the 2003 permit and has much more stringent regulations. Due to this increased level of regulation, the 2014 draft MS4 permit will cost much more to implement than the 2003 MS4 permit.

The Massachusetts Department of Environmental Protection (MassDEP), in collaboration with Worcester Polytechnic Institute (WPI), developed this project in order to assess the cost of implementing the 2014 draft MS4 permit in three Massachusetts towns: Southbridge, Holden, and Millbury. Our subject towns are part of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). As of the 2014 fiscal year, The CMRSWC consists of communities that share resources for stormwater management, such as water sampling kits and GPS mapping equipment. Our goal for this project was to provide a comprehensive analysis of the cost of implementing the 2014 draft MS4 permit in Southbridge, Holden, and Millbury Massachusetts.

Methodology

In order to achieve our goal of providing a comprehensive analysis of the cost of implementing the 2014 draft MS4 permit in Southbridge, Holden, and Millbury Massachusetts, we utilized the following methodology.

1) Became educated on the details of the 2003 MS4 permit and 2014 MS4 permit
2) Assessed what Holden, Millbury, and Southbridge, Massachusetts have done to meet the requirements of the 2003 MS4 permit
3) Identified Holden, Millbury, and Southbridge's total current expenditures for stormwater management
4) Identified what changes each of our subject towns will have to make in order to comply with the requirements of the 2014 MS4 permit
5) Provided a detailed analysis of the complete costs for each town to comply with the requirements of the 2014 MS4 permit
6) Created an informational video to explain the costs of implementing the 2014 MS4 permit

Throughout our project, we used various research methods such as document analysis, field work, and interviews in order to learn about the cost of compliance with the MS4 permit. By analyzing various background documents about stormwater management, including the 2003 MS4 permit and 2014 draft MS4 permit, we were able to learn about the need for stormwater management as well as the BMPs typically used to manage stormwater.

We conducted interviews with various municipal officials, including public works directors, fire chiefs, town engineers, and members of town conservation commissions. These interviews allowed us to learn about our subject towns' stormwater programs and the costs associated with these programs. We also conducted an interview with the Department of Conservation and Recreation (DCR), which allowed us to estimate costs of BMPs, which town officials could not provide to us.

During our project, we also performed field work, which included outfall sampling using the CMRSWC kits, using dry and wet weather screening forms, and using the geographical information system (GIS) maps of our subject towns. This fieldwork allowed us to gain a more accurate understanding of the amount of labor involved with screening outfalls, which ultimately assisted us in completing our cost analysis.

After we completed our goals and objectives, we were able to provide findings and recommendations to our subject towns.

Findings and Recommendations

Finding 1: The 2014 draft MS4 permit may cost too much for the towns to effectively implement

The costs associated with stormwater management are very high, yet many towns have a limited budget for stormwater. The MS4 permit may cost too much for towns to individually implement. For implementation of the 2014 draft MS4 permit, Holden should expect to spend $258,790 annually, Millbury should expect to spend $753,173 annually, and Southbridge should expect to spend $343,008 annually.

Recommendation 1: Effective regionalization will allow towns to better implement their stormwater management programs

Due to the high cost of implementing the 2014 draft MS4 permit, we recommend that the towns regionalize. Regional organization, such as through the CMRSWC, can reduce the cost of many materials related to stormwater management.

Finding 2: Using innovative funding techniques can help the towns spend less from their general funds on stormwater management

The CMRSWC has received funding from the Community Innovation Challenge (CIC) grant. The first year of the Coalition's existence was fully funded by the CIC grant program and the subsequent two years of grant funding supplemented the Coalitions expenditures. In FY2014, member towns paid 4,000 dollars to continue as members of the Coalition. Millbury has begun applying for other grants to support implementation of BMPs, which may save them money over time.

Recommendation 2: The towns should seek alternative sources of funding such as additional grants beyond the CIC

Due to the reduction of CMRSWC funding from the CIC, we recommend that the towns apply for other grants. These grants can include the 604(b) grant from the MassDEP. The Towns should apply to these grants as quickly as possible, and the Coalition should lobby for additional future funding from the USEPA and MassDEP.

Finding 3: Using innovative stormwater management techniques can help the towns save money and thus implement the permit more effectively

Millbury uses innovative stormwater BMPs, such as a school art contest, to fulfill the public participation control measure. These BMPs allow Millbury to implement the MS4 permit effectively and at a low cost.

Recommendation 3: The towns should strive to utilize innovative stormwater management techniques

Millbury's use of creative BMPs has saved them money in implementing the MS4 permit. We encourage other towns to do the same, as they may be able to come up with BMPs, which are more efficient and cost-effective than their current BMPs.

Finding 4: Towns that communicate with other towns, even to a small extent, can more effectively manage and fund their stormwater management programs

A previous IQP group from WPI demonstrated that the CMRSWC towns spend less money on stormwater management than towns that work independently. This type of collaboration can also help generate more innovative BMPs, which will save the towns money.

Recommendation 4: Regionalization can help towns save money by sharing information and resources

We recommend that the towns regionalize and attempt to share information and resources. This practice will help them implement the 2014 draft MS4 permit more effectively.

Finding 5: In each of our subject towns, stormwater management information was divided amongst different departments

In many of our subject towns, there was not one person fully dedicated to stormwater management. Multiple departments in each town were responsible for implementing the stormwater management programs. As a result, we often had to request information from more than one department in each town.

Recommendation 5: Having a central source of stormwater management should allow for easier implementation of future MS4 permits and make continuous compliance easier for the towns

We recommend that the towns research the feasibility of either creating a position dedicated to managing stormwater information, or making this responsibility part of a single position. If smaller towns cannot afford to pay for this position, we recommend that multiple towns share a person dedicated to stormwater information. This practice will make it easier to implement the MS4 permit in the future.

Finding 6: The IDDE control measure will be a significant contributor to the increase in cost between the 2003 and 2014 draft MS4 permits

The 2014 draft MS4 permit has many more requirements than the 2003 MS4 permit, especially in the IDDE control measure. Much of the increase in cost between the two permits will be due to the increased stringency of the IDDE measure. The IDDE measure will also have more detailed requirements for practices such as outfall sampling with water testing kits.

Recommendation 6: The CMRSWC should have one person in charge of keeping track of and maintaining the sampling kits

When we performed sampling in the field, the sampling kits were often disorganized and had expired components, which slowed down our work. Having the kits intact will make it easier to sample, and will thus save money on sampling costs.

Finding 7: The current Asus tablet in use by the CMRSWC is slow and ineffective

When we used the tablet in the field, it was often slow to load. Town employees often complained about the delay. When we used a new smart phone, we did not see this delay. The delay caused by the old technology costs the towns in the CMRSWC money on labor costs.

Recommendation 7: The towns should use software, which can collect data offline and then upload it to an online database later, as well as a tablet, which is more up to date. This would allow the DPW workers to work more efficiently, thus saving the town labor costs

We recommend that the Coalition should purchase a new tablet, such as an Apple iPad. The labor costs that the tablet will save will pay for the cost of the tablet very quickly.

Other Recommendations

The Massachusetts Department of Environmental Protection should research the potential of providing standardized materials available to Massachusetts municipalities

Many of the control measures of the permit, such as public education and public involvement and participation, require municipalities to create similar documents. If the MassDEP could create standardized templates for these requirements, it could reduce the cost to towns, as well as give them more time to focus on eliminating pollutants.

The CMRSWC should streamline and update the digital forms. This practice would reduce the time needed to inspect outfalls, thus saving money

While we performed fieldwork in Holden, we found that the dry and wet weather forms had categories relating to pollutants, which are not regulated by the MS4 Permit. These extra categories made the forms time-consuming to fill out. Collecting this additional information causes the towns to spend increased labor costs. By updating the forms, the CMRSWC can reduce labor costs for the towns.

Recommendations for Future Research

We recommend that future project groups research the cost of implementing Total Maximum Daily Load (TMDL) requirements in towns. These requirements may generate a very large cost, which has not been researched well. We also recommend that future research groups

attempt to eliminate some of the biases, which may have appeared in our research. These biases stemmed from our limited sources of budget data, and as a result, some of our cost figures may be inaccurate. We recommend other project groups eliminate this bias by finding multiple sources for town budget data.

Conclusion

The findings and methods that we present should help the towns understand and prepare for the financial implications of implementing the 2014 draft MS4 permit. The towns will have to work hard to comply with this new permit, but this effort will be worth protecting people and the environment from the negative effects of stormwater runoff. Among our most important recommendations, we emphasize the benefits of regionalization, the use of innovative stormwater management and funding techniques, and the centralization of stormwater management in each town. We also recommend that the towns reach out to the MassDEP for advice on implementing the 2014 draft MS4 permit. Although the task of effective stormwater management is daunting, the towns can plan to effectively manage stormwater, thus protecting human health and the environment.

1.0 Introduction

Pollution affects a staggering number of water bodies in the United States. "In 2006 there were over 15,000 beach closings or swimming advisories issued due to bacterial levels exceeding health and safety standards" (Council, 2008). A 2012 United States Environmental Protection Agency (USEPA) study evaluating 57% of the lakes, reservoirs, and ponds in the United States found that 97.5% of the examined water bodies contained unacceptable levels of pollution (USEPA, 2012).

One illustrative example of the extent of water pollution is in Ohio's Cuyahoga River. The water pollution in the Cuyahoga River was so profound that the river has actually caught on fire multiple occasions, as Figure 1 illustrates. In the 1960s, industries used the river as a dumping ground for contaminants such as oil, industrial waste, sludge, and sewage.

Figure 1. Cuyahoga River on Fire

(Greater Elkhart County Stormwater Partnership)

In 1969, one of these fires captivated national attention, and caused a chain of events, which spawned the creation of the Clean Water Act (EPA, 2013). The Cuyahoga river fires are just one of many cases of such extreme water pollution.

Water displaced by the weather events, also known as stormwater runoff, pollutes the surface waters of the United States. Stormwater runoff occurs when stormwater flows over an impervious surface, an area that water cannot pass through, such as house roofs, streets, and

parking lots. As the stormwater flows over these surfaces, it often collects pollutants such as oils, sediment, and heavy metals (EPA, 2012). These pollutants are detrimental to aquatic life, which in turn, affects the people in the surrounding areas. Pollutants such as nutrients can cause severe harm to aquatic life through the formation of algal blooms. These are alga blooms that become harmful under certain conditions including light availability and an abundance of nutrients. These harmful algal blooms can damage aquatic plants by blocking sunlight and depleting nutrients from the water, which can kill aquatic fauna (Kuentzel, 1969). Beyond the flora and fauna, stormwater runoff pollution also erodes natural structures such as deltas as illustrated in Figure 2.

Figure 2. Example of sediment runoff (Lehman, 2010)

To combat the issue of stormwater runoff, the USEPA created a system to move stormwater runoff into nearby bodies of water this is known as Municipal Separate Storm Sewer Systems (MS4s). In order to minimize stormwater flow over impervious surfaces, the design of the area around MS4s incorporates efficient methods of directing stormwater into the MS4s. The issue with moving the stormwater runoff directly into the bodies of water is that the pollutants that the stormwater runoff carries end up in the body of water.

To mitigate the impact of stormwater runoff, the USEPA has created an MS4 permitting system. The USEPA categorizes these permits are as either MS4 or National Pollutant Discharge Elimination System (NPDES). NPDES permits are a more general category of permits, which apply to facilities that have a wastewater output. The MS4 permits fall under the category of the

NPDES permits, but MS4 permits deal with requirements more specific to stormwater runoff (US EPA, 2014b). Figure 3 shows a simplified example of an MS4. The MS4 permit contains measures, which help mitigate the impacts of stormwater runoff. (USEPA, 2014c)

The MS4 permit contains six minimum control measures that permittees must follow in order to maintain compliance with the permit. These six measures provide general guidelines for stormwater management and public education. On September 30, 2014, the USEPA issued a new draft MS4 permit for permit holders in Massachusetts. In Massachusetts, the USEPA issues the MS4 permit. In the meantime, the Massachusetts Department of Environmental Protection (MassDEP) acts as the cosigner, while the USEPA enforces the permit.

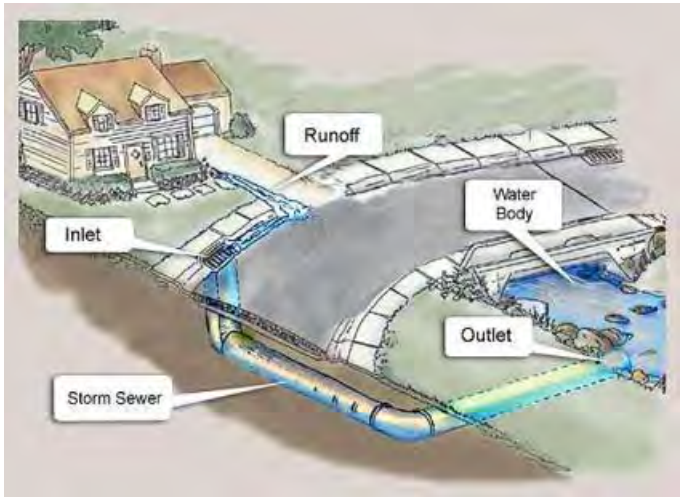

Figure 3. Example of a simple MS4 (Bardstown, 2014)

The MassDEP has developed this project requesting assistance from students with Worcester Polytechnic Institute's (WPI) Worcester Community Project Center. Our project was specifically aimed to assist the Central Massachusetts towns of Holden, Millbury, and Southbridge in understanding the costs of updating to the new 2014 draft MS4 permit. The goal of this project was to assess various municipalities' stormwater management practices for compliance with the MS4 permit, and provide a detailed analysis of the financial cost needed to fulfill the requirements of the 2014 draft MS4 permit. In addition to the cost analyses, we created

an informational video to help selectmen and town meeting members understand the implications of both stormwater runoff and the new MS4 permit requirements.

In chapter 2, we provide a detailed overview of stormwater runoff and its effects, the history and details of the MS4 permit, our sponsor the MassDEP, and the role of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). In chapter 3, we describe the methodology we used to learn the details of the 2014 MS4 Draft permit and assess the total financial expenditures for compliance with its requirements. In our final two chapters, chapter 4 and 5, we outline our findings and provide recommendations for future research to the CMRSWC, the MassDEP, and the towns we worked with, Holden, Millbury, and Southbridge based on our findings.

We hope that this project will have a lasting and meaningful impact on stormwater management in Central Massachusetts. With the assistance of the MassDEP and CMRSWC, we hope our efforts help Central Massachusetts' municipalities prepare for the MS4 permit and protect the waters of the United States (U.S.) from pollution.

2.0 Background

2.1 Introduction

Rainwater runoff poses a serious risk of pollution to the world's surface water bodies. Impervious manmade surfaces such as roads and sidewalks drain pollutants into local water bodies after rain events occur. These pollutants, which can include chemicals, oils, metals, sediment, and bacteria, can directly affect human health by polluting local sources of drinking water (Gaffield, Goo, Richards, & Jackson, 2011). We discuss stormwater runoff and its impacts in more detail in section 2.2 of this chapter. To fully understand the problem of stormwater that the United States (U.S.) faces, we discuss the history of stormwater management in section 2.3

of this chapter. To help mitigate the impacts of stormwater, the United States Environmental Protection Agency (USEPA) released Municipal Separate Storm Sewer System (MS4) permit. This permit helps municipalities reduce pollution in water bodies by using effective stormwater management, which we discuss in more detail in section 2.4 (USEPA, 2014f). The Massachusetts Department of Environmental Protection (MassDEP), a Massachusetts state agency, helps municipalities navigate the intricacies of the MS4 permit. The MassDEP served as our sponsor throughout our project; we introduce them in section 2.5. We discuss the Central Massachusetts Regional Stormwater Coalition (CMRSWC), formed in 2012 to help communities meet the requirements of the MS4 permit (Spain, 2014); in section 2.6.

2.2 Stormwater Runoff

There is a difference between stormwater and stormwater runoff. Stormwater is the water that falls from storms or that which snowmelt produces. Stormwater runoff is the water that travels along impervious surfaces and gathers pollutants. The USEPA defines stormwater runoff as "generated when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not percolate into the ground" (USEPA, 2014g). An impervious surface is a surface which water cannot pass through, such as asphalt and roofs. The stormwater runoff that flows over these impervious surfaces often collects pollutants that contaminate the stormwater and passes those contaminants into local water supplies. Contaminated stormwater runoff may contain oils, nutrients, and sediment. The oils, which usually come from leaking vehicles or car washing, are toxic to aquatic life. The nutrients that come from fertilizer and sewage overflow cause an unnatural increase in the growth of unwanted plant life, which depletes the oxygen in the body of water, causing aquatic life to die (EPA, 2012).

Sediment pollutants are found when land around the water body starts to erode, causing sediment to gather on aquatic life that lives close to the bottom of the water body, which prevents sunlight from getting to the plants (EPA, 2012).

In an effort to mitigate the impacts of stormwater runoff, municipalities may make land use changes, pass by-laws, and/or focus on public education. Municipalities mitigate the impacts of polluted stormwater runoff through Best Management Practices (BMP) and compliance with the MS4 permit, which we explain in section 2.4 below. When land use planners do not consider stormwater runoff, there can be serious environmental, aesthetic, and financial ramifications.

2.2.1 Environmental Impacts of Stormwater Runoff

Stormwater runoff is one of the top causes of water pollution in the U.S. today (Blair et al., 2014). Every two years, the USEPA releases a National Water Quality Inventory Report (NWQIR) on two groups of water bodies: rivers and streams, and lakes, reservoirs, and ponds. The NWQIR is the primary tool that the USEPA uses to keep the public, as well as Congress, informed about the quality of U.S. surface water. The USEPA monitors these bodies of water by regularly testing for various contaminants. These tests primarily look for contaminants such as fecal coliform, Escherichia Coli

Figure 4. Watershed

(S. R. W. Coalition, 2014)

(E. coli), polychlorinated biphenyls (PCB) in fish tissue, total phosphorus, and examine the concentration of dissolved oxygen. Based on these indicators and scientifically determined established safe levels, the USEPA determines if the body of water is impaired (Council, 2008). The USEPA breaks up the different municipalities by watersheds when issuing these reports to the public.

A watershed is the area where all of the connected rivers and ponds merge into one body of water as we illustrate in Figure 4. The Blackstone Watershed encompasses towns around Worcester, Massachusetts and municipalities to the south east of Worcester. In the 2012 NWQIR, the USEPA assessed 28.3% of Rivers and Streams; in the Blackstone watershed, 63.8% were impaired. The majority of the impairment was due to a lack of total maximum daily load (TMDL) management. TMDL is the total maximum amount of pollutants that can be discharged into a body of water while remaining safe for the water's intended use such as swimming or fishing (USEPA, 2013b). Since stormwater has caused so much pollution to bodies of water, the USEPA requires municipalities to use TMDLs, which the state creates, to help restore water bodies from over-pollution (USEPA, 2013b).

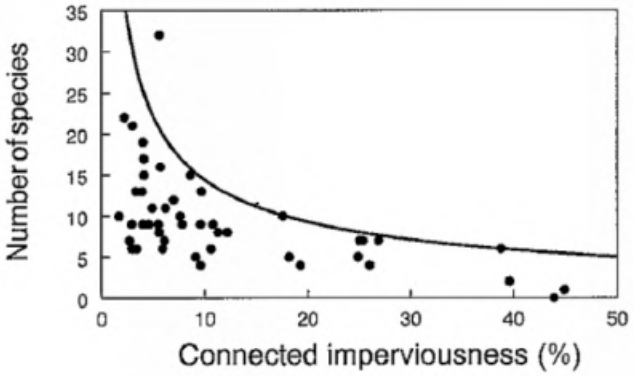

Figure 5: Species vs. EIA

(Council, 2008)

As more areas become urbanized, the amount of impervious area increases. The U.S. is experiencing a urbanization trend of increased urban population; the urban population went from 79.0% in 2000 to 80.7%

in 2010 (Bureau, 2012). This change would increase the Effective Impervious Area (EIA), causing more pollutants to run off into the local bodies of water.

The USEPA performed a study on surface water bodies, assessing, among other things, the amount of different fish species that inhabit that body of water. As Figure 5 illustrates, as the percent of imperviousness increases, the number of fish species in the area exponentially decreases. Figure 5 demonstrates a correlation between the amount of EIA and the presence of bio diverse aquatic system. This correlation is explained by an increase in pollution in the local area, causing the fish to either be poisoned by various pollutants or to suffocate on those same pollutants (Council, 2008).

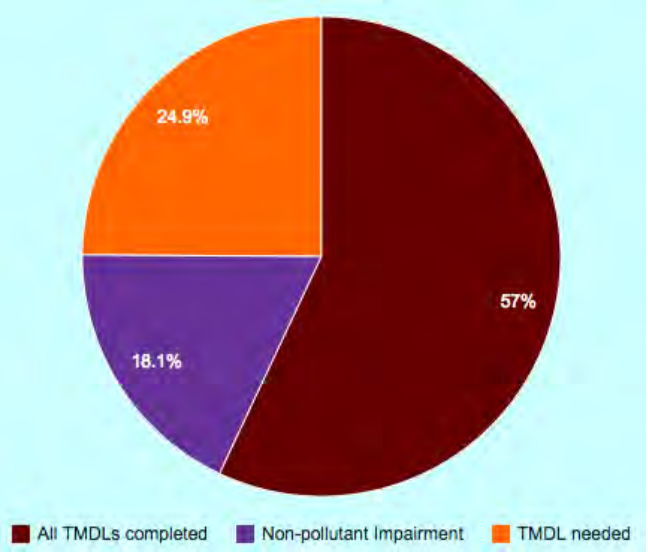

Figure 6. Causes of Lake Impairment (USEPA, 2012)

In addition, in 2012, the USEPA evaluated 57% of lakes, reservoirs, and ponds in the Blackstone watershed area. In this study, the USEPA found that of the 57% evaluated, 97.5% of the lakes, reservoirs, and ponds were impaired. In this case, however, only 24.9% of the lakes, reservoirs, and ponds needed a TMDL to be set in place (Council, 2008). THE USEPA also cited non-pollutant impairment as a problem in the lakes, reservoirs, and ponds in the Blackstone watershed, as seen in Figure 6. Non-stormwater pollutant impairment occurs when unregulated sources of non-stormwater pollution impair a body of water, such as turbidity (US EPA, 2014a).

The pollutants themselves are not the only problem with stormwater flowing into local water bodies untreated. Harmful algal blooms (HABs) are of great concern for aquatic life. HABs not only reduce water clarity, but they also deplete the oxygen in the water, which in turn can kill the natural life in the body of water. Since the HABs create a layer of colored algae on top of the water body, they also have a negative effect on the aesthetics of the water body. In addition, as the water becomes an eyesore, the tourism in the area also is likely to drop (Andersen, 2009).

2.2.2 Low Impact Designs

Low Impact Designs (LIDs) are a way to, "simulate natural hydrologic conditions, by gradually recharging groundwater and slowing runoff that flows to collection systems and receiving water systems" (MassDEP, 2014).

Figure 7. Bioswale

(Service, 2005)

Some of these methods include bioswales, green roofs, and infiltration or retention basins. People who design these areas usually create these designs as LIDs. A LID is a way that the designers try to address stormwater runoff by reducing the amount of impervious surface area and working with the natural landscape. LID includes stormwater BMPs, which we will explain in the next paragraph. LID can also be applied to redesigning areas; in that case, the LID would work more towards rebuilding the landscape rather than working with the existing area (Cahill, 2012).

BMPs are methods and designs that towns use to mitigate the effects of stormwater runoff. Some common BMPs include grassy swales, rain barrels, and vegetated roofs. *Grassy swales* are similar to the bio swales that we will discuss in the next paragraph, except the designers just use grass rather than other plant life. *Rain barrels* collect rainwater from roof runoff. Rather than dumping the runoff into the streets, the rain barrels allow the owner to use the water for watering plants or just dispersing on the ground so that the runoff naturally filters through the ground. *Vegetated roofs* are the same as extensive *green roofs*, which we will discuss later in this section.

Figure 8. Green Roof

(Division, 2014)

Bioswales can be an alternative method to using stormwater drains or simply to augment the drains. Workers place plants and foliage around an area, which is slightly lower than the area around it, as seen in Figure 7. The stormwater then flows into the bioswale, and the plants filter the stormwater for low flow storms. For larger storms, bioswales can direct the flow of stormwater into nearby drainage systems, however average bioswales can handle storms up to 4.3inches per 24hour period (Service, 2005). *Green Roofs* are a layer of dirt and plant life on the roof of a building. This layer above the roof provides shade to the roof, preventing it from reaching extremely hot temperatures; instead, the plant life absorbs most sunlight, which will normally heat the roof (Division, 2014). The layer of dirt also acts as a

Figure 9. Retention Basin

(USGS, 2004)

filtration system for light storms as seen in Figure 8. There are two types of green roofs, intensive and extensive. Intensive is similar to a roof garden, where the plant life is usually flowers, trees, and general garden plants in separate pots. Extensive roofs consist of a layer of dirt and rugged vegetation, which needs little to no maintenance (Division, 2014).

Figure 10. Infiltration Basin (University, 2011)

Infiltration and retention basins filter stormwater in a similar manner. An infiltration basin takes stormwater from the surface, trickles it down slightly below the surface of the ground, and dissipates the stormwater over a larger area, as Figure 9 illustrates. A retention basin is similar to an infiltration system, but instead of keeping the stormwater underground, it turns the stormwater into an artificial lake or pond, which drains slowly, but at a fixed rate, as Figure 10 illustrates (Mays, 2001).

LID	Average Cost
Green Roof (Intensive)	$10/ft^2
Green Roof (Extensive)	$25/ft^2
Rain Barrels	$216
Grassy Swales	$30/ft^2
Bioswales	$16.25/ft^2
Infiltration Basin	$4,500
Retention Basin	$7,500

Table 1. Comparison of LIDs

These methods of handling and filtering stormwater are just some of the ways that engineers and building planners handle the issue of stormwater runoff. Businesses work to mitigate stormwater runoff when it has an economic impact on their business. Below is Table 1[1], which compares the average costs of implementing each of the LIDs mention in this section. In the next section, we discuss the economic impacts of stormwater.

[1] (Brennan, 2014; Center, 2007; Division, 2014; PennsylvaniaDEP, 2006; USEPA, 2013a)

2.2.3 Economic Impacts of Stormwater Management

The goal of improved stormwater management raises questions about cost. Towns use many LID measures to effectively reduce the impact of stormwater runoff. The implementation of these LID measures, i.e. swales, permeable pavement, filter strips, and infiltration trenches, increases the cost of construction projects, as implementation requires careful planning and additional work. However, the economic benefits of these LIDs may in fact defray the cost of their implementation.

The BMPs, which towns use to comply with the requirements of the MS4 permit, can require a large initial financial input. For example, the town of Millbury, Massachusetts estimated that they spent about $75,000 on street sweeping during the 2013 fiscal year (Spain, 2014). The towns must understand the expenditures related to stormwater management in order to effectively fulfill the requirements of the MS4 permit.

Despite the increased cost of construction projects, LIDs can actually save towns money over time. The use of these LIDs minimizes the extent to which stormwater runoff impairs water quality. If there are fewer impaired water bodies, then towns spend less money on treating the water bodies. LIDs may also reduce the effects of flood damage, and eliminate the need for water treatment facilities (Thurston & EnvironetBase, 2012). LID measures can also save money by reducing construction cost. For example, a parking garage can cost approximately $20,000 per space to build. An open parking lot with non-impervious surfaces, however, can cost as little as $2,000 per space to build (Cahill, 2014). In this case, the use of an LID does not just reduce the construction cost; it also reduces the amount of runoff that needs to be treated.

2.3 History of Stormwater Management

October 2012 marked the 40th anniversary of the 1972 Amendments to the Federal Water Pollution Control Act, better known as the Clean Water Act (CWA). Many decades of surface

water pollution preceded the CWA, and some of the causes of pollution are rooted in the industrial surge of the previous two centuries. Unsanitary conditions and polluted drinking water led to health issues, such as yellow fever and cholera (Andreen, 2003b). Even in rural areas, water pollution was a problem. Most towns simply integrated any stormwater management systems into their sewer system. Easy to implement as a combined system, these constructs only involved the conveyance of water away from highly populated areas (Robert B. Stegmaier, 1942). Due to their combined nature, these systems were highly prone to overflow, contaminating topsoil and surrounding water bodies with raw sewage waste (Joseph-Duran, Jung, Ocampo-Martinez, Sager, & Cembrano, 2014). In 1948, the conclusion of World War II allowed the federal congress to bring focus onto more domestic issues. The massive industrial output of the war had taxed rivers, and funding for wastewater treatment had dropped during the years of conflict (Andreen, 2003a).

2.3.1 Evolution of the Clean Water Act

The 1948 Federal Water Pollution Control Act (FWPCA) served as a precursor to the CWA, which would undergo many revisions before the federal government expanded the CWA in 1972. The National Pollution Discharge Elimination System (NPDES) is a permit system added into the FWPCA with the 1972 amendments. Created by the Subcommittee on Air and Water Pollution of the Senate Committee on Public Works, the permit specifies what pollutant discharges the towns must manage. The permitting program specifies that discharges of a pollutant from a point source into a navigable waterway are prohibited unless the discharger has a NPDES. Specifically, the NPDES permit regulates point source discharges of pollutants into surface waters. A point source is defined by the CWA as "any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel [etc.] from which

pollutants are or may be discharged" (U.S.C § 1251, (2014)). Originally, the USEPA intended the NPDES to regulate industrial wastewater and municipal sewage as this was the most abundant sources of liquid pollution (Tyer, 1993). Legislative amendments to the FWPCA in 1977, 1983, and 1987 increased the pollutants regulated under the CWA. As these regulations expanded, the EPA decided to implement stormwater management through a separate permit. Under the 1987 amendments, the Municipal Separate Storm Sewer System (MS4) came into being (MINAN, 2005). The CWA has since then expanded to cover many more pollutants than in its original conception.

2.3.2 What is the NPDES Stormwater Program

One of the main reasons that the USEPA put NPDES permits in place was to regulate how many pollutants can be safely discharged into surface waters (USEPA, 2014d). Congress charged the USEPA with administering the NPDES permit program. Congress first established this program with the enactment of the 1972 amendments to the FWPCA. The USEPA can also authorize state and local governments the power to administer the requirements of the CWA by what is called primacy authority (USEPA, 2014h). Massachusetts, however, does not have primacy authority to enforce the CWA so Massachusetts created its own set of laws that mirror the USEPA's laws. Generally, only industrial, municipal, and commercial facilities have to comply with the NPDES permits since they are the primary dischargers of pollutants into surface waters via point sources. Individuals, generally, do not have to get NPDES permits since their wastewater flows through the sewage system or septic tank.

The types of material that NPDES permits regulate are discharged pollutants from point sources. The CWA defines a point source as a pipe, ditch, channel, tunnel, conduit, well, landfill, etc. (U.S.C § 1251, (pg. 214) (2014)). A point source is a source of runoff that only has a single

point of release. A good example of a point source is a chemical treatment plant that uses a chemical to treat their product and then pumps out any of the runoff from their process into a local river. That pipe, which takes the runoff out of the plant, would be a point-based source, as Figure 11 illustrates.

Conversely, the other source of pollution comes from non-point sources. Non-point sources are sources of water pollution, which do not have a point of release such as rainwater and snow melting. Once the stormwater runoff and the melting snow travel into the local MS4s, the runoff becomes a point source, therefore falling under the regulatory authority of the NPDES permit program. A good example of a point source and a non-point source of pollution is Figure 11.

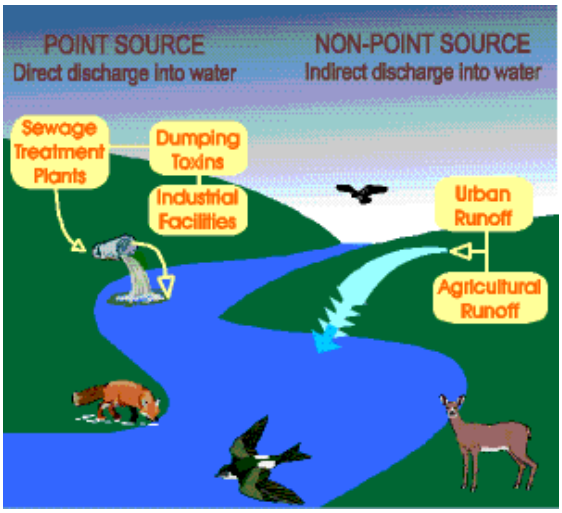

Figure 11. Point and Non Point Sources of Pollution

(College, 2014)

The USEPA and other government bodies, which have primacy authority, require companies and businesses to apply for these NPDES permits when they want to discharge any pollutant into a navigable surface water body through a point source (U.S.C § 1251, (2014))

2.4 The Municipal Separate Storm Sewer System Permit

As part of the CWA, the USEPA issued the MS4 permit in 1990 to reduce the impacts of storm water runoff. The government issues these permits with the sole purpose of addressing the large amounts of stormwater runoff that storms generate. These systems receive stormwater

runoff from the environment, and transport it into nearby bodies of water. These systems do not treat water; they only convey it from impermeable surfaces. With these permits, towns can regulate non-point discharges as point source discharges through the MS4, and create broad stormwater management programs. In 1990, at the inception of the MS4 permitting program, the USEPA issued phase-I MS4 permits on a per-city basis (USEPA, 2014h). These first permits contain measures tailored to individual municipalities, as many large cities had different requirements.

The primary requirement to qualify for a phase-I permit is that the town has a population of at least 100,000. In Massachusetts, there are 2 towns of this size: Boston and Worcester (Massachusetts, 2014b). The phase-II MS4 permit applies to smaller towns with a population of less than 100,000 and contains broad regulations so that it can be applicable to any small municipality. In total, the USEPA has issued approximately 7,450 MS4 permits across the United States from 1990 to 2014 (USEPA, 2014h) (USEPA, 2014b). At their core, these phase-II MS4 permits all integrate practices known as the six minimum control measures. The six minimum control measures are: Public Education, Public Involvement, Illicit Discharge Detection & Elimination, Construction, Post-Construction, and Pollution Prevention/Good Housekeeping.

Although the 2003 MS4 permit has expired, the six minimum control measures remain the primary focus of the 2014 MS4 permit draft. In the following sections, we outline the six minimum control measures and describe some of the BMPs that towns can use to comply with each control measure in the 2014 MS4 permit draft.

2.4.1 Public Education & Outreach

The first minimum control measure addresses the need for public education. Public education plays an important role in reducing pollution levels. Towns can meet the requirements through BMPs such as educational pamphlets, media campaigns, and workshops

The National Environmental Education and Training Foundation (NEETF) found that in 2005, 78% of Americans did not know that runoff from lawns, roads, and agricultural land is the most common source of water pollution. Of further concern, 47% of the public believes that industry accounts for most water pollution (USEPA, 2014b). In order to correct these misconceptions, this control measure requires municipalities to educate the public on the impacts of stormwater runoff and offer residents information on mitigation strategies they can implement at home.

2.4.2 Public Involvement and Participation

The second minimum control measure requires the municipality to form a working partnership with members of the community (USEPA, 2014b). A common way that municipalities fulfill the requirements of this control measure is to create volunteer programs, which engage the public in reducing the pollution caused by stormwater runoff. These programs offer opportunities for volunteers to mark storm drains and participate in cleanup and monitoring programs, as well as to create watershed groups and conservation corps teams (USEPA, 2014b). The officials of each municipality design these opportunities to integrate directly with stormwater programs. When towns implement and utilize this control measure correctly, they can involve the community and create self-monitoring environmental conservation groups.

2.4.3 Illicit Discharge Detection and Elimination

The third minimum control measure deals with the threat of stormwater contamination. Although the MS4 system carries stormwater, it does not treat the stormwater. The MS4 permit defines an illicit discharge as any discharge that is not entirely composed of stormwater. The MS4 stormwater drains are particularly vulnerable to foreign pollutants; the stormwater runoff in these MS4 systems may contain pathogens, nutrients, and various other pollutants. The phase-II MS4 permit requires four primary programs in this control measure, beginning with a full diagram of the MS4 system (USEPA, 2014b). The second program requires the municipality to create a legislative ordinance prohibiting discharges based on pollutant type (USEPA, 2014b). The third is the implementation of reporting techniques such as hotlines, onsite notifications, and outfall water tests (USEPA, 2014b). The fourth is an educational program on the dangers of these illicit discharges (USEPA, 2014b). When used effectively, these programs work to create a system that is both reactive in response to spills and proactive through prevention via education and enforcement.

2.4.4 Construction Site Stormwater Runoff Control

The fourth minimum control measure deals with construction-site stormwater runoff. Of the public works projects that adversely affect the health of a water system, construction site runoff is particularly detrimental. These effects stem from the sediment dissolved in the runoff, including dirt, sand, and other fine particles. When these concentrations of the sediment particles settle in waterways, they block sunlight, and can suffocate many forms of aquatic life (USEPA, 2014a). Phase-II MS4s require the municipalities they regulate to formulate a program to reduce pollutant stormwater runoff for construction exceeding one acre of land. This requirement is

comprised of six components. Collectively, they ensure that construction groups know of their management obligations for proper stormwater pollution management.

2.4.5 Post-Construction Stormwater Management

The fifth minimum control measure refers to post-construction stormwater management. In practice, this control measure is not a continuation of the previous control measure, but a different control measure to monitor BMP effectiveness, as well as the continued prevention of pollution. This control measure is implemented primarily through inspections of on-site facilities, and structures responsible for stormwater management. With these practices in place, areas with new development can continue to manage stormwater runoff pollution after construction has finished.

2.4.6 Pollution Prevention and Good Housekeeping

The final control measure is responsible for the housekeeping of a municipality's stormwater management program. In order for municipalities to maintain good operating conditions within municipal-owned facilities such as the Department of Public Works (DPW) and schools, they must construct a rigorous system of upkeep management. These components can consist of road maintenance and repairs, automobile fleet maintenance, landscape maintenance, as well as building upkeep. Pollution prevention practices can include activities such as street sweeping and storm drain system cleaning (USEPA, 2014e).

2.4.7 General Practices and Municipal Individuality

In order to account for thousands of different municipalities, the MS4 permit authors designed the six minimum control measures to be applicable to any possible situation. Independent of environmental conditions or area development, these measures have to be

comprehensive. Unfortunately, these phase-II MS4 permits rely on a large degree of self-reliance and proactive involvement by the municipalities, but there are resources available to help with this. In order to assist Massachusetts municipalities with MS4 permit compliance, the MassDEP has created a Stormwater Handbook, which contains resources about how a city or town can comply with the minimum control measures (MassDEP, 2014). Additionally, the Massachusetts Watershed Coalition, an organization dedicated to protecting and restoring Massachusetts watersheds, is able to provide many materials to their members, such as brochures and standard operating procedures (Coalition, 2014). However, the officials of each municipality must ultimately take responsibility to implement the practices in the six minimum control measures.

The MassDEP manages a system of computer checks and administering programs for stormwater management in Massachusetts. If the system flags a municipality for irregular readings or reports, inspection by MassDEP officials becomes necessary (Civian, Sept. 26, 2014). Implementation of these control measures requires the municipalities to spend a large amount of money, which raises budget concerns for the 2014 MS4 Draft permit.

2.5 The MassDEP and the Central Massachusetts Regional Stormwater Coalition

The MassDEP is the Massachusetts environmental agency charged with making sure Massachusetts has clean air and water (Massachusetts, 2014a). The central office of the MassDEP serves the entirety of Worcester County (MassDEP, 2013). The MassDEP assists the CMRSWC by providing them with numerous guidance documents, which teach the municipalities how to fulfill the requirements of the MS4 permit (CMRSWC, 2014b). In collaboration with the MassDEP, we sought to provide a cost analysis of implementing the new 2014 MS4 permit in three Massachusetts municipalities. During this project, we worked with

two primary contacts from the MassDEP: Frederick Civian, Statewide Stormwater Coordinator for the MassDEP, and Andrea Briggs, Deputy Regional Director of the Central MassDEP.

2.6 Central Massachusetts Regional Stormwater Coalition

Central Massachusetts is one of many regions in Massachusetts whose municipalities seek to effectively implement the 2014 MS4 permit. The CMRSWC helps its members achieve this goal. The CMRSWC, formed in 2012, initially consisted of 13 municipalities (Spain, 2014). Due to the success and utility of the CMRSWC, it has expanded to 30 municipalities by 2014. All of the municipalities within the CMRSWC are subject to regulations from the USEPA, which require the municipalities to mitigate the impacts of stormwater runoff (CMRSWC, 2014c).

The municipalities within the CMRSWC receive numerous benefits because of their collaboration. The municipalities can share stormwater management tools, such as Leica units and water quality testing kits, thus reducing cost (Coalition, 2014). Their collaboration also reduces redundancies in stormwater management projects, thus allowing the municipalities to use money more efficiently. Although the CMRSWC members try to collaborate as much as possible, the individual towns are ultimately responsible for utilizing the tools developed by the CMRSWC in order to comply with the MS4 permit (Spain, 2014).

2.6.1 Funding of the CMRSWC

The CMRSWC receives funding from the Community Innovation Challenge (CIC) Grant. Massachusetts Governor Deval Patrick started the CIC grant program in 2012 in order to ease the taxpayer burden of community improvements (Massachusetts, 2013a). The CMRSWC received $310,000 in 2012 to help implement the 2003 MS4 permit (Massachusetts, 2013b). The CIC Grant provided the CMRSWC with $105,000 for the 2013 fiscal year. This grant did not cover the total cost of the CMRSWC's efforts, thus each municipality had to provide $2,800 in order to supplement the cost (Spain, 2014). For the 2014 fiscal year, the CIC Grant provided the

CMRSWC with $80,000 (CMRSWC, 2014a). The grants are awarded in December, so at the current time the CMRSWC does not know if they have secured funding for next year.

2.6.2. Organizational Involvement in the CMRSWC

The CMRSWC operates with the help of various agencies and companies. The government agencies, which support the CMRSWC, include the MassDEP, the Massachusetts Department of Conservation and Recreation (DCR) and the USEPA. The CMRSWC also receives support from the private consulting firms of Tata & Howard and Verdant Water. The companies which provide services to the CMRSWC include Maine Technical Source, HACH Company Chemetrics, and People GIS (CMRSWC, 2014d).

2.6.3. Stormwater Consultants

The CMRSWC receives support from the private consulting firms of Tata & Howard and Verdant Water. Tata & Howard is an engineering firm which provides consulting for the management of wastewater, stormwater, and hazardous waste (Tata&Howard, 2014a). Tata & Howard also helped create a system which collects inspection data and maps runoff patterns within the CMRSWC (Tata&Howard, 2014b). Verdant Water operates from Scarborough, Maine, and focuses on industrial and municipal stormwater management. Verdant Water provides Stormwater Pollution Prevention Plans (SWPPPs), Illicit Discharge Detection and Elimination (IDDE) assistance and water quality screening.

The use of these private consulting services to fulfill components of the MS4 permit requires the municipalities to spend a large amount of money. We had to take the cost of these services into account in order to construct our cost analysis. In the next chapter of our report, we describe our methodology for creating our cost analysis.

2.7 Goals and Objectives

In collaboration with the MassDEP and the CMRSWC, we sought to provide the towns of Southbridge, Holden, and Millbury, Massachusetts with a comprehensive analysis of their cost of compliance with the new 2014 MS4 permit.

In order to achieve this goal, we:

1. Became educated on the details of the 2003 MS4 permit and the new 2014 MS4 permit
2. Assessed the degree to which Millbury, Holden, and Southbridge have met the requirements of the 2003 MS4 permit
3. Researched Millbury, Holden, and Southbridge's total current expenditures for stormwater management
4. Identified what changes each of the aforementioned towns will have to make to comply with the requirements of the new 2014 MS4 permit
5. Provided a detailed analysis of the complete costs each town will need to defray in order to comply with the requirements of the new permit.
6. Created an educational video to explain the costs of implementing the 2014 MS4 permit

We discuss our methodological approach to accomplishing these objectives in detail in chapter 3.

3.0 Methodology

3.1. Introduction

In collaboration with the Massachusetts Department of Environmental Protection (MassDEP) and the Central Massachusetts Regional Storm Water Coalition (CMRSWC), we provided the towns of Millbury, Holden, and Southbridge, Massachusetts with a comprehensive analysis of the cost of compliance with the new 2014 Municipal Separate Storm Sewer System (MS4) permit. We focused our project objectives on determining the current and future cost of stormwater management in the subject towns. The MassDEP and CMRSWC proposed this project to increase municipal and agency understanding of the cost of compliance with the MS4 permit; The MassDEP will not use this information for enforcement of the MS4 permit. The MassDEP recruited us to address this problem as independent consultants. The United States Environmental Protection Agency (USEPA) released the new 2014 draft MS4 permit on September 30, 2014. In order to accomplish our goal and objectives, we created the following methodology.

The main goal of our project was to gather information from the towns of Holden, Millbury, and Southbridge Massachusetts in order to help them identify the financial costs of implementing the 2014 MS4 permit draft when it eventually comes into effect. Below we discuss each of the objectives we achieved in order to accomplish our project goal.

3.2. Objective 1: Became educated on the details of the 2003 MS4 permit and the 2014 MS4 permit

In order to create a complete cost analysis of compliance with the 2014 Massachusetts draft MS4 permit, we first sought to understand the requirements of 2014 MS4 permit draft. Understanding the permit also involved an in-depth analysis of the expired 2003 MS4 permit that

the towns have to maintain compliance until the new permit goes into effect. The USEPA issued each of the towns a Phase II permit, as their populations do not exceed 100,000 people (US EPA, 2014).

We analyzed the content of the 2003 MS4 permit minimum control measures so that we would each become more familiar with the minimum control measures. We then contrasted the requirements of the 2003 MS4 permit with those of the 2014 MS4 Draft Permit. As we researched the requirements that are a part of the 2003 MS4 permit, we determined how the permit changed from the 2003 version to the 2014 version with the help of Fred Civian. In addition, we analyzed previous reports written by groups that have worked with the MS4 permit. We interviewed Worcester Polytechnic Institute (WPI) students Xinping Deng, Nicholas Houghton, Haoran Li, and Joseph Weiler, who completed the previous MS4 related project, to gain a better understanding of how to create a cost analysis and work with the towns. We also interviewed them to better understand the efforts that have gone into implementing the permit. After analyzing both permits and interviewing the past IQP group, we were better able to approach the task of creating a cost analysis for our subject towns, see Appendix A for a list of interview questions.

3.3. Objective 2: Assessed what Millbury, Holden, and Southbridge have done to meet the requirements of the 2003 MS4 permit

In order to achieve this objective, we reviewed annual stormwater reports, conducted interviews, and conducted fieldwork. Even though the 2003 MS4 permit expired, understanding what the towns have done to comply with the permit requirements helped us increase our understanding of the additional measures and costs the towns will need to take to maintain compliance once the USEPA implements the 2014 MS4 Draft permit.

In our subject towns, we interviewed Department of Public works (DPW) directors such as Heather Blakeley, John Woodsmall, and Rob McNeil. We also interviewed other municipal officials such as Mark DiFronzo Southbridge's fire chief, Isabel McCauley Holden's Town Engineer, a Conservation Commission member from Southbridge Ken Pickerin, and Pamela Harding Holden's Town Planner. We conducted these interviews to determine what each town currently does to comply with the 2003 MS4 permit. Through our sponsors at the MassDEP, we contacted these towns in order to set up interviews with the municipal officials that oversee compliance with MS4 permit requirements. We focused these interviews on each municipality's efforts to comply with the six minimum control measures. In addition, we asked the interviewees to provide us with any documentation of expenditures, which we used to determine their town's costs. See Appendix A for examples of the interview questions that we asked each of the towns.

The expense reports from the consultants, DPW, and highway department, which the officials provided to us, did not encompass all of the town's expenditures, so we also used these interviews and fieldwork to obtain a more complete understanding of the expenditures. We conducted this fieldwork in order to determine the man-hours needed to conduct sampling tests on site. We used this data for information regarding procedures, costs, and methods used to fulfill the 2003 MS4 permit.

3.4. Objective 3: Identified Millbury, Holden, and Southbridge's total current expenditures for stormwater management

Once we collected data detailing the practices that our subject towns use to manage their stormwater runoff, we aggregated our data to create a cost analysis. Millbury, Holden, and Southbridge are members of the CMRSWC, which utilizes the expertise of the environmental consulting firms Verdant Water and Tata & Howard. We analyzed cost data from any

expenditure that occurred before release of the 2014 draft MS4 permit, but after 2012 to get a general idea of expenses. We analyzed all expenditures from the experience reports mentioned in the previous objective because towns often do more than they report to manage stormwater but are not necessarily aware of the task coming under the rubric of one of the 2003 MS4 permit minimum control measures (Deng, Houghton, Li, & Weiler, 2014). These tasks could include street sweeping, public education, volunteer organizations, and hazardous waste cleanup.

Many municipalities hire construction contractors to make changes to existing Best Management Practices (BMP), if required, or to keep up with maintenance on the town's BMPs. These construction companies may not be a frequent cost, but towns may still face these costs, or similar as-needed costs, while they manage their stormwater. We spoke with stormwater consultants Matthew St. Pierre of Tata & Howard and Aubrey Strause of Verdant Water in order to get a better understanding of how much these municipalities have spent on stormwater management. We also interviewed the municipal officials that oversee the stormwater management programs such as the Directors of the DPW as mentioned in the previous objective. Andrea Briggs put us in contact with them during the course of the project. By interviewing both of these groups of people, we were able to assess stormwater management spending using multiple sources. Drawing on the research that we conducted in the previous objective, we analyzed the methods, which the towns used, and the cost of each method, in order to calculate a total amount that the towns spend on stormwater management.

To compile the data that we gathered from our subject towns, Ms. Strause and Mr. St. Pierre provided us with a chart that the previous IQP group had put together and that Ms. Strause and Mr. St. Pierre had updated, the chart can be seen in Appendix B. This chart had many common costs of towns and ways that towns pay for stormwater management. Once Ms. Strause

provided us with the chart, she was able to take the areas that we were looking at and add them to the chart. By using this chart, towns will be able to directly compare the data that we gathered with the data that the towns would gather from their own cost analyses.

Using the information that we gained from identifying Southbridge, Holden, and Millbury's current expenditures and the previous objective, we were able to compile data from all three municipalities and create a cost analysis.

3.5. Objective 4: Identified what changes each of the subject towns will have to make to comply with the requirements of the 2014 draft MS4 permit

In order to accomplish this objective, we used the knowledge gained in accomplishing objectives one, two, and three to begin calculating the cost of compliance with the 2014 MS4 permit. We performed research to determine the BMPs that the municipalities already have in place to comply with the 2003 MS4 permit. This research included a detailed analysis of the town's annual stormwater reports. In addition, we conducted interviews with town officials and stormwater consultants who have worked with the towns. Examples of the interview questions we used can be found in Appendix A. By identifying what Best Management Practices (BMPs) the towns already use, we were able to determine whether, and in what manner, our subject towns will need to expand their stormwater management efforts to meet the requirements of the 2014 MS4 permit.

In order to identify the necessary changes, we conducted interviews with municipal officials in each town. We also spoke with Frederick Civian; Regional Stormwater Coordinator of the MassDEP. These interviews provided us with insight into each town's level of preparedness toward meeting the requirements of the 2014 MS4 permit.

Ultimately, this objective helped us gain a comprehensive understanding of the financial cost of implementing the 2014 MS4 permit in each municipality. By understanding the BMPs each town uses, we were able to assess what changes they need to make, and by extension, the financial cost of implementing each change. We created a checklist of the common practices such as street sweeping, distribution of pamphlets, and outfall mapping that municipalities use to comply with stormwater permits, and combined this with a similar chart given to us by Mr. St. Pierre and Ms. Strause. We discuss our cost analysis in further detail in objective 5.

3.6. Objective 5: Provided a detailed analysis of the complete costs for each subject town to comply with the requirements of the 2014 draft MS4 permit

In order to complete this objective, we first determined the changes each town will need to make in order to comply with the 2014 draft MS4 permit, as we described in objective four. We then computed the financial cost of the implementation of these changes. In order to perform our cost analysis, we spoke with Mr. St. Pierre, Ms. Strause, and Mr. Civian. These people were able to provide us insight into the typical cost of implementing BMPs, which fulfill the MS4 permit. We were able to determine what equipment each town has, such as street sweepers, outfall mapping equipment, and signage, through interviews that we conducted with municipal officials. The CMRSWC possesses some of this equipment, which the municipalities can use, therefore eliminating the need for the towns to buy and maintain their own equipment. We also determined the human resources each municipality can provide to manage stormwater. This knowledge allowed us to determine the labor costs. This knowledge also allowed us to determine if the towns will need to hire contractors or additional personnel in order to supplement their workforce. Once we had a list of all of the costs of stormwater management from the subject

towns, we were able to estimate the total cost of meeting the requirements of the 2014 draft MS4 permit.

In order to assist us with our cost analysis, Mr. Civian provided us with a chart, which listed every regulation of the 2014 draft MS4 permit. This chart is utilized in Appendices D, E, and F where we used it for each of our three subject towns. We divided this chart into eight separate sheets. Seven of the sheets individually detail the requirements of the six minimum control measures, as well as miscellaneous requirements such as submitting a Notice of Intent (NOI). Within each of these sheets, we divided the costs into annual costs, one-time costs, and intermittent costs, and calculated a total for each. We then took the totals from each of the seven sheets and compiled them into an eighth master sheet. This chart allowed us to create a comprehensive analysis of implementing the 2014 draft MS4 permit in each of our subject towns.

3.7. Objective 6: Created an informational video to explain the costs of implementing the 2014 MS4 Draft permit

Over the course of the project term, we gathered photos, videos, and interviews from Fred Civian, Andrea Briggs, and John Woodsmall and compiled them into an informational video. By gathering this material, we were able to highlight the challenges and importance of stormwater management. These challenges include raising funds and garnering public support for stormwater management.

In order to create this video, we first created an outline. During the outlining process, we reached out to Frederick Civian, Andrea Briggs, Matthew St. Pierre, and Aubrey Strause in order to generate ideas for the content of our video. We then borrowed video recording equipment from WPI's Academic Technology Center (ATC). This equipment included a digital camera, monopod, tripod, GoPro, and a shotgun microphone. We used the GoPro to gather underwater

footage of the outfalls. The shotgun microphone allowed us to eliminate ambient noise from cars during our filming in the field. We also borrowed wireless clip-on interview microphones to get clear audio during our interviews. Once we acquired the equipment, we then began to create our video. We filmed our fieldwork, which included our use of the water sampling kits. We then conducted interviews with stormwater experts that we had contacted previously.

4.0 Cost Analysis

4.1 Introduction

One of our major findings details the benefits of regionalization to effectively implement the 2014 draft Municipal Separate Storm Sewer System (MS4) permit. Due to the high costs that we describe in this chapter, towns should consider joining an established coalition, such as the Central Massachusetts Regional Stormwater Coalition (CMRSWC), or starting a new coalition to serve their specific region.

After completing objectives one through four of our methodology, we were able to construct our cost analysis. In this cost analysis we detail both current stormwater expenditures for the towns of Southbridge, Holden, and Millbury, and potential costs of compliance with the new requirements of the 2014 MS4 Draft permit requirements.

After calculating the current expenditures of our towns, we sought to predict the cost of implementing the 2014 draft MS4 permit in our subject towns. In order to assist us with this portion of our cost analysis, Frederick Civian provided us with a spreadsheet, which lists each of

the requirements of the 2014 draft MS4 permit. We divided this table by the six minimum control measures of the MS4 permit, and then used the resulting spreadsheet to predict the cost of implementing each requirement in our subject towns. See the spreadsheets we used in Appendices D, E, and F.

In this chapter, we first provide some background information on the towns of Holden, Millbury, and Southbridge, Massachusetts. Then we discuss the results of our 2003 MS4 permit and 2014 draft MS4 permits cost analyses. We then explain the results of our comparative analysis of the three subject towns' current costs of implementing the 2003 permit requirements. Next, we describe the results of our comparative analysis of Holden, Millbury and Southbridge's estimated cost of compliance with the 2014 draft MS4 permit requirements.

4.2 Background Information on Millbury, Holden and Southbridge, Massachusetts

The three subject towns for the cost analysis are all located within Central Massachusetts. Despite their similar geographic location as seen in Figure 12, the subject towns vary in size, budget, and population. Southbridge, Massachusetts has a population of approximately 16,800, while Holden has a population of about 17,600, and Millbury has a population of about 13,300.

Figure 12: Town Locations in Massachusetts

The towns' geographic area and percentage of impervious surface area also varied. With a higher impervious surface area comes a more expensive stormwater management program since there is more area for the stormwater runoff to run along. As the runoff runs along

impervious area it collects pollutants and the more polluted the runoff becomes. This requires the towns to take more of an effort to reduce the pollution, which leads to a high cost for stormwater management. As our subject towns cover more geographic area, their budget increases except in Southbridge, which has a larger budget than Holden even though Southbridge is significantly smaller. Millbury has the highest percentage of impervious surface area even though they have the smallest total area, which significantly increases their stormwater management costs.

The form of town government can have a large effect on how long towns take to implement the new draft requirements for stormwater management. Both Millbury and Holden have open town meetings as their primary form of government, whereas Southbridge has a Council and an Alderman as their government structure. When we spoke with Robert McNeil, he told us that having open town meetings could cause regulations to take longer to pass since the meetings are open to the public. This, however, does allow for much more public involvement and participation.

Town	Form of Government	Population	Town Budget	Area	Percent Impervious
Southbridge	Council and Alderman	16,799	56,739,257	20.9mi^2	8.69%
Holden	Open Town Meeting	17,636	52,774,844	36.2mi^2	7.04%
Millbury	Open Town Meeting	13,305	39,018,827	16.3mi^2	13.09%

Table 2: Town Information

4.2.1 Current Cost of Public Education and Outreach

The Public Education control measure requires towns to educate their population about the issues the town faces with regard to stormwater and to offer opportunities for the residents to participate in stormwater-related activities. In Table 3, we show how much Southbridge, Holden, and Millbury currently spend on the Public Education control measure.

Town	Population	Cost
Southbridge	16,799	$10,952
Holden	17,636	$1,000
Millbury	13,305	$566

Table 3: Public Education Costs by Town

A first glance at Table 3 may indicate that Southbridge does much more for this control measure than the other towns, but that is not entirely the case. Much of Southbridge's cost comes from the pamphlets and brochures that they create and distribute to their residents. Both Holden and Millbury have savings of about $6,000 annually since they utilize the resources provided to them by the Central Massachusetts Regional Stormwater Coalition (CMRSWC). Holden also uses pamphlets and brochures comply with this control measure, but since they use materials from the CMRSWC, they only have to pay for distribution. Millbury distributes its public education material digitally through their Department of Public Works (DPW) website, saving on distribution and printing costs. Any town that is trying to maintain compliance with this control measure should utilize any already existing education materials, thereby saving money on design, especially if the town is part of the CMRSWC.

Southbridge also holds hazardous waste removal days in order to gather hazardous waste from households. This practice increases the amount Southbridge spends on this public education, but this helps prevent this waste from appearing in runoff, which in the end saves Southbridge money. This practice of preventative action is an example of what other towns can try as a cost-reduction effort.

4.2.2 Current Cost of Public Involvement and Participation

The next minimum control measure is Public Participation. Public Participation requires that towns comply with their own town meeting requirements. The United States Environmental Protection Agency (USEPA) designed this minimum control measure to allow the public to have a voice in the creation of town specific stormwater ordinances and regulations as required by the MS4 permit. In Table 4, we show the costs associated with maintaining compliance with the 2003 MS4 permit for each town.

Town	Cost
Southbridge	$0
Holden	$0
Millbury	$0

Table 4: Public Participation Costs by Town

The table has zero costs for each town, since this control measure only requires that the towns offer a place and time for people to comment and look at the regulations and ordinances before the town puts them into effect. Towns comply with most of this control measure by following basic town meeting requirements laid out outside of the MS4 permit.

4.2.3 Current Cost of Illicit Discharge Detection and Elimination (IDDE)

As illustrated by Table 5, the subject towns have a wide range of costs associated with implementing the 2003 MS4 permit IDDE control measure. Some of the requirements of the IDDE control measure include developing a storm sewer system map and creating a plan to detect and eliminate illicit discharges.

Town	Cost
Southbridge	$2,452
Holden	$3,520
Millbury	$4,678

Table 5: IDDE Costs by Town

Southbridge, Holden, and Millbury have all completed the mapping requirements of the 2003 MS4 permit. Therefore, the towns have not had to map their town in a couple years. The current costs associated with the IDDE control measure in Southbridge reflects outfall sampling since outfall sampling accounts for 97% of the money the town spends on this control measure. Millbury complies with this requirement by using a Best Management Practice (BMP) that includes use of a closed circuit television (CCTV) system and vacuum truck to remove blockages from their storm drain system. This takes up about 86% of the combined cost for this control measure.

Holden also spends much of their money on use of the vacuum truck totaling about 64% of their total costs for this control measure. Isabel McCauley the senior civil engineer for Holden, and John Woodsmall, the director of the department of public works (DPW) for Holden,

estimate that Holden typically spends $3,000-$4,000 per occurrence on the removal of illicit discharges and had to remove one illicit discharge this past year.

We must note, however, that our costs for Holden were based only on data which Ms. McCauley and Mr. Woodsmall were able to provide to us. Environmental Partners Group (EPG) performs many of Holden's costs associated with the IDDE control measure, including outfall mapping and water quality screening. Financial invoices from Holden detailed the town's annual expenditures on EPG services since 2007 at $119,000. However, the invoice descriptions do not specify exactly what service is associated with each line item. Therefore, it was difficult for us to discern between annual costs and one-time costs. We were unable to connect with EPG to obtain a more detailed cost breakdown.

4.2.4 Current Cost of Construction Site Runoff

As illustrated in Table 6, the costs associated with implementing the construction site runoff control measure of the 2003 MS4 permit in Southbridge, Holden, and Millbury is low. The 2003 MS4 permit requirements for this control measure include developing a plan to reduce the discharge of pollutants from construction sites.

Town	Cost
Southbridge	$0
Holden	$0
Millbury	$350

Table 6: Construction Site Runoff Control Cost by Town

Our three subject towns implement this control measure using volunteers from their conservation commissions. The volunteers conduct most of the site inspections for the towns. The use of these volunteers is an excellent way to enforce this control measure without costing the towns any additional money. Another reason the cost of implementing this control measure is so low is that contractors must eliminate any violations at their own expense, as Pamela Harding

of Holden (Holden Senior Planner) and Ken Pickerin (Conservation Commission member) of Southbridge described to us in our interviews.

Our subject towns also already have sediment control ordinances in place. These ordinances do not cost any money to the towns as they are laws, which are already in place, and they do not need to be developed by town lawmakers. Although we did not learn of the particular details of these ordinances, they are similar in the fact that they require sediment and erosion control measures at construction sites.

4.2.5 Current Cost of Post-Construction

Differently from the previous control measure, the USEPA designed the Post Construction Site Stormwater Runoff control measure to ensure continuing pollution prevention, as well as BMP functionality, after construction has been completed. In the 2003 MS4 permit, this control measure states that the permittee must develop, implement, and enforce a program to address stormwater runoff from new development and redevelopment projects that disturb land greater than one acre and discharge into the municipal system (US EPA, 2013). Beyond this function, the control measure requires towns to have an ordinance addressing post-construction stormwater runoff, plans for BMP longevity, and that any control measure the towns put in place will prevent or minimize impacts to water quality (US EPA, 2013).

Town	Cost
Southbridge	$0
Holden	$1,760
Millbury	$0

Table 7: Post Construction Costs by Town

In calculating the costs for each town, we sought to determine what funds the towns spent for stormwater management after they completed development projects. Based on the cost estimation sheets developed in *Cost Analysis For The MS4 Permits* (used in Appendices A, B,

and C) we have found that the annual cost for this control measure is $0 for Southbridge, $1,760 for Holden, and $0 for Millbury as illustrated in Table 7.

These costs can be explained by the ways in which each town implements the post construction site regulations. A representative from Southbridge, Ken Pickerin, is part of the local conservation commission. The Southbridge Conservation Commission (ConCom) is a group of volunteers who inspect construction sites, as well review construction site plans for construction projects. In Southbridge, the ConCom volunteers complete all of the Post-Construction Stormwater Management control measure requirements. Consequently, Southbridge's cost of compliance with the Post-Construction Stormwater Management control measure is zero (Ken Pickerin, 2014).

The town of Holden handles this differently, because they are within the Wachusett watershed and the Department of Conservation and Recreation (DCR) performs a number of the required elements of this control measure without any cost to the town (Robert Lowell, 2014). The $1,760 annual cost is from collaborative efforts between the Department of Conservation and Recreation (DCR) (paid by their agency), and Holden DPW workers paid under Holden. Because of this, Holden does have a notable cost of $1,760 to pay its workforce.

In Millbury, developers of a construction project handle the cost of the post construction control measure for that project. As part of the requirements for development within Millbury, a developer must pay for all required inspection programs themselves (Robert McNeil, 2014). This method is aligned with some of the innovative funding techniques Millbury utilizes, which we discuss in Section 5. Developers who secure the appropriate grants to fund the projects perform many of the projects in the town. As part of the grant, the developers pay for the costs of the post-construction control measures as well.

4.2.6 Current Cost of Good Housekeeping

The final requirement in the 2003 MS4 permit is Good Housekeeping. The USEPA designed this control measure to minimize or prevent the effects of stormwater runoff from municipal operations (US EPA, 2013). Generally, this means the towns must implement maintenance activities, inspection procedures for structural controls, employee training, and the upkeep of BMPs. In the implementation of this control measure, the towns have varying costs.

The annual cost for complying with this control measure for Southbridge is $255,200, while the annual cost for Holden is $180,246, and the annual cost for Millbury is $555,123, as illustrated in Table 8. There is a large degree of variation between the towns on cost of current good housekeeping practices. However, this large variation in expenditures is not unique to these three towns.

Town	Cost
Southbridge	$255,200
Holden	$180,246
Millbury	$555,123

Table 8: Good Housekeeping Costs by Town

In 2011, the USEPA conducted an analysis of the cost of complying with the good housekeeping control measure and found similar results. In this analysis the USEPA found that the Massachusetts towns of Bellingham, Franklin, and Milford, good housekeeping expenditures had a difference of $791,000 between the highest and lowest costs for existing programs (Committee, 2011).

In the town of Southbridge, good housekeeping costs are primarily due to catch basin cleanings, salt and sand road management, a leaf collection program, and an employee training program. Of Southbridge's $255,200, 85% is due to the salt and sand road management, BMP maintenance schedule, street sweepings, and the cleaning of catch basins and outfalls every two years.

In Millbury, the town maintains a schedule of yearly catch basin and outfall cleanings, as well as street sweeping, and the use of salt in their roadway management. Their roadway

management constitutes 83% of the cost for complying with this control measure in Millbury, and represents the largest cost in Millbury's entire stormwater management program. While these costs are part of stormwater management, the actions are not for the stormwater management alone. A few of these procedures are part of other departments, such as the Highway Department (Robert McNeil, 2014), and so the costs do not accurately represent the total budget for a municipality.

4.2.7 Total Current Cost Comparison

When we combined the current costs of the control measure, we were able to obtain an estimation of the total costs of compliance for each town. In implementing their stormwater program, the town of Southbridge spends an estimated $268,604 annually, as illustrated in Table 9. The town of Holden spends an annual $186,526 to fund their stormwater management program, as we illustrate in Table 9. Our third town of Millbury annually spends $584,960 on 2003 MS4 compliance as we illustrate in Table 9. We compiled these total costs from available information provided by the towns.

Town	Cost
Southbridge	$268,604
Holden	$186,526
Millbury	$584,960

Table 9: Total Annual Costs by Town

Based on our research, each town appears to go above what is required for the 2003 MS4 permit, but the magnitude of this differs by town.

For example, Millbury cleans its catch basins and outfalls annually, while Holden cleans them every two years. Despite these differences, both towns maintain compliance with the permit, and do so through different methods. Between each municipality, there are differing divisions of stormwater management responsibility. In our experience interacting with each town, they divide their stormwater management programs amongst multiple departments. Because of this, there is a degree of reporting bias in our cost estimation for each town. These

biases are because different town representatives in different towns are all looking for or maintaining and providing different records. This means that towns may have over or underreported what their actual costs were, even with this, we hope that they can be used by towns in comparing the costs for different categories, if not the total costs.

4.3 Comparative Cost Analysis of 2014 MS4 Draft Permit

In this section, we analyze the cost of compliance with the 2014 draft MS4 permit. We discuss each of the minimum control measures and the costs associated with them on a town-by-town basis in the sections below. To complete the analysis we created a system of charts and created estimations with the assistance of Frederick Civian. The charts detail the costs of each of the requirements of the 2014 draft MS4 permit. There are columns in the charts for information about the control measure, the estimated cost of the specific requirement, the reference number to the MS4 Draft permit, and a justification for our estimation. Within the charts, and this section, we use three different frequencies of costs to describe when costs are applicable: annual, one-time, and intermittent.

Annual costs are costs that the towns will have to spend every year to maintain compliance, such as submitting an annual report, and yearly street sweeping. One-time costs include costs that towns have to pay for only once either in the beginning of the permit term or at some point during the permit term. One-time costs include mapping outfalls, submitting a notice of intent, and labeling outfalls. Finally, intermittent costs are costs that occur inconsistently, such as removing an illicit discharge. Appendices A, B, and C contain the completed cost sheets for Southbridge, Holden, and Millbury.

4.3.1 Future Public Education and Outreach Cost

In the 2014 MS4 Draft permit, requirements for the Public Education minimum control measure have increased. Specifically, in addition to the 2003 MS4 permit Public Education

requirements, the 2014 MS4 Draft permit requires towns to measure the effectiveness of their messages, such as educational materials released to the municipality public. Lawrence Pistrang, Environmental Analyst with the Wachusett Watershed DCR, explained that it will cost towns approximately $8,820 to comply with the measuring effectiveness requirement under this control measure. In both Holden and Millbury, the additional cost of assessing the effectiveness of Public Education control measure would increase their cost by over eight times what they spend currently in this control measure. The increase in cost for would amount to double the town's present expenditures on Public Education. The Public Education minimum control measure has small low-cost administrative tasks, but the bulk of the cost comes from continuing the education efforts and adding an evaluative component to the program.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$19,242	$0	$0
Holden	$9,908	$0	$0
Millbury	$12,106	$0	$0

Table 10: Estimated Public Education Costs

Table 10 shows the cost of compliance of each of the towns, and as we can infer from the values present in the table, the annual costs have increased by 75.2% for Southbridge, 890% for Holden, and 2003% for Millbury. To save money on this control measure, the towns can reuse education materials that already exist within the town or the CMRSWC. The towns can also reduce costs by sharing the metrics and tools used to analyze the effectiveness of their education.

By regionalizing, and working with other towns, every town can save money since towns do not have to work complete these minimum control measures on their own.

4.3.2 Future Public Participation Cost

The Public Participation control measure changed little between the 2003 MS4 permit and the 2014 draft MS4 permit. Consequently, the towns will not have to expend any additional costs to maintain compliance with this control measure. Table 11 shows the expected costs of this minimum control measure based on our estimated costs to update and maintain compliance. The costs do not change for any of the towns since the requirements changed only slightly, the changes that did occur were minor administrative tasks such as adding a section in the annual report, which describes this control measure, and requiring that towns comply with public notice requirements outside of the MS4 permit.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$0	$0	$0
Holden	$0	$0	$0
Millbury	$0	$0	$0

Table 11: Estimated Public Participation Costs

4.3.3 Future IDDE Cost

The IDDE control measure of the 2014 MS4 Draft permit represents a large portion of the cost associated with the permit. Much of this cost is due to more stringent requirements, including mapping, outfall sampling, and priority ranking outfalls. These requirements will

generate many material and labor costs, as the towns will have to sample all of their outfalls, while they currently only sample a small fraction of them.

As we show in Table 12, Millbury and Southbridge share similar annual costs on implementing the IDDE control measure of the 2014 draft MS4 permit. However, Holden's cost is much lower. The main reason for this difference is the variation in number of outfalls between

Town	Annual Cost	One-Time Cost	Intermittent Costs	Number of Outfalls
Southbridge	$19,242	$304,006	$50,440	206
Holden	$7,872	$314,494	$50,440	144
Millbury	$11,523	$306,833	$76,730	267

Table 12: Estimated IDDE Costs

the towns. Much of the annual cost for the IDDE control measure is due to the need for the towns to sample all of their outfalls. Southbridge and Millbury have 206 and 267 outfalls respectively, while Holden only has 144 outfalls.

The one-time cost of implementing the IDDE control measure is similar between our three subject towns. This similarity is because most of the one-time requirements are applicable to all of the towns. For example, all of the towns will be required to update their mapping system, which will cost approximately the same amount for all three towns, as they have a similar number of outfalls to map. The towns will also be required to develop an IDDE ordinance, as well as priority ranking catch basins based on conditions and other factors(US

EPA, 2014a). These requirements are of similar cost as the towns all have a similar number of catch basins, and similar resources from which to develop the ordinance.

The intermittent costs listed are very similar between the towns because many of these intermittent costs are indeterminable at this point. Consequently, for comparison purposes, we operated under the assumption that each town will have to treat one illicit discharge per year. We explain our assumptions in more detail in Appendices D, E, and F.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$0	$770	$0
Holden	$0	$770	$0
Millbury	$350	$858	$0

Table 13: Estimated Construction Site Costs

4.3.4 Future Construction Site Runoff Cost

As we demonstrate in Table 13, the towns are almost identical in the cost that will be required for them to implement the construction site runoff control measure of the 2014 draft MS4 permit. There is only one annual cost associated with this control measure, which is to continue implementing the construction ordinance from the 2003 MS4 permit. Because of this, the town's only have to spend a minimal amount of funds in maintaining this already-establish construction ordinance. Since Millbury is the only town that actually has to spend money to implement this requirement, they are the only town with a future cost associated with it.

The one-time costs of the construction site runoff control measure are all administrative tasks, which should take a similar amount of labor from each town to implement. There is no intermittent cost associated with implementing this measure in any of the towns, as there is only

one intermittent requirement of this control measure, which is to develop and implement a construction site runoff program. In all of the subject towns, the responsibility of this cost primarily falls on independent contractors working on town projects. We found that every town official we spoke informed us that when stormwater runoff issues are found on-site, the responsibility for correcting these issues falls to the developer.

4.3.5 Future Post-Construction Costs

The 2014 MS4 Draft permit, contains numerous additional requirements for the post-construction site runoff minimum control measure. Some of these new requirements include the development, implementation, and enforcement of a post-construction stormwater program for new developments and redevelopments (US EPA, 2014a). Frederick Civian assisted us in analyzing this control measure, and making estimations for the completion of individual items as we demonstrate in Appendices D, E, and F. For the town of Southbridge, we estimated that to implement the requirements of the Post Construction control measure would require an annual cost of $5,280, as we show in Table 14. This cost is joined by a $1,496 cost to update from 2003 MS4 requirements, and an

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$5,280	$1,496	$7,436
Holden	$5,280	$1,496	$7,436
Millbury	$5,280	$1,496	$7,480

Table 14: Estimated Post Construction Costs

estimated $7,436 in intermittent costs as we show in Table 14. We have estimated that Holden will need to pay $5,280 annually, $1,496 in one-time costs, and $7,436 in intermittent costs as we illustrate in Table 14. We estimate our third town, Millbury, will need to pay $5,280 annually, $1496 in one-time costs, and $7,436 in intermittent costs as we show in Table 14. These are all estimated costs that each town should expect to pay, but they may be different depending on how the town plans to implement it. For example, Millbury could expect to reduce its costs by following its current grant funding system. If Millbury imparts these costs onto developers funded by grants, they will be significantly lower (Rob McNeil, 2014). Similarly, if Holden utilizes DCR services; they may be able to forgo some of these costs as well (Robert Lowell, 2014). This section needs some additional detail so we understand where each of the separate costs is coming from.

4.3.6 Future Good Housekeeping Costs

In the new 2014 draft MS4 permit, the Pollution Prevention and Good Housekeeping control measures represent an on average 20% increase in annual costs in comparison to the 2003 MS4 permit cost of compliance. This is because there are many new and specific requirements for this draft permit, where municipalities have to be far more specific in their practices to comply with the permit. We based these cost on our estimates provided in part by Mr. Civian.

We have estimated that the town of Southbridge will have an annual Good Housekeeping cost of $283,458, a onetime cost of $6,292, and an intermittent cost of $0 as illustrated in Table 15. The town of Holden will need to expend an estimated $220,562 annually, as well as $6,292 in one-time costs, but similarly to Southbridge, Holden will have $0 in intermittent costs as

illustrated in Table 15. We have estimated that the town of Millbury will need to pay an annual cost of $693,578, a one-time cost of $6, 292, and no intermittent cost we illustrate in Table 15.

We deduce these costs based on what the towns currently expend in good housekeeping compliance for the 2003 MS4 permit. The 2003 MS4 permit costs, shown in Table 7, represent the current costs for compliance for the subject towns. In the case of annual costs, the largest contributors for this value in each town were their current snow and ice road management. This is a requirement that the USEPA did not update from the 2003 MS4 permit to the 2014 MS4 permit draft.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$283,458	$6,292	$0
Holden	$220,562	$6,292	$0
Millbury	$693,578	$6,292	$0

Table 15: Estimated Good Housekeeping Costs

The annual cost for Millbury is an estimated 275% increase from the average cost of Holden and Southbridge As mentioned earlier in Section 2.4.7, such a large deviation should not come as a surprise. After being interviewed, DPW Director for Millbury Rob McNeil provided us with the costs of salt, the largest contributor to this control measure cost as seen in Appendix F, in the 2014 Fiscal Year.

4.3.7 Total Future Cost Comparison

Beyond the cost of compliance with each of the control measures, there are many miscellaneous requirements that are located elsewhere in the permit. These requirements include: the submission of a notice of intent, total maximum daily load requirements, and the development of a stormwater management program. These costs are difficult to estimate, as some of them have not been performed before (such as meeting Total Maximum Daily Load requirements), and are not implemented as numbers in our cost sheets located in Appendices A (Southbridge 2003 Cost Analysis), B (Holden 2003 Cost Analysis), and C (Millbury 2003 Cost Analysis). The annual miscellaneous costs in each individual town are $15,168, $2,376 in one-time costs and $0 in intermittent costs we illustrate in Table 16 and Appendices A, B, and C. When all of the values in Tables 10 through 15 of this chapter have been summed up in Table 17, we estimate Southbridge's annual cost of compliance with the 2014 Draft MS4 permit to be $343,008 per year. We have also estimated their one-time cost for the 2014 MS4 permit to be $314,940, which we included in Table 17. In terms of intermittent costs, we expect the towns of Southbridge and Holden to have to pay $57,876 per year as we illustrate in Table 17. We estimate the town of Millbury to need to pay $84,210, as indicated in Table 17. In the Town of Holden, their annual costs are $258,790, their one-time costs are $325,428, and their

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$15,168	$2,376	$0
Holden	$15,168	$2,376	$0
Millbury	$15,168	$2,376	$0

Table 16: Estimated Miscellaneous Costs

intermittent costs are $57,876 as we include in Table 17. In the Town of Millbury, we expect the annual costs to total $753,173, their one-time costs to total $320,231, and their intermittent costs to total $84,210 per year, as illustrated in Table 17. These costs reflect the current stormwater management programs in each town that will continue, as well as a multitude of new requirements. We calculated these cost estimates in direct collaboration with Frederick Civian.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$343,008	$314,940	$57,876
Holden	$258,790	$325,428	$57,876
Millbury	$753,173	$320,231	$84,210

Table 17: Estimated Total Costs

5.0 Findings and Recommendations

5.1 Introduction

Having completed our goals, objectives, and cost analysis, we were able to develop many findings and recommendations for the towns of Southbridge, Holden, and Millbury, Massachusetts, the Central Massachusetts Regional Stormwater Coalition (CMRSWC), and other Massachusetts towns. In this chapter, we discuss the results of our research and recommendations for the CMRSWC and the towns so they can be adequately prepared for the 2014 Municipal Separate Storm Sewer System (MS4) draft permit. Our findings detail the cost of implementing the 2014 draft MS4 permit, as well as the difficulties associated with implementing the draft permit in our subject towns. Despite our rigorous methods, our research may not have revealed all potential costs of compliance with the new draft permit. Therefore, the towns should read our cost analysis as an estimate guideline or starting point. We believe, however, that our findings will be accurate and can help our towns effectively implement the 2014 draft MS4 permit.

5.2 Finding 1: The 2014 MS4 permit may cost too much for the towns to effectively implement

Southbridge, Holden, and Millbury, Massachusetts all struggle to finance elements of their stormwater management programs. Currently, Southbridge spends an estimated $ 326,118 annually on their stormwater programs. Comparatively, the towns of Holden and Millbury spend approximately $150,232 and approximately $647,475 respectively on their annual stormwater budgets. We have compiled these reports from information that individual town representatives have provided us as well as our own observations. We also obtained financial information from town archives, such as 2014 annual stormwater reports from each town. In order to ensure the validity of each wage, capital cost, and reoccurring cost, we obtained each value from

representatives of their respective towns. In cases where we could not find specific details, we translated financial estimates for certain services and programs from one town to another and checked the numbers with Frederick Civian, Stormwater Coordinator for the Commonwealth of Massachusetts.

Based on the reports that each town has provided us, each of our subject towns are experiencing difficulties in meeting these requirements, both financially, and with enough workers. Heather Blakeley, the Director of the Southbridge Department of Public Works (DPW), has expressed concern for the town's ability to fund its stormwater management program. Southbridge is running into difficulty with Proposition 2.5, which prevents towns from increasing taxes by more than 2.5% per year, and citizens can vote to reject an increase in taxes. This issue makes compliance with new MS4 requirements more difficult (Heather Blakely, 2014). Based on our interview, Southbridge is especially concerned with the lack of available labor. There are a large number of new requirements in the current MS4 Draft permit, and Southbridge does not have the dedicated labor force to tackle so many new programs (Heather Blakely, 2014).

John Woodsmall, the Director of the DPW in Holden, has expressed similar concerns. He has stated, "A lot of it depends on what the final format of the permit will be, and what the magnitude is in the increase in costs. We're able to absorb some but not too much generally. If it's substantial then that's going to be a real concern." (John Woodsmall, 2014).
Millbury's DPW director Robert McNeil has also indicated a similar situation. He said, "Particularly since it's still in draft form, we have not made any effort to determine the cost of the changes. So I think part of this whole effort, the hope is to work through that. Either [our IQP team] Figure out where the gap is, or what's changing, or work through the [CMRSWC] to

determine what those costs are" (Robert McNeil, 2014). Mr. McNeil also stated in our interview that of all the preparations, funding lacks the most assistance, even though funding is the backbone for the whole system.

After collecting financial data from each town, we were able to create a cost estimate for each town's stormwater management costs as we show in the Finding 1. These cost estimates represent their total costs of compliance with the 2003 MS4 based on currently available information. We were able to contact representatives in the Massachusetts Department of Conservation and Recreation (DCR) during our project. We interviewed Robert Lowell, Stormwater Manager for the DCR, and Lawrence Pistrang, Environmental Analyst for the DCR. They were able to provide us with cost estimates for educational programs, as well as guidelines for estimating the costs of certain requirements. With these resources, we were able to construct a separate cost estimation of complying with the 2014 MS4 Draft permit for Southbridge, Holden, and Millbury. Appendix H contains the blank cost sheets, Appendix D for contains the completed sheets for Southbridge, Appendix E contains the completed sheets for Holden, and Appendix F for Millbury. In total, we expect an annual cost increase of 28% for Southbridge, 39% for Holden, and 30% for Millbury. These costs do not take into account the one-time costs for each town to update mapping systems, ordinances, and other one-time programs. Based on these increases in cost and the current state of the stormwater management programs in each town, we believe that the requirements in the 2014 MS4 Draft permit may cost too much for towns to effectively implement.

5.3 Recommendation 1: Effective regionalization will allow towns to better implement their stormwater management programs

If towns can regionalize their stormwater management programs, they will be able to implement the 2014 MS4 permit more effectively and at a lower cost. In our findings, we have

determined that towns can more effectively manage and fund their stormwater programs if they are part of a regional organization. In our study, the CMRSWC unified 30 towns by providing them an effective and centralized stormwater management resource. With the CMRSWC, the members do not have to produce many of the materials required under the 2014 MS4 Draft permit. Our project did not involve municipalities that were not part of a Coalition. Based on our interviews with DCR representatives and Massachusetts Stormwater Coordinator Frederick Civian, a municipality not part of a regional organization would need to expend an excess of $9,433 to develop these materials in house or hire a contractor. We discuss the benefits of regionalization further in finding 4 and recommendation 4.

5.4 Finding 2: Using innovative funding techniques can help the towns spend less from their general fund on stormwater management

With the new draft permit having so many new requirements, towns will have to use innovative funding techniques such as grants, stormwater taxes, or stormwater utilities to fund all of the necessary changes. When funding large construction projects, towns look outside of the town for assistance. Many towns, however, do not look for additional funding outside of their town for stormwater management. When we interviewed the directors of the DPW in Southbridge and Holden, Heather Blakely and John Woodsmall respectively, both said that they have a line item in the town's general fund that funds the stormwater management program. In addition, when we asked how they planned to fund the required changes, both said they would just seek additional funding from the town. However, our other subject town Millbury did not use the same funding strategy as Southbridge and Holden. Millbury uses a unique method of partially funding their stormwater management, which we learned about when we spoke with the Millbury's DPW director Robert McNeil.

As all towns do, Millbury has contractors bid for projects within the town, such as replacing pipes, building new municipal buildings, and repairing municipal buildings. As a part of this system, Millbury asks some of the contractors to write grant requests for the town. If the town gets the grant, then the town gives the project to the contractor. This is an innovative way for both the town and the contractor to benefit; the town has the project completed with all of, or some of the grant money, and the contractor gets the contract. Innovative ways of funding stormwater management are becoming increasingly necessary, as the Community Innovation Challenge (CIC) grant continues to decrease the amount of funds that the CMRSWC receives.

The CIC grant is an innovative way to get community projects off the ground, but the state government established the grant program to start the projects, not sustain the projects, so every year the funding decreases. The CMRSWC is in its 3rd year of CIC funding, and the funding decreased by 62.9% in the first year and 30.4% in the second year. Therefore, the Coalition should explore other ways to fund their efforts. The CMRSWC member towns help the CMRSWC continue to operate by contributing annual dues. Some towns in the CMRSWC are considering implementing a stormwater tax or a stormwater utility, and in some cases that will be necessary. However, by using innovative funding methods, towns can minimize the amount that their residents have to pay for these measures.

5.5 Recommendation 2: The towns should seek alternative sources of funding such as additional grants beyond the CIC

As we mentioned in Finding 2, towns should start to seek new ways of funding stormwater management. When the United States Environmental Protection Agency (USEPA) releases a new MS4 permit, towns are going to have to find ways to fund the permit, and their current method of funding stormwater management through the general fund can only work for a limited amount of time. Some towns in the CMRSWC have talked about implementing a

stormwater tax, but according to Southbridge's DPW director Heather Blakeley, town residents will be hesitant to vote for this tax. This reservation may be due to the citizens' lack of information of the need for and importance of stormwater management. Another method for funding the necessary changes to stormwater management is to create a stormwater utility. This is most likely the best option for many towns, since it is a small increase in cost to the property owners: $11 per single-family household or some similar number. Gathering this money from all of the properties in the town would significantly help towns pay for stormwater management (USEPA, 2009). The stormwater utility allows the town to gather funding based on a factor such as impervious surface or total area, or just a flat rate. A utility would also not have to through the town approval process, so it may be easier for towns to implement.

As we mentioned in Finding 2, Millbury has contractors look for grants that the town could apply for and has the contractors do the application for the town as part of bidding for a project. This way, the towns can source funding for stormwater management outside of their town with little effort, according to Robert McNeil. When we interviewed Mr. McNeil, he told us that the contractor does almost all of the work in this process, which means that even if the town does not get the grant they did not spend much time and money applying for it. The contractor does most of the actual work and it pays off for them if they can manage to get the grant for the town, since the town is much more willing to fund the project with grant money.

A few examples of grants the towns could apply for is the 604(b) grant from the Massachusetts Department of Environmental Protection (MassDEP), Wastewater grants from the Massachusetts Environmental and Energy Agency (MassEEA), and River Revitalization Grants from the Massachusetts Department of Fish and Game (MassDFG). The 604(b) grant program through the MassDEP serves to help towns determine issues in their current stormwater

management systems. The River Revitalization grant from the MassDFG directs the grant at towns for revitalizing rivers in the towns. The towns should apply for funding as quickly as possible before these funds go away. The Coalition should also lobby for additional future funding from the USEPA and the MassDEP

5.6 Finding 3: Using innovative stormwater management techniques can help towns save money and thus implement the MS4 permit more effectively

Millbury utilizes many innovative methods of stormwater management, which helps them save money in implementing the MS4 permit. During our interview with Millbury's DPW director Robert McNeil, we learned about many of these innovative techniques. Millbury has begun the process of removing sump pump lines from their sewer system and directing them into the stormwater system. The town initiated this process in order to prevent combined sewer overflows (CSOs). In anticipation of the increased flow volume from this project, Millbury has begun installing larger drainpipes. These pipes are much larger than they need to be to handle the flow volume from the current project. The town has installed these larger pipes in case they ever decide to tie more discharges into the stormwater system. If Millbury had installed pipes that were only of adequate size to handle the flow volume from the current project, then they would need to perform additional construction if they ever decided to tie more discharges into the stormwater system. Since Millbury has installed these larger pipes, they have eliminated the need to perform additional construction in the event that they decide to increase the flow volume through the stormwater system. Therefore, by anticipating the need for future construction, Millbury will save money over time, thus reducing their costs for stormwater management.

Millbury also saves money by performing innovative public participation programs. The town promoted an art contest to raise awareness of stormwater management in both their middle school and high school. The middle school art contest involved the entire 5^{th} and 6^{th} grade classes

in Millbury's public schools. The high school art contest targeted about 25 students (Rob McNeil, 2014). However, Mr. McNeil expressed interest in targeting the entire high school, which holds students from 7th through 12th grades, in the future. The town rewarded some of the students by allowing them to paint their artwork on the town's snowplows. The art contest was an effective way to target a large number of people. In addition, the contest only involved about four hours of labor from the town DPW. By keeping the cost of fulfilling the public participation control measure low, the town can focus more of their monetary resources on implementing the Illicit Discharge Detection and Elimination (IDDE) control measure, anticipated to be the most costly requirement of the 2014 draft permit.

5.7 Recommendation 3: The towns should strive to utilize innovative stormwater management techniques

As we have discussed in finding 3, the towns can save money by using innovative stormwater management techniques. The 2014 draft MS4 permit allows for a degree of creativity when designing BMPs. The permit allows the permittee to add a Best Management Practice (BMP) to their Stormwater Management Program (SWMP) at any time. If the towns strive to generate creative ideas, they may end up creating a new BMP, which is far more effective than any BMP, which is currently in use. Therefore, generating innovative ideas can be a tremendously helpful way to reduce the cost of implementing the 2014 draft MS4 permit.

5.8 Finding 4: Towns that communicate with other towns, even to a small extent, can more effectively manage and fund their stormwater management programs

In gathering data for our financial report, we have found that there is a lack of communication and sharing of information between towns to improve their stormwater management programs. Within the municipalities of the CMRSWC, there is a group called the Steering Committee, which meets on a monthly basis to discuss stormwater management within their municipalities. During our IQP term, we were able to attend two of these meetings, and in

both of these meetings, we noted the attendance of DPW Director for Millbury, Robert McNeil, DPW Director for Holden, John Woodsmall, and Town Engineer from Holden, Isabel McCauley. In addition, we noted the attendance of ten other members. These members represented other towns within the Coalition, and from the roster of attendees, we noted representatives from Auburn, Leicester, Millbury, Northborough, Shrewsbury, and Spencer. Of the thirty towns in the CMRSWC, only about 25% of towns were represented. Although there are many new members to the CMRSWC, this still represents a low level of communication between towns on this topic, even among towns that are members of a dedicated stormwater coalition. Despite this, the collaboration within the CMRSWC has benefitted all members. Based on our cost analysis efforts seen in Appendices D, E, and F, towns can save approximately $9,433, not including the thousands in a Global Positioning System (GPS) mapping tools such as a Leica, in the implementation of the new permit as members of the CMRSWC.

In our meetings with representatives within the towns of Millbury and Southbridge, we have found that some cost-saving practices of one town may not appear in another. For example, Southbridge prints and mails all of their public education materials, but Millbury uses digital materials from the CMRSWC. Using the materials from the CMRSWC and digitally distributing them, Millbury saves the $6,500 that Southbridge spends on postage. Millbury also has undertaken a way to gather grant funding that was unique among our subject towns the municipalities. Even though both of these towns are part of the CMRSWC, they were unaware of these cost saving techniques that they could apply to their own stormwater management programs.

In working with these towns in the CMRSWC, we have found that even though they do not always communicate their own techniques, they are able to save money through CMRSWC

membership. There are some requirements within the 2014 MS4 draft that require significant investment within a town, but other requirements that will have little or no financial cost. We found this particularly evident in the Public Education minimum control measure. This control measure requires information materials, such as pamphlets, brochures, or information on a website. Additionally, there are requirements such as a sump pump discharge policy, a municipal Stormwater Pollution Prevention Plan (SWPPP), and various ordinances that do not necessarily need to be uniquely tailored to every municipality. The CMRWSC has templates for these materials, and municipalities can save money by using these materials provided as opposed to developing their own.

5.9 Recommendation 4: Regionalization can help towns save money by sharing information and resources.

The CMRSWC is a great example of towns working together to help each other with stormwater management. Not every town needs to join the same coalition, but towns should form coalitions with neighboring towns to share knowledge and tools. The small $4,000 cost of membership to the CMRSWC more than covers the amount that the towns would normally spend on consultants, testing kits, mapping tools, and educational messages. All towns have to map their MS4 system and test their outfalls. This mapping does not have to happen every year, so a single town buying this equipment would be highly inefficient. Additionally, having to purchase water quality testing kits individually would also be a financial burden, based on the seven different factors to test for in the 2014 MS4 permit draft (US EPA, 2014a).

In the CMRSWC, there are monthly steering committee meetings where members talk about current issue in stormwater management as well as issues that they are facing in their town. This is a great place for the person who is in charge of stormwater to learn more from their peers and discuss the current methods of stormwater management. Towns looking to form their

own coalition should look to the CMRSWC as a model or if they are in the region, they should look into joining the CMRSWC.

5.10 Finding 5: In each of our subject towns, stormwater management information was divided amongst different departments

Since the USEPA released the 2014 draft MS4 permit, the towns recognized the increased importance of updating their stormwater management programs. However, some towns struggle to find all of their stormwater management data. Neither Millbury, Southbridge, nor Holden had a centralized source of stormwater management information. In Southbridge, Heather Blakeley knew some of the general costs of stormwater management, but had to send us to Ken Pickerin for information on the conservation commission and to the fire chief Mark DiFronzo for information on hazardous waste removal. Mr. Pickerin and Mr. DiFronzo both dealt with stormwater management indirectly, which led to some confusion as to what information we needed from them. In Holden, we spoke with Isabel McCauley and John Woodsmall, both of whom were knowledgeable on the stormwater management relating to their jobs, but had to send us to town planner Pamela Harding for information on the conservation commission. In our towns, we eventually received the data that we needed, but always after talking with many different people and looking at many different cost sheets. The people we interviewed were often located between different departments in the town.

In Millbury when we interviewed the director of the DPW, Robert McNeil, he had to check for some of the stormwater data, given that he is in charge of the whole department and there is not a single place for that information. However, the numbers he provided to us were from all from different parts of the town's records, which was the case for all three of our subject towns. Many requirements of the 2003 MS4 permit are likely to be performed by multiple departments, such as ordinance creation and street sweeping being two completely different

programs requiring completely different personnel. For all three of our subject towns, these records were not located in a single place, because the required tasks of stormwater management were handled by multiple departments.

5.11 Recommendation 5: Having a central source of stormwater management would allow for easier implementation of future MS4 permits and make continuous compliance easier for the towns.

Based on our previous finding, having a single person in charge of stormwater management, for example, a stormwater coordinator, would make compliance much easier for towns. According to the Department of Conservation and Recreation's (DCR) Stormwater Coordinator Robert Lowell, the USEPA classifies the Wachusett Watershed as a non-traditional MS4 system. Therefore, looking at the Wachusett Watershed DCR for stormwater management is not too different from looking at a town; there are just some different requirements. When interviewing Mr. Lowell, he was able to access information easily because of his position. Since Mr. Lowell is in charge of stormwater management for the Wachusett Watershed DCR, he had intimate knowledge of how many of the requirements the DCR are meeting and what their plans were for the future with the new 2014 draft MS4 permit. If towns were able to replicate what the Wachusett Watershed DCR does with a stormwater manager, then they would be in a much better position for the any future MS4 permits. We recommend that towns research the feasibility of either creating a full-time position to manage stormwater, or make it part of an already-existing position within the municipality. We realize that small towns may not be able to afford this option, and we suggest some towns research the potential of Regional Stormwater Coordinators. These could be Stormwater Managers for multiple municipalities, whose wages are paid in part by each municipality the manage stormwater for. This option may allow smaller

municipalities to be able to consolidate their stormwater management information within their municipal budget.

5.12 Finding 6: The IDDE control measure will be a significant contributor to the increase in cost between the 2003 and 2014 draft MS4 permits

The IDDE control measure of the 2014 draft MS4 permit will cause a significant increase in the cost of implementation in onetime costs. When researching the permits, we found that the IDDE control measure is much longer and has many more requirements in the 2014 draft MS4 permit than in the 2003 MS4 permit. These more stringent requirements will cause a significant increase in the cost of compliance with the MS4 permit, as we illustrate in Table 18. For example, the town of Southbridge should anticipate a large increase in the cost of testing their outfalls. Southbridge has 206 outfalls. In the 2014 fiscal year, they sampled 25 outfalls. Under the 2003 permit, this effort is enough to fulfill the permit requirements. However, the 2014 draft MS4 permit requires each town to sample all of their outfalls, which will result in an eightfold increase in cost for the town. Many of the other permittees will likely face the same challenge as Southbridge and have to increase their sampling work. Massachusetts's towns should anticipate much higher costs in order to fulfill the new requirements of the IDDE measure.

Town	2003	2014 Draft
Southbridge	$3,520	$7,872
Holden	$4,678	$11,523
Millbury	$2,452	$19,242

Table 18: Annual Cost Comparison of IDDE

5.13 Recommendation 6: The CMRSWC should have one person in charge of keeping track of and maintaining the field sampling kits.

One issue that we often faced during our project was with the field sampling kits. The kits often had disorganized and expired components. For example, there was one day we could not run the ammonia test in the field because of expired components. If town workers discover expired components while they sample in the field, this would delay their opportunity to run the test. The workers would have to take the time to find new components and return to their sampling locations. This delay would raise the labor costs for the towns. It was also difficult to find some of the kits. There was one day we had to travel to Oxford in order to find the Total Dissolved Solids (TDS) meter and the Turbidity test. As we discuss in finding 6, the condition of the sampling kits often made it difficult to perform the tests in the field. The kits often had expired components or were in many different locations. If one person was in charge of tracking and maintaining the kits, the CMRSWC would save time trying to find kits and would not have to perform repeat sampling days at outfalls. Therefore, having one person in charge of the kits will save the CMRSWC money.

5.14 Finding 7: The current Asus tablet in use by the CMRSWC is slow and ineffective

When we were in Holden doing outfall testing, we used the tablet from the CMRSWC, which towns use for mapping and data collection. The tablet was not able to connect to the Internet without Wi-Fi, which made it difficult to use in the field. The current solution to that issue is to have an AT&T wireless hotspot to create a mobile hotspot for the tablet. This was not always reliable since the mobile hot spot could be lost or be out of range of the tablet.

The next issue that we learned about with the tablet system was the software. According to Isabel McCauley, Holden's Town Engineer, the software was slow on the tablet and was hard

for the DPW workers to use. When we used the CMRSWC tools on the tablet in the field, we saw this delay. However, when we tried the same tools on one of our smart phones, an iPhone 5, the tools worked smoothly. The screen of the iPhone was smaller than that of the tablet, but the CMRSWC's software was clearly not the issue, the issue was with the tablet.

5.15 Recommendation 7: The towns should use software, which can collect data offline and then upload it to an online database later, as well as a tablet, which is more up to date. This would allow the DPW workers to work more efficiently, thus saving the town labor costs

There are many issues with using the current CMRSWC tablet. Sometimes there just is no cellular signal, which a new tablet could help with, but not be able to completely fix. For this issue, we recommend that the CMRSWC develop an offline mode for the tablet so that anyone using the tablet can collect data and save it so that when the tablet can connect to the network, either via Wi-Fi or via a cellular network, the tablet can upload any data it saved while in offline mode.

Since the tablet is almost three years old, and there are new tablets that would work better, we recommend that the CMRSWC buy a new tablet on which to use their software. Buying a tablet would decrease the amount of time that anyone using the tablet has to wait for loading and reloading when the tools crash. There are tablets that have built-in cell signal receptors, which may be better so the hot spot is not lost and there is a better signal. The combination of the mobile hotspot and the older tablet causes unnecessary frustration and loss of time. When buying the new tablet, the CMRSWC should invest in model that will be durable and will function well over time and with many different users.

For this purpose, we recommend that the CMRSWC purchase a low-end Apple iPad, since they run much better and have a much better life span compared to an Asus tablet. A low-end iPad would cost about $530 for the lowest end full iPad with a diagonal screen size of 9.7in.

A cheaper option is an iPad Mini, which costs $380 with a diagonal screen size of 7.87in. Either of those options would easily out-perform the current Asus tablet. The Asus tablet costs about $250 with a screen size of about 7in and lasted probably two good years. With either iPad they would continue to function well into four years after they are purchased. While working on the current Asus tablet, we lost about four minutes per outfall having to wait for pages to load and reloading pages. If a town is paying a DPW employee $22/hour to use this tablet and they lose four minutes per outfall, they are losing about $2 per outfall. Since the town has to go to each outfall for some of the new requirements approximating 145 outfalls a town, the town is losing $290 due to the cost of the inadequate technology. Just in that savings from one town, the CMRSCW is making the money back in timesaving, especially since the CMRSWC distributes the tablet to many different towns.

5.16 Other Recommendations

5.16.1 The Massachusetts Department of Environmental Protection should research the potential of providing standardized materials available to Massachusetts municipalities

Based on our findings, we believe the MassDEP should consider making available a collection of materials that municipalities could use for their permit compliance when administering the new 2014 MS4 permit. Within the requirements of the 2014 draft MS4 permit, there are many line items that municipalities must develop and implement. These materials primarily consist of those in the Public Education and Public Involvement control measures, such as pamphlets, brochures, and public notices. Beyond these two control measures there are still a number of material requirements, including Stormwater Pollution Prevention Plans (SWPPPs), outfall-screening procedures, and construction site stormwater plans. These materials will require a significant investment from municipalities to implement (See Appendices D, E, and F for cost estimations in our subject towns). In one case, Mr. Lowell provided our team with a high-end

cost estimate for complying with the Public Education requirement. Based on the requirements of the current MS4 Draft permit, a high-end public education program for a town of approximately 17,000 individuals costs an estimated $19,787 annually (Robert Lowell, 2014). This cost can be different, depending on how the municipality chooses to implement certain requirements. Some towns like Millbury are working to abolish paper materials completely (Robert McNeil, 2014). In regards to the Central Massachusetts Regional Stormwater Coalition (CMRSWC), these materials are made by the CMRSWC for its member municipalities, and are available as part of the paid membership to the CMRSWC. Beyond this Coalition, there is also the Massachusetts Watershed Coalition. Formed in 1991, this Coalition works with community partners across Massachusetts in order to protect and restore watershed ecosystems across the state (Coalition, 2014). As part of its goal, the Mass Watershed Coalition also provides information and other services relating to stormwater to many communities in the state (Coalition, 2014). In the 2014 MS4 Draft permit, Most of the requirements are not specific to individual municipalities. The USEPA made the MS4 permit to be applicable to many different municipalities, and the materials that are required are similarly nonspecific to any municipality. With special attention paid to the success of Coalitions distributing materials, it may be highly beneficial for the MassDEP to develop certain materials in-house, as opposed to municipalities developing them themselves. These would be materials like standard operating procedures, ordinances, and other administrative tools that are required under the 2014 draft permit. The MassDEP should certainly not force municipalities to use these materials, but the materials should be available in electronic and physical forms. Even if only a few towns make use of these materials, they could potentially save tens of thousands of dollars.

5.16.2 The CMRSWC should streamline and update the digital forms. This practice would reduce the time needed to inspect outfalls, thus saving money

While we performed outfall sampling in Holden, we completed wet and dry weather sampling forms. We spent roughly ten minutes per outfall in order to complete these forms. As noted by Matthew St. Pierre of Tata & Howard, these forms have many additional categories. These categories include test results for pollutants that are not regulated by the MS4 permit. It is worth noting that, by having categories that go beyond the regulations of the MS4 permit, the CMRSWC can create a cleaner and less polluted environment. The detail of these forms illustrates the CMRSWC's admirable commitment to protecting the environment. However, the cost of implementing the 2014 draft MS4 permit is significant, and will likely strain many towns' budgets. If the CMRSWC updates these forms and removes the categories unrelated to the draft MS4 permit, it will save the town workers time, and thus streamline the process of outfall sampling. These times savings will also save the towns labor costs.

The CMRSWC should also utilize these updated forms on their digital system. Digital sampling forms are easy to upload to a database or the CMRSWC's website. When we were performing field work in Holden, Ms. McCauley demonstrated how to complete the dry and wet weather sampling forms on the CMRSWC tablet and then upload them to the CMRSWC website. Having a database of these forms makes it easy to see trends in pollution, both within a single town, and between towns, which have shared watersheds. Therefore, the database makes it much easier to perform outfall sampling and inspections, thus saving money. A previous IQP group detailed the efficiency of uploading digital forms to the People GIS database using the Leica tablet. This process circumvented the need to submit the forms outside of the field, and also prevented municipal employees from making repeated trips to outfalls in order to inspect

them (Barat, Chin, & Feraco, 2012). Therefore, the use of a digital database makes sampling and inspection easier and more efficient.

5.16.3 Recommendations for Future Research

In the future, we recommend project groups perform an assessment of the cost of implementing Total Maximum Daily Load (TMDL) measures. According to Frederick Civian, the cost of implementing TMDL measures could be overwhelmingly significant for the towns. Although not much research has been done on TMDL, the USEPA has shown the extent of these costs. The USEPA estimated the cost of implementing TMDL requirements in Bellingham, Franklin, and Milford Massachusetts at $23,595,000, $62,810,000, and $67,363,000, respectively (Group, 2011). A proper assessment of these costs could prove to be valuable to the USEPA, as well as the towns, in the future.

We also recommend future project groups attempt to fill the gaps in our research. We received most of our data from the town officials, with few outside sources except for the DCR. We attempted to contact Environmental Partners Group for information about Holden, but we were unable to reach them. In addition, we had to estimate many of our costs. These factors made our cost numbers difficult to verify as being accurate. Because of this lack of verification, some of our data could have resulted in bias. We recommend that future research groups find a method to eliminate some of the biases in our data, such as by finding budget data from multiple sources.

6.0 Conclusion

Stormwater runoff is one of the leading contributors to water pollution in the United States. In order to combat this pollution, the United States Environmental Protection Agency

(USEPA) created the Municipal Separate Storm Sewer System (MS4) permit. On September 30, 2014, the USEPA released the 2014 draft MS4 permit. Once the USEPA releases the permit in full, towns throughout Massachusetts will have to comply with it, which will lead to substantial spending increases.

In our cost analysis chapter, we discuss the predicted annual costs of complying with the 2014 draft MS4 permit in our subject towns of Holden, Millbury, and Southbridge. From our cost analysis, we predict an annual cost of implementing the 2014 draft MS4 permit of $258,790 for Holden, $735,629 for Millbury, and $343,008 for Southbridge. These costs represent an increase in the annual cost of implementation from the 2003 MS4 permit of 39% for Holden, 26% for Millbury, and 28% for Southbridge.

These cost increases are significant, and we propose several potential methods for defraying the cost increases of effectively implementing the 2014 Draft MS4 to individual towns. In addition, we recommend that towns reach out to the Massachusetts Department of Environmental Protection (MassDEP) for advice on implementing the permit. In our findings and recommendations chapter, we provide recommendations to towns, and the Central Massachusetts Regional Stormwater Coalition (CMRSWC) for effective implementation of the 2014 draft MS4 permit. Among our most important recommendations, we emphasize the benefits of regionalization, the use of innovative stormwater management and funding techniques, and centralization of stormwater management in each town.

The task of effective stormwater management is daunting. However, by implementing the proper procedures, the towns can plan effectively manage stormwater management, thus protecting human health and the environment.

KEY:

Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$10,952	Pamphlets (6500), Hazardous Waste Collection (3360), Newspaper Article (500), Media Campaign (500), Develop a curriculum for school system (92)	Yes
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2hrs @ $22/hr	No
3	Admin	*Identify parties responsible for each message	2.3.2 a	$22	1hr @ $22/hr, once a year for 8 years	No
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1hr @ $22/hr	No
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	No
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	Included in No. 5	No
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$19,860
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	Minimal cost, can post on website	No
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	In compliance with public meeting requirement	Yes
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	Yes

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	Varies depending on severity of infraction average cost, actual cost may vary	Yes
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	Included in No. 1	Yes
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hr @ $22/hr for scheduling	Yes
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	Yes
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	Varies depending on severity of infraction around 25000-50000	No
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr if records are available	No
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr to determine the information	No
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included in No. 7	No
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included in No. 7	No
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	No
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr for informing EPA/MassDEP orally/written	Yes
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$1,133	15min/outfall (includes travel), 206 outfalls, @ $22/hr	No
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	No
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$1,183	10min/outfall (includes travel), 206 outfalls, @ $22/hr, + materials ($2 stick per outfall + spraypaint + sharpie)	No
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included in No. 14	No
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included in No. 14	Yes
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Enough new requirements to have to add new data elements, cost assuming outside contracting and implementation into GIS map	No
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included in No. 17	No
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included in No. 17	No
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included in No. 17	No
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included in No. 17	No
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included in No. 17	No
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr for continuous additions to stormwater systems	No
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	Yes
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	Complete redevelopment of the program, review and upgrades	No
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	Change ordinance, 13 weeks @ 5hrs/week @ $22/hr, has to go to different committees	Yes
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included in No. 25	No
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories (soupped up from previous "priority" mark in 2003)	2.3.4.7 c i	$13,200	Approx. 1200 catch basins, approx. 30 min/basin @ $22/hr	No
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors (soupped up from previous "priority" mark in 2003)	2.3.4.7 c ii	$26,400	Approx. 1200 catch basins, approx. 1hr/basin @ $22/hr	No
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included in No. 29	No
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	$0 with CMRSWC Membership	Yes
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	Included in No. 34	Yes
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	Possible time extensions, no cost	Yes
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$2,266	206 outfalls, approximately 30min/outfall @ $22/hr	Yes
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$0	Included in No. 39	Yes
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$15,656	206 outfalls, done by contractor, $30/outfall, $23/hr, 2hrs/outfall Testing Kits (0) b/c CMRSWC membership	Yes
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if records are available	No
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr	No
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included in No. 41	No
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$88	Assuming 4 catchments, 1 hr/catchment @ $22/hr	No
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included in No.43	No
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included in No.43	No
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	Assuming using WPI spreadsheet, otherwise about 10min per catchment	No
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	$0 since CMRSWC Membership	No
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included in No. 47	No
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included in No. 47	No
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$176	8hrs @ $22/hr, for scheduling	Yes
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$0	See Miscellaneous No. 50	No
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included in No. 51	No
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included in No. 51	No
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	Yes
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	No
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	$0 since CMRSWC Membership	No
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included in No. 37 and No. 38	No
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	No
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Deadlines, See No. 38 and 37	No
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Deadlines, See No. 28	No
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Deadlines, See No. 28	No
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Deadlines, See No. 28	No
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Deadlines, See No. 28	No
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	No
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$176	8hrs @ $22/hr	No
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	No
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	$0 since CMRSWC Membership	Yes
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$19,242
Estimated One-time Costs	$304,006
Estimated Intermittent Costs	$50,440

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$0	Volunteer based program	Yes
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	See No. 3-12	Yes
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1hrs @ $22/hr, for review of current document	No
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of current document	No
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$88	4hrs @ $22/hr	No
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr	No
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr	No
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr	No
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr	No
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr	No
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr	No
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr	No
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$0
Estimated One-time Costs	$770
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Yes
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, but 8hrs @ $22/hr if not	Yes
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, assumes no controversy and 4 people working	No
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	Included in No. 3	No
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	No
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	No
7	Admin	*all BMPs must be constructed in accordance with the MA Stormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	Yes
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	No
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	Yes
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,100	Submitted by construction company, 50hrs @ $22/hr, if it's new	No
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	5hrs w/ an attorney, 208hrs @ 22/hr, legal authority adds complexity and cost	No
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included in No. 11	No
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	Yes
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @ $22/hr	No
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included in No. 14	No
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included in No. 14	No
17	BMP	*permittee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included in No. 14	No
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	No
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40hrs @ $22/hr	No
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included in No. 19	No
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included in No. 19	No
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included in No. 19	No
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included in No. 19	No
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	Yes
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80hr @ $22/hr, a lot of data required	No
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	See No. 17 in IDDE	No
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	See No. 17 in IDDE	No
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	No
29	Admin	*break out those figures by development, redevelopment or retrofit by permittee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	No
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	No
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hrs, many properties to assess	No
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included in No. 32	No
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii	$0	Included in No. 32	No
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included in No. 32	No
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included in No. 32	No
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included in No. 32	No
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,436

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hrs @ $22/hrs	No
2	Admin	*w/in 1 year inventory all permittee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	Included in No. 1	No
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	No
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	Included in No. 3	No
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	Included in No. 3	No
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	Included in No. 3	No
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	Included in No. 3	No
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	Included in No. 3	No
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc	2.3.7 a ii b	$1,760	80hrs @ $22/hr	No
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	Included in No. 9	No
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	Included in No. 9	No
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	Included in No. 9	No
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	4hrs @ $22/hr	No
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included in No. 13	No
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included in No. 13	No
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22	No
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0	Included in No. 16	No
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/basin @ $22/hr, assuming 10 basins/year	No
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17 & Annual Report	No
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	Included in No. 17	No
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	Included in No. 23	No
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	Included in No. 23	No
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$40,624	Materials + Labor given by town	Yes
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$0	Included in No. 26	Yes
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Development Cost	No
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Development Cost	No
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$0	$0 Since Southbridge owns their own landfill	Yes
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$0	Properly house materials in municipally owned properties	Yes
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	Yes
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0		Yes
36	Admin	*establish procedures for O&M or all permittee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr	No
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Inspect each BMP, assuming 2000/year 15min/BMP @ 22/hr	No
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	No
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr, based on templates from the CMRSWC	No
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	4hrs to update existing SWPPPs, 10hrs for new SWPPPS, @ $22/hr, assume 5 new facilities + 5 old facilities	No
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included in No. 40	No
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included in No. 40	No
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included in No. 40	No
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$10,000	Depends on variations of the extent of impaired waters varies about 10000-25000	No
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	Included in No. 44	No
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included in No. 44	No
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included in No. 44	No
48	BMP	*Good Housekeeping	2.3.7 d 2	$189,540	Snow removal (3300), leaf collection (34020), salt/sand distribution (152220)	Yes
49	BMP	*Preventative Maintenance	2.3.7 d 3	$23,056	Catchment cleaning (23056)	Yes
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included in No. 44	Yes
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included in No. 44	Yes
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included in No. 44	Yes
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included in No. 44	Yes
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$1,980	Given by town	Yes
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included in No. 44	Yes
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,000	30min/inspection, assume 10 facilities with 4 areas each @ $100/area	No
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$2,266	206 outfalls, approx. 30min/outfall @ $22/hr	No
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc	2.3.7 b iii a	$0	Included in No. 44	No
59	BMP	*permittee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	Included in No. 44	No
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	No
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$283,458
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs @ $22/hour, historical properties or endangered species will increase this cost	No
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	No
3	BMP	*Implement measures to protect endangered species	1.9.1	$0	Included under No. 1	No
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	See Miscellaneous No. 50	No
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	Varies	Included under No. 1	No
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	No
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	No
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	No
9	BMP	Develop a SWMP	1.10	$1,760	80hrs @ $22/hr	Yes
10	BMP	Implement a SWMP	1.10	$0	Included under No. 10	Yes
11	Admin	*Update/modify SWMP	1.10	$440	20hrs @ $22/hr	No
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	No
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	No
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	No
15	Admin	***Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Yes
16	Admin	*List all receiving water bodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	No
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	No
18	Admin	*List all outfalls that discharge to each water body	1.10.2	$0	Included under No. 9	No
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	No
20	Admin	*List all interconnected MS4s and receiving water body	1.10.2	$0	Included under No. 9	No
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	No
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	No
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	No
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	No
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	No
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	No
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	No
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	No
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	No
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	No
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	Yes
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	No
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	No
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	No
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	No
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	No
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	No
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included in No. 9	No
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hrs, of paperwork for new BMP	Yes
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	No
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	See Miscellaneous No. 50	No
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	No
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	40hrs at $22/hr, week of work annually	No
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	No
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	No
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"	4.3 b	$0	See Miscellaneous No. 50	No
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Part of annual report, see No. 46	No
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Part of annual report, see No. 46	No
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Part of annual report, see No. 46	No
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$14,200	The Consultant fee for creating the annual report increased based off of the increase in requirements	Yes
51	Admin	*The status of any required plans	4.4 b iii	$0	Part of annual report, see No. 50	No
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Part of annual report, see No. 50	No
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Part of annual report, see No. 50	No
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Part of annual report, see No. 50	No
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Part of annual report, see No. 50	No
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Part of annual report, see No. 50	No
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Part of annual report, see No. 50	Yes
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Part of annual report, see No. 50	Yes
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Part of annual report, see No. 50	No

Estimated Annual Costs	$15,168
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Appendix E

Control Measure	Annual	One-Time	Intermittent
Public Education and Outreach	$9,908	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$7,872	$314,494	$50,440
Construction Site Stormwater Runoff Control	$0	$770	$0
Post Construction Stormwater Management	$5,280	$1,496	$7,436
Good Housekeeping	$220,562	$6,292	$0
Non-Control Measure			
Miscellaneous	$15,168	$2,376	$0
Totals	**$258,790**	**$325,428**	**$57,876**

KEY:	
Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$1,000	Pamphlets to homes, $500 and businesses,$500	Yes
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2 hrs @ $22/hr	No
3	Admin	*Identify parties responsible for each message	2.3.2 a	$22	1 hr @ $22/hr	No
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1 hr @ $22/hr, once a year for 8 years	No
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	No
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	Included in No. 5	No
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$9,908
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	Minimal cost, can post on website	Yes
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	In compliance with public meeting requirement	No
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	Yes

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	Varies depending on severity of infraction average cost, actual cost may vary	Yes
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	Included in No. 1	Yes
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hrs @ $22/hr, for scheduling	Yes
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	Yes
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	Varies depending on severity of infraction, around $25,000-$50,000	No
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr, if records are available	No
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr, to determine the information	No
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included in No. 7	No
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included in No. 7	No
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	No
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr, for informing EPA/MassDEP orally/written	No
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$792	15min/outfall (includes travel), 144 outfalls, @ $22/hr	No
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	No
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$528	10min/outfall (includes travel), 144 outfalls, @ $22/hr, + materials ($2 stick per outfall + spraypaint+sharpie)	No
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included in No. 14	No
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included in No. 14	Yes
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Enough new requirements to have to add new data elements, cost assuming outside contracting and implementation into GIS map	No
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included in No. 17	No
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included in No. 17	No
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included in No. 17	No
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included in No. 17	No
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included in No. 17	No
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr, for continuous additions to stormwater systems	No
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	Yes
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	Complete redevelopment of the program, review and upgrades	No
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	Change ordinance, 13 weeks @ 5 hrs/week @$22/hr, has to go to different committees	Yes
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included in No. 25	No
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories	2.3.4.7 c i	$17,028	Approx. 1548 catch basins, approx. 30 min/basin @ $22/hr	No
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors	2.3.4.7 c ii	$34,056	Approx. 1548 catch basins, approx. 60min/basin @ $22/hr	No
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included in No. 29	No
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	8hr @ $22/hr, work day to complete process, ($0 W/CMRSWC Membership)	Yes
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	See No. 34	Yes
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	possible time extensions	Yes
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$1,584	144 outfalls, approx. 30min/outfall @ $22/hr	Yes
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$0	Included in No. 39	Yes
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$4,968	144 outfalls, approx. 1.5hr/outfall @ $23/hr, Paperwork for wet weather sampling (2,266), Testing Kits (0) b/c CMRSWC membership	No
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if records are available	No
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr	No
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included in No. 41	No
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$88	Assuming 4 catchments, 1 hr/catchment @ $22/hr	No
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included in No.43	No
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included in No.43	No
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	Assuming using WPI spreadsheet, otherwise about 10min per catchment	No
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	$0 since CMRSWC Membership	No
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included in No. 47	No
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included in No. 47	No
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$176	8hrs @ $22/hr, for scheduling	Yes
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$0	See Miscellaneous No. 50	No
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included in No. 51	No
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included in No. 51	No
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, 1.5hr/illicit, 3 illicit	No
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, 1.5hr/illicit, 3 illicit	No
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	$0 since CMRSWC Membership	No
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included in No. 37 and No. 38	No
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	No
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Deadlines, See No. 38 and 37	No
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Deadlines, See No. 28	No
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Deadlines, See No. 28	No
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Deadlines, See No. 28	No
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Deadlines, See No. 28	No
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	No
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$176	8hrs @ $22/hr	No
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	No
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	$0 since CMRSWC Membership	Yes
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$7,872
Estimated One-time Costs	$314,494
Estimated Intermittent Costs	$50,440

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$0	Volunteer based program	Yes
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	See No. 3-12	Yes
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1 hr @ $22/hr, for review of current document	Yes
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of current document	No
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$88	4hrs @ $22/hr	No
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr	No
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr	No
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr	Yes
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr	No
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr	No
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr	No
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr	No
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$0
Estimated One-time Costs	$770
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Yes
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, but 8hrs @ $22/hr minimum	Yes
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, assumes no controversy and 4 people working	No
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	See No. 3	No
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	No
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	No
7	Admin	*all BMPs must be constructed in accordance with the MA stormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	Yes
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	No
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	Yes
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,100	Submitted by construction company, 52hrs @ $22/hr, if it's new	No
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	legal authority adds complexity and cost, 5hr w/ an attorney, 208hrs of labor @ $22/hr	No
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included in No. 11	No
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	Yes
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @ $22/hr	No
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included in No. 14	No
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included in No. 14	No
17	BMP	*permitee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included in No. 14	No
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	No
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40 hrs @ $22/hr	No
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included in No. 19	No
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included in No. 19	No
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included in No. 19	No
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included in No. 19	No
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	Yes
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80 hrs @ $22/hr, a lot of data required	No
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	See No. 17 in IDDE	No
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	See No. 17 in IDDE	No
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	No
29	Admin	*break out those figures by development, redevelopment or retrofit by permitee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	No
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	No
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hr, many properties to assess	No
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included in No. 32	No
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc)	2.3.6 d iii	$0	Included in No. 32	No
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included in No. 32	No
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included in No. 32	No
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included in No. 32	No
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,436

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hr @ $22/hr	No
2	Admin	*w/in 1 year inventory all permitee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	Included in No. 1	No
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc.	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	No
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	Included in No. 3	No
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	Included in No. 3	No
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	Included in No. 3	No
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	Included in No. 3	No
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	Included in No. 3	No
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc.	2.3.7 a ii b	$1,760	80hrs @ $22/hr	No
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	Included in No. 9	No
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	Included in No. 9	No
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	Included in No. 9	No
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	8hrs @ $22/hr	No
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included in No. 13	No
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included in No. 13	No
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22	No
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0		No
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/basin @ $22/hr, assuming 10 basins /year	No
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17/Annual Report	No
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	Included in No. 17	No
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	included in No. 23	No
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	included in No. 23	No
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$10,560	Materials + Labor	Yes
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$0	See No. 26	Yes
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Development Cost	No
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Development Cost	No
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$0	$0 Since Southbridge owns their own landfill	Yes
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$0	Properly house materials in municipally owned properties	Yes
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	Yes
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0		Yes
36	Admin	*establish procedures for O&M or all permitee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr	No
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Inspect each BMP, assuming 2000/year 15min/BMP @ $22/hr	No
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	No
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr, based on templates from the CMRSWC	No
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	4hrs to update existing SWPPPs, 10hrs for new SWPPPS, @ 22/hr, assume 5 new facilities and 5 old facilities	No
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included in No. 40	No
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included in No. 40	No
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included in No. 40	No
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$10,000	depends on variations of the extent of impaired waters	No
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	Included in No. 44	No
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included in No. 44	No
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included in No. 44	No
48	BMP	*Good Housekeeping	2.3.7 d 2	$180,246	$7,040 catch basin cleaning, $10,560 street sweeping, $152,200 salt/sand, $5,956 maintenance, $4,470 audits	Yes
49	BMP	*Preventative Maintenance	2.3.7 d 3	$0		Yes
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included in No. 44	Yes
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included in No. 44	Yes
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included in No. 44	Yes
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included in No. 44	Yes
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$1,980		Yes
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included in No. 44	Yes
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,200	30 minutes per inspection , assume 10 facilities with four areas each @ $100/hr	No
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$1,584	144 outfalls, approx. 30min/outfall @ $22/hr	No
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc.	2.3.7 b iii a	$0	Included in No. 44	No
59	BMP	*permitee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	Included in No. 44	No
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	No
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0		No

Estimated Annual Costs	$220,562
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs at $22/hr, historical properties or endangered species will increase this	No
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	No
3	BMP	*Implement measures to protect endangered species	1.9.1	Varies	Included under No. 1	No
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	See Miscellaneous No. 50	No
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	Varies	Included under No. 1	No
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	No
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	No
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	No
9	BMP	Develop a SWMP	1.10	$1,760	80hrs at $22/hr	Yes
10	BMP	Implement a SWMP	1.10	$0		Yes
11	Admin	*Update/modify SWMP	1.10	$440	20hrs at $22/hr	No
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	No
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	No
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	No
15	Admin	***Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Yes
16	Admin	*List all receiving waterbodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	No
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	No
18	Admin	*List all outfalls that discharge to each waterbody	1.10.2	$0	Included under No. 9	No
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	No
20	Admin	*List all interconnected MS4s and receiving waterbody	1.10.2	$0	Included under No. 9	No
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	No
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	No
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	No
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	No
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	No
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	No
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	No
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	No
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	No
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	No
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	Yes
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	No
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	No
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	No
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	No
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	No
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	No
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included under No. 9	No
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hr, paperwork for new BMP	Yes
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	No
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	See No. 50	No
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	No
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	Week of work annually, 40hrs at $22/hr	No
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	No
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	No
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"	4.3 b	$0	See No. 50	No
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Part of annual report, see No. 46	No
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Part of annual report, see No. 46	No
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Part of annual report, see No. 46	No
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$14,200	Consulting fee for annual report	No
51	Admin	*The status of any required plans	4.4 b iii	$0	Part of annual report, see No. 50	No
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Part of annual report, see No. 50	No
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Part of annual report, see No. 50	No
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Part of annual report, see No. 50	No
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Part of annual report, see No. 50	No
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Part of annual report, see No. 50	No
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Part of annual report, see No. 50	Yes
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Part of annual report, see No. 50	Yes
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Part of annual report, see No. 50	No

Estimated Annual Costs	$15,168
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Appendix F

Control Measure	Estimated Annual Costs	Estimated One-time Costs	Estimated Intermittent Costs
Public Education and Outreach	$12,106	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$11,347	$306,481	$76,972
Construction Site Stormwater Runoff Control	$350	$858	$0
Post Construction Stormwater Management	$5,280	$1,496	$7,480
Good Housekeeping	$693,578	$6,292	$0
Non-Control Measure			
Miscellaneous	$12,968	$2,376	$0

KEY:			
Yearly	No. = Reference Number		
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work		
As Needed	X Requirement = The short name for a requirement		
	Requirement = Section in the 2014 MS4 permit draft		
	Cost = Cost of completing the requirement		
	Justification = List of methods used to complete the requirement, as well supporting data from sources		
	In Place (Y/N) = Is the requirement listed currently in place		

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$3,176	Art Contest (3000) for materials, 8 hr(s) @ $22/hr	Y
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2hrs @ $22/hr, a minor administrative cost	N
3	Admin	*Identify parties responsible for each message	2.3.2 a	$44	2hrs @ $22/hr, a minor administrative cost	N
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1hr @ $22/hr, a minor administrative cost, once a year for 8 years	N
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	N
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	No significant cost	N
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$12,106
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	No significant cost, website hosting	Y
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	No significant cost	Y
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	[Varies depending on infraction, ranges from ($0-50,000) provided by DCR Director Larry Pistrang]	Y
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	See No. 1, part of identification process	Y
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hrs @ $22/hr, for scheduling	N
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	N
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	[Varies depending on infraction, ranges from ($0-50,000) provided by DCR Director Larry Pistrang]	Y
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr, assuming records are easily available	N
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr, to determine the information	N
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included under No. 7	N
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included under No. 7	N
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	N
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr, informing EPA/MassDEP orally/written	N
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$1,469	2hrs @ $22/hr, about 15min/outfall, 267 outfalls	N
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	N
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$2,003	2hrs @ $22/hr, about 10min/outfall, 267 outfalls, materials included ($2 stick per outfall + spraypaint+sharpie)	N
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included under No. 14, materials are available from the Coalition	N
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included under No. 14, materials are available from the Coalition	N
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Will likely require complete redevelopment of the map system, this numbers based on Millbury estimations for People GIS	N
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included under No. 17	N
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included under No. 17	N
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included under No. 17	N
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included under No. 17	N
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included under No. 17	N
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr, for continuous developments and additions to stormwater systems	N
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	N
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	A complete redevelopment of the program, smaller towns can expect a cost of 10,000	N
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	65hrs @ $22/hr, will have to change ordinance and allow a representative to go to different committees	Y
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included under No. 25	N
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories	2.3.4.7 c i	$13,310	1210 catch basins, about 30min/basin @ $22/hr	N
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors	2.3.4.7 c ii	$26,620	1210 catch basins, about 1hr/basin @ $22/hr	N
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included under No. 29	N
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	No cost with Coalition Membership	N
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	Included under No. 34	N
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	Minimal cost, possible time extensions to test applicable outfalls	N
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$979	267 outfalls, about 10min/outfall @ $22/hr	N
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$1,469	267 outfalls, about 15min/outfall @ $22/hr	N
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$8,811	267 outfalls, about 1.5hr/outfall @ $22/hr, along with applicable water quality testing kit costs (none with Coalition)	N
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if files readily available	N
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr, for development of procedure	N
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included under No. 41	N
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$26,620	1210 catchments, 1 hr/catchment @ $22/hr	N
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included under No. 43	N
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included under No. 43	N
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	See Miscellaneous No. 50	N
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	No cost with Coalition Membership	N
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included under No. 47	N
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included under No. 47	N
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$22	1hr @ $22/hr, for scheduling	Y
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$88	4hrs @ $22/hr, for scheduling	N
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included under No. 51	N
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included under No. 51	N
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	N
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	N
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	8hrs @ $22/hr, one work day to complete process, no cost with Coalition membership	N
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included under No. 37 and No. 38	N
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	N
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Included under No. 37 and No. 38, deadlines	N
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Included under No. 28, deadlines	N
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Included under No. 28, deadlines	N
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Included under No. 28, deadlines	N
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Included under No. 28, deadlines	N
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	N
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$0	8hrs @ $22/hr, administrative work	N
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	N
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	No cost with Coalition membership	Y
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$11,347
Estimated One-time Costs	$306,481
Estimated Intermittent Costs	$76,972

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$350	Compare to previous cost, Millbury cost provided by Laurie Connors	Y
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	as provided by Laurie Connors, Town planner	Y
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1hr @ $22/hr, included under No. 2	Y
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of the established document included under No. 2	Y
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$176	4hrs @ $22/hr, included under No. 2	N
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr, included under No. 2	N
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr, included under No. 2	N
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$350
Estimated One-time Costs	$858
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Y
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, amendment would be 8 hr(s) @ 22/hr minimum	N
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, difficult to assess cost, assumes no controversies or unresolved issues and four people working	N
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	Included under No. 3	N
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	N
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	N
7	Admin	*all BMPs must be constructed in accordance with the MA Sstormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	N
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	N
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	N
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,144	52hrs @ $22/hr and submitted by construction company if it is new	N
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	208hrs @ $22/hr, Submitted by construction company, legal authority and complexity add costs, including maybe 5 people inc/attorney	N
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included under No. 11	N
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	N
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @$22/hr, including fire chief	N
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included under No. 14	N
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included under No. 14	N
17	BMP	*permitee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included under No. 14	N
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	N
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40hrs @ $22/hr	N
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included under No. 19	N
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included under No. 19	N
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included under No. 19	N
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included under No. 19	N
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	N
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80hrs @ $22/hr, data intensive, devising system and updating yearly, assumes 4 people working	N
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	Included in IDDE No. 17	N
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	Included in IDDE No. 17	N
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	N
29	Admin	*break out those figures by development, redevelopment or retrofit by permitee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	N
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	N
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hr, involving schools, DPW, fire, police etc. assume 13 weeks work time	N
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included under No. 31	N
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii	$0	Included under No. 31	N
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included under No. 31	N
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included under No. 31	N
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included under No. 31	N
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,480

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hrs @ $22/hr,	N
2	Admin	*w/in 1 year inventory all permitee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	included under No. 1	N
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc.	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	N
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	included under No. 3	N
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	included under No. 3	N
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	included under No. 3	N
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	included under No. 3	N
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	included under No. 3	N
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc.	2.3.7 a ii b	$1,760	80hrs @ $22/hr, to write procedures	N
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	included under No. 1	N
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	included under No. 1	N
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	included under No. 1	N
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	8hrs @ $22/hr,	N
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included under No. 13	N
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included under No. 13	N
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22, will likely require significant investment	N
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0	See below	N
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/catch basin, for example put 10 catch basins assume only 10 more than 50% each year	N
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17/Annual Report	N
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See No. 17/Annual Report	N
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See No. 17/Annual Report	N
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	See No. 17/Annual Report	N
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See No. 17/Annual Report	N
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	See No. 17/Annual Report	N
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	See No. 17/Annual Report	N
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$0	Included under No. 27, already in place, Based on Estimations for one annual sweep	Y
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$165,000	Already implemented, Based on Estimations provided by Rob McNeil	Y
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Developmental cost	N
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Developmental cost	N
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	N
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	Included under No. 28	N
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$33,200	400tons @ $83/ton, based on numbers provided by Rob McNeil	Y
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$476,449	Properly house materials in municipally owned properties, performed yearly	Y
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	N
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0	Announcement to DPW workers involved with snow procedures	N
36	Admin	*establish procedures for O&M or all permitee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr,	N
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Assuming 2000 per year, 15 minutes per structure	N
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	N
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr,	N
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	Assume 4 hrs to update existing SWPPPs, 10hrs for new SWPPPS, 70 hr(s) @ 22/hr, assume 5 new facilities a	N
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included under No. 40	N
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included under No. 40	N
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included under No. 40	N
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$0	Implementation of a number of control measures, cost will depend upon type of enforcement	N
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	extra work, depends on variations of the extent of impaired waters	N
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included under No. 44	N
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included under No. 44	N
48	BMP	*Good Housekeeping	2.3.7 d 2	$0	Included under No. 44	N
49	BMP	*Preventative Maintenance	2.3.7 d 3	$0	Included under No. 44	N
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included under No. 44	N
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included under No. 44	N
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included under No. 44	N
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included under No. 44	N
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$0	Included under No. 44	N
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included under No. 44	N
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,000	20hrs @ $100/hr, assume 30min/inspection and 10 facilities with four areas each	N
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$2,937	267 outfalls, about 30min/area @ $22/hr	N
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc.	2.3.7 b iii a	$0	Already included as operating costs, should be green	N
59	BMP	*permitee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	costs for maintenance procedures	N
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	N
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0	Minimal investment for records keeping	N

Estimated Annual Costs	$693,578
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs @ $22/hr, historical properties or endangered species will increase this cost	Y
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	N
3	BMP	*Implement measures to protect endangered species	1.9.1	$0	cost varies. included under No. 1	N
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	minimal cost, Included under No. 50	N
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	$0	Varies, Included under No. 1	N
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	N
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	N
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	Y
9	BMP	Develop a SWMP	1.10	$1,760	80hrs @ $22/hr,	Y
10	BMP	Implement a SWMP	1.10	$0	Included under No. 9	Y
11	Admin	*Update/modify SWMP	1.10	$440	20hrs @ $22/hr,	N
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	Y
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	Y
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	N
15	Admin	**Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Y
16	Admin	*List all receiving water bodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	N
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	N
18	Admin	*List all outfalls that discharge to each water body	1.10.2	$0	Included under No. 9	N
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	N
20	Admin	*List all interconnected MS4s and receiving water body	1.10.2	$0	Included under No. 9	N
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	N
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	N
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	N
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	Y
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	N
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	Y
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	N
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	N
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	Y
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	N
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	N
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	N
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	N
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	N
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	N
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	N
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	N
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included under No. 9	N
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hr, paperwork for new BMP	N
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	Y
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	Included under Public Education No. 7	N
42	Admin	EPA or MassDEP may require the permitte to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	Y
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	40hrs at $22/hr	N
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	N
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	Y
46	Admin	*the permitee "shall document all monitoring results each year in the annual report"	4.3 b	$0	Included under Public Education No. 7	N
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Included under No. 46	N
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Included under No. 46	N
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Included under No. 46	N
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$12,000	Consulting fee for annual report, increased from $3000 based on Matt's estimated	Y
51	Admin	*The status of any required plans	4.4 b iii	$0	Included under No. 50	N
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Included under No. 50	N
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Included under No. 50	N
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Included under No. 50	N
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Included under No. 50	N
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Included under No. 50	N
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Included under No. 50	Y
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Included under No. 50	Y
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Included under No. 50	N

Estimated Annual Costs	$12,968
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Sample Interview Material

Preamble

We are a group of students from Worcester Polytechnic Institute (WPI). We are conducting this interview in order to learn more about the cost of implementing the new 2014 MS4 permit. By participating in this interview, you will help us assess the total cost of compliance for _____(Town Name). If you want, we are able to keep your responses anonymous so you cannot be identified in this report. Your participation in this interview is completely voluntary and you can abstain from answering any question or stop the interview at any point. If you would like, we can provide you with a copy of the results at the end of our project. This project is a collaboration between the Massachusetts Department of Environmental Protection (MassDEP) and WPI, and all of us appreciate your participation.

Sample Interview Questions

1. Does your municipality use a contractor for stormwater management?
    a. If so, may we have their contact information?
2. How much does your municipality spend on public education?
    a. Does your municipality provide pamphlets?
    b. Does your municipality have public access television programs about stormwater management?
    c. How much do you spend on posting signage?

    d. Do you use social media to provide information? If so, how much does it cost?

3. How much does your municipality spend on public participation?
    a. Do you hold town meetings about stormwater management?
4. How much does your municipality spend on illicit discharge and elimination?
    a. Does your municipality use the database?
    b. How much does it cost you to map your catchment basins?
    c. Does your municipality have retention ponds for stormwater? If so, do you maintain them?
    d. How often does your municipality street sweep?
    e. How much does it cost you to remove illicit discharges?
    f. How much does it cost you to train municipal employees to use the detection equipment?
5. How much does your municipality spend on construction site runoff control?
    a. How much does it cost to notify municipal residents about impending construction projects?
    b. How much does it cost you to inspect construction sites?
6. How much does your municipality spend on post-construction site runoff control?
    a. How much does it cost for you to inspect the construction sites after completion of the construction?
7. How much does your municipality spend on good housekeeping?
    a. How much does it cost your municipality to maintain stormwater management BMPs every year?
    b. How much does it cost to train your employees to maintain BMPs?

c. How much does it cost you to inspect your best management practices?

d. How much does it cost you per year to street sweep?

8. Could you provide us with a cost report for your municipality?

    a. Itemized report stormwater spending?

9. Do you believe that your town effectively implemented the requirements of the 2003 MS4 permit?

10. To what extent do you believe your town is prepared to implement the requirements of the new MS4 permit?

    a. What challenges do you foresee in implementing the new MS4 permit?

    b. How do you plan to provide additional funding for implementing the new permit?

Appendix H

Control Measure	Estimated Annual Costs	Estimated One-time Costs	Estimated Intermittent Costs
Public Education and Outreach	$0	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$0	$0	$0
Construction Site Stormwater Runoff Control	$0	$0	$0
Post Construction Stormwater Management	$0	$0	$0
Good Housekeeping	$0	$0	$0
Non-Control Measure			
Miscellaneous	$0	$0	$0
Totals	**$0**	**$0**	**$0**

KEY:

Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a			
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a			
3	Admin	*Identify parties responsible for each message	2.3.2 a			
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c			
5	Admin	*Show evidence that messages are achieving results	2.3.2 e			
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e			
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a			
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b			
3	Admin	*Put in annual report these public participation activities	2.3.3 c			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2			
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2			
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2			
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2			
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3			
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b			
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b			
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b			
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b			
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b			
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c			
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5			
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b			
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b			
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c			
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c			
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6			
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i			
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i			
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i			
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii			
22	BMP	*Include various recommended elements	2.3.4.6 a iii			
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b			
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c			
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7			
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a			
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b			
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories (soupped up from previous "priority" mark in 2003)	2.3.4.7 c i			
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors (soupped up from previous "priority" mark in 2003)	2.3.4.7 c ii			
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii			
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii			
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii			
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii			
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d			
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i			
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii			
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii			
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv			
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v			
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi			
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e			
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e			
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i			
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i			
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i			
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i			
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii			
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a			
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b			
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii			
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f			
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f			
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f			
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f			
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g			
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h			
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a			
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a			
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b			
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c			
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i			
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii			
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii			
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e			
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9			
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9			
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10			
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a			
2	BMP	Develop and implement a construction site runoff program	2.3.5 c			
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i			
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii			
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii			
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii			
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv			
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v			
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v			
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v			
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v			
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v			
13	Admin	*All to be included in the annual report	2.3.5 c v			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a			
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii			
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a			
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a			
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b			
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c			
7	Admin	*all BMPs must be constructed in accordance with the MA Stormwater Handbook	2.3.6 a ii d			
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e			
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f			
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii			
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii			
12	Admin	*may include annual self-certification program	2.3.6 a iii			
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii			
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b			
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b			
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b			
17	BMP	*permittee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b			
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b			
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c			
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c			
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c			
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c			
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c			
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c			
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d			
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i			
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i			
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii			
29	Admin	*break out those figures by development, redevelopment or retrofit by permittee, by others voluntarily	2.3.6 d ii			
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii			
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii			
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii			
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii			
34	Admin	*also include existing rights-of-way,	2.3.6 d iii			
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii			
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii			
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i			
2	Admin	*w/in 1 year inventory all permittee owned facilities in these "good housekeeping" categories	2.3.7 a ii			
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc	2.3.7 a ii a			
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a			
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a			
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a			
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a			
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a			
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc	2.3.7 a ii b			
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b			
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b			
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b			
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c			
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c			
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c			
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a			
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b			
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b			
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b			
20	Admin	*describe these actions in the annual report	2.3.7 a iii b			
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b			
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b			
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b			
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b			
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b			
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c			
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c			
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c			
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c			
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c			
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c			
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d			
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e			
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e			
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e			
36	Admin	*establish procedures for O&M or all permittee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f			
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f			
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv			
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v			
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b			
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b			
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a			
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b			
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c			
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c			
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c			
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1			
48	BMP	*Good Housekeeping	2.3.7 d 2			
49	BMP	*Preventative Maintenance	2.3.7 d 3			
50	BMP	*Spill Prevention and Response	2.3.7 d 4			
51	BMP	*Erosion and Sediment Control	2.3.7 d 5			
52	BMP	*Management of Runoff	2.3.7 d 6			
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7			
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8			
55	BMP	*Maintenance of Control Measures	2.3.7 d 8			
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a			
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a			
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc	2.3.7 b iii a			
59	BMP	*permittee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a			
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a			
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv

No.	BMP/Admin	Miscellaneous Requirement		Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI		1.7.1			
2	Admin	*Document endangered species status (part of NOI)		1.9.1			
3	BMP	*Implement measures to protect endangered species		1.9.1			
4	Admin	Document Historic Properties Observation (part of NOI)		1.9.2			
5	BMP	*Describe effect of discharges on Historic properties		1.9.2			
6	Admin	*Report documents received re: such discharges		1.9.2			
7	Admin	*Provide results of Appendix D historic property screening		1.9.2			
8	BMP	Describe efforts to avoid or minimize impacts on such properties		1.9.2			
9	BMP	Develop a SWMP		1.10			
10	BMP	Implement a SWMP		1.10			
11	Admin	*Update/modify SWMP		1.10			
12	Admin	Provide SWMP "immediately" to various agencies and public		1.10.1			
13	Admin	*Post SWMP online		1.10.1			
14	Admin	Identify Names and titles of people implementing the SWMP		1.10.2			
15	Admin	***Include status of 2003 permit requirements**		1.10.2			
16	Admin	*List all receiving water bodies, classifications, pollutants of concern		1.10.2			
17	Admin	*list all applicable TMDLs, WLAs		1.10.2			
18	Admin	*List all outfalls that discharge to each water body		1.10.2			
19	Admin	*list all public water sources that may be affected by SW discharges		1.10.2			
20	Admin	*List all interconnected MS4s and receiving water body		1.10.2			
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern		1.10.2			
22	Admin	*Document all new or increased discharges		1.10.2			
23	Admin	*Include map of separate storm sewer system (Map must be improved)		1.10.2			
24	Admin	List all discharges to impaired water and the response		1.10.2			
25	Admin	*Describe BMPs proposed to meet TMDL requirements		1.10.2			
26	Admin	For each BMP, list the milestone, timeframe and assessment measure		1.10.2			
27	Admin	*For each BMP, list person or department responsible for implementation		1.10.2			
28	Admin	*Describe BMPs proposed to meet impaired waters requirements		1.10.2			
29	Admin	Describe BMPs used to meet the 6 minimum control measures		1.10.2			
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters		1.10.2			
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards		2.1			
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)		2.1.1 b			
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)		2.1.1 c			
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days		2.1.1 d			
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04		2.1.2 a			
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)		2.1.2 b			
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)		2.2			
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP		4.1 a			
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time		4.1 b			
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective		4.1 b			
41	Admin	*Each Annual shall include a brief explanation of any BMP modification		4.1 b			
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit		4.1.c			
43	Admin	*The permittee shall keep all record required by this permit for at least five years		4.2 a			
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."		4.2 a			
45	Admin	these records all be made available to the public		4.2 c			
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"		4.3 b			
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results		4.3 b			
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term		4.3 b			
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."		4.3 c			
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs		4.4 b i			
51	Admin	*The status of any required plans		4.4 b iii			
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards		4.4 b iii			
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements		4.4 b iii			
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables		4.4 b iii			
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)		4.4 b iv			
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term		4.4 b v			
57	Admin	Description of activities for the next reporting cycle		4.4 b vi			
58	Admin	Description of any changes in identified BMPs or measurable goals		4.4 b vii			
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit		4.4 b viii

Bureau of Land and Water Quality

General Permit for the Discharge of Stormwater from Small Municipal Separate Storm Sewer Systems

MER041000

General Permit--Municipal Separate Storm Sewer Systems

Maine Pollutant Discharge Elimination System (MEPDES)

Table of Contents

PART I. General Coverage Under This Permit

A. Permit Coverage. This Municipal Separate Storm Sewer System General Permit, hereinafter described as the General Permit, authorizes the direct discharge of stormwater from a regulated small municipal separate storm sewer system ("MS4") to a MS4 or waters of the State other than groundwater, provided that the MS4 is located in an Urbanized Area as determined by the inclusive sum of the 2000 and 2010 Decennial Census by the Bureau of Census. Small MS4s are those entities which meet the definition in 40 CFR Part 122.26(b)(16). Regulated small MS4s are those entities required pursuant to 40 CFR 122.26(a)(9)(i)(A) to obtain stormwater permit coverage to operate their small MS4. Discharges from regulated small MS4s must meet the requirements of this General Permit and applicable provisions of Maine's waste discharge and water classification statutes and rules. Compliance with this General Permit authorizes a person to discharge stormwater, pursuant to Water Pollution Control Law, 38 M.R.S.A. § 413, as described below. Discharges listed in Part I(D)(2-6) are excluded from coverage under this General Permit. Unless otherwise explicitly noted, this permit only covers operations or activities associated with stormwater runoff from the regulated small MS4 within an identified Urbanized Area.

1. **Effective date of this General Permit.** This General Permit is effective July 1, 2013, and, except as provided in Continuation of General Permit Coverage (Part I, Section C), authorization to discharge under this General Permit expires at midnight June 30, 2018. This General Permit replaces Maine's General Permit for the Discharge of Stormwater from Small Municipal Separate Storm Sewer Systems issued July 1, 2008.

2. **Waiver of authorization.** The Department may grant a regulated small MS4 a waiver from the requirement to obtain authorization if:

   a. The population within the Urbanized Area portion of the municipality is less than 1,000, and stormwater from the MS4 is not causing or contributing to the impairment of a receiving water body; and

   b. The MS4 does not contribute substantially to the pollutant load of a physically interconnected regulated MS4 (see 40 CFR 122.32(d)(1); and

   c. If the MS4 discharges any pollutant(s) that has/have been identified as a cause of impairment of any water body to which it discharges, stormwater controls are not needed based on waste load allocations that are part of an EPA approved or established "total maximum daily load" (TMDL) that addresses the pollutants of concern (see 40CFR 122.32 (d)(2)).

B. Authority. A waste discharge permit is required for the direct or indirect discharge of pollutants to waters of the State.[1] A general permit may be issued for point source discharges (direct discharges) of stormwater.[2] A violation of a condition or requirement of a general permit constitutes a violation of Maine's water quality laws and the federal Clean Water Act, and subjects the discharger to penalties under *Organization and Powers*, 38 M.R.S.A. § 349, and § 309 of the Clean Water Act[3]. Nothing in this General Permit is intended to limit the Department's authority under the waste discharge and water classification statutes or rules. This General Permit does not affect requirements under other applicable Maine statutes such as Site Location of Development (Site Law), Stormwater Management, and Natural Resources Protection (NRPA).

[1] See 38 M.R.S.A. § 413.
[2] See 06-096 CMR 529(2)(a)(2)(i) , 40 CFR §§122.32-122.35.
[3] See 40 CFR §122.36.

This General Permit does not prevent a municipality from adopting stricter standards than contained in this General Permit, or in state or federal law.

C. Continuation of General Permit Coverage. Coverage under this General Permit will be continued, provided there are no changes in the discharge as described in the Notice of Intent ("NOI"). If changes occur or are proposed, the permittee having filed the NOI shall notify the Department, as specified in this General Permit. Upon reissuance of a new general permit, a permittee wishing to continue coverage shall submit a new NOI to the Department.

If this permit is not reissued, revoked or replaced prior to the expiration date, it will be administratively continued and remain in force and effect. In that case, any permittee who was granted permit coverage prior to the expiration date will automatically remain covered by the continued permit until the earlier of:

1. Reissuance or replacement of this General Permit, at which time the permittee shall submit a new NOI to the Department in accordance with the new general permit to maintain authorization to discharge;
2. The permittee's submittal of a Notice of Termination;
3. Issuance of an individual permit for the permittee's discharges; or
4. A formal permit decision by the Commissioner not to reissue this General Permit, at which time the permittee shall seek coverage under an alternative general permit or individual permit.

D. Limitations on Coverage. This General Permit does not authorize a stormwater discharge that requires an individual waste discharge permit or is required to obtain coverage under another waste discharge general permit. The Department may require any person with a discharge authorized by this General Permit to apply for and obtain an individual permit or an alternative general permit.[4] Any interested person may petition the Department to take action under this paragraph. Examples of when an individual waste discharge permit may be required are specified in rule.[5]

1. Compliance with this general permit. Regulated small MS4s must remain in compliance with all standards and requirements of this General Permit. If the Department determines that the standards of this General Permit have not been met, the Department shall notify the permittee and may undertake one or more of the following actions:

a. Authorize coverage under this General Permit after appropriate controls and implementation procedures designed to bring the discharge into compliance with this General Permit and water quality standards have been implemented as determined by the Department;

b. Require an individual waste discharge permit;

c. Inform the person that the discharge is prohibited; or

d. Take enforcement action to address the violation(s).

2. Non-stormwater. This General Permit does not authorize discharges that are mixed with sources of non-stormwater, other than those discharges in compliance with Part IV (H)(3)(c).

3. Discharge of hazardous substances, chemicals, or oil. This General Permit does not authorize the discharge of hazardous substances, chemicals, or oil resulting from an on-site spill.

4. Total maximum daily load ("TMDL"). This General Permit does not authorize a direct discharge that

[4] See General Permits for Certain Wastewater Discharges, 06-096 CMR 529(2)(b)(3) (last amended June 27, 2007).
[5] See 06-096 CMR 529(2)(b)(3)(i)(A)-(G).

is inconsistent with any EPA approved TMDL waste load allocation, except where the TMDL does not provide adequate information to develop specific measures to protect water quality, and any implementation plan for the waterbody to which the direct discharge drains.

5. **Violation of water quality standards.** This General Permit does not authorize a discharge that causes or contributes to a violation of a water quality standard. Discharges covered under this permit may not:

   a. Contain any pollutant, including toxic substances, in quantities or concentrations, which may cause or contribute to any adverse impact on the receiving water;
   b. Be to a receiving water which is not meeting its classification standard for any characteristic which may be affected by the discharge; or
   c. Impart color, taste, turbidity, radioactivity, settleable materials, floating substances or other properties that cause the receiving water to be unsuitable for the designated uses ascribed to its classification.

6. **Waste discharge license (groundwater).** A waste discharge license ("WDL") may be required for the discharge of stormwater through any well or wells, including drywells and subsurface fluid distribution systems. For complete requirements, see Rules To Control The Subsurface Discharge Of Pollutants, 06-096 CMR 543 (effective October 6, 2006), and Stormwater Management, 06-096 CMR 500 Appendix D (last amended December 27, 2006).

   A "subsurface fluid distribution system" is an assemblage of perforated pipes, drain tiles, or similar mechanisms intended to distribute fluids below the surface of the ground. A "well" is a bored, drilled, or driven shaft the depth of which is greater than the largest surface dimension, whether the shaft is typically dry or contains liquid; or a dug hole the depth of which is greater than the largest surface dimension; or a subsurface fluid distribution system. "Well injection" means the subsurface discharge of fluids into or through a well.

7. **Reopener.** This General Permit may be modified or reopened by the Department as provided in Water Pollution Control, 38 M.R.S.A. § 414-A(5).

PART II. Definitions

The following terms have the following meanings as used in this General Permit in addition to the definitions found in Chapter 520 of the Department's rules, and applicable statutory definitions.

A. Applicant. "Applicant" means a municipality, sanitary or sewerage district which files an NOI pursuant to Part III of this General Permit.

B. Best Management Practices ("BMP"). "Best Management Practices" or "BMPs" means schedules of activities, prohibitions of practices, maintenance procedures, and other management practices to prevent or reduce the pollution of waters of the State. BMPs also include treatment requirements, operating procedures, and practices to control plant site runoff, spillage or leaks, sludge or waste disposal, or drainage from raw material storage.

C. Commissioner. "Commissioner" means the Commissioner of the Maine Department of Environmental Protection.

D. Common Plan of Development or Sale. "Common Plan of Development or Sale" means a subdivision under municipal law as determined by the municipality where the subdivision is located.

E. Compensation Fee Utilization Plan. A "Compensation Fee Utilization Plan" means a plan that specifies how funds received as a fee payment will be allocated to reduce the impact of stormwater pollution to an impaired waterbody.

F. Construction Activity. "Construction Activity" or "activity" means:

1. Construction activity including one acre or more of disturbed area, or activity with less than one acre of total land area that is part of a common plan of development or sale, if the common plan of development or sale will ultimately disturb equal to or greater than one acre;[6] or

2. Any other construction activity designated by the Department based on the potential for contribution to a violation of a water quality standard or for significant contribution of pollutants to waters of the State.

G. Department. "Department" means the State of Maine Department of Environmental Protection.

H. Direct Discharge. "Direct Discharge" or "point source" means any discernible, confined and discrete conveyance, including, but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation or vessel or other floating craft, from which pollutants are or may be discharged.[7]

I. **Discharge**. "Discharge" means any spilling, leaking, pumping, pouring, emptying, dumping, disposing or other addition of pollutants to the Waters of the State (for the purpose of this General Permit, other than groundwater.)

J. Disturbed Area. "Disturbed Area" means all land areas that are stripped, graded, grubbed, filled or excavated at any time during the site preparation or removing vegetation for, or construction of, a project. Cutting of trees, without grubbing, stump removal, disturbance or exposure of soil is not considered "disturbed area" "Disturbed area" does not include routine maintenance, but does include redevelopment and new impervious areas. "Routine maintenance" is maintenance performed to maintain the original line and grade, hydraulic capacity, and original purpose of the facility. Paving impervious gravel surfaces provided that an applicant or permittee can prove the original line and grade and hydraulic capacity will be maintained and original purpose of the gravel surface remains the same is considered routine maintenance.

K. Illicit Discharge. "Illicit Discharge" means any discharge to a municipal separate storm sewer that is not composed entirely of stormwater other than discharges authorized pursuant to another permit issued pursuant to 38 M.R.S.A. § 413 and the allowable non-stormwater discharges identified in Part IV(H)(3)(c) of this permit.

L. Impaired Waterbody. "Impaired Waterbody" means a waterbody that is not attaining water quality criteria or standards, as determined by the Department.

M. Low Impact Development ("LID"). "Low Impact Development" or "LID" means an approach to land development or redevelopment that provides water quality treatment of stormwater as close to its source as possible.

N. Maximum Extent Practicable ("MEP"). "Maximum Extent Practicable" or "MEP" means available and

[6] Common plan of development or sale has the same meaning as defined in the Maine Construction General Permit.

[7] See Water Classification Program, 38 M.R.S.A. § 466(5) (definition of "direct discharge") and 06-096 CMR 520 (definition of "point source").

feasible considering cost, existing technology, and logistics based on the overall purpose of the project. MEP is the Clean Water Act standard that establishes the level of pollutant reductions that operators of regulated small MS4s must achieve. The reduction of pollutants is achieved by implementing BMPs and other requirements of this General Permit in an iterative process that continually adapts to current conditions and BMP effectiveness, on a location-by-location basis, taking into consideration such factors as condition of receiving waters, specific local concerns, a comprehensive watershed plan, MS4 size, climate implementation schedules, current ability to finance the program, beneficial uses of receiving water, hydrology, geology, and capacity to perform operation and maintenance. The goal of the General Permit, and the projects required to be undertaken under the General Permit, is to protect and improve water quality.

O. Municipal Separate Storm Sewer System ("MS4"). "Municipal Separate Storm Sewer System" or ("MS4") means a conveyance or system of conveyances designed or used for collecting or conveying stormwater (other than a publicly owned treatment works (POTW), as defined at 40 CFR 122.2, or a combined sewer), including, but not limited to, roads with drainage systems, municipal streets, catch basins, curbs, gutters, ditches, human-made channels or storm drains owned or operated by any municipality, sewer or sewage district, Maine Department of Transportation (MaineDOT), Maine Turnpike Authority (MTA), State agency or Federal agency or other public entity that discharges directly to waters of the State other than groundwater.

P. Notice of Intent ("NOI"). "Notice of Intent" or "NOI" means a notification of intent to seek coverage under this General Permit, as provided in Part III(A), made by the applicant to the Department on an NOI form(s) provided by the Department. This is also the mechanism used to request coverage under this General Permit.

Q. Outfall. "Outfall" means the point source where the MS4 discharges from a pipe, ditch or other discrete conveyance to the waters of the State other than groundwater, or to another MS4 and does not include pipes, such as cross culverts, tunnels or other conveyances which connect segments of the same stream or other waters of the State and are used to convey waters of the State.

R. Permittee. "Permittee" means a municipality, sanitary or sewerage district that owns or operates the storm sewer system authorized under this General Permit.

S. Person. "Person" means an individual, firm, corporation, municipality, quasi-municipal corporation, state agency, federal agency or other legal entity which creates, initiates, originates or maintains a discharge authorized by this General Permit.[8]

T. Redevelopment. "Redevelopment" means, an activity undertaken to redevelop property in which the new developed area, not including maintenance, is located within the same footprint as the existing developed area. Redevelopment projects do not include such activities as exterior remodeling.

U. Regulated Small MS4. "Regulated Small MS4" means any Small MS4 authorized by this General Permit or the general permits for the discharge of stormwater from Maine Department of Transportation (MaineDOT) and Maine Turnpike Authority (MTA) small MS4s or State or Federally owned or operated small MS4s including all those located partially or entirely within an Urbanized Area ("UA") . A list of these regulated small MS4s owned or operated by municipalities is included in Appendix A of this General Permit.

V. Small MS4. "Small MS4" means any MS4 that is not already covered by the Phase I MS4 stormwater program including municipally owned or operated storm sewer systems, State or Federally-owned systems, such as colleges, universities, prisons, military bases and facilities, and transportation entities such as MaineDOT and MTA road systems and facilities. See also 40 CFR 122.26(b)(16).

[8] See Protection and Improvement of Waters Laws – General Provisions, 38 M.R.S.A. § 361-A(4).

W. Stormwater. "Stormwater" means the part of precipitation including runoff from rain or melting ice and snow that flows across the surface as sheet flow, shallow concentrated flow, or in drainageways. "Stormwater" has the same meaning as "storm water".

X. Stormwater Pollution Prevention Plan ("SWPPP"). "Stormwater Pollution Prevention Plan" or "SWPPP" means a written plan developed and implemented for select municipal operations to reduce or eliminate pollutants as described in this General Permit.

Y. Total Maximum Daily Load ("TMDL"). "Total Maximum Daily Load" or "TMDL" means the maximum capacity of a surface water to assimilate a pollutant as established by the Department and approved by the U.S. Environmental Protection Agency ("EPA"), consistent with conditions set forth in 40 CFR Part 130 including pollutants contributed by point and non-point sources and a margin of safety.

Z. Urban Impaired Stream. "Urban Impaired Stream" means a stream that fails to meet water quality standards because of effects of stormwater runoff from developed land. Urban impaired streams are those streams identified and listed in Chapter 502, Appendix B of the Department of Environmental Protection Rules as amended from time to time. A list of the urban impaired streams is included in Appendix B of this General Permit.

AA. Urban Runoff. "Urban Runoff" means stormwater runoff from an Urbanized Area, and may contain elevated levels of pollutants such as hydrocarbons, chlorides, heavy metals and nutrients which may cause or contribute to a waterbody's impairment. In many instances frequent elevated storm flows, low base flows, and high temperatures will also be significant contributors to a waterbody's impairment.

AB. Urbanized Area ("UA"). "Urbanized Area" or "UA" means the area of the State of Maine so defined by the inclusive sum of the 2000 decennial census and latest decennial census (2010) by the U.S. Bureau of the Census.

Part III. Procedure

A. NOI requirements. The operator of any regulated small MS4 that initiates, creates, originates or maintains a discharge described in Part I of this General Permit and that wishes to obtain coverage under this permit shall file with the Department an NOI that meets the requirements of this General Permit no later than July 30, 2013. By submitting a signed NOI, the applicant agrees to comply with the terms and conditions of this General Permit.

B. Scope of NOI. The applicant shall register on one set of NOI forms for all discharges from the regulated small MS4 within the Urbanized Area that are operated by the municipality.

C. Submission. The applicant shall file the NOI using a form(s) provided by the Department. The applicant shall sign the NOI in accordance with Part III(D)(2). The NOI must be submitted to the Department with the appropriate fee, with failure of proper payment resulting in summary rejection of the NOI as incomplete. An applicant is not prohibited from submitting an NOI after July 30, 2013. If a late NOI is submitted, authorization to discharge is only for discharges that occur after obtaining authorization pursuant to Part III(E). The Department reserves the right to take appropriate enforcement actions for any unpermitted discharges.

D. Contents of NOI.

1. NOI Form. The NOI must be filed on a form(s) provided by the Department and must include the following.

a. Name of the municipality and the name, title, address, email address, and telephone number of the chief elected official or principal executive officer.

b. Name, address, email address, and telephone number of the primary municipal contact person responsible for the stormwater management program.

c. Permit number assigned to the municipality under the previous Department MS4 permit, if any.

d. Name of the receiving stream(s), wetland(s) or waterbody(s) to which the Regulated Small MS4 discharges, and a list of the impaired waterbody(s) which receive stormwater from the Regulated Small MS4.

e. An estimate of the area in square miles, of the Urbanized Area.

2. **Signatory Requirements.** All Notices of Intent, reports certifications or information either submitted to the Department, or that this permit requires to be maintained by the permittee, must be signed and certified in accordance with Waste Discharge Licenses, 06-096 CMR 521(5) (effective date January 23, 2001).

   The signature of the applicant's chief elected official or principal executive officer of the municipality shall certify in writing as follows:

   > "I certify under penalty of law that this document and all attachments were prepared under my direction or supervision in accordance with a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons that directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

3. **Filing an NOI form.** An NOI must be filed with the Department at the following address:

   Municipal/Industrial Stormwater Coordinator
   Department of Environmental Protection
   17 State House Station
   Augusta, Maine 04333-0017

4. **Additional information.** The Department may require an applicant to submit additional information that the Department reasonably deems necessary to evaluate the consistency of the subject activity with the requirements for authorization under this General Permit.

E. Obtaining Authorization.

1. **Interim Coverage.** Upon the Department's receipt of an NOI that meets the requirements of Part III(C) of this General Permit, the applicant is authorized to discharge on an interim basis for up to 180 days from the effective date of this permit. The Commissioner shall return as incomplete any NOI that does not satisfy the requirements of Part III (C) of this General Permit. The applicant shall meet the standards contained in this General Permit during the interim period. Interim coverage will terminate earlier than 180 days if a complete Stormwater Program Management Plan has been submitted and reviewed by the Department and coverage under this permit is either granted or denied by the Department. The Department shall provide written notice of interim coverage under the NOI.

2. Public Notice and Comment.

a. Applicant Public Notice and Comment. Applicants are required to publish a public notice that the NOI is being filed with the Department of Environmental Protection. The notice must be published within 30 days prior to the NOI being sent to the Department. The notice may be published in the legal advertisement section of a daily or weekly newspaper having general circulation in the area where the discharges authorized by this permit will occur or by making the notice available on the MS4's official internet web site. Applicants are required to provide a letter of notice to all regulated small MS4s into which the MS4 discharges, and also to persons who have requested to be notified of the NOI application, provided that the Department has provided the mailing addresses of such interested persons to the respective applicants. If the public notice is not published or made available at the proper time, or if the NOI is returned because it is incomplete, the Department may require that notice be published a second time.

b. Department Public Notice and Comment. The Department will provide a public notice and opportunity for comment on the contents of the submitted NOIs and Stormwater Program Management Plans by making information available on the internet.

The public comment period is a minimum of 20 days. Based on a review of the NOI, Stormwater Program Management Plan or other information, the Department may extend the public comment period, require additional information or may deny coverage under this permit and require submission of an application for an individual or alternative MEPDES permit.

3. Action by Commissioner. The Commissioner shall return as incomplete any NOI that does not satisfy the requirements of Part III (C) and Part III (D) of this General Permit.

a. The Commissioner may deny coverage under this General Permit if more than 30 days have elapsed following the applicant's receipt of a written request by the Commissioner that the applicant submit additional information required pursuant to this General Permit and the applicant has not timely and completely submitted such information.

b. The Commissioner shall deny coverage under this General Permit if the subject activity is ineligible for this General Permit, if the applicant cannot or is unlikely to comply with this General Permit, or for any other reason provided by law.

c. The Commissioner shall grant coverage under this General Permit if the Stormwater Program Management Plan is consistent with the requirement to reduce pollutants under the MEP standard, to protect water quality, and to satisfy the appropriate water quality requirements of the Clean Water Act.

4. Coverage under this General Permit. The applicant is authorized to discharge under the terms and conditions of this General Permit when coverage under this General Permit is granted. The grant or denial of coverage under this General Permit must be in writing.

5. Effect of Denial of Coverage. Denial of coverage under this General Permit constitutes notice to the applicant that the subject activity may not lawfully be conducted or maintained without issuance of an individual MEPDES permit or coverage under an alternative General Permit. Denial of coverage under this General Permit must be in writing.

Part IV. Requirements

The permittee shall at all times continue to meet the requirements for authorization set forth in Part I of this General Permit. In addition, the permittee shall assure that authorized discharges and activities are conducted in accordance with the following required conditions.

A. Stormwater Program Management Plan. The permittee shall develop, implement, and enforce a Stormwater Program Management Plan ("Plan") implementing six minimum control measures, set forth in Section H below, which are designed to reduce the discharge of pollutants from its regulated small MS4 to the maximum extent practicable, to protect water quality, and to satisfy the appropriate water quality requirements of the Clean Water Act. For the purposes of this permit, narrative effluent limitations requiring implementation of BMPs are generally the most appropriate form of effluent limitations when designed to satisfy technology requirements (including reductions of pollutants to the MEP) and to protect water quality. The Plan and all Minimum Control Measures must be substantially implemented by June 30, 2018.

The permittee shall describe in its Stormwater Program Management Plan how it will reduce or eliminate polluted stormwater runoff to the maximum extent practicable, from its regulated MS4. The Stormwater Program Management Plan must be signed in accordance with the signatory requirements in Part III (D)(2). Upon receipt of the NOI and Stormwater Program Management Plan, the Department shall post the NOIs and "Plans" on the Department's website to provide public notice. The permittee shall submit the regulated small MS4's comprehensive Stormwater Program Management Plan for Department review in accordance with the following submittal schedule.

Stormwater Program Management Plan Submission Date	Municipalities
October 28, 2013	Hampden, Bangor, Brewer, Veazie, Orono, Old Town, Milford
November 15, 2013	Falmouth, Cumberland Yarmouth, Windham, Lewiston, Auburn, Sabattus, Lisbon
December 6, 2013	Biddeford, Old Orchard Beach, Scarborough, Cape Elizabeth, Westbrook, Gorham, Freeport
December 20, 2013	York, Kittery, Eliot, South Berwick, Berwick, Saco, South Portland, Portland

1. Stormwater Program Management Plan Requirements.

a. For each of the six Minimum Control Measures in Part IV(H), the following information must be included:

i. The measurable goal(s) by which each BMP will be evaluated;

ii. The person(s) or position(s) responsible for implementing each BMP; and

iii. The date by which each BMP will be implemented including as appropriate, time lines and milestones for implementation of BMPs.

Note: Guidance documents that may be used in the development of BMPs and measurable goals include, but are not limited to, the following:

- EPA's BMP menu:
- MaineDOT's Best Management Practices for Erosion & Sedimentation Control

b. Additional stormwater treatment controls are necessary for Urban Impaired Stream watersheds. For discharges from the permittee's infrastructure and operations, to an Urban Impaired Stream, the permittee shall implement structural and non-structural measures to the maximum extent practicable necessary to control, the discharge of stormwater runoff including known pollutants of concern. Pollutant(s) of concern refer to the pollutant(s) identified as causing or contributing to the waterbody's impairment. Urban runoff may be used as a surrogate pollutant of concern where information is lacking on specific causes of impairment.

B. Keeping Plans Current. The permittee shall keep the Plan current. Circumstances when the Plan must be amended include the following:

1. Amended plan. The Plan must be amended if the Department or the permittee determines that:

a. The actions required by the Plan fail to control pollutants to the maximum extent practicable or to adequately protect against pollution of the waters of the State other than groundwater;

b. The Plan does not prevent the potential for a significant contribution of pollutants to waters of the State other than groundwater;

c. The Plan does not meet one or more requirements of this General Permit; or

d. New information results in a shift in the Plan's priorities.

2. Department notification. The Department shall notify the permittee if Department determines that the Plan must be amended. Within 30 days of such notification, unless otherwise specified by the Department in writing, the permittee shall respond to the Department indicating how the permittee plans to modify the Plan to address these requirements. Within 90 days of this response or within 120 days of the original notification, whichever is less, unless otherwise specified by the Department in writing, the permittee shall revise the Plan. The permittee shall perform all actions required by the revised Plan in accordance with the timelines in the revised Plan, and certify to the Department that the requested changes have been made and implemented.

3. Permittee information. The permittee shall provide such information as the Department requires to evaluate the Plan and its implementation. The permittee shall note minor modifications to the Plan in its annual report. Major modifications to the Plan such as a change in the Plan's priorities must be submitted to the Department and approved prior to implementation.

C. Failure to Prepare or Amend the Plan. Failure to complete or update a Plan in accordance with this General Permit does not relieve a permittee of responsibility to implement actions required to protect the waters of the State other than groundwater and to comply with all conditions of this General Permit.

D. Evaluation and Assessment. As specified in Part IV(J)(1), the permittee shall evaluate program compliance, the appropriateness of identified best management practices, and progress towards achieving identified measurable goals.

E. Assessment of Stormwater Program Management Plan. The Plan must address the six Minimum Control Measures ("MCMs") as required in this permit. The Plan must, at a minimum, include the measures indicated as required within the UA of the municipality. The permittee may also include in the Plan those measures indicated as suggested and any other measures the permittee deems appropriate. Some municipalities may choose to implement required minimum control measures or portions of minimum control measures throughout the entire municipality, however this General Permit only requires implementation of the minimum control measures within the UA to the extent the measures will have an impact on the MS4, and for municipal facilities, operations and activities within the UA, that discharge to waters of the State other than groundwater.

F. Signature Requirements

1. **Signature.** The Plan must be signed by the chief elected municipal official or principal executive officer. The Plan must be retained by the chief elected official or principal executive officer for the duration of the permit period and copies must be available and retained by municipal officials or employees responsible for implementation of the Plan.

2. **Plan availability.** The permittee shall have a signed copy of the plan available either at the municipal office or on the official municipal web site and shall make a copy of the Plan available to the following immediately upon request:

a. The Commissioner of the Department;

b. In the case of a regulated small MS4 adjacent to or interconnected with the permittee's storm sewer system, to the operator of that regulated small MS4; and

c. In the case of a regulated small MS4 stormwater discharge to a water supply watershed, to the public water supply company.

G. Annual Fee. Coverage under an existing General Permit will be continued upon payment of an annual fee. An annual fee must be submitted by no later than July 20 each year, starting July 20, 2013. Fees must be paid by check or money order payable to **Treasurer, State of Maine.**

H. Minimum Control Measures. For each Minimum Control Measure, the permittee shall: define appropriate BMPs; designate a person(s) responsible for each BMP; define a time line for implementation of each BMP; and define measurable goals for each BMP. The Minimum Control Measures to be included in the Plan are as follows.

1. Public Education and Outreach on Stormwater Impacts.

The three goals of this minimum control measure are:
1. To raise awareness that polluted stormwater runoff is the most significant source of water quality problems for Maine's waters;
2. To motivate people to use Best Management Practices (BMPs) which reduce polluted stormwater runoff ; and
3. To reduce polluted stormwater runoff as a result of increased awareness and utilization of BMPs.

The permittee shall document changes in awareness and BMP adoption (behavior change) in target audiences.

a. Required Strategies.

i. Raise Awareness (Goal 1): Beginning July 1, 2013, the permittee shall continue their outreach efforts from the previous MS4 permit cycle while developing or revising an existing Awareness Plan.

1. Develop or Revise a Plan to Raise Awareness: By February 1, 2014, each permittee or stormwater group of which the permittee is a member shall have a new Awareness Plan or revise an existing Plan to raise awareness of stormwater issues for a target audience outside of municipal government. The Plan's goal must be to raise awareness of polluted stormwater

runoff issues such as the path stormwater runoff takes, sources of stormwater pollution, and the impact that polluted stormwater runoff has in the community or communities.

2. By December 1, 2013, the permittee shall submit draft Stormwater Awareness Plan to the Department for review and approval. The Stormwater Awareness Plan is considered approved as of February 1, 2014, unless the permittee receives written communication from the Department indicating non-approval. The permittee shall begin implementation of the Stormwater Awareness Plan within one week of its approval.

   The Stormwater Awareness Plan must identify:
   a) The target audience
   b) The outreach tool(s) to be used
   c) The message
   d) The distribution system
   e) The time line and implementation schedule
   f) The person(s) responsible for implementation
   g) An impact evaluation protocol
   h) A plan modification protocol (this must include DEP approval of significant plan modifications)
   i) The goals (e.g., the targeted level of change sought as a result of the education and outreach effort)

3. The permittee shall include a review of the Stormwater Awareness Plan in each of its Annual Reports. The review must include process indicators which assess the permittee's execution of the Stormwater Awareness Plan. The permittee shall also include impact indicators according to the following schedule unless otherwise indicated in the approved Stormwater Awareness Plan: in permit year three (3), the permittee shall conduct a cursory evaluation and assessment on both the progress of implementing the Stormwater Awareness Plan as well as the impact the efforts are having on the target audience. In permit year five (5) the permittee shall provide an in-depth assessment of both the implementation and the impact of the Stormwater Awareness Plan.

NOTE: Process indicators relate to the execution of the program (e.g., did people attend the meetings? did the press release result in media coverage?). Impact indicators relate to the achievement of the goals/objectives of the program (e.g., what effect did the effort have on behavior?).

The Department has available a number of evaluation tools as well as samples from other regions.

4. The permittee shall include a comprehensive review of the Stormwater Awareness Plan in its permit year five (5) Annual Report. The review must include an analysis of the process indicators and impact indicators.

ii. Raise Awareness of Both stormwater Pollution and the MS4 program requirements for municipal staff including municipal employees, volunteers, council members and other elected officials.

1. Develop or revise a Permit Awareness Plan to raise awareness and permit implementation and compliance: By March 1, 2014, each permittee shall have a new Permit Awareness Plan or revise an existing Plan to raise awareness of stormwater issues including MS4 permit

requirements for municipal employees, elected officials and volunteers within municipal government. The Permit Awareness Plan's goal is to raise awareness of polluted stormwater runoff such as the sources of stormwater pollution, the path polluted stormwater runoff takes from the pollution source to waters of the State, the impact polluted stormwater runoff has on the community, potential measures to reduce or eliminate pollution sources, and General Permit obligations and the permittee's obligations and responsibility to ensure permit compliance.

2. By January 6, 2014, the permittee shall submit the draft Permit Awareness Plan to the Department for review and approval. The Permit Awareness Plan is considered approved as of March 1, 2014, unless the permittee receives written communication from the Department indicating non-approval. The permittee shall begin implementation of the Permit Awareness Plan within one week of its approval.

   The Permit Awareness Plan must identify:
   a) The target audience
   b) The outreach tool(s) to be used
   c) The distribution system
   d) Method to address turnover of employees, elected officials and volunteers
   e) The time line and implementation schedule
   f) The person(s) responsible for implementation
   g) An impact evaluation protocol
   h) A plan modification protocol (this must include DEP approval of significant plan modifications)
   i) The goal (e.g. the target level of awareness for each audience)

3. The permittee shall include a review of the Permit Awareness Plan in each of its Annual Reports. The review must include process indicators which assess the permittee's execution of the Permit Awareness Plan. The permittee shall also include impact indicators according to the following schedule unless otherwise indicated in the approved Permit Awareness Plan: In year 3, the permittee will do an evaluation and assessment on both the progress of implementing the plan as well as the impact the efforts are having on the target audience. In year 5 the permittee shall provide an in-depth assessment of both the implementation and the impact of the Permit Awareness Plan.

4. The permittee shall include a comprehensive review of the Permit Awareness Plan in its permit year five (5) Annual Report. The review must include an analysis of the process indicators and impact indicators.

iii. Targeted BMP Adoption: Beginning July 1, 2013, the permittee shall continue outreach efforts from the previous MS4 General Permit while developing or revising a new BMP Adoption Plan.

1. By January 15, 2014, each permittee or stormwater group of which the permittee is a member shall have a new or revised Adoption Plan with the goal of promoting behavior change through the implementation of BMPs. Each permittee or stormwater group shall select at least one specific BMP to target for a focused outreach Plan. In order to facilitate statewide consistency and efficient use of resources, permittees may work collaboratively to develop and implement a Statewide BMP Adoption Plan that allows for regional flexibility.

The permittee shall target at least 15% of the segmented audience to adopt the targeted BMPs.

2. By November 1, 2013, the permittee shall submit the draft BMP Adoption Plan to the Department for review and approval. The BMP Adoption Plan is considered approved as of January 15, 2014, unless the permittee receives written communication from the Department indicating non-approval. The permittee shall begin implementation of the BMP Adoption Plan within one week of its approval.

   The BMP Adoption Plan must identify:
   a) The BMP
   b) The target audience
   c) The outreach tool(s) to be used
   d) The message
   e) The distribution system
   f) The time line and implementation schedule
   g) The person(s) responsible for implementation
   h) An impact evaluation protocol
   i) A plan modification protocol (this must include DEP approval of significant plan modifications)
   j) The goal (e.g. the target level BMP adoption for each audience)

NOTE: For example, if 10% of dog owners are picking up pet waste in public parks, then in five years the permittee will seek to raise the percentage of dog owners picking up pet waste and disposing of it in the trash to 25% in public parks. Or if 50% of the homeowners are using weed & feed lawn care chemicals, seek to reduce the number to 35%.

3. The permittee shall include a review of the BMP Adoption Plan in each of its Annual Reports. The review must include process indicators which assess the permittee's execution of the BMP Adoption Plan. The permittee shall also include impact indicators according to the following schedule unless otherwise indicated in the approved BMP Adoption Plan: in permit year 1, the permittee will assess the target audience to set the baseline and inform the development of the BMP Adoption Plan. In permit year three (3), the permittee will conduct a preliminary evaluation and assessment on both the progress of implementing the plan as well as the impact the efforts are having on the target audience. In permit year five (5) the permittee shall provide final assessment of both the implementation and the impact of the BMP Adoption Plan.

4. The permittee shall include in its fifth year Annual Report a comprehensive review of the BMP Adoption Plan. The review must include an analysis of the process indicators and impact indicators.

iv. Permittees will enhance their education and outreach effort in their impaired or priority watershed or work to address a stormwater pollutant issue of regional or statewide significance.

1. Permittees with an impaired waterbody may either target a specific activity that if successfully addressed will improve and/or protect water quality in the priority or impaired watershed(s) or the permittee may implement option 2 below. The effort can be undertaken individually or collectively by MS4s. Examples include developing an outreach effort to encourage stormwater BMP owners to properly maintain their BMPs or target an audience to increase the use of LID practices within the priority watershed.

2. Permittees may choose instead to work singly or collaboratively on a common regional or statewide stormwater pollutant issue. Such issues include but are not limited to elevated chloride in waterbodies from winter salt applications or the toxic constituents associated with the application of coal tar sealants. The goal of the effort should be to reduce or eliminate the pollutant(s) of concern.

3. By July 1, 2014, each permittee shall provide a draft plan on how it plans to meet either permit requirement iv 1 or 2 with elements a-h below, by November 1, 2014, each permittee shall provide a final plan with implementation to begin by January 5, 2015

    a. Identify the specific stormwater activity or pollutant to be addressed
    b. The target audience(s)
    c. The outreach tool(s) to be used
    d. The message and the BMPs to be encouraged
    e. The time line and implementation schedule
    f. The person(s) responsible for implementation
    g. The goal of the outreach effort
    h. An impact evaluation protocol.

4. The permittee shall report the progress and results of the targeted outreach effort in the Annual Report. In the fifth year Annual Report will include a comprehensive review of the outreach effort . The review must include an analysis of the process indicators and impact indicators

v. Compliance with this minimum control measure will be based upon whether the permittee:
    a) Continued existing education and outreach efforts
    b) Developed both the required plans in elements i though iv
    c) Successfully executed the plans
    d) Reported process and impact indicators, and
    e) Completed annual reports and a 5-year analysis of the plans.

Ultimately, the adoption and use of BMPs by the targeted audience(s) to reduce polluted stormwater runoff is the goal of this section but is not a condition of compliance with the education and outreach minimum control measure.

b. Suggested Strategies.

i Schools. Each permittee or regional stormwater group is encouraged to develop an outreach plan directed at its school age population. It is recommended that students receive information regarding:

- The definition of stormwater
- The path stormwater takes
- The sources of pollution in stormwater
- The harmful effects of polluted stormwater
- BMPs in age appropriate concepts and materials

1. The permittee is encouraged to include in each of its Annual Reports, a review of the plan. The review could include process indicators which assess the permittee's execution of the school Outreach Plan, and impact indicators which assess the effectiveness of the plan.

2. The permittee is encouraged to include in its fifth year Annual Report a comprehensive review of the school Outreach Plan. The review could include an analysis of the process indicators and an analysis of the impact indicators.

ii. Partnering with local organizations: A critical mass of a community (e.g., a neighborhood, a social group, or some sort of group with identifiable and similar characteristics) must accept new ideas and behaviors for those new ideas and behaviors to spread. With this in mind, a permittee may wish to include in its outreach efforts various local organizations which may be able to assist in helping to spread the stormwater message. Examples of potential partner organizations include: girl and boy scouts, fish & game clubs, water districts, conservation commissions, garden clubs, rotary, religious organizations, ethnically based groups, and watershed associations.

iii. Involving members of the community in the implementation of BMPs.

2. Public Involvement and Participation.

The goal of this minimum control measure is to involve the public in both the planning and implementation process of improving water quality and reducing stormwater quantity via the stormwater program. A program planned with a stakeholder group is more likely to be successful in achieving its goals. The public can provide valuable input and assistance to a MS4's municipal stormwater management program. Therefore, the public should be given opportunities to play an active role in both the development and implementation of the program. An active and involved community is crucial to the success of a municipal stormwater management program because it allows for broader public support, additional expertise and a conduit to other programs. Community members are also more likely to apply these lessons/BMPs at home.

a. Required Strategies.

i. Public notice requirements. The permittee shall comply with applicable state and local Public Notice requirements using effective mechanisms for reaching the public, and comply with the public notice requirements of the Maine Freedom of Access Act, 1 M.R.S.A. §§ 401 et seq. ("FOAA") when the permittee involves stakeholders in the implementation of this General Permit. The permittee shall document the meetings and attendance through the annual report as a way of measuring this goal.

ii. Public Event. The permittee or regional stormwater group of which the permittee is a member shall annually host/conduct or participate a public event (for example, storm drain stenciling, stream clean-up, household hazardous waste collection day, volunteer monitoring, neighborhood educational events, conservation commission outreach program, Urban Impaired Stream outreach program, or adopt a storm drain or local stream program). The event must include a pollution prevention and/or water quality theme. The target audience does not need to be the entire urbanized area but should be aimed at a segment of the population that the permittee wishes to reach. The permittee is encouraged to plan this event and consult with the Department to ensure it will satisfy this permit's requirements.

1. The permittee shall include a report of the public event in each of its Annual Reports. The report must include process indicators which assess the permittee's planning and execution, as well as impact indicators which assess the effectiveness of the event.

NOTE: The Department has available a number of evaluation tools as well as samples from other regions.

2. The permittee shall include a comprehensive review of the public events in its fifth year Annual Report that must include an analysis of the process indicators and impact indicators.

b. **Suggested Strategies.**

If there are a variety of ethnic or economic groups in the community, the permittee could develop specific public participation outreach opportunities for these communities.

3. Illicit Discharge Detection and Elimination.

a. Required Strategies. Each permittee shall develop, implement and enforce a program to detect and eliminate illicit discharges and non-stormwater discharges, as defined in 06-096 CMR 521(9)(b)(2), except as provided in Part IV(H)(3)(c) of this permit.

i. By June 30, 2018, Permittees not subject to the 2008 MS4 General Permit shall develop a watershed based storm sewer system infrastructure map or series of maps for its regulated area. The map(s) must show the location of all stormwater catch basins, connecting surface and subsurface infrastructure and depict the direction of in-flow and out-flow pipes, and the locations of all discharges from all stormwater outfalls operated by the regulated small MS4 to receiving waters or to an interconnected MS4. Each catch basin must be uniquely identified to facilitate control of potential illicit discharges, and to ensure proper operation and maintenance of these structures. For each outfall, the following information must be included: type (e.g. culvert or ditch), material, size of conveyance, the name and location of the nearest named waterbody to which the outfall eventually discharges. Permittees subject to the 2008 MS4 General Permit shall continue to keep their map(s) current and ensure that maps are reviewed for any updates at least annually.

ii. Permittees not subject to the 2008 MS4 General Permit shall develop and implement a non-stormwater discharge ordinance which effectively prohibits non-stormwater discharges and stipulates the implementation of appropriate enforcement procedures and actions by no later than January 10, 2015. Permittees subject to the 2008 MS4 General Permit shall to the extent allowable under State or local law, continue to implement, and provide annual reporting of the permittee's non-stormwater discharge ordinance that effectively prohibits, unauthorized non-stormwater discharges into the permittee's storm sewer system.

iii. Permittees not subject to the 2008 MS4 General Permit shall develop a prioritized dry weather outfall inspection plan by no later than June 30, 2014. This dry weather outfall inspection plan must pertain to a watershed or sub-watershed that the permittee has identified as having the greatest potential threat to the receiving water. (See *Guidelines and Standard Operating Procedures For Stormwater Phase II Communities in Maine* volumes 1 and 2) The SOP can be obtained from the following web site http://www.thinkbluemaine.org/docs/index.htm under the illicit discharge detection and elimination section. Permittees subject to the 2008 MS4 General Permit shall continue to implement its prioritized dry weather outfall inspection plan based on drainage areas such as an urban impaired stream watershed, or based on a watershed or sub-watershed that the permittee has identified as having the greatest potential threat to the receiving water. (See *Guidelines and Standard Operating Procedures For Stormwater Phase II Communities in Maine* volumes 1 and 2) The SOP can be obtained from the following web site. http://www.thinkbluemaine.org/docs/index.htm under the illicit discharge detection and elimination section.

Permittees not subject to the 2008 MS4 General Permit shall conduct a dry weather inspection of MS4 outfalls that discharge to the two highest priority sub-watersheds, as approved by the Department. In subsequent permit years, dry weather inspections must be expanded to other sub-watersheds within the permittee's two highest priority watersheds as approved by the Department. The municipality must have a defined procedure/policy or protocol in place that details the steps that must be taken when an illicit discharge is identified during these inspections to locate the source of the illicit discharge and eliminate it. Permittees subject to the 2008 MS4 General Permit shall revise their outfall inspection plan and continue conducting dry weather inspections in different watersheds or sub-watersheds as approved by the Department and evaluate discharges for illicit connections.

iv Permittees not subject to the 2008 MS4 General Permit shall, by no later than June 30, 2018, develop and implement a strategy to detect any illicit discharges to their open ditch system within their highest priority watershed, to the extent allowable under State or local law. Permittees subject to the 2008 MS4 General Permit shall continue to implement an illicit discharge/illicit connection detection program based upon a schedule approved by the Department.

v By June 30, 2016, each permittee shall develop a list of septic systems in its highest priority watershed that are 20 years old or greater and which may discharge to the MS4 if the system fails. By June 30, 2017, each permittee shall implement a drive-by evaluation and documentation program of septic systems in its highest priority watershed that are 20 years old or greater and which have the potential to discharge into the MS4. This septic system inspection and documentation program must include a mechanism for addressing any discharges to the MS4 from malfunctioning septic systems.

b. Suggested: Each permittee may develop and implement an annual municipal household hazardous waste collection, or participate in an annual regional household hazardous waste collection program, or provide some other mechanism for residents to dispose of household hazardous waste.

c. Non-stormwater discharges. This permit authorizes the following non-stormwater discharges provided they do not contribute to a violation of water quality standards as determined by the Department. These discharges must be addressed in the Plan if they are identified by the permittee as significant contributors of pollutants to the regulated small MS4.

- landscape irrigation
- diverted stream flows
- rising ground waters
- uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20))
- uncontaminated pumped ground water
- uncontaminated flows from foundation drains
- air conditioning and compressor condensate
- irrigation water
- flows from uncontaminated springs
- uncontaminated water from crawl space pumps
- uncontaminated flows from footing drains
- lawn watering runoff
- flows from riparian habitats and wetlands
- residual street wash water (where spills/leaks of toxic or hazardous materials have not occurred, unless all spilled material has been removed and detergents are not used), and

- hydrant flushing and firefighting activity runoff
  - water line flushing and discharges from potable water sources
- individual residential car washing
- dechlorinated swimming pool discharges

4. **Construction Site Stormwater Runoff Control.** Each permittee shall develop, implement, and enforce a program, or modify an existing program, to reduce pollutants in any stormwater runoff to the regulated small MS4 from construction activities that result in a land disturbance of greater than or equal to one acre. Reduction of stormwater discharges from construction activity disturbing less than one acre must be included in the program if that construction activity is part of a larger common plan of development or sale that would disturb one acre or more. The program must include, but not be limited to, the development and implementation of:

   a. If the permittee chooses to rely on either the Maine Construction General Permit ("MCGP") and if applicable Chapter 500, Stormwater Management, the program must include the development and implementation of:

      i. Procedures for notifying construction site developers and operators of the requirements for registration under the Maine Construction General Permit or Chapter 500, Stormwater Management for the discharge of stormwater associated with construction activities; and

      ii. Document every construction activity that disturbs one or more acres within the UA.

      ii. Implement site inspections procedures to ensure projects are in compliance with the MCGP and Chapter 500, Stormwater Management. In watersheds of Urban Impaired Streams, and in the permittee's highest priority watershed, inspect the construction activity at least three times with one inspection at project completion to ensure that all post construction BMPs were properly installed, and that final stabilization of the site has been completed. All construction inspections must be properly documented. For other watersheds, inspect the construction activity a minimum of twice, with one inspection at project completion to ensure that all post construction BMPs were properly installed, and that final stabilization of the site has been completed.

   b. Non-reliance on the MCGP. If the permittee <u>does not</u> choose to rely on the MCGP, the program must include the development and implementation of:

      i. An ordinance or other regulatory mechanism to require erosion and sediment controls, as well as sanctions for non-compliance, to the extent allowable under State or local law;

      ii. Procedures for notifying construction site developers and operators of the requirements for registration under the MCGP and Chapter 500, Stormwater Management for the discharge of stormwater associated with construction activities;

      iii. Requirements for construction site operators to implement appropriate erosion and sediment control best management practices in accordance with state law and any local requirements;

      iv. Requirements for construction site operators to control waste at the site such as discarded building materials, concrete truck washout, chemicals, litter, and sanitary waste that may cause adverse impacts to water quality;

v. Procedures for site plan review that incorporate consideration of potential water quality impacts;

vi. Procedures for receipt and consideration of information submitted by the public; and

vii. Site inspections procedures to ensure projects are in compliance with the erosion and sedimentation control plan, MCGP and Chapter 500, Stormwater Management. In watersheds of Urban Impaired Streams and the permittee's highest priority watershed or sub-watershed, inspect and properly document the construction activity at least three times with one inspection just prior to or within 24 hours of a rain event greater than .2 inches, and one inspection at project completion to ensure that all post construction BMPs were properly installed, and that final stabilization of the site has been properly completed. For other watersheds, inspect the construction activity at least twice, with one inspection at project completion to ensure that all post construction BMPs were properly installed, and that final stabilization of the site has been properly completed.

5. Post-Construction Stormwater Management in New Development and Redevelopment.

a. Required Strategies.

i. Each permittee shall develop, implement, and enforce a program to address stormwater runoff from new development and redevelopment projects that disturb greater than or equal to one acre, including projects less than one acre that are part of a larger common plan of development or sale, that discharge into the MS4. This program shall ensure that controls are in place that will prevent or minimize water quality impacts.

ii. To ensure adequate long-term operation and maintenance of post construction BMPs, each permittee subject to the 2008 MS4 General Permit shall continue to implement a post construction discharge ordinance, or similar measure approved by the Department. Permittees not subject to the 2008 MS4 General Permit shall implement a post construction discharge ordinance, or similar measure approved by the Department, by no later than June 30, 2015. This ordinance or similar measure must stipulate that the owner or operator of a post construction BMP described in Part IV(H)(5)(a)(i) provide the permittee with an annual report documenting that the BMP is adequately maintained and is functioning as intended or requires maintenance. If the post construction BMP requires maintenance, the owner or operator shall provide a record of the deficiency and corrective action(s) taken to the permittee. In permit year two and in subsequent permit years, each permittee shall include the following in their annual report:

- the cumulative number of sites that have post construction BMPs discharging into their MS4;
- a summary of the number of sites that have post construction BMPs discharging into their MS4 that were reported to the municipality;
- the number of sites with documented functioning post construction BMPs; and
- the number of sites that required routine maintenance or remedial action to ensure that the post construction BMP is functioning as intended.

iii. Each permittee shall annually inspect a percentage of post construction BMPs located in the direct watershed of a lake most at risk from new development or in watersheds of an urban impaired stream. If the owner or operator of a post construction BMP hires a qualified third party inspector, the permittee will have no inspection requirements. If the owner or operator of a post construction BMP does a "self" inspection, the permittee is required to conduct the following inspection schedule.

1-10 post construction sites: inspect at least one site, or 40% (whichever is greater)
11-30 post construction sites: inspect at least four sites, or 30% (whichever is greater)
31-60 post construction sites: inspect at least nine sites, or 25% (whichever is greater)
61-100 post construction sites: inspect at least fifteen sites, or 20% (whichever is greater)
101-160 post construction sites: inspect at least twenty sites, or 17% (whichever is greater)
Over 160 post construction sites: inspect at least twenty seven sites, or 11% (whichever is greater)

NOTE: For the purposes of this Minimum Control Measure, a post construction site may be a large commercial development i.e. big box store, or a subdivision, or any activity that disturbed one of more acres. Construction sites may have multiple post construction BMPs.

iv. Develop and implement a procedure for notifying site developers to consider incorporating low impact development techniques.

6. Pollution Prevention/Good Housekeeping for Municipal Operations.

This program has the ultimate goal of preventing or reducing pollutant runoff from municipal operations.

a. Required Strategies.

i. Permittees not subject to the 2008 MS4 General Permit shall by the end of permit year one, develop an inventory of all municipal operations conducted in, on, or associated with facilities, buildings, golf courses, cemeteries, parks and open space owned or operated by the permittee that have the potential to cause or contribute to stormwater or surface water pollution. By the end of permit year two, Permittees not subject to the 2008 MS4 General Permit shall develop and implement written operation and maintenance procedures for its highest priority watershed that includes maintenance schedules and inspection procedures to ensure long term operation of structural and non-structural controls that reduce stormwater pollution to the maximum extent practicable. By the end of year three develop and implement operation and maintenance procedures for the remaining watersheds within the Urbanized Area. Permittees subject to the 2008 MS4 General Permit shall continue to maintain their inventory of properties, facilities and activities, and continue implementation of their operation and maintenance plans. These procedures must address as applicable:

- Proper use, storage and disposal of petroleum and non-petroleum products, hazardous materials, waste materials, pesticides and fertilizers including minimizing the use of these products, and an alternative product analysis;
- Spill response and prevention;
- Vehicle and equipment storage, maintenance and fueling;
- Amount and type(s) of deicing materials used each deicing season
- Landscaping and lawn care including, where applicable, an evaluation of reduced mowing frequencies, establishing and maintaining buffers, cutting vegetation within 100 feet of a stormwater conveyance or surface water;
- Erosion and sedimentation control;
- Feeding gulls, waterfowl or other wildlife.

ii. Using training materials that are available from the EPA, the State, regional stormwater groups or other organizations, *Guidelines and Standard Operating Procedures For Stormwater Phase II Communities in Maine* volumes 1 and 2, and the Think Blue Maine website, www.thinkbluemaine.org this program must include employee training to prevent and reduce

stormwater pollution from municipal operations and facilities. The permittee shall report annually on the types of trainings presented, the number of municipal and contract staff that received training, the length of the training, and training effectiveness.

iii. The permittee shall develop and implement a program to sweep all publicly accepted paved streets and publicly owned paved parking lots maintained by the permittee at least once a year as soon as possible after snowmelt.

iv. The permittee shall develop and implement a program to evaluate and, if necessary, clean catch basins and other stormwater structures that accumulate sediment at least once every other year and dispose of the removed sediments in accordance with current state law. The permittee shall clean catch basins more frequently if inspections indicate excessive accumulation of sediment. Excessive accumulation is greater than or equal to 50 percent filled.

v. The permittee shall evaluate and implement a prioritized schedule, as necessary, for repairing or upgrading the conveyances, structures and outfalls of the regulated small MS4.

vi. Permittees not subject to the 2008 MS4 General Permit shall by June 30, 2015, develop and implement a stormwater pollution prevention plan ("SWPPP") for the following municipal operations: public works facilities, transfer stations, and school bus maintenance facilities operated by the permittee unless the facility is currently regulated under Maine's Industrial Stormwater Program. The SWPPP must meet the conditions and requirements including quarterly visual monitoring per Maine's Multi-Sector General Permit ("MSGP") Stormwater Discharge Associated with Industrial Activity, published April 26, 2011. The SWPPP outlines sources of potential stormwater pollutants and the methods by which these pollutants will be reduced or prevented from entering Waters of the State, other than groundwater, or to an MS4. The Plan identifies in writing a SWPPP team of facility personnel as well as a SWPPP team leader who is ultimately responsible for SWPPP implementation. The Department has developed a generic SWPPP for municipal operations which can be modified by the permittee for individual facilities as required by this permit. Contact the Municipal and Industrial Stormwater Coordinator for an electronic copy of the SWPPP, Quarterly inspection forms, visual monitoring forms or for technical assistance, including on-site assistance, to meet this permit obligation. Permittees subject to the 2008 MS4 General Permit shall continue to implement and update their SWPPP(s) to ensure it meets Maine's April 26, 2011 MSGP requirements including visual monitoring. The Department shall honor request for technical assistance including on-site technical assistance inspections and SWPPP training.

b. Suggested Operational Strategies. At a minimum, consider the following in developing your program.

i. Structural and non-structural stormwater controls to reduce floatables and other pollutants discharged from your separate storm sewers.

ii. Controls for reducing or eliminating the discharge of pollutants from streets, roads, highways, municipal parking lots, and snow disposal areas.

iii. Ensure that new flood and stormwater management projects assess the impacts on water quality and examine existing projects for incorporating additional water quality protection devices or practices.

I. Sharing responsibility

1. **Reliance on other entity.** The permittee may satisfy the requirement to implement a BMP for a Minimum Control Measure by having a third party implement the BMP. For example, if a local watershed organization organized or funded by the permittee performs an annual "river clean-up", this event may be used to satisfy a BMP for the Public Participation and the Pollution Prevention and Good Housekeeping Minimum Control Measure.

   If the permittee is relying on a third party to implement one or more BMP(s), the permittee shall note that fact in the Stormwater Program Management Plan and annual report required in Part IV (J). If the third party fails to implement the BMP(s), the permittee remains responsible for its implementation.

2. **Qualifying state or federal program.** If a BMP or Minimum Control Measure is the responsibility of a third party under another NPDES or MEPDES permit, the permittee is not required to include such BMP or Minimum Control Measure in its stormwater management program. The permittee shall reference this qualifying program in their Stormwater Program Management Plan. However, the permittee is responsible for its implementation if the third party fails to perform. The permittee shall periodically confirm that the third party is still implementing this measure. If the third party fails to implement the measure, the Plan may be modified to address the measure, if necessary.

   In the case of a permitted municipal industrial activity, such as a publicly owned treatment works covered by the Multi Sector General Permit, the permittee may reference the activity's Stormwater Pollution Prevention Plan to address a portion of the permittee's Plan.

3. **Other MS4 Permittees.** The permittee shall identify interconnections within the regulated small MS4s and find ways to cooperate with other regulated entities. Where a portion of the separate storm sewer system within a municipality is owned, operated or otherwise the responsibility of another regulated small MS4, the two entities may coordinate the development and implementation of their respective Plans to address all elements of Part IV H (1-6). At the very least, a clear description of their respective responsibilities for these elements must be included in each regulated small MS4's Plan.

   For example, a storm sewer system within a municipality may be operated and maintained by the MaineDOT, or other public or quasi-public entity. In cases such as these, the two entities shall cooperate and coordinate their Plans to reduce duplicative efforts to address the Minimum Control Measures, particularly at the interconnections within storm sewer systems. Where an illicit discharge is detected from an outfall near an interface between two storm sewer systems and where there is more than one responsible entity, the two entities shall coordinate their efforts to detect and ultimately eliminate the cause of the illicit discharge. These efforts must be noted in both the regulated small MS4's annual reports.

J. Reporting and Record Keeping Requirements

1. The permittee shall keep records required by this permit for at least three (3) years following its expiration, or longer if requested by the Commissioner. The permittee shall make records, including its Stormwater Program Management Plan, available to the public at reasonable times during regular business hours.

   By September 15, 2014 and annually thereafter by September 15, the permittee shall submit a report for the Department's review and approval to:

Municipal/Industrial Stormwater Coordinator
Department of Environmental Protection
17 State House Station
Augusta, Maine 04333-0017

The report must include the following.

a. The status of compliance with permit conditions based on the permittees Plan, an assessment of the appropriateness of identified best management practices, progress towards achieving identified measurable goals for each of the Minimum Control Measures, and progress toward achieving to goal of reducing the discharge of pollutants to the MEP.

b. Results of information collected and analyzed, including monitoring data, if any, during the reporting period.

c. A summary of the stormwater activities the permittee intends to undertake pursuant to its Plan during the next reporting cycle.

d. A change in any identified BMPs or measurable goals that apply to the Plan.

e. A summary describing the activities, progress, and accomplishments for each of the minimum control measures #1 through #6 (including such items as the status of education and outreach efforts, public involvement activities, stormwater mapping efforts, dry weather inspections, detected illicit discharges, detected illicit connections, illicit discharges that were eliminated, construction site inspections, number and nature of enforcement actions, post construction BMP status and inspections, and the status of the permittee's good housekeeping/pollution prevention program.

2. Changes to the report based on the Department's review comment(s) must be submitted to the Department within 60 days of the receipt of the comment(s).

3. Suggested. Provide an estimate of annual expenditures for permit compliance for the reporting period and projected budget for the following year.[9]

K. Impaired Waters and Total Maximum Daily Load (TMDL). If the waterbody to which a discharge drains is impaired and has an EPA approved TMDL, then the discharge must be consistent with the TMDL waste load allocation ("WLA") and any implementation plan. This general permit does not authorize a direct discharge that is inconsistent with the WLA of any EPA approved TMDL. If a TMDL is approved or modified by EPA subsequent to the effective date of this General Permit, the Department shall notify the permittee and may:

1. Require the permittee to review its Plan for consistency with the TMDL, and propose any necessary modification to the Plan to be submitted to the Department within six months of the receipt of notification concerning the TMDL;

2. Issue a watershed-specific general permit for the area draining to the impaired waterbody. The watershed-specific MS4 general permit may reference parts of this General Permit; or

[9] The collection of expenditure data by the Department is solely for the purpose of determining generic program costs not as a measure of the permittee's program compliance or effectiveness. The Department recognizes that expenditure data tracking and reporting methodology may vary from one reporting entity to another, as well as over time, and will assess any data for its validity, relevance and utility as it pertains to the purpose stated above.

3. Require an individual permit.

PART V. Standard Conditions

A. Removed Substances. Solids, sludges, filter backwash or other pollutants removed or resulting from the treatment of wastewaters shall be disposed of in a manner approved by the Department.

B. Other Applicable Conditions. The conditions in Waste Discharge License Conditions,06-096 CMR 523(2) (effective January 23, 2001) also apply to discharges pursuant to this General Permit and are incorporated herein as if fully set forth. These conditions address areas such as: duty to comply; need to reduce or halt activity not a defense; duty to mitigate; permit actions; property rights; duty to provide information; and inspection and entry.

C. Monitoring Requirement. The Department may require monitoring of an individual discharge as may be reasonably necessary in order to characterize the nature, volume or other attributes of that discharge or its sources.

D. Other Information. When the permittee becomes aware that he or she failed to submit any relevant facts or submitted incorrect information in the Notice of Intent or in any other report to the Department, he or she shall promptly submit such facts or information.-

E. Endangered Species. Pursuant to State and Local Cooperation Law, 12 M.R.S.A. § 12806, A state agency or municipal government shall not permit, license, fund or carry out projects that will:

1. Significantly alter the habitat identified under Conservation of Endangered Species Law, 12 M.R.S.A. § 12804, subsection 2 of any species designated as threatened or endangered under this subchapter; or

2. Violate protection guidelines set forth in 12 M.R.S.A. § 12804, subsection 3.

F. Individual Permit or Alternative General Permit. When an individual permit is issued to a discharger otherwise subject to this permit, or the discharger is authorized to discharge under an alternative general permit, the applicability of this permit to the individual permittee is automatically terminated on the effective date of the individual permit or the date of authorization of coverage under the alternative general permit, whichever the case may be. When an individual permit is denied to an operator otherwise subject to this permit, or the operator is denied for coverage under an alternative general permit, the applicability of this permit to the individual NPDES permittee is automatically terminated on the date of such denial, unless otherwise specified by the Commissioner.

General Permit for the Discharge of Stormwater from Small Municipal Separate Storm Sewer Systems

Issued: TBD

General Permit for the Discharge of Stormwater from Small Municipal Separate Storm Sewer Systems

Table of Contents

Section 1. Authority

This general permit is issued under the authority of Section 22a-430b of the Connecticut General Statutes.

Section 2. Definitions

The definitions of terms used in this general permit shall be the same as the definitions contained in Sections 22a-423 of the Connecticut General Statutes and Section 22a-430-3(a) of the Regulations of Connecticut State Agencies. As used in this general permit, the following definitions shall apply:

"x-year, 24-hour rainfall event" means the maximum 24-hour precipitation event with a probable recurrence interval of once in the given number of years (i.e. x=2, 25 or 100), as defined by the National Weather Service in Technical Paper Number 40, "Rainfall Frequency Atlas of the United States," May 1961, and subsequent amendments, or equivalent regional or state rainfall probability information developed therefrom.

"Aquifer protection area" means aquifer protection area as defined in section 22a-354h of the Connecticut General Statutes.

"Best engineering practices" means the design of engineered control measures to control pollution to the maximum extent achievable using measures that are technologically available and economically practicable.

"Best Management Practices (*BMP*)" means schedules of activities, practices (and prohibitions of practices), structures, vegetation, maintenance procedures, and other management practices to prevent or reduce the discharge of pollutants to waters of the state consistent with state, federal or other equivalent and technically supported guidance. BMPs also include treatment requirements, operating procedures, and practices to control site runoff, spillage or leaks, sludge or waste disposal, or drainage from material storage.

"Coastal area" means coastal area as defined in Section 22a-93(3) of the Connecticut General Statutes.

"Coastal Jurisdiction Line" means the location of the topographical elevation of the highest predicted tide as defined in Section 22a-359(c) of the Connecticut General Statutes.

"Coastal waters" means coastal waters as defined in Section 22a-93(5) of the Connecticut General Statutes.

"Commissioner" means commissioner as defined in section 22a-2(b) of the Connecticut General Statutes.

"Control Measures" means any BMPs or other methods (including effluent limitations) used to prevent or reduce the discharge of pollutants to waters of the state.

"Department" means the Department of Energy & Environmental Protection.

"Directly Connected Impervious Area (DCIA)" means that impervious area from which stormwater runoff discharges directly to waters of the state or to a storm sewer system that discharges to waters of the state.

"Effective Impervious Cover" is the total area of a site with a Rational Method runoff coefficient of 0.7 or greater (or other equivalent methodology) from which stormwater discharges directly to a surface water or to a storm sewer system.

"" means a tidal wetland located outside of coastal waters.

"Grab sample" means an individual sample collected in less than fifteen minutes.

"Guidelines" means the 2002 Connecticut Guidelines for Soil Erosion and Sediment Control, as amended, established pursuant to Section 22a-328 of the Connecticut General Statutes.

"High Quality Waters" means those waters defined as high quality waters in the Connecticut Water Quality Standards pursuant to Section 22a-426-1(36) of the Regulations of Connecticut State Agencies.

"Illicit Discharge" means any unpermitted discharge to waters of the state that does not consist entirely of stormwater or uncontaminated ground water except those discharges identified in Section 3(a)(2) of this general permit when such non-stormwater discharges are approved, in writing, by the Commissioner as discharges that are not significant contributors of pollution to a discharge from an identified MS4.

"Impaired water(s)" means those surface waters of the state designated by the Commissioner as impaired pursuant to Section 303(d) of the federal Clean Water Act and as identified in the most recent State of Connecticut Integrated Water Quality Report within Categories 4 or 5, including any subdivisions of these categories.

"Individual permit" means a permit issued to a named permittee under Section 22a-430 of the Connecticut General Statutes.

"Inland wetland" means wetlands as that term is defined in Section 22a-38 of the Connecticut General Statutes.

"Low Impact Development" or *"LID"* means a site design strategy that maintains, mimics or replicates pre-development hydrology through the use of numerous site design principles and small-scale treatment practices distributed throughout a site to manage runoff volume and water quality at the source.

"Maximum Extent Practicable" or "MEP" is a technology-based standard established by Congress in the Clean Water Act Section 402(p)(3)(B)(iii). Since no precise definition of MEP exists, it allows for maximum flexibility on the part of MS4 operators as they develop their programs. (40CFR 122.2, See also: Stormwater Phase II Compliance Assistance Guide EPA 833-R-00-002, March 2000). When trying to reduce pollutants to the MEP, there must be a serious attempt to comply, and practical solutions may not be lightly rejected. If a covered entity chooses only a few of the least expensive methods, it is likely that MEP has not been met. On the other hand, if a covered entity employs all applicable BMPs except those where it can be shown that they are not technically feasible in the locality, or whose cost would exceed any benefit to be derived, it would have met the standard. MEP required covered entities to choose effective BMPs, and to reject applicable BMPs only where other effective BMPs will serve the same purpose, the BMPs would not be technically feasible, or the cost would be prohibitive.

"Minimize", for purposes of implementing the minimum control measures in Section 6 of this general permit, means to reduce and/or eliminate to the MEP.

"Municipal separate storm sewer system" or *"MS4"* means conveyances for stormwater (including roads with drainage systems, streets, catch basins, curbs, gutters, ditches, man-made channels or storm drains) owned or operated by any municipality or by any state or federal institution and discharging to surface waters of the state.

"Municipality" means a city, town or borough of the state as defined in section 22a-423 of the Connecticut General Statutes.

"New or Increased Discharge" means new discharge or activity as defined in section 22a-426-8(b)(3) and increased discharge or activity as defined in section 22a-426-8(b)(2), as referenced to the Regulations of Connecticut State Agencies.

"Permittee" means any MS4 that initiates, creates, originates or maintains a discharge authorized by this general permit and that has filed a registration pursuant to Section 4 of this permit.

"Point Source" means any discernible, confined and discrete conveyance, including but not limited to, any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, landfill leachate collection system, vessel or other floating craft from which pollutants are or may be discharged.

"Qualified professional engineer" means a professional engineer who has, for a minimum of eight years, engaged in the planning and designing of engineered stormwater management systems for (i) municipal separate storm sewer systems and (ii) residential and commercial construction projects in accordance with the Guidelines and the Stormwater Quality Manual including, but not limited to, a minimum of four years in responsible charge of the planning and designing of engineered stormwater management systems for such projects.

"Registrant" means a municipality or institution which files a registration pursuant to Section 4 of this general permit.

*"*Redevelopment*"* means any construction activity (including, but not limited to, clearing and grubbing, grading, excavation, and dewatering) within existing drainage infrastructure or at an existing site to modify or expand or add onto existing buildings or structures, grounds, or infrastructure.

"Registration" means a registration form filed with the Commissioner pursuant to Section 4 of this general permit.

"Retain" means to hold runoff on-site to promote vegetative uptake and groundwater recharge through the use of runoff reduction or LID practices or other measures. In addition, it means there shall be no subsequent point source release to surface waters from a storm event defined in this general permit or as approved by the Commissioner.

"Runoff reduction practices" means those post-construction stormwater management practices used to reduce post-development runoff volume delivered to the receiving water, as defined by retaining the volume of runoff from a storm up to the first half inch or one inch of rainfall in accordance with Sections 6(*a*)(5)(B) or 6(*b*)(5)(B), respectively. Runoff reduction is quantified as the total annual

post-development runoff volume reduced through canopy interception, soil amendments, evaporation, rainfall harvesting, engineered infiltration, extended filtration or evapotranspiration.

"Small MS4" means any MS4 that is not already covered by the Phase I MS4 stormwater program (pursuant to 40CFR 122.26(a)(3)) including municipally-owned systems as well as state- and federally-owned systems, such as colleges, universities, prisons, and military bases. (Note: the Department of Transportation is authorized under a separate general permit.)

"Standard of care", as used in Section 3(*b*)(9), means to endeavor to perform in a manner consistent with that degree of care and skill ordinarily exercised by members of the same profession currently practicing under similar circumstances.

"State or Federal Institution" means any facility (including, but not limited to, state and federal prisons, office complexes, hospitals; university campuses, public housing authorities, schools, or other special districts) consisting of more than one building that is owned by an agency or department of the State of Connecticut (except the Department of Transportation) or a federal agency and has an average daily population of 1,000 people or more.

"Stormwater" means waters consisting of rainfall runoff, including snow or ice melt during a rain event.

"Stormwater Quality Manual" means the 2004 Connecticut Stormwater Quality Manual published by the Connecticut Department of Energy & Environmental Protection, as amended.

"Surface water" means those waters as defined in Section 22a-426-1(60) of the Regulations of Connecticut State Agencies.

"Tidal wetland" means a wetland as that term is defined in Section 22a-29(2) of the Connecticut General Statutes.

"Tier 1 Small MS4" means any municipally-owned or -operated Small MS4 (as defined above) including all those located partially or entirely within an Urbanized Area and all state- and federally-operated Small MS4s and any other MS4s located outside an Urbanized Area as may be designated by the Commissioner. (Note: A list of Tier 1 municipalities is included in Appendix A1 of this general permit.)

"Tier 2 Small MS4" means any municipally-owned or municipally-operated Small MS4 (as defined above) other than those designated as a Tier 1 Small MS4 or as may be designated by the Commissioner. (Note: A list of Tier 2 municipalities is included in Appendix A2 of this general permit.)

"Total Maximum Daily Load (*TMDL*)" means a water quality implementation plan established pursuant to Section 303 of the federal Clean Water Act.

"Urbanized Area (*UA*)" means the areas of the State of Connecticut so defined by the U.S. Census Bureau for the 2000 or 2010 census.

"Water Quality Standards or Classifications" means those water quality standards or classifications contained in Sections 22a-426 -1 through 22a-426-9, inclusive, of the Regulations of Connecticut State Agencies and the Classification Maps adopted pursuant to Section 22a-426 of the Connecticut General Statutes, which together constitute the Connecticut Water Quality Standards., as may be

amended.

"Water Quality Volume" or *"WQV"* means the volume of runoff generated by one inch of rainfall on a site as defined in the 2004 Connecticut Stormwater Quality Manual, as amended.

Section 3. Authorization Under This General Permit

(a) Eligible Activities

(1) This general permit authorizes the discharge of stormwater from or associated with a Tier 1 or Tier 2 Small MS4, provided the requirements of subsection (*b*) of this section are satisfied and the activity is conducted in accordance with the conditions listed in Section 5 of this general permit.

(2) This permit authorizes the following non-stormwater discharges provided they do not contribute to a violation of water quality standards and such discharges are documented in the Stormwater Management Plan and are not significant contributors of pollutants to any identified MS4:

- uncontaminated ground water discharges including, but not limited to, pumped ground water, foundation drains, water from crawl space pumps and footing drains;
- irrigation water including, but not limited to, landscape irrigation and lawn watering runoff;
- residual street wash water;
- discharges or flows from fire fighting activities (except training); and
- naturally occurring discharges such as rising ground waters, uncontaminated ground water infiltration (as defined at 40 CFR 35.2005(20)), springs, diverted stream flows and flows from riparian habitats and wetlands.

(b) Requirements for Authorization

This general permit authorizes the activity listed in the "Eligible Activities" section (Section 3(*a*)) of this general permit provided:

(1) Coastal Management Act

Such activity is consistent with all applicable goals and policies in Section 22a-92 of the Connecticut General Statutes, and must not cause adverse impacts to coastal resources as defined in Section 22a-93(15) of the Connecticut General Statutes.

(2) Endangered and Threatened Species

Implementation of the MS4's Stormwater Management Plan shall not threaten the continued existence of any species listed pursuant to section 26-306 of the Connecticut General Statutes as endangered or threatened and must not result in the destruction or adverse modification of habitat designated as essential to such species.

(3) Aquifer Protection Areas

Such activity, if it is located within an aquifer protection area as mapped under section 22a-354b of the Connecticut General Statutes, must comply with regulations adopted pursuant to section 22a-354i of the Connecticut General Statutes.

(4) Discharge to POTW

The stormwater is *not* discharged to a Publicly Owned Treatment Works (POTW).

(5) Discharge to Groundwater

The stormwater is *not* discharged entirely to groundwater, meaning a stormwater discharge to a surface water will not occur up to a 100-year, 24-hour rainfall event.

(6) New or Increased Discharges to High Quality Waters

On or before thirty (30) days prior to the commencement of a new or increased discharge to a High Quality Waters from its MS4, the permittee must document compliance with the Connecticut Anti-Degradation Implementation Policy in the Water Quality Standards, as amended. Before commencing any new or increased discharge, the permittee shall identify in its Stormwater Management Plan ("Plan"), the control measures it will implement to ensure compliance with anti-degradation provisions and the terms of this Permit. At a minimum, the permittee shall evaluate and implement to the Maximum Extent Practicable practices which will prevent the discharge of the Water Quality Volume to a surface water body or other practices necessary to protect and maintain designated uses and meet standards and criteria contained in the Water Quality Standards.

(7) New or Increased Discharges to Impaired Waters

(8) Certification Requirements for Registrants and other Individuals

As part of the registration for this general permit, the registrant and any other individual or individuals responsible for preparing the registration submits to the Commissioner a written certification which, at a minimum, complies with the following requirements:

(A) The registrant and any other individual or individuals responsible for preparing the registration and signing the certification has completely and thoroughly reviewed, at a minimum, this general permit and the following regarding the activities to be authorized under such general permit: (i) all registration information provided in accordance with Section 4(*c*)(2) of such general permit, (ii) the Stormwater Management Plan, and (iii) any plans and specifications and any Department approvals regarding such Stormwater Management Plan;

(B) The registrant and any other individual or individuals responsible for preparing the registration and signing the certification pursuant to this general permit has, based on the review described in section 3(*b*)(8)(A) of this general permit, made an affirmative determination to: (i) comply with the terms and conditions of this general permit; (ii) maintain compliance with all plans and documents prepared pursuant to this general permit including, but not limited to, the Stormwater Management Plan; (iii) properly implement and maintain the elements of the Stormwater Management Plan; and (iv) properly operate and maintain all stormwater management measures and systems in compliance with the terms and conditions of this general permit to protect the waters of the state from pollution;

(C) Such registrant and any other individual or individuals responsible for preparing the registration certifies to the following statement:

"I hereby certify that I am making this certification in connection with a registration under the General Permit for the Discharge of Stormwater from Small Municipal Storm Sewer Systems, submitted to the Commissioner by [INSERT NAME OF REGISTRANT] for an activity located at or within [NAME OF MUNICIPALITY OR ADDRESS OF THE REGISTERED ACTIVITY] and that all terms and conditions of the general permit are being met for all discharges which have been created, initiated or maintained and such activity is eligible for authorization under such permit. I further certify that a system is in place to ensure that all terms and conditions of this general permit will continue to be met for all discharges authorized by this general permit at the site. I certify that I have personally examined and am familiar with the information that provides the basis for this certification, including but not limited to all information described in Section 3(*b*)(8)(A) of such general permit, and I certify, based on reasonable investigation, including my inquiry of those individuals responsible for obtaining such information, that the information upon which this certification is based is true, accurate and complete to the best of my knowledge and belief. I certify that I have made an affirmative determination in accordance with Section 3(*b*)(8)(B) of this general permit. I understand that the registration filed in connection with such general permit is submitted in accordance with and shall comply with the requirements of Section 22a-430b of Connecticut General Statutes, as amended by Public Act 12-172. I also understand that knowingly making any false statement made in the submitted information and in this certification may be punishable as a criminal offense, including the possibility of fine and imprisonment, under section 53a-157b of the Connecticut General Statutes and any other applicable law."

(9) Stormwater Management Plan Certification

As part of the registration for this general permit, the registrant submits to the Commissioner a written certification by a qualified professional engineer who has reviewed the Stormwater Management Plan (Plan) in accordance with the following requirements:

(A) The qualified professional engineer did not engage in any activities associated with the preparation, planning, designing or engineering of the Plan.

(B) The qualified professional engineer has, at a minimum, completely and thoroughly reviewed this general permit and the following regarding the discharges to be authorized under such general permit: (i) all registration information provided in accordance with Section 4(*c*)(2) of such general permit, (ii) the Stormwater Management Plan, and (iii) all non-engineered and engineered stormwater management measures and systems, including any plans and specifications and any Department approvals regarding such stormwater management measures and systems.

(C) Affirmative Determination

A qualified professional engineer signing the certification must have made an affirmative determination, based on the review described in section 3(*b*)(9)(B) of this general permit and on best engineering practices, that the Plan and control measures therein are adequate to assure that the activity authorized under this general permit will comply with the terms and conditions of such general permit and all non-engineered and

engineered stormwater management measures and systems: (i) have been designed in accordance with best engineering practices; (ii) will function properly as designed; (iii) are adequate to ensure compliance with the terms and conditions of this general permit; and (iv) will protect the waters of the state from pollution.

(D) The qualified professional engineer, as specified in sections 3(*b*)(9)(A) and (B), above, shall certify to the following statement:

"I hereby certify that I am a qualified professional engineer, as defined in the General Permit for the Discharge of Stormwater from Small Municipal Storm Sewer Systems and as further specified in sections 3(*b*)(9)(A) of such general permit. I am making this certification in connection with a registration under such general permit, submitted to the Commissioner by [INSERT NAME OF REGISTRANT] for an activity located at or within [NAME OF MUNICIPALITY OR ADDRESS OF THE REGISTERED ACTIVITY]. I have personally examined and am familiar with the information that provides the basis for this certification, including but not limited to all information described in Section 3(*b*)(9)(B) of such general permit, and I certify, based on reasonable investigation, including my inquiry of those individuals responsible for obtaining such information, that the information upon which this certification is based is true, accurate and complete to the best of my knowledge and belief. I certify, based on my review of all information described in Section 3(*b*)(9)(B) of such general permit and on the standard of care for such projects, that I have made an affirmative determination in accordance with Section 3(*b*)(9)(C) of this general permit. I understand that this certification is part of a registration submitted in accordance with Section 22a-430b of Connecticut General Statutes, as amended by Public Act 12-172, and is subject to the requirements and responsibilities for a qualified professional in such statute. I also understand that knowingly making any false statement in this certification may be punishable as a criminal offense, including the possibility of fine and imprisonment, under section 53a-157b of the Connecticut General Statutes and any other applicable law."

(E) Nothing in this subsection shall be construed to authorize a qualified professional engineer to engage in any profession or occupation requiring a license under any other provision of the Connecticut General Statutes without such license.

(c) Registration

Pursuant to the "Registration Requirements" section (Section 4) of this permit, a Tier 1 or Tier 2 Small MS4 shall submit an electronic Registration Form (accessible from the DEEP website) to the Commissioner at least one hundred eighty (180) days prior to the effective date of this general permit. The electronic form will guide the registrant to submit the appropriate information.

Include any additional forms and information regarding compliance and/or consistency with the Coastal Management Act, National Historic Preservation Act, High Quality Waters, Impaired Waters (including TMDL requirements), Endangered and Threatened Species, and Aquifer Protection Areas that may be required pursuant to the "Requirements of Authorization" section (Section 3(*b*)).

(d) Geographic Area

This general permit applies throughout the State of Connecticut.

(e) Effective Date and Expiration Date of this General Permit

This general permit is effective TBD and expires on TBD.

(f) Effective Date of Authorization

An activity is authorized by this general permit: on the date the general permit becomes effective; on the date a complete registration meeting the requirements of Section 4(*c*) is submitted; for registrants that did not register as required by Section 3(*c*), on the date the authorized activity is initiated; or on another date approved by the Commissioner, whichever is latest.

(g) Redesignation of Authorization

A municipality designated as a Tier 1 Small MS4 may request a redesignation for authorization as a Tier 2 Small MS4 under this general permit if the population within the Urbanized Area portion of town, as determined by the 2000 and 2010 United States censuses, is less than 1000 people and the Commissioner issues such waiver in writing.

Section 4. Registration Requirements

(a) Who Must File a Registration

Any municipality or state or federal institution that initiates, creates, originates or maintains a discharge of stormwater from or associated with a Tier 1 or Tier 2 Small MS4 shall file with the Commissioner a registration form that meets the requirements of this section of this general permit. Such form shall be submitted along with the applicable fee within the timeframes and in the amounts specified in Sections 3(*c*) and 4(*c*)(1)(A), respectively.

(b) Scope of Registration

A registrant must register on one set of registration forms for all discharges that are operated by the registering MS4. A MS4 may not submit more than one registration under this general permit.

(c) Contents of Registration

(1) Fees

(A) The registration fee for a Tier 1 or Tier 2 Small MS4 shall be $625 to be submitted with the registration form.

(B) The fees for municipalities shall be half of those indicated in subsection (A) above pursuant to section 22a-6(b) of the Connecticut General Statutes. State and Federal agencies shall pay the full fees specified in this subsection.

(C) The registration fee shall be paid electronically or by check or money order payable to the **Department of Energy & Environmental Protection**.

(D) No activity shall be authorized by this general permit until the registration fee has been paid in full.

(E) The registration fee is non-refundable.

(2) Registration Form

The registration shall be filed electronically in a form prescribed and provided by the Commissioner (available on the DEEP website) and shall include the following:

(A) Name of the MS4 and the name, title, address, telephone number, and email address of the chief elected official or principal executive officer.

(B) An indication of the status of the MS4 as either a Tier 1 or Tier 2 Small MS4 (see Appendices A1 and A2).

(C) Name, address, telephone number, and email address of the primary contact person for the MS4.

(D) Name, primary contact, address, telephone number, and email address of any consultant(s) or engineer(s) retained by the MS4 to prepare the registration,

(E) Name of receiving stream(s), watershed(s) or waterbody(s) (including waterbody ID number which can be identified at *www.**cteco**.uconn.edu*) to which the MS4 discharges and indication of whether or not a receiving stream is listed as an impaired water, with or without a TMDL, and including identification of the impairment in the most recent State of Connecticut Integrated Water Quality Report or identification of the receiving stream as a high quality water by the Commissioner as defined in the Connecticut Water Quality Standards.

(F) An electronic map or a paper copy of the relevant portion or a full-sized original of a United States Geological Survey (USGS) quadrangle map with a scale of 1:24,000, showing the MS4 boundaries and limits of its separate storm sewer system. If a paper copy of a map is submitted, identify the quadrangle name on the map and be sure to include the name of the MS4.

(G) Assurance that the Stormwater Management Plan for the MS4 is consistent with the following provisions of state statutes and regulations, as appropriate:

(i) For sites within the Coastal Boundary, the MS4 must address all applicable goals and policies in Section 22a-92 of the Connecticut General Statutes, and must not cause adverse impacts to coastal resources as defined in Section 22a-93(15) of the Connecticut General Statutes.

(ii) The MS4's Stormwater Management Plan will not threaten the continued existence of any species listed pursuant to section 26-306 of the Connecticut General Statutes as endangered or threatened and will not result in the destruction or adverse modification of habitat designated as essential to such species.

(iii) The implementation of the MS4's Stormwater Management Plan for any part of the MS4 located within an aquifer protection area (see Appendix C) as mapped under

section 22a-354b of the Connecticut General Statutes will comply with regulations adopted pursuant to section 22a-354i of the Connecticut General Statutes. For any activity regulated pursuant to sections 8(c) and 9(b) of the Aquifer Protection Regulations (section 22a-354i(1)-(10) of the Regulations of Connecticut State Agencies), the Stormwater Management Plan must assure that stormwater run-off generated from the MS4 is managed in a manner so as to prevent pollution of groundwater.

(iv) The Stormwater Management Plan has been reviewed for consistency with state Historic Preservation statutes, regulations, and policies including identification of any potential impacts on property listed or eligible for listing on the Connecticut Register of Historic Places. A review conducted for an Army Corps of Engineers Section 404 wetland permit would meet this qualification.

(v) The Stormwater Management Plan appropriately addresses new or increased discharges to high quality waters, as specified in Section 3(*b*)(6).

(vi) The Stormwater Management Plan appropriately addresses new or increased discharges to impaired waters, as specified in Section 3(*b*)(7).

(H) For each of the Minimum Control Measures in Section 6(*a*), the following information shall be included:

(i) each Best Management Practice (BMP) to be implemented;

(ii) the person(s) responsible for implementing and maintaining each BMP;

(iii) the date by which each BMP will be implemented;

(iv) the measurable goal(s) by which each BMP will be evaluated.

(I) Provide an internet address (URL) where the Stormwater Management Plan required by Section 5(*b*) and the Annual Reports required by Section 6(*k*) are accessible for public review. Also provide a physical address where a paper copy of the Plan and Annual Reports are available for inspection. If the registrant claims that certain elements of their Plan constitute secure information (pursuant to Section 4(*d*)(2)(C)) or are otherwise exempt from the disclosure requirements of the state Freedom of Information Act (section 1-210 et seq of the Connecticut General Statutes, also called FOIA) as specified in that Act, the registrant shall follow the procedures provided in the registration form instructions for this general permit regarding information subject to FOIA requirements. The process of complying with the FOIA requirements does not exempt the registrant from the registration and Plan preparation deadlines of this general permit.

(J) The certification of the registrant and of the individual or individuals responsible for actually preparing the registration, in accordance with Section 3(*b*)(8).

(K) Certification (pursuant to the requirements and conditions of Section 3(*b*)(9)) that the Stormwater Management Plan has been reviewed by a qualified professional engineer (as defined in Section 2) licensed in the State of Connecticut.

(d) Availability of Registrations, Stormwater Management Plans and Annual Reports

(1) Registration and Plan Availability

Within thirty (30) days of receipt of a registration, the Commissioner shall post on the DEEP website a list of registrations submitted and identify the location where the Stormwater Management Plan is available for review.

On or before thirty (30) days from the date of posting of a registration by the Commissioner, members of the public may review the registration and Stormwater Management Plan and submit written comments to the Commissioner.

(2) Stormwater Management Plan Availability

A Regulated Small MS4 shall make its Stormwater Management Plan available, electronically and at a publicly available location, for public review and comment. In addition to the internet address (URL) required as part of the registration (pursuant to Section 4(*c*)(2)(I)), reasonable efforts to inform the public of this document shall be undertaken by the MS4. The Plan shall be made available at the MS4's main office, a local library or other publicly available location for public inspection and copying consistent with the federal and state Freedom of Information Acts. On or before thirty (30) days from the date of the availability of the Plan, members of the public may review the Plan and submit written comments on it to the Commissioner. The Plan shall be made available in accordance with the following:

(A) Re-Registrants

For a Regulated Small MS4 that was previously permitted under the General Permit for the Discharge of Stormwater from Small Municipal Separate Storm Sewer Systems issued January 9, 2004, the Plan shall be made available at least one hundred eighty (180) days prior to the effective date of this general permit.

(B) New Registrants

For a Regulated Small MS4 that was **not** previously permitted under the General Permit for the Discharge of Stormwater from Small Municipal Separate Storm Sewer Systems issued January 9, 2004, the Plan shall be made available at least ninety (90) days prior to the effective date of this general permit.

(C) Secure Information

If the registrant claims that certain elements of their Plan constitute secure information subject to restrictions related to Homeland Security or other security issues otherwise exempt from the disclosure requirements of the state Freedom of Information Act (section 1-210 et seq of the Connecticut General Statutes, also called FOIA) as specified in that Act, they shall follow the procedures provided in the registration form instructions for this general permit regarding information subject to FOIA requirements. The process of complying with the FOIA requirements does not exempt the registrant from the registration and Plan preparation deadlines in this general permit.

Following the comment period specified above, the final Plan shall remain available for public inspection on-line and a paper copy made available at the location specified above during regular business hours.

(3) Annual Report Availability

At least forty five (45) days prior to submission of each Annual Report to the Department, pursuant to Section 6(*k*), each MS4 shall make available for public review and comment a draft copy of the complete Annual Report. Comments on the Annual Report may be made to the MS4 and are *not* submitted to the Department. Reasonable efforts to inform the public of this document shall be undertaken by the MS4. Such draft copies shall be made available electronically on the MS4 website and at the MS4's main office, a local library or other central publicly available location for public inspection and copying consistent with the federal and state Freedom of Information Acts. Following submission of the Annual Report (pursuant to Section 6(*k*)), a copy of the final report shall be made available for public inspection during regular business hours.

(e) Where to File a Registration

A registration shall be filed electronically with the Commissioner through the DEEP website.

In the event that electronic submission is not available, contact the DEEP's Stormwater Section at (860) 424-3025.

(f) Additional Information

The commissioner may require a registrant to submit additional information, which the commissioner reasonably deems necessary to evaluate the consistency of the subject activity with the requirements for authorization under this general permit.

(g) Additional Notification

For discharges authorized by this general permit to another Regulated Small MS4 or to the City of Stamford, a copy of the registration and all attachments thereto shall also be submitted to the owner and operator of that system.

For discharges authorized by this general permit to a DOT separate storm sewer system, a copy of the registration and all attachments thereto shall also be submitted to the DOT upon request.

For discharges within a public drinking water supply watershed or aquifer area, a copy of the registration and the Plan described in subsection 5(*b*) of this general permit shall be submitted to the water company.

For discharges to river components and tributaries which have been designated as Wild and Scenic under the Wild and Scenic Rivers Act, a copy of the registration and the Plan described in 5(*b*) of this general permit shall be submitted to the applicable Wild and Scenic Coordinating Committee.

(h) Action by Commissioner

(1) The Commissioner may require that a permittee obtain an individual permit for any

discharge authorized by this permit in accordance with Section 22a-430b of the Connecticut General Statutes.

(2) The Commissioner may reject without prejudice a registration if he or she determines that it does not satisfy the registration requirements (Section 4(*c*)) of this general permit. Any registration refiled after such a rejection shall be accompanied by the fee specified in the "Fees" section (Section 4(*c*)(1)) of this general permit.

(3) The Commissioner may disapprove a registration if he or she finds that the subject activity is inconsistent with the "Requirements for Authorization" section (Section 3(*b*)) of this general permit, or for any other reason provided by law.

(4) Disapproval of a registration under this subsection shall constitute notice to the registrant that the subject activity must be authorized by an individual permit.

(5) Disapproval of a registration shall be in writing.

Section 5. Requirements of this General Permit

The permittee shall at all times continue to meet the requirements for authorization set forth in Section 3 of this general permit. In addition, a permittee shall ensure that authorized activities are conducted in accordance with the following conditions:

(a) Conditions Applicable for Certain Discharges

(1) If the permittee initiates, creates, or originates a discharge of stormwater which is located less than 500 feet from a tidal wetland that is not a fresh-tidal wetland, such discharge shall flow through a system designed to retain the Water Quality Volume, as defined in Section 2.

(2) If the permittee wishes to initiate, create, or originate a discharge of stormwater below the coastal jurisdiction line into coastal, tidal, or navigable waters for which a permit is required under the Structures and Dredging Act in accordance with Section 22a-361(a) of the Connecticut General Statutes or into tidal wetlands for which a permit is required under the Tidal Wetlands Act in accordance with Section 22a-32 of the Connecticut General Statutes, the municipality shall obtain such permit(s) from the Commissioner prior to initiating, creating or originating such discharge.

(3) There shall be no distinctly visible floating scum, oil or other matter contained in the stormwater discharge. Excluded from this are naturally occurring substances such as leaves and twigs provided no person has placed such substances in or near the discharge.

(4) The stormwater discharge shall not result in pollution which may cause or contribute to acute or chronic toxicity to aquatic life, impair the biological integrity of aquatic or marine ecosystems, or result in an unacceptable risk to human health.

(5) The stormwater discharge shall not cause or contribute to an exceedance of the applicable Water Quality Standards in the receiving water.

(6) Any new stormwater discharge to high quality waters (as identified by the Commissioner consistent with the Water Quality Standards) shall be discharged in accordance with the Connecticut Anti-Degradation Implementation Policy in the Water Quality Standards

manual. At a minimum, the permittee shall evaluate and implement to the Maximum Extent Practicable practices which will prevent the discharge of the Water Quality Volume to a surface water body or other practices necessary to protect and maintain designated uses and meet standards and criteria contained in the Water Quality Standards.

(7) Any stormwater discharge to the waters identified in Appendix D shall be managed for the Stormwater Pollutant of Concern identified in the appendix consistent with the requirements in Section 6 of this permit.

(b) Stormwater Management Plan

The permittee shall develop, implement, and enforce a stormwater management plan designed to reduce the discharge of pollutants from the Small MS4 to the maximum extent practicable, to protect water quality, and to satisfy the appropriate water quality requirements of the federal Clean Water Act. Under this program, the permittee shall prepare a Stormwater Management Plan pursuant to Section 6 of this general permit, which plan must be completed by such time as specified in Section 4(*d*)(2) of this general permit. The permittee shall continue to implement the Stormwater Management Plan and all Minimum Control Measures required by this general permit throughout the entire term of the general permit. The permittee shall continue to provide for adequate staffing and economic resources for such implementation throughout the entire term of the general permit. If at any time the Commissioner finds that the Plan is not adequate to protect the waters of the state from pollution, the Commissioner may terminate authorization under this permit and require the MS4 to submit an individual permit application.

Section 6. Development of Stormwater Management Plan (the Plan)

The Plan shall address the Minimum Control Measures as indicated in this section. Section 6(*a*) contains the requirements for Tier 1 Small MS4s and section 6(*b*) contains the requirements for Tier 2 Small MS4s. These measures shall be implemented throughout the boundaries of the municipality or institution.

(a) Tier 1 Minimum Control Measures

For each Minimum Control Measure, the permittee shall: define appropriate BMPs; designate a person(s) and job title responsible for each BMP; define a time line for implementation of each BMP; where appropriate, identify the location, including the address and latitude and longitude, for each BMP; and define measurable goals for each BMP. The Minimum Control Measures in the Plan include, but are not limited to:

(1) Public education and outreach

(A) Implement a public education program to distribute educational materials to the community (i.e. residents, business and commerce, students, staff, contractors, etc.) or conduct equivalent outreach activities about the sources and impacts of stormwater discharges on waterbodies and the steps that the public can take to reduce pollutants in stormwater runoff. The education program shall include, but not be limited to, information on management of pet waste, application of fertilizers, herbicides, and pesticides, impervious cover and impacts of illicit discharges and improper disposal of waste into the MS4. Educational information may be developed or acquired from other MS4s, governmental agencies, academia, and/ or environmental advocacy organizations. Information may be disseminated with flyers, brochures, door hangers, television public

service announcements, and web based tools. Each Annual Report shall summarize the types, sources, number of, and methods by which materials disseminated.

(i) Municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit shall implement this measure upon the effective date of this permit and continue until permit expiration.

(ii) Municipalities and institutions newly regulated by this permit shall implement this measure within 6 months of the effective date of this permit and continue until permit expiration. Permittees shall utilize the 6 month period following the effective date of this permit to develop the content of the outreach materials.

(B) To implement the public education and outreach program, the permittee shall develop or acquire current educational material that identifies the pollutants (such as pathogens/ bacteria, nitrogen, phosphorus, sediments, metals, oils & greases) associated with stormwater discharges, the potential sources of the pollutants, the environmental impacts of these pollutants, and related pollution reduction practices.

(C) Additional measures for discharges to waters associated with a Stormwater Pollutant of Concern

(i) For waters for which **Phosphorus** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts, and available pollution reduction practices from the following:

a. Septic systems
b. Fertilizer use
c. Grass clippings and leaves management
d. Detergent use
e. Discharge of sediment (to which Phosphorus binds) from Construction sites
f. Other erosive surfaces

(ii) For waters for which **Nitrogen** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts, and available pollution reduction practices from the following:

a. Septic systems
b. Fertilizer use
c. Grass clippings and leaves management
d. Discharge of sediment (to which Nitrogen binds) from Construction sites
e. Other erosive surfaces

(iii) For waters for which **Bacteria** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts, and available pollution reduction practices from the following:

a. Septic systems
b. Sanitary cross connections
c. Waterfowl
d. Pet waste

e. Manure piles associated with livestock and horses

(iv) For waters for which **Mercury** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts and available recycling programs for elemental mercury and mercury-containing items such as:
a. Thermometers
b. Thermostats
c. Fluorescent lights
d. Button cell batteries

(2) Public Involvement/Participation

(A) Publish a public notice, which complies with state and local public notice and Freedom of Information requirements, of the Plan and Annual Report required by Section 5(*k*) of this permit and hold an annual public meeting to inform the public of the Plan and Annual Report information. The notice shall provide a contact name (with phone number, address, and email) to whom the public can send comments and a publicly accessible location (such as the MS4's main office, a local library or other central publicly available location) and/or URL where the Plan and Annual Report are available for public review. Where state and local notice requirements are inconsistent, the notice provisions providing for the most notice and opportunity for public comment shall be followed. The public notice shall allow for a 30 day comment period, at a minimum. Municipalities and institutions shall publish this public notice annually no later than January 31. The annual public meeting shall be held no later than February 28.

(B) The permittee is encouraged to enlist local organizations to help implement the elements of their SMP.

(C) No requirements in addition to those specified in subsections (A)-(B) above exist for discharges to waters impaired for Phosphorus, Nitrogen, Bacteria, or Mercury.

(3) Illicit discharge detection and elimination.

The permittee shall develop an Illicit Discharge Detection and Elimination (IDDE) program designed to: provide the legal authority to prohibit and eliminate illicit discharges (as defined in 40CFR 122.26(b)(2) except for those discharges noted in the Section 3(*a*)(2) of this permit) to the MS4; find the source of any illicit discharges; eliminate those illicit discharges; and ensure ongoing screening and tracking to prevent and/or eliminate future illicit discharges.

(A) IDDE Program Elements

(i) Illicit discharges to the MS4 are prohibited, and any such discharges are a violation of this permit and remain a violation until they are eliminated. The permittee shall prohibit all illicit discharges from entering its MS4. Upon detection, the permittee shall eliminate illicit discharges as soon as possible and require the immediate cessation of such discharges upon confirmation of responsible parties in accordance with its enforceable legal authorities established pursuant to subsection (B) below. Where elimination of an illicit discharge within thirty (30) days of its confirmation is not possible, the permittee shall establish a schedule for its elimination; such schedule

not to exceed six (6) months. No later than six (6) months after confirmation, such discharges shall be eliminated or the permittee shall initiate appropriate enforcement actions. If the source of the illicit discharge cannot be identified in 6 months, despite reasonable efforts, the permittee shall amend the Plan to provide an alternate timeframe, not to exceed one (1) year after confirmation of responsible parties. In the interim, the permittee shall take all reasonable and prudent measures to minimize the discharge of pollutants to its MS4.

(ii) The permittee shall implement outfall screening and an illicit discharge detection protocol pursuant to subsections A and B of **Appendix B** to identify, prioritize, and investigate separate storm sewer catchments for suspected illicit discharges of pollutants.

(iii) The permittee shall maintain a record of illicit discharge abatement activities including, at a minimum: location (identified with an address and latitude and longitude), description, method of discovery, date(s) of inspection, sampling data (if applicable), action(s) taken, date of removal or repair, responsible party(ies), costs associated with removal or repair, and estimated daily flow or total volume removed. This information shall be included in the permittee's Annual Report pursuant to the Section 6(*k*) of this permit.

(iv) Timelines – permittees shall implement IDDE program elements in accordance with the schedule below:

		% of MS4				
MS4 Type	Population	Year 1	Year 2	Year 3	Year 4	Year 5
Old Muni[1]	<15,000	-	25%	50%	75%	100%
	15,000-50,000	-	25%	30%	40%	50%
	>50,000	-	-	10%	-	20%
New Muni[1]	<15,000	-	25%	50%	75%	100%
	15,000-50,000	-	25%	30%	40%	50%
	>50,000	n/a				
Institutions[2]	<15000	-	25%	50%	75%	100%
	15,000-50,000	-	25%	35%	40%	50%
	>50,000	-	-	10%	-	20%

[1] "Old Muni" means MS4s previously permitted by the MS4 general permit issued on January 9, 2004. "New Muni" means MS4s newly permitted under this general permit.
[2] The population of a state or federal institution is the average daily population including staff, residents and those receiving or providing services on-site.

(B) Establish the necessary and enforceable legal authority by statute, ordinance, rules and regulations, permit, easement, contract, order and any other means, to eliminate illicit discharges.

(i) The legal authority shall:

a. prohibit illicit discharges to its storm sewer system and require removal of such discharges consistent with subsection (3)(A), above; and

b. control the discharge of spills and prohibit the dumping or disposal of materials including, but not limited to, residential, industrial and commercial wastes, trash, used motor vehicle fluids, pesticides, fertilizers, food preparation waste, leaf litter, grass clippings, and animal wastes into its MS4; and

c. assess fines or penalties and/or recoup costs incurred by the permittee from anyone creating an illicit discharge or spilling or dumping as specified in subsection (3)(A), above.

(ii) Municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit must establish and implement this ordinance or regulatory mechanism by the effective date of this permit.

(iii) Municipalities and institutions newly regulated by this permit must implement an ordinance or regulatory mechanism on or before one (1) year of the effective date of this permit.

(C) Develop a list (spreadsheet or database) and map or series of maps at a minimum scale of 1"=2000' and maximum scale of 1"=100' showing all stormwater discharges from a pipe or conduit with a diameter of 12" or greater (or equivalent cross-sectional area) located within and owned or operated by the municipality or institution. The map(s) should be developed in a GIS format.

(i) The list and map(s) shall include for each discharge:

a. Type, material, size, and location (identified with a latitude and longitude) of conveyance, outfall or channelized flow (e.g. 24" concrete pipe);

b. the name, water body ID and Surface Water Quality Classification of the immediate surface waterbody or wetland to which the stormwater runoff discharges;

c. if the outfall does not discharge directly to a named waterbody, the name and water body ID of the nearest named waterbody to which the outfall eventually discharges; and

d. the name of the watershed, including the subregional drainage basin number (available from CT ECO at www.cteco.uconn.edu) in which the discharge is located.

e. the spreadsheet or database should be prepared in a format compatible with Microsoft Excel.

(ii) For municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit, this list and mapping must be completed by the effective date of this permit.

(iii) For municipalities and institutions newly regulated by this permit, this list and mapping must commence upon the effective date of this permit and be completed in minimum increments of twenty-five percent (25%) no later than **2, 3, 4, and 5 years**, respectively, from the effective date of this permit. The entirety of the

municipal or institutional MS4 shall be mapped by the expiration date of this permit.

(D) For waters for which **Phosphorus**, **Nitrogen**, or **Bacteria** is a Stormwater Pollutant of Concern:

(i) To address septic system failures, the IDDE program shall prioritize the IDDE program in areas with a high potential to discharge bacteria, phosphorus, and nitrogen to the MS4. Such areas shall be identified based on assessment of the following criteria: historic on-site sanitary system failures, proximity to bacteria impaired waters, low infiltrative soils, and shallow groundwater. The Annual Report shall include a summary of the program, the number of areas identified with failing systems, actions taken by the permittee to respond to and address the failures, and the anticipated pollutant reduction.

(E) No requirements in addition to those specified in subsections (A) - (C) above exist for discharges to waters for which **Mercury** is a Stormwater Pollutant of Concern.

(4) Construction Site Stormwater Runoff Control

The permittee shall implement and enforce a program to control stormwater discharges (to its MS4) associated with land disturbance or development (including re-development) activities from areas with one half acre or more of soil disturbance, whether considered individually or collectively as part of a larger common plan. Such program shall include the following elements:

(A) Legal Authority

(i) The permittee shall establish an ordinance, bylaw, regulation, or other appropriate legal authority that requires or allows:

a. developers, construction site operators, or contractors to maintain consistency with the 2002 Guidelines for Soil Erosion and Sedimentation Control, as amended, the 2004 Connecticut Stormwater Quality Manual, as amended, and all stormwater discharge permits issued by the DEEP within the municipal or institutional boundary pursuant to CGS 22a-430 and 22a-430b,

b. the implementation of additional measures to protect/improve water quality (in addition to the above requirements) as deemed necessary by the municipality or institution.

c. the permittee to carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with municipal regulations or institutional requirements related to the management of the permittee's MS4. Specifically, inspections shall be conducted to inventory the number of privately-owned retention ponds, detention ponds and other stormwater basins that discharge to or receive drainage from the permittee's MS4.

d. A long term maintenance plan and schedule to ensure the performance and

pollutant removal efficiency of privately-owned retention ponds, detention ponds and other stormwater basins that discharge to or receive discharge from the permittee's MS4. Such authority will require the plan to specify short-term and long-term inspection and maintenance measures to be implemented by the private owner and measures to provide financial assurance to implement this plan.

e. the permittee to control through interagency or inter-jurisdictional agreements, the contribution of pollutants between the permittee's MS4 and MS4s owned or operated by others.

(ii) For municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit, within one (1) year from the start of the permittee's first fiscal year that begins after the effective date of this permit, the permittee shall implement, upgrade (if necessary) and enforce its land use regulations to meet the requirements of subsections 4(A)(i)a. – e. above.

(iii) For municipalities and institutions newly regulated by this permit, within three (3) years from the start of the permittee's first fiscal year that begins after the effective date of this permit, the permittee shall implement, upgrade (if necessary) and enforce its land use regulations (for municipalities) or its construction requirements (for institutions) to meet the requirements of Sections 4(A)(i)a. – e. above.

(B) Interdepartmental Coordination

(i) The permittee will develop and implement a plan outlining how all municipal or institutional departments and boards with jurisdiction over the review, permitting, or approval of land disturbance and development projects within the MS4 will coordinate their functions with one another.

(ii) All municipalities and institutions shall implement this measure upon the effective date of this permit.

(C) Site Review and Inspection

(i) The permittee will conduct site plan reviews that incorporate consideration of stormwater controls or management practices to prevent or minimize impacts to water quality.

(ii) The permittee will conduct site inspection(s) and enforcement to assess the adequacy of the installation, maintenance, operation, and repair of construction and post construction control measures.

(iii) All municipalities and institutions shall implement this measure upon the effective date of this permit.

(D) Public Involvement

(i) The permittee will implement a procedure for receipt and consideration of information submitted by the public concerning proposed and ongoing land disturbance and development activities.

(ii) All municipalities and institutions shall implement this procedure upon the effective date of this permit.

(E) State Permit Notification

(i) The permittee will implement a procedure for notifying developers (working in a municipality) or contractors (working for an institution) of their potential obligation to obtain authorization under the DEEP's General Permit for the Discharge of Stormwater and Dewatering Wastewaters Associated with Construction Activities ("construction general permit") if their development or redevelopment project disturbs one or more acres of land, either individually or collectively, as part of a larger common plan, and results in a point source discharge to the surface waters of the state directly or through the permittee's MS4. The notification shall include a provision informing the developer/ contractor of their obligation to provide a copy of the Storm Water Pollution Control Plan (required by the construction general permit) to the permittee upon request.

(ii) All municipalities and institutions shall implement this procedure upon the effective date of this permit.

(F) No requirements in addition to those specified in subsections (A)-(E) above exist for discharges to waters for which **Phosphorus**, **Nitrogen**, **Bacteria**, or **Mercury** is a Stormwater Pollutant of Concern.

(5) Post –construction stormwater management

(A) Legal Authority

(i) The permittee shall establish an ordinance, bylaw, regulation, or other appropriate legal authority that requires or allows the use of runoff reduction and low impact development ("LID") practices in its land use regulations or construction project requirements to meet the following standards: 1) for development or redevelopment of sites that are currently developed with an effective impervious cover of forty percent or more, retain on-site half the water quality volume for the site, or 2) for new development and redevelopment of sites with less than forty percent effective impervious cover, retain the water quality volume for the site, or 3) an alternate retention/ treatment standard as outlined in subsections 5(B)(i)-(ii) below. All permittees shall identify and eliminate existing local regulatory barriers to implementing LID and runoff reduction practices. These may include site planning requirements, zoning regulations, street design regulations, or infrastructure specifications that address minimal dimensional criteria for the creation of roadways, parking lots, and other impervious cover. If such barriers cannot be eliminated within the timeframe dictated by subsections 5(A)(ii) and (iii) below, the permittee shall provide in the Annual Report(s) required by Section 6(*k*) a justification and a revised schedule for implementation.

(ii) For municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit, the permittee shall implement this requirement within two (2) years after the

effective date of this permit.

(iii) For municipalities and institutions newly regulated by this permit as Tier 1 MS4s, the permittee shall implement this requirement within three (3) years after the effective date of this permit.

(B) Runoff Reduction/ Low Impact Development ("LID") Measures

Pursuant to the requirements of subsection 5(A)(i) above, the permittee shall require the party responsible (i.e. a developer within a municipal boundary or a developer/contractor with the institution) for development and redevelopment projects within its MS4 to:

(i) For development or redevelopment of sites that are currently developed with an effective impervious cover of forty percent or more, retain on-site half the water quality volume for the site. In cases where this entire amount cannot be retained, the permittee shall require the responsible party to retain runoff volume to the maximum extent achievable using control measures that are technologically available and economically practicable and achievable in light of best industry practice. In such cases, additional stormwater treatment, to the maximum extent achievable using control measures that are technologically available and economically practicable and achievable in light of best industry practice, shall be required for sediment, floatables and nutrients for the volume above that which can be retained up to the water quality volume. In cases where the runoff retention requirement cannot be met, the developer/ contractor shall submit, for the permittee's review, a report detailing factors limiting the capability of achieving this goal. The report shall include: the measures taken to maximize runoff reduction practices on the site; the reasons why those practices constitute the maximum extent achievable; the alternative retention volume; and a description of the measures used to provide additional stormwater treatment above the alternate volume up to the water quality volume. In the case of linear redevelopment projects (e.g. roadway reconstruction or widening) for the developed portion of the right of way: (1) for projects that may be unable to comply with the full retention standard, the alternate retention and treatment provisions may also be applied as specified above, or (2) for projects that will not increase the effective impervious cover within a given watershed, the developer/ contractor shall implement the additional stormwater treatment measures referenced above, but will not be required to retain half of the water quality volume.

(ii) For all new development and for redevelopment of sites with less than forty percent effective impervious cover, retain the water quality volume for the site. If there are site constraints that would prevent retention of this volume on-site (e.g., brownfields, capped landfills, bedrock, elevated groundwater, etc.), documentation must be submitted, for the permittee's review and written approval, which: explains the site limitations; provides a description of the runoff reduction practices implemented; provides an explanation of why this constitutes the maximum extent achievable; offers an alternative retention volume; and provides a description of the measures used to provide additional stormwater treatment for sediment, floatables and nutrients above the alternate volume up to the water quality volume. Any such treatment shall be designed, installed and maintained in accordance with the Stormwater Quality Manual. In the case of linear projects that do not involve

impervious surfaces (e.g. electrical transmission rights-of-way or natural gas pipelines), retention of the water quality volume is not required as long as the post-development runoff characteristics do not differ significantly from pre-development conditions.

(iii) Consider the limitation of turf areas to those areas necessary to construct buildings, utilities, stormwater management measures, parking, access ways, reasonable lawn areas and contouring necessary to prevent future site erosion,

(iv) Maintain consistency with the Connecticut Stormwater Quality Manual (as amended), or if inconsistent, provide an explanation of why consistency is not feasible or practicable and information that the proposed plan of development is adequately protective.

(v) For municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit, the permittee shall implement this requirement within two (2) years after the effective date of this permit.

(vi) For municipalities and institutions newly regulated by this permit, the permittee shall implement this requirement within three (3) years from the start of the permittee's first fiscal year that begins after the effective date of this permit.

(C) Impervious Cover

(i) Using mapping provided by the Commissioner (available at www.ct.gov/deep/stormwater), the permittee shall estimate the Directly Connected Impervious Area (DCIA) that contributes stormwater to each of its MS4 outfalls. In its SMP and initial annual report, the Permittee shall describe the methodology and assumptions used to estimate the DCIA. Each annual report shall document the progress of this task until its completion. The Permittee shall revise its DCIA estimate as development, redevelopment, or retrofit projects effectively add or remove DCIA to its MS4.

(ii) All municipalities and institutions shall implement measurement of DCIA upon the effective date of this permit and complete the DCIA estimate within four (4) years of the date of the effective date of this permit.

(D) Long Term Maintenance

(i) The permittee shall implement a maintenance plan for ensuring the long-term effectiveness of retention or detention ponds which discharge to, or receive stormwater from, its MS4. This shall include ponds that are owned by the permittee and all privately-owned ponds where the permittee maintains an easement or other legal authority pursuant to Section 6(*a*)(4)(A)(i) of this permit. At a minimum, the permittee shall annually inspect all such retention or detention ponds and remove accumulated sediment to restore full solids capture design capacity where found to be in excess of 50% design capacity.

(ii) The permittee shall implement a maintenance plan for ensuring the long-term effectiveness of stormwater treatment structures or measures (such as swirl concentrators, oil/ grit separators, water quality wetlands or swales, etc) installed

within its MS4. This shall include structures that are owned by the permittee or those for which the permittee maintains an easement or other legal authority pursuant to Section 6(*a*)(4)(A)(i) of this permit. At a minimum, the permittee shall annually inspect all such structures/ measures and remove accumulated pollutants (such as sediment, oils, leaves, litter, etc) to restore full solids capture design capacity where found to be in excess of 50% design capacity.

(iii) For municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit, the permittee shall implement this requirement upon the effective date of this permit.

(iv) For municipalities and institutions newly regulated by this permit as Tier 1 MS4s, the permittee shall implement this requirement within two (2) years after the effective date of this permit.

(E) Additional measures for discharges to impaired waters (with or without a TMDL)

(i) For waters for which **Nitrogen, Phosphorus** or **Bacteria** is a Stormwater Pollutant of Concern:

To address erosion and sediment problems noted during the course of conducting the inspections required by subsection D above and identified by other means, the permittee shall develop, fund, implement, and prioritize a Retrofit program to correct the problem(s) in a specific timeframe and to establish short term and long term maintenance. Each annual report shall include which problem areas were retrofitted, the cost of the retrofit, and the anticipated pollutant reduction.

(ii) No requirements in addition to those specified in subsections (A)-(D) above exist for discharges to waters for which **Mercury** is a Stormwater Pollutant of Concern.

(6) Pollution Prevention/ Good Housekeeping

(A) Employee Training

The permittee shall continue a formal employee training program to increase awareness of water quality related issues in management of its MS4. In addition to providing key staff with topical training regarding standard operating procedures and other activities necessary to comply with the provisions of this permit, the training program shall include establishing an awareness of the general goals and objectives of the SMP; identification and reporting of illicit discharges and improper disposal; and spill response protocols and respective responsibilities of involved personnel.

(B) Infrastructure Repair and Rehabilitation

The permittee shall repair and rehabilitate its MS4 infrastructure in a timely manner in order to reduce or eliminate the discharge of pollutants from its MS4 to receiving waters. Priority for repair and rehabilitation shall be based on the following:

(i) For municipalities regulated by the MS4 permit issued on January 9, 2004 and this permit, the permittee shall utilize the information developed pursuant to Section

6(a)(6)(A)(v) of the 2004 general permit to fund and implement a program for repairing, retrofitting or upgrading the conveyances, structures and outfalls of the MS4. This program shall be updated based on new information on outfalls discharging pollutants, impaired waters, inspection observations or observations made during outfall mapping pursuant to Section 6(*a*)(3)(C) of this permit

(ii) For municipalities and institutions newly regulated by this permit as Tier 1 MS4s, the permittee shall develop a program to identify conveyances, structures and outfalls in need of repairing, retrofitting or upgrading utilizing new and existing information on outfalls discharging pollutants, impaired waters, inspection observations or observations made during outfall mapping pursuant to Section 6(*a*)(3)(C) of this permit.

(C) MS4 Property and Operations Maintenance

Streets/ road and associated rights-of-way, parking lots, parks, and facilities that are owned, operated, or otherwise the legal responsibility of the permittee shall be maintained so as to minimize the discharge of pollutants to its MS4. Such maintenance shall include, but not be limited to:

(i) Parks and open space

The permittee shall optimize the application of fertilizers by municipal employees, institutional staff, or private contractors on lands and easements for which it is responsible for maintenance. Optimization practices considered shall include conducting soil testing and analysis to determine soil phosphorus levels are inadequate, the reduction or elimination of fertilizers, reduction of usage by adhering to the manufacturers' instructions, and use of alternative fertilizers forms (i.e., products with reduced, slow-releasing, or insoluble phosphorus compositions). Additional optimization practices to be considered include: proper storage and application practices (i.e. avoid impervious surfaces), application schedule (i.e., appropriate season or month) and timing (i.e., coordinated with climatic conditions to minimize runoff potential); develop and implement standard operating practices for the handling, storage, application, and disposal of pesticides and herbicides in compliance with applicable state and federal laws; evaluate lawn maintenance and landscaping activities to promote water quality (protective practices include reduced mowing frequencies, proper disposal of lawn clippings, and use of alternative landscaping materials like drought resistant and native plantings); and establish procedures for management of trash containers at parks (scheduled cleanings; sufficient number).

The permittee shall establish practices for the proper disposal of grass clippings and leaves at municipal owned lands. Clippings shall be composted or otherwise appropriately disposed. Clippings should not be enter the MS4 system or waters of the state.

(ii) Pet waste management

The permittee shall identify locations within its community/ institution where inappropriate pet waste management practices are immediately apparent and pose a

threat to receiving water quality due to proximity and potential for direct conveyance of waste to its storm system and waters. In such areas, implement targeted management efforts such as public education and enforcement (e.g., increased patrol for violators). In municipally-owned recreational areas where dog walking is allowed, the permittee shall install educational signage, pet waste baggies, and disposal receptacles (or require carry-out). In order to measure the effectiveness of its pet waste management practices, the permittee shall document in its annual reports information regarding the scope and extent of its education, compliance, and enforcement efforts (including the number of violations pursued and fines levied).

(iii) Waterfowl management

Identify lands where waterfowl congregate and feeding by the public or institutional staff/ residents occurs. To raise awareness regarding the water quality impacts, the permittee shall install signage or use other targeted techniques to educate the public about the detrimental impacts of feeding waterfowl (including the resulting feces deposition) and discourage such feeding practices. The permittee shall also implement practices that discourage the undesirable congregation of waterfowl in these areas, or otherwise isolate the direct drainage from these areas away from its storm system and waters.

(iv) Buildings and facilities (schools under the jurisdiction of the permittee, town offices, police and fire stations, pools, parking garages and other permittee-owned or operated buildings or utilities)

Evaluate the use, storage, and disposal of both petroleum and non-petroleum products; ensure, through employee training, that those responsible for handling these products know proper procedures; ensure that Spill Prevention Plans are in place, if applicable, and coordinate with the fire department as necessary; develop management procedures for dumpsters and other waste management equipment; sweep parking lots and keep areas surrounding the facilities clean to minimize runoff of pollutants; and ensure that all interior building floor drains are not connected to the MS4. This permit does not authorize such discharges; wastewaters from interior floor drains must be appropriately permitted.

(v) Vehicles and Equipment

Establish procedures for the storage of permittee-owned vehicles; require vehicles with fluid leaks to be stored indoors or in contained areas until repaired; evaluate fueling areas owned by the permittee and used by permittee-owned vehicles and if possible, place fueling areas under cover in order to minimize exposure; establish procedures to ensure that vehicle wash waters are not discharged to the municipal storm sewer system or to surface waters. This permit does not authorize such discharges; wastewaters from interior floor drains must be appropriately permitted.

(vi) Parking lots

Establish and implement procedures for sweeping and/or cleaning permittee-owned parking lots with a minimum frequency of once per year in the spring (following winter activities); establish a more frequent sweeping/ cleaning frequency of

targeted areas determined by the permittee to have an increased pollution potential (based on inspections, pollutant loads, catch basin cleaning or inspection results, land use, impaired or TMDL waters or other factors established by the permittee); and report in each annual report the number of miles cleaned and the volume or mass of material removed. For new and redeveloped municipal parking lots, evaluate options from reducing stormwater runoff to surface waters and/ or the storm sewer system by the installing pervious pavements and/ or other measures to promote sheet flow of stormwater.

(vii) Snow Management Practices

a. Deicing Material Management

Develop and implement standard operating practices for the use, handling, storage, application, and disposal of deicing products such as salt and sand to minimize exposure to stormwater; explore means to minimize the use and optimize the application of chloride-based or other salts or deicing product (while maintaining public safety) and evaluate opportunities for use of alternative materials; for any exterior containers of liquid deicing materials installed after the effective date of this permit, provide secondary containment; ensure that areas used for snow disposal will not result in discharges to waters; and maintain consistency with the DEEP's Best Management Practices for Disposal of Snow Accumulations from Roadways and Parking Lots, revised 2/4/11 and as amended (see link at: www.ct.gov/deep/stormwater).

b. Snow Removal

The permittee shall implement and refine its standard operating practices regarding its snow and ice control operations to minimize the discharge of pollutants. The permittee shall establish goals for the optimization of chemical application rates through the use of automated application equipment (e.g. zero-velocity spreaders), anti-icing and pre-wetting techniques, implementation of pavement management systems, and alternate chemicals. The permittee shall maintain records of the application of anti-icing and/ or de-icing chemicals to document the reduction of chemicals to meet established goals. The permittee shall ensure the proper training for deicing applications for municipal employees, institutional staff, or private contractors on lands and easements for which it is responsible for maintenance;

The permittee shall maintain consistency with the DEEP's Best Management Practices for Disposal of Snow Accumulations from Roadways and Parking Lots (Snow Disposal BMPs), as amended, for the stockpiling or disposal of post-plowing snow. The permittee shall not dispose of snow accumulations in waters of the state except as may be allowed for emergency purposes in the Snow Disposal BMPs document. In its Annual Report, the permittee shall document results of its snow removal program including, at a minimum: the type of staff training conducted on application methods and equipment, type(s) of deicing materials used; lane-miles treated; total amount of each deicing material used; type(s) of deicing equipment used; any changes in deicing practices (and the reasons for the change); and snow disposal methods.

(viii)Sweeping

a. Conduct a street sweeping program to remove sand, sediment and debris at a minimum frequency below in Table 1. Include methods for dust suppression while sweeping. If wet dust suppression is conducted, the use of water should be minimized such that a discharge of excess water to surface waters and/ or the storm sewer system does not occur.

b. Ensure the proper disposal of street sweeping in accordance with Department policies, guidance and regulations. Sweepings shall not be discharged back into the storm drain system and/or surface waters.

c. In its Annual Report, the permittee shall document results of its sweeping program including, at a minimum: curb miles swept, dates of cleaning, cubic yards of material collected, and method(s) of reuse or disposal.

(ix) Leaf Collection

All permittees shall conduct a town- or institution-wide leaf pickup program annually on or before December 15. Permittee shall ensure proper disposal of yard waste.

(x) Catch Basin Cleaning

The Permittee shall conduct routine cleaning of all catch basins. The Permittee shall track catch basin inspection observations. Utilizing information compiled through its inventory of catch basins, operational staff and public complaints, the Permittee shall optimize routine cleaning frequencies for particular structures or catchment areas as follows to maintain acceptable sediment removal efficiencies:

a. For the first two years of this permit, those catch basins serving catchment areas that discharge to a receiving water identified as impaired shall be inspected and cleaned, if necessary, at a minimum frequency of once every six (6) months in order to establish a cleaning frequency determined such that no sump shall become more than fifty percent (50%) full. Once this frequency has been determined, it shall be included in the SMP and noted in the Permittee's Annual Reports.

			Table 1 - Sweeping Schedule [1]					
Municipal or institutional[2] population	Main line roads	Arteries to main line roads	Event gathering places	Commercial/ business district main roads	Commercial/ business district sidewalks	City wide residential	All other streets	Public or institutional parking lots
<15,000	Monthly	Monthly	Prior to event & within 48 hrs of event (or within 24 hrs if rain is forecast)	Monthly	Quarterly	Annually	Annually	Monthly
15,000-50,000	Monthly	Quarterly	Prior to event & within 48 hrs of event (or within 24 hrs if rain is forecast)	Twice monthly	Monthly	Semiannually	Annually	Quarterly
>50,000	Weekly	monthly	Prior to event & within 48 hrs of event (or within 24 hrs if rain is forecast)	Daily	Weekly	Quarterly	Twice annually	Monthly
	[1] Sweeping shall be conducted year-round, with the exception of winter months (Dec 1 – Mar 31). At least one sweeping event shall be conducted at the end of the winter season, between April 1-June 30. Street sweeping shall be conducted so as to minimize the amount of excess runoff of street sweeping water. [2] The population of a state or federal institution is the average daily population including staff, residents and those receiving or providing services on-site.							

b. For all other catch basins, during the first two years of this permit, the Permittee shall inspect and, if necessary, clean these catch basins at least once to establish a cleaning frequency determined such that no catch basin sump is found to be more than fifty percent (50%) full during routine cleaning events. If any of these catch basins are found to be more than fifty percent (50%) full, such basins shall be cleaned and re-inspected within six (6) months to determine the appropriate cleaning frequency. Once this frequency has been determined, it shall be included in the SMP and noted in the Permittee's Annual Reports.

c. Following the establishment of appropriate cleaning frequencies pursuant to subparagraphs (i) and (ii) above, and notwithstanding extenuating circumstances (such as excessive erosion from an active construction site), if a catch basin sump is found to be more than fifty percent (50%) full during each of two consecutive routine cleaning events, the Permittee shall investigate the contributing drainage area for sources of excessive sediment loading, and to the extent practical, abate contributing sources through appropriate measures. Appropriate measures may include stabilization practices, drainage modifications, and increased frequencies of catch basin cleaning and street sweeping, and structural controls suitable for controlling the excessive loading. The Permittee shall describe in its annual report actions taken or its plans to abate areas of persistent sedimentation (including a timeframe for the implementation of such actions), including stabilization practices, structural improvements or operational modifications. After implementation of these measures, if subsequent inspections continue to find the sump more than fifty percent (50%) full, cleaning frequency shall be increased as appropriate to maintain levels below fifty percent (50%). Such changes in frequency shall be included in the SMP and noted in the Permittee's Annual Report.

(xi) Interconnected MS4s

As part of interagency agreements established pursuant to Section 6(*c*)(3) of this permit, the Permittee shall coordinate with operators of interconnected MS4s (such as neighboring municipalities and DOT) regarding the contribution of potential pollutants from the storm sewer systems, contributing land use areas and stormwater control measures in the respective MS4s. This same coordination shall be conducted regarding operation and maintenance procedures utilized in the respective systems.

(xii) Sources contributing pollutants to the MS4

The permittee shall develop and implement a program to control the contribution of pollutants to its MS4 from commercial, industrial, municipal, institutional or other facilities, not otherwise authorized by permit issued pursuant to Sections 22a-430 or 22a-430b of the Connecticut General Statutes.

(D) Additional measures for discharges to waters associated with a Stormwater Pollutant of Concern

(i) For waters for which **Nitrogen** or **Phosphorus** is a Stormwater Pollutant of Concern:

a. On MS4 owned lands, implement a turf management practices and procedures policy which includes, but is not limited to, procedures for proper fertilizer application and the planting of native plant materials to lessen the amount of turf area requiring mowing and the application of chemicals. Each Annual Report shall discuss the actions taken to implement this policy with an estimate of fertilizer and turf area reduction.

(ii) For waters for which **Bacteria** is a Stormwater Pollutant of Concern:

a. On MS4 owned lands with a high potential to contribute bacteria (such as dog parks, parks with open water, sites with failing septic systems), the permittee shall develop, fund, implement, and prioritize a Retrofit program to correct the problem(s) within a specific timeframe. Each Annual Report shall identify which problems areas were retrofitted, the cost of the retrofit, and the anticipated pollutant reduction.

b. On MS4 owned lands, prohibit the feeding of geese or waterfowl and implement a program to manage geese and waterfowl populations. Each Annual Report shall discuss the actions taken to implement this program.

(iii) No additional requirements in addition to those specified in subsections (A)-(C) above exist for discharges to waters for which **Mercury** is a Stormwater Pollutant of Concern.

(b) Tier 2 Minimum Control Measures

For each Minimum Control Measure, the permittee shall: define appropriate BMPs; designate a person(s) and job title responsible for each BMP; define a time line for implementation of each BMP; where appropriate, identify the location, including the address and latitude and longitude, for each BMP; and define measurable goals for each BMP. The Minimum Control Measures in the Plan include, but are not limited to:

(1) Public education and outreach

(A) Within 1 year of the effective date of this permit and continue until permit expiration, implement a public education program to distribute educational materials to the community (i.e. residents, business and commerce, students, staff, contractors, etc.) or conduct equivalent outreach activities about the sources and impacts of stormwater discharges on waterbodies and the steps that the public can take to reduce pollutants in stormwater runoff. The education program shall include, but not be limited to, information on management of pet waste and yard waste, application of fertilizers, herbicides, and pesticides, and impacts of illicit discharges and improper disposal of waste into the MS4. Educational information may be developed or acquired from other MS4s, governmental agencies, academia, and/ or environmental advocacy organizations. Information may be disseminated with flyers, brochures, door hangers, television public service announcements, and web based tools. The permittee shall utilize the 1 year period following the effective date of this permit to develop the content of the outreach materials. Each annual report shall summarize the types, sources, number of, and methods by which materials disseminated.

(B) To implement the public education and outreach program, the permittee shall develop or acquire current educational material that identifies the pollutants (such as pathogens/ bacteria, nitrogen, phosphorus, sediments, oils & greases) associated with stormwater discharges, the potential sources of the pollutants, the environmental impacts of these pollutants, and related pollution reduction practices.

(C) Additional measures for discharges to waters associated with a Stormwater Pollutant of Concern

(i) For waters for which **Phosphorus** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts, and available pollution reduction practices from the following:

a. Septic systems
b. Fertilizer use
c. Grass clippings and leaves management
d. Detergent use
e. Discharge of sediment (to which Phosphorus binds) from Construction sites
f. Other erosive surfaces

(ii) For waters for which **Nitrogen** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts, and available pollution reduction practices from the following:

a. Septic systems
b. Fertilizer use
c. Grass clippings and leaves management
d. Discharge of sediment (to which Nitrogen binds) from Construction sites
e. Other erosive surfaces

(iii) For waters for which **Bacteria** is a Stormwater Pollutant of Concern, educational materials shall be specifically tailored and targeted to educate on the sources, impacts, and available pollution reduction practices from the following:

a. Septic systems
b. Sanitary cross connections
c. Waterfowl
d. Pet waste
e. Manure piles associated with livestock and horses

(iv) No requirements in addition to those specified in subsection (A)-(B) above exist for discharges to waters for which **Mercury** is a Stormwater Pollutant of Concern.

(2) Public Involvement/Participation.

(A) Publish a public notice, which complies with state and local public notice and Freedom of Information requirements, of the Plan and Annual Report required by Section 6(*k*) of this permit and hold an annual public meeting to inform the public of the Plan and Annual Report information. The notice shall provide a contact name (with phone number, address, and email) to whom the public can send comments and a publicly accessible location (such as the MS4's main office, a local library or other central

publicly available location) and/or URL where the Plan and Annual Report are available for public review. Where state and local notice requirements are inconsistent, the notice provisions providing for the most notice and opportunity for public comment shall be followed. The public notice shall allow for a 30 day comment period, at a minimum. The MS4 shall implement this measure annually between October 31 and January 31.

(B) The permittee is encouraged to enlist local organizations to help implement the elements of their SMP.

(C) No requirements in addition to those specified in subsection (A)-(B) above exist for discharges to waters for which Phosphorus, Nitrogen, Bacteria, or Mercury is a Stormwater Pollutant of Concern.

(3) Illicit discharge detection and elimination.

Illicit discharges to the MS4 are prohibited, and any such discharges are a violation of this permit and remain a violation until they are eliminated. The permittee shall prohibit all illicit discharges from entering its MS4. The permittee shall provide the legal authority to prohibit and eliminate illicit discharges (as defined in 40CFR 122.26(b)(2) except for those discharges noted in the Section 3(*a*)(2) of this permit) to the MS4.

(A) Establish the necessary and enforceable legal authority by statute, ordinance, rules and regulations, permit, easement, contract, order and any other means, to prohibit and eliminate illicit discharges.

(i) The legal authority shall:

a. prohibit illicit discharges to its storm sewer system and require removal of such discharges; and

b. prohibit the dumping or disposal of materials including, but not limited to, residential, industrial and commercial wastes, trash, used motor vehicle fluids, pesticides, fertilizers, food preparation waste, leaf litter, grass clippings, and animal wastes into its MS4; and

c. assess fines or penalties and/or recoup costs incurred by the permittee from anyone creating an illicit discharge or spilling or dumping to the MS4.

(ii) The permittee must implement this ordinance or regulatory mechanism on or before three (3) years from the effective date of this permit.

(B) Develop a means for citizen reporting of possible illicit discharges. Include in the Annual Report a summary of such citizen reporting and investigative/ corrective actions by the permittee to respond to and address the complaints.

(C) For waters for which **Phosphorus**, **Nitrogen**, or **Bacteria** is a Stormwater Pollutant of Concern:

Develop a program to address reports of illicit discharges with a high potential to discharge bacteria, phosphorus, and nitrogen to the MS4. The Annual Report shall

include a summary of the illicit discharge complaints received, and the investigative and corrective actions taken to identify and eliminate the illicit discharge, and the anticipated pollutant reduction.

(D) No requirements in addition to those specified in subsections (A) - (B) above exist for discharges to waters for which **Mercury** is a Stormwater Pollutant of Concern.

(4) Construction Site Stormwater Runoff Control

The permittee shall implement and enforce a program to control stormwater discharges (to its MS4) associated with land disturbance or development (including re-development) activities from areas with one half acre or more of soil disturbance, whether considered individually or collectively as part of a larger common plan. Such program shall include the following elements:

(A) Legal Authority

(i) The permittee shall establish an ordinance, bylaw, regulation, or other appropriate legal authority that requires or allows:

a. developers, construction site operators, or contractors to maintain consistency with the 2002 Guidelines for Soil Erosion and Sedimentation Control, as amended, the 2004 Connecticut Stormwater Quality Manual, as amended, and all stormwater discharge permits issued by the DEEP within the municipal boundary pursuant to CGS 22a-430 and 22a-430b,

b. the implementation of additional measures to protect/ improve water quality (in addition to the above requirements) as deemed necessary by the municipality.

c. the permittee to carry out all inspection, surveillance and monitoring procedures necessary to determine compliance with municipal regulations related to the management of the permittee's MS4.

d. the permittee to control through interagency or inter-jurisdictional agreements, the contribution of pollutants between the permittee's MS4 and MS4s owned or operated by others.

(ii) Within three (3) years from effective date of this permit, the permittee shall implement, upgrade (if necessary) and enforce its land use regulations to meet the requirements of subsection 4(A)(i) above.

(B) Interdepartmental Coordination

(i) The permittee will develop and implement a plan outlining how all municipal departments and boards with jurisdiction over the review, permitting, or approval of land disturbance and development projects within the MS4 will coordinate their functions with one another.

(ii) All permittee shall implement this measure within one (1) year of the effective date

of this permit.

(C) Site Review and Inspection

(i) The permittee will conduct site plan reviews that incorporate consideration of stormwater controls or management practices to prevent or minimize impacts to water quality.

(ii) The permittee will conduct site inspection(s) and enforcement to assess the adequacy of the installation, maintenance, operation, and repair of construction and post construction control measures.

(iii) The permittee shall implement this measure within one (1) year of the effective date of this permit.

(D) Public Involvement

(i) The permittee will implement a procedure for receipt and consideration of information submitted by the public concerning proposed and ongoing land disturbance and development activities.

(ii) The permittee shall implement this procedure within one (1) year of the effective date of this permit.

(E) State Permit Notification

(i) The permittee will implement a procedure for notifying developers of their potential obligation to obtain authorization under the DEEP's General Permit for the Discharge of Stormwater and Dewatering Wastewaters Associated with Construction Activities ("construction general permit") if their development or redevelopment project disturbs one or more acres of land, either individually or collectively, as part of a larger common plan, and results in a point source discharge to the surface waters of the state directly or through the permittee's MS4. The notification shall include a provision informing the developer of their obligation to provide a copy of the Storm Water Pollution Control Plan (required by the construction general permit) to the permittee upon request.

(ii) The permittee shall implement this procedure within one (1) year of the effective date of this permit.

(F) No requirements in addition to those specified in subsections (A)-(E) above exist for discharges to waters for which **Phosphorus**, **Nitrogen**, **Bacteria**, or **Mercury** is a Stormwater Pollutant of Concern.

(5) Post –construction stormwater management

(A) Legal Authority

(i) The permittee shall establish an ordinance, bylaw, regulation, or other appropriate legal authority that requires or allows the use of runoff reduction and low impact development ("LID") practices in its land use regulations or construction project

requirements to meet the following standards:

a. for development or redevelopment of sites that are currently developed with an effective impervious cover of forty percent or more, retain on-site half the water quality volume (as defined in Section 2 of this general permit) for the site,

b. for new development and redevelopment of sites with less than forty percent effective impervious cover, retain the water quality volume for the site,

c. an alternate retention/ treatment standard as outlined in subsection 5(B) below.

(ii) All permittees shall identify and eliminate existing local regulatory barriers to implementing LID and runoff reduction practices. These may include site planning requirements, zoning regulations, street design regulations, or infrastructure specifications that address minimal dimensional criteria for the creation of roadways, parking lots, and other impervious cover. If such barriers cannot be eliminated within the timeframe dictated by subsection 5(D) below, the permittee shall provide in the Annual Report(s) required by Section 6(*k*) a justification and a revised schedule for implementation

(B) Runoff Reduction/ Low Impact Development ("LID") Measures

Pursuant to the requirements of subsection 5(A)(i) above, the permittee shall require the party responsible (i.e. a developer) for development and redevelopment projects within its MS4 to:

(i) for development or redevelopment of sites that are currently developed with an effective impervious cover of forty percent or more, retain on-site half the water quality volume for the site. In cases where this entire amount cannot be retained, the permittee shall require the responsible party to retain runoff volume to the maximum extent achievable using control measures that are technologically available and economically practicable and achievable in light of best industry practice. In such cases, additional stormwater treatment, to the maximum extent achievable using control measures that are technologically available and economically practicable and achievable in light of best industry practice, shall be required for sediment, floatables and nutrients for the volume above that which can be retained up to the water quality volume. In cases where the runoff retention requirement cannot be met, the developer/ contractor shall submit, for the permittee's review, a report detailing factors limiting the capability of achieving this goal. The report shall include: the measures taken to maximize runoff reduction practices on the site; the reasons why those practices constitute the maximum extent achievable; the alternative retention volume; and a description of the measures used to provide additional stormwater treatment above the alternate volume up to the water quality volume. In the case of linear redevelopment projects (e.g. roadway reconstruction or widening) for the developed portion of the right of way: (1) for projects that may be unable to comply with the full retention standard, the alternate retention and treatment provisions may also be applied as specified above, or (2) for projects that will not increase the effective impervious cover within a given

watershed, the developer/ contractor shall implement the additional stormwater treatment measures referenced above, but will not be required to retain half of the water quality volume.

(ii) for all new development and for redevelopment of sites with less than forty percent effective impervious cover, retain the water quality volume for the site. If there are site constraints that would prevent retention of this volume on-site (e.g., brownfields, capped landfills, bedrock, elevated groundwater, etc.), documentation must be submitted, for the permittee's review and written approval, which: explains the site limitations; provides a description of the runoff reduction practices implemented; provides an explanation of why this constitutes the maximum extent achievable; offers an alternative retention volume; and provides a description of the measures used to provide additional stormwater treatment for sediment, floatables and nutrients above the alternate volume up to the water quality volume. Any such treatment shall be designed, installed and maintained in accordance with the Stormwater Quality Manual. In the case of linear projects that do not involve impervious surfaces (e.g. electrical transmission rights-of-way or natural gas pipelines), retention of the water quality volume is not required as long as the post-development runoff characteristics do not differ significantly from pre-development conditions.

(iii) consider the limitation of soil disturbance to that necessary to construct buildings, utilities, stormwater management measures, parking, access ways, reasonable lawn areas and contouring necessary to prevent future site erosion,

(iv) maintain consistency with the Connecticut Stormwater Quality Manual (as amended), or if inconsistent, provide an explanation of why consistency is not feasible or practicable and information that the proposed plan of development is adequately protective.

(C) The permittee shall implement a maintenance plan for ensuring the long-term effectiveness of stormwater treatment structures or measures (such as swirl concentrators, oil/ grit separators, stormwater treatment wetlands or swales, etc) installed within its MS4. This shall include structures that are owned by the permittee or those for which the permittee maintains an easement or other legal authority. At a minimum, the permittee shall annually inspect all such structures/ measures and remove accumulated pollutants (such as sediment, oils, leaves, litter, etc) to restore full solids capture design capacity where found to be in excess of 50% design capacity.

(D) The permittee shall implement the requirements of this subsection within three (3) years after the effective date of this permit.

(E) Additional measures for discharges to impaired waters (with or without a TMDL)

(i) For waters for which **Nitrogen, Phosphorus,** or **Bacteria** is a Stormwater Pollutant of Concern**:**

a. To address erosion and sediment problems identified by MS4 staff, residents, and/or contractors, the permittee must develop, fund, implement, and prioritize a Retrofit program to correct the problem(s) in a specific timeframe and to establish short term and long term maintenance, as necessary. Each annual

report shall identify which problems areas were retrofitted, the cost of the retrofit, and the anticipated pollutant reduction.

(ii) No requirements in addition to those specified in subsections (A)-(D) above exist for discharges to waters for which **Mercury** is a Stormwater Pollutant of Concern.

(6) Pollution Prevention/ Good Housekeeping

(A) Employee Training

The permittee shall implement a formal employee training program to increase awareness of water quality related issues in management of its MS4. In addition to providing key staff with topical training regarding standard operating procedures and other activities necessary to comply with the provisions of this permit, the training program shall include, at a minimum: establishing an awareness of the general goals and objectives of the SMP; identification and reporting of illicit discharges and improper disposal; winter road maintenance application procedures; deicing equipment maintenance and training, snow disposal and storage practices; and spill response protocols and respective responsibilities of involved personnel.

(B) Infrastructure Repair and Rehabilitation

The permittee shall repair and rehabilitate its MS4 infrastructure in a timely manner in order to reduce or eliminate the discharge of pollutants from its MS4 to receiving waters. Priority for repair and rehabilitation shall be based on existing information on outfalls discharging pollutants, impaired waters or inspection observations. This shall include refinement of the permittee's standard operating procedures and good housekeeping practices for management of its MS4.

(C) MS4 Property and Operations Maintenance

Streets/ road and associated rights-of-way, parking lots, parks, and facilities that are owned, operated, or otherwise the legal responsibility of the permittee shall be maintained so as to minimize the discharge of pollutants to its MS4. Such maintenance shall include, but not be limited to:

(i) Parks and open space

The permittee shall optimize the application of fertilizers by municipal employees, or private contractors on lands and easements for which it is responsible for maintenance. Optimization practices considered shall include conducting soil testing and analysis to determine soil phosphorus levels are inadequate, the reduction or elimination of fertilizers, reduction of usage by adhering to the manufacturers' instructions, and use of alternative fertilizers forms (i.e., products with reduced, slow-releasing, or insoluble phosphorus compositions). Additional optimization practices to be considered include proper storage practices and application practices (i.e. avoid impervious surfaces), application schedule (i.e., appropriate season or month) and timing (i.e., coordinated with climatic conditions to minimize runoff potential); develop and implement standard operating practices for the handling, storage, application, and disposal of pesticides and herbicides in compliance with applicable state and federal laws; evaluate lawn maintenance and

landscaping activities to promote water quality (protective practices include reduced mowing frequencies, proper disposal of lawn clippings, and use of alternative landscaping materials like drought resistant and native plantings); and establish procedures for management of trash containers at parks (scheduled cleanings; sufficient number).

The permittee shall establish practices for the proper disposal of grass clippings and leaves at municipal owned lands. Clippings shall be composted or otherwise appropriately disposed. Clippings should not enter the MS4 system or waters of the state.

(ii) Pet waste management

The permittee shall identify locations within its community where inappropriate pet waste management practices are immediately apparent and pose a threat to receiving water quality due to proximity and potential for direct conveyance of waste to its storm system and surface waters. In such areas, implement targeted management efforts such as public education and enforcement (e.g., increased patrol for violators). In municipally-owned recreational areas where dog walking is allowed, the permittee shall install educational signage, pet waste baggies, and disposal receptacles (or require carry-out).

(iii) Waterfowl management

Identify lands where waterfowl congregate and feeding by the public occurs. To raise awareness regarding the water quality impacts, the permittee shall install signage or use other targeted techniques to educate the public about the detrimental impacts of feeding waterfowl (including the resulting feces deposition) and discourage such feeding practices. The permittee shall also implement practices that discourage the undesirable congregation of waterfowl in these areas, or otherwise isolate the direct drainage from these areas away from its storm sewer system and surface waters.

(iv) Buildings and facilities (schools under the jurisdiction of the permittee, town offices, police and fire stations, pools, parking garages and other permittee-owned or operated buildings or utilities)

Evaluate the use, storage, and disposal of both petroleum and non-petroleum products; ensure, through employee training, that those responsible for handling these products know proper procedures; ensure that Spill Prevention Plans are in place, if applicable, and coordinate with the fire department as necessary; develop management procedures for dumpsters and other waste management equipment; sweep parking lots and keep areas surrounding the facilities clean to minimize runoff of pollutants; and ensure that all interior building floor drains are not connected to the MS4. This permit does not authorize such discharges; wastewaters from interior floor drains must be appropriately permitted.

(v) Vehicles and Equipment

Establish procedures for the storage of permittee-owned vehicles; require vehicles with fluid leaks to be stored indoors or in contained areas until repaired; evaluate

fueling areas owned by the permittee and used by permittee-owned vehicles and if possible, place fueling areas under cover in order to minimize exposure; establish procedures to ensure that vehicle wash waters are not discharged to the municipal storm sewer system or to surface waters. This permit does not authorize such discharges; wastewaters from interior floor drains must be appropriately permitted.

(vi) Parking lots

Establish and implement procedures for sweeping and/or cleaning permittee-owned parking lots with a minimum frequency of once per year in the spring (following winter activities); establish a more frequent sweeping/ cleaning frequency of targeted areas determined by the permittee to have an increased pollution potential (based on inspections, pollutant loads, catch basin cleaning or inspection results, land use, impaired or TMDL waters or other factors established by the permittee); and report in each annual report the number of parking lots cleaned, the approximate area of the lots and the volume or mass of material removed.

(vii)Deicing material & snow management practices

Develop and implement standard operating practices for the use, handling, storage, application, and disposal of deicing products such as salt and sand to minimize exposure to stormwater; for roadways and parking lots, explore means to minimize the use and optimize the application of chloride-based or other salts or deicing product (while maintaining public safety) and evaluate opportunities for use of alternative materials; for any exterior containers of liquid deicing materials installed after the effective date of this permit, provide secondary containment; ensure that areas used for snow disposal will not result in discharges to waters; and maintain consistency with the DEEP's Best Management Practices for Disposal of Snow Accumulations from Roadways and Parking Lots, revised 2/4/11 and as amended (see link at: www.ct.gov/deep/stormwater).

(viii)Sweeping

a. Conduct a street sweeping program to remove sand, sediment and debris at a minimum frequency of once per year after snow melt but no later than June 30. Include methods for dust suppression while sweeping. If wet dust suppression is conducted, the use of water should be minimized such that a discharge of excess water to surface waters and/ or the storm sewer system does not occur.

b. Ensure the proper disposal of street sweeping in accordance with Department policies, guidance and regulations. Sweepings shall not be discharged back into the storm drain system and/or surface waters.

c. In its Annual Report, the permittee shall document results of its sweeping program including, at a minimum: curb miles swept, dates of cleaning, cubic yards of material collected, and method(s) of reuse or disposal.

(ix) Leaf Collection

All permittees shall conduct a town-wide leaf pickup program annually on or before December 15. Permittee shall ensure proper disposal or reuse of collected leaves.

(x) Catch Basin Cleaning

The permittee shall develop and implement a program for the routine cleaning of all catch basins and stormwater structures. The permittee shall inspect all catch basins and structures at least once a year for the first two years of the permit and track inspection observations. Catch basins identified as being more than fifty percent (50%) full during these inspections shall be cleaned. Utilizing information compiled through its inspection program and public complaints, the permittee shall develop a schedule for the routine cleaning of all catch basins and stormwater structures.

(xi)Interconnected MS4s

As part of interagency agreements established pursuant to Section 6(*c*)(3) of this permit, the Permittee shall coordinate with operators of interconnected MS4s (such as neighboring municipalities and DOT) regarding the contribution of potential pollutants from the storm sewer systems, contributing land use areas and stormwater control measures in the respective MS4s. This same coordination shall be conducted regarding operation and maintenance procedures utilized in the respective systems.

(D) Additional measures for discharges to waters associated with a Stormwater Pollutant of Concern

(i) For waters for which **Nitrogen** is a Stormwater Pollutant of Concern:

a. Implement a turf management practices and procedures policy which includes, but is not limited to, procedures for proper fertilizer application on lands owned by the permittee and the planting of native plant materials to lessen the amount of turf area requiring mowing and the application of chemicals. Each annual report shall discuss the actions taken to implement this policy with an estimate of fertilizer and turf area reduction.

(ii) For waters for which **Bacteria** is a Stormwater Pollutant of Concern:

a. On MS4 owned lands (such as dog parks, parks or areas with open water, sites with failing septic systems) with a high potential to contribute bacteria, the permittee shall develop, fund, implement, and prioritize a Retrofit program to correct the problem(s) within a specific timeframe. Each annual report shall identify which problems areas were retrofitted, the cost of the retrofit, and the anticipated pollutant reduction.

b. On municipal owned lands, prohibit the feeding of geese and implement a program to manage goose populations on lands. Each annual report shall discuss the actions taken to implement this program.

(iii) No additional requirements in addition to those specified in subsections (A)-(C) above exist for discharges to waters for which **Phosphorus** or **Mercury** is a Stormwater Pollutant of Concern.

(c) Sharing Responsibility

(1) Qualifying Local Program

The permittee may satisfy the requirement to implement a BMP for a Minimum Control Measure by having a third party implement the BMP.

When a permittee is relying on a third party to implement one or more BMP(s), the permittee shall note that fact in the registration and annual report required in subsection (i) below. If the third party fails to implement the BMP(s), the permittee remains responsible for its implementation.

(Note: For example, if a local watershed organization performs an annual "river clean-up", this event may be used to satisfy a BMP for the Public Participation and/or the Pollution Prevention and Good Housekeeping Minimum Control Measure.)

(2) Qualifying State or Federal Program

If a BMP or Minimum Control Measure is the responsibility of a third party under another NPDES stormwater permit, the permittee is not required to include such BMP or Minimum Control Measure in its Stormwater Management Plan. The permittee shall reference this qualifying program in their Stormwater Management Plan. However, the permittee is not responsible for its implementation if the third party fails to perform. The permittee shall periodically confirm that the third party is still implementing this measure. If the third party fails to implement the measure, the Stormwater Management Plan may be modified to address the measure, if necessary.

In the case of a permitted municipal industrial activity that is covered by the General Permit for the Discharge of Stormwater Associated with Industrial Activity, the permittee may reference the activity's Stormwater Pollution Prevention Plan to address a portion of the permittee's Stormwater Management Plan.

(Note: For example, the permittee may reference a regional mall's requirement to perform sweeping and catch basin cleaning under the General Permit for the Discharge of Stormwater Associated with Commercial Activity. This third party action may be used to address a portion of the permittee's requirement under the Good Housekeeping and Pollution Prevention Minimum Control Measure.)

(3) Coordination of Permit Responsibilities

Where a portion of the separate storm sewer system within a municipality is owned or otherwise the responsibility of another municipality, institution or a state or federal agency the entities shall coordinate the development and implementation of their respective Stormwater Management Plans to address all the elements of Section 6. A description of the respective responsibilities for these elements shall be included in the Stormwater Management Plan for each municipality.

(Note: For example, a storm sewer system within a municipality may be operated and maintained by the DOT. In cases such as these, the two entities shall coordinate their Stormwater Management Plans to address the Minimum Control Measures, particularly at the interface between the two storm sewer systems.)

(4) Co-Permitting

When a municipal Regulated Small MS4s is co-located within the corporate boundary of another Regulated Small MS4, the two may, at their discretion, submit a single registration and share a single Plan as co-permittees. In such a case, the Plan shall clearly indicate which MS4 is responsible for implementing each of the control measures and other elements of the Plan.

(Note: This provision currently applies only to the City of Groton within the Town of Groton and the Borough of Stonington within the Town of Stonington.)

(d) Proper Operation and Maintenance

The permittee shall at all times properly operate and maintain all facilities and systems of treatment and control, including related appurtenances, which are installed or used by the permittee to achieve compliance with the conditions of this permit. Proper operation and maintenance includes adequate laboratory controls and appropriate quality assurance procedures. Proper operation and maintenance requires the operation of backup or auxiliary facilities or similar systems, installed by a permittee when necessary to achieve compliance with this permit.

(e) Signature Requirements

The Plan shall be signed by the chief elected official or principal executive officer, as those terms are defined in Section 22a-430-3(b)(2) of the Regulations of Connecticut State Agencies. The Plan shall be retained by the chief elected official or principal executive officer and copies retained by MS4 officials or employees responsible for implementation of the Plan.

(f) Plan Review Fee

When submitting a Stormwater Management Plan as requested by the Commissioner pursuant to Section 6(*g*), below, the permittee shall submit a plan review fee of $375.

(g) Keeping Plans Current

The permittee shall amend the Plan whenever; (1) there is a change which has the potential to cause pollution of the waters of the state; or (2) the actions required by the Plan fail to prevent pollution of the waters of the state or fail to otherwise comply with any other provision of this general permit; or (3) the Commissioner requests modification of the Plan. The amended Plan shall be completed and all actions required by such Plan shall be completed within a time period determined by the Commissioner.

The Commissioner may notify the permittee in writing at any time that the Plan does not meet one or more of the requirements of this general permit. Within 30 days of such notification, unless otherwise specified by the Commissioner in writing, the permittee shall respond to the Commissioner indicating how they plan to modify the Plan to address these requirements. Within 90 days of this response or within 120 days of the original notification, whichever is less, unless otherwise specified by the Commissioner in writing, the permittee shall then revise the Plan, perform all actions required by the revised Plan, and shall certify to the Commissioner that the requested changes have been made and implemented. The permittee shall provide such information as the Commissioner requires to evaluate the Plan and its implementation. If at any time the Commissioner finds that the Plan is not adequate to protect the waters of the state from pollution, the Commissioner may terminate authorization under this permit and require the MS4 to submit an individual permit application.

(h) Failure to Prepare or Amend Plan

In no event shall failure to complete or update a Plan in accordance with Sections 5(*b*) and 6 of this general permit relieve a permittee of responsibility to implement actions required to protect the waters of the state and to comply with all conditions of this general permit.

(i) Plan Review Certification

A copy of the Plan review certification made in accordance with Section 3(*b*)(9) shall be maintained with the Plan.

(j) Monitoring Requirements

All Tier 1 MS4s shall comply with the monitoring requirements in this subsection. Tier 2 MS4s are not required to comply with this subsection.

(1) In-stream Dry and Wet Weather Monitoring of Receiving Water Quality

In-stream dry and wet weather monitoring shall be conducted by the permittee in accordance with the provisions of this subsection. These in-stream samples shall be taken at a location representative, as much as possible, of the nature of the stream flow at the chosen location. Dry weather in-stream samples shall be taken at the same locations as the wet weather in-stream samples. The permittee should avoid sampling in close proximity to a stormwater outfall or any other location that could alter the representative nature of the in-stream sample. Each sample shall be a composite sample taken in accordance with Section 6(*j*)(4) below.

(A) Location

In-stream dry and wet weather monitoring shall be conducted at the number of locations specified in the table below. Where feasible, these locations should be along the primary stem of the principal watercourse in separate subregional watersheds (as identified in mapping available at www.cteco.uconn.edu) that fall entirely or partially within the corporate boundaries of the MS4. Specific monitoring locations shall be established by the permittee through consideration of criteria that may include; location of significant development, nearby land-use, illicit discharge "hot spots", previous in-stream sampling locations, or other criteria as may be determined by the permittee. The location of these sampling points and the rationale for their location shall be included in the Stormwater Management Plan.

Municipal or Institutional[1] Population	Number of in-stream locations
<15,000	4
15,000 – 50,000	8
>50,000	12

[1] The population of a state or federal institution is the average daily population including staff, residents and those receiving or providing services on-site.

(B) Frequency

(i) Dry Weather Monitoring

The permittee shall perform dry weather in-stream monitoring once a year in the first and second years following the effective date of this general permit in accordance with the procedures in Section 6(*j*)(4) below. Dry weather monitoring shall be conducted between July 1 and September 30.

(ii) Wet Weather Monitoring

The permittee shall perform wet weather in-stream monitoring once a year in the third, fourth and fifth years following the effective date of this general permit. Monitoring must be conducted during a rain event in accordance with the stormwater monitoring procedures in Section 6(*j*)(4) below. Monitoring may be conducted at any time of year as long as the watercourse is accessible (i.e. not frozen or in a hazardous flooding condition) and there is no significant snow cover in the watershed.

(C) Institutions

Where an appropriate watercourse (as specified in Section 6(*j*)(1)(A), above) is not located within the corporate boundaries of the MS4, an institution authorized under this general permit is not required to conduct in-stream monitoring. In such a case, the institution shall monitor its outfalls in accordance with the wet weather outfall monitoring provisions of Sections 6(*j*)(2) below.

(2) Wet Weather Outfall Monitoring

The permittee shall monitor the number of outfalls specified in the table below that are twelve (12) inches or greater from the MS4 once in each year of this general permit. Different outfall locations shall be selected each year. The order in which outfall locations are monitored shall be prioritized, with discharges to impaired waters receiving the highest priority in accordance with Section 6(*j*)(6) below. Other criteria to be considered may include; location of significant development, nearby land-use, illicit discharge "hot spots", previous in-stream sampling locations, or other criteria as may be determined by the permittee. Monitoring may be conducted at any time of year when there is no significant snow cover in the watershed and shall be conducted in accordance with the procedures in Section 6(*j*)(4) below.

Municipal or Institutional[1] Population	Number of outfall locations
<15,000	4
15,000 – 50,000	8
>50,000	12

[1] The population of a state or federal institution is the average daily population including staff, residents and those receiving or providing services on-site.

(3) Monitoring Parameters

(A) In-Stream Monitoring Parameters

The parameters to be monitored for in-stream dry and wet weather monitoring shall include:

pH (SU)
Temperature
Dissolved Oxygen (mg/l)
Hardness (mg/l)
Conductivity (umos)
Oil and grease (mg/l)
Chemical Oxygen Demand (mg/l)
Surfactants as MBAS (mg/l)
Chloride (mg/l)
Magnesium (mg/l)
Cyanide (mg/l)
Turbidity (NTU)
Total Suspended Solids (mg/l)
Total Phosphorous (mg/l)
Ammonia (mg/l)
Total Kjeldahl Nitrogen (mg/l)
Nitrate plus Nitrite Nitrogen (mg/l)
Total Copper (mg/l)
Total Lead (mg/l)
Total Zinc (mg/l)
E. coli and Total Coliform (col/100ml) (for Class AA, A and B surface waters)
Fecal coliform and Entercocci (col/100ml) (for Class SA and SB surface waters)

In addition to this list of parameters, uncontaminated rainfall pH shall be measured at the time the in-stream sample is taken.

(B) Outfall Monitoring Parameters

The parameters to be monitored for wet weather outfall monitoring shall include:

pH (SU)
Temperature
Dissolved Oxygen (mg/l)
Hardness (mg/l)
Conductivity (umos)
Chloride (mg/l)
Magnesium (mg/l)
Cyanide (mg/l)
Surfactants as MBAS (mg/l)
Total Petroleum Hydrocarbons (mg/l)
Oil and grease (mg/l)
Chemical Oxygen Demand (mg/l)
Total Suspended Solids (mg/l)
Total Phosphorous (mg/l)
Ammonia (mg/l)
Total Kjeldahl Nitrogen (mg/l)
Nitrate plus Nitrite Nitrogen (mg/l)
Total Copper (mg/l)
Total Lead (mg/l)
Total Zinc (mg/l)

E. coli and Total Coliform (col/100ml) (for Class AA, A and B surface waters)
Fecal coliform and Entercocci (col/100ml) (for Class SA and SB surface waters)

In addition to this list of parameters, uncontaminated rainfall pH shall be measured at the time the outfall sample is taken.

(4) Stormwater Monitoring Procedures

(A) In-Stream Dry Weather Monitoring

Dry weather monitoring shall be performed only when there has been no rain storm producing runoff to the stream for at least 48 hours prior to sampling. Monitoring methodology shall consist of collecting a minimum of four (4) separate grab samples spaced at a minimum interval of 5 minutes each. Grab samples will be combined into a single composite sample from each station, preserved, and delivered to the laboratory for analysis.

(B) In-Stream Wet Weather Monitoring

Samples shall be collected in-stream during any rain storm that produces runoff into the stream and occurs at least 48 hours after any previous storm event that produced runoff into the stream. In-stream monitoring shall be conducted no sooner than two (2) hours after the start of the rain event and no later than two (2) hours after cessation of rainfall. Composite samples shall be used for in-stream monitoring. Monitoring methodology will consist of collecting a minimum of four (4) separate grab samples spaced at a minimum interval of 5 minutes each. Grab samples will be combined into a single composite sample from each sampling location, preserved, and delivered to the laboratory for analysis. The uncontaminated rainfall pH measurement shall also be taken at the time sampling is conducted. At the time of sampling, the permittee shall record any observed erosion of stream banks, scouring, or sedimentation in streams, such as sand bars or deltas. Monitoring shall be consistent with guidance provided by DEEP (at www.ct.gov/deep/stormwater) on quality assurance protocols for required storm water sampling of surface waters and outfalls.

(C) Wet Weather Outfall Monitoring

Samples shall be collected from discharges resulting from any rain storm that produces a discharge from the outfall(s) being monitored and that occurs at least 48 hours after any previous rain storm that produced a discharge from the outfall. Runoff events resulting from snow or ice melt alone cannot be used to meet these monitoring requirements. However, monitoring may be conducted during a rain event that may include insignificant amounts of snow or ice melt. Monitoring shall consist of a single grab sample taken within the first six (6) hours of discharge from the outfall. Monitoring shall be consistent with guidance provided by DEEP (at www.ct.gov/deep/stormwater) on quality assurance protocols for required storm water sampling of surface waters and outfalls.

(D) Rain Event Information

For monitoring conducted during a rain event (wet weather in-stream or wet weather outfall monitoring), the following information shall be collected for the rain events monitored:

(i) The date, temperature, time of the start of the discharge, time of sampling, and magnitude (in inches) of the rain event sampled.

(ii) The duration between the rain event sampled and the end of the previous measurable (greater than 0.1 inch rainfall) rain event.

(E) Test Procedures

Unless otherwise specified in this permit, all pollutant parameters shall be tested according to methods prescribed in Title 40, CFR, Part 136 (1990). Laboratory analyses must be consistent with Connecticut Reasonable Confidence Protocols.

(5) Illicit Discharge Monitoring

The permittee must conduct monitoring in support of the Illicit Discharge Detection and Elimination (IDDE) program in Section 6(*a*)(3). Monitoring locations, frequency, parameters and methodology are included in that section.

(6) Water Quality Based Monitoring

Regulated Small MS4s that discharge to waters, as identified in Section 6(*l*) below, must monitor additional parameter(s) in the wet weather outfall monitoring required in Section 6(j)(2) above.

(A) Discharges to Impaired Waters Without an Established Total Maximum Daily Load (TMDL)

If the permittee discharges to an impaired water without a TMDL, the permittee must include in their monitoring plan any indicator pollutants identified as contributing to the impairment (and for which a standard analytical method exists) in their wet weather outfall monitoring. Outfall(s) discharging to an impaired water shall be prioritized and sampled in accordance with Section 6(*j*)(2), above. Impaired waters monitoring priorities do not apply when a waterbody's biological communities are impaired but no pollutant, including indicator or surrogate pollutants, is identified as an indicator of the impairment, or when a waterbody's impairment is related to hydrologic modifications, impaired hydrology, or temperature.

(B) Discharges to Waters Included in a Total Maximum Daily Load (TMDL)

For stormwater discharges to waters for which Phosphorus, Nitrogen, Bacteria, or Mercury are stormwater pollutants of concern, outfall(s) discharging to an impaired water shall be prioritized and sampled in accordance with Section 6(*j*)(2) above. For other pollutants for which pollutant load reductions are identified within a TMDL, the permittee is not required to monitor for any indicator pollutant identified in the TMDL unless informed in writing by the commissioner, upon examination of the applicable TMDL and/or Waste Load Allocation (WLA), that the permittee is subject to such a requirement consistent with the assumptions of the applicable TMDL and/or WLA. The

commissioner's notice will include specifications on which indicator pollutant to monitor and the required monitoring frequency. Following the first monitoring event:

(C) If the indicator pollutant is not detected in an outfall discharge sample, the permittee shall make note of this in the Annual Report and Stormwater Monitoring Report form.

(k) Reporting & Record Keeping Requirements

(1) The permittee shall keep records required by this permit for at least 5 years following its expiration or longer if requested by the Commissioner in writing. Such records, including the Stormwater Management Plan, shall be available to the public at reasonable times during regular business hours.

(2) Annual Report

By April 1 of the second year following the effective date of this general permit and annually thereafter by April 1, the permittee shall submit an Annual Report for the preceding calendar year electronically to the Department. The DEEP stormwater webpage (www.ct.gov/deep/stormwater) will provide guidance on Annual Report submittal. The Annual Report must be in Microsoft Word©, Adobe Acrobat© or other format acceptable to the Commissioner. In the event that electronic submission is not available or possible, please contact the Stormwater Section at (860) 424-3025.

The report shall include:

(A) The Annual Report review fee is $375.00.

(i) The fees for municipalities shall be half of those indicated above pursuant to section 22a-6(b) of the Connecticut General Statutes. State and Federal agencies shall pay the full fees specified in this subsection.

(B) A written discussion of the status of compliance with this general permit including, but not limited to:

(i) a listing and brief description (including, where appropriate, the address and latitude and longitude) of all BMPs within each Minimum Control Measure;

(ii) an implementation schedule for each BMP and an indication of whether or not the BMP or any portion of the BMP was scheduled to be implemented during the year covered by the Annual Report;

(iii) the status of implementation for each BMP scheduled to be completely or partially implemented during the year covered by the Annual Report, including an assessment of the appropriateness of the BMP and progress towards achieving the implementation dates and measurable goals for that BMP;

(iv) for any portion of a BMP implementation scheduled for the year covered by the Annual Report that was *not* completed as scheduled, a discussion of the circumstances and reasons for non-implementation, a modified implementation schedule, and, if necessary, a modified or alternate BMP to replace the BMP not implemented including the rationale for such modification or alternate BMP;

(v) the overall status of each of the six categories of the Minimum Control Measures and an discussion of the effectiveness of each category in achieving its goals;

(vi) a discussion of any changes to personnel responsible for the Plan or BMP implementation;

(vii) a description of any new BMPs added to the Plan during the year including a description of the BMP, the reason or rationale for adding the BMP, the timeline for implementation, the party responsible for implementation and the measurable goal for the BMP and, where appropriate, the location for each BMP, including the address and latitude and longitude;

(viii) a discussion of the progress and status of the MS4's IDDE program (see Section 6(*a*)(3) for Tier 1 or 6(*b*)(3) for Tier 2) including outfall screening, mapping, drainage area evaluation and prioritization, illicit discharge tracking activities, IDDP field monitoring results, number and type of illicit discharges detected, and number of illicit discharges eliminated;

(ix) a discussion of measures included in the Plan for the control of discharges to impaired waters (see Section 6(*l*) below) including a list of BMPs in the Minimum Control Measures that are targeted for such discharges, progress in implementing these measures, any evaluation of the effectiveness of these measures in meeting the goals of the Plan's impaired waters program, and any new or modified BMPs to be added to the Plan to improve its effectiveness;

(x) a discussion of the MS4's stormwater monitoring program describing the status of monitoring for the year of the report, the overall status of the monitoring program, a summary of the findings, any significant observations regarding the results, any modifications to the Plan as a result of the monitoring results;

(xi) a discussion of any planned BMP implementation in the coming year, including a discussion of any new or modified BMPs planned for future implementation;

(C) All monitoring data collected and analyzed pursuant to Section 6(*j*).

(D) All other information collected and analyzed, including data collected under the Illicit Discharge Detection Protocol (Appendix B), during the reporting period;

(l) Discharges to Impaired Waters or Water bodies subject to a Pollutant Load Reduction within a TMDL

MS4s that discharge to impaired waters (with or without a TMDL), waters for which nitrogen, phosphorus, bacteria or mercury are stormwater pollutants of concern, or waters which have pollution load reductions specified within a TMDL are required to meet certain criteria identified in this section and other sections of this general permit.

(1) Existing Discharge to an Impaired Water without an Established TMDL

If the permittee discharges to an impaired water without an established TMDL, the permittee must follow:

(A) For waters for which Phosphorus, Nitrogen, Bacteria, or Mercury are stormwater pollutants of concern, the control measures in Section 6(*a*) (Tier 1) or 6(*b*) (Tier 2) and the annual monitoring requirements of Section 6(*j*)(6),

(B) For all other impairments, implement control measures to reduce the discharge of the pollutant(s) associated with the impairment, or as directed by the Commissioner.

(2) Existing Discharge to a Water with an Established TMDL or with a Pollutant Load Reduction specified within the TMDL

If the permittee discharges to a water included in a TMDL, the permittee must follow:

(A) For waters for which Phosphorus, Nitrogen, Bacteria, or Mercury is a stormwater pollutant of concern, the control measures in Section 6(*a*) (Tier 1) or 6(*b*) (Tier 2) and the annual monitoring requirements of Section 6(*j*)(6),

(B) For all other discharges subject to a pollutant load reduction contained within a TMDLs, implement control measures to be consistent with the Waste Load Allocation in the specific TMDL. The permittee must also conduct the appropriate monitoring in accordance with Section 6(*j*)(6).

(C) The permittee shall implement BMPs as necessary to achieve the Waste Load Allocation, Load Allocation or Water Quality Targets specified within the TMDL (see Appendix D).

(3) New Discharge to an Impaired Water Without an Established TMDL

If a new discharge to an impaired water without a TMDL is authorized pursuant to the conditions of Section 3(*b*)(7), the permittee must implement and maintain any control measures or conditions on the site that enabled such authorization, and modify such measures or conditions as necessary to maintain such authorization. The permittee must also maintain compliance with this subsection and Section 6(*j*).

(4) New Discharge to a Water with an Established TMDL or with a Pollutant Load Reduction specified within the TMDL

If a new discharge to a water with a TMDL or with a pollutant load reduction established within the TMDL is authorized pursuant to the conditions of Section 3(*b*)(7), the permittee must follow the discharge consistent with the applicable Wasteload Allocations, Load Allocations or Water Quality Targets for that TMDL. The permittee must also conduct the appropriate monitoring in accordance with Section 6(*j*)(6).

Section 7. Additional Requirements of this General Permit

(a) Regulations of Connecticut State Agencies Incorporated into this General Permit

The permittee shall comply with all laws applicable to the subject discharges, including but not limited to, the following Regulations of Connecticut State Agencies which are hereby incorporated into this general permit, as if fully set forth herein:

(1) Section 22a-430-3:

Subsection (b) General - subparagraph (1)(D) and subdivisions (2),(3),(4) and (5)
Subsection (c) Inspection and Entry
Subsection (d) Effect of a Permit - subdivisions (1) and (4)
Subsection (e) Duty to Comply
Subsection (f) Proper Operation and Maintenance
Subsection (g) Sludge Disposal
Subsection (h) Duty to Mitigate
Subsection (i) Facility Modifications, Notification - subdivisions (1) and (4)
Subsection (j) Monitoring, Records and Report Requirements - subdivisions (1), (6), (7), (8), (9) and (11) (except subparagraphs (9) (A) (2) and (9) (c)
Subsection (k) Bypass
Subsection (m) Effluent Limitation Violations
Subsection (n) Enforcement
Subsection (p) Spill Prevention and Control
Subsection (q) Instrumentation, Alarms, Flow Recorders
Subsection (r) Equalization

(2) Section 22a-430-4

Subsection (t) Prohibitions
Subsection (p) Revocation, Denial, Modification
Appendices

(b) Reliance on Registration

In evaluating the permittee's registration, the Commissioner has relied on information provided by the permittee. If such information proves to be false or incomplete, the permittee's authorization may be suspended or revoked in accordance with law, and the Commissioner may take any other legal action provided by law.

(c) Duty to Correct and Report Violations

Upon learning of a violation of a condition of this general permit, a permittee shall immediately take all reasonable action to determine the cause of such violation, correct and mitigate the results of such violation and prevent further such violation. The permittee shall report in writing such violation and such corrective action to the Commissioner within five (5) days of the permittee's learning of such violation. Such information shall be filed in accordance with the certification requirements prescribed in Section 7(*e*) of this general permit.

(d) Duty to Provide Information

If the Commissioner requests any information pertinent to the authorized activity or to compliance with this general permit or with the permittee's authorization under this general permit, the permittee shall provide such information within thirty (30) days of such request. Such information shall be filed in accordance with the certification requirements prescribed in Section 7(e) of this general permit.

(e) Certification of Documents

Any document, including but not limited to any notice, information or report, which is submitted to the Commissioner under this general permit shall be signed by the chief elected official or principal executive officer of the municipality or institution, and by the individual or individuals responsible for actually preparing such document, each of whom shall certify in writing as follows:

"I have personally examined and am familiar with the information submitted in this document and all attachments thereto, and I certify that, based on reasonable investigation, including my inquiry of those individuals responsible for obtaining the information, the submitted information is true, accurate and complete to the best of my knowledge and belief. I understand that a false statement made in this document or its attachments may be punishable as a criminal offense, in accordance with Section 22a-6 of the Connecticut General Statutes, pursuant to Section 53a-157b of the Connecticut General Statutes, and in accordance with any other applicable statute."

(f) Date of Filing

For purposes of this general permit, the date of filing with the Commissioner of any document is the date such document is received by the Commissioner. The word "day" as used in this general permit means the calendar day; if any date specified in the general permit falls on a Saturday, Sunday, or legal holiday, such deadline shall be the next business day.

(g) False Statements

Any false statement in any information submitted pursuant to this general permit may be punishable as a criminal offense, in accordance with Section 22a-6, under Section 53a-157b of the Connecticut General Statutes.

(h) Correction of Inaccuracies

Within fifteen days after the date the permittee becomes aware of a change in any information in any material submitted pursuant to this general permit, or becomes aware that any such information is inaccurate or misleading or that any relevant information has been omitted, the permittee shall correct the inaccurate or misleading information or supply the omitted information in writing to the Commissioner. Such information shall be filed in accordance with the certification requirements prescribed in Section 7(*e*) of this general permit.

(i) Other Applicable Law

Nothing in this general permit shall relieve the permittee of the obligation to comply with any other applicable federal, state and local law, including but not limited to the obligation to obtain any other authorizations required by such law.

(j) Other Rights

This general permit is subject to and does not derogate any present or future rights or powers of the State of Connecticut and conveys no rights in real or personal property nor any exclusive privileges, and is subject to all public and private rights and to any federal, state, and local laws pertinent to the property or activity affected by such general permit. In conducting any activity authorized hereunder, the permittee may not cause pollution, impairment, or destruction of the air, water, or other natural resources of this state. The issuance of this general permit shall not create any presumption that this general permit should or will be renewed.

Section 8. Commissioner's Powers

(a) Abatement of Violations

The Commissioner may take any action provided by law to abate a violation of this general permit, including but not limited to penalties of up to $25,000 per violation per day under Chapter 446k of the Connecticut General Statutes, for such violation. The Commissioner may, by summary proceedings or otherwise and for any reason provided by law, including violation of this general permit, revoke a permittee's authorization hereunder in accordance with Sections 22a-3a-2 through 22a-3a-6, inclusive, of the Regulations of Connecticut State Agencies. Nothing herein shall be construed to affect any remedy available to the Commissioner by law.

(b) General Permit Revocation, Suspension, or Modification

The Commissioner may, for any reason provided by law, by summary proceedings or otherwise, revoke or suspend this general permit or modify to establish any appropriate conditions, schedules of compliance, or other provisions which may be necessary to protect human health or the environment.

(c) Filing of an Individual Application

If the Commissioner notifies a permittee in writing that such permittee shall obtain an individual permit under Section 22a-430 of the Connecticut General Statutes if he wishes to continue lawfully conducting the authorized activity, the permittee shall file an application for an individual permit within thirty (30) days of receiving the Commissioner's notice, or at such other date as the Commissioner may allow. While such application is pending before the Commissioner, the permittee shall comply with the terms and conditions of this general permit and the subject approval of registration. If the Commissioner issues an individual permit to a permittee under this general permit, this general permit, as it applies to such permittee, shall automatically terminate on the date such individual permit is issued. Nothing herein shall affect the Commissioner's power to revoke a permittee's authorization under this general permit at any time.

Support for Central Massachusetts Regional Stormwater Coalition Comments Addressing 2014 Draft Massachusetts MS4 Permit

The Central Massachusetts Regional Stormwater Coalition (the Coalition) represents 28 Towns in Central Massachusetts, most of which are Permittees under the United States Environmental Protection Agency's (USEPA's) Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit, and all of which take their role as stewards of the environment seriously. Coalition participants recognize and share the USEPA's goal of maintaining water quality and recognize that stormwater management is an important component in protecting the water resources of the Commonwealth of Massachusetts (and beyond).

The Coalition, as a group, has prepared comments on the 2014 Draft Massachusetts MS4 Permit published by the USEPA in the Federal Register on September 30, 2014, for submittal to the USEPA. The Town of Charlton (the Town) is a member of the Coalition. This signature page documents the support of the Town for the comments submitted by the Coalition. The Town hereby reserves the following rights:

- The right to submit individual comments on the 2014 Draft Massachusetts MS4 Permit (and any and all revisions), in addition to these Coalition comments.
- The right to submit additional comments to any Response to Comments prepared by the USEPA after the close of the public comment period for the 2014 Draft Massachusetts MS4 Permit.
- The right to submit additional comments on the Final Massachusetts MS4 Permit to address any and all changes made by the USEPA subject to comments the agency receives on the 2014 Draft Massachusetts MS4 Permit.
- The right to appeal any provision of the Final Massachusetts MS4 Permit when it is issued, regardless of whether that provision has been specifically noted in these Coalition comments, in subsequent Coalition comments, or in any comments the Town submits to USEPA individually.

The Coalition and the Town hereby adopt and support, in whole or in part, by reference, comments submitted by the Northern Middlesex Stormwater Collaborative, the Merrimack Valley Stormwater Collaborative, the Neponset Valley Stormwater Collaborative, the Massachusetts Municipal Association, Department of Environmental Protection, and the Massachusetts Coalition for Water Resources Stewardship.

TOWN OF MILLBURY

Support for Central Massachusetts Regional Stormwater Coalition Comments Addressing 2014 Draft Massachusetts MS4 Permit

The Central Massachusetts Regional Stormwater Coalition (the Coalition) represents 28 Towns in Central Massachusetts, most of which are Permittees under the United States Environmental Protection Agency's (USEPA's) Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit, and all of which take their role as stewards of the environment seriously. Coalition participants recognize and share the USEPA's goal of maintaining water quality and recognize that stormwater management is an important component in protecting the water resources of the Commonwealth of Massachusetts (and beyond).

The Coalition, as a group, has prepared comments on the 2014 Draft Massachusetts MS4 Permit published by the USEPA in the Federal Register on September 30, 2014, for submittal to the USEPA. The Town of Millbury(the Town) is a member of the Coalition.

The Town hereby reserves the following rights:

- The right to submit individual comments on the 2014 Draft Massachusetts MS4 Permit (and any and all revisions), in addition to these Coalition comments.
- The right to submit additional comments to any Response to Comments prepared by the USEPA after the close of the public comment period for the 2014 Draft Massachusetts MS4 Permit.
- The right to submit additional comments on the Final Massachusetts MS4 Permit to address any and all changes made by the USEPA subject to comments the agency receives on the 2014 Draft Massachusetts MS4 Permit.
- The right to appeal any provision of the Final Massachusetts MS4 Permit when it is issued, regardless of whether that provision has been specifically noted in these Coalition comments, in subsequent Coalition comments, or in any comments the Town submits to USEPA individually.

The Coalition and the Town hereby adopt and support by reference, in whole or in part, comments submitted by the Northern Middlesex Stormwater Collaborative, the Merrimack Valley Stormwater Collaborative, the Neponset Valley Stormwater Collaborative, the Massachusetts Municipal Association, and the Massachusetts Coalition for Water Resources Stewardship.

The Coalition has also been in communication with the Massachusetts Department of Environmental Protection for on the Department's comments on the 2014 Draft Massachusetts MS4 Permit. While not yet available to the public, we understand that many of the Department's comments will mirror the concerns of Coalition members about the administrative burden many provisions impose on municipalities without direct benefit on water quality. As such, we incorporate comments submitted by the Massachusetts Department of Environmental Protection by reference, in whole or in part.

This signature page documents the support of the Town for the comments submitted by the Coalition, with rights reserved, as noted.

Re: Comment for the 2014 Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder,

This letter is intended to provide the Town of Concord's comments for consideration by the EPA Region 1 when developing the final Massachusetts Small MS4 General Permit. The Town recognizes the importance of stormwater management and the critical role this program plays in protecting the environmental health of Massachusetts waterways and appreciates the opportunity to comment on the permit.

The Town does have serious concerns related to the financial and staff resource impacts which will be required to administer multiple sections within this Permit as well as the resulting questionable or negligible environmental gains of many of the permit requirements. To that end, the Town has developed a planning level compliance/resource estimate *(Exhibit A)* which we have attached to this comment letter for review.

The Town has focused its comments on items that we believe could easily be modified to assist communities in complying with the Permit's new conditions, while delivering real environmental benefit. The following is an outline of sections which the Town offers comments. Within each comment the Town provides recommendations in italics for improvements to that section:

- **1.2.1** - The Town remains unclear on the definition of the non-traditional MS4s. Concord has a Regional School District (with Carlisle) consisting primarily of one building with a large campus, a School Department with multiple buildings and parcels throughout Town and a Municipal Light Plant with multiple buildings and parcels throughout Town. Each District/Department has their own separate maintenance budget for the associated infrastructure on the parcels funded separately through the general fund and in some instances is a separate political body functioning on a regional basis. Additionally, the Departments include separate staff with specific maintenance responsibilities. We observe that several municipalities have similar organizational structures and would have similar ownership responsibility questions.

  We would recommend the Agency provide clarification around the definition of the non-traditional MS4. We would also recommend the EPA/DEP provide outreach to these entities, if they are

intended to be included as a non-traditional MS4, to inform them of their new responsibilities under the proposed permit. We would also highlight that if the Agency's intent is to include these entities within the proposed Permit responsibilities, they have not been given appropriate notification or an opportunity to provide comment to the Permit. EPA/DEP should also notify the municipalities what institutions within Town boundaries are required to file for separate coverage under the permit to ensure no duplication of efforts.

- **1.7.2.d/1.10.2** – The requirement for a 90 day turnaround for the Notice of Intent filing (1.7.2.d) appears to contradict the timeline for the development of the Stormwater Management Program. The example NOI included within Appendix E appears to include most of the items within the SWMP, including the planned BMPs to meet each minimum control measure. The SWMP timeline was extended to allow communities time to develop the program, funding strategies and staffing/consultant needs.

  The Town would suggest extending the NOI submittal to one year to align with the SWMP and modifying the NOI application form for use as the SWMP template. Alternatively, a less detailed NOI application limiting municipality's obligation to only requesting permit coverage would provide a similar outcome.

- **2.3.2.e,f,g** – The requirement for evaluation of the outreach program's effectiveness seems overly broad and fairly subjective. Within the informational meetings, the example cited was dog waste dumping. This appears to be an easy example to measure effectiveness. Specifically within Concord, the Town implemented a targeted dog waste disposal message. The Town evaluated the effectiveness of the messages through multiple follow up inspections of the areas where dog waste bags were discovered. However, the message was delivered 1) through letters to residents in the affected area, 2) letters to all dog license holders and 3) flyers with dog license renewals/applications. It would be difficult to metric exactly which of those methods of outreach provided the corrective action outcome.

  The Town agrees with the EPA's approach to require two messages to four separate audiences. However, incorporation of any type of metric for outreach would be purely subjective. The Town recommends that the EPA require additional messages only if the Town's analysis of a specific outfall watershed reveals a need for more outreach.

2.3.4 (General Comments) – The Town of Concord firmly believes that the General Permit's "one size fits all" approach places a disproportionate financial and administrative burden on stormwater programs for rural communities such as Concord when compared to an urban city. This is most prevalent within the IDDE section of the permit, where the prescriptive nature of the permit's requirements will require significant administration, analysis and testing to comply. The Town recognizes the targeted goal of the IDDE section is to eliminate illicit connections to the storm sewer system. However, the rural community will have a lower probability of containing illicit cross connections because less of the Town is serviced by municipal sewers. Furthermore, the rural storm sewer systems will also contain significantly more outfalls as the stormwater is typically discharged locally into nearby wetlands or waterways. Requiring communities with very different infrastructure layouts to meet the same set of standards regardless of actual illicit connection vulnerability or probability or review of the cost implications for the regulated community is shortsighted.

Concord has only 56% of the Town contained within the urbanized area and approximately 30% of the Town served by municipal sewer. However we contain three major river sections and contain over 400 outfalls. The Town completed wet-weather sampling and testing of 80+ outfalls within watersheds impaired for pathogens over the 2003 permit term. The results from wet weather testing highlighted

questions around the practicality of the testing approach proposed by the EPA to detect illicit connections. During our testing the Town found bacteria results were greatly skewed by environmental factors such as animal activity, time of year sampling and rainfall frequency. In all instances follow up testing for surfactants or ammonia/potassium ratio were found to be below illicit connection levels. This result is not surprising as the Town's drainage and sewer systems were designed to be separate. Furthermore, the Town has received very few water quality complaints throughout the 11 years of implementing the 2003 permit even though the Town contains multiple wild and scenic river segments which are actively used for recreation. All issues have been determined to be the result of some form of illegal dumping into catch basins (dog waste, car wash water, pool discharges, etc.). This is a very different problem from those issues experienced in urbanized communities and not a problem that will be solved through outfall investigation, screening and sampling.

The use of Town resources and funds to prioritize and investigate catchments and test outfalls will redirect already scarce funding with the sole purpose of providing data for an annual report with questionable tangible environmental benefit to the Town's environmental resources. The Town believes it would be more prudent for the EPA to provide municipalities with flexibility in the permit to develop a custom IDDE program to better focus community's scarce resources to programs that will provide environmental benefit. The updated permit instead should remain consistent with the 2003 permit to incentivize screening and inspection for rural communities. Testing should only be used to verify the existence of a problem. This will allow each Town to optimize the IDDE program resources to meet regional issues utilizing the experience gained over the past 11 years of the 2003 permit term.

Further comment on the specific IDDE sections of the permit are bulleted below:

- **2.3.4.4** – The Town notes that reporting of SSOs is already required through the NPDES POTW point source discharge permit for the Town's treatment plant.

  The Town recommends this section be removed from the NPDES MS4 permit to eliminate a redundant reporting requirement.

- **2.3.4.5.b** – The Town questions the benefits and logistics of physically labeling each outfall. A large number of these outfalls are flared end sections located in or near wetland areas. Labeling would require the installation of a sign and post. As noted prior, Concord has over 400 outfalls that have been located, screened and inspected. It is unclear what environmental benefit would be gained by visiting these locations again to label them.

  Concord recommends waiving this physical label requirement for communities which have completed GIS mapping with higher accuracy levels (i.e. sub-meter GPS).

- **2.3.4.6.a.i/2.3.4.7.c.i** – Concord questions the benefit of delineating catchments for all outfalls in the Town. With communities expending significant energy and resources to locate, screen and inspect the outfalls within their communities as part of the 2003 permit, this exercise appears to disregard earlier permit compliance efforts.

  Concord recommends requiring catchment delineation only for outfalls which have evidence of sewer input through olfactory/visual evidence or testing results.

- **2.3.4.7.c.ii** – The Town disagrees with the prioritization ranking considerations provided within the permit. "Past complaints", "industrial areas that are over 40yrs old", "areas where sewer are more than 40yrs old", "sewer conversion and areas with septic systems over 30yrs old" are all

overly broad arbitrary metrics, which will do little to prioritize potential areas needing follow-up investigation.

Concord recommends removing the prioritization ranking requirement within the permit and only requiring further catchment investigations and sampling/testing for outfalls which have evidence of sewer connection through olfactory/visual evidence or previous testing results.

- **2.3.4.7.c.ii/2.3.4.7.d.i** – Concord questions the use of the bacteria testing results "greater than water quality criteria" as a trigger for a problem catchment. As highlighted above, bacteria results can be greatly skewed by environmental factors like animal activity, farming activities, time of year sampling and rainfall frequency. Bacteria is also the most costly and labor intensive parameter to sample and test.

  The Town does not believe the bacteria sampling is an accurate indicator of possible sewage inflow and should be removed as a criterion. Furthermore, the permit's support "draft" document "EPA New England Bacterial Source Tracking Protocol" should also be open to public comment and peer review if municipalities are required to adopt a sampling and testing protocol consistent with the document.

- **2.3.4.7.e.i** – The Town does not believe that the System Vulnerability Factors as written provide proper metrics for prioritization. The Town highlights the 6th SVF bullet "sewer and drain crossings" as an example. Any street which has a sewer and a drainage system will have crossings. Similarly bullet 10, drainage and sewer system 40 years old, only eliminates newer subdivision construction from the program. Utilizing these overly broad parameters as triggers for wet weather sampling does little to narrow the sampling/testing requirements for municipalities in the permit.

  Concord recommends removing the SVFs trigger for catchment testing and only requiring further catchment investigations and sampling/testing for outfalls which have evidence of sewer input through olfactory/visual evidence or previous testing results.

- **2.3.4.8.a** - As a community who has been proactive in its piloting of innovative stormwater technologies, programs and pilot studies, the Town takes this opportunity to formally highlight commitments made by the EPA during the 2014 Permit's public hearings and informational meetings. It was indicated at that time that municipalities would be allowed to take credit for work completed within the 2003 MS4 Permit term toward the new requirements of the 2014 Permit. Specifically discussed were sustainable infrastructure retrofit installs, outfall investigations (mapping, screening and testing), catchment investigations, etc.

  As this comment references multiple sections within the permit, the Town suggests the EPA include similar language highlighting 2003 permit "credits" in the Stormwater Management Plan (SWMP) section of the permit.

- **2.3.4.8.a (reference 2.3.4.7)** – The Town disagrees with the requirement that previous outfall sampling and testing must meet the new requirements of 2.3.4.7. Section 2.3.4.7 includes new testing parameters that were not included within the Town's previous Administrative Order. This minor change will require municipalities to re-test significant numbers of outfalls. This requirement is also inconsistent with the Town of Concord's Administrative Order which noted that all testing performed under the Order would satisfy future MS4 permit testing requirements.

The Town recommends the removal of the reference to the Section 2.3.4.7 requirements within section 2.3.4.8a and further suggests the EPA include similar language highlighting 2003 permit "credits" in the Stormwater Management Plan (SWMP) section of the permit.

- **2.3.4.7.e.ii (by reference Appendix 'A" - Junction Manhole/Key Junction Manhole Definition)** – The definition included within Appendix A for Junction Manhole and Key Junction Manhole appear to contradict previous EPA public outreach presentations. The Town understood the EPA's presentations to highlight the mapping and screening of Junction Manholes to mean be limited to manholes where an MS4's stormwater would flow into a separately owned/operated MS4 system or to manholes where a MS4 system accepts stormwater flow from a separately owned/operated MS4 system. The definition as written appears to require the screening/testing review of Junction Manholes for drainage alignments on separate streets within the same MS4.

  Concord recommends updating the definition to clarify the intent of the term Junction Manhole and Key Junction Manhole. If the intent is to require this additional level of screening of the MS4 system, the Town believes this just be required only for catchments which have evidence of sewer connection through olfactory/visual evidence or previous testing results.

- **2.3.6.a** – The Town highlights that the new requirement to infiltrate 1" of stormwater runoff for all new and redeveloped sites, is much more stringent than MA DEP Stormwater Standards. More specifically, the permit removes certain redevelopment exceptions. This has the potential for serious compliance implications for developers with expansions of large campuses and municipalities with linear roadway reconstruction projects.

  The Town recommends the MS4 permit be revised to align with MA DEP Stormwater Standards and provide consistent redevelopment exceptions.

- **2.3.6.d** – Concord questions the environmental benefit provided by tracking and monitoring of Direct Connected Impervious Area (DCIA). While EPA has highlighted the data's use for correlating receiving water quality on a global scale, the data's use for evaluating or prioritizing stormwater treatment and/or infiltration retrofit opportunities is questionable at best.

  The Town recommends the EPA eliminate the DCIA evaluation requirement and put further emphasis on community's evaluation of infiltrative/ sustainable infrastructure retrofit opportunities, including code review, SOPs and design standards. As a community who has undertaken many SI retrofit projects, a careful design and review at much tighter scale is required.

- **2.3.7 (Appendix F-V.3)** – The Town does not agree with the requirement to include a fall street sweep. The typical sweepers owned by municipalities will find it difficult if not impossible to meet the requirement as they do not work well in heavy rain or for picking up leaves. Concord believes this work would need to be contracted with a vac-sweeper company. Additionally, the time requirement, "following leaf drop" will require all the work to be completed within a tight time window prior to snow operations which is not feasible. Lastly, if a Town puts a formal fall sweeping program in place, we can expect an increase in yard debris put in the roadway from property owners hoping to take advantage of the sweeping.

  The Town suggests the fall street sweeping be required to the "maximum extent practical" or completely eliminated from the permit due to the logistic limitations to comply with the requirement as written.

The Town of Concord appreciates the opportunity to submit comments on the Draft Massachusetts Small MS4 General Permit. If you have any questions on this letter or require any clarification on the comments, please do not hesitate to contact Town Engineer, William Renault, P.E. at (978) 318-3210 or wrenault@concordma.gov.

Respectfully Submitted,

Nick Pappas

RE: Comments on 2014 DRAFT Massachusetts MS4 Permit

Dear Mr. Tedder,

Thank you for the opportunity to comment on the 2014 Draft Massachusetts MS4 Permit (2014 Draft). I appreciate the opportunity to share concerns that have been conveyed to me from numerous local officials throughout my Congressional District. I must say that I share the concerns expressed by these local officials. Many of their concerns mirror those shared with the EPA during the comment period for the 2010 Draft, but are worth repeating here.

With no funding sources available through the EPA, my Towns are concerned that the 2014 Draft will impose a considerable burden on them to meet the new permit requirements within the given time constraints. None of my municipalities have sufficient funds in free cash to pay for the upgrades required by the 2014 Draft. In addition, the 2014 Draft does not have a sufficient mechanism to acknowledge existing municipal practices that have a positive effect on water quality, but are not within the purview of the draft, practices that might cost less but provide the same positive outcome as the 2014 Draft requirements.

The Towns have also raised the issue of compliance timelines as a source of trepidation. The changes required by the 2014 Draft are not short-term projects. Should a town be unable to comply with Draft requirements within the required timeframe, the fines levied against that town will result in even longer delays in completion of permit requirements and potentially additional fines.

In addition, there is the issue of providing sufficient Town staff to ensure that upgrades are properly and effectively installed and implemented. Most of my communities do not have the resources and staff available to handle the requirements of the 2014 Draft within the given time frame.

Many communities are also distressed that the terms of this Permit will negatively impact projects within the framework of the Massachusetts Department of Transpiration's Complete Street Initiative. The 2014 Draft requirements may delay or halt work on providing safe streets for pedestrians and vehicles as provided for by the Initiative. The 2014 Permit should work in unison with programs like the Complete Streets Initiative, not against them.

I thank you for the opportunity to comment and I respectfully ask that you take these concerns into careful consideration before finalizing any MS4 permit changes.

Sincerely,

James P. McGovern
Member of Congress

RE: Comments on 2014 Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder,
Thank you for the opportunity to review and provide comments on the proposed 2014 Draft Massachusetts Small MS4 General Permit. We appreciate the effort and thought that has been put into the draft permit to date, and anticipate that EPA will carefully consider the concerns raised herein prior to developing final permit language. We wish to call attention to the following concerns relative to the draft permit.

1. **Considerable differences between the existing MADEP stormwater standards and the proposed MS4 permit requirements**. As you are likely aware the MADEP worked with an extensive group of stakeholders to refine a set of stormwater standards and accompanying stormwater management manuals that are routinely used by the engineering community in the Commonwealth of Massachusetts. While these standards are only directly applicable to those sites discharging to wetlands within the commonwealth, for the sake of consistency many practitioners rely on them to guide stormwater management decisions for the majority of development projects in the Commonwealth. We are concerned that implementing a MS4 permit that effectively established a set of standards that differ substantially from the existing MADEP stormwater standards will result in widespread confusion and frustration among stormwater professionals. This opinion was also expressed by several speakers at the recent public hearing held in Leominster on November 19, 2014. For this reason we ask that EPA work with MADEP to better align the proposed MS4 permit requirements with the MADEP stormwater standards. We feel the MADEP standards represent a sound foundation for achieving stormwater management goals in the Commonwealth.

2. **Failure to differentiate standards for post construction stormwater controls on new development and redevelopment sites.** We recognize that existing impervious areas serve as a major source of polluted stormwater runoff and that redevelopment efforts represent an ideal opportunity to mitigate those impacts. However, redevelopment projects often face numerous site constraints not inherent to new development projects, so achieving the same level of post construction stormwater control expected of a new development site is often considerably more expensive or entirely unachievable as a result. We believe that redevelopment projects should be required to install post construction stormwater controls, but the permit should recognize the unique constraints redevelopment sites often face and incorporate more flexible post construction stormwater requirements in order to encourage the redevelopment of existing impervious areas.

3. **Failure to define clear performance criteria for flow through stormwater treatment practices**. The draft permit currently contains language stating that in instances when the first 1 inch of runoff from all impervious surfaces on the site can't be retained then it may be treated using a combination of BMPs capable of providing an equivalent or greater level of pollutant load reduction to that achieved by biofiltration systems. Additional language is provided indicating that the level of pollutant removal provided by any proposed BMP shall be calculated using EPA Region 1's BMP Performance Extrapolation Tool. This prescriptive standard is highly inadequate for several reasons. First, it is widely documented that the performance of biofiltration systems is highly variable and dependent on the biofiltration media blend, among other variables. A growing body of research including research done by the Washington

CONTECH

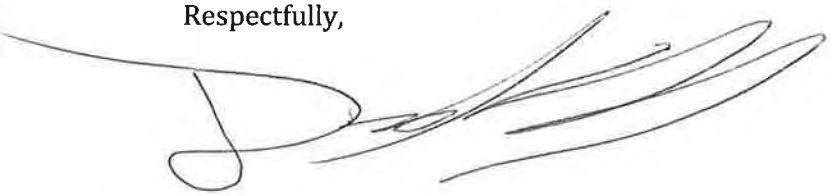
Fax: (207) 885-9825
www.ContechES.com

State Department of Ecology and the University of New Hampshire Stormwater Center demonstrates that biofiltration systems can actually serve as pollutant sources depending on the media specification. This is particular true for nutrients, which are a pollutant of concern in many watersheds in Massachusetts. To ensure the performance of biofiltration cells is optimized a well thought out design spec is necessary and should be provided in a comprehensive stormwater management manual. Second, it is our understanding that the EPA Region 1 BMP Performance Extrapolation Tool is only able to model a small subset of stormwater BMPs, so mandating its use to comply with this standard drastically limits the number of BMP options available. This will be particularly problematic in urbanized areas where site constraints are common. Additionally, there is not a clear path or process identified for including/adding additional BMPs to the EPA Region 1 BMP Performance Extrapolation Tool which will serve to hamper further BMP innovations.

We feel that the development and inclusion of a performance based BMP standard in the permit language is the appropriate path forward. Instead of mandating that BMPs perform equivalent to or better than biofiltration cells, the specific level of pollutant removal that is consistently achieved by biofiltration cells should be identified. It is well known that the performance of all BMPs varies widely, so these pollutant load reductions should reflect what is common and not the high end of the expected performance range. Any and all BMPs capable of achieving an equivalent level of pollutant load reduction should be acceptable for use in meeting the standard as long as there is credible long term field data supporting pollutant load reduction claims.

We trust that you will careful consider and address the concerns raised herein prior to finalizing the draft permit language. We would appreciate being notified of what steps are being taken to address these issues. Should you require any additional information relative to our comments I encourage you to contact me at your convenience.

Respectfully,



Derek M. Berg

February 18, 2015

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts.

The Charles River Conservancy is a 501(c)3 non-profit that works to make the parklands along the Charles River more active, attractive, and accessible for all, from the Watertown Dam to the Boston Harbor. The CRC was founded in 2000, and has over 30,000 supporters and volunteers in the Greater Boston area; every year some 2,000 landscape volunteers work with the Conservancy to help maintain and improve the parklands around the urban Charles. One of the Conservancy's most prominent projects is the construction of the Lynch Family Skatepark underneath the Zakim Bridge ramps, on a former brownfield site in East Cambridge.

Since its founding, the Conservancy has advocated for the return of swimming to the Charles River as a part of the Swimmable Charles Initiative. In collaboration with the Department of Conservation and Recreation, we have successfully hosted community swims every year since 2013, drawing over 300 swimmers to the Charles. The Conservancy's Swimmable Charles Initiative would not be possible without the dedication of state and community partners to clean the waters of the Charles River. The 2014 MS4 permit presents an opportunity for the state to uphold this dedication and to continue improving the water quality in the Charles and in other municipal waterways.

Polluted stormwater is the most serious water pollution problem in Massachusetts today. EPA Region 1 has found that stormwater causes or contributes to at least 55% of the violations of water quality standards in the state's rivers, streams, and lakes. Climate change presents an additional, important reason to improve stormwater management. Most scientists expect the recent cycles of flooding and drought to become more pronounced, and

Massachusetts communities need to maintain or upgrade their aging infrastructures, to safeguard both public safety and the environment into the future. **This permit is an important step in promoting these urgently-needed changes, and we strongly support its promulgation.**

The 2014 permit represents a significant improvement over the 2003 permit, and is likely to be much more effective in reducing pollution, flooding and erosion caused by stormwater in urbanized areas.

- The permit incorporates **water-quality requirements** that directly address the pollutants that are actually causing specific Water Quality Standard violations in each town.

- The permit provides **more specific requirements and deadlines** in many cases, which should result in better compliance than was achieved under 2003 permit.

- The permit gives towns **adequate time and substantial flexibility** in choosing approaches to compliance that are most appropriate for local conditions. In response to comments on the 2010 proposed permit, EPA eliminated some requirements that were believed to be overly prescriptive.

- **Permit requirements for greater public access and opportunities to comment** on towns' stormwater management programs will increase public support for these programs, which is essential if towns are to raise the resources necessary to deal with polluted stormwater. Greater public scrutiny will also encourage more effective plans and more consistent implementation.

- **The post-construction requirements for new development and redevelopment will prevent future projects from continuing the poor stormwater management practices of the past.** EPA has chosen a balanced and effective strategy, setting a high standard for infiltration of stormwater (the most cost-effective way of removing pollutants from stormwater), providing a safety valve where site conditions make meeting that standard infeasible.

In short, the permit requirements ask municipalities to do better monitoring and planning, to improve implementation, to raise public awareness of stormwater issues, and to design and maintain better stormwater management measures. If successful, the permit **will result in major improvements in the management of urban stormwater in Massachusetts, and we will see the results in cleaner, healthier, rivers, streams, lakes, bonds, and coastal waters**.

We also note that good planning **can help towns reduce compliance costs and fund the required investments in stormwater programs and infrastructure**. Towns can take advantage of help and support from EPA, MassDEP, watershed groups and regional planning agencies; work regionally (including through storm water consortiums) to achieve economies of scale, develop and fund stormwater utilities, and ensure that private entities assume their share of the responsibility for stormwater management.

Finally, while we strongly endorse the overall approach and requirements of this permit, we **have identified some areas where improvements are needed:**

- **The stormwater bylaw requirements should apply to projects as small as a quarter or half an acre.** Most urbanized towns, at least in the Boston area, have very few large development and redevelopment projects, and projects under an acre would not be required to employ *any* stormwater management measures unless they are located in wetland resource areas. This will make it exceedingly difficult for many towns to comply with the proposed prohibition against new and increased stormwater discharges from MS4s.

- In addition to conducting an annual evaluation of BMP compliance and effectiveness, **permittees should be required to take corrective action** where the evaluation shows that goals and objectives are not being met. An effective iterative approach to improving stormwater management requires that problems be addressed, and not simply identified.

- **MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements**. This includes requiring new development and redevelopment projects and retrofits on town-owned property to implement BMPs that are most effective at reducing bacteria where the waters they discharge to (via an MS4) do not meet bacteria Water Quality Standards. These requirements are consistent with the proposed requirements for other stormwater pollutants.

- **The new requirements proposed for projects discharging to water impaired for chloride should apply to all MS4s.** While relatively few water bodies have been assessed for chloride, evidence suggests that this is a significant problem in most, if not all, urbanized areas.

We appreciate the careful work EPA has done to improve on the 2003 permit and the 2010 proposals, based on experience with the 2003 permit and comments on the 2010 proposals. However, the process has taken a very long time. We **strongly support prompt issuance of the final permit**, to end a long period of drift and uncertainty associated with delay in issuing this permit. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date

Thank you for considering our comments on this very important permit.

Sincerely,

Renata von Tscharner

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Douglas Macdonald

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Suzanne Towne

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

David Parks

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Claude Austin

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

John Terry

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Michele Meagher

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Elaine Savignano

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Boston, MA 02109-3912

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

David Marshall

Dear Mr. Tedder,

Over half the pollution in our lakes, ponds, rivers, wetlands and coastal waters is runoff from roads, parking lots and other urban surfaces. It is critical a new permit is finalized to govern municipal storm-sewer systems that would significantly reduce runoff pollution.

I'm writing to urge you to ensure that the final stormwater permit has the strongest possible protections to make Massachusetts waters cleaner.

It was a big step forward when in 2003, your agency required that municipalities obtain stormwater-discharge permits and better manage their runoff. But the rules dictated by the 2003 permits need to be updated. A new permit needs to be finalized that will better protect our state waters.

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Shirley Winer

Prior efforts by EPA to update the permits have failed, so the 2003 program, which was to have expired in 2008, still governs runoff. This time, EPA must update the permitting program and take steps to significantly reduce runoff pollution. Massachusetts can do much better today than what was possible in 2003.

Managing runoff is necessary to protect the quality of our water bodies, aquatic habitats and drinking water sources. I urge you to ensure that the final version of the new stormwater permit has the strongest possible regulations to ensure water quality.

Please let me know how you intend to address this issue.

Sincerely,

Susan Rice

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder,

The Connecticut River Watershed Council (CRWC) has reviewed the draft Small Municipal Separate Storm Sewer System (MS4) National Discharge Elimination System (NPDES) permit for Massachusetts. CRWC is a nonprofit citizen group established in 1952 to advocate for the protection, restoration, and sustainable use of the Connecticut River and its four-state watershed. The Connecticut River, an American Heritage River and the only National Blueway, is a regional resource that merits the highest level of protection. Despite this, the Connecticut River is water quality-impaired along its entire length in Massachusetts. As part of our work, we conduct weekly bacteria testing at several recreational sites in the river during the summer and early fall, and our results are posted online at www.connecticutriver.us. We have also conducted dry weather bacteria source tracking in several communities, and a multi-state one-day nutrient monitoring project in 2014.

A portion of our watershed in Massachusetts is considered urbanized under the current and draft MS4 permit. We are strongly supportive of EPA's efforts to improve stormwater management, and we urge EPA to finalize this permit. It has been five years since we reviewed and commented on the original draft of this updated MS4 permit, and it is time to finalize it.

CRWC is a member of the Massachusetts Rivers Alliance, and we endorse the detailed comment letter they submitted. We offer the following brief additional comments.

In our section of the Commonwealth, we have not a single TMDL drafted or finalized for any impaired river segment, of which there are many. Therefore, we are glad that there are requirements for discharges to impaired rivers without a TMDL. We very much endorse the comments of the Charles River Watershed Association (see bottom of page 6 in their letter), who suggest clarifying language be added that as new TMDLs are approved, the municipalities covered by them will be subject to Appendix F requirements.

We thoroughly endorse the comments submitted by several organizations calling for additional requirements to reduce widespread chloride pollution. We believe that the main reason there aren't more water bodies listed as impaired for chloride is the lack of chloride monitoring. We think some of the work from the New Hampshire Road Salt Reduction Initiative (http://des.nh.gov/organization/divisions/water/wmb/was/salt-reduction-initiative/index.htm) could be helpful for chloride management in Massachusetts.

Several rivers within MS4s in our watershed are impaired due to total suspended solids (TSS) or turbidity. We assume these impairments fall under section 2.2.2(e) “Discharges to water quality limited waterbodies where oil and grease (hydrocarbons), solids, or metals is the cause of impairment.” While we endorse more frequent street sweeping recommended in Appendix H, we think that there should be additional requirements beyond that. We would recommend that Section 2.3.5, Construction Site Stormwater Runoff Control, apply to construction projects less than an acre in watersheds impaired for TSS or turbidity.

Three cities in our watershed still have significant combined sewer overflow (CSO) systems that contribute to impairments in the Connecticut River. It is our understanding that the portions of Springfield, Chicopee, and Holyoke with combined systems are not subject to the MS4 requirements. It strikes us that because these cities have chosen to install satellite (pathogen) treatment facilities for their largest CSO outfalls, this allows them to continue to operate outside of other MS4 requirements, such as nutrient reduction for the Long Island Sound TMDL or BMPs for the TSS impairment. In these cases, implementation of the MS4 permit may not lead to as many water quality improvements as we would wish.

Thank you for an opportunity to comment on this draft MS4 permit.

Sincerely,

Andrea F. Donlon
River Steward

Re: Draft Massachusetts MS4 Permit

Dear Mr. Tedder:

Charles River Watershed Association (CRWA) has reviewed the draft Small Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) general permit for Massachusetts (draft permit). CRWA, a research and advocacy organization formed in 1965, works extensively on stormwater pollution issues, and we have conducted research and modeling on phosphorus pollution in the Charles River; undertaken wet weather end-of-pipe and receiving water monitoring programs; and designed and constructed stormwater improvement projects. We work in partnership with agencies, municipalities and organizations across Massachusetts.

We are strongly supportive of EPA's efforts to improve stormwater management in the Commonwealth and urge the agency to finalize the permit (with the modifications discussed below) as expeditiously as possible. We join in the comments of the Massachusetts Rivers Alliance on the draft permit and submit the following additional comments.

General

The draft permit reflects EPA's significant commitment to the progress that has been made over the past decade in the science and regulation of stormwater management. Stormwater is a major source of pollution impacting the health of the Charles River today and preventing it from achieving water quality standards. It has been amply demonstrated through research, demonstration projects and several successful stormwater programs that stormwater pollution can be significantly reduced, resulting in measurable improvements in receiving water quality, habitat restoration, and improved hydrologic function. The draft permit reflects this and it is an important regulatory tool that when paired with additional stormwater regulatory programs and permits, will provide meaningful protections for surface waters.

The Stormwater Phase II program was intended to be an iterative program; understandably, the 2003 MS4 general permit no longer reflects current best practice for municipal stormwater management and

does not result in achievement of water quality standards.[1] We believe the new permit will drive LID and green infrastructure—critical, timely approaches that will also help to reduce flooding through onsite stormwater retention. The permit will also facilitate compliance with "The Draft MEPA Climate Change Adaptation and Resiliency Policy" now being developed and vice-versa.

This permit provides permittees with clear guidance and support for their stormwater management programs. In particular, we note the highly detailed technical analyses undertaken by Region 1 staff and their consultants to understand and share with permittees and the public the physical, technical and fiscal implications of the new permit. We believe the tools and guidance documentation EPA has provided to assist municipalities in developing sound, fiscally responsible programs will be of tremendous benefit.

By providing standardized methodologies for permittees to estimate current loads, and the reductions they can achieve using a variety of measures, EPA has also created a fair and level playing field, and reduced the burden on permittees to develop their own methodologies.

Appendix F: Requirements for Discharges to Impaired Waters with TMDLs and Attachments

CRWA is strongly supportive of the development of the detailed appendix and attachments to assist in the development of phosphorus control programs (PCPs) to achieve phosphorus reductions consistent with wasteload allocations (WLAs) in TMDLs.

Timelines and Milestones

There has been significant discussion, review and public input to EPA about its proposed MS4 program updates over the past five years. This draft permit, which follows the New Hampshire draft MS4 permit (2013) and the draft General Permit for Massachusetts North Coastal Watersheds (2010) does not come as a surprise to covered municipalities. Small MS4 permittees have had ample opportunity to develop stormwater management programs over the past decade and have also had many years to prepare for the more stringent requirements that are necessary to meet the objectives of the Clean Water Act. Given this, and the pressing need for immediate action to control nutrient-polluted runoff in the Charles, the Phosphorus Control Plan (PCP) timelines in the draft permit in Appendix F should be shortened considerably. Twenty years—well beyond the life of this permit—to complete implementation of the PCP Plan in the Charles River Watershed is unwarranted, not environmentally protective, and in our opinion, not legal. We note that under the permit as currently drafted, only 25% of the necessary phosphorus load reduction in the Charles watershed is required to be achieved in the next decade;[2] the draft permit is back-end loaded with 50% of the total phosphorus reduction not required until years 15 to 20 of the permit.

Allowing five years from permit effectiveness[3] for creating the PCP Phase 1 Plan is far too long. Municipalities will not even be required to have completed ***creation of the Phase I Plan*** until this

[1] The Massachusetts Stormwater Standards will also need to be updated to reflect the draft permit conditions and current stormwater management practices and science.

[2] The first phosphorus reduction milestone is not until 8 years after the permit effective date.

[3] EPA intends to make the new MS4 general permit effective six months after it is finalized.

five-year permit has expired! CRWA strongly believes that two years from permit effectiveness is reasonable for creating the PCP Phase 1 plan with full implementation of the Phase 1 Plan and development of the Phase 2 Plan by permit expiration, or within 5 years. We believe it is feasible for municipalities in the Charles to implement programs and practices to achieve at least half of their total phosphorus load reduction (Phase 2) requirements within seven years of the permit's effective date, and to create the Phase 3 Plan, with Phase 3 Plan implementation completed by year 10. We urge EPA to adopt these shorter, reasonable timeframes.

The milestones are especially important given the poor performance of some municipalities and non-traditional MS4s under the 2003 MS4 permit. While Appendix F does contain milestones which will help to ensure that municipalities are making progress in creating and implementing the PCP, the timeframes for the milestones are so long, we think they may well stall momentum, rather than build it.

Moreover, some of the planning in the milestones would benefit from being done simultaneously. For instance, there is no reason to give permittees five years to provide a description of planned nonstructural controls, let alone another year to implement these types of controls. The enhanced non-structural BMPs (Attachment 2 to Appendix F) can and certainly should be implemented within the first two years of the permit. Similarly, the legal analysis, funding source assessment, and definition of phosphorus baseline/reduction/allowable load[4] should take place at the same time. We think a funding source assessment (year 3, item 1-2) makes little sense until the PCP scope is defined (year 4, Item 1-3) and should be switched.

Annual Reporting

Reporting on progress and compliance with PCP milestones should be required in each annual report, rather than beginning six years after the permit effective date. As we read Appendix F in conjunction with Part 4.4,[5] PCP development progress would be virtually unmonitored for the first six years of the permit. Our concern is that until there is an actual reporting deadline, little progress may actually be made in some communities. Either Appendix F or Part 4.4. should be modified to require reporting on PCP progress, planning, implementation and the milestones in each annual report.[6] Appendix F should also be modified to require, rather than "to encourage," on line posting of each Phase of the PCP. Since permitees are required to make the Phases of the PCP available for public comment during development, it makes sense to post the PCP Phases on line.

---

[4] EPA provides Tables F-2 and F-3 to enable permittees to determine their Phosphorus Baseline Load, Reduction Requirement and Allowable Load, depending on whether the permittee opts to implement the PCP in all areas within its jurisdiction or in the regulated MS4 area only.

[5] Section 4.4b.iii prescribing the contents of annual reports provides only that discharges subject to TMDL related requirements must identify specific BMPs used to address the pollutant and an assessment of effectiveness in controlling the pollutant "and any deliverables required by Appendix F."

[6] While Appendix F requires that performance evaluations be included in each permittee's annual report, those evaluations do not begin until 6 and 7 years (Phase 1) after permit effective date, and then in years 11 and 12 (Phase 2) , and 16 and 17 (Phase 3) thereafter.

We commend EPA for providing a methodology for calculating phosphorus load increases due to development and phosphorus load export rates. We also agree that to receive credit, conversion of impervious surfaces must be restored to provide hydrologic functioning.

IDDE "Credit"

A serious problem in the draft methodology, however, is the phosphorus reduction from IDDE subtracted to determine the stormwater-only phosphorus load reduction requirement for each municipality. This reduction, in effect a "credit" granted to permittees for IDDE, is inconsistent with the methodology used to estimate the existing phosphorus load, and does not appear to be consistent with the way WLAs were calculated in phosphorus TMDLs. We strongly urge EPA to eliminate this illicit phosphorus load default value.

Watershed models, TMDLs and watershed assessments by the nature of their scale and design, use well-established methodologies for estimating typical or average stormwater pollution loads and apply these rates across a broad area based on land use types, topography, soils and other statistically relevant factors. Even models that use more detailed hydrologic routing, rainfall data, and dynamic in-stream processes rely on some averaged or typical measured concentrations which are applied across a modeled area. Discharges from Illicit connections are sporadic, geographically isolated, and difficult to separate out from other sources of stormwater pollution in a modeled condition. They are not generally included in such models except as they may influence the overall average concentration of a pollutant in stormwater. Furthermore, TMDLs do not include a WLA for illicit discharges because they are not allowed under the permit and thus cannot have a maximum daily load allowance.[7]

Since these illicit discharges have not been explicitly included in estimating existing loads, it is not appropriate to give them credit when estimating reductions. Furthermore, from a practical perspective, CRWA has demonstrated with sampling and modeling that stormwater loads – even those with no apparent illegal connections whatsoever – can still cause significant violations of water quality standards in receiving waters. Clearly, the MS4 general permit is intended to focus on a permittee's stormwater management, and its phosphorus reduction credits should reflect improvements in stormwater control and treatment, not basic, required corrections of failing sewage infrastructure.

Notably, as the map attached to our comments shows, Dover, Holliston, Mendon, Norfolk, Sherborn, Wayland, Weston and Wrentham are entirely on septic; and Bellingham and Millis have little sewage infrastructure. Yet the default phosphorus load reduction for IDDE work in Table 15 is applied to each of them. This is erroneous.

CRWA believes that in the case of a general permit, where highly detailed site specific data is not being used to establish permit requirements, this is inappropriate. At a minimum, the reduction should be limited to no more than five percent and then only applicable in those communities with the potential to have a high number of illicit connections/discharges.

[7] Nor does EPA explain the basis for its determination that an estimated 10% of the calculated phosphorus load from the commercial, industrial and all residential land use groups is due to illicit sanitary discharges to the Charles, or its statement that the "illicit phosphorus load estimate is based on considering the magnitude of illicit loads that have already been identified and eliminated from communities with the CRW." Fact Sheet Attachment 1 at 21.

Attachment 2

CRWA applauds EPA for developing calculation methods and tools that are sufficiently robust to provide a high level of confidence they will achieve required control levels, and yet are simple enough to be of great assistance to permittees, providing clarity, certainty and cost-savings.

It is not clear to CRWA whether the export load rates for pervious soils in Table 2-1 should be broken out by soil type. Those for hydrologic soil group D (DevPERV HSG D) which will be the default soil group used in many instances because there is not sufficient site specific data, seem very high. We think it is more appropriate to use an average load rate, or at least to use HSG C if there is no information available.

A proper bar is set in the draft permit to receive credit for no application of fertilizers containing phosphorus: "the application of any fertilizers that contain phosphorus at any time during the reporting year within the permittee's regulated area shall preclude the permittee from earning this credit for the reporting year." While the MA Department of Agricultural Resources is promulgating phosphorus fertilizer regulations, the act authorizing the regulations, G.L. c. 128, § 65A, is not, as EPA characterizes it, a "Massachusetts phosphorus fertilizer ban." Rather, this statute addresses signage in stores to discourage its use, but does not ban its sale and specifically allows application "where a soil test indicates that additional phosphorus is needed for growth of that lawn or non-agricultural turf "and in "establishing a new lawn or new non-agricultural turf area. " We question the default values in Table 2-5, which seem high—but just as importantly, we do not think communities will be able to certify accurately that phosphorus fertilizer is not being used in the MS4 regulated area.

Attachment 3

CRWA believes the resources EPA has put into developing methodologies and calculation tools for estimating the phosphorus removal of structural BMPs serve as an outstanding resource for permittees and the public. Over time, as more data becomes available, and more practices are evaluated specifically for phosphorus reduction, EPA may wish to change the credits allowed. We suggest that language be added at the beginning of Attachment 3 that calculations should be based on the most up to date versions of the Tables and Charts, which may be modified, and also direct permittees to a website where such updates will be made available.

We also encourage EPA to continue to evaluate structural practices' effectiveness over time, as well as their effectiveness at removing different types of phosphorus and phosphorus in different states of availability. As new research emerges, the methodologies and calculation tools should be modified accordingly.

<u>Appendix H Requirements Related to Discharges to Certain Water Quality Limited Waterbodies</u>

Few segments are listed for chloride impairment yet many water bodies are in fact "water quality limited" due to chloride. Rather than limit the requirement of a Salt Reduction Plan with additional or enhanced BMPs to 303(d) and 305(b) listed waters, we recommend that EPA include this under good housekeeping and pollution prevention measures in Part 2.3.7 of the permit and also be incorporated as requirements in post-construction bylaws.

Additional Comments on the Draft Permit

1.10 Stormwater Management Program (SWMP)

We suggest Part 1.10c. be modified to read "The permitee shall maintain an adequate funding source . . . " (emphasis added). "Encouraging" adequate funding for the program is not an appropriate permit condition and we are troubled that it provides the appearance of a potential loophole for permit compliance. If the permit cannot be modified to *require* adequate funding, this section should be removed. The development of a compliant program is a requirement of the permit and failure to identify sources of funding cannot be used as an excuse not to do so.

1.10.1.b. Stormwater Management Program Availability

We strongly support the requirement to make the SWMP available on line. Any permittee unable to post its SWMP on line should be required to explain why it cannot do so, and provide a reasonable alternative repository of free copies. We propose the same for Annual Reports (Section 4.4) which will provide transparency and allow residents to track permit compliance progress.

1.10.2 Contents of Stormwater Management Program

This section should contain language requiring the permittee to use (or at a minimum demonstrate that they have considered using and reasons for rejecting) Low Impact Development (LID) and Green Infrastructure (GI) techniques as part of their program to comply with Parts 2.0, 2.1 and 2.2, as has been required to demonstrate compliance in Part 2.3.5c.v. If permittees do not use LID or GI techniques as part of their program to comply with water quality based effluent limitations (Part 2.1) and discharge to impaired waters (Part 2.2), they should discuss why they have been determined not to be feasible. Current best practices in stormwater management in urbanized areas clearly include the use of LID and GI, and many EPA-approved programs including CSO Control Plans, Settlement Agreements and Consent Decrees require LID and GI practices. See, also,
http://water.epa.gov/infrastructure/greeninfrastructure/gi_regulatory.cfm
The LID and GI requirements should also be specified in Parts 2.2.1.g. and 2.2.2.a.

2.1.1 Requirement to Meet Water Quality Standards

The last sentence of both 2.1.1.b. and 2.1.1.c. and the first sentence of 2.2.2d. should be eliminated. While EPA would certainly exercise enforcement discretion if a permitee is complying with all "applicable requirements and BMP implementation schedules" in Appendices F and H, it is very important that this not serve as a shield to avoid eliminating expeditiously those conditions causing or contributing to an exceedance of water quality standards when the plan turns out to be inadequate or there is a newly discovered discharge.

Section 2.2 Discharges to Certain Impaired Waters

CRWA appreciates the listing of municipalities with discharges subject to TMDLs or to certain water quality limited waters. However, in Part 2.2.1 we suggest clarifying language be added that as new TMDLs are approved, the municipalities covered by them will be subject to Appendix F requirements and that the SWMP shall be modified to comply with new WLAs or new requirements. Pursuant to 2.2.2, a water quality limited water body (not meeting applicable water quality standards) does not have to be listed in categories 5 or 4b on the 303(d) or 305(b) lists to be subject to Appendix H requirements. We understand that a permittee not listed in these sections is subject to Appendix H requirements once it becomes

"aware" that it is discharging to an impaired waterway or tributary, we are concerned about the latitude this may provide permitees.

2.3.2 Public Education and Outreach

It is not clear what EPA means by requiring the permittee to "at a minimum consider" the topics in Part 2.3.2.d.i-iv when developing its outreach/education program. These are basic topics that will be relevant to almost all MS4 communities. Accordingly, we recommend changing the word "consider" to "include." The requirement of two messages to each audience in Part 2.3.2.b. over the permit term (8 messages total) is a very low bar. In order to comply with the objective of this section to "increase knowledge and change behavior of the public so that pollutants in stormwater are reduced," permittees should be required to distribute educational materials to each sector at a minimum of once per year during the permit term.[8] Given opportunities to collaborate with other MS4s, MS4 consortiums, and watershed associations, we think this is reasonable.

2.3.3. Public Involvement and Participation

This is a very important requirement that will result in an effective stormwater management program and public support for it. In addition to public participation in review and implementation of the SWMP, the permit should require public participation the self evaluation component.

2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program

CRWA strongly supports the revised methodology and detailed approach to the IDDE program in the draft permit. Illicit discharges remain a persistent problem, and an aggressive, standardized approach to detection and elimination is necessary to achieve water quality standards and reduce the impacts of storm drains and sanitary sewer systems on receiving waters. The written IDDE program (Part 2.3.4.7.) should be required to be posted and updated on the MS4's website.

2.3.4.4 Sanitary Sewer Overflows

CRWA suggests the language and requirements in this section be strengthened, with a particular focus on locations where repeated SSOs are identified. In spite of the permit specifications that SSOs are unlawful, the primary requirements of this section remain focused on inventorying and reporting SSOs. The requirement to eliminate an SSO as "expeditiously as possible," while good, seems somewhat subjective and remediation requirements should be spelled out in this section. In practice, many municipalities have ongoing and recurring SSOs, which they are not moving "expeditiously" to eliminate, nor are they aggressively taking interim mitigation measures to minimize the discharge of pollutants unless EPA begins enforcement proceedings. As the permit does in other parts, we suggest that specific required remedial measures for areas with recurring SSOs be spelled out in this section. A requirement to notify the local watershed association orally and in writing at the same times specified for the permitee to notify EPA and DEP should be a permit requirement.

2.3.4.6 Revised Mapping

As the permit recognizes, mapping was required to be completed during the 2003 MS4 permit term. Mapping is a basic first step in MS4 stormwater management and permit compliance. While 2.3.4.6.c. requires permittees to report on progress toward completing the revised mapping in each annual report,

[8] This provision is also important since the permit could well be administratively continued for a number of years as has been the case with the 2003 MS4 general permit.

because only one annual report should occur before mapping is completed and the second annual report is filed, we recommend this language be modified to: "The permittee shall report on progress toward the completion of the map required by this permit in its first annual report and shall report on its completion in its second annual report. If not completed within two years, the permittee shall provide the reasons therefore and the expected date of completion in each annual report."

2.3.4.8 IDDE Program Implementation and Milestones

A date for completion of elimination of illicit connections identified as a result of the Catchment Investigation Procedure (Part 2.3.4.8c.iii) should be a permit condition. As discussed above, we suggest this section also be strengthened to include specific measures that should be taken to remediate SSOs.

2.3.6 Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management)

We believe the one acre threshold is too large, especially in urbanized areas where most redevelopment projects are smaller than 1 acre. We urge EPA to adopt a 0.5 acre threshold which is more appropriate to achieve the program goals. At an absolute minimum, EPA should modify Part 2.3.6.a. to make it clear that permittees can regulate new development or redevelopment projects less than one acre. Perhaps this was EPA's intent in the phrase "at a minimum" at the end of the first sentence of 2.3.6.a., however, we think this could and should be stated more clearly especially given the language in Part 2.3.6.a.i. which provides that the permittee's program must include projects less than one acre if part of a larger common plan of development or redevelopment which disturbs one or more acre since permittees may believe that this is the only situation in which they are authorized to go below the one acre threshold.

We strongly support the requirement for an ordinance "at least as stringent as" retention of 1.0 inch of runoff from all impervious surfaces on the site. The 1.0 inch onsite retention standard is already required by Boston Water and Sewer Commission, the Town of Franklin, and other municipalities, and by all reports has been working well. While we have heard that some commentators would like EPA to limit the application of this requirement to only that portion of the site which is actually "redeveloped," or altered, this would be a departure from the definition of redevelopment under Massachusetts Stormwater Standards[9] and common understanding and application by municipalities of the applicability of the retention requirement to the entire property.

Most importantly, redevelopment provides the opportunity to redesign stormwater on the entire site, and is absolutely critical to an MS4's effective stormwater management since much of the development in the urban and suburban areas is in fact redevelopment. One inch retention site wide is also essential to enabling MS4s to meet the phosphorus reduction requirements in the two Charles watershed nutrient TMDLs. Lastly, application to all impervious surfaces on the site is quite important as communities grapple with extreme storm events and flooding impacts in the face of climate change.

In Part 2.3.6.a.ii.(a) permittees should not be given a choice between retaining on site the first inch of runoff from all impervious surfaces (2.3.6.a.ii.(a)1.) or providing the level of pollutant removal equal or greater than the level of removal provided through the use of biofiltration on the first inch of runoff from all impervious surfaces (2.3.6.a.ii.(a)2.). Parts 2.3.6.a.ii.(a)1. and 2. do not provide the same level of

[9] See, *Massachusetts Stormwater Handbook*, Volume I, ch. 1, p. 20-21 (Standard 7, redevelopment definition).

protection/benefit. Instead, 1.0 inch retention should be required where technically feasible. We recommend that the word "either" in (2.3.6.a.ii.(a) be stricken and the words "where not technically feasible" added after "OR" at the end of Part 2.3.6.a.ii.(a)1.[10]

CRWA also believes that the permit should allow for offsite compliance options in MS4s subject to nutrient TMDLs when compliance with Part 2.3.6.a.ii.(a)1. is not technically feasible. CRWA believes that off-site TMDL compliance is legally required when full onsite compliance is not feasible due to high groundwater, poor soils, the lack of available space or existing utilities, or other site constraints. Projects should have the option to either perform BMPs offsite, or to participate in an EPA-approved phosphorus reduction trading program, purchasing phosphorus reduction credits to partially meet their onsite stormwater management obligations. [11]

We believe that a trading program is a useful tool[12] that would provide an alternative stormwater management option for developers and property owners subject to regulation by MS4s. Trading would facilitate permit compliance and the achievement of nutrient TMDL limits,[13] reduce the costs of compliance, foster efficiency in meeting water quality standards at lower cost, and create incentives for voluntary reductions. *Water Quality Trading Policy* (EPA 2003). As EPA recognizes, "[m]arket-based approaches can also create economic incentives for innovation, emerging technology, voluntary pollution reductions and greater efficiency in improving the quality of the nation's waters." *Id*.

Trading could also provide incentives to promote stormwater infiltration across broader geographic areas helping to further reduce total stormwater loads while beginning to replicate more natural groundwater hydrology. We encourage EPA to modify the draft permit to authorize offsite mitigation and trading for nutrient TMDL compliance and to include this in the accompanying Fact Sheet. We suggest that a subsection 3. be added to Part 2.3.6.a.ii.(a) authorizing offsite mitigation and participation in an EPA-approved trading program when full nutrient TMDL compliance cannot be achieved on site.

The rules for trading will need to be established by the regulators and there are a number of options for how to structure and implement the trading program. However, the permit should authorize trading in the first instance. While EPA should take the lead in establishing basic trading parameters, we think MassDEP could and should play a key role in nutrient reduction trading program implementation.

---

[10] We note that although EPA explains in the Fact Sheet at p. 89 that developers can meet the retention/treatment standard by either retaining the first inch of runoff from all impervious site areas or by "retaining on site the maximum amount of runoff feasible and providing treatment of the remainder of the runoff that cannot be retained on site due to site constraints," we do not believe this is what Part 2.3.6.a.ii.(a)2 actually says.

[11] Onsite TMDL compliance to the extent feasible should still be required before the purchase of stormwater reduction credits could be used to fully satisfy the onsite requirements. Sites able to go beyond compliance, or unregulated properties, could generate stormwater reduction credits for purchase by those properties unable to meet onsite requirements.

[12] CRWA's Blue Cities Exchange (BCE) is an online program developed for three upper watershed towns that enables regulated entities to log on, identify cost-effective BMPs using the EPA BMP phosphorus removal curves and cost estimates developed by CRWA staff based on experience installing BMPs and with input and peer review by consulting engineers. Once trading rules are established BCE would facilitate trades.

BMPs that promote infiltration should not be prohibited at every industrial site or site with documented soil contamination. Infiltration BMPs may be appropriate on a portion of an industrial site or with some types of soil contamination. We suggest that EPA qualify Part 2.3.6.ii(b) by adding the words "unless appropriate," or something similar. The phrase "documented soil contamination" seems both vague and overly broad and we think EPA could be more specific.

2.3.7 Good Housekeeping and Pollution Prevention for Permitee-Owned Operations

2.3.7.a.ii.(a) should include an evaluation of areas where there is existing or potential erosion, and the development of a remediation plan. Soil erosion is significant in many parks and open spaces, and often represents a highly effective and inexpensive opportunity for municipalities to reduce stormwater pollution, and phosphorus loading in particular.

2.3.7.1.a.3.(c): Once a year street sweeping operations are entirely inadequate. An absolute minimum of twice per year sweeping should be required for good housekeeping. We agree municipalities should prioritize areas of town where more frequent street sweeping is needed.

In conclusion, CRWA strongly supports the draft permit overall, and we encourage EPA to move forward expeditiously to finalize and effectuate this permit. Please do not hesitate to contact me should you have questions.

Sincerely,

Margaret Van Deusen

Re: Comments on Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

I write to you about the Draft Massachusetts Small MS4 permit on behalf of the Connecticut River Stormwater Committee, a coalition of 13 stormwater-regulated cities and towns here in the Pioneer Valley. Stormwater Committee member cities and towns in the region have met or exceeded requirements under the 2003 permit and have expended significant municipal resources in doing so. Committee members appreciate EPA's efforts to further advance water quality improvements through the forthcoming MS4 permit, but have several important recommendations. These are listed here in priority order:

1. **Reduce costs of compliance for this proposed permit by delaying certain requirements until the next permit or provide a more realistic plan for municipal investment by extending the timeline for meeting proposed permit requirements to 10 years, rather than 5 years.** The current requirements as drafted represent a huge and very sudden leap in investment of municipal resources. EPA's reported estimate to meet the 6 minimum control measures, not including water quality-based requirements, ranges from $78,000 to $829,000 per year. For many local municipalities, this represents a doubling or quadrupling of current budgets at a time when they are seeing significant increases in other costs and income from all sources is shrinking. Years 1 through 3 of the permit in particular present an extreme jump in expectations of existing stormwater programs. There are important ways that EPA could help to make sure that municipalities have requirements that are more achievable. These include:

   Delay certain requirements to a subsequent permit. Within the current draft permit, there are certain requirements--such as impervious cover tracking, and many of the water quality requirements, including Lake Phosphorous Control Plans, nitrogen and phosphorous source reduction reports, BMP nitrogen and phosphorous tracking--that would be far more effective if delayed to a next permit when there are better methodologies and tools available to municipalities. (See comment #3 below on impervious cover tracking.)

or

Extend the timeline for meeting permit requirements to 10 years rather than 5 years. EPA already has a 10-year time frame built into the 5 year permit for catchment investigation procedure, etc. Why not extend this same timeline to other activities within the permit to provide a more reasonable rate of increased investment? The Connecticut River is in far better ecological condition today, but it took more than 20 years to reach this point.

2. **Provide flexibility for management of the first one inch of runoff on redeveloped sites (Section 2.3.6.a.ii).** While management of the first one inch of runoff from all impervious surfaces or providing equivalent pollutant removal is an important objective, we are concerned that there will be unintended consequences if there is not some flexibility. Unintended consequences could include increased development of "green fields" and an inability to properly maintain roadways. The following two ideas would help provide flexibility and help avoid these consequences:

   Allow permittees to provide for off-site stormwater compliance, including off-site mitigation in the same watershed or "payment in lieu of" to help cover the cost of implementing runoff reduction projects elsewhere in the watershed. Smart growth practices generally encourage infill redevelopment, but the permit requirement as written could produce disincentives to this. Where sites are already highly impervious and existing site conditions--including the need to work around existing infrastructure--translate to greater complexity, the costs can be far greater to retrofit than to build new development elsewhere. Tom Schueler, Director of the Chesapeake Stormwater Network, notes in a 2011 study, "The cost to construct LID practices at high intensity redevelopment projects (85% or more of impervious cover) can be 4 times more expensive than installing them at low density new development projects (25% of impervious cover or less)." This translates to around $191,000 per impervious acre for the high-intensity scenario as compared to $46,600 per impervious acre for the suburban greenfield site. (*Technical Bulletin No. 5: Stormwater Design for High Intensity Redevelopment Projects in the Chesapeake Bay Watershed*, Chesapeake Stormwater Network, May 2011, p. 12.)

   The Center for Watershed Protection recently developed a guidance document for West Virginia on off-site stormwater compliance that could provide a useful framework for Massachusetts permittees. See: http://www.cwp.org/guidance-for-developing-an-off-site-stormwater-compliance-program-in-west-virginia

   Articulate that the one-inch control standard applies only to roadway projects where there is full-depth reconstruction. The requirement as written implies that to proceed with a roadway maintenance project, permittees would need to redesign and reconstruct roadways and related stormwater management systems. We are concerned that this would cripple municipalities in the ability to maintain roads. Rather than

disincentivize roadway maintenance, this section ought to exempt all maintenance activities, including overlays, mill and overlays, and full-depth reclamation, and apply only to full-depth reconstruction projects. Where appropriate, municipalities could have the option to eliminate curbing so as to allow roadway drainage to flow into right of way areas for infiltration.

3. **Rethink the impervious cover tracking requirement and provide an initial baseline of impervious cover that is connected to water quality objectives in the next permit (Section 2.3.6.d).** Given the permit's current framework, impervious cover tracking does not seem to provide meaningful connection to water quality. As you may know, the concept of percentage imperviousness and its relationship to water quality arose from studies specific to 1st and 3rd order systems. (*Impacts of Impervious Cover on Aquatic Systems*, Center for Watershed Protection, March 2003, p. 2.) Most of the urbanized areas in the Pioneer Valley lie within 4th, 5th, and 6th order systems. (*Gazetteer of Hydrologic Characteristics of Streams in Massachusetts: Connecticut River Basin*, USGS, 1984.) Furthermore, it appears that the subwatershed delineations and calculations of impervious cover developed by EPA for use as a baseline by municipalities are drawn from elevation data and not actual drainage infrastructure catchments. As such, impervious cover changes recorded by a permittee will not provide a true understanding of water quality improvements due to impervious reductions. If impervious cover is to remain a measure for larger stream systems within the MS4 regulatory framework, it ought to be put to more effective use and delayed to when EPA can provide baseline information that integrates topographic information with actual drainage infrastructure catchments (to be developed by MS4s under Section 2.3.4.6 of the draft permit).

4. **Allow municipalities to combine education and outreach messaging under water quality standards requirements (Section 2.1.1, and Appendixes F and H).** Where a municipality is responding to requirements for multiple impairments or TMDLs within its jurisdiction, a municipality should have the option to combine messaging for maximum effectiveness provided they address the topics related to the impairment or TMDL. For example, a few municipalities within the Pioneer Valley region must meet requirements under the Nitrogen TMDL for Long Island Sound, a local Phosphorous TMDL, and water bodies impaired for bacteria. Rather than generate an avalanche of messages related to each of these pollutants, a municipality should be able to disseminate seasonally appropriate messaging to address nutrients in spring and fall and bacteria in summer. Combined with the basic education and outreach requirements required under 2.3.2, that would mean the total minimum required education and outreach messages would be 23 during the 5-year permit term. This seems more than adequate.

5. **Ensure that TMDL or impaired water quality requirements are tied to stormflows from MS4 areas (Sections 2.2.1 and 2.2.2).** In at least 2 locations in the Pioneer Valley, the draft permit ties regulated MS4 areas to upstream TMDL waters or impaired waters. If the urbanized areas are not contributing to water quality issues in a particular location, municipalities should be able to flag these locations for EPA and be removed from lists that

appear under Sections 2.2.1 and 2.2.2. Additional language in this section regarding location of the MS4 area relative to impacted waters would also be helpful.

6. **Remove the requirement to label all MS4 outfall pipes (Section 2.3.4.5).** If the purpose of the MS4 outfall signs is to be able to find the outfall for sampling, municipalities can better do this through the use of GPS information. We are concerned that the cost of installing signs and then making replacements when they are vandalized is not the best use of municipal resources in serving water quality objectives.

Thank you very much for your consideration of our comments. If you have any questions, please do not hesitate to contact Patty Gambarini, who facilitates the Connecticut River Stormwater Committee for PVPC.

Sincerely,

Timothy W. Brennan

Re: Additional Comments on Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

Given the extension of the comment period to February 27th, the Connecticut River Stormwater Committee, facilitated by the Pioneer Valley Planning Commission, would like to submit two additional comments on the Draft Massachusetts Small MS4 permit.

It used to be that the federal government more actively supported communities in meeting goals for clean water. Given the significant costs that are projected for complying with the MS4 permit requirements, EPA should find ways to provide more substantive help to communities. Just two examples: 1. Water Quality Act Section 319 funding, which has provided some important stormwater management improvement grants in the past, can no longer be used for work in MS4 regulated areas. Since this is at least one source of funding that could help communities meet stormwater requirements, EPA ought to change language to enable grants to MS4 areas. 2. In addition, the MS4 permit mentions the use of test kits for sampling and analysis, but few municipal officials have had training on this. EPA recently offered free training and test kits to NGOs in Massachusetts, but EPA ought to consider extending this same opportunity to municipalities.

More generally, the Connecticut River Stormwater Committee would like to note the importance of collecting some good baseline data from major surface water systems before the final MS4 permit is issued. Given the enormity of the investments being required of communities, there should be a way of showing actual gains in improved water quality after the permit term of 5 years. What will success be measured against? We understand that data on the Connecticut River, for example, is somewhat limited. While the Pioneer Valley Planning Commission has been sampling shoreline recreational access sites for the past 7 years, the study has been limited to E. coli. A good baseline study that examines Total Suspended Solids as well as nutrients and E. coli along transects of the river seems to be missing. If indeed this

data does exist from another source, it would be great to share it with communities now so that everyone has a common baseline for measuring success of their stormwater programs.

Thank you very much for your consideration of our additional comments. If you have any questions, please do not hesitate to contact Patty Gambarini, who facilitates the Connecticut River Stormwater Committee for PVPC.

Sincerely,

Timothy W. Brennan

RE: Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder:

The Town of Dalton Stormwater Management Commission (SWMC) respectfully submits these comments on the draft Massachusetts Small MS4 General Permit. The Town of Dalton has an excellent track record of compliance with the prior permit and takes its role as a steward of the environment extremely seriously. The SMWC applauds the efforts of the EPA to clean up the waters of the Commonwealth, but has serious concerns with regard to the schedule and associated costs to comply with the permit. These draft regulations represent a major effort by many environmental and regulatory professionals and provide an excellent program that when implemented should result in improvements to the nation's streams, ponds and lakes. Although the SWMC agrees with the intent of the draft permit, the result is an added burden to communities that are already struggling to provide necessary services.

As a regulated small MS4, the Town of Dalton is directly affected by this General Permit and encourages EPA to develop an appropriate program that will address stormwater and water quality concerns while balancing local needs and economic considerations. It is a mandate to municipalities without state or federal funding subsidies, which leaves the burden to comply entirely on the shoulders of the regulated communities. In these troubling economic times, many municipalities have been faced with potential cuts to vital services. For this reason, it is a very difficult time to meet the addition mandates required by the draft General Permit.

To make this program successful, municipalities need funding from the state and federal governments similar to the programs where funding was available to build wastewater treatment facilities when the Federal Water Pollution Control laws surfaced in the 1970s. Nonpoint source pollutant and nutrient discharges into receiving streams is a national issue and funds to implement mandated programs to improve water quality should come from a national source. The requirements of the draft regulations require professional engineering and administrative services which cannot be met solely by

municipal employees and cannot be complied with through the volunteer members of local commissions or interested and concerned citizens.

In addition to the issue of cost, the SMWC is concerned with the schedule for compliance with the general permit. Logistically, the schedule simply involves too much, too soon, within the same timeframe for a municipality the size of Dalton to comply. Many of the requirements require additional staff or the assistance of subcontractors to perform the necessary work. Even if adequate funding was available, budget appropriations and the addition of new staff and/or procurement for subcontractual services require long lead times to comply with bidding and hiring laws. It is understood and appreciated that revisions were made from the 2011 Draft Permit that allow additional time before the permit goes into effect and before the written Stormwater Management Program is due. However, the timing for municipal budgeting only works if the permit is published no later than December and, preferably, goes into effect the next fiscal year (July 1st). Any other schedule requires municipalities to prepare budgets based on the speculations formed from the draft permit and/or simply misses the small window between December and March to prepare budgets and prepare warrant articles for Annual Town Meeting. Other examples of how the schedule involves too much, too soon and within the same timeframe include, but are not limited to, the following:

- Sixty (60) days from the effective date of the permit is not enough time to develop an inventory of all sanitary sewer overflows.
- Two (2) years to gather and map the enormous quantity of data required is a very short time frame and the logistics of developing a project of that magnitude in 2 years would be difficult and very expensive.
- Data collection for individual catch basin inspection and maintenance is very time-consuming and costly.
- Treating and retaining the first 1" of rainfall on all road projects 1 acre or greater is not feasible financially or practically (due to availability of land). This requirement should not be applied to *all* projects including maintenance. As written, Towns like Dalton will have no choice but to forego maintenance so as to not be in violation of this permit.

Lastly, a streamlined approach could be employed with regard to certain components of the draft permit rather than duplicating efforts and expense in multiple communities. The "paper burden" of the permit is staggering; the Notice of Intent (NOI), Stormwater Management Program (SWMP), Illicit Discharge Detection and Elimination Program (IDDE), Stormwater Pollution Prevention Plan (SWPPP), in addition to reporting requirements. Having streamlined, generic, preformatted templates generated by one agency instead of the many individual communities working independently would standardize and expedite the permit process. Many of the data collection tasks relate to regional or state-wide efforts, such as water quality classifications, identified impairments and endangered species habitats. This data should be made available to all regulated communities rather than imposing a highly redundant effort on individual communities.

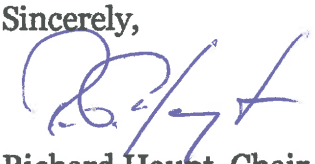
Additional examples of ways in which to ease the burden of permit requirements are as follows:

- Provide flow charts or other graphs to guide laypeople through the permit process;
- Provide technical assistance help, via phone or web based;
- Provide models or examples of the required plans, procedures, etc;

- Provide guidance regarding acceptable methodologies - for example, methods used to evaluate the effectiveness of educational messages and overall education as well as to demonstrate that a defined goal has been achieved.
- Provide preformatted GIS resources to support NOI submission: endangered species, historic properties, impaired water bodies, etc.;
- Provide streamlined forms and online submission for Stormwater Management Plan, reporting, etc.;
- Provide training resources and available classes to meet the training requirements for in-house personnel– live classes, webinar training programs, or pre-recorded video;

The SWMC is dedicated to improving the quality of stormwater runoff and only seek to ensure that the permit requirements are efficient and cost effective. It appears that the proposed program will have many issues with regard to compliance and that many of the towns and cities in Massachusetts will not be able to fully comply by the end of the five year permit period unless this program has some subsidies provided for it on the state and federal levels. In the absence of or in addition to subsidies, modifying the schedule may ease the burden and increase the level of compliance. We respectfully request that the EPA give more consideration to the financial implications and schedule of the draft permit.

Sincerely,



Richard Haupt, Chair
Stormwater Management Commission

Re: NPDES-Phase II Stormwater
Massachusetts Small MS4 Draft General Permit

Dear Mr. Tedder:

The Town of Danvers is in receipt of a copy of the revised draft General Permit under the Clean Water Act – NPPES Phase II stormwater Program. While it is generally accepted to achieve improved water quality, the revised draft permit continues to be overly prescriptive, burdensome, costly, and in many instances unachievable without staff augmentation and substantial Operations, Maintenance and Capital Expenditures.

For example, the Town will now be required to inventory and map all *private* stormwater and BMP Systems. This requirement is costly to complete. The cost to hire surveyors, gain access to the property (Legal Right of Access), analyze the system, and, ultimately, generate maps (GIS) is a significant burden to the Town, estimated at up to $30,000 for a single large commercial site.

In addition to the private properties, the State (MassDOT) highway storm drainage systems within Routes 95, 1, 128, and 114 are not currently mapped within the Town's GIS, as MassDOT will receive their own individual NPDES Permit. The Town will incur the cost to incorporate all MassDOT drainage systems into the Danvers GIS, as these systems are interconnected to the Town's drainage system and brooks. The requirement to identify the directly-connected impervious areas (DCIA) is burdensome, costly and a major change in the permit process.

Wet weather sampling of outfalls is another time consuming, labor intensive, and costly venture, which can only be achieved IF the rainfall event meets the minimum storm criteria. Many "false" alarms and unnecessary testing will be conducted with minimal beneficial results. Dry weather sampling has proven to be more effective in Danvers as there are no existing CSO or SSO facilities.

Furthermore, the requirement to inspect all junction manholes town-wide is an enormous undertaking, which appears to contradict the core principles of dry weather screening. For example, if the end of the line (outfall) screening results indicate no harmful pollutant flows reaching the receiving waters, then what beneficial data would be obtained by inspecting junction manholes not associated with known problems? The indiscriminate inspection of junction manholes would cost several hundred dollars per location, whereby these same dollars would be more effectively used in other parts of the program.

The following comments highlight these issues as they pertain to specific permit requirements.

GENERAL COMMENTS

NOI Form: The amount of detailed information required to complete the new electronic NOI Form is extensive and includes information that, in the previous permit cycle, was provided in the Stormwater Management Plan (SWMP). Having a detailed understanding of all proposed BMPs that will be used to meet the six minimum measures, as well as those to be used to meet the water quality based effluent limitations, within 90 days is impractical.

Timeline: First Year Requirements: The number of major activities and related plans that need to be completed in the first year of Permit is impractical. Our review of the permit indicates that there are more than ten major plans or action items need to be competed in first year after issuance of final permit, or sooner, including:

- NOI preparation
- SWMP preparation
- Inventory of municipally-owned parks, buildings, facilities and equipment
- O&M plans for municipal facilities
- Inventory of the Town's infrastructure requiring rehabilitation and /or repair
- Sanitary Sewer Overflow (SSO) inventory
- Outfall/interconnection inventory (including condition assessment)
- Phosphorus Control Plan (PCP)
- Updated Illicit Discharge Detection and Elimination (IDDE) Plan
- Storm Water Pollution Prevention plans (SWPPPs) for relevant municipal facilities
- Updated written protocols for erosion control inspections and infrastructure maintenance.

Comment: We suggest that the time frame to complete these activities, especially the O&M Plans, outfall/interconnection inventory and condition assessment, PCP, and SWPPP preparation be extended to at least two years from the effective date.

Pollutant Load Calculations - Appendix F and Appendix H: There is a significant amount of work associated with the complex calculations, tracking, accounting, and data analysis required to remediate impaired bodies of water. It will be difficult for Danvers to prepare all this information and complete the data management relative to pollutant load reductions and credits without a consultant or full time staff member.

Comment: EPA should provide significant support to municipalities if they are expected to prepare this information on their own. Training sessions and outreach assistance is recommended, as this type of work is not typical for a municipal engineering department and often would require the use of an outside consultant at a significant cost.

SECTION SPECIFIC COMMENTS

Section 1.9.1 - Documentation Regarding Endangered Species: Before submitting an NOI for coverage, applicants must determine whether they meet the Endangered Species Act (ESA) eligibility criteria for following the steps in Appendix C of the permit.

two permit cycles or allow up to 10 years to complete this section's requirements. We further recommend EPA place more emphasis on the Maximum Extent Practicable than a specific limit.

Section 2.3.4.5/6 Outfall Inventory and System Mapping: These sections requires the outfall and interconnection inventory to be completed within the first year and system mapping to be completed within two years of the effective date of the permit.

Comment: This time frame is very short for the undertaking. While many towns have mapped the outfalls, developing a plan for mapping entire stormwater systems in a programmatic and efficient way is important. The Town will need to plan for this capital expense and budget for it. The time frame should be expanded to match the TMDL and Impaired Waters control plans, thus using limited resources most effectively. Allow staggered mapping by higher priority impacts across the Town.

Section 2.3.4.7.iii - Priority Ranking: This section states that the initial illicit discharge potential assessment and priority ranking based on existing information shall be completed within one year from the effective date of the permit for every individual outfall system.

Comment: Since the drainage mapping will not be complete until two years after the permit effective date, and since much of the ranking is based on this information, we suggest that a two-and-a-half or three-year time frame be given to align with the mapping schedule, instead of asking the town to develop the ranking once based on current information and then updating it based on the more detailed information one year later. Furthermore, the Town of Danvers has over 300 individual drainage outfalls, some with as little as three structures connected to an outfall. Ranking individual systems for priority would result in arbitrary assignment of ranks for the vast number of small and nearly identical systems. This data would not be an effective planning tool. Prioritizing sub-watersheds based on receiving water delineations would be a more practical approach and a more meaningful planning tool.

Section 2.3.4.7.d.iv - Written Illicit Discharge Detection and Elimination Program: This section states that "The permit does not require a minimum rainfall event prior to wet weather screening. However, the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather."

Comment: Wet weather sampling can be extremely costly and difficult to implement, especially given the 4 month specified sampling period. Unless there is clear evidence of a wet weather contamination threat, wet weather sampling should not be mandated. Bacteria levels in stormwater are highly variable and individual sampling events easily show spikes which could falsely be interpreted as an illicit point source. These results could be extremely costly to pursue, often with little results to show for the effort. It is requested that EPA provide data on past wet weather sampling results, compare those results to dry weather sampling event for the same outfall sources, and provide data showing the number of illicit sources identified through wet weather that were not detected during dry weather. EPA should also provide information regarding the costs of both the wet weather and dry weather sampling events, and whether or not the wet weather events yielded conclusive sources of any additional illicit flows found during wet weather events.

Section 2.3.4.7.e.ii - Catchment Investigation Procedure: This section describes the manhole inspection methodology.

Comment: Is EPA confident that Fish and Wildlife will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI? Is it reasonable to think that communities can meet this requirement within the 90 day NOI time period?

Section 1.9.2. - Documentation Regarding Historic Properties: It is unclear what documentation will be needed to demonstrate no impact to historic properties. The screening procedure outlined in Appendix D suggests that any subsurface excavation activity related to the stormwater program, which is highly likely as part of any future repair, upgrade or replacement of stormwater infrastructure, will require consultation with State Historic Properties Office (SHPO – Massachusetts Historical Commission) to certify that there will be no impact to historic properties and the documentation of this consultation/certification must be included in the NOI and the SWMP in order to be eligible for permit coverage.

Comment: The SHPO certification requirement regarding subsurface excavation activity imposes two major problems: 1) the extent of possible future repairs and related excavation activity will not be fully understood at the time of NOI submittal, and 2) to obtain SHPO certification for each potential excavation activity will result in extensive added coordination time, cost and project delays if field investigations are required to obtain this certification. Also, is EPA confident that SHPO will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI?

Section 2.1.2.b Prohibition for Increased Discharges to Impaired Waters: This section states that there shall be no net increase in discharges from the MS4 to impaired waters listed in Categories 5 or 4B on most recent Massachusetts Report of Integrated Waters unless the permittee demonstrates there is no net increase in loading for the specific impairment and provides documentation in the SWMP. This requirement is inconsistent with the language in Appendix F Sections IV and V which states that stormwater management for the new redevelopment shall be required to optimize pollutant removal for the pollutant of concern but not necessarily prohibit any additional increase.

Comment: In the absence of a TMDL, we feel that there is not sufficient basis for requiring no net increases and places and unnecessary burden on the MS4.

Section 2.2.1 - Discharges to Impaired Water Bodies with an Approved TMDL: Table F-1 and F-2 of Appendix F indicate that various towns would have phosphorus reductions targets as high as 50% or more.

Comment: Given that the reported phosphorus removal efficiencies are generally in range of 40 and 65 percent for structural stormwater BMPs and much lower for non-structural measures, this would essentially mean that nearly all, or a large majority of existing IC area, would need to be treated with structural BMPs . This is not only impractical, given the wide range of site constraints that will be encountered in implementing stormwater retrofit BMPs, but in many cases will require land acquisition (in some cases eminent domain) at a significant cost. We suggest that EPA provide guidance for municipalities to realistically meet the targets including increased credits for non-structural measures if they are considered truly worthy actions.

Section 2.3 - Requirements to Reduce Pollutants to the Maximum Extent Practicable (MEP):

Comment: Completing the multitude of requirements included in this section in a 5-year permit cycle is not realistic. We suggest that the number of requirements be reduced substantially and be spread over

Comment: We feel that it is an excessive amount of work to investigate every junction manhole if there is no dry weather flow or indication of any illicit discharges at an outfall location. Investigating upstream reaches requires work within roadways, sidewalks, private property and will require police details and substantial field work. Time and money may be better spent on training municipal staff and contractors during their regular field work and maintenance, as well as the focused educational materials regarding what is an illicit connection for the resident/businesses/property owners. We request that EPA provide data showing that investigating upstream drainage systems, when there is no evidence of illicit connections at the outfalls, results in the identification of illicit connections worthy of the associated costs.

Section 2.3.4.7.g - Follow-up Screening: This section requires follow up screening (dry weather with additional wet weather where performed previously) once every five years after the initial review.

Comment: We request EPA provide evidence that spending this ongoing expense will have a significant water quality impact.

Section 2.3.6(d) – Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management): This section states "All BMPs installed as part of the site's stormwater management system shall be constructed in accordance with Massachusetts Stormwater Handbook Volume 2, Chapter 2."

Comment: The Massachusetts Stormwater Handbook is outdated for many of the changing BMP design features. Some BMPs, such as permeable pavements, are not even included in the Handbook. Other states, such as Rhode Island and the Chesapeake Bay area states, are developing more updated design handbooks in response to TMDLs and stormwater requirements. In addition, limiting designers to the Massachusetts Stormwater Handbook will discourage those designers from installing BMPs that do not meet the standards but still provide treatment (as indicated by the EAP pollutant treatment curves). The wording should be changed to reference the MA Stormwater Handbook, as well as EPA, and other state manuals with recent updates that provide good BMP design guidelines.

Section 2.3.6.d.: This section requires permittees to track directly connected impervious area and disconnected impervious areas each year.

Comment: Requiring a municipality to have an accurate database of the impervious cover, broken down by what is directly connected or disconnected, is an onerous requirement without an explanation of the use of benefit of such detailed data. Statewide and/or regional impervious cover data layers provide a much more cost effective estimate of impervious cover for the purpose of planning, understanding trends, and identifying hot spots. Annual changes in impervious cover are insignificant system-wide.

Section 2.3.7.a/b - Operations and Maintenance (O&M) Programs and Stormwater Pollution Prevention Plan (SWPPP): This section requires written O&M procedures for the municipal facilities that have specific activities listed within the first year and SWPPPs within the first two years.

Comment: This requirement includes collecting, organizing, and updating information on each facility and will be difficult to effectively complete within two years, in addition to the other first-year tasks. We suggest extending the time for completion of these documents to three years.

Appendix H Attachment 1 - Street Sweeping and Catch Basin Cleaning Credits: The credits included in the permit are based on information from Center for Watershed Protection Street Sweeping program in the Chesapeake Basin, dated 2008.

Comment: The credits provided for street sweeping are extremely low and there is no mention in the permit of the extensive benefits of street sweeping for removing extensive amounts of debris and sediment in addition to actual pollutant loads. The credits do not provide incentives to utilize this source control method that not only removes contaminants and trash, but also contributes to the long-term longevity of the BMPs that are listed as most valuable for phosphorus removal: infiltration BMPs. We recommend that this be researched further, including the region-specific USGS street sweeping study completed recently in Cambridge Massachusetts, to identify the appropriate value of credits. If, in fact, the water quality benefit is shown to have such an insignificant impact, then these costly practices should not be required.

Appendix F Section 2 Reporting: The equation used to calculate yearly phosphorus loads requires the permittee to estimate the amount of development that has occurred since 2005.

Comment: It is unreasonable to expect a Town to perform this estimate. We suggest that TMDL standards apply to today's levels of development or that EPA update Tables F1 and F2 to reflect conditions at the date of the final permit.

Appendix F Attachment 1 and 2: The loading rate Table 2-1 indicates in a footnote to assume Hydrologic Soil Group (HSG) D soils (if soils are unknown) to estimate previous loading rates. Attachment 1 text on page 1 says to assume HSG C/D.

Comment: Please clarify. We suggest to assume C soils or use the surrounding soil types as an indicator. HSG D and C/D are too conservative for our region. We suggest only including this table in one location to avoid confusion.

Appendix F Attachment 3 Semi - Structural/Non-structural BMP Performance Credits: The section states that the cumulative runoff reduction is being used to estimate the cumulative phosphorus load reduction credit for the semi structural/non-structural BMPs, which have an infiltration benefit by disconnecting IA and providing soil amendments to increase permeability.

Comment: The infiltration BMP curves show that phosphorus reductions are greater than runoff volume reductions. Therefore, it is conservative to use runoff volume as a direct surrogate, when in fact phosphorus reductions are likely higher. We suggest an additional phosphorus treatment factor in addition to the runoff reduction alone.

Appendix F Attachment 3 Table 3-18: The porous pavement BMP performance table gives credits based on the depth of filter course.

Comment: We would expect that the credit would be dependent on the relative watershed size to filter course depth. Please clarify.

We support and incorporate into this comment letter the correspondence dated February 24, 2015 from the Massachusetts Coalition for Water Resource Stewardship and Tighe & Bond, Inc.

Thank you for the opportunity to comment on the revised, draft MS4 permit for Massachusetts. The Town urges the EPA to consider modifications to this draft permit to make the Massachusetts Phase II Stormwater Final Permit more sustainable and affordable to the "maximum extent practicable," for the cities and towns of the Commonwealth.

Sincerely,

Steve Bartha

Subject: Comments on the Draft Massachusetts North Coastal Small MS4 General Permit

Dear Mr. Tedder:

The Massachusetts Department of Conservation and Recreation, Division of Water Supply Management, Office of Watershed Management (DCR-OWM) has reviewed the Draft Massachusetts Small MS4 General Permit for stormwater management. We would like to offer the following comments for your consideration for finalizing the permit.

DCR-OWM is responsible for protection of the watersheds that provide drinking water for 2.5 million users of the MWRA system. Our staff works with watershed communities, businesses and residents to manage all potential water quality threats to the drinking water reservoirs. As stormwater is a major conveyance of pollutants, the measures outlined in the permit provide a framework and guidance for managing stormwater. We have found that the watershed communities and, in particular the DPWs who are primarily responsible for the measures outlined in the draft permits, are concerned about impact of stormwater and want to be good stewards of the water resources in their communities. However, the communities are financially stretched and the new requirements of the draft permit are financially prohibitive.

DCR-OWM has worked with the communities in the past and will work with them in the future to help implement stormwater mitigation measures. The current permit is very "prescriptive" in detailing steps that must be taken. We feel that EPA should allow individual permittees, at least for those in our watershed, an option to modify the specific tasks to be more useful in the particular watershed. Two examples of changes that we thing could be made in our watersheds are found in section **2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program:**

2.3.4.7.c Written Illicit Discharge Detection and Elimination Program – Assessment and Priority Ranking

The requirement to assess and prioritize catchments appears misguided, especially for communities in the Wachusett Reservoir watershed. All streams in the watershed are tributary to a drinking water supply and therefore all are equally important, but even if not it seems impractical to devote a year towards developing a methodology and then

COMMONWEALTH OF MASSACHUSETTS · EXECUTIVE OFFICE OF ENERGY & ENVIRONMENTAL AFFAIRS

John P. Murray, Commissioner
Department of Conservation & Recreation

using it to rank and prioritize catchments when the time might be better spent actually implementing detection protocols and finding problems. The goal here is being overlooked and too much emphasis placed on documenting each detail of the decision-making process. Simplification makes more sense, especially in a watershed with a very low likelihood of illicit discharges.

2.3.4.7.d Written Illicit Discharge Detection and Elimination Program – Outfall Screening and Sampling

Wet weather sampling is difficult to coordinate, and sample collection and analysis will be expensive. Collection of a few wet weather samples at each outfall during the five year permit period will provide limited information. In-stream monitoring downstream of outfalls is more practical and in many cases data already exist or are being collected regularly by others. The DCR-OWM has monitored temperature, bacteria, and conductivity weekly for many years and has monthly nutrient data from a number of tributaries. DCR-OWM believes that existing data and ongoing tributary sampling efforts are sufficient to help locate illicit discharges and will continue to work with local communities to support their efforts.

In addition, we offer the following comments on section **2.3.6 Post Construction Stormwater Management (New Development/Redevelopment)**

2.3.6.a.ii.(a) Retain the first one (1) inch of runoff from all impervious surfaces on site.

As long as there are differences between EPA stormwater requirements and DEP stormwater standards, there will be difficulties obtaining compliance. There should be agreement so that EPA and DEP are asking for the same thing.

2.3.6.d. Directly Connected Impervious Area

The methodology used for initial estimates of impervious surfaces and directly connected impervious surfaces is based on outdated land use and therefore includes error. Annual changes will be small and likely fall within the margin of error, so labor intensive efforts to determine annual change seems impractical and unnecessary. .

Thank you for the opportunity to comment on the draft permit. If you have specific questions on our comments, please contact Patricia Austin, P.E., Director of Environmental Quality, Wachusett Watershed at 508-792-7423 x204.

Sincerely,

Jonathan Yeo

2014 DRAFT MS4 COMMENTS

S**ECTION 1.9 – SPECIAL ELIGIBILITY DETERMINATIONS**

1. *Comment:* Part 1.9.1 requires that each small MS4 certify eligibility regarding the Endangered Species Act, as per the steps outlined in Appendix C.

   Recommendation: Requiring communities where none of the 20 listed species are present to document this through an additional Federal permit process seems excessive. The Massachusetts Natural Heritage and Endangered Species Program provides specific mapping information on all of the state and federally listed species. Inclusion of documentation from NHESP that no listed species exist within the municipal boundaries should be sufficient to determine eligibility for the permit.

SECTION 2.1 – WATER QUALITY BASED EFFLUENT LIMITATIONS

1. *Comment:* Part 2.1.1.b requires compliance with Appendix F schedules and requirements. The concern with this requirement is that it does not take into consideration the process by which local by-laws are created and/or modified in Massachusetts. This issue also pertains to proposed funding sources, which include stormwater utilities.

   Recommendation: The appendix should be revised to take into consideration the possibility that a community's governing body (Town Meeting members in the case of Dedham) may not approve by-law revisions or the creation of funding sources for the work required as part of the small MS4 permit. Funding for the requirements of the proposed permit is a considerable obstacle to compliance for Dedham.

SECTION 2.3.2 – PUBLIC EDUCATION

1. *Comment:* Part 2.3.2g requires the permittee to document in each annual report the measures/methods used to assess the effectiveness of the messages, and the method/measures used to assess the overall effectiveness of the education program. Changes in behavior can be difficult to document and measure unless there is an incident of infraction on one of the specific audiences mentioned in the permit and a corrective measure resulting from the education and outreach program which could then be measured.

   Recommendation: The term and acceptable methods for demonstrating effectiveness need to be more clearly defined. Not all education and outreach initiatives have a measurable result that can assess the effectiveness of the message. We can track how many flyers were distributed, letters sent out, press releases put in the papers, events tabled or students addressed during presentations, but changes in behavior as a result of the campaign are difficult to track.

SECTION 2.3.4 - IDDE PROGRAM

1. *Comment:* Part 2.3.4.5.c states that as part of the data collected for the outfall inventory, that the receiving waterbody be identified along with a spatial location consisting of a latitude and longitude.

   Recommendation: Not all receiving waterbodies have a name associated with them. This information should be supplied if available only. Most communities that utilize GIS have their data in the MA State Plane Coordinate System (NAD83). It would be easier for these communities to utilize a northing and easting coordinate system for their outfall spatial location identification. Using the NAD83 coordinate system should be an option for the spatial location requirement.

2. *Comment:* Part 2.3.4.6.a.i states the required information on the system mapping. What is of concern for the Town is the requirement to identify all waterbodies by name.

   Recommendation: Not all receiving waterbodies have a name associated with them. This information should only be supplied if available. It would be a waste of resources to take the time to perform research on waterbody names, where the end result could still determine that there is no name. If a water body is within an identified impairment, then listing the impairment seems more important than the actual name.

3. *Comment:* There are several instances in this section where it states that catchments indicate sewer input if sampling results have ammonia ≥ 0.5 mg/l, surfactants ≥ 0.25 mg/l and bacteria levels greater than the water quality criteria applicable to the receiving water; or ammonia ≥ 0.5 mg/l, surfactants ≥ 0.25 mg/l, and detectable levels of chlorine.

   Recommendation: It is unclear whether one or all three of the indicators have to exceed the acceptable levels to be classified as a High Priority Catchment. The way that I interpret the statement is that all 3 indicators have to exceed acceptable levels to be classified as a High Priority Catchment, otherwise it would be classified as a Low Priority Catchment. This should be clarified. It makes sense that all 3 indicators would have to exceed allowable levels.

4. *Comment:* The Town understands the concept behind the dry weather outfall/interconnections and catchment investigations, but believes it could be streamlined to remove potential redundancies in investigations, hence wasting municipal resources and money.

   Recommendation: During dry weather investigations if no flow is observed and also no indication of sewer inputs are observed, the municipality should be provided the opportunity to sand bag the outfall or first upstream drainage structure for the next 48 hours when there are no significant rain events forecasted. That 48 hours should provide ample time for any illicit sources to show up in the sand bagged location for sampling. If there is still no flow or stormwater present, then there should be no requirement of catchment investigation. If flow or stormwater is present, then sampling should take place. If no indicators of sewer input are present from sampling then again, no catchment investigation is needed. If indicators for sewer input are present as determined from sampling, then catchment investigation as described in the permit shall be followed.

5. *Comment:* Thresholds for all impaired waterbodies with approved TMDLs should be shown in the permit or in an appendix. All information required for correct sampling protocol should be provided to lessen confusion.

6. *Comment:* The goals and milestones established for the IDDE section appear to be extremely stringent. It appears that the EPA is trying to right all the wrongs created over many decades within a window of approximately 5 years. The Town can appreciate the intent behind the advantageous goals and milestones, but does not believe that the resources, both staff and funding, were really considered as part of this strategy. Most communities may be able to handle these goals and milestones without the need for significant assistance from consultants or from establishing utilities that take more money from the taxpayers if the goals and milestones were extended to allow for more time. It should not be expected for municipalities to correct all of the past issues in just 5 years.

   Recommendation: The following modifications to the goals and milestones as stated in Section 2.3.4.8 should be considered:

   - Complete dry weather screening and sampling (where flowing) of every MS4 outfall starting from the effective date and ending at the end of year 3.

- Begin catchment investigations in every problem and high priority catchment of the MS4 starting in year 3 and completed by the end of year 11.
- Begin catchment investigations in every low priority catchment of the MS4 starting in year 11 and completed by the end of year 15.

7. *Comment:* Sanitary sewer overflows are already prohibited and regulated at the Federal and State level under existing governing wastewater facilities. This will most likely create duplicative and potentially conflicting requirements for compliance.

   Recommendation: The MS4 permit should only discuss that SSOs could result in illicit discharges to the MS4 and should be investigated, documented and eliminated as part of the IDDE program.

8. *Comment:* There is a need for clarity in Section 2.3.4.5 as it pertains to the outfall/interconnection inventory. It does not specify whether inventories completed as part of the municipalities' MS4-2003 permit would be accepted should they meet the requirements as set forth in this Section of the new permit.

   Recommendation: Municipalities should be allowed to use data collected for outfall/interconnection inventory conducted as part of the MS4-2003 permit should it meet the requirements of Section 2.3.4.5.

9. *Comment:* There appears to be a disconnect in the requirements for initial illicit discharge potential assessment and priority ranking and the system mapping. According to Section 2.3.4.7.c.iii, the initial illicit discharge potential assessment and priority ranking must be completed within 1 year of the effective date and according to Section 2.3.4.6, system mapping shall be completed within 2 years of the effective date.

   Recommendation: The MS4-2003 permit only included MS4 outfalls as part of the mapping requirement and therefore the mapping will not have sufficient information to complete the assessment/ranking requirement. The required catchment assessment and ranking needs to be consistent with the system mapping requirement and have a completion date of 2 years from the effective date of the permit.

10. *Comment:* The timeframe restriction (March to June) associated with the requirements set forth in Section 2.3.4.7.d.iv as it pertains to wet-weather sampling during times of high groundwater levels does not make sense for IDDE. For example, if the System Vulnerability Factors (SVFs) indicate structural defects and exfiltration potential, then high groundwater would most likely hinder the investigation.

    Recommendation: The timeframe restriction should be revised to state that wet weather sampling be performed during conditions appropriate for the identified SVFs for each catchment area. This section should also contain examples similar to the one described above to assist the MS4 in making a proper decision about when to sample.

11. *Comment:* The requirements in Section 2.3.4.7.d.iv related to wet weather sampling are unclear. Inspections must be performed during wet weather, defined as sufficient intensity to produce discharge. It is not clear whether a discharge must be observed at every outfall to achieve compliance. Does the Town have to return to an outfall/interconnection repeatedly until a discharge is actually observed, even if substantial rainfall events have occurred? This could lead to a waste in resources (mobilizing staff, equipment, laboratory services) and seems unnecessary.

    Recommendation: This section should be revised to provide specific minimum storm event parameters for both time and rainfall amount so the municipality can make reasonable determinations as whether to conduct any screening and sampling. This minimum storm event should be one that will be sufficient to anticipate discharges at all outfalls/interconnections. It should also be stated that if a discharge is not observed at an outfall/interconnection during this minimum storm event, then sampling will not be required and the requirements for wet weather screening and samplings shall be considered satisfied.

12. *Comment:* The level of accuracy for each required sampling parameter is not provided in Sections 2.3.4.7.d.v & 2.3.4.7.d.vi.

    Recommendation: The permit must be revised to clarify the required level of accuracy for analyses.

13. *Comment:* Section 2.3.4.7.e lists one of the SVFs as "Any sanitary sewer and stormdrain infrastructure greater than 40 years old in medium and densely developed areas". This statement is too generalized since a majority of the MS4s have infrastructure greater than 40 years and are also mostly comprised of medium and densely developed areas.

    Recommendation: This SVF should be completely removed from the permit or at the very least only used for a community that has not recently (within 10 years) began a program to inspect/investigate their sewer infrastructure. Communities that have spent a lot of time and money investigating their sanitary systems should not have to be penalized by this generalization. This generalization will categorize many catchments as being high priority, hence wasting time and money on catchment investigations by requiring MS4s to complete all the investigations of high priority catchments within 5 years. There is already a more concise SVF to adequately aid MS4s in the ranking of catchments which relates to the intent of the SVF mentioned above which states " Sanitary sewer infrastructure defects such as leaking service laterals, cracked, broken, or offset sanitary infrastructure, directly piped connections between stormdrain and sanitary sewer infrastructure, or other vulnerability factors identified through I/I Analyses, Sanitary Sewer Evaluation Surveys, or other infrastructure investigations."

SECTION 2.3.5 – CONSTRUCTION SITE STORMWATER RUNOFF CONTROL

1. *Comment:* Part 2.3.5.c .iii requires that the small MS4 include requirements that applicable construction site operators implement a sediment and erosion control program that include appropriate BMPS. The concern is that this requirement is a duplication of those already in effect as part of the Massachusetts Stormwater Handbook.

   Recommendation: That this duplication in state and local requirements be eliminated, leaving the Massachusetts state requirements in place to regulate sedimentation and erosion control me asures. This will effectively duplicate existing state regulations.

SECTION 2.3.6 – MANAGEMENT IN NEW DEVELOPMENT AND REDEVELOPMENT (POST CONSTRUCTION STORMWATER MANAGEMENT)

1. *Comment:* Section 2.3.6.a refers to the development and redevelopment of "sites". The word "site" is subjective in nature and is not clearly defined.

   Recommendation: A clear definition of a "site" should be implemented into the permit. A proper and thorough review of this section cannot be made until this definition is clarified. If a "site" is too include roadway projects undertaken by the MS4, then it should exclude road work associated with rehabilitation projects (i.e. reclamation, mill & overlay, overlay) where the existing roadway is not to be widened.

2. *Comment:* Part 2.3.6.a.iii. requires that an as-built plan be provided no later than one year after the completion of a construction project. Again, this requirement duplicates requirements already in place as part of the Massachusetts Stormwater Handbook.

   Recommendation: That this requirement be eliminated as it duplicates the existing state requirement.

3. *Comment:* Part 2.3.6.b & c requires the development of two reports assessing the status of existing local regulations. The Town's concern is the amount of staff time required to prepare reports rather than spending that time on modifications to the current regulations to bring them into conformance with the new permit. The local planning board would ultimately need to hire a consultant, which would be a financial strain on the budget to create new guidelines.

   The Town appreciates LID strategies, but sees a conflict between these DRAFT guidelines and MassDOT's Complete Streets Standards and Site Design Standards. Under the Complete Streets program roadways are evaluated for bike lanes and pedestrian sidewalks. Narrowing of streets to reduce impervious surface limits the ability for communities to make transportation improvements that would improve the safety of cyclists and pedestrians.

   Recommendation: The Town is aware that the local regulations regarding street design and parking lots result in an excess of impervious surface and are an obstacle to Low Impact Development Best Management Practices. However, we see conflicting interests with MassDOT's Complete Streets Standards and Site Design Standards, as well as, New Fire Protection Standards that are going into effect January 2015 and the DRAFT Guidelines. A conversation between agencies regarding this conflict is suggested. In regards to the creation of two reports assessing the status of existing regulations we believe the Town's staff time would be better spent crafting revisions to existing regulations that reduce the amount of impervious surfaces and that encourage LID and appropriate BMPs and that could be promulgated through the Town Meeting process.

Comment: Part 2.3.6.d requires tracking of the changes in town-wide totals of impervious surfaces that are directly connected to MS4 discharges by sub-basin. The Town's concern again is the amount of staff time that must be devoted to the collection of this information, without a specific means of funding. The Dedham Conservation Agent, who would be directly involved in this reporting requirement, works twenty hours per week and has numerous statutory requirements to meet. This reporting requirement is onerous without a source of funding, which is problematic given the Town Meeting form of government, as mentioned above.

Recommendation: That this reporting requirement be reduced or that the time frame be extended so that it could be accomplished within the limitations of the budget for the Conservation Agent.

4. *Comment:* Section 2.3.6.d states that permittees shall tabulate its estimates of impervious area (IA) and directly connected impervious areas (DCIA) by the sub-basin as delineated pursuant to Part 2.3.4.6.a.i. Part 2.3.4.6.a.i does not make mention of sub-basins.

   Recommendation: If the intent was to have sub-basins mean catchment, then the permit should be revised accordingly. If not, a clear definition of a sub-basin should be provided.

SECTION 2.3.7 – GOOD HOUSE KEEPING AND POLLUTION PREVENTION

1. *Comment:* Section 2.3.7.a.iii requires the permittee to establish and implement procedures for sweeping, winter road maintenance and storm drain systems. Establishing written procedures for these items is wasteful on resources. These procedures will most likely end up in a recycling bin, file cabinet or on a shelf collecting dust. The time should be spend actual sweeping and cleaning catch basins rather than writing procedures. Actions are worth much more than useless written procedures when it comes to improved water quality.

   Recommendation: The establishment of procedures for these items should be removed from the permit. Again, actions speak better than words and by having the permittee required to report on what was actually

accomplished in a given year (i.e. lanes miles of roadway swept, catch basins cleaned, volume of sweepings collected) is far more important.

2. *Comment:* Section 2.3.7.a.iii.(b) requires the permittee to investigate the contributing drainage area for sources of excessive sediment loading whenever a catch basin sump is more than 50% full during two consecutive cleanings. Most communities in the Commonwealth have stormwater infrastructure that was constructed before stormwater standards were implemented. Therefore, many communities will likely have nontraditional sumps (less than 4 feet) that could even be as deep as a few inches. By having limited depths sumps on older catch basins means that a catch basin could easily accrue more than 50% of the sump depth in debris causing unwarranted investigations.

   Recommendation: This section should be revised so that only existing catch basins that have a minimum sump depth of 3 feet be required to conduct an investigation whenever a catch basin sump is more than 50% full during two consecutive cleanings.

APPENDIX H

1. *Comment:* Sections I.2, II.2, III.4, IV.5 & V.5 states that if a permittee wants to demonstrate that its discharge does not contain a certain impairment for which it has been identified, then at least 30 flow-weighted samples over a 2-3 year period from each stormwater outfall discharging to an impaired water must be collected from a variety of storm sizes to characterize a discharge properly.

   Recommendation: All of these sections of the permit should be revised to require sampling of outfalls during not more than 10 rainfall events. The EPA should simply provide a list or table of required rainfall events under which outfalls shall be sampled.

DEPARTMENT OF THE NAVY

Boston, MA 02109-3912

Dear Mr. Tedder:

SUBJECT: DEPARTMENT OF DEFENSE (DOD) COMMENTS ON THE NOTICE OF AVAILABILITY OF A DRAFT GENERAL PERMIT FOR STORMWATER DISCHARGES FROM SMALL MUNICIPAL SEPARATE STORM SEWER SYSTEMS (MS4s) IN MASSACHUSETTS

As the Department of Defense (DoD) Regional Environmental Coordinator (REC) for U.S. Environmental Protection Agency (EPA) Region I and on behalf of the military services, the Commander, Navy Region Mid-Atlantic is responsible for coordinating responses to environmental policies and regulatory matters of interest. We appreciate the opportunity to provide comments for your consideration on the reissuance of the subject permit. Our comments are attached.

If you have any questions, the technical point contact for this matter is Mr. William Bullard, Senior Water Program Manager, at (757) 341-0429 or william.bullard1@navy.mil; or Commander Mark P. Nevitt, JAGC, USN, at (757) 322-2938 or E-Mail mark.nevitt@navy.mil.

Sincerely,

SEAN S. HEANEY
Director for Regional
Environmental Coordination
By direction of the Commander

Enclosure

Copy to: U.S. Air Force REC, Regions I, III (Mr. Ron Joyner)
U.S. Air Force REC, Water (Mr. John Gordon)

DOD COMMENTS ON THE NOTICE OF AVAILABILITY OF A DRAFT GENERAL PERMIT FOR STORMWATER DISCHARGES FROM SMALL MS4s IN MASSACHUSETTS

Part 2.3.6. Stormwater Management in New Development and Redevelopment

Comments on Part 2.3.6.a.ii.(a). The draft permit requires that all stormwater management systems on new and re-developed sites be designed to retain the first inch of runoff from all impervious area, or meet an optional standard to retain a portion of the first inch and treat the remainder. The Fact Sheet, however, explains that it is not intended to require the capacity to retain or treat the runoff from every storm that produces one inch of runoff from impervious area under all circumstances, as that would substantially increase the design volume of the system and significantly increase the cost of implementation. Fact Sheet page 88. Instead, this is a "quantifiable target for program implementation." Fact Sheet page 88.

The flexibility explained in the Fact Sheet is not reflected in the proposed permit terms of Part 2.3.6.a.ii.(a). This flexibility should be captured in the permit terms in order to be consistent with EPA small MS4 regulations at 40 C.F.R. § 122.34 ("attempt to maintain pre-development runoff conditions") and the Clean Water Act's mandate to "require controls to reduce the discharge of pollutants to the maximum extent practicable." 33 U.S.C. § 1342(p)(B)(iii).

With respect to the retention/treatment standard, Part 2.3.6.a.ii.(a)2 states that the on-site runoff retention practices be implemented "where technically feasible." The Fact Sheet, however, states there is enough flexibility in the retention/treatment standard to allow retaining on site the maximum amount of runoff "feasible" and providing treatment for the remainder. Fact Sheet page 89. Use of the term "feasible" is more closely aligned with the Clean Water Act statutory language of "maximum extent practicable" and includes cost considerations, unlike "technically feasible." Using "feasible" in place of "technically feasible" will avoid confusion with using a new term, and is consistent with the permit's already existing "maximum extent practicable" standard set forth in Section 2.3 of the permit.

Recommendation on Part 2.3.6.a.ii.(a): Add "the maximum extent practicable" to state, "Stormwater management systems on new and re-developed sites shall be designed to the maximum extent practicable . . ."

Recommendation on Part 2.3.6.a.ii.(a)(2): Delete "technically" to align the permit with the Fact Sheet to read, "[t]his standard shall be met through a combination of practices designed to retain runoff on site….where feasible . . ."

Comment on Part 2.3.6.a.ii.(d). This section of the draft permit requires that "All BMPs installed as part of the site's stormwater management system shall be constructed in accordance with The Massachusetts Stormwater Handbook Volume 2 Chapter 2." The Stormwater Handbook provides guidance for compliance with the Massachusetts Stormwater Management Standards. However, these standards are only implemented through the Wetlands Protection Act Regulations and the Section 401 Water Quality Certifications Regulation. Hence, they apply to the specific activities and locations they cover. The draft permit is, therefore, requiring compliance with the standards/handbook beyond what is authorized in current regulation.

In addition, the Fact Sheet is clear that the "Draft Permit does not mandate the use of a particular technology to retain the first inch of runoff on-site, which provides maximum flexibility . . . to use the vast array of Low Impact Development (LID) and green infrastructure techniques during site design to meet the standard in the most economical way possible." Fact Sheet page 88. The Massachusetts Stormwater Handbook briefly speaks to the potential to use alternative technologies not listed in the Tables, but there is insufficient information provided on the process to submit an alternative technology for review and approval. Moreover, the potential to consider alternative technologies is absent from the permit itself. In addition, while structural BMPs should consider Volume 2, Chapter 2 of the Massachusetts Stormwater Handbook, structural BMPs may not be the most appropriate BMP for the site.

Recommendation on Part 2.3.6.a.ii.(d): Add "structural" prior to BMP. Insert "consider" and delete "be constructed in accordance with" to read: "[a]ll structural BMPs installed as part of the site's stormwater management system shall consider The Massachusetts Stormwater Handbook Volume 2 Chapter 2." Add "alternative structural BMPs not currently listed in the handbook can be submitted for review and approval."

Comment on Part 2.3.6.d.iii: This section requires the permittee to complete an inventory and priority ranking of permit-owned property and existing infrastructure that could potentially be modified or retrofitted with BMPs to reduce the frequency, volume, and pollutant loads of stormwater discharges. This section would thus appear to extend beyond "stormwater management in new development and redevelopment" sites. Practicality, feasibility, and cost are not listed as considerations the permittee must use in developing the priority ranking. However, the Fact Sheet on page 91 recognizes that properties can be retrofitted "where it is practicable" and states the Draft Permit requires evaluating the "feasibility of reducing the [Directly Connected Impervious Area] on permittee-owned properties," which would involve feasibility and cost.

Recommendation on 2.3.6.d.iii: Add "The permittee should also consider factors such as practicality, feasibility and cost."

Part 5.1.1 Public Education. "For the purpose of this permit, the audiences for a Non-traditional MS4 include the employees, clients and customers (including students at education MS4s) or visitors to the property, and any contractors working at the facility where the MS4 is located... The permittee shall document the educational topics for each target audience in the SWMP and annual reports."

Comment: This permitting provision only applies to non-traditional MS4s to include "properties owned and operated by the United States." In Part 2.3.2.b. the audiences for the public education program of traditional MS4s only includes people who live or work in that MS4 community. It does not include visitors or others with a temporary connection to the MS4. We appreciate the flexibility provided in tailoring the educational topics.

Recommendation: Revise the language to be more consistent with the audiences for MS4s to read (added words italicized): "For the purposes of this permit, the audience of non-traditional MS4s includes the employees, customers, tenants, and long-term contractors working at the facility where the MS4 is located."

Part 5.1.3 Assessment of Regulations. "Non-traditional MS4s do not need to meet the requirements of Part 2.3.6.c. Non-traditional MS4s shall instead evaluate opportunities to manage and reduce stormwater discharges by including green infrastructure practices in new development and redevelopment at

their facilities. Non-traditional MS4s shall evaluate opportunities to manage and reduce stormwater discharges by reducing the amount of impervious cover due to parking areas and walkways and create an implementation plan and schedule for implementation of practices to reduce impervious area. The permittee shall complete the implementation plan on the schedule the permittee creates as part of the plan.

Comment: Part 2.3.6.c only requires traditional MS4s to assess existing local regulations and report on the feasibility of making certain green infrastructure practices allowable. This Part does not specifically address retrofitting at all. Part 2.3.6.d which applies to all permittees discusses evaluating the potential for retrofits but only requires an inventory and priority ranking. The requirement to submit a retrofit implementation plan and schedule and to implement same is a higher substantive requirement for non-traditional MS4s, including DoD.

Recommendation: Exclude non-traditional MS4s from the requirements of 2.3.6.c and 2.3.6.d. Alternatively, retain only the first two sentences in 5.1.3 or align the requirements of non-traditional MS4s with the requirements of traditional MS4s to ensure equitable and fair treatment across all regulated entities

Fact Sheet, Page 96: This portion of the Fact Sheet states that Federal MS4 permittees should consider the standards in Part 5.2 of the Draft Permit as a minimum requirement and should adopt post construction stormwater standards that fulfil the requirements of §438 of the Energy Independence and Security Act (EISA) as well as Part 5.2 of the Draft Permit.

Comment/Recommendation:
While not part of the permit, please note that the requirements under EISA § 438 are not related to the "control and abatement of water pollution" obligation for federal facilities set forth in the Federal Facilities Pollution Control provision of the Clean Water Act (33 U.S.C. § 1323(a)). DoD is already implementing the provisions of EISA § 438, consistent with EPA's EISA § 438 technical guidance, using Low-Impact Development techniques in accordance with DoD policy

Subject: EPA's Request for Comments Regarding draft Small Municipal Separate Storm Sewer System (MS4) National Pollutant Discharge Elimination System (NPDES) general permit for Massachusetts

Dear Reviewer,

This letter constitutes comments from the Town of Dracut, Massachusetts Stormwater Coordinator in response to EPA's request for comments on proposed changes to the NPDES MS4 Stormwater Permit Program. Dracut is committed to partner in protecting and maintaining water quality by improving our Stormwater System to reduce potential impacts. Given our limited revenue opportunities and stagnant or declining state funding sources, Dracut must ensure that public funds are used as efficiently and effectively as possible. Therefore we respectfully request that proposed changes in Stormwater regulations contain requirements that are flexible, directly aimed at improving water quality, based on proven science and has regard for persistent budgetary pressures.

We are particularly concerned with language in section 2.1.1 subsection (a) of the General Permit – *Requirement to Meet Water Quality Standards.* The section states "The permittee shall reduce the discharge of pollutants such that the discharges from the MS4 do not cause or contribute to an exceedance of water quality standards." Local Governments in the vast majority of cases, do not contribute or produce pollutants referenced in this section since they are held to a "higher standard" with regard to procurement and use of hazardous materials than its residents or businesses. It appears from our standpoint that many of the referenced pollutants emanate from processes that our municipality has little or no control over. It strikes me as unrealistic to require actions at the local level to clean up pollutants that can be more efficiently and effectively addressed at the State and Federal level that addresses source reduction.

A common recurring issue in this permit as well as the 2003 permit is funding. At the risk of being repetitive, this issue is persistent in our municipality and adjacent municipalities. We understand the current climate of funding opportunity and understand that it affects all governmental agencies including EPA. However, what is particularly frustrating is that the Federal Government is silent with regard to providing local agencies with legislative authority to establish entities that would bring about revenue to achieve the goals established by the EPA. Officials such as myself are burdened with compliance tasks and threat of fines for noncompliance while competing for funds required for other municipal departments tasked with Education, Public Safety, Public Health and Administration without any assistance from the Federal Agencies that promulgated the rules in the first place. It is extremely difficult to present the concept of a utility to pay for Stormwater expenses to a community that has become accustomed to not paying for it and views Stormwater as less of a priority than Public Safety or Education.

There are several aspects of the permit that appear to utilize a "one size fits all" approach which can be inefficient. The requirement of wet weather sampling for all outfalls that have at least one vulnerability factor, as specified in the IDDE section of the Draft Permit is a good example of this. Wet weather sampling will require extensive effort and increased funding with little assurance of any appreciable environmental benefit. The Permit should allow municipalities to develop a more targeted approach; identifying areas to sample that exhibit the highest likelihood of illicit connections based on local and inherent knowledge of their system. Based on results from the foregoing, municipalities could assess other areas to be sampled, avoiding diminishing returns. Basing the need for wet-weather sampling on the potential presence of one vulnerability factor would likely require any developed area regardless of density to be sampled. Many areas of Dracut could be categorized as having one vulnerability factor while possessing a low potential for contaminated wet-weather discharge. Many of our DPW personnel have the historical knowledge to readily identify problem areas and would be much more effective utilizing that approach as opposed to sampling every area. The comprehensive nature of field inspection, sampling, written plan development and reporting requirements are daunting. Transportation engineering reveals that a corridor with numerous regulatory signage and controls leads to confusion and resentment while a simpler and targeted approach yields more compliance and respect. A Stormwater permit that is rife with requirements may have a similar effect.

The permit should provide for more opportunities to develop a more phased or targeted approach which continually assess benefits while evaluating methods and funding based on site specific data. Also in reviewing the permit, the regulations appear to be "all stick and no carrot"; there should be incentives for compliance and not just fines and penalties for noncompliance.

In closing I would like to offer the following recommendations:

- Additional regulation of industry and commercial agencies with regard to Stormwater discharge at the Federal level to lessen the burden on local communities. Local communities can be a partner is this effort, however Federal agencies possess enhanced powers of enforcement.

- Regulations at the Federal level that empower local agencies to establish funding mechanisms. Perhaps a Federal tax tied to impervious area. Such action will shift resentment away from local officials trying to comply with federal regulations with minimal available local resources.

Sincerely,

Glen Edwards

RE: Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. We wish to add our voice to the numerous others who have put forth comments in the state of Massachusetts. The concerns enumerated below constitute "reasonably ascertainable issues" developed on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), and practical experience implementing the program over the preceding eleven (11) years of the existing permit term. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit. The initial comments refer to conditions associated with "Requirements to Reduce Pollutants to the Maximum Extent Practicable" (the six Minimum Control Measures [MCM]); the latter comments refer to conditions related to "Water Quality Based Effluent Limitations (WQBELs)." General comments follow thereafter.

Comments

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **MCM 1 – Public Education and Outreach**: Although not explicitly required under the permit, EPA has repeatedly suggested that introducing stormwater quality-related topics in school curricula would be an appropriate and cost-effective means of achieving MCM-1 objectives. Experience has demonstrated that statutory subject requirements within most school systems makes it very difficult to introduce non-mandatory (or non-MCAS related) material. Cost estimates related to achieving the minimum requirements of this MCM appear to be under-representing the broad audience targets and should not assume school programs as the basis for cost estimates.

2. **MCM 3 - IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm drain and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification*: Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.
    b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification*: Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification*: Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

d. **Catchment Investigative Procedure (2):** : EPA states, "This review shall be used to identify areas within the catchment with higher potential for illicit connections and System Vulnerability Factors that indicate a risk of sanitary or septic system inputs to the MS4 under wet weather conditions." Septic systems are not designed to remove nutrients and may discharge nutrients to an MS4 through groundwater. Septic systems can comply with MA Title 5 (310 CMR 15.00) and still discharge nutrients. Are septic systems considered an illicit connection if they discharge nitrogen and phosphorus to groundwater? Do the Clean Water Act and this MS4 permit override MA Title 5 and therefore limit septic systems from discharging any amount of nitrogen or phosphorus indirectly to an MS4, even though they do not violate the state's Title 5 permitting program? *Proposed Modification*: EPA should set a concentration limit, consistent with other regulations,that may trigger mitigation action under this permit's regulations.

3. **MCM 3 - IDDE Mapping:** New mapping requirements relating to sewer infrastructure under the IDDE MCM are a significant concern, as they not only require mapping of all storm drain components, but now must include sanitary sewer infrastructure "where available" and knowledge of asset conditions relative to both storm and sewer systems in order to implement procedures related to prioritization and execution of catchment investigations on the basis of the System Vulnerability Factors. This level of asset inventory, condition assessment, mapping and documentation represents an effort that could take much longer than the two (2) year deadline in the permit. Based on the dynamic and cumulative documentation relative to investigations and program progress, it is also clear that communities are virtually required to develop this mapping and condition assessment as part of a GIS database. For communities that have not begun or are in early stages of GIS development, two years is certainly an inadequate amount of time. The "where available" language relative to sewer mapping (Section 2.3.4.6 (a) (ii)) is itself problematic because it is not clear to what extent the MS4 operator, who may be different than the sanitary sewer system operator, is required to obtain, develop or update sanitary sewer mapping elements that could influence catchment prioritization or wet weather screening obligations through the course of the permit term. *Proposed Modification*: Extend deadlines for storm system mapping requirements to Years 4 or 5 and make all sanitary sewer mapping voluntary or "recommended" rather than required.

4. **MCM 3 - Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties

under separate permit programs in the event of an SSO excursion. *Proposed Modification*: Elimination of this requirement.

5. **Affordability; Estimated Program Cost Increases**: EPA directs MS4 owners to the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report for reference regarding anticipated program cost increases (administrative, operating and capital) under a variety of scenarios. This document, and subsequent evaluations conducted for Upper Charles River watershed communities indicates that program administrative/operational costs alone will range from double to quadruple existing expenditures. More recent updates to these figures for the communities that were the subject of EPA's detailed analysis indicate that, if anything, these estimates are under-representing the magnitude of cost increases. Capital costs to comply with the TMDL requirements embedded in the permit are estimated in the tens of millions of dollars. The enormous gains in water quality under the Clean Water Act in the first two decades after passage were achieved through a locally affordable program aimed at primarily wastewater-related point source discharges, and underwritten by state and federal funding equivalent in many cases to 90% of the program capital cost. Stormwater-related pollutant contributions to receiving water bodies are much more difficult to control and will achieve an incremental water quality improvement compared to the wastewater discharges that were the target of initial infrastructure investments. It is inconceivable that the estimated costs of this MS4 program can be affordably sustained by a limited number of property owners within communities subject to the most stringent pollutant reductions. Water quality improvements have local, state and national benefits. A program that EPA and other environmental organizations (regulatory, advocacy/non-profit or commercial) recognize as this important should have some kind of legislative or Congressional support that provides adequate funding to promote programs that can achieve water quality improvements in a more equitable and financially sustainable manner.
6. **Regional or Alternative Implementation Opportunities**: Many of the sustainable funding alternatives explored in the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report refer to opportunities for working with designated dischargers (DD) in some capacity. The Residual Designation Authority (RDA) Draft Permit has not progressed in some time, and there is little information available as to the likelihood of this permit ever becoming final. In addition, under current conditions, it applies to a very small number of communities (Bellingham, Franklin and Milford). Private properties are a major contributor of pollutants to MS4 discharges, however, this RDA mechanism is an unwieldy approach to incorporating private activity into pollutant control. Without passage, however, private property owners have no incentive to collaborate with local authorities regarding operation of sites that were designed and constructed in accordance with local stormwater regulations in place at the time of development. It is unrealistic to include any of the funding scenarios that include cooperation or collaboration with a group of designated dischargers that do not exist today, are unlikely to be designated in the near future, and are unlikely to voluntarily engage in a complex and costly program without measurable benefit to them directly.
7. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in

your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

8. **Definitions – Redevelopment**: The term "redevelopment" is nowhere defined in the permit or appendices. Given that EPA is requiring "redevelopment" projects to meet the new development design guidelines for stormwater management (and particularly in reference to the one-inch retention/treatment provision), it is important to know what constitutes redevelopment versus rehabilitation, restoration, maintenance or repair projects. This is particularly of concern as it relates to transportation-related projects such as pavement programs (full depth reconstruction, pavement overlays, chipping, etc.), and the possibility that routine maintenance could trigger requirements for significant drainage improvements that would not otherwise be appropriate or necessary for operational purposes. *Proposed Modification*: Define redevelopment to exclude roadway projects that do not add significant new paved acreage.
9. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.
10. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.
11. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MassDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design

standards and by-laws. This permit represents a divergence from the MassDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.

12. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MassDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.
13. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b),the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in its best interest.
14. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO Long Term Control Plan programs.

Water Quality Based Effluent Limitations (WQBELs)

15. **Source Reports and controls**: With this MS4 draft some Municipalities are required to submit source reports for certain WQBELs. The cost of producing the reports and the control measures are high when coupled with the other requirements of the NPDES permits. Program affordability is again called into question. Furthermore, the program is experimental and the likely effectiveness of it is unknown.
16. **Sampling:** Communities can perform a sampling plan to show that specific outfalls are not contributing nutrients or bacteria, but the sampling protocol outlined in the draft permit is onerous and could be difficult or impossible to complete depending on precipitation events. *Proposed Modification:* Allow grab samples, and reduce the number of samples required.
17. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.
18. **Phosphorus Load Export Rates – Appropriate Use:** Regarding Appendix F and attachments, the Phosphorus Load Export Rates (PLERs) are general and approximate at best. The composite PLERs are good for screening / planning purposes or comparative purposes. They are not accurate for determining hard design of control measures. For example, they can be used to evaluate whether a proposed change in land use is expected to increase or decrease pollutant loads. But to use a PLER to conclude that the loading rate is actually X lbs/yr, or will change from Y lbs/yr to Z lbs/yr with land use or other changes, is not a recommended technical practice. Loading rates are ordinal rather than cardinal, i.e., they can tell you if one is higher than another, but not exactly how much higher one is than another. It appears that EPA assumes that over the entire Commonwealth of Massachusetts, using PLERs will represent the average condition. That may be true, but EPA is requiring that the PLERs be used to make decisions on a much smaller watershed and sub watershed scale, which is inappropriate.
19. **PLERs - Derivation:** It is not clear how the values for PLERs in the EPA documents are derived, however, a literature search shows that there is a large range of values for any given land use. For example, the PLER for medium density residential is given as 0.55 lb/ac/yr in Table 1-1 (App. F Attachment 1), but the range of PLERs for medium density residential in the scientific literature can be an order of magnitude around the value. Please provide further information regarding derivation of the PLERs since these values have significant impact on program implementation for regulated communities.

20. **PLERs – Blanket vs. Site Specific:** PLERs found in older literature generally do not reflect the presence of stormwater BMPs, low impact development (LID) planning, etc., and therefore may overestimate pollutant loads for current land uses. In addition, composite PLERs are a particular concern for communities that have previously instituted stricter local development standards for stormwater management many years ago (in some cases, decades) where assumed PLERs may be much greater than actual conditions. *Proposed Modification:* Rather than limiting appeals of assumed baseline watershed phosphorus loading to updates of land use information, allow permittees the option to develop their own alternative methodology for determining baseline phosphorus loads and reduction requirements based on more detailed data and/or site specific information.
21. **Ambiguity in Determining Contributing Drainage Area:** It is not clear in Appendix F and its pertaining attachments whether the permittee will be using the impervious area or the directly connected impervious area (DCIA) in the PLER calculations, which includes factoring in DCIA in determining PCP area. The phosphorous loads should be determined from the DCIA of a target catchment, but this is not explicitly mentioned in either Appendix F or its attachments. The only explicit mention on DCIA is in Appendix F under sections "Phosphorous Source Identification Report" and "Nitrogen Source Identification Report" which simply state that the source identification report should include the "Impervious area and DCIA for the target catchment." There is no mention of how this DCIA information needs to be used, for example, in determining either the PCP area, total development area, impervious area (IA) for calculating phosphorous reduction credits for non-structural BMPs, or in distributing the total drainage area into impervious area for BMP load and volume calculations. In all the above instances, DCIA should be considered, rather than total impervious area. This needs to be clarified in the new permit.
22. **Determining Infiltration Rate for Structural BMPs:** Attachment 3 of Appendix F specifies identification of infiltration rate for a particular BMP when determining the design volume of a structural BMP to achieve a known phosphorous load reduction target from a contributing drainage area. However, it is not clear how the infiltration rate needs to be determined. It is stated that the infiltration rates represent the saturated hydraulic conductivity of the soils. Since saturated hydraulic conductivity of soils is a function of its hydrologic soil group, it is important to mention how this rate needs to be determined for a combination of soil types. Please provide further guidance to determine infiltration rates for an infiltration type structural BMP, such as an infiltration trench or infiltration basin.
23. **Choosing BMP Performance Curve for Multiple Combination of BMPs:** Attachment 3 of Appendix F provides several BMP performance curves for different types of structural BMPs. However, the permittee may choose a combination of BMPs to achieve a desired phosphorous load reduction. It has been noted through literature search that a combination of BMPs may be more effective in capturing larger storms, and hence will be more effective in providing desired phosphorous load reductions from these storm events. For example, if a bio-retention system is coupled with a secondary spillway to a porous pavement, it has been found from literature that this combination is effective in capturing the first 1" rain (first flush) and higher flows, respectively. In such a situation, it is not clear what BMP performance curve should be referenced and how the curve(s) need to be used by the permittee. Please

provide further documentation regarding the method to determine BMP performance curves for a combination of BMPs.

24. **Appendix H. II (1)(a)(i)(3) Additional /Enhanced BMPs for Phosphorus-Impaired Waters:** Under the Good House Keeping requirement, permitees are required to increase frequency of street sweeping to at least twice a year for **all municipal streets and parking lots.** This requirement should be related exclusively to those streets within the impaired catchment, not all streets/ parking lots in the Town. It might be what was intended, but that is not how the language reads and should be modified.

Other Issues

25. **Non-Stormwater Discharges**: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." Explicit guidance is necessary regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges.
26. **Town Administration Outreach**: In most communities responsibility for permit compliance resides with Public Works or similar agency officials. Boards of Selectmen and/or Town Managers are often not involved in program administration outside of procurement or appropriation processes for identified projects. Their lack of understanding and support to local implementing agencies has been a continuing challenge. EPA and/or DEP must increase their involvement in educating Town officials about the extent, costs, operational impacts and policy determinations incumbent on program administrators to ensure continued organizational support, particularly for funding strategies.
27. **Floor Drain Inventory:** It is appropriate and appreciated that this requirement has been removed from the Draft Permit.
28. **Errors:** A number of errors in referencing were noted in the document. The ones we noticed are listed below, there may be more. Please carefully check all cross references in the preparation of the Final Permit and correct the following errors:

- Page 12 – change references from Table F-5 to Table F-6
- Page 14 – change references from Table F-6 to Table F-8
- Page 14 lists reference to Buzzards Bay but there is no Nitrogen TMDL for Buzzards Bay watershed on DEP's website
- Page 14 list does not include Wareham although Wareham is in Buzzards Bay watershed
- Page 15 change reference from Table F-7 to F-9
- Page 17 – reference to Table F-10 is incorrect (that is a table of Assabet towns)
- Appendix F page 5 of 53 – footnote No. 4 incorrectly references Table F-2 for PCP area scope inclusive of MS4 only (should be Table F3) and references Table F-1 for jurisdiction-wide PCP area (should be F-2)
- Section I.1.c.iii, page 44 of Appendix F references Table 4-3 of Attachment 1 to Appendix H. There is no such table in Appendix H.

As you have assuredly noticed, we are echoing the comments from just about every MS4 community in the state of Massachusetts. Your serious consideration of our comments and concerns, and those of all the other affected communities in the state, shall be greatly appreciated.

Respectfully submitted,

Joseph I. Pipczynski

Subject: Submittal of Comments and Concerns
September 2014 Draft MA MS4 General Permit

Dear Mr. Tedder:

This correspondence provides our comments on the Environmental Protection Agency's (EPA) 2014 Draft of the Massachusetts Municipal Separate Storm Sewer System (MS4) Permit regulated under the National Pollutant Discharge Elimination System (NPDES). Although we certainly agree with the EPA's goal of removing pollutants from stormwater runoff, we find that many of the permit requirements are burdensome while providing minimal benefits to our waterways and resource areas. We appreciate some of the steps that the EPA has taken in relation to the 2010 Draft Permit, by minimizing some of the less-effective requirements and extending the time table of numerous requirements.

General Comments

1. Currently the City of Fitchburg (City) is under a Consent Decree from the EPA, which mandates the City upgrade its sewer system to meet the Clean Water Act. As a result of all the improvements required under this Decree, the City has raised sewer rates exponentially. This increase is causing the annual combination of water and sewer service costs be near 4.5% of the median household income (MHI) in the City, which is the maximum amount recommended by MassDEP. Adding an additional fee for stormwater will push these costs over the 4.5% limit.
2. In the current economic climate, implementing new fees to assist in funding storm water improvements will most likely be met with stiff resistance. Many requirements of the permit have a low cost-benefit ratio, and will require high capital costs. We recommended the EPA concentrate on requirements that will have the most impact for the least amount of municipal financial resources, such as public education and outreach, and implementing regulations that emphasize low-impact development. Many of the "hard" requirements, such as increased street sweeping, catch basin cleaning, and outfall monitoring are very time consuming and costly. These types of procedures will require additional staff and equipment, with most likely minimal improvement in water quality, as they do not address

infiltrating runoff from impervious surface, which has the largest negative impact on stormwater quality.

3. The sampling requirement of outfalls and subsequent catchment investigation is excessively onerous and will most likely cost in the hundreds of thousands of dollars, for what will amount to a small amount of previously unknown illicit discharges detected. The cost-benefit ratio for this requirement appears to be small. We feel funds for this task would better be delegated to installing a stormwater treatment BMP at a city-owned property, such as a city-owned parking lot or park. Completing a BMP in these high-visibility areas presents an opportunity to inform the public about stormwater issues, and also guarantee a level of stormwater treatment in a high-use area.
4. Although extensive research has shown that runoff from impervious surfaces contributes to decreased water quality, we feel there is limited research that shows all the requirements in the Draft Permit will lead to increased water quality. We ask that the EPA conducts a case study in Massachusetts. The case study would consist of rewarding one community based on a written grant application, where the EPA or MassDEP funds and conducts all the requirements in the Permit. Outfalls and waterways would be monitored, over a 5-year term, to determine if water quality increases and to what extent. After the 5-year term, a report would be produced identifying which aspects were most effective and had the highest cost-benefit ratio. From the results a more effective and direct permit could be produced and applied to communities.
5. As with many communities in Massachusetts, budgets are strained in the current economy. The remainder of our infrastructure, not just our stormwater infrastructure, is in great need of repair. The City of Fitchburg is an aging mill city in the lower echelon of median household income in Massachusetts. We feel the limited available funds of our municipality and our citizens would best be spent on improving our roads, sidewalks, municipal facilities, and water distribution system. This infrastructure is in greater need of repair than our stormwater system, and will have a greater impact on quality of life. We receive relatively few complaints or concerns about water quality in the Nashua River or other water bodies, however we receive constant criticisms about our remaining infrastructure.
6. This is an unfunded mandate. If the Federal Government does not have funds to even partially pay for the requirements of the permit, it seems unreasonable that small and struggling communities be expected to fund it?
7. In the past, the EPA and MassDEP have relied upon municipal DPWs and Engineering Departments to convey information about the MS4 Permit to local elected and administrative officials. It is often up to these departments to explain why the permit is needed, the requirements of the permit, and the associated costs with implementing the permit. This approach leads to these

municipal departments conveying the details of a permit which they did not write or develop themselves. We appeal to the EPA to take a more "hands-on" approach to the MS4 Permit, by reaching out directly to elected municipal officials, mayors, and selectmen, in via e-mails, letters, or pamphlets, or informational sessions. Using these methods, questions and concerns can be relayed directly from officials who serve local citizens, to the agency who developed the permit.

8. We recommend the EPA be at the forefront of the education requirement by placing nationwide newspaper ads and developing stormwater education into school curriculum. The best way to raise nationwide awareness about a nationwide problem is to start at the national level. Stormwater impacts can occur in all communities and areas, not just areas within MS4 jurisdiction. It is important to educate people in all communities, as currently rural areas, and other areas outside the MS4 jurisdiction may see increased development, and hence more negative stormwater impacts.
9. We ask the EPA and State to collaborate on a state regulation that mandates communities develop a stormwater utility. This would be similar to what has been completed in the State of Maryland (*Stormwater Management Watershed Protection and Restoration Program*). By initiating this requirement on the state level, there will be less resistance from residents in each community that attempt to set up a utility, as the municipality is obligated by state law to do so. However, we still ask that our suggestions within this letter are taken into consideration, to reduce the burdensome user fees that will need to be collected as a result of the new permit.
10. For the past several years Fitchburg has consistently ranked in the top 2-3% of all Massachusetts communities in both foreclosure and distressed property rates. The additional cost burden of implementing the proposed MS4 Regulations without allowing for more targeted and cost effective approaches to achieve the intent of the regulations may very well exacerbate the ravages of abandonment and foreclosure in our community, which in turn will further erode the very tax base upon which we must rely to cover the costs of this unfunded mandate.

Specific Permit Comments

Section 1.7 – Obtaining Authorization to Discharge

1. 1.7.2.d - We request that the MS4 Permit requirement deadlines start at the date an "acceptance" is granted by the EPA for a Permittee's Notice of Intent (NOI). The first 90 days after the final permit is published will be spent by communities developing the NOI, with the following 30 days slated for public comment on the NOI. This effectively shortens the time frame to complete a task by 4 months or more.

Section 2.3.2 – Public Education and Outreach

1. 2.3.2.d.iv – The "industrial program" educational requirement should be conducted by the EPA. These industries are regulated directly by the EPA under the MSGP Program, with no input from the municipalities. It would be more effective for the EPA to develop and distribute these materials, as the EPA could track the amount of new registrations within the MSGP Program more effectively.
2. 2.3.2.d.e – Tracking a change in public opinion and behaviors is a slow and evolving process. Tracking the effectiveness of the public education and outreach program is a difficult and time-consuming task, especially on a yearly basis. We recommend an evaluation of the education program be conducted in the final permit reporting year (or every 5-years). Making this adjustment will allow for a more realistic time period of gauging the public's actions and the education program effectiveness. Any results of the program evaluation can be used in implementing the public education program in the next permit term.

Section 2.3.4 – Illicit Discharge Detection and Elimination (IDDE) Program

1. 2.3.4. – As part of the City's Consent Decree with the EPA for its Wastewater Operations, a full CCTV and evaluation of the sewer collections system is required. During these operations, the sewer is being investigated and evaluated for condition, illicit connections, inflow/infiltration, and proper and legal connectivity. During this operation, almost all illicit discharges to the storm drain system would be detected. The amount of service connections will be verified on each street to ensure the total amount of services matches the number of dwellings on a specific street, greatly eliminating the possibility that a sanitary service is connected to the storm drain. We recommend that the EPA reconsider extensive IDDE in communities where a full sewer collections system investigation and evaluation is being conducted.

2. The City has recently separated tens of thousands of linear feet of combined sewer. In these areas it is extremely unlikely that an illicit discharge exists, as new catch basins and drains were installed in almost every street where construction took place. During construction, it is relatively easy to identify an illicit discharge as all buried infrastructure is exposed, and all intersecting drain lines and laterals are reconnected properly. We request that an exception to IDDE be provided for areas separated within the last 20 years, as a large financial expense will be required for investigation in areas where it is unlikely that many, if any, IDs will be found.
3. 2.3.4.2.b – The draft permit states that the 60-day period allowed to correct an illicit discharge is not a grace period and the discharge remains unlawful. We request this statement be struck from the permit, as it exposes municipalities to enforcement action immediately upon discovering an ID. These seems unreasonable, and effectively contradicts the statement that a permittee has 60 days to rectify the situation.
4. 2.3.4.4 – As part of the City's Consent Decree with the EPA, a full investigation of SSOs have been mapped and identified, including all manholes with twin inverts. The City is actively monitoring each SSO location, including twin invert manholes, and has to report this information to the EPA with a timetable for removal. We request that the SSO requirements in the permit be removed for communities in our situation. The requirement effectively will double the City's efforts by submitting the same information to the same agency for minimal, if any, benefit.
5. 2.3.4.6 – The City has thousands of catch basins and manholes, many of which are cross country or paved over. Mapping all of these features is daunting to complete within the two year permit term, especially if a municipality would like to use its own staff or volunteers to save funds. Confirming connectivity of the system will also be a time consuming task as much of the infrastructure is over 100-years old with no records, this will require tedious and time-consuming dye testing and CCTVing in many instances. We recommend that the mapping of the system be completed within 5-years. In addition, without an accurate system map, implementation of the Catchment Investigation Procedure of the IDDE Program will be difficult to conduct, especially on large catchments.

Section 2.3.4.7 – Written IDDE Program

1. 2.3.4 – The catchment assessment/ranking and the outfall sampling are overly complicated for what will amount in most communities, to only a few illicit discharges detected. For the few illicit discharges that are currently occurring, they most likely have been occurring for years. The permit requires that **all** catchments are investigated in 10 years, eliminating the need to rank and prioritize catchments. For instance, if an ID has been

occurring for 30 years, the impact of the ID occurring for a few more years seems minimal compared to the burdensome expense and time it will take to prioritize and rank all catchments. In addition, the outfall sampling requirements are also unnecessary. If all catchments need to be investigated, most IDs are almost certain to be found during the task of inspecting manholes (in non-combined systems), eliminating the need to sample outfalls.

2. Vice-versa to the above, if we are conducting outfall sampling in wet and dry weather in areas with a System Vulnerability Factor, it seems ill-advised to proceed with the Catchment Investigation if no water quality issues were noted by the sample results. It appears we'd be looking for IDs where none exist, or at a minimum, where no IDs are impacting the receiving water. We are in favor of conducting dry weather inspections of outfalls, similar to the 2003 MS4 Permit, especially in areas with a separated sewer/drain system.

Section 2.3.5 – Construction Site Stormwater Runoff Control

1. 2.3.5 - Although it is important to have local enforcement on construction site stormwater issues, the permitting aspect should be regulated on the national level, and should be part of the EPA's Construction Stormwater Permit Program. As stated previously in this letter, stormwater impacts are a nationwide issue. Many contributing areas to the Nashua River for instance, are not within MS4 jurisdiction, however these areas could have construction stormwater runoff issues, which impact the river downstream in Fitchburg. It would seem prudent for the EPA to develop the regulations for this aspect of the MS4 Permit, and to have the municipality assist with inspections to ensure developers are in compliance, and to report to the EPA when a problem is noted. The requirements of this portion of the draft MS4 permit could be incorporated into the EPA's Existing Construction Stormwater Program, as the requirement only applies to a site over one-acre in size, which is the threshold for EPA's Construction Stormwater Permit.

Section 2.3.6 – Construction Site Stormwater Runoff Control

1. 2.3.6.a - As a general comment, the requirements noted in this portion of the draft permit would be more applicable to implement on a state or national level. The Massachusetts Stormwater Standards are implemented on the state level under the Wetlands Protection Act, and a similar approach would be fitting here to provide consistency for developers, engineers, and municipalities. By implementing these requirements on a state level, the regulations could be applied to all communities. Impervious surfaces are the biggest contributor to stormwater degradation, so it would seem reasonable to enforce the same regulations in non-MS4 areas, as it is more effective to start treating and infiltrating stormwater from the early stages of an area being developed.

2. 2.3.6.a.i – The one-acre threshold leaves room for interpretation. The purpose of post-construction stormwater BMPs is to treat and infiltrate stormwater from impervious surfaces. Stating the requirement applies to sites which "disturb more than one acre" is not relevant to post-construction stormwater management. For example, a site of a half-acre may have the entire site composed of impervious area, where a site that disturbs one-acre may only have a quarter acre of impervious area. The requirement should solely be based on the impervious area of a site.
3. 2.3.6.a.ii.a – Requiring infiltration and/or treatment of the first 1-inch of rain on a redeveloped site contradicts the MA Stormwater Standards, which only require this standard be met to the maximum extent practicable on redevelopment sites. On many redevelopment sites space is a premium, especially in Fitchburg, which limits the practicability of implementing stormwater controls. In a post-industrial City such as Fitchburg, the City expends much effort in attracting redevelopment. By adding additional regulation, many developers will seek other areas. We recommend the EPA work with the State to develop consist standards, and implement "maximum extent practicable" attributes to the redevelopment requirement.
4. We request that full-depth reclamation road paving projects be exempt from this minimum control measure. Many communities are struggling to keep roads in a basic state of usability. Adding infiltration or treatment requirements to any reclamation project will increase costs substantially.

Section 2.3.7 – Good Housekeeping and Pollution Prevention for Permittee Owned Operations

1. To develop all the programs required under this Control Measure is a large undertaking, which will take inordinate amounts of time and investigation. If municipalities were to use their own employees or volunteers to generate these programs and procedures, it would take far longer than a year. We recommend a minimum of 3-years to develop these programs, with implementation occurring in the final two years of the permit term.
2. 2.3.7.ii.a – Many of these procedures are already conducted by municipalities, eliminating the need for a written plan, as it will provide little additional benefit. Fertilizers, herbicides, and grass mowing operations are already minimized to the greatest extent possible, as it is fiscally irresponsible to conduct these activities more than necessary. In addition, the DPW already inspects city owned trash receptacles and empties as necessary.
3. 2.3.7.ii.b – All municipally owned facilities actively manage their grounds, and store hazardous chemicals in a careful manner. For any spills of hazardous materials, the Fire Department is capable of responding, as the

department personnel has proper spill prevention training (Haz-Mat Operations Level). We ask the EPA to allow for a blanket plan to be produced by a permittee that can be applied to all municipally owned buildings and facilities.

4. 2.3.7.iii.b – The requirements for catch basin cleaning should be streamlined. Much of the reporting requirements will provide little value or difficult to obtain. For instance, estimating the amount of debris removed from a catch basin is a difficult measurement to obtain without weighing the material from each catch basin. A percentage full measurement, along with the date of inspection/cleaning should be the only two requirements. Using these two data points will allow a municipality to determine problem areas.
5. 2.3.7.iii.c – Requiring street sweeping twice a year (as the City is subject to Appendix H.II), is a very costly proposition. This requirement will most likely require the addition of additional staff and equipment, with a cost in the hundreds of thousands of dollars. Although street sweeping is an important mechanism in reducing sediment in our waterways, we recommend an investigative approach, similar to the catch basin approach. Instead of requiring sweeping twice a year, an inspection program should be done in specific areas to determine where street sweeping would be most effective. Sweeping and catch basin investigations should be blended together to maximize effectiveness; street sweeping should be targeted in areas where catch basins are reaching more than 50% full in a short time frame. In many instances, the City would be sweeping streets that have very little sediment accumulation or leaf litter, as the City already sweeps once a year.

Appendix H – Requirements Related to Discharges to Certain Water Quality Limited Waterbodies

1. II – Phosphorous loading in many waterways is directly linked to sewerage entering a waterway. As the EPA is aware, the City has been aggressively separating its combined sewer system to prevent SSOs, and is also in the process of designing a $22 Million upgrade to its East WWTF for enhanced nutrient removal. In addition to this upgrade, the City may also be required to construct tertiary treatment for phosphorous removal. We recommend that the EPA suspend the enhanced phosphorous removal requirements in Appendix H for the City until it is determined how successful the wastewater system upgrades are.
2. II.1.c – It should be noted if roadways are included as "permittee-owned" property, and are subject to requirements of sub-section II.1.c.

3. III – As previously stated, we recommend the City is exempt from the additional requirements due to bacteria, until sufficient water quality monitoring results are obtained after completion of the latest, and largest-to-date, separation project in June 2015. The City has a strong inclination that high bacteriological results will be greatly reduced as a result of this separation project.
4. III.3.i – As the entire City drains to the Nashua River, this would put the entire sewer system in the "HIGH" priority ranking for the IDDE program requirements. This would require the City complete the IDDE program, including wet weather sampling, on hundreds of outfalls, within 5-years. This is a daunting task and has a likelihood of not being feasible, as the high-precipitation events that are required to sample may not occur on a frequent enough basis to sample all outfalls.

This completes our comments on the 2014 MS4 Draft Permit for Massachusetts. If there are any comments or questions regarding the above subject please feel free to contact us.

Boston, MA 02109-3912

Re: 2014 Draft Massachusetts Small MS4 General Permit
Comments from the Town of Framingham

Dear Mr. Tedder:

The Town of Framingham currently operates its storm sewer system under the NPDES Phase II Municipal Separate Storm Sewer System (MS4) General Permit (Permit No. MAR041116), effective May 1, 2003. The Town of Framingham appreciates the opportunity to provide comments on the Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts (draft permit) that was published in the Federal Register on September 30, 2014. The Town participated in the Public Meeting held in Westborough on October 22, 2014 and attended the Public Hearing in Leominster on November 19, 2014. The Town also submitted comments on the 2010 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts Interstate, Merrimack, and South Coastal Watersheds and has noted that some, but not all, of these comments appear to have been considered and incorporated into the changes in the 2014 draft permit.

BACKGROUND

At nearly 69,000 inhabitants, the Town of Framingham is the largest Town in the Commonwealth of Massachusetts located approximately 20 miles west of Boston. The Board of Selectmen and the Town Manager form the executive branch of the Town, with the Town Meeting serving as the legislative branch. Town Meetings, at which operating and capital budgets are approved and changes to bylaws are requested, are held annually in spring.

The Town has a land area of approximately 26 square miles containing mixed land uses ranging from agricultural to highly urbanized, historically industrialized areas. Of that land area, approximately 24% is impervious. The Town has very large and complex infrastructure, which includes over 250 miles of roadways, 200 miles of subsurface storm drainage pipes, 8,500 catch basins, 3,700 drainage manholes, 600 storm drainage outfalls, 450 Town owned properties, and 50 Town owned buildings. Our sanitary sewer system is separate from our stormwater sewer (aka drainage) system. In addition to municipal properties and facilities, several large state and federal facilities and infrastructure are located within the Town limits, some of which are

permitted under other NPDES permits, including: the Massachusetts Turnpike (*Individual NPDES permit*), Framingham State University (*non-traditional MS4 permit*), Massachusetts Correctional Institution – Framingham (*non-traditional MS4 permit*), National Guard Armory (*MSGP permit*), US Postal Service (*MSGP permit*), MWRA facilities (*MSGP permit*), Mass Bay Community College, Massachusetts Emergency Management Agency headquarters, and Callahan and Cochituate State Parks.

The Town supports improvements in water quality. We work very closely with the Massachusetts Department of Environmental Protection (MassDEP) and EPA managers to implement the existing stormwater regulations. All stormwater runoff from the Town's MS4 ultimately flows to the Sudbury River; therefore the Town lies completely in one watershed. A Total Maximum Daily Load, or TMDL, has not been developed for the Sudbury River. The most recent *Massachusetts Integrated List of Waters* listing of waterbodies in Massachusetts that do not meet surface water quality standards (their capacity to support designated uses such as fishing, recreation, drinking water supply, or aquatic life support) has identified nine water bodies within Framingham that are currently identified as impaired. It should be noted that many of the causes of impairments are not attributed to stormwater runoff and some are noted as "TMDL not required (Non-pollutant)". One cause of impairment in several of the waterbodies is Mercury associated with impacts from the Nyanza Superfund site and not attributed to the Town's MS4 stormwater discharge.

COMMENTS ON PROPOSED MS4 GENERAL PERMIT

We have reviewed the 2014 Draft MA MS4 General Permit, and are concerned that our next permit will require a significant increase in the level of effort beyond the current program with limited additional benefits. We understand it is challenging to create an effective regulatory program to address a watershed-based problem that is also economically feasible. However, it is incumbent upon the EPA to make every effort to develop a reasonable program with set goals achievable through a reasonable use of Town resources, which builds upon the investments and improvements in water quality already made.

The Town encourages the EPA to more thoroughly review the economic impact proposed under the draft permit. According to EPA's News Release dated September 30, 2014, "As drafted, EPA estimates the cost to meet the requirements associated with implementation of the six minimum control measures to be between $78,000 and $829,000 per year averaged over the permit term." EPA "…does not have sufficient information to reasonably estimate those [costs] associated with achievement of water quality based limitations." The Town currently makes a significant investment in both operational costs and capital improvement for stormwater management. The new requirements contained in the draft permit amount to unfunded federal and state mandates with the burden of implementation falling upon local communities. The cost of implementation of the new requirements in the draft permit will be a financial burden to the Town, which has many high priority needs competing for limited available funding. In our opinion, these costs are far more than reasonable and do not represent an iterative approach. Thus the Town considers these permit requirements to be beyond its financial capabilities and exceed the Town's requirement to implement stormwater BMPs to the maximum extent practicable.

- Based on the Town's initial assessment, costs associated with complying with the six minimum control measures and initial requirements for discharges to certain impaired waters as outlined in the draft permit are estimated at over $1.85 Million in annual costs.
- Annual capital and operating costs would increase further depending on the level and extent of BMPs and retrofits required to comply with requirements for discharges to water quality limited waters following the initial assessments and planning efforts.

The effort to maintain and improve stormwater management and water quality needs to be balanced with future infrastructure demands, economic conditions, and the Town's overall master planning. Although the Town appreciates that EPA extended many timelines for implementation from the 2010 draft permit based on comments from the municipalities, the Town feels that the timeframe for implementation of all the additional requirements beyond the 2003 permit is still extremely aggressive. We anticipate that meeting the EPA permit goals outlined in the draft permit will take at least 15 years to implement. This is because we will need to both

understand and prioritize the stormwater problems within Town, plan for improvements, and set in place funding mechanisms to accomplish the work. The Town would like to continue building on the planning and implementation investment made under the 2003 MS4 permit, but focus on high priority areas and BMPs during the next permit term for the best use of the Town's funds.

We are providing the following comments organized by major topic with specific reference to the 2014 draft permit and the Town's specific request for EPA's response and/or modification to the permit.

Administration & Recordkeeping

1. *Part 1.7.2.d Notice of Intent* – "The NOI shall be submitted within 90 days of the effective date of the permit."

   Comment: The NOI requires a significant effort by the Town to develop. The commitment to activities outlined in the NOI requires review and approval by multiple departments within the Town. The authorization for funding needs to coincide with the Town's budget cycle and be approved at the annual Town Meeting. This effort cannot be effectively completed, reviewed and approved within such as short time frame.

   From the Public Meeting on October 22, 2014, it is the Town's understanding that the effective date of the permit will be approximately 6 months following finalization of the permit and will be synchronized with the fiscal year. The NOI will be due 90 days following the effective date. Therefore, the Town will have approximately 9 months from announcement of the final permit until the NOI is due.

   Request: The Town requests that the EPA verifies that the deadline for submitting the NOI will be 9 months to one year from the date the final permit is announced and will be synchronized with the fiscal year to allow more efficient coordination with the Stormwater Management Plan development and the Town's budget cycle beginning July 1st.

2. *Part 4.4 Annual Reports* – The annual reports shall contain the following information and data:
   - *IDDE summaries – Part 4.4.b.iv.* "… number and identifier of catchments evaluated; number and identifier of outfalls screened; number of illicit discharges located; number of illicit discharges removed; gallons of flow removed…"
   - *Outfall Inventory - Part 2.3.4.5.b & c Outfall/Interconnection Inventory* – "[The permittee] shall include the inventory in each annual report. The inventory shall be updated annually to include data collected in connection with the dry weather screening under Part 2.3.4.7.d. and other relevant inspections conducted by the permittee."
   - *Outfall Monitoring - Part 4.4.b.v* – "[The annual reports shall contain the following information]…All outfall screening and monitoring data collected by or on behalf of the permittee during the reporting period and cumulative for the permit term, including but not limited to all data collected pursuant to Parts 2.3.4. The permittee shall also provide a description of any additional monitoring data received by the permittee during the reporting period."
   - *SSOs – Part 2.3.4.4.d* "The permittee shall include and update the SSO inventory in its annual report, including the status of mitigation and corrective measures implemented by the permittee to address each SSO identified pursuant to this part."
   - *Catch Basin Cleaning – Part 2.3.7.a.iii.(b)* "The permittee shall report in each annual report the total number of catch basins, number inspected, number cleaned, and the volume or mass of material removed from each catch basin draining to water quality limited waters and the total volume or mass of material removed from all catch basins."
   - *Street Sweeping – Part 2.3.7.a.iii.(c)* "The permittee shall report in each annual report the number of miles cleaned and the volume or mass of material removed."

- *SWPPP findings - Part 2.3.7.b.iii (a) Stormwater Pollution Prevention Plan (SWPPP)* - "Inspect all areas that are exposed to stormwater and all stormwater control measures… The permittee shall report the findings from the Site Inspections in the annual report."

Comment: As stated in the Fact Sheet that accompanied the draft permit, "The Draft Permit contains more detailed reporting requirements than in the previous permit. Reports must contain sufficient information to enable EPA to assess the permittee's compliance with the permit." The EPA is requesting a significant amount of information to be provided with the annual reports, as shown with the examples above, which will create an administrative burden on the permittee. The information submitted with each annual report should be limited to a status update for that reporting period. The intent of the annual report is to document new progress and it is an unnecessary administrative burden to continue reporting the cumulative data for the permit term with each annual report. The Town feels that we can provide sufficient information to justify compliance with the permit without providing all the specific information requested by the EPA.

Also, the EPA has not specified in what format or method this information should be provided. The EPA is developing an annual report template for MS4s, which will reportedly populate information from the eNOI and be in the form of an electronic fillable .pdf. The effort to update information previously saved from the eNOI to a web-based reporting system would be less burdensome than re-submitting tables, databases, or GIS files each year. The Town is concerned about how compatible the annual report template will be to the Town's methods for data management.

Request: Data, inventories, and other detailed information should be tracked as part of the Town's SWMP and made available to EPA upon request, not submitted with each annual report. Please remove the requirement to submit the cumulative outfall monitoring and water quality data with each annual report.

The annual report template should be available when the final permit is issued so that MS4s can better customize their SWMPs and NOIs. Allow MS4s to comment and provide feedback on the annual report template before finalizing.

3. *Part 4.3.c Outfall Monitoring Reporting* – "The permittee shall also include in the annual report results from any other stormwater or receiving water quality monitoring or studies conducted during the reporting period" conducted on behalf of the permittee or conducted by other entities and reported to the permittee.

Comment: Again, this seems like an unnecessary administrative burden. Monitoring conducted by volunteers or required and reported to the EPA under separate permits or regulatory requirements should not be required in the MS4's Annual Report. The Town should also not report data for which they cannot verify quality assurance. The Town feels this information, if used by the Town for evaluating, designing, or implementing BMPs or other measurable goals identified in the MS4's SWMP, should be maintained with the SWMP and made available to EPA upon request.

Request: Please remove the requirement to submit any other stormwater or receiving water quality monitoring or studies with each annual report.

Stormwater Management Program (SWMP)

4. *Part 1.10.c Stormwater Management Program (SWMP)* – "The permittee is encouraged to maintain an adequate funding source for implementation of this program."

Comment: According to the Fact Sheet that accompanied the draft permit, "EPA recognizes that compliance with this permit will require substantial investment by permittees..." and that "…additional funding sources or mechanisms will be necessary to comply with the provisions in this Draft Permit." Federal funding programs (e.g., grants, revolving loans, LID incentive programs, etc.) should be available to support permit

requirements. More communities should benefit from federally funded water quality studies and planning, similar to the significant investment to support evaluation and planning in the Upper Charles River watershed. This is important for the ongoing evaluation of water quality issues, development of cost-effective solutions, and support of regional solutions.

Many of the current water quality funding programs, such as the Section 319 Nonpoint Source Competitive Grants Program, provide limited support for or even preclude NPDES Phase II planning and implementation activities. Revolving loan programs offer little incentive over the current bonding capacity of regulated communities.

The Town proposes to continue focusing available funding on high priority BMPs, as identified in our SWMP, as we continue to seek adequate funding sources.

Request: The Town requests more technical and funding support from federal and state programs to assist regulated MS4s with addressing regional water quality problems and support the federal unfunded mandates associated with the draft permit.

5. *Part 1.10.1.b Stormwater Management Program Availability* – "The permittee shall also post the SWMP online if the permittee has a website on which to post the SWMP."

   Comment: The Town prefers not to post the SWMP to the Town's website for the following two reasons:
   - The SWMP is a dynamic document that is continuously updated. Maintaining a dynamic document on the Town's website is difficult and can lead to outdated, misinformation for the public.
   - The mapping and municipal inventory components of the SWMP have a lot of critical information about the Town's infrastructure that we would prefer to provide upon request.

   Although the Town agrees with making more information about the stormwater program available through our website, the Town would prefer not to publish the SWMP through our website. The Town would prefer to continue to maintain the SWMP at the Department of Public Works Engineering Division and make it available to the public during normal business hours with a proper request.

   Request: Please remove the requirement to post the SWMP to the permitte's website. Revert to language from the 2010 Draft Permit "The permittee is encouraged to post the SWMP online…"

Non-Numeric Effluent Limitations

6. *Part 2.1.1.a Requirement to Meet Water Quality Standards* – "The permittee shall reduce the discharge of pollutants such that the discharges from the MS4 do not cause or contribute to an exceedance of water quality standards."

   Comment: According to the Fact Sheet provided with the draft permit, "Congress enacted Section 402(p) of the Clean Water Act, which requires that "[p]ermits for discharges from municipal storm sewers . . . shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and shall require controls to reduce the discharge of pollutants to the maximum extent practicable…" MEP is the statutory standard that established the level of pollution reductions that MS4 operators must achieve. Application of pollution controls to the MEP may not assure that discharges do not cause or contribute to an exceedance of water quality standards. Since MEP is the statutory standard for MS4s, it should apply throughout the permit and be the governing standard to determine compliance.

   Request: Revise this part of the permit to clarify that "…discharges from the MS4 do not cause or contribute to an exceedance of water quality standards *to the maximum extent practicable based on the measures outlined in the MS4's SWMP*."

7. *Part 2.1.1.d Requirement to Meet Water Quality Standards* - "… if there is a discharge from the MS4 that is causing or contributing to a violation of applicable water quality standards (including numeric and narrative water quality criteria) for the receiving water…, the permittee shall, as expeditiously as possible, but no later than 60 days of becoming aware of the situation, eliminate the condition causing or contributing to an exceedance of water quality standards."

   Comment: This requirement does not differentiate between point and non-point source causes of the violation of applicable water quality standards. Although it seems reasonable to be able to identify and eliminate point sources within 60 days using the Town's IDDE procedures, this time frame seems unreasonable for nonpoint sources. Permittees can reasonably be expected to investigate non-point pollution sources and make progress towards eliminating them within this time frame, but not completely eliminate them.

   Request: Please remove the requirement to eliminate the condition "no later than 60 days of becoming aware of the situation". The Town recommends requiring permittees to provide a plan and schedule for eliminating the condition within 60 days of becoming aware of the situation.

Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements

8. *Part 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements* – "For purposes of this permit, a 'water quality limited water body' is any water body that does not meet applicable water quality standards, *including but not limited to* waters listed in categories 5 or 4b on the Massachusetts Integrated Report of Waters listed pursuant to Clean Water Act section 303(d) and 305(b). "

   Comment: "Any water body that does not meet applicable water quality standards" is subjective. The definition should be limited to waters listed on the Massachusetts Integrated List of Waters which is the tool used to evaluate and identify waters with respect to their capacity to support designated uses as defined in the states' surface water quality standards. The 2010 draft permit used this standard ("Impaired waters include those waters that MassDEP has identified pursuant to section 303(d) of the Clean Water Act as not meeting applicable state water quality standards). The 2014 draft has expanded the definition of water quality limited water bodies. The Massachusetts Integrated List of Waters should be used to define which waters are subject to the additional requirements of Part 2.2.2.

   Request: Please revise the definition of 'water quality limited water body' to limit it to only waters listed in categories 5 or 4b on the Massachusetts Integrated Report of Waters.

9. *Part 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements* – "In the absence of a defined pollutant reduction target and where no approved TMDL has been established, this permit Part and Appendix H define an iterative approach addressing pollutant reductions to waterbodies where the permittee's discharge is causing or contributing to an excursion above water quality ..."

   Comment: Similar to the comment 8 above, "..where the permittee's discharge is causing or contributing to an excursion …" is subjective. The Town does not agree with the EPA's following assumption as stated in the Fact Sheet that accompanied the draft permit that "…urban stormwater discharges from urbanized areas in New England contain bacteria/pathogens, nutrients, chloride, sediments, metals, and oil and grease (hydrocarbons) and finds that MS4 discharges are likely causing or contributing to the excursion above water quality standards when the receiving waterbody impairment is caused by bacteria/pathogens, nutrients, chloride, metals, sediments, or oil and grease (hydrocarbons)." According to the Fact Sheet, "Roughly half of [impairments] were related to stormwater pollution…" That also means that roughly half of the impairments are due to other sources not related to stormwater discharges.

The default assumption should not be that stormwater discharges from the MS4 are causing or contributing to the impairment and the EPA should have the burden of proof to show that the Town's discharge is causing or contributing to the impairments before the Town is subject to Part 2.2.2 and Appendix H of the draft permit. TMDL studies, environmental assessments, and water quality monitoring conducted with approved Quality Assurance Project Plans (QAPP) are used to identify what sources are causing or contributing to water quality impairments. In many cases, these studies show that the permittee is not a source of the pollutant. For example, Framingham Reservoirs #1 and #2, Saxonville Pond, and the Sudbury River within Framingham are Category 5 Waters requiring a TMDL for mercury in fish tissue. Based on environmental assessments, it is known that the mercury impairment is a result of a Superfund site located upstream and that the Town of Framingham's MS4 did not contribute to this impairment.

Another example is that much sediment and silt in the drainage channels, streams, and brooks in Town is from leaching of surrounding fine soils and organics, bank erosion, and re-suspension. The Town has focused operations on preventing silt and sediment deposits into streams from our roadways. To further reduce the pollutants that are causing the silt and sediment impairments would require a watershed approach and require cooperation between numerous entities to include Towns, the state, EPA, and US Corps of Engineers and would be better achieved by a regional, state, or federal entity.

Request: The EPA should have the burden of proof to show that the Town's discharge is causing or contributing to the impairments before the Town is subject to Part 2.2.2 and Appendix H of the draft permit. Please identify what method(s) will be used to confirm that the permittee's discharge is considered a source for the pollutant causing the excursion above water quality standards and therefore, must comply with Part 2.2.2 and Appendix H.

10. *Part 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements* – "… where the permittee's discharge is causing or contributing to an excursion above water quality standards due to nutrients (nitrogen or phosphorus), solids, bacteria/pathogens, chloride, metals or oil and grease (hydrocarbons)."

    Comment: Categories of pollutants in Part 2.2.2 should be consistent with the impairment causes listed in the Massachusetts Integrated Report of Waters for Category 5 Waters to avoid confusion. There are currently no waters listed as impaired for "solids" or "metals".

    The listed impairment cause that seems to be most closesly correlated to "solids" listed in Category 5 is "Total Suspended Solids (TSS)". Is that the only impairment that will be subject to this requirement for "solids"? The MS4 should not be expected to infer which other impairments, such as "turbidity", would also be considered "solids" for compliance with Part 2.2.2.

    Metals is too broad a category and some metals, such as the mercury impairment referenced in Comment 9, are not typically associated with stormwater runoff. Only the following specific metals are listed under the Massachusetts Integrated Report of Waters for Category 5: Lead, Mercury, Cadmium, Copper, and Arsenic. In the fact sheet that accompanies the draft permit, the EPA stated that "Metals like lead, zinc, copper, and cadmium get into runoff from impervious areas that are trafficked by vehicles, such as roadways, driveways and parking lots, from vehicle wear, tire wear, motor oil, grease and rust. Zinc was used here as a surrogate for other metals found in stormwater runoff because it is the most ubiquitous of all metals found in urban runoff, and as the concentration of metals like copper, chromium and lead increase, so does the concentration of zinc (generally)." Note that neither Mercury nor Arsenic was associated with stormwater runoff although these listed metals impairments would require additional actions by the MS4 for compliance with Part 2.2.2. of the permit as written. Also note that zinc, which was identified as "the most ubiquitous of all metals found in urban runoff" is not an impairment listed on the Massachusetts Integrated Report of

Waters for Category 5. Therefore, the Town does not feel that the EPA has adequately verified the assumptions that "metals" impairments are a result of stormwater runoff for which MS4s must comply with Part 2.2.2 and Appendix H for metals impairments.

Additionally, some listed impairments causes are not directly attributed to a pollutant source. The Massachusetts Integrated Report of Waters has impairments causes which could or could not be indirectly attributed to a pollutant listed in Part 2.2.2. For example dissolved oxygen and aquatic macroinertebrate bioassessments could be indirectly attributed to many pollutant sources, including those listed. As stated above regarding solids, the MS4s should not be expected to infer if compliance to Part 2.2.2 is required for impairments that are not directly attributed to a pollutant source.

Request: The Town requests that the EPA provide additional clarification of which impairments listed in Category 5 will be subject to Part 2.2.2 and Appendix H of the permit. The Town requests that the permit language is revised to reflect the same impairment causes listed in the Massachusetts Integrated Report of Waters for Category 5 Waters, such as listing specific metals, to avoid confusion as to which water bodies will be subject to Part 2.2.2 and Appendix H. The permit should specify that Mercury and Arsenic impairments will not be subject to Part 2.2.2 or Appendix H.

11. *Part 2.2.2 c.i.1., Part 2.2.2 d.i., and Part 2.2.2 e.i.1.* – The requirements of these Parts are applicable to any MS4 discharging directly to a water quality limited waterbody where bacteria, chloride, solids, oil and grease (hydrocarbons) or metals are the cause of the impairment.

    Comment: Unlike the previous sections for nutrients where specific MS4s were listed that were required to comply with those Parts, these sections do not identify the MS4s. Similar to Comment 10, the MS4 should not be expected to infer whether they are subject to these parts since the MS4 may be unclear if the water body's impairment applies to these categories or whether the MS4 is contributing a pollutant that is causing or contributing to the impairment.

    Request: Consistent with the previous permit parts, specific MS4s should be listed for Parts2.2.2.c.i.1, 2.2.2.d.i.1,and 2.2.2.e.i.1 as they have been for 2.2.2.a and 2.2.2.b
12. *Part 2.2.2 e.i.1.* – "The requirements of this Part are applicable to: Any MS4 discharging directly to a water quality limited waterbody where solids, oil and grease (hydrocarbons) or metals is the cause of the impairment."

    Comment: Similar to previous comments, although these pollutants may typically be found in stormwater it cannot be assumed that stormwater discharge from the MS4 is a source of these pollutants causing or contributing to water quality impairments. Until it is confirmed that the MS4 is a source, the MS4 should not be subject to the requirements of this Part. For example, Framingham Reservoirs #1 and #2, Saxonville Pond, and the Sudbury River within Framingham are Category 5 Waters requiring a TMDL for mercury in fish tissue. Based on environmental assessments, it is known that the mercury impairment is a result of a Superfund site located upstream and that the Town of Framingham's MS4 did not contribute to this impairment.

    Request: Revise the text to state "The requirements of this Part are applicable to: Any MS4 discharging directly to a water quality limited waterbody where solids, oil and grease (hydrocarbons) or metals is the cause of the impairment and where the permittee's discharge has been shown to be a causing or contributing source."
13. *Appendix H* – "At any time, a permittee may submit information to EPA demonstrating that its discharge does not contain [nitrogen, phosphorus, bacteria or pathogens, chloride, solids, oil and grease (hydrocarbons), or metals] by characterizing its discharge. Such demonstration must be documented through long term monitoring using the outfall characterization recommendations of the National Research Council.

The National Research Council recommends a minimum of 30 flow weighted composite samples collected over the course of 2-3 years on a variety of storm sizes to characterize a discharge properly."

Comment: The NRC's outfall characterization recommendations should not be the only means by which a MS4 can demonstrate that the MS4's discharge does not contain pollutant loading that would cause a water quality impairment. Similar to Comment 12, other studies completed by either the MS4 or other organizations should be allowed. For example, the Town should not be required to demonstrate that the MS4 is not a source of mercury when the EPA has already identified another source as part of their Superfund program.

Request: Revise language to allow flexibility to use other methods to demonstrate that the MS4's discharge does not contain pollutant loading that would cause a water quality impairment and is not required to comply with requirements in Part 2.2.2 or Appendix H.

14. *Appendix H, Part II.1.c.ii. Discharges to water quality limited waterbodies and their tributaries where phosphorus is the cause of the impairment* – "The permittee shall plan and install a minimum of one structural BMP as a demonstration project within the drainage area of the water quality limited water or its tributaries within six years of the permit effective date."

Comments:
Non-structural BMPs can be as effective as structural BMPs and should also be allowed to meet the requirement of a demonstration project.

The Phosphorus Source Identification Report is required within 4 years and the demonstration project is required to be installed within 6 years of the effective date of the permit. Therefore, there is a 2 year period to plan and install the BMP following the report. Considering the design, permitting, funding, contracting, and execution requirements for a demonstration BMP, the BMP should not be required to be installed for at least 3-5 years following completion of the Phosphorus Source Identification Report.
The Town has had difficulty developing and implementing BMPs near or within streams, tributaries, and other waterbodies that are subject to multiple, sometimes conflicting, permitting requirements from the state and federal governments. Several BMPs that the Town would like to implement to improve stormwater management and water quality, such as stream restoration, dam removal, or dredging to remove contaminated sediments, become infeasible due to the varying permit requirements under the limitations imposed by other agencies. We recommend as part of the MS4 permitting process, the EPA coordinates with other state and federal agencies such as the US Army Corps of Engineers and MassDEP which have permitting jurisdiction over water resources to streamline the permitting process and improve the feasibility for implementing BMPs as required by this permit. Otherwise, the Town does not feel that it may be feasible to install a structural demonstration BMP within six years of the permit effective date.

Request: Allow a non-structural or structural BMP to be implemented as the demonstration project. Allow additional time from the completion of the Phosphorus Source Identification Report until the installation of the BMP. The Town recommends that installation of the BMP is required within 10 years of effective date of the permit.

Public Education and Outreach

15. *Part 2.3.2.b. Public Education and Outreach* – "The educational program shall include education and outreach efforts for the following four audiences: (1) residents, (2) businesses, institutions (private colleges, private schools, hospitals), and commercial facilities, (3) developers (construction), and (4) industrial facilities."

Comment: Some of these audiences should be targeted at a regional, state, or national level instead of a local level. The local MS4 has limited authority or ability to reach these audiences effectively. Specifically:

- The Town does not feel that industrial facilities should be included as an audience under this requirement since industrial discharges are permitted separately by the EPA under the NPDES Multi-Sector General Permit (MSGP). The MSGP requires annual training which should meet the intent of education for this audience.
- Similarly, the Town does not feel that developers should be included as an audience under this requirement since construction operations are permitted separately by the EPA under the NPDES Construction General Permit (CGP). The CGP includes training and certification requirements which should meet the intent of education for this audience.
- Identifying and reaching a broad audience for commercial operations and businesses which have the potential to adversely affect water quality will be difficult for the Town. At this time, the Town has targeted efforts for the commercial sector as part of our IDDE program. The Town uses our outfall monitoring program to identify potential illicit discharges, identify potential sources, and then target the facilities from which those potential sources may have originated. Additionally, most businesses, institutions, and commercial facilities that can potentially adversely impact stormwater runoff based on their operations are (or should be) required to permitted under the MSGP or non-traditional MS4 permits. The Town feels that this audience is best addressed with the IDDE program or separate NPDES permits and that this audience should not be included under Part 2.3.2.b.

Request: Please remove commercial facilities, developers, and industrial facilities as audiences from this part of the permit. Let the Town continue to focus education efforts on (1) residents since residential areas are our leading contributors to non-point pollution and (2) targeted audiences identified as part of our IDDE program.

16. *Part 2.3.2.e. Public Education and Outreach* – "The program shall show evidence of focused messages for specific audiences as well as *evidence* that progress toward the defined educational goals of the program has been achieved. The permittee shall identify methods that it will use to evaluate the effectiveness of the educational messages and the overall education program."

    Comment: It is difficult to provide evidence of the ultimate objectives of this minimum control measure which are to "increase knowledge and change behavior of the public".

    Request: Provide guidance on what will be acceptable evaluation methods and "evidence" required to be documented in the annual report.

Illicit Discharge Detection and Elimination (IDDE)

In general, the Town feels that the IDDE Program requirements as outlined in the draft permit are too prescriptive. The Town feels we can achieve the intent and goals of the IDDE minimum control measure with a program customized for our community which will better use our resources and achieve better results by focusing on priorities developed from previous assessments and master planning efforts. Compliance with the overly detailed methods and requirements in the draft permit will limit, not enhance, the Town's ability to address illicit discharges effectively.

17. *Part 2.3.4.2.b* – "The period between identification and elimination of an illicit discharge is not a grace period. Discharges from an MS4 that are mixed with an illicit discharge are not authorized by this Permit (Part 1.3.a) and remain unlawful until eliminated."

Comment: The Town recognizes and understands that the MS4 Permit does not authorize illicit discharges. However, the purpose of the IDDE program is to identify and remove these unauthorized discharges. As long as the Town has an effective IDDE program in place pursuant to Part 2.3.4 with a reasonable schedule as described in Part 2.3.4.2. for the removal of identified illicit discharges, the presence of such discharges should not constitute an ongoing violation of the permit. It would be more appropriate to state that failure to effectively implement the IDDE program is a violation.

Request: Please remove Part 2.3.4.2.b from the permit.

18. *Part 2.3.4.4. Sanitary Sewer Overflows* – Overall SSO inventory and reporting requirements.

    Comment: The Town currently tracks and reports SSOs as required by MassDEP's Bureau of Resource Protection – Wastewater Management Program which has similar, if not the same, requirements for inventory and reporting as Part 2.3.4.4 of the draft permit. This program also requires EPA notification. The requirements in part 2.3.4.4 seem to duplicate efforts and be an unnecessary administrative burden since the goal of identifying and addressing SSOs is already accomplished by the other state program.

    Request: Please remove Part 2.3.4.4.

19. *Part 2.3.4.5.b Outfall/Interconnection Inventory* – "The permittee shall physically label all MS4 outfall pipes (excluding interconnections) with their unique identifier by the end of the permit term."

    Comment: The Town does not see a benefit to physically labeling all MS4 outfalls. All of our outfalls can be identified by their unique identifier and associated attributes using our GIS mapping and located with a GPS in the field. With over 600 outfalls of various size, construction, and location this requirement will take considerable effort. Although this may be easy for outfalls with well-maintained headwalls, it will be difficult, if not impossible, to physically label many outfalls. For example, some outfalls are located under bridges or are pipe ends within a steep vegetated bank.

    Request: Please remove this requirement from the permit.

20. *Part 2.3.4.6.a.i. Required Mapping Elements* – Mapping requirements include "Catchment delineations. For the purpose of this permit, a catchment is the area that drains to an individual outfall or interconnection, for use in priority rankings …"

    Comment: Although the Town agrees that delineation of drainage areas is important for the IDDE program, the Town feels that delineation down to the catchment drainage area for every outfall is unnecessary. With over 600 outfalls, the effort to delineate each catchment would be significant. The effort required to accomplish this within the 2 year deadline for system mapping would pull resources from other Town priorities identified in our SWMP. The Town would prefer to build on previous IDDE efforts which focused on sub-basin delineation. Within prioritized sub-basins, the Town would identify, assess, and prioritize outfalls to identify which catchments need further evaluation. Catchment delineation would not be needed for outfalls with no or low potential for illicit discharges. Catchment delineation would be conducted as part of the assessment for outfalls with medium or high potential for illicit discharges.

    Request: Remove the catchment delineation mapping requirement from the permit. If the requirement remains, allow additional time to complete this element of the mapping to within the 5-year permit cycle and not within 2 years.

21. *Part 2.3.4.7.c. Assessment and Priority of Catchments* – "The permittee shall assess and priority rank the catchments… This ranking will determine the priority order for screening of outfalls and interconnections

pursuant to Part 2.3.4.7.d., catchment investigations for evidence of illicit discharges and SSOs pursuant to Part 2.3.4.7.e., and provides the basis for determining permit milestones pursuant to Part 2.3.4.8"

Comment: Although the Town agrees that there should be a procedure for assessing and prioritizing IDDE efforts, the Town would prefer to have more flexibility to develop the program. The Town would prefer to build on previous stormwater master planning efforts which focused on assessing and prioritizing sub-basins instead of catchments. In prioritized sub-basins, the Town would identify, assess, and prioritize outfalls to identify which catchments need further evaluation.

Request: Allow more flexibility for Towns to develop an assessment and priority ranking for their IDDE program. Part 2.3.4.7.c. should be guidance for the IDDE program and not the required method.

22. *Part 2.3.4.7.d.iii Dry Weather Screening and Sampling* – "When a flow is observed, a sample of the flow shall be collected and analyzed for the parameters listed in 2.3.4.7.d.v."

    Comment: If the screening assessment and an inspection of physical indicators does not indicate a potential illicit discharge, sampling should not be required. The parameter list for dry weather monitoring should be specific to the outfall and receiving water body based on the screening and inspection and not the generalized list in the permit. Flow should only be required to be analyzed for suspect pollutants if the screening assessment and inspection indicate the potential for those pollutants. For example, if previous screening events and visual observation indicate that the flow is likely groundwater infiltration and the receiving water is impaired for pathogens, then the Town should not be required to analyze for ammonia.

    Request: Please revise the permit to provide flexibility for MS4s to exclude unnecessary analytical parameters for dry weather flows based on the MS4's understanding of the drainage system, water quality issues, past analytical data, and inspections.

23. *Part 2.3.4.7.d.v Dry Weather Sampling* – "Samples shall be analyzed at a minimum for ammonia, chlorine, conductivity, salinity, *E. coli*. (freshwater receiving water) or enterococcus (saline or brackish receiving water), surfactants (such as MBAS), and temperature."

    Comment: The Town of Framingham is located entirely in freshwater watersheds and does not have waters impaired for chlorides. The Town does not see the need or benefit for analyzing for salinity. Impacts from salt used on roads during winter conditions is addressed in Part 2.3.7 under Good Housekeeping and would not be captured by dry weather sampling efforts. Water quality limited waterbodies where chloride is the cause of the impairment are addressed by Part 2.2.2.c.

    Request: Remove requirement for salinity analysis.

24. *Part 2.3.4.8.a – IDDE Program Implementation Goals and Milestones* – "The permittee shall complete dry weather screening and sampling (where flowing) of every MS4 outfall and interconnection (except Excluded and Problem Catchments) no later than three years from the permit effective date. The permittee may rely on screening conducted under the MS4-2003 permit."

    Comment: The Town has previously completed dry weather screening of all outfalls and will rely on our records to revise and update our IDDE Program for compliance with the new permit. The previous draft permit allowed considerably more time to complete outfall screening using a prioritized method. If previous data is not available or cannot be used, 3 years is very aggressive for completing the screening.

    Request: Allow for the full permit term (five years) to complete screening of all outfalls, using a prioritized method outlined in the MS4's IDDE Program.

25. *Part 2.3.4.8.c – IDDE Program Implementation Goals and Milestones* – "The permittee shall implement the Catchment Investigation Procedures in every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges."
and
Part 2.3.4.7.e.ii Catchment Investigation Procedure – "Either method [of manhole inspection methodology] must, at a minimum, include an investigation of each key junction manhole within the MS4, even where no evidence of an illicit discharge is observed at the outfall."

Comment: If the purpose of these parts of the permit is to identify and remove illicit discharges, the Town does not understand why investigation procedures are required in every catchment and manhole of the system where there is no evidence of an illicit discharge. The ability to reduce the number of catchments and manholes for physical investigation by a clearly defined desktop screening process in accordance with Part 2.3.4.7.e.i. would focus the Town's efforts and result in a more feasible and achievable goal.

Request: Please remove the requirement to conduct catchment investigations in every catchment and manhole of the MS4, even where dry weather screening does not indicate evidence of illicit discharges. The IDDE program development, specifically the priority ranking of catchments based on detailed mapping information, is an appropriate screening tool to focus the Town's efforts on catchments where illicit discharges are most likely to be present.

Construction Site Stormwater Management

No comments.

Post-Construction Stormwater Management

26. *Part 2.3.6.a.ii Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management)* – "The permittee shall develop or modify, as appropriate, an ordinance or other regulatory mechanism within two (2) years of the effective date of the permit to contain provisions that are as least as stringent as the following:
    (a) Stormwater management systems on new and re-developed sites shall be designed to either:
        1. Retain the first one (1) inch of runoff from all impervious surfaces on site. OR
        2. Provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of biofiltration on the first one (1) inch of runoff from all impervious surfaces on site."

Comment: The Town feels that this requirement is very stringent as compared to current requirements and requires a very aggressive schedule for completion. "All impervious surfaces" is vague and can be interpreted in multiple ways. The Town believes that regulatory changes should be promulgated at the state or federal level, not the local level, to provide consistent standards. Additionally, enforcement of these regulations should be at the state or federal level, or additional financial support should be provided to the Town for implementation and enforcement of these regulations. There are many reasons why this makes more sense than requiring municipalities to promulgate their own ordinances or regulations.

1) Like many other municipalities, the Town's bylaws for design of stormwater management systems require meeting the Stormwater Management Standards and technical guidance contained in the Massachusetts Department of Environmental Protection's Stormwater Management Handbook. This requires treatment for water quality to the maximum extent practicable. The proposed permit requirement is more stringent than the MassDEP requirements, although the Fact Sheet accompanying the permit states "State-wide consistency will provide a common bar for development and

redevelopment in every regulated community and afford more consistent protection of affected waters."

2) Local ordinances are not easily enforceable and do not have the strength of state or federal laws. The Town has seen an increasing number of appeals and request for variances to local requirements, especially those that are more stringent than state requirements. The locally elected boards, in an effort to be development and business friendly, usually grant these variances since economic drivers and encouraging redevelopment are Town priorities above environmental drivers.

Redevelopment projects may have site restrictions that make the proposed water quality treatment and level of pollutant removal infeasible. There should be a waiver for this requirement for sites where infiltration is determined to be infeasible (e.g., due to contamination, high groundwater table, shallow bed rock, poor infiltration rates, etc.) or where it can be demonstrated that infiltration would cause property or environmental damage.

Request: If these regulations are required, EPA should provide more guidance on what will be considered part of "all impervious surfaces" for the proposed requirement for re-development. The Town recommends that this standard be required for management of the first one inch of runoff from all Directly Connected Impervious Areas (DCIA) within the limits of earth disturbance.

These regulatory changes should be promulgated at the state or federal level, not the local level. BMP design requirements in the permit should be consistent with the MassDEP Stormwater Management Standards. EPA should work with MassDEP to ensure the MassDEP's standards are consistent and should not require individual municipalities to develop or modify their bylaws to be more stringent than the MassDEP standards. Waivers should be considered to allow for potential redevelopment on sites for which these requirements are infeasible.

27. *Appendix H.II.1.a.i.2. Additional or Enhanced BMPs for Discharges to water quality limited waterbodies and their tributaries where phosphorus is the cause of the impairment* – Requires "adoption/amendment of the permittee's ordinance or other regulatory mechanism shall include a requirement that new development and redevelopment stormwater management BMPs be optimized for phosphorus removal."

Comment: Similar to Comment 26 above, the Town feels that this requirement is very stringent as compared to current requirements and that regulatory changes should be promulgated at the state or federal level, not the local level.

Request: If these regulations are required, promulgate these regulatory changes at the state or federal level, not the local level. BMP design requirements in the permit should be consistent with the MassDEP Stormwater Management Standards. EPA should work with MassDEP to ensure the MassDEP's standards are consistent and should not require individual municipalities to develop or modify their bylaws to be more stringent than the MassDEP standards.

28. *Part 2.3.6.a.ii(b)* – "Stormwater management systems designed on sites with documented soil contamination or management systems designed on industrial sites shall not include BMPs that promote infiltration and shall instead require the use of treatment BMPs on site."

Comment: Infiltration BMPs should not be excluded from all industrial sites, but should be evaluated on a case-by-case basis since not all industrial sites are land uses with higher potential pollutant loads. Similar to the comment above, this requirement should be consistent with the MassDEP Stormwater Management Standards and require water quality controls to the maximum extent practicable. The achievement of pollutant removal equal to or greater than the level of pollutant removal provided through the use of

biofiltration on the first one (1) inch of runoff will be difficult for sites with poor soils and limited space.

Request: Revise the permit language to "Stormwater management systems designed on sites with documented soil contamination or management systems designed on *land uses with higher potential pollutant loads as defined in 310 CMR 10.04 and 314 CMR 9.02* shall not include BMPs that promote infiltration and shall instead require the use of treatment BMPs on site *to the maximum extent practicable*."

29. *Part 2.3.6.b & c* – Permittees must assess if and how regulations and guidance support LID and green infrastructure. "The permittee shall implement *all* recommendations, in accordance with the schedules, contained in the assessment."

    Comment: The permittee should not be required to implement all recommendations. Instead, the permittee should be allowed to evaluate recommendations and implement those that they feel are appropriate.

    Request: Revise language to remove "all recommendations" and replace with "appropriate recommendations".

30. *Part 2.3.6.c* – "Within four (4) years from the effective date of the permit, the permittee shall develop a report assessing existing local regulations to determine the feasibility of making, *at a minimum*, the following practices allowable when appropriate site conditions exist:
    i. Green roofs;
    ii. Infiltration practices such as rain gardens, curb extensions, planter gardens, porous and pervious pavements, and other designs to manage stormwater using landscaping and structured or augmented soils; and
    iii. Water harvesting devices such as rain barrels and cisterns, and the use of stormwater for non-potable uses."

    Comment: The Town agrees with the requirement to assess local regulations and the feasibility to remove barriers and encourage green infrastructure and LID. That being said, the Town feels that the draft permit should not specify which minimum green infrastructure and LID practices should be assessed (i.e. the minimum practices listed above).

    Request: Revise language to remove specified practices. For example, "…the permittee shall develop a report assessing existing local regulations to determine the feasibility of making green infrastructure and low impact development practices allowable when appropriate site conditions exist, *such as* the following:…"

31. *Part 2.3.6.d Directly Connected Impervious Area* – "The permittee shall estimate the annual increase or decrease in the number of acres of impervious area (IA) and directly connected impervious area (DCIA) discharging stormwater to its MS4 …and report those estimates in each annual report… the permittee shall estimate for each sub-basin identified pursuant to Part 2.3.4.6.a. the number of acres of IA and DCIA discharging stormwater to its MS4 that have been added or removed during the prior year. The permittee shall include in its estimates the additions or reductions resulting from development, redevelopment, or retrofit projects undertaken directly by the permittee; or by private developers and other parties in a voluntary manner or in compliance with the permittee's ordinance or bylaw pursuant to Part 2.3.6.a. of this permit.

    Comment: The Town appreciates that the draft permit is only requesting estimated IA and DCIA, as opposed to detailed analysis. The Town sees the value in detailed analysis for MS4s required to develop and implement a Phosphorus Control Plan or MS4s that plan to or currently implement a stormwater utility,

but neither of these situations apply to Framingham. The Town feels that the baseline data provided by MassGIS is sufficient for our needs and that additional evaluation of IA or DCIA at the local level will be burdensome and take staff away from more valuable functions while resulting in little benefit to the municipal stormwater managers. Local stormwater managers should not be charged with gathering or improving data that is not significantly beneficial to them when baseline data is available.

Additionally, this data is currently owned and managed at the state level through MassGIS with the quality controls and assurances provided by the MassGIS program. Locally gathered data that is not collected or managed using the same QA/QC procedures may lead to future confusion and contradictions. Not every MS4 has the staff, training, equipment, or personnel to collect and maintain GIS data.

Note: This section references "sub-basins" as opposed to "catchments" pursuant to Part 2.3.4.6.a. The Town supports the use of sub-basins as opposed to catchments for planning and assessment.

Request: Remove Parts 2.3.6.d.i and ii which require tracking and estimating IA and DCIA at the local level. If change in impervious surface over time is a metric of interest to federal and state regulators, then this GIS data should be tracked and maintained at the state level to provide consistent quality and reliability statewide.

Good Housekeeping and Pollution Prevention

32. *Part 2.3.7.a.i Operations and Maintenance Programs* - *"*Within one (1) year from the effective date of the permit, the permittee shall develop, if not already developed, written operations and maintenance procedures for [parks and open space, buildings and facilities where pollutants are exposed to storwmater runoff, and vehicles and equipment]. These written procedures shall be included as part of the SWMP."

    Comment: This will require a significant coordination effort amongst multiple Town departments including, but not limited to, Parks & Recreation, Conservation Commission, Schools, Police, Fire, and DPW. Operations and maintenance procedures are being followed, but we do not currently have written O&M procedures that specifically address stormwater management concerns. The Town anticipates that significant effort is needed and one year will not be sufficient to plan and complete this requirement.

    Request: The full permit term (5 years) should be granted for this effort.

33. *Part 2.3.7. a.iii(b)Second Bullet Infrastructure Operations and Maintenance* – *"*Establish a schedule that the frequency of routine cleaning will ensure that no catch basin at anytime will be more than 50 percent full."

    Comment: The requirement to clean all catch basins when they are 50 percent full could potentially require frequent cleaning of all catch basins in areas where deep sump basins have not yet been installed (the Town has an on-going program to retrofit catch basins with deep sump catch basins as part of roadway projects). The catch basin cleaning protocol outlined in this part of the draft permit may be excessive compared to the associated benefit. Town departments responsible for catch basin cleaning strive to maximize efficiency, despite local budgets constraints and staff and specialized equipment shortages. For the roadways, greatest efficiency is realized when catch basins are cleaned following a geographic pattern, i.e., all basins in a given area are cleaned one after the other before moving on to a new area. Cleaning catch basins when they become 50 percent full is contrary to efficient use of manpower and cannot be implemented in a practical way. Furthermore, the inspection and cleaning of stormwater structures should be modified to be at the same frequency, allowing both to be performed at once.

Request: Change the permit language to allow more flexibility in developing the cleaning schedule. This can be done by establishing goals, not required actions. For example, revise the language to be similar to the 2010 draft "Establish a goal that the frequency of routine cleaning will prevent catch basins at anytime from being more than 50 percent full."

34. *Part 2.3.7.a.iii(f) Infrastructure Operations and Maintenance* - "All permit-owned stormwater treatment structures (excluding catch basins) shall be inspected annually at a minimum."

    Comment: The Department of Public Works is currently in the third of five phases of a Stormwater Master Plan which assesses, evaluates, and recommends improvements to the Town's stormwater system. The phased approach was prioritized by sub-basin and allows the Town to focus on our most critical stormwater management infrastructure. As a result of our Stormwater Master Plan, the Department of Public Works has installed a SmartSponge® stormwater treatment system at an outfall to a Town beach, Stormceptors at high priority areas that discharge to the Sudbury River, deep sump and hooded catch basins as part of Town roadway projects, and other BMPs throughout the Town. Based on our previous efforts and amount of infrastructure, we feel it would be nearly impossible to comply with an annual inspection requirement. Inspection frequencies should be part of stormwater planning and should be based on recommended industry best practices, manufacturer's recommendations, and inspection history. The inspection frequency should not be set arbitrarily at an annual minimum requirement. This will allow the Town to focus on high priority areas and maximize the use of our limited staff and equipment.

    Request: Please revise this part to allow the MS4 to set the appropriate inspection frequency for stormwater treatment structures. Additionally, the Town requests that the EPA allow MS4s to develop a prioritized inspection and cleaning schedule for all BMPs.

35. *Part 2.3.7.b.iii (a) Stormwater Pollution Prevention Plan (SWPPP)* - "Inspect all areas that are exposed to stormwater and all stormwater control measures. Inspections shall be conducted at least once each calendar quarter… The permittee shall report the findings from the Site Inspections in the annual report."

    Comment: Quarterly inspections of facilities under a SWPPP are inefficient and wasteful. The Town recommends an annual inspection of facilities and semi-annual inspection (spring and fall) of discharge points.

    Also, the draft permit requires that SWPPPs be developed and implemented for maintenance garages, public works facilities, transfer stations, and other waste handling facilities. The Town recommends that a comprehensive SWPPP that covers all facilities be required rather than developing individual SWPPPs for each of the facilities. The Town has used this method successfully to develop and implement a comprehensive Spill Prevention, Control, and Countermeasures (SPCC) Plan for DPW facilities. Developing and implementing individual SWPPPs will result in significant cost burden to the Town.

    Request: Allow a comprehensive SWPPP to covers all similar municipal facilities and operations and adjust inspection schedule to annually.

36. *Part 4.1.a Program Evaluation* - "EPA or MassDEP may require the permittee to add, modify, repair, replace or change BMPs or other measures described in the annual reports as needed."

    Comment: This is open-ended and onerous.

    Request: More specific allowances should be made for what will be required and how long a community will be given to make changes if they are requested or required by the regulatory agencies.

In closing, thank you for the opportunity to comment on the 2014 Draft Massachusetts MS4 General Permit and for your consideration of these comments as the permit is finalized. We hope that these comments and information are helpful in shaping the new MS4 Permit and the Town respectfully requests a written response from EPA to each of the items in this letter.

The Town feels we are proactive in our Stormwater Management Program and we continue to move towards the mutual goal of improved water quality in our waterways as we implement our Stormwater Management Plan under the MS4 Permit. If you have any questions or wish to discuss this information, please feel free to contact the Town's Stormwater Engineer, Kerry Reed, by phone at 508-532-6015 or e-mail at kr@framinghamma.gov.

Respectfully,

Robert J. Halpin
Town Manager

TOWN OF FRANKLIN
DEPARTMENT OF PUBLIC WORKS
257 Fisher Street
Franklin, MA 02038

February 25, 2015

Mr. Newton Tedder
US Environmental Protection Agency, Region 1
5 Post Office Square, Suite 100
Boston MA 02109-3912

Re: 2014 Draft Massachusetts Small MS4 General Permit
Comments from the Town of Franklin

Dear Mr. Tedder,

The Town of Franklin would like to take this opportunity to respectfully submit comments on the 2014 Draft Massachusetts Small MS4 General Permit, which was published on September 30, 2014.

While the goal of the Clean Water Act is commendable and supported by the Town of Franklin, we consider the majority of the requirements in the new proposed MA Small MS4 general permit to be overly assertive, burdensome, expensive, unrealistic and most likely not feasible and unachievable for the Town of Franklin within the specified timeframe and without funding support from the US Environmental Protection Agency (US EPA) and/or the Massachusetts Department of Environmental Protection (MassDEP).

As you are aware, The Town of Franklin has made huge strides towards improving the overall water quality and water availability in Franklin. These improvements have been made in not only Stormwater Management, but also drinking water and sewer connivance over the past decade. Our successes have been made through MS4 compliance activities, proven and innovative drinking water conservation practices, smart sewer infiltration and inflow (I/I) monitoring and improvements, stormwater drainage improvements, impervious area reductions during redevelopment of public and private property, and with capital infrastructure improvements in all areas. The Town of Franklin has spent in excess of $30,000,000.00 on all drinking water, sewer and stormwater improvements over the last 12 years. The majority of the funding for this work has come from an operational increase of 22% for stormwater, increases of water and sewer rates of 334%, additional local bylaws and requirements for development and redevelopment and an aggressive pursuit of grants that were matched with Town effort.

In the absence of a current updated permit, resulting in little or no direction from EPA over the last eight years, the town has developed its own approach for stormwater management and we have relied heavily on capital improvement projects to execute stormwater improvements. The Town has been able to include these improvements with every town construction project, allowing for a variety of stormwater improvements including the removal of impervious surfaces (road narrowing and sidewalk removal), the construction of rain gardens and tree wells and the installation of proprietary BMPs, such as stormceptors.

Full compliance with the 2014 Draft MS4 Permit is an additional significant effort that cannot be currently supported with the Town's existing resources and funding within the next permit cycle, as specified in the draft permit. The Town wishes to continue improving stormwater management and water quality, but this effort needs to take into consideration the progress made to date and be balanced with future infrastructure demands town-wide and economic conditions. Additionally, the town feels that the most cost-effective approach for stormwater improvements is integration with redevelopment and capital projects as infrastructure needs to be upgraded and/or replaced.

Similar to many other communities, Franklin has considered creating a stormwater utility to meet the current and proposed additional costs associated with the updated MS4 permit. Attached are working budget sheets that are based on current costs to meet the existing MS4 permit compared to estimated short-term EPA proposed MS4 stormwater activities. These worksheets clearly show that the additional tasks proposed by the new MS4 permit would go up over 100%!

Presently the Public Work's General Fund Operational Budget (GFOB) is $3,996,424.00. It is estimated that 14% or $559,499.00 of the GFOB is used for only stormwater tasks. If the new MS4 permit becomes effective as proposed, it is estimated that the stormwater program effort in Franklin would require an increase to 26% or $1,039,070.00 of the GFOB. In order for the Town to maintain "level funded services" they would have to increase taxes to come up with an additional $479,571.00 or other services and personnel would have to be cut from one or more town sectors (public works, police, fire, library, senior services, education or elsewhere). Please be aware this large increase is just for annual operation costs and does not consider the capital improvement costs and related operation and maintenance needs required under the draft MS4 permit.

In 2011, The Town of Franklin, in conjunction with EPA, studied the cost for the Town to meet the requirements of the Charles River TMDL. EPA estimated Franklin's capital improvement cost to be $74,600,000.00! The tables below are from the 2011 Upper Charles Study. The target reduction in phosphorous for Franklin was 52%, 15% of which would be met by enhanced operational and non-structural BMPs, which are rolled up into the future operational costs. The remaining 37% was to be achieved through implementation of structural BMPs. It also needs to be noted that the $74,600,000.00 is only for operational and construction of new BMPs and there is consideration for land acquisition that would be needed. It is estimated that many more millions of dollars would be needed to acquire the land though purchase or easement to install future BMPs.

Table E.5: Recommended Capital Cost for Implementation of Structural Stormwater Controls to Achieve Compliance with Phosphorus Load Reductions (2011 Dollars)

Town	% Phosphorus Removal from Structural Controls[1]	Total Cost of Structural BMPs (Charles River Watershed)[2]
Bellingham	37%	$29,700,000
Franklin	37%	$74,600,000
Milford	42%	$75,800,000

[1] Assumes 15% TP reductions in each community via non-structural controls
[2] Estimated costs are based on a calibration against Spruce Pond Brook subwatershed and rounded to the nearest $100,000

Table E.9: Estimated Operational and Capital Costs – Charles River Watershed (2011 dollars)

Town	DD CIP	Town CIP	Total CIP	Operating Costs[1]
Bellingham	$2,600,000[2]	$27,100,000	$29,700,000	$891,000
Franklin	$10,900,000	$63,700,000	$74,600,000	$1,815,000
Milford	$11,100,000	$64,700,000	$75,800,000	$1,037,000
TOTALS	$24,600,000	$155,500,000	$180,100,000	$3,744,000

[1] Annual Average for first five years
[2] Bellingham DD implementation costs per impervious acre are estimated to be significantly lower due to the presence of higher infiltration capacity soils underlying subject properties and the lower ratio of impervious to pervious surfaces compared to DD properties in the other two municipalities.
Costs are rounded to the nearest $1,000 (totals may not add up due to round-off error).

Table E.10: Estimated Total Implementation Costs over 25 Years Beginning in 2012 (2011 Dollars)

Town	10-Year Implementation	15-Year Implementation	20-Year Implementation	25-Year Implementation
Bellingham	$70,800,000	$65,900,000	$60,700,000	$55,000,000
Franklin	$165,900,000	$153,400,000	$140,400,000	$127,000,000
Milford	$146,000,000	$133,400,000	$120,200,000	$107,000,000
TOTALS	$382,700,000	$352,700,000	$321,300,000	$289,000,000

Costs are rounded to the nearest $100,000.

Besides the unrealistic cost associated with the proposed Phosphorus Control Plan that was identified during the 2011 Upper Charles River Study, the current draft MS4 permit outlines an implementation time frame of no later than 20 years to complete the Phosphorous Control Plan. The table above clearly shows the overall cost savings that are realized with a longer implementation time table. EPA needs to consider extending the time table to implement the Phosphorus Control Plan to save money for all communities.

The draft MS4 permit outlines a 37% reduction requirement for Franklin, which is less than the 52% previously outlined in the Upper Charles Study. Even if we only have to meet a 37% reduction, I calculated the costs for the relative structural BMP cost and weight by lbs. of phosphorous from 52% to 37%. The table below still shows an implementation cost of over $42,000,000.00 to meet proposed Phosphorus Reductions in Franklin.

Phosphorous Reduction Requirements

	Existing Load (lbs/yr)	TMDL Allowable Load (lbs/yr)	Required Load Reduction (lbs/yr)	% Reduction	Non-Structural BMPs %	lbs Removed by Non-structural BMPs	Structural BMPs %	lbs Removed by Structural BMPs	Structural BMPs Cost	$/lb Structural BMPs
Upper Charles Study	5,428	2,600	2,828	52.1%	15%	814	37%	2,008	$74,600,000	$ 37,145
2014 MS4 Permit	5,218	3,302	1,916	36.7%	15%	783	22%	1,133	$42,096,429	$ 37,145

As mentioned previously regarding operational costs, I am unsure how the Town of Franklin can come up with $42,096,429.00 over the next 20 years for the implantation of the Phosphorus Control Plan and realistically implement this magnitude of projects. The Town of Franklin presently has a FY15 operation budget (schools, DPW, police, fire, library, etc.) of $111,318,801.00, with a capital improvement appropriation of $2,092,000.00. It would be difficult, if not impossible for the Town of Franklin to come up with an additional $2,104,821.45 for this program without reductions in other areas for capital improvements in Town like needed repairs to our schools and Town buildings, roadway improvements and equipment purchases, just to name a few. Taxes would need to be increased significantly or other services and personal would have to be cut from all other town sectors (public works, police, fire, library, senior services, education or elsewhere).

In conjunction with the comments mentioned above, EPA needs to be aware of the release date of the proposed permit and the Massachusetts municipal budget cycles. Many of the deadlines provided in the draft permit do not allow sufficient time to allocate appropriate time to complete the tasks required. No item in the permit should be required to be completed during the first permit year, except for the preparation of the Notice of Intent (NOI) and the Stormwater Management Plan (SWMP).

Additionally, there should be language within the permit that references EPA's Integrated Planning framework and allow communities the flexibility to utilize this approach to address a community's stormwater/MS4 requirements. EPA's Integrated Planning framework has been shown to save time and money so it should be embraced and recognized.

Additionally, the Town of Franklin and all communities should be recognized and credit should be given for all the improvements that have been constructed and completed since the implantation of the first MS4 permit in 2003, not just the last five years. Through local regulations, zoning requirement, the Town's overall infrastructure improvement program, and grants many BMP have been constructed over the last 10+ years and the Town should receive credit. Additionally, there are many older BMPs in town that may not have been designed for water quality, but still provide some benefit. The Town should have the option to incorporate these BMPs into its approach and calculations to meet the MS4 permit requirements for phosphorous control.

Finally, I would request that before the new MS4 permit is issued in Massachusetts that EPA evaluate how the permit program has worked since the initial phase "Small" MS4 program was implemented in 2003. It appears that the new permit is based on information that was collected and compiled before 2003. Charles River Basin communities have spent millions of dollars on stormwater improvements. How much better is the condition of the Charles River in 2015 compared to the understanding of water quality in 2003? EPA should be able to show some sort of measurable results! Why has there been no incremental evaluation of these permits to see if they are working before new and more stringent and expensive permits are implemented?

Below are our comments along with feedback specific to the proposed Small MS4 General Permit.

Comments on Proposed MS4 General Permit

1. **Section 1.7.2.d** Notice of Intent – "The NOI shall be submitted within 90 days of the effective date of the permit."
   Comment: The NOI and Stormwater Management Plan (SWMP) requires a significant effort by the Town as it represents the Town's commitment to meeting the MS4 Permit requirement and a significant upfront effort to develop a realistic and effective approach to meet the MS4 Permit with clearly defined roles and responsibilities. It is unrealistic to expect such a detailed plan in such a short period of time.
   Suggestion: Extend the deadline for submitting the NOI to one year from the effective date of the permit to allow for more coordination and integration with the SWMP development. If an extension is not possible, please consider a less detailed document that requires only an outline of the proposed SWMP.

2. **Section 1.10.c** Stormwater Management Plan – "The permittee is encourages to maintain an adequate funding source for the implementation of this program. Adequate funding means that a consistent source of revenue exists for the program."
   Comment: The increased level of effort to address water quality needs as required under the 2014 Draft Small MS4 General Permit should include Federal funding sources. This is crucial to not only continue monitoring water quality and foster development of solutions but also to allow for construction that will ensure compliance. The current source of grants available in Massachusetts will not be sufficient, particularly if other MS4s require assistance.
   Suggestion: The EPA and/or MassDEP need to provide financial assistance to MS4 communities to help them meet the MS4 Permit.

3. **Section 2.3.4.6** System Mapping – "The mapping shall include a depiction of the permittee's separate storm sewer system in the permit area. The mapping is intended to facilitate the identification of key infrastructure and factors influencing proper system operation, and the potential for illicit sanitary sewer discharges."
   Comment: The MS4 Permit requires that all system mapping of the MS4 be completed within two years of the effective date of the permit. This mapping will be crucial in determining the catchment areas, as stated in section 2.3.4.7.c. There is a discontinuity between these two activities; the catchment priority ranking is required to be completed within one year of the effective date of the permit.
   Suggestion: Please revise the order of these planning efforts to ensure that mapping data that will be gathered can be utilized and built upon.

4. **Section 2.3.4.7.e.ii.b** Wet Weather Investigation – "The permittee shall conduct at least one wet weather screening and sampling at the outfall for any catchment where one or more System Vulnerability Factors are present."

Comment: Wet weather sampling for outfalls should be based on an evaluation of catchments under Part 2.3.4.7.c and the requirements for discharges to impaired waters under Part 2.2.
Suggestion: Please revise the permit to provide flexibility for MS4s to conduct wet weather investigations based on priority catchments and the MS4s specific knowledge and understanding of their drainage system and water quality issues.

5. **Section 2.3.4.7.e.ii.b** Wet Weather Investigation – The permittee "inspect and sample under wet weather conditions to the extent necessary to determine whether wet weather-induced high flows in sanitary sewers or high groundwater in areas served by septic systems result in discharges of sanitary flow to the MS4."
Comment: While the intent of this effort is to identify potential illicit discharges that occur during wet weather events, a wet weather outfall sampling program could be utilized to collect data in relation to the Phosphorous Control Plan (PCP) by characterizing high priority catchments.
Suggestion: Please revise the wet weather sampling until the end of year four so that it coincides with the assessment of catchments and load reduction requirements under the PCP.

6. **Section 2.3.4.8.c** IDDE Program Implementation Goals and Milestones – "The permittee shall implement the Catchment Investigation Procedures in every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges."
Comment: The Town of Franklin has already done initial screening of all its outfalls under the 2003 MS4 Permit and has identified areas that require additional monitoring. Reducing field visits to catchment areas by using an office screening process (in accordance with section 2.3.4.7.e.i) will focus the Town's efforts with added efficiency.
Suggestion: Please remove the requirement to implement the Catchment Investigation Procedures in every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges. Using the IDDE program development (based on detailed mapping information) is an appropriate method of screening.

7. **Section 2.3.7.a.iii.f** – "All permittee-owned stormwater treatment structures (excluding catch basins) shall be inspected annually at a minimum."
Comment: Stormwater treatment structures should be inspected on a frequency that is based on industry standards/best practices, manufacturer's recommendations (stormceptors) and inspection history.
Suggestion: Please revise this to allow individual MS4s to set the appropriate inspection schedule of all stormwater treatment structures.

8. **Section 4.4.b.v** – The annual report shall contain the following information: "All outfall screening and monitoring data collected by or on behalf of the permittee during the reporting period and cumulative for the permit term…"
Comment: The data submitted with the annual report should be limited to the reporting period and not be cumulative. The reason a MS4 submits an annual report is to submit progress made over the year and it is therefore inefficient to continue reporting cumulative information.

Suggestion: Please remove the requirement to submit the cumulative data for the entire permit term with each annual report.

General Feedback on Proposed MS4 General Permit

9. Phosphorous Control Plan – The draft MS4 permit does not address pollutant loads from private properties.
   Suggestion: The Town believes that MS4s should be allowed to identify and investigate phosphorous reduction from private properties, but over a longer time period for planning and implementation. This may be more cost-effective and not constrain MS4s to working only within the MS4 regulated area and within the Town's current jurisdiction. The potential saving for the Town of Franklin was evaluated in the 2011 Upper Charles River Study.

10. Phosphorous Control Plan Implementation Timeframe – The current timeframe for implementation of the PCP capital projects is 15 years from the development of the PCP. The 2011 Upper Charles Study outlined an option for a 25-year implementation timeframe, which proved to be costly and the study suggested that an even longer timeframe may be needed.
    Suggestion: As stated previously, based on the findings of the study, it was determined that a longer implementation period would provide greater flexibility and cost saving in meeting the permit requirements. The time frame should be extended beyond 25 years if communities are making reasonable and measurable progress towards water quality goals.

11. The 2011 Upper Charles Study suggested using a "back-end-loaded" approach for implementing structural controls. It was found that using such an approach would lessen initial funding to "allow for better quantification of benefits from non-structural measures and early implementation of the most cost effective structural practices. This approach would also reduce initial expenditures as practitioners gain expertise and will likely lead to long-term savings over time."
    Suggestion: The Town suggests that this capital expenditure approach be considered by the EPA to ensure successful and long term compliance with cost savings for the Town.

12. Regional coalition groups – The permit doesn't discuss any benefits for municipalities to work together and pool their resources to meet requirements of the Permit. It would be beneficial if the EPA offered an incentive program to encourage cooperation between municipalities to meet some of the goals stated in the Permit. For example, it would be more efficient and cost effective for a coalition of towns to hire a contractor to do catch basin cleaning instead of each municipality contracting the work or burdening their current staff.
    Suggestion: An incentive from the EPA would encourage municipal cooperation and assist in obtaining support from the public and local officials, which would be difficult to otherwise achieve.

13. Education programs for government/elected officials – The Permit does not address providing education/information programs geared towards government/elected officials.

It would be helpful if the EPA provided training materials or personally conducted regional information sessions geared specifically towards these officials. Obtaining funding for this permit is going to be difficult, if not impossible, particularly without the support of the town government.
Suggestion: A presentation specifically for government officials by the EPA would be crucial in selling the permit and ensuring acceptance, cooperation and the motivation needed to establish stable funding.

14. Public outreach and educational programs – The Permit does not provide guidance or specific requirements for providing education/information programs geared to the general public.
Suggestion: EPA at the regional or national level needs to provide a structured approach and curriculum for local communities to follow. The burden should not be placed at the local level. There are many creative individuals at the EPA; they need to come up with the appropriate guidance and message for local communities to facilitate and share with their residents.

In closing, thank you for the opportunity to comment on the 2014 Draft Massachusetts Small MS4 General Permit and for your consideration of these comments as the permit is finalized. The Town feels we are proactive in our Stormwater Management Program and we would like to continue making progress towards water quality goals under a reasonable MS4 Permit. We hope that these comments and information are helpful in shaping the final MS4 Permit.

If you have any questions or wish to discuss this information, please feel free to contact me by phone at 508-553-5300 or e-mail at rcantoreggi@franklin.ma.us.

Attention: Comments on the 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

Sent via email to Tedder.Newton@epa.gov on February 26, 2015

Dear Mr. Tedder:

The Town of Grafton, currently regulated under the United States Environmental Protection Agency's (the Agency's) 2003 NPDES Phase II Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit, has reviewed the proposed Draft 2014 Massachusetts MS4 Permit (proposed Permit) that was released for public comment by the Agency on September 30, 2014. Based on the Town's review, several concerns have been identified related to the feasibility of in-the-field implementation and administrative compliance documentation required by the proposed Permit. This draft Permit will require a significant increase in man hours and funding to maintain compliance with the proposed increased stormwater regulations. The Town is concerned that it will not have the resources required by the proposed Permit to meet future stormwater compliance regulations.

The Town is also a member of the Central Massachusetts Regional Stormwater Coalition (the Coalition), which represents 28 Towns in Central Massachusetts, most of which are Permittees under the Agency's 2003 MS4 Permit. The Town of Grafton defers to the Coalition's separately prepared comments on the proposed Permit for specific technical concerns.

Through this letter, the Town of Grafton reserves the right to: (1) submit additional comments to any Response to Comments prepared by the Agency after the close of the public comment period for the 2014 Draft Massachusetts MS4 Permit, (2) submit additional comments on the Final Massachusetts MS4 Permit to address any and all changes made by the Agency subject to comments the Agency receives on the proposed Permit, and (3) appeal any provision of the Final Massachusetts MS4 Permit when it is issued, regardless of the origin of the provision or related comments.

This signature page documents the Town of Grafton's official comments related to the 2014 Draft Massachusetts Municipal Storm Sewer System (MS4) Permit.

Re: Objections to Proposed draft Massachusetts new EPA Storm Phase 2 regulations

The following is a list of the most troubling portions of the proposed new Stormwater Phase Two regulations.

1) Pavement maintenance work triggers retaining first inch of stormwater or stormwater treatment. Under the new regulations, when one disturbs more than 1 acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) or more which will include road reclamation projects, the new regulations require that the first inch of storm water be retained or all the stormwater must be treated. This essentially means one now not only has to resurface the road one has to completely redesign and re-construct the entire stormwater collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for stormwater storage or pay for the expense of stormwater treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way.

   As everyone is aware, the funds available for pavement maintenance are less than half of what are needed to simply preserve the condition of the current infrastructure. This means that Massachusetts roads are falling apart faster than they can be repaired. The above added costs will compound the problem and create more failing roads and more erosion. Municipalities will be forced to use the wrong pavement rehabilitation technique at the wrong time which will squander the available limited pavement maintenance resources.
   There must be an exemption for pavement maintenance projects. The above regulations should not be applied to maintenance projects. If a new road is being

constructed or a lane is being added, these stormwater management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should not trigger rebuilding the world.

2) Chloride Reduction. Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to legal action. Yes, usage of chlorides could all stop tomorrow, but at what cost to human life. If the EPA will protect an endangered salamander, it should be equally as concerned with the loss of human life. The chloride reduction regulations should be limited to recommending that municipalities follow the latest accepted Best Management Practices.
3) Requirement for tracking impervious area. The EPA in its permit guidance documents implicitly admits that the simple presence of impervious areas is not a direct correlation to stormwater quality. Sites with paved areas can store/detain or treat stormwater so that the presence of paved areas on stormwater quality is mitigated. Similarly, the MaDEP considers roof water runoff "clean" and can be infiltrated into the ground without pre treatment. Tracking the amount of impervious areas does not have a direct correlation to water quality; therefore the MS4's should not have to expend resources tracking changes in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities. Any attempt at limiting /restricting development through the veiled attempt at controlling impervious area is outside the purview of the Clean Water Act.
4) Cost of implementation. An article published in Construction Outlook a publication of UCANE recently published EPA cost estimates of compliance between $70,000 and $829,000 per year depending on population and size. This is very troubling because they have been known to significantly under-estimate the actual cost. At the meeting, Newton Tedder from the EPA commented that he believes most cities and towns will have to pass a stormwater utility in order to pay for the costs to comply with the new Storm Phase Two regulations. Obviously, the EPA is admitting that the new regulations are an undue burden and so costly that the municipalities cannot afford them with existing revenues. It seems unlikely that the intent of Congress in passing the Clean Water Act was to authorize the EPA to mandate additional taxes and create its own hidden tax structure to accomplish its charge of cleaning the water. The EPA was charged with cleaning the water and operating within its budget as set by Congress.

The States and local cities and towns must do the same. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to capriciously raise the cost of compliance with the new regulations. The local governments will be happy to work with the EPA to achieve progress on storm water. However, the heavy handed, adversarial and punishing regulations as proposed will not encourage cooperation from state and municipal partners.

The Congress of the United States should act to restrain the EPA from imposing uncontrolled and expensive tax burdens on the subjects it regulates. Taking reasonable actions to improve water quality is one thing, but being mandated to accomplish everything overnight is unfathomable. All levels of government must be cognizant of costs. The regulations, reporting requirements and the overall implementation costs must be reduced to a sustainable and rational level. The taxpayers and the country cannot be bankrupted by an attempt to reach unrealistic goals set by a bloated out of touch federal bureaucracy.

5) Signage at outfalls: Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources. The signs will encourage theft or vandalism and will provide little to no use in management of the stormdrain system. All regulated organizations are required to have maps with locations of all outfalls. The availability of low cost GPS devices makes these outfalls easily located by just about anyone.

Re: Comments on Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

The City of Haverhill (the "City") appreciates the opportunity to comment on the *Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts* (the "Draft Permit"), which EPA made available for public review and comment on September 30, 2014. These comments are timely based on EPA's extension of the public comment period to February 27, 2015.

As EPA knows, the City was actively involved in providing comments on the *Draft Massachusetts Interstate, Merrimack and South Coastal Small MS4 General Permit* (the "2010 Draft Permit"). On March 9, 2011, the City submitted extensive written comments on the 2010 Draft Permit. That letter enclosed and incorporated the comments submitted on February 22, 2011 by the Massachusetts Coalition for Water Resources Stewardship. The City also joined with 35 other municipalities and towns in comments submitted under separate cover by Kopelman and Paige, P.C. on March 11, 2011. Because the Draft Permit is a modestly-revised version of the 2010 Draft Permit, and like the 2010 Draft Permit is to be compared with the permit it will replace, i.e., the May 1, 2003 *General Permit for Stormwater Discharges from Small MS4s*, the above-referenced comments remain highly germane, and therefore copies of the three comment letters are enclosed and incorporated by reference. Furthermore, in the interest of economy, the balance of this comment letter restates in summary form and underscores the essential elements of the earlier comments.

The City is extremely disappointed that EPA has failed to recognize the substantial economic burden imposed on cities and towns in Massachusetts, including the City of Haverhill, by the Draft Permit. The City recognizes the need to maintain its stormwater collection and discharge system to control the introduction of pollutants to the Merrimack River, and will continue to take the necessary steps to control contributing sources of pollutants in stormwater by all practicable means. However, the Draft Permit imposes an expansive set of detailed prescriptive measures and requirements which micromanage the permittee's local permitting and public facilities operations and procedures, with no apparent justification or basis for determining that such detailed measures will result in measurable improvements in water quality. In effect, the Draft Permit would require the City to undertake substantial administrative actions,

JAMES J. FIORENTINI

WWW.CI.HAVERHILL.MA.US

at great cost, and on an unrealistically tight timeline, simply because EPA believes that these actions may result in a reduction of pollutants being introduced by the public (on both public and private property) into the waters of the United States. It is wholly unnecessary to mandate such actions. Instead, each community should be permitted to determine the best practicable measures to manage its stormwater systems to reduce the overall impacts on the receiving waters.

Inconsistent with the Clean Water Act. The Draft Permit continues to include provisions that conflict with the limited scope of municipal stormwater pollution control required under the Clean Water Act (the "Act"), specifically, the obligations imposed on municipalities. As previously stated, Section 402(p)(3)(B)(iii) of the Act, 33 U.S.C. § 1342(p)(3)(B)(iii), does not mention water quality standards or requirements for MS4 dischargers to not cause or contribute to exceedance of such standards. Rather, the Act states that MS4s must remove pollutants in stormwater to the maximum extent practicable, a term undefined in the Act, but which explicitly establishes that there are cost and reasonableness considerations to stormwater pollution removal by municipalities.

Inappropriate Transfer of Federal Responsibilities to the City. The Draft Permit requires the City develop and enforce a detailed set of procedures to ensure that certain development projects in the City apply for and comply with the *NPDES General Permit for Discharges from Construction Activities* issued under the Act. There is no explicit authority under the Act to require the City to serve as the "first line" enforcement mechanism for this federal permitting program. Whereas the City acknowledges EPA's authority to regulate direct discharges from the City's stormwater system to waters of the United States, the City has no legal responsibility under the Act to ensure that private developers, who may or may not be discharging to the MS4 system, comply with the federal requirements.

Limitations on Local Resources. Though EPA included a reference in Part 2.3.2.(c) of the Draft Permit to a web address at which municipalities may access prepared educational materials, EPA's overall effort to respond to commenters on the 2010 Draft Permit falls far short of what the City and others, including MassDEP, had requested in their earlier comments. We see EPA's effort in producing these educational materials as an acknowledgment that the overwhelming number of administrative requirements in the 2010 Draft Permit created enormous and unreasonable burdens on municipalities. One of MassDEP's comments on the 2010 Draft Permit speaks to this. MassDEP said that the changes in the 2010 Draft Permit were more than incremental, and would require significant changes in the ways municipalities fund and conduct their stormwater programs.

While the MS4 permit requirements *may* produce some environmental benefits, they will require of permittees an overwhelming amount of work and investment. Competing demands and dwindling budgets will make complying with the Draft Permit impossible for many municipalities, opening them up to potential enforcement action. We believe that in order for municipal leaders to justify to their citizens the dedication of such enormous human and financial resources, EPA must satisfy a greater burden. For example, with respect to wet weather

WWW.CI.HAVERHILL.MA.US

sampling, EPA must answer questions about its effectiveness, must provide data demonstrating how discharges were actually discovered using this protocol, and the quantity of pollutant reduction it produced. In short, it requires a cost-benefit analysis.

EPA's effort, therefore, falls far short. The City's earlier comments also sought agency assistance in other areas, e.g., ordinances, policies, templates, etc., none of which are addressed in the Draft Permit. In 2011, MassDEP was another voice seeking ways to make implementation more efficient, stating that additional changes should be made to streamline the public education, illicit discharge, monitoring and reporting requirements. EPA should reduce the multitude of administrative requirements in the Draft Permit so that implementation can be more affordably and effectively administered by cities and towns.

Time to Implement. Though in some instances, EPA provided additional time to reach certain milestones, e.g., IDDE program implementation, here too the agency's response is far from adequate. More time without fewer requirements during the five-year permit cycle does not generate a realistic formula for success. The timeline for completion of permit milestones requires dozens of varied tasks of each community with detailed reports during the permit cycle. This is unrealistic and a setup for failure. The list should be pared to achievable goals to be achieved over a realistic period of time, to be in effect "practicable."

Cost and Cost Effectiveness. In the City's 2011 comments, we went to great lengths to demonstrate the extent of the financial burden imposed on the City by the requirements in the 2010 Draft Permit. In preparing these comments, we have not rerun the numbers. Nonetheless, the points regarding cost effectiveness and "bang for the buck" running throughout the comment letters on the 2010 Draft Permit are no less valid. Indeed, in at least one area – MS4 outfalls – already a major cost item due among other things to the pointless requirement to perform wet weather sampling, information developed since 2011 indicates that there are one-third more outfalls in the City than previously thought (±800 rather than ±600), adding yet further costs. Conditions since then, i.e., over the past 4 years, have not improved; if anything, the struggle with severe constraints on resources to deliver an array of programs, including those that will have greater environmental benefit, is significantly worse. Though some activities in the Draft Permit may provide incremental benefits to stormwater quality, a federal mandate which prescribes specific measures and reporting requirements imposes significant administrative costs which are not reasonably recoverable.

At Odds With Integrated Planning. In recent years, EPA has increasingly embraced integrated planning approaches to municipal wastewater and stormwater management. According to EPA, integrated planning is intended to assist municipalities by identifying efficiencies in implementing requirements from different wastewater and stormwater programs. Integrated planning is a process to identify, evaluate and select alternatives and propose implementation schedules. The Draft Permit is at odds with the flexibilities built into integrated planning. The Draft Permit imposes extremely burdensome obligations and mandates compliance with all of its requirements within a five-year term. Effectively, this renders moot efforts by cities and towns to develop an integrated plan and find some relief from the

cumulative requirements of compliance with the permits for their publicly-owned treatment works and MS4 obligations with respect to stormwater. The Draft Permit must be revised so that it provides greater flexibility for municipalities to remove pollutants in stormwater to the maximum extent practicable, through the integrated planning process, i.e., a process that acknowledges there are cost and reasonableness considerations in stormwater pollution removal by municipalities. This should include recognition that each community is best able to establish priorities for public works expenditures to manage and upgrade the components of its stormwater and wastewater systems.

Thank you for your consideration of the City's comments. Should you have any questions, please contact Mr. Michael Stankovich, Haverhill DPW Director, at (978) 420-3815.

Very truly yours,

James J. Fiorentini
Mayor, City of Haverhill

Subject: Comments on the Draft Massachusetts Interstate, Merrimack and South Coastal Small MS4 General Permit

Dear Ms. Renahan:

The City of Haverhill ("the City") is in receipt of the Draft Massachusetts Interstate, Merrimack and South Coastal Small MS4 General Permit for stormwater management. This letter provides our comments for consideration when developing the final permit. Please note that these comments within are in addition to comments submitted on behalf of the City by Kopelman and Paige, P.C. under separate cover.

The regulatory agencies and the regulated communities share a common mission – to ensure the health and quality of our cities and towns and their natural resources. In order to accomplish these goals, environmental programs must be balanced with other needs and responsibilities of each community and implemented in a fashion that is both feasible and financially responsible. In this context, we offer the following comments on the Draft Permit:

Financial Burden to City of Haverhill

We anticipate that the Stormwater Permit will cost the City of Haverhill nearly $**5,400,000 over the 5-year permit to comply with all the requirements therein**. For example, the Draft Permit requires sampling of the outfalls that discharge to waters of the United States. The City has 604 outfalls. To deal with these outfalls through Minimum Control Measure # 3, Stormwater Illicit Discharge Detection and Elimination could cost up to **$294,000** annually. This is just one small component of the Draft Permit. Combined with the labor and consulting fees required to develop and distribute public education materials, to conduct illicit discharge detection and elimination investigations, to complete data and mapping requirements, to inventory and inspect municipal facilities, to inspect and enforce construction activities, to review site plans for proposed new development or redevelopment projects, and to develop and implement reports, policies and ordinances, the financial burden of the Draft Permit is excessive.

The Fact Sheet for the Draft Permit addresses the Unfunded Mandates Reform Act (UMRA). UMRA requires Federal agencies to assess effects of regulatory actions on tribal, state, and local governments and the private sector. UMRA defines "regulatory actions" to include proposed or final rules with Federal mandates. The Fact Sheet indicates that the Draft Permit is not considered a rule and is not subject to the requirements of UMRA. The EPA justified that the original 1999 Final Rule that created the NPDES Phase II program (FR Doc. 99-29181) as not an unfunded mandate and, accordingly, has not provided any direct financial assistance for this program since then. The City disagrees that the 1999 Final Rule is not an unfunded mandate, and because the Draft Permit is an extension of the 1999 Final Rule, the new Draft Permit is also

an unfunded mandate. Compared to the 1999 Final Rule, the Draft Permit has many additional costly requirements. The enclosed City of Haverhill analysis of what we feel it will take to comply with the new stormwater permit indicates that the Stormwater Permit will cost the City over **$1,200,000 for permit year one** and over $**5,400,000 over the 5-year permit to comply**. The City hereby requests that the Federal government provide direct financial assistance regarding this permit or reduce the scope of the Draft Permit.

Furthermore, in Section 1.10 c, the permittee is "encouraged to maintain an adequate funding source for the implementation of this program. Adequate funding means that a consistent source of revenue exists for the program." With only 120 days from the permit's authorization date to develop the Stormwater Management Plan and commit to particular measures for implementation, there is not adequate time for funding to be secured. In addition, a "consistent source of revenue" implies a funding mechanism such as a stormwater utility. Although the City of Haverhill is exploring options to implement a stormwater utility, this type of program requires years to develop and implement, normally requiring multiple levels of review, public hearings, and approval from Haverhill City Council. At a time when communities are not flush with money, and when most communities do not have enterprise funds for addressing stormwater infrastructure needs, the financial obligations of the proposed regulations are insurmountable. Therefore, the City requests that it be allowed the entire length of the permit cycle to comply with this requirement.

<u>Notice of Intent (NOI)/Stormwater Management Program (SWMP)</u>

The Draft Permit requires the submission of the NOI within 90 days of the effective date of the permit in order to receive authorization to discharge under the permit. Once authorization from EPA is granted, the SWMP must be completed within 120 days. Preparation of these documents will require assistance from an engineering consulting firm. However, because of City and state procurement requirements, seeking out and selecting a consulting firm to complete these documents within the required time-frames is not feasible. We suggest extending the submission of the NOI to 180 days from the effective date of the permit and then completion of the SWMP within one (1) year following receipt of authorization.

<u>Increased Discharges to Impaired Waters without an Approved TMDL</u>

The Draft Permit requires a permittee to identify and estimate a load for each pollutant in the increased discharge for which the receiving water is impaired and implement additional BMPs to assure that the increased discharge is not causing or contributing to a water quality standards violation. It places additional burden and financial cost upon the City to determine pollutant loads in increased discharges. Dry weather screening and the wet weather monitoring of

outfalls should be sufficient to meet water quality standards. Therefore, the City requests that this requirement be eliminated from the permit.

Outfall Inventory

The Draft Permit requires that each outfall be labeled in the field with a unique identifier. The City has identified over 600 outfalls. A Global Positioning System (GPS), reading which captures the latitude and longitude for all outfalls, along with the mapping requirements, should be sufficient to locate each outfall in the field. Accordingly, the requirement to individually label outfalls in the field should be eliminated.

Illicit Discharge Detection and Elimination (IDDE) Program

The City has completed most of the mapping requirements in the Draft Permit. Nevertheless, the requirement to delineate the drainage system into catchments and then evaluate each catchment for potential illicit discharges within one (1) year of the permit effective date is unrealistic. Within that year, the City is being required to identify catchments that are known "Problem Catchments" and then rank each delineated catchment not designated as "Problem Catchments" as "high", "medium" or "low" based on numerous factors. With over 600 outfalls, this will be a time-consuming and costly task for the City. Therefore, the City suggests completion of the mapping and prioritization of the catchments within three (3) years of the permit effective date.

In addition, the City is tasked with establishing a written protocol that identifies responsibilities for eliminating illicit discharges within one (1) year from the effective date of the permit. Combined with the mapping and catchment prioritization requirements, this task places additional burden on the City.

Lastly, the IDDE investigation and elimination schedule is too aggressive. By the end of year 3, a minimum of one-half of the Problem Catchments and catchments identified as "high" or "medium" must be investigated. By the end of the permit term, 100 percent of these areas must be investigated. Within seven (7) years of the effective date of the permit, all catchment areas ranked as "low" must be investigated. Given the high number of catchments and the cost associated with performing these investigations, we suggest completion of all investigations within ten (10) years of the effective date of the permit. The Draft Permit also requires the elimination or appropriate enforcement actions of a confirmed illicit discharge no later than 6 months after confirmation. Because of procurement laws, seeking out and selecting a consulting firm to assist the City in the elimination of an illicit connection will not be feasible within that time frame. The City suggests the Draft Permit provide one (1) full year to eliminate or commence an enforcement action to eliminate the illicit connection.

Outfall Monitoring

The monitoring of 25% of outfalls each year in both wet and dry weather conditions is cumbersome, costly, and unreasonable. Currently, the City has over 604 stormwater outfalls; with a 25% sampling rate, the City would need to sample up to 150 outfalls during dry and wet weather. Dry weather monitoring should be sufficient to identify an illicit connection. The City suggests removing the wet weather requirement or scaling back the dry and wet weather screening program to a more achievable level, such as 10% per year, starting with known problem areas.

In addition, the Draft Permit requires that if no dry weather flow is observed at the outfall, but evidence of flow exists, the outfall shall be revisited during dry weather within one week of the initial observation, if practicable. EPA needs to provide some guidance for the meaning of "no flow is observed, but evidence of flow exists." How does the City distinguish evidence of normal stormwater flow from evidence of dry weather flows? The EPA should clarify.

Sanitary Sewer Overflows

Sanitary Sewer Overflows SSO should not be in a MS4 permit. The definition of MS4 is Municipal **Separate** Storm Sewer System. Nowhere in this definition is there any reference to a "**Sanitary** sewer." Furthermore sanitary sewer overflows do not exist in a separate sewer system. No where in the 33 U.S.C or 40 CFR 122 is there a mention regarding SSO except for Wastewater Treatment Plant see 314 CMR 12.03(8).

Infrastructure Operations and Maintenance

Catch Basins

The Draft Permit requires the permittee to optimize catch basin inspection and cleaning such that the catch basins are no more than 50 percent full. The City currently has mapped nearly

4,000 catch basins thus far, but we estimate there may be as many as 10,000 catch basins within Haverhill. The additional cost to inspect and clean all catch basins according to the permit cycle is estimated to be over $557,000. We therefore request that just 20% of our catch basins be inspected and cleaned during the permit cycle.

Street Sweeping

The Draft Permit requires streets to be swept and/or cleaned a minimum of twice per year, once in the spring (following winter activities) and once in the fall (leaf clean up). The City currently has over 452 lane miles of streets. Currently, the City only sweeps streets with the most debris from sanding operations during the winter months.

The projected cost to sweep the streets is estimated to be $244,000. This is yet another example of EPA adding additional burdens to the City for this unfunded mandate. We request that the EPA drop this request in the permit.

Stormwater Structures

Lastly, the Draft Permit requires all City-owned stormwater structures, such as swales; retention/detention basins or other structures, be inspected annually at a minimum. As there has been no requirement to date to inspect stormwater structures, it is unknown how many swales and retention/detention areas are currently installed within the City. However, we anticipate this task to be very time consuming based upon a preliminary review of this situation. Over the 5-year permit period this could potentially costs upwards of $ 50,000.00 to complete this requirement. We request that this requirement be eliminated and instead the City will commit to locating and inspecting all the city-owned structures by the end of the permit cycle.

<u>Floor Drains</u>

The Draft Permit requires the development of an inventory of all floor drains within all City-owned buildings within one (1) year of the effective date of the permit. Identifying all floor drains in City-owned facilities and their connectivity within a year is a requirement that the City will not be able to meet. This is an extensive task that will take much longer than a year. For example, the City has 18 schools and these activities need to be done when school is not in session. The City suggests the deadline be extended to be within five (5) years of the effective

date of the permit. With 40 City owned buildings and reduced staff, this is another example of burdensome (est. $50,000) unfunded mandate to the City.

The permit also requires that all floor drains not be connected to the drainage system. The City disagrees with this requirement. A spill prevention control plan for City-owned facilities that have floor drains should be sufficient for protecting the drainage system. Requiring disconnection of floor drains is another example of a burdensome cost to the City.

Foundation Drains

In the Fact Sheet, EPA requested comments on potential pollutants in discharges from foundation drains. The purpose of a foundation drain is to collect rainwater so that basements do not become flooded. Foundation drains are located below the basement floor, away from potential sources of pollution. It is doubtful that foundation drains are a source of pollution and the City is aware of no documentation to the contrary.

Assistance from the Regulatory Agencies

There are several areas in which the regulatory agencies could provide information that would greatly reduce the financial burden and time constraints imposed by the Draft Permit, as described below. As much as possible, the regulatory agencies should provide guidance documents and templates to meet the individual requirements of the permit.

Public Education Materials
For the required public education materials, having each community create their own language and graphics for brochures, websites, signs, etc. is an inefficient use of resources. Enough of the information on non-structural controls implementable by the public is generic and can be provided in a series of templates to communities. A few versions of this information could be developed depending on the size and demographics of each community or depending on the watershed. Similarly, for business and industrial user education, much of the information is generic and applies to all facilities. Specific recommendations regarding pet waste management, the use of alternative fertilizers, appropriate fertilizer application, and yard waste recycling, to name a few, are common to most locations. Templates could include areas where communities can input information specific to their locations. This would greatly reduce duplicate efforts and costs.

Ordinances and Policies
Similar to public education materials, the regulatory agencies should provide suggested language for ordinances and policies. The Draft Permit requires the development of a number of specific policies and procedures, including those relating to illicit discharges, construction

oversight, new development reviews, and management of municipal facilities. Again, much of this information is generic and could be provided to communities as a range of templates. Furthermore, many communities are likely to have counsel review new bylaw language prior to its adoption. If the regulatory agencies provide only that language that has been reviewed from a legal perspective and is deemed appropriate and enforceable, this would further reduce the costs to the City.

Other Comments

The following is a list of miscellaneous comments that apply to topics other than those discussed above:

- The definition of a "New Discharger" states, in part, that the discharges did not begin at a particular site prior to August 13, 1979. However, the Fact Sheet states that it would be reasonable for a community to use the effective date of the permit, rather than August 13, 1979, in determining whether a new discharge should be treated as a new discharger. This is a more reasonable approach in defining a "New Discharger" and we recommend that the language "prior to August 13, 1979" be removed from the Draft Permit.

- The requirement to annually estimate changes in the number of acres of impervious area (IA) and directly connected impervious area (DCIA) tributary within the City will be time-consuming and add a financial burden to the City. This requirement should be removed from the permit, or alternatively, be required just in year 1 and year 5 of the permit.

- Section 5.1.5 states that "EPA or MassDEP may require the permittee to add, modify, repair, replace or change BMPs or other measures" at any time. This is open-ended and onerous. More specific allowances should be made for how long a community will be given to make changes if they are requested or required by the regulatory agencies. Please be reminded that the City budgets its expenses on an annual bases. Thus if EPA requires additional BMP's or changes after the budget is completed, additional funding must wait until the start of the next budget cycle.
- The requirements for construction site stormwater runoff control represent an improvement over the present General Construction Permit. Enforcement is often lacking with the present program, and having communities more involved with construction within their limits should help to mitigate the impacts of construction-related erosion and sedimentation. There could be a substantial reduction in pollutants from this alone, and the requirements appear to be reasonable and achievable.

- Similarly, post-construction stormwater management from new development and redevelopment are also "low-hanging fruit." The application of the existing DEP stormwater management standards to upland areas outside of the Massachusetts Wetlands Protection Act jurisdiction, which results in two or more acres of impervious surfaces, is appropriate. These are standards that have been implemented in and around wetland resource areas for a number of years and are tested, implementable, and enforceable.

In conclusion, the Draft Permit as presented includes several requirements which are not achievable and do not take into account time and budget constraints that affect cities and towns. The permit should be scaled back to include achievable, cost-effective goals during the course of the five-year permitting period. The final permit should present a means of building upon previous efforts to achieve continuous improvements to water quality in a rational, feasible manner and cost effective manner.

Enclosed for your review is a spreadsheet which illustrates the potential costs to comply with the requirements for permit year one for the City of Haverhill, as well as the projected 5-year cost to the City to maintain compliance. Additionally, attached hereto and incorporated by reference as if fully set forth herein are the "Comments on the Draft Massachusetts Interstate, Merrimack, and South Coastal Small MS4 General Permit" (dated February 22, 2011).

Thank you for your consideration of these comments. Should you have any questions, please contact Mr. Michael Stankovich, Haverhill DPW Director, at (978) 420-3815.

Very truly yours,

James J. Fiorentini

James J. Fiorentini
Mayor City of Haverhill

STORMWATER WORK ACTIVITIES FOR THE 6 MINIMUM CONTROL MEASURES	New Permit Requirement (Days)	Cost to Implement Year One	Cost to Implement Year Two	Cost to Implement Entire Permit
Notice of Intent and SWMP				
Preparation and submission of Notice of Intent	7.5	$7,200		$7,200
Preparation and submission of SWMP	15	$14,400		$14,400
Sub Total:	**23**	**$21,600**		**$21,600**
Minimum Control Measure 1: Public Education and Outreach	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Distribute a minimum of two (2) educational messages to each of the four audiences identified in Part 2.4.2.1(a). The educational program shall include education and outreach efforts for the following four (4) audiences: (1) residents, (2) businesses, (3)				
Develop educational material	3	$2,160		$2,160
Distribute 2 educational messages to the four targeted group	3	$2,160	$2,160	$10,800
Minimum Control 1 Sub Total:	**6**	**$4,320**	**$2,160**	**$12,960**
Minimum Control Measure 2: Public Participation /Involvement	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Conduct one public meeting (residential)	2	$2,240	$0	$2,240
Conduct one public meeting (business)	0.5	$560	$0	$560
Conduct one public meeting (industrial)	0.5	$560	$0	$560
Conduct one public meeting (developers)	1	$1,120	$0	$1,120
Minimum Control 2 Sub Total:	**4**	**$4,479**	**$0**	**$4,479**
Minimum Control Measure 3: Stormwater Illicit Discharge Detection and Elimination (IDDE)	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Field locate, inspect and sample (assume 20% have flow) 150 outfalls, dry weather, 20 outfalls/day	7.5	$6,300	$6,300	$31,500
Field locate, inspect and sample 150 outfalls, wet weather, 10 outfalls/day	15	$12,600	$12,600	$63,000

Lab analysis/field kits 20% dry weather outfalls, 100% wet weather outfalls		$14,200	$14,200	$71,000
Investigate positive (20% positive) sample results for 150 outfalls sampled 3 staff days to investigate with two staff members	180	$151,200	$151,200	$756,000
Preparation of a report summarizing IDDE program, including dry and wet weather screening.	10	$9,600	$9,600	$48,000
Develop a map of the separate storm sewer system and all structures associated with the system per 2.4.4.6 (a). The map shall include the entire separate storm sewer system, including pipes, catch basins, interconnections to other small MS4s	35	$60,000	$0	$60,000
Establish a written protocol which clearly identifies responsibilities with regard to eliminating illicit discharges and the systematic procedure for locating and removing illicit connections.	5	$4,200		$4,200
Delineate catchments and complete illicit discharge potential assessment and prioritization of catchments as part of IDDE program	17	$14,280		$14,280
Remove all illicit discharges found in each identified problem catchment.	10	$20,000	$20,000	$100,000
Train employees about the IDDE Program including how to recognize discharges and SSOs	2	$1,920	$1,920	$9,600
Minimum Control 3 Sub Total:	**282**	**$294,300**	**$215,820**	**$1,157,580**
Minimum Control Measure 4: Construction Site Runoff Control	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Enact an ordinance or regulatory mechanism that requires use of sediment and erosion control practices at construction sites	-	-		
Develop procedures for site plan review and enforcement, site plan review	5	$5,599		$5,599
Minimum Control 4 Sub Total:	**5**	**$5,599**	**$0**	**$5,599**

Minimum Control Measure 5: Post-Construction Stormwater Management in New Development and Redevelopment	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Enact an ordinance or regulatory mechanism that regulates runoff from new development and redevelopment projects.		-		
Develop a report assessing current street design and parking lot guidelines and requirements that affect the creation of impervious cover	7.5	$7,200		$7,200
Develop a report assessing existing local regulations to determine the feasibility of making green infrastructure practices allowable	8	$7,680		$7,680
Estimate number of acres of impervious area (IA) and directly connected impervious area (DCIA) ; Report tabulated results and estimation methodology if baselines provided by EPA are not used.	5	$4,200	$4,200	$21,000
Estimate the number of acres of DCIA added or removed to each sub basin during the prior year	4	$3,360	$3,360	$16,800
Complete an inventory and priority ranking of MS4 owned property and infrastructure that may be retrofitted with BMPs designed to reduce the frequency, volume, and peak intensity of stormwater discharges to and from its MS4.	5	$4,800		$4,800
Minimum Control 5 Sub Total:	**30**	**$27,240**	**$7,560**	**$57,480**
Minimum Control Measure 6: Pollution Prevention/Good Housekeeping for Municipal Operations	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Develop written operations and maintenance procedures for the municipal activities listed in paragraphs of 2.4.7.1 (a-c). a. Parks and open space: b. Building and facilities: c. Vehicles and equipment	15	$12,600		$12,600

a. Parks and open space: Establish procedures to address the proper use, storage, and disposal of pesticides, herbicides, and fertilizers including minimizing the use of these products and using only in accordance manufacturer's instruction. Evaluate l		$0		$0
b. Buildings and facilities: This includes schools, town offices, police, and fire stations, pools, parking garages and other permittee-owned or operated buildings or utilities. Evaluate the use, storage, and disposal of both petroleum and non-petroleum		$0		$0
c. Vehicles and Equipment: Establish procedures for the storage of permittee-owned vehicles. Vehicles with fluid leaks shall be stored indoors or in contained areas until repaired. Evaluate fueling areas owned by the permittee and used by permittee-own		$0		$0
Clean and inspect approximately 10,000 catch basins, assuming inspect and/or clean twice during the 5-yr. permit cycle.		$557,000	$557,000	$2,785,000
Establish procedures for sweeping and/or cleaning streets, sidewalks, and permittee-owned parking lots. These areas shall be swept and/or cleaned a minimum of twice per year.		$240,000	$240,000	$1,200,000
Develop an inventory of all permittee owned facilities within the categories listed per 2.4.7.1 (a-d) and other facilities not in the categories listed, but owned and operated by the permittee.	5	$2,599		$2,599
Develop an inventory of all floor drains within all permittee owned buildings Schools, DPW, etc.	5	$50,000		$2,599
Minimum Control Measure 6: Pollution Prevention/Good Housekeeping for Municipal Operations	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
If a catch basin sump is more than 50 percent full during two consecutive routine cleaning events, describe any actions taken to investigate the contributing drainage area for sources of excessive sediment loading, and to the extent practicable, abate con	8	$6,720		$6,720

Document plan for optimizing catch basin cleaning, which includes metrics and other information used to reach the determination that the established plan for cleaning and maintenance is optimal for the MS4.	5	$4,200		$4,200
Establish within 6 months of the effective date of the permit a program to repair and rehabilitate its MS4 infrastructure in a timely manner to reduce or eliminate the discharge of pollutants from the MS4.	5	$4,800		$4,800
Establish inspection and maintenance frequencies and procedures for the storm drain systems and for all structural stormwater BMPs such as swales; retention/detention basins or other structures. All permittee-owned stormwater structures shall be inspected	20	$19,200	$9,000	$55,200
Develop, implement, and sign a written SWPPP for maintenance garages, public works facilities, transfer stations, and other waste handling facilities. SWPPP to include all requirements identified in 2.4.7.2 (b)	15	$14,400		$14,400
Conduct SWPPP quarterly inspections	10	$9,600		$9,600
Minimum Control 6 Sub Total:	**88**	**$921,1**	**$806,000**	**$4,097,718**

Annual Reporting	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Self assessment on permit terms and conditions and appropriateness of BMPS	0.5	$420	$420	$2,100
For increased discharges identify those additional BMPs that the permittee has or will implement to assure that the increased discharge is not causing or contributing to a water quality standards violation.	0.5	$420	$420	$2,100

For the public education program report on the messages for each audience; the method for distribution; the measures/methods used to assess the effectiveness of the messages, and the method/measures used to assess the overall effectiveness of the education	0.5	$420	$420	$2,100
For public participation report on the activities undertaken to provide public participation opportunities including compliance with Part 2.4.3.1.	0.5	$420	$420	$2,100
Include inventory of all Problem Catchments and track removal illicit discharges	4	$3,360	$3,360	$16,800
Track progress of IDDE program, including mapping, SSO's, outfall inventory progress, illicit discharge removal in annual reports.	5	$4,200	$4,200	$21,000
Document the number of site reviews, inspections, and enforcement actions in the SWMP and include in each annual report.	1	$840	$840	$4,200
Report on (a) status of assessment of current street design and parking lot guidelines, (b) progress towards allowing green infrastructure, (c) those MS4 owned properties and infrastructure that have been retrofitted with BMPs designed to reduce the freq.	1	$840	$840	$4,200
Annual Reporting	**New Permit Requirement (Days)**	**Cost to Implement Year One**	**Cost to Implement Year Two**	**Cost to Implement Entire Permit**
Report on actions taken for catch basin sumps that are more than 50 percent full during two consecutive routine inspections. Report on plan for optimizing catch basin cleaning. Report the number of catch basins inspected, number cleaned, and the volume o	2	$1,680	$1,680	$8,400
Report the number of miles of streets swept/cleaned and the volume or mass of material removed.	0.5	$420	$420	$2,100

Report on the status of the inventory and any subsequent updates; The status of the O&M programs for the permittee owned facilities and activities in Parts 2.4.7.1(a – d) ; In addition, the maintenance activities associated with each.	1	$840	$840	$4,200
Report on results of inspections conducted under the Stormwater Pollution Prevention Plan (SWPPP)	0.5	$420	$420	$2,100
Description of activities for next reporting cycle and changes in identified BMPS or measurable goals.	0.5	$420	$420	$2,100
Sub Total for Annual Reporting:	**18**	**$14,700**	**$14,700**	**$73,500**
Total	**454**	**$1,29,358**	**$1,046,240**	**$5,430,917**

Subject: Comments on the 2010 Massachusetts Interstate, Merrimack and South Coastal Watersheds Small MS4 NPDES Draft General Permit.

Dear Ms. Renahan:

The following comments on the 2010 Massachusetts Interstate, Merrimack, and South Coastal Small MS4 NPDES draft general permit (the "Permit") are submitted on behalf of the Town of Abington (pop. 6,799),[1] Town of Acushnet (pop. 10,161), Town of Boxborough (pop. 4,868), Town of Burlington (pop. 22,876), Town of Carver (pop. 11,163), Town of Chelmsford (pop. 33,858), Town of Dennis (pop. 15,973), Town of Douglas (pop. 7,045), Town of Eastham (pop. 5,453), Town of Freetown (pop. 8,472), Town of Groton (pop. 9,547), Town of Groveland (pop. 6,038), Town of Hadley (pop. 4,793), City of Haverhill (pop. 58,969), Town of Lakeville (pop. 9,821), Town of Lancaster (pop. 7,380), City of Leominster (pop. 41,303), Town of Lunenburg (pop. 9,401), Town of Mattapoisett (pop. 6,268), Town of Millbury (pop. 12,784), City of Newburyport (pop. 17,189), Town of Northborough (pop. 14,013), Town of Northbridge (pop. 13,182), Town of Oxford (pop. 13,352), Town of Pembroke (pop. 16,927), Town of Plymouth (pop. 51,701), Town of Rehoboth (pop. 10,172), Town of Sandwich (pop. 20,136), Town of Sturbridge (pop. 7,837), Town of Templeton (pop. 6,799), Town of Townsend (pop. 9,198), Town of Upton (pop. 5,642), Town of Wareham (pop. 20,335), Town of Webster (pop. 16,415), Town of Westminster (pop. 6,907) and the Town of Westport (pop. 14,185) (the "Municipalities").[2]

As an initial matter, the Municipalities recognize and share the EPA's goals and objectives in eliminating pollution in the Commonwealth's waterways and recognize that that stormwater management is an important factor in eliminating and cleaning up the waterways. All of the communities that have joined in submitting these comments have an excellent track record of

[1] Population estimates are based on information publicly available through the Massachusetts Department of Housing and Community Development.

[2] Please note that certain of the Municipalities have provided additional comments under separate cover, the within comments are in addition to not a substitute for the other comments already submitted.

compliance with prior permits and take their role as stewards of the environment extremely seriously. However, while the goals and objectives of the Permit may be laudable, the Municipalities object to the means by which the EPA is attempting to achieve them. As will be discussed in greater detail below, there are numerous provisions in the Permit that unduly shift the burden of obtaining the EPA's goals and objectives to the Municipalities. This burden shifting would be unwarranted and troublesome in prosperous economic times, but in these uncertain economic times it is simply unacceptable. As a result, the Municipalities request that the EPA withdraw the draft Permit and take additional time to work with all of the stakeholders in this matter to craft a permit that properly recognizes the Municipalities' role in preventing degradation of the Commonwealth's waterways as well as the role of private stakeholders.

The Municipalities object to the Permit for the following reasons.

A. The Compliance with the Permit Conditions and Requirements is Cost Prohibitive

1. As a general observation, it is important to note that the Municipalities have an overall concern with increased Permit expectations and obligations. Earlier this year, the Massachusetts Legislature announced that local aid to cities and towns will be reduced for the coming Fiscal Year and further cuts are likely. This reduction follows significant reductions for the last two Fiscal Years. In addition to dramatic decreases in state aid, property values and other taxable spending by residents remains extremely low. As a result, cities and towns have to balance their budgets with record-low revenues and have to reduce staffing in order to stay afloat. Of course, these drastic reductions in state aid reflect the weakened state of the economy generally, and the loss of income by individual homeowners and ratepayers. This overall weakness not only constrains tax revenue, but also makes imposition of new fees and charges all but impossible. Therefore, in light of the present state of the world, national, state, and local economies and the resulting municipal budget cuts and staffing reduction, these increased expectations and obligations will place a burden on the Municipalities that will force a choice of compliance with the proposed Permit conditions or the provision of essential municipal services. The provision of both is not an economically feasible option.

2. As an example of the cost-prohibitive nature of the Permit conditions, as indicated in comments by other permittees and acknowledged by EPA at the Public Hearing, the cost for sampling and laboratory testing for 25% of the outfalls as required by the Permit (Section 3.0 et seq.) is approximately $70,000-$500,000 for communities with 20 to 600 outfalls. Other sources estimate that it will cost $60 per capita, per year to comply with the requirements of the draft Permit. Costs for compliance with the other conditions of the Permit, e.g. labor and consumable supplies required to develop and distribute public education materials, conduct site investigations, develop the data and mapping, to inventory and inspect municipal facilities, inspect and enforce construction activities, review site plans for proposed new development or redevelopment projects, and develop and implement reports, policies and ordinances make compliance with the Permit economically

impossible for the Municipalities in today's economic environment. Indeed, according to information on the EPA website, the Municipalities contain almost 32,000 acres of regulated impervious area. If remediation costs an average of $25,000 per impervious acre, the total cost to these Municipalities approaches $1 billion.

3. Section 1.10(a)(b) requires the Municipalities to develop a written Stormwater Management Plan (SWMP) within 120 days of the effective date to the Permit. This deadline is too stringent and fails to take into account the reality of having to coordinate with numerous municipal departments and consultants at the time where financial resources are scare. This requirement should be amended to allow significantly more time to complete and submit the SWMP.

4. Section 1.10(c) of the Permit "encourages" the permittee to maintain an adequate funding source for the implementation of the program. While the language of this section appears to be directory and not mandatory, it is vague and does not adequately provide the Municipalities with guidance for compliance with this provision. Moreover, to the extent that the language is mandatory, in all likelihood the Municipalities will be in violation of the Permit upon its effective date due to the timing of municipal funding. Municipal budgets are established at least 6 months prior to the end of a fiscal year. Fiscal Year 2011 budgets have already been established and adopted and Fiscal Year 2012 budgets will be established and adopted prior to the issuance of the final permit. The Permit was only recently released and still does not provide the necessary detail for the Municipalities to make long term financial projections. Even if the Permit did contain the necessary detail, the budgets for the first year Permit term will already be established.

5. Furthermore, the requirement that the Municipalities maintain a "consistent source of revenue" is not achievable. Unlike public water and sewer systems which are funded through user fees, stormwater systems costs may only be passed on to the citizens through property taxes or by adopting ordinances and bylaws, a process that is both lengthy and uncertain. With no independent source of revenue, stormwater budgets must be established annually by Town Meeting or City Council appropriation. Municipal officials cannot control how the voters will choose to spend limited resources in a given year. In these economic times it is difficult to see where the necessary funding would be obtained. In the short term, funding at least for the first year permit cycle will be unavailable as budgets will have been set and approved by Town Meeting or City action.

6. In this economic climate the Municipalities are struggling to maintain public roads, sidewalks, schools, teachers, fire and police personnel and other critical infrastructure and personnel requirements. Without financial assistance from the EPA and DEP, the diversion of funds for compliance with permit conditions such as requiring the monitoring and enforcing of dog waste bylaws and requiring personnel to monitor dumpster covers is simply too onerous and expensive and should be significantly scaled back to reflect the severe economic realities of today. Additionally,

and significantly, the numerous conditions in the Permit that require extensive expenditures of funds by the Municipalities amount to an unfunded mandate by the state and federal government.

B. Numerous Conditions and Requirements of the Permit are Vague

7. The Municipalities object to numerous conditions and requirements of the permit because they are vague in that the conditions and requirements fail to include specific, measurable quantitative standards to determine compliance with the Permit or inform the Municipalities of what is required of them, making it difficult, if not impossible to determine compliance. Such vague permit conditions and requirements also unlawfully allow the EPA or DEP unfettered discretion to determine which communities are in compliance and which communities are not, essentially leaving the determination to whichever EPA or DEP enforcing authority is charged with reviewing the reports submitted by the Municipalities. This may result in uneven and disparate enforcement and indefinite expansion and manipulation of the Municipalities' obligations. The Municipalities' vagueness objections include, but are not limited to, the following provisions:

8. 2.3.2.2 (d) is vague and does not provide the Municipalities with any notice as to what is required of them in order to comply with this section. Specifically the phrase "[t]o the extent consistent with law and EPA policy" leaves unfettered discretion to EPA to indefinitely expand and manipulate this condition.

9. Section 2.3.3 (b) is similarly vague, requiring permittees to "demonstrate to the satisfaction of MassDEP . . . ." This vague language and lack of specific criteria for compliance leaves the Municipalities with no guidance for compliance and MassDEP unfettered discretion to determine compliance. The condition should provide specific criteria for compliance so that the Municipalities can meaningfully comment on this requirement during the comment period.

10. Section 2.3.3(c) is vague and vests in both EPA and MassDEP unfettered and unappealable discretion to add requirements above and beyond those found in the Permit even if all of the conditions found in Section 2.3.3 are met. This condition should be struck from the Permit and clear criteria should be established so that the Municipalities can know, going forward, what will be required to comply with the Permit.

11. Section 2.4.4.8 (c) requires the Municipalities to designate catchments as problem catchments. However, the criteria for establishing a "problem catchment" is vague and could result in either requiring the Municipalities to check every catchment or miss a catchment because the Municipalities did not characterize the catchment as "highly suspect" since that term is not defined in the Permit. The term "highly suspect" should be defined and specific criteria for establishing a catchment as highly suspect should be provided in the Permit so that the Municipalities have an opportunity to comment on the criteria.

C. The Timeline Outlined in the Permit is Unrealistic

12. The many "milestones" described in the Permit cannot realistically be met. The requirements should be reduced to reflect a more realistic set of achievable milestones in light of the considerable other requirements of the Permit, including data gather and testing.

D. Compliance with Certain Permit Conditions is Impossible

13. Section 2.4.4.8 in some respects is impossible for the Municipalities to comply with. This section requires that the "permittee has adequate legal authority to accomplish the following tasks: prohibit illicit discharges; investigate suspected illicit discharges . . . including discharges from properties not owned or controlled by the MS4 . . ." The United States and Massachusetts Constitutions limit the extent to which government officials can enter private property without the permission of the property owner, and state law further limits the authority of the Municipalities to regulate certain entities and uses such as agricultural uses. The Municipalities cannot be required to violate the constitutional rights of its citizens a condition of a permit making this provision legally impossible for the Municipalities to comply with.

14. Likewise, Section 2.4.4.4 requires the permittee to "implement measures to control [non-stormwater discharges] so they are no longer significant contributors of pollutants or eliminate [them]." In many instances, this is an impossible condition for the Municipalities to comply with, there are numerous circumstances where a municipality simple does not have the legal authority to prevent non-stormwater discharges.

15. Finally, the IDDE program outlined in Section 2.4.4.8 is far too ambitious in its requirements in light of the other conditions in the Permit. The systemic procedure for locating and removing illicit connections will require significant resources thereby diverting valuable man hours and resources at a time when municipalities are forced to reduce their labor forces and not increase them.

E. EPA has Exceeded its Authority in Issuing this Permit

16. Section 2.1.1 requires that discharges not cause or contribute to an exceedance of water quality standards. Section 2.4 requires that the discharge of pollutants be reduced to the maximum extent practicable (MEP). These directives appear to be in conflict. MEP is the statutory standard that establishes the level of pollution reductions that MS4 operators must achieve. Application of pollution controls to the MEP may not assure that discharges do not cause or contribute to an exceedance of water quality standards. Since MEP is the statutory standard for MS4s it should apply throughout the Permit and be the governing standard to determine compliance.

F. The Permit Will Cause Undue Financial Burden On the Municipalities

17. Section 2.4.7.1 (ii) requires the municipalities to provide "pet waste baggies" and install signs along with "increased patrol for violators." This requirement will add significant costs to the already depleted municipal budgets.

18. Section 2.4.7.1 (c) requires that the "permittee shall ensure that all floor drains are not connected to the MS4." This condition will require municipalities to expend significant resources to determine where drains that have been in place for many years empty. In light of the requirements in the first sentence of this section, this added expense is unnecessary.

19. Section 2.4.7.1 (d) requires inspection of all catch basins twice per year. This requirement will entail the expenditure of additional man hours and resources at a time when municipalities are reducing their staffing and not increasing it.

20. Section 2.4.7.1 (d)(iv) requires street sweeping twice per year. This requirement will require the expenditure of additional man hours and resources at a time when municipalities are reducing their staffing and not increasing it.

21. Section 2.4.7.1 (vii) requires annual inspections of all permittee-owned stormwater structures. This requirement will require the expenditure of additional man hours and resources at a time when municipalities are reducing their staffing and not increasing it.

22. Section 2.4.7.2 requires that "the permittee shall select, design, install and implement the best available control measures to minimize or eliminate pollutants in the stormwater discharge from permittee owned facilities." Because this requirement fails to take into account the myriad of facilities owned and operated by municipalities and fails to establish a priority for implementing the best available control measures, the municipalities could be required to expend significant amounts of scarce resources in a very short time frame (one year) without the assurance that the benefit will have a rational relationship to the cost of the measure.

23. Additionally, due to the nature of municipal finance, the one year deadline for compliance with this condition may not be possible if the design and installation requires a third party vendor. Specifically, G.L. c. 30B requires adherence to a mandatory, time consuming procurement process before awarding of public contracts.

24. Section 3.0 requires the monitoring and testing of all permittee owned outfalls. As indicated in Section A.2 of this Comment, this requirement alone will place such a significant financial burden on the municipalities that compliance will be practically impossible.

G. Concerning Section 2.0 Non Numeric Effluent Limitations

25. This section should be re-titled "Effluent Limitations," as many of the limits imposed by this section are numeric.

H. Concerning 2.1.1.1. c The "Cause or Contribute" Provision

26. This section requires permittees to develop plans for remediation of discharges that "cause or contribute" to an exceedance of a water quality standard. At a minimum, this should be rewritten to clarify that only discharges that cause or contribute to a **violation** of a water quality standard are covered by this provision. It is possible to exceed a water quality standard, without causing or contributing to a violation. For example, a discharge could contain copper at a level above its CCC, but only if that concentration is above the CCC for 4 days would it actually be a violation of the standard.

27. This clause is impractical because permittees are not equipped to determine if their discharges "cause or contribute" to exceedances in the following circumstances:

> Where there are non-numeric standards applicable to the waterbody. For these standards, the permittee has no way of determining if a discharge contains pollutants in quantities that would cause or contribute to exceedances, as the standards are, by definition, subjective.
>
> Where the receiving waters are known to require a TMDL such waters invariably represent complicated environmental settings. In some cases a discharge may contain a pollutant in a concentration above a numeric criterion, but until the TMDL is completed, the appropriate level of control for the MS4 discharge is unknown.

28. This clause should explicitly exclude existing discharges to receiving waters that have been assessed to meet designated uses.

I. Concerning Section 2.2.1.d Limits on Phosphorus

29 The Permit is based on a misinterpretation of the various TMDLs referenced in the permit, when it requires each community to achieve the specific percentage reduction in phosphorus identified in the TMDL. The community level phosphorus loadings presented in the TMDLs were

developed based on land uses in the communities and export coefficients (pounds per unit of time) associated with those land uses. By knowing the different types of land uses and export coefficients, it is possible to estimate the phosphorus loading from that community. However, this does not mean that that EPA or DEP knows how much phosphorus comes from the community MS4; to the extent that the phosphorus comes from a property not a tributary to an MS4, that phosphorus is not the responsibility of the community under its ownership of the MS4. It may be either the responsibility of the owner of the storm sewer, or it may represent overland flow to the receiving water, and thus represent a non point phosphorus source. Thus, the requirements of appendix G-1 should be modified to reflect the phosphorus load reductions required from the MS4's, and not from the community as a whole.

30. Phosphorus limits should be expressed as a combined mass loading, where such loadings are known.

31. The limits on phosphorus discharge are expressed in the permit in terms of percent reduction from some baseline level, usually the loading based on the loads existing at the time of development of the TMDL. For those sources where the actual TMDL mass loading rates used to develop the TMDL are known, the permit should specify the mass loading rate, rather than a percent reduction. This will eliminate any confusion as to the baseline level, and will accommodate a more holistic evaluation of compliance with phosphorus reduction goals. For example, a community might attempt to meet its phosphorus reduction goal by maximizing phosphorous reductions at one site, rather than achieving the same level of phosphorous reduction at all sites. In this case, the percent reduction requirement may not always be met, even though the overall goal will have been met. Some might argue that the permittee is not in compliance with its permit for the outfall with lower percentage reduction.

32. Table G-1 could create confusion where it indicates that the Flint Pond and Lake Quinsigamond TMDLs require a 52 % reduction in storm flow. The TMDLs require a 52 % reduction in phosphorus. This should be clarified.

J. Concerning Section 2.2.1.e Long Island Sound TMDL Nitrogen Limits

A. The Nitrogen Limits Should Be Struck In Their Entirety.

33. The draft permit imposes nitrogen restriction on discharges tributary to Long Island Sound. These restrictions include a 10% reduction in nitrogen from existing levels, and a requirement to limit nitrogen such that they are "maintained, or decreased". See 2.2.1.e, appendix G-2, and part 2.4.2.1.1(c)(i),(ii). These limitations are based on the assumption that the approved TMDL requires these limitations.

34. Such an assumption is incorrect. Although the approved TMDL references a 10% reduction in total nitrogen loads for out-of-basin sources, EPA's approval letter of the TMDL, and the TMDL itself are clear that these represent assumptions made for the purpose of determining that there is "reasonable assurance" that the nonpoint source load reductions are achievable, and therefore that the detailed in-basin source reductions are appropriate[3]. The relevant portions of documents associated with the approved TMDL supporting this position are as follows:

35. EPA's Approval letter of the TMDL indicates the following:

> B. Phase IV Nonpoint Source Reductions
>
> The TMDL identifies load allocations for out-of-basin nitrogen loads (i.e., tributary loads) that would be achieved through the implementation of Phase IV reduction targets. For nonpoint sources, the Phase IV targets include a 10 percent reduction in urban and agricultural loads throughout the Long Island Sound basin north of Connecticut, and an 18 percent reduction in atmospheric nitrogen loads. These reductions are based on the clear role that these nonpoint sources have on water quality in Long Island Sound.
>
> Some public comments on the draft TMDL questioned whether states have the authority to assign allocations to sources in other states. ***In this case, EPA is not approving the out-of-basin nitrogen reductions as formal allocations but rather as reasonable assumptions on which the inbasin reductions are based.*** EPA believes that states have some flexibility to make assumptions about improvements in water quality beyond their jurisdictions. If they base a TMDL on such assumptions, states must clearly explain why the assumptions are reasonable. In this case, the states estimated 10 percent reduction in urban and agricultural nonpoint source loads is reasonable for the same reasons that were identified for the 10 percent reduction to the in-basin urban and agricultural loads. These reasons are detailed in the Reasonable Assurances section of this review. The estimated 18 percent reduction in atmospheric nitrogen loads is reasonable because it was taken from EPA estimates of the effect of implementation of CAA controls and its enforceable requirements, similar to the in-basin reductions of atmospheric nitrogen loads. EPA believes that these estimates of future reductions make sense. Moreover, as discussed in the Reasonable Assurance section below, EPA is committed to working with the three northern states to address nitrogen loads affecting Long Island Sound through their nonpoint source management programs. EPA TMDL approval letter, p. 9 (emphasis supplied).

---

[3] If the TMDL could not prove "reasonable assurance" for the out of basin sources, then the in-basin reductions would need to be greater than presented in the TMDL.

36. The TMDL, in discussing the implementation plan for the TMDL says:

> Achieving reductions in point and nonpoint source loads from states north of Connecticut will require increased coordination and exchange of technical information between the Long Island Sound Management Conference and those states. Some reductions in nonpoint source nitrogen loads are anticipated through the ongoing implementation of state nonpoint source management, stormwater permitting, and animal feeding operation (AFO) permitting programs. However, it will be necessary to conduct additional monitoring and assessment to better determine the relative importance of point and nonpoint sources, as well as the role of natural attenuation as the distance from Long Island Sound increases. Based on this assessment, the ***TMDL revision scheduled for 2003 will describe a framework for managing these out-of-basin sources and a schedule for implementing Phase IV nitrogen reduction actions***. Because Phase III and IV overlap and are interrelated, Phase IV nitrogen reductions should be initiated as soon as interstate agreements on specific implementation actions are established. Several steps have been identified to assess and achieve nitrogen reductions from out-of-basin sources (Table 12). Long Island Sound TMDL, p. 45 (emphasis supplied).

37. Until the TMDL Revision has been developed, subjected to public review, and approved by the Agency, it is premature to include any limits on nitrogen in this permit based on the TMDL. All requirements associated with nitrogen control must be struck from the permit.

K. Concerning Section 2.2.1.f and g Regarding Bacteria TMDL's

38. The Permit expresses limits on pathogens in stormwater discharges for the Shawsheen River and Palmer River using the Commonwealth's old fecal coliform requirements for primary contact recreation . However, fecal coliform densities are no longer used as the measure of bacteriological contamination in these waters and for these uses under the Massachusetts water quality standards. The proper organism is E. Coli for freshwater. Thus, there is no basis for including fecal coliform standards in this permit.

A. All Percent Reduction Limits for Pathogens Should be Struck from the Permit

39. The percentage reduction requirements for pathogens contained in the Permit are based on calculations contained in the TMDL. Those calculations were based on the reduction in pathogen densities in the receiving water necessary to meet water quality standards. This is not a calculation of a "maximum daily load," which is what the TMDL regulations require. Thus, the percentage reduction limits for pathogens should be struck from the permit.

40. Moreover, the observed concentrations in the receiving waters represent a variety of sources ranging from combined sewer overflows to privately owned storm drains to animal wastes. Even if percentage reduction was some form of a "load," the proper way to allocate this "load" would be to identify the relative sources, and assign both waste load allocations and load allocations to the various sources, as specified by the TMDL regulations. This process would more properly assign the responsibility for source reductions.

B. All Numeric Limits on Fecal Coliform Should be Struck from the Permit

41. The numeric limits on fecal coliform are imposed as a result of the approved Buzzards Bay, Mt Hope Bay, the Palmer River, Cape Cod and Shawsheen River TMDLs, among others. However, the approved TMDLs are flawed because they fail to identify the maximum daily load which the water body can tolerate and then to provide load allocations and waste load allocations as established by the TMDL regulations. Rather, the TMDLs simply decide that if all discharges meet the water quality standards, the receiving water will then be protected. This line of logic is inconsistent with the entire regulatory scheme established under the Clean Water Act. If all discharges meet water quality standards, not only would there be no need for a TMDL, there would be no need for technology based effluent limits, or water quality based effluent limits that vary according to the dilution of the discharge in the receiving water . All discharges everywhere would simply need to meet water quality standards.

42. The basic rationale for this line of improper logic was presented in the Total Maximum Daily Loads of Bacteria for the Neponset River Basin which states:

43. FECAL COLIFORM TMDL

> Loading Capacity. The pollutant loading that a waterbody can safely assimilate is expressed as either mass-per-time, toxicity or some other appropriate measure (40 C.F.R. § 130.2(i)). Typically, TMDLs are expressed as total maximum daily loads. However, MADEP believes it is appropriate to express bacteria TMDLs in terms of concentration because the fecal coliform standard is also expressed in terms of the concentration of organisms per 100 ml. Since source concentrations may not be directly added, the previous equation does not apply. To ensure attainment with Massachusetts' water quality standards for bacteria, all sources (at their point of discharge to the receiving water) must be equal to or less than the standard. Expressing the TMDL in terms of daily loads is difficult to interpret given the very high numbers of bacteria and the magnitude of the allowable load is dependent on flow conditions and, therefore, will vary as flow rates change. For example, a very high number of bacteria are allowable if the volume of water that transports the bacteria is high too. Conversely, a relatively low number of bacteria may exceed water quality standard if flow rates are low.

For all the above reasons the TMDL is simply set equal to the standard and may be expressed as follows:

TMDL = Fecal Coliform Standard = WLA(p1) = LA(n1) = WLA(p2) = etc.

Where:
WLA(p1) = allowable concentration for point source category (1)
LA(n1) = allowable concentration for nonpoint source category (1)
WLA(p2) = allowable concentration for point source category (2) etc.

44. For Class B surface waters the fecal coliform TMDL includes two components: (1) the geometric mean of a representative set of fecal coliform samples shall not exceed 200 organisms per 100 ml; and (2) no more than 10 % of the samples shall exceed 400 organisms per 100 ml. For Class SB surface Waters the fecal coliform TMDL is more restrictive to protect the shellfish use goal and also includes two components: (1) the geometric mean of a representative set of fecal coliform samples shall not exceed 88 organisms per 100 ml; and (2) no more than 10 % of the samples shall exceed 260 organisms per 100 ml. The goal to attain water quality standards at the point of discharge is environmentally protective, and offers a practical means to identify and evaluate the effectiveness of control measures. In addition, this approach establishes clear objectives that can be easily understood by the public and individuals responsible for monitoring activities. Also, the goal of attaining standards at the point of discharge minimizes human health risks associated with exposure to pathogens because it does not consider losses due to die-off and settling that are known to occur.

45. This logic is faulty for a variety of reasons, including the following:

a. The fact that the standard is expressed as a concentration does not justify the use of concentration alone in establishing the "load." Virtually all numeric water quality standards are established in terms of concentrations, but TMDL's are expressly designed to measure the loading that a water body can safely assimilate, expressed as a mass per unit time. In the case of these bacteria TMDL's, it would have been appropriate to use the number of organisms per unit of time as the proper metric. EPA provides several example pathogen TMDL's on its website that approach pathogen total load development in this manner.

b. The statement is wrong when it says that source concentrations may not be added. It is quite common to "add" the sources using numerical simulation models to develop the assimilative capacity of the receiving water. EPA and the New England Interstate Water Pollution Control Commission have developed that kind of model for the lower Charles River which was published as Appendix B to the final pathogen TMDL for the Charles River, and is a technique used in the

example pathogen TMDL's on EPA's website.

c. The statement is wrong when it says that all sources must be at or below the standard to ensure compliance with standard. As a practical matter, to the extent that any source is below the standard, then other sources may be above the standard, and the standard may still be met. In addition, bacteria undergo natural reduction in the receiving waters due to die-off, settling and other factors. As a result, waters that may be initially contaminated becomes less contaminated over time, and can serve to offset the input of discharges that are in excess of the standard. All of these factors are amenable to analysis and simulation through numerical models. Indeed, simulation model described in Appendix B of the Charles River Pathogen TMDL clearly showed that implementation of stormwater controls at levels far above the 200/100 ml standard was effective in significantly reducing the distribution of water quality violations.

d. The statement is wrong when it claims that the limits represent a practical means for assessing the effectiveness of control measures. Since the requirement is for a geometric mean to be lower than 200 organisms per 100 ml, and not more than 10 % to be lower than 400 organisms per 100 ml, a person can only know if compliance is being achieved if they have the entire sampling dataset available to them. This is hardly more effective for assessing compliance than any other limitation, or more easily understood by the general public. For example, it is quite possible to have a single discharge with a concentration of 100,000 coliform per 100ml – but if less than 10 % of the discharges from this source are over 400/100 ml, or the geometric mean of all samples is over 200 per 100 ml, the single discharge does not constitute a violation.

e. The statement is correct when it says that the goal of meeting water quality standards at the point of discharge is environmentally protective. But in the context of a TMDL this is irrelevant – the purpose of a TMDL is to develop the assimilative capacity of the receiving water. The fact that a pollutant discharged at the water quality standard (or indeed if the proposal were to require no coliform in the discharge) is environmentally protective is not material and cannot be used to justify a TMDL limit.

46. The communities realize that development of tools necessary to establish proper total maximum daily loads will be neither simple nor inexpensive. But, by the same token, compliance with these arbitrary standards will be far more costly. More work on the basic pathogen sources, and controls needs to be done to justify the expenditures necessary to comply with these requirements.

L. Concerning Section 2.2.1 g Nitrogen limits for discharges to Cape Cod/Buzzard Bay Waters

47. The description in Appendix G, table G4 usually characterizes this as "negligible", and includes a footnote that says this means that the nitrogen from the MS4 is less than 2%. This appears

to be a slight mischaracterization of what the TMDL says. The TMDL says that stormwater usually percolates into the ground; and that on the whole, stormwater constitutes a very small fraction of the nitrogen load. The TMDL makes no estimate of a nitrogen waste load allocation associated with MS4's. It appears that there is no specific load allocation for stormwater, either. Perhaps the best way to characterize the TMDL limitation is in these situations is "NA".

48. The permit requires that communities identify those sources of nitrogen discharging to the impaired waters listed in table G-4. A pollution budget for these waters has already been done as part of the Mass Estuaries Project, and so this requirement appears unnecessary. In addition, taken literally, the requirement would essentially require detailed sampling of a number of sources that are not related to the MS4 – groundwater, atmospheric deposition, overland flow, etc. This would likely be very expensive, and is beyond the scope of what should be included in an MS4 permit. If the purpose of this requirement is to establish some understanding of the nitrogen loads from the MS4, that can be accomplished by the testing required under section 3.0 of the permit.

49. Table G-4 is in error when it says that there is a nutrient TMDL for the Bay (presumably Mount Hope Bay) and Palmer River for Swansea. There is no nutrient TMDL for these waters.

M. Adoption of Any and All other Comments Submitted during the Comment Period of this Permit

50. The Municipalities hereby adopt any and all other comments submitted on behalf of any municipality to the EPA in response to its request for comments as if actually set forth herein together with any and all documentary support for said comments.

If you have any questions regarding this matter please do not hesitate to contact me or Attorney Gregg J. Corbo.

Massachusetts Coalition for Water Resources Stewardship

February 22, 2011

United States Environmental Protection Agency – Region 1
Ms. Kate Renahan
Office of the Regional Administrator
5 Post Office Square – Suite 100
Mail Code: ORA01-1
Boston, Massachusetts, 02109-3912

Subject: Comments on the Draft Massachusetts Interstate, Merrimack, and South Coastal Small MS4 General Permit

Dear Ms. Renahan:

The Massachusetts Coalition for Water Resources Stewardship ("the Coalition") is in receipt of the Draft Massachusetts Interstate, Merrimack, and South Coastal Small MS4 General Permit for stormwater management, applicable to over 150 communities in the Commonwealth. This letter provides our comments for consideration when developing the final permit.

The Coalition recognizes the importance of stormwater management to the environmental health of Massachusetts waterways and the maintenance of designated uses. With the Clean Water Act (CWA) long focusing on point sources alone, we applaud the efforts of the Environmental Protection Agency (EPA) and the Massachusetts Department of Environmental Protection (MassDEP) over the last decade to incorporate non-point source pollutant reduction into the CWA regulatory program.

The regulatory agencies and the regulated communities share a common mission – to ensure the health and quality of our cities and towns and their natural resources. In order to accomplish these goals, communities must balance environmental programs with other needs and responsibilities they have and implement them in a fashion that is both feasible and financially responsible. In this context, the Coalition offers the following comments on the Draft Permit:

Municipal Stormwater Requirements under the Clean Water Act

- Section 2.1 (page 12) states that, "pursuant to Clean Water Act 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to an exceedance of applicable water quality standards." A check of this section of the Clean Water Act (CWA) reveals no mention of water quality standards or requirements for MS4 discharges to not cause or contribute to an exceedance of said standards. Rather, **the law** states that MS4's must remove pollutants in stormwater to the maximum extent practicable (MEP), a term undefined in the CWA but which explicitly establishes that there are cost and reasonableness considerations to stormwater pollutant removal by municipalities.[1] In crafting the 1987 amendments to the CWA that established the MS4 program, Congress recognized that achieving water quality standards in something so variable and often times uncontrollable as municipal stormwater was so daunting and unlikely that a new standard, MEP, must be applied. EPA has effectively ignored this reality of the law in drafting a permit that requires compliance with water quality standards. It is not until section 2.4 on page 18 that MEP is raised as a permit condition. In this section MEP is properly described and the BMP approach to meeting MEP through an iterative process is appropriately offered. It is suggested that all language in the water quality section of the draft permit be stricken and the permit begin with the language from section 2.4. Per the CWA, MEP is the standard to which pollutants must be removed. Achieving MEP may not, and is unlikely to, achieve water quality standards in MS4 discharges. MEP does not equate to achieving Water Quality Standards as the cost and effort involved to meet the standards will rarely be feasible for a municipality. Achievement of water quality standards and requirements that MS4 discharges not cause or contribute to exceedances of WQS can only be set as goals in a stormwater permit if the permit is to be consistent with federal law.

- Section 2.2 is a continuation of the "achieve water quality standards" requirements of the draft general permit with a focus on impaired waters and TMDL waste load allocations (WLA). The TMDL WLA is effectively a numeric water quality standard that permittees are directed to achieve. For phosphorus, Section 2.2.1(d)(i) requires that "The permittee shall develop a written plan to assess the amount of phosphorus discharged from the MS4 to the waters identified in Appendix G, Table G-1 **and to reduce the phosphorus to levels consistent with the assumptions and requirements of the LAs and WLAs of the TMDL."** Permittees are given 3 years to develop the written plan and 7 years to complete implementation. A check of Appendix G, Table G-1 reveals that phosphorus removal requirements of TMDLs can range up to 97% for some ponds! Table G-1 identifies specific numeric phosphorus reduction values for each town and each impaired water with values of 50%-97% not uncommon. These are numeric water quality requirements that go well beyond any interpretation of MEP. Requiring municipalities to achieve these phosphorus reduction levels is impracticable. The more appropriate permit language would be to the effect that the MS4 must remove phosphorus to the MEP from discharges to impaired waters with TMDLs for phosphorus.

[1] The Random House College Dictionary Revised Edition, 1988, defines practicable as " capable of being done, effected, or put into practice, with the available means; feasible"

Data Needs for Compliance by MS4 Communities

The Draft Permit requires an enormous quantity of data to be gathered in a very short timeframe in order to meet all of the permit requirements. The following is a list of data requirements included in the permit.

- The locations of all stormwater infrastructure including outfalls, pipes, catch basins, interconnections to other small MS4s, catchment delineations, treatment structures and other Best Management Practices (BMPs);
- Data regarding the water quality of receiving waters, including water quality classifications and standards, identified impairments, total maximum daily loads (TMDLs), and waste load allocations (WLAs);
- Additional detailed receiving water quality information to identify areas with a high illicit discharge potential, such as fecal coliform, ammonia-nitrogen, total phosphorus, and surfactant data, and "any other available sources of dry weather water quality data including state agencies or watershed associations";
- Locations of drinking water supplies, shellfish beds, fishing areas and other sensitive environmental resources;
- Parcel-by-parcel land use information, including specific uses (car dealers, car washes, gas stations, garden centers, industrial manufacturing areas, colleges, and residential areas), building ages, septic system ages, results of Title 5 inspections, locations of swimming pools, and ages of industries;
- Sanitary sewer system information, including sewer ages, the location, date, volume, and mitigation of sanitary sewer overflows, and the locations of existing and former combined sewer overflows; and
- Additional optional information such as topography and orthophotography.

If a community does not already have a robust Geographic Information System (GIS), the development of these data layers would require years of work and will cost hundreds of thousands of dollars. The timeline for completion of much of the mapping in the Draft Permit and the data analyses that are contingent upon its completion is one to two years from the effective date. These are not achievable milestones for communities that do not already have access to this information. Data collection would require a flyover of the community and/or extensive global positioning system (GPS) field work. The allocation of funds followed by the procurement of the required services could consume the majority of the time allowed for these mapping and data analysis tasks. This could be exacerbated depending on the timing of the permit issuance within a community's fiscal year. For a community that already has all of the required data, the data compilation and analyses could consume the entire time allowable for these tasks.

Timeline for Completion of Permit Milestones

Among the many requirements in the Draft Permit, the following milestones are included at the times indicated for communities that were subject to the 2003 permit:

120 days following EPA authorization:

- Submit the Stormwater Management Plan, including initial mapping, measurable goals for each BMP, milestones, timeframes, and measures of assessment.

Within 6 months of the effective date:

- Inventory all permittee-owned facilities within the categories listed;
- Develop a program to rehabilitate infrastructure at municipal facilities as needed;
- Begin sweeping all streets twice per year; and
- Begin quarterly inspections of all municipal facilities.

Within 1 year of the effective date:

- Submit a Stormwater Pollution Prevention Plan for all municipal facilities;
- Prepare written operations and maintenance procedures for municipal activities;
- Develop a procedure for site inspections and enforcement of construction site measures;
- Develop a protocol for the illicit discharge detection program and prioritize areas based on the data listed above;
- Inspect all stormwater structures on municipal properties annually;
- Begin distribution of public education materials to four identified audiences;
- Identify areas of inappropriate pet waste management; and
- Develop an inventory of all floor drains within permittee-owned buildings.

Within two years of the effective date:

- Submit the storm sewer infrastructure map showing all stormwater utilities;
- Submit an inventory and priority ranking of MS4-owned property and infrastructure;
- Implement targeted management efforts for pet waste at identified locations;
- Submit a report assessing the current street design and parking lot guidelines;
- Amend the previously enacted ordinance (if completed under the 2003 Permit) for development/redevelopment post-construction stormwater standards;
- Distribute public educational materials about feeding waterfowl in targeted areas;
- Begin monitoring and sampling 25% of outfalls per year in both dry and wet weather;
- Submit an annual estimate of changes in impervious area in each sub-basin tributary to the stormwater system, both directly and indirectly connected, from both public and private projects; and
- For communities that ultimately discharge to Long Island Sound and those within the Cape Cod and Buzzards Bay watersheds, identify sources of nitrogen which discharge from or through the MS4.

Within 3 years of the effective date:

- Develop a report assessing existing local regulations to determine the feasibility of allowing or encouraging green infrastructure; and
- For communities with approved phosphorus TMDLs, develop a plan to assess the amount of phosphorus discharged.

Within 4 years of the effective date:

- Complete investigations of 50% of the storm sewer catchments; and

- For communities that ultimately discharge to Long Island Sound, implement practices such that nitrogen discharge levels are reduced.

Within 7 years of the effective date:

- For communities with approved phosphorus TMDLs, implement the plan to reduce phosphorus discharges.

By the end of the permit cycle:

- Monitor and sample all outfalls in both dry and wet weather; and
- Distribute a minimum of eight public educational messages.

Many of the individual requirements, on their own, would be achievable. However, requiring so many varied tasks of each community during a five-year permit cycle is unrealistic and is setting communities up for failure to comply. For this permit cycle, the program should be pared down to a list of achievable goals that build on the efforts that communities have already expended for compliance with the 2003 permit.

Financial Burden to Regulated Communities

For sample communities with 200 to 700 outfalls, the sampling and laboratory testing alone for 25% of the outfalls could cost upwards of $40,000 to $100,000 annually, depending on the parameters being tested. This is just one small component of the Draft Permit. While EPA has estimated compliance costs on the order of $100,000, it is important to note that the Massachusetts **2002** Clean Water SRF had 19 stormwater planning projects that ranged from $190,000 to $750,000, with an average of a little over $400,000. Combined with the labor costs required to develop and distribute public education materials, to conduct site investigations, to develop the data and mapping described above, to inventory and inspect municipal facilities, to inspect and enforce construction activities, to review site plans for proposed new development or redevelopment projects, and to develop and implement reports, policies and ordinances, the financial burden of the Draft Permit is excessive.

In Section 1.10 c, the permittee is "encouraged to maintain an adequate funding source for the implementation of this program. Adequate funding means that a consistent source of revenue exists for the program." With only 120 days from the permit's effective date to develop the Stormwater Management Plan and commit to particular measures for implementation, there is not adequate time for funding to be secured. Furthermore, a "consistent source of revenue" implies a funding mechanism such as a stormwater utility assessing user fees. This type of program could require years to develop and implement, normally requiring multiple levels of review and approval from town boards and committees, town counsel, town meetings or general elections, and sometimes the state legislature. At a time when communities are not flush with money, and when most communities do not have enterprise funds for addressing stormwater infrastructure needs, the financial obligations of the proposed regulations are insurmountable.

Pollutant Loading Offsets

Pollutant loading "offsets" are mentioned in the Draft Permit with regards to watersheds both with and without approved TMDLs. The Coalition is hopeful that this is a step in the direction of more holistic water resources planning, where trading could be between not only stormwater outlets discharging to a particular receiving water, but also between MS4 communities and a host of stakeholders involved in watershed management. This could include wastewater treatment facilities, agricultural operations, golf courses and impoundment managers.

Many communities are presently spending millions of dollars to upgrade their wastewater treatment facilities to meet stringent new pollutant goals. Some of these facilities can already attain levels below those required in TMDLs. Communities should be able to extend the benefit of their investment and offset some of the costs of stormwater treatment by meeting less stringent standards for stormwater, as long as the same total load can be achieved. Conversely, they should be able to invest in stormwater management and offset the need for additional wastewater treatment upgrades. Options for achieving offsets might also be present by provision of such in-stream improvements as impoundment removal or management, management of stream shading to reduce water temperature and management of aquatic vegetation. Other opportunities might also include better fertilizer management at agricultural operations and golf courses, which could be addressed as offsets to stormwater or wastewater treatment.

Watersheds with Phosphorus TMDLs

Based on the Draft Permit, communities with phosphorus TMDLs are required to meet unrealistic phosphorus reduction goals over a 7-year period, as specified in the tables in Appendix G. Presently, BMPs for stormwater phosphorus reduction are not well-developed. Furthermore, consistent guidance is needed in the permit regarding how to calculate the reduction potential associated with particular BMPs. Without presenting a consistent approach to calculating their reduction potentials, each community is likely to assess its achieved removal differently. In order to have an equitable program across cities and towns within the watershed, the permit documents must be more specific in this regard. A list of phosphorus-reducing BMPs should be provided as an appendix, with detailed instructions as to how to relate BMP implementation to a removal percentage for the flow that is affected by the BMP. This should apply to both structural and non-structural controls. Alternatively, one specific BMP guidance document should be referenced as the resource for all communities to perform these calculations. This will also minimize the frequency of phosphorus sampling required to assess compliance with the permit.

In addition to the need for more detailed and equitable methods of calculating reduction potential, the permit should address alternatives for highly urbanized areas where the installation of structural BMPs on public property may not be feasible. In these areas, communities can work with private property owners as properties are redeveloped to require BMPs on their sites. In the meantime, however, there may not be feasible approaches to meeting TMDL WLAs for phosphorus.

For all communities subject to phosphorus TMDLs, a phased approach with less stringent, achievable goals over a longer period of time is more appropriate at least until a range of feasible, cost-effective options for meeting water quality goals is developed through bona fide research and testing.

Shawsheen River Bacteria Reduction Requirements

In an August 2004 report entitled, "Evaluation of Stormwater Management Benefits to the Lower Charles River," prepared by Metcalf & Eddy for the EPA, 2000 cfu/100 mL is described as "the extreme of dry weather and wet weather stormwater quality that could occur if aggressive illicit connection removal is implemented, and all possible BMPs are applied to their fullest extent." The bacteria removal requirements in Appendix G of the draft permit are 200 cfu/100 mL (geometric mean) across Shawsheen River communities. Achieving these levels in urban stormwater discharges is not realistic.

Long Island Sound Tributary Nitrogen Reduction Requirements

The draft permit imposes nitrogen restrictions on discharges tributary to Long Island Sound. These restrictions include a 10% reduction in nitrogen from existing levels, and a requirement to limit nitrogen levels such that they are "maintained or decreased." These limitations are based on the assumption that the approved TMDL requires these limitations.

Such an assumption is incorrect. Although the approved TMDL references a 10% reduction in total nitrogen loads for out-of-basin sources, EPA's approval letter of the TMDL, and the TMDL itself, are clear that these are only assumptions made for the purpose of determining that there is "reasonable assurance" that the nonpoint source load reductions are achievable, and therefore that the detailed in-basin source reductions are appropriate. In particular, the TMDL includes the following language: "*the TMDL revision scheduled for 2003 will describe a framework for managing these out-of-basin sources and a schedule for implementing Phase IV nitrogen reduction actions*." Until the TMDL Revision has been developed, subjected to public review and approved by the EPA, it is premature to include any limits on nitrogen in this permit based on the TMDL.

Assistance from the Regulatory Agencies

There are several areas in which the regulatory agencies could provide information that would greatly reduce the financial burden and time constraints imposed by the Draft Permit. These include the following, each of which is described in more detail below: (1) public education materials, (2) ordinances and policies, (3) GIS data, (4) BMP removal efficiencies and related data, and (5) coordination with other review agencies. The provision of impervious area and directly connected impervious area for each community in Section 2.4.6.9 is a good example of the type of information that should be provided to assist in compliance. We note also that this Draft Permit included many more links to such resources than the North Coastal Draft Permit, which will be of assistance to communities. As much as possible, the regulatory agencies should provide guidance documents and templates to meet the individual requirements of the permit.

Public Education Materials
For the required public education materials, having each community create their own language and graphics for brochures, websites, signs, etc., is an inefficient use of resources. Enough of the information on non-structural controls implementable by the public is generic and can be provided in a series of templates to communities. A few versions of this information could be developed depending on the size and demographics of each community or depending on the watershed. Similarly, for business and industrial user education, much of the information is generic and applies to all facilities. Specific recommendations regarding pet waste management, the use of alternative fertilizers, appropriate fertilizer application, and yard waste recycling, to name a few, are common to most locations. Templates could include areas where communities can input information specific to their locations. Providing these templates would greatly reduce duplicate efforts and costs.

Ordinances and Policies
Similar to public education materials, the regulatory agencies should provide suggested language for ordinances and policies. The Draft Permit requires the development of a number of specific policies and procedures, including those relating to illicit discharges, construction oversight, new development reviews, and management of municipal facilities. Again, much of this information is generic and could be provided to communities as a range of templates, where a community could select the provisions applicable to their needs from a list of potential wording. If five templates could be made for each ordinance, rather than one for each community, this, again, would greatly reduce duplicate efforts and costs. Furthermore, many communities are likely to have counsel review new bylaw language prior to its adoption. If the regulatory agencies provide only that language that has been reviewed from a legal perspective and is deemed appropriate and enforceable, this would further reduce the costs to communities.

GIS Data
Many of the data needs listed above are a part of state-wide or regional initiatives. For instance, water quality classifications and standards, identified impairments, data from watershed organizations, waste load allocations, and waterways with endangered species habitat are not specific to individual communities, but instead are applicable to reaches of receiving waters that cross town boundaries. Rather than each community seeking out this information individually, the Draft Permit should contain links to downloadable GIS data for all regional or state-wide data required to be used to comply with the permit requirements.

BMP Removal Efficiencies and Related Information
As described above, the regulatory agencies should provide means of calculating removal efficiencies based on particular BMPs to arrive at a fair and equitable accounting across all communities. This is especially true for non-structural controls, such as public education and outreach, detection and elimination of illicit discharges, source control, and good housekeeping. Results from these activities are hard to measure otherwise.

Coordination with Other Review Agencies
Reviews for the presence of and impacts to endangered species, specific habitats, historical resources, and archeologically significant areas are cumbersome for each community to coordinate individually, both for the communities and for the review agencies. The permitting

authorities should coordinate the reviews by these agencies with the comment periods and with particular future milestones, and all comments should be funneled through the permitting agencies to the applicants via formal comments. The Draft Permit describes activities as minor as constructing a ditch or installing a new catch basin as requiring the community to contact the review agencies due to the disturbance of land, especially in relation to archeological resources. A more streamlined process is required for obtaining input from these agencies on minor activities such as these.

Other Comments

The following is a list of miscellaneous comments that apply to topics other than those discussed above:

- The monitoring of 25% of outfalls each year in both wet and dry weather conditions is cumbersome, costly, and unreasonable. This should be lowered to a more achievable level, such as 10% per year, starting with known problem areas. Because of the vagaries of stormwater quality, wet weather monitoring is of little value. Such monitoring should be kept to a minimum with representative sampling rather than monitoring of all outfalls. Representative sampling could be used to provide a general overview of stormwater quality. This overview will no doubt affirm what is already well known and documented – stormwater quality is highly variable and can be very poor.

- For receiving waters both with and without approved TMDLs (Sections 2.2.2 and 2.3.1), requiring the installation of BMPs in municipal systems to meet all impaired water quality standards is an enormous and expensive undertaking.

- Many, if not most, of the TMDLs cited in this draft permit are questionable as to their scientific basis and applicability to a regulatory program. There are inconsistencies in the development of TMDLs that may lead to imposition of costly requirements on some communities and not others. If TMDLs are to form the basis for assigning enforceable water quality improvements to permittees then the quality of TMDLs needs to be re-evaluated and held to a higher standard.

- The permit states that the regulations only apply to the "urbanized" areas of each community – those with at least 500 people per square mile – and that "irrigation water" is excluded as a non-stormwater discharge. This may result in an exclusion of agricultural areas, which tend to be major contributors to stormwater pollution, especially with regard to nutrients. The regulatory agencies would be remiss to require such stringent requirements to meet WLAs from urbanized areas but not include agricultural inputs.

- In Section 2.3.3 – Antidegradation, item (b) requires that for "discharges to tier II waters as defined by 314 CMR 4.04 the permittee shall demonstrate to the satisfaction of MassDEP that the discharge will cause no significant lowering of water quality by documenting one or more of the following: …(iii) The discharge does not cause a significant lowering of water quality because the effluent will be of a quality equal to or

better than the existing water quality of the receiving water…" This should be clarified, as it implies that water quality standards do not need to be met in water bodies where they are not presently being met. This rationale could be used by all permittees discharging to tier II waters to maintain the status quo.

- Several of the data needs may require data from adjacent communities or from entities other than the MS4 communities being regulated. For instance, if the sanitary sewers are owned and operated by a different entity, such as a sewer district, the MS4 community may be relying on the adequacy and quality of their data to meet some of the permit requirements. This applies to information on sewer locations, ages, sanitary sewer overflows (SSOs), etc. Similarly, where this situation exists, requiring correction of SSOs may be more challenging if they are not within the community's jurisdiction.

- The permit mentions that areas with sanitary sewers over 50 years old should be considered as having a high illicit discharge potential. Note that in some communities, the majority of sewers are over 50 years old. Therefore, a further division of priority areas would be required.

- Section 5.1.5 states that "EPA or MassDEP may require the permittee to add, modify, repair, replace or change BMPs or other measures" at any time. This is open-ended and onerous. More specific allowances should be made for how long a community will be given to make changes if they are requested or required by the regulatory agencies.

- Section 2.4.4.2 accurately recognizes that 6 months is not enough time to pursue and resolve a legal dispute with a discharger unwilling to comply; this could take years, and no time limit should be placed on such a dispute where it is beyond the control of the community.

- The requirements for construction site stormwater runoff control represent an improvement over the present General Construction Permit. Enforcement is often lacking with the present program, and having communities more involved with construction within their limits should help to mitigate the impacts of construction-related erosion and sedimentation. There could be a substantial reduction in pollutants from this alone, and the requirements appear to be reasonable and achievable.

- Similarly, post-construction stormwater management from new development and redevelopment are also "low-hanging fruit." The application of the existing DEP stormwater management standards to upland areas outside of the Massachusetts Wetlands Protection Act jurisdiction is appropriate. These are standards that have been implemented in and around wetland resource areas for a number of years and are tested, implementable, and enforceable.

- The requirements for good housekeeping and pollution prevention from municipal facilities all appear to be reasonable and achievable, with the exception of the following two provisions: (1) Investigating municipal buildings to identify all floor drains may be a challenging task, especially in a 1-year timeframe, if large facilities such as school

buildings and public meeting spaces are included; (2) The requirement to clean all catch basins when they are 50% full could require frequent cleaning of all catch basins in areas where deep sump basins have not yet been installed and may be excessive compared to the associated benefit. Agencies responsible for catch basin cleaning strive to maximize efficiency in light of local budgets and staff shortages. Greatest efficiency is realized when catch basins are cleaned following a geographic pattern, i.e., all basins in a given area are cleaned one after the other before moving on to a new area. Cleaning basins when they become 50% full is contrary to efficient use of manpower and cannot be implemented in a practical way. Furthermore, the inspection and cleaning of stormwater structures should be modified to be at the same frequency, allowing both to be performed at once.

- The requirements to measure and monitor changes in impervious area (Section 2.4.6.9), while an interesting academic exercise, provides little benefit to the municipal stormwater manager. This exercise will be burdensome and will take staff away from more valuable functions. If change in impervious surface over time is a metric of interest to Federal and State regulators then perhaps every 10 years the regulators can utilize advances in satellite imagery or other statewide GIS data to track this information. Stormwater managers should not be charged with gathering data that does not provide them with useful information.

- The Coalition agrees with the requirements for stormwater inputs into drinking water supply areas (Section 4.1) and the encouragement of groundwater recharge where feasible (Section 4.2).

- Where some of the permit requirements extend for a period of 10 years, it seems that record keeping should be required for longer than a five-year period.

In conclusion, while the Coalition agrees with the regulation of stormwater inputs to maintain high water quality, the Draft Permit as presented includes several requirements that are not achievable by many communities and do not take into account time and budget constraints that affect cities and towns. The permit should be scaled back, especially in the areas of mapping, outfall monitoring and sampling, and loading requirements, to include achievable, cost-effective goals during the course of the five-year permitting period. The final permit should present a means of building upon previous efforts to achieve continuous improvements to water quality in a rational, feasible manner. The CWA stipulates that municipal stormwater systems must remove pollutants to the maximum extent practicable. That is the standard to which this permit must be written in its entirety. The Coalition believes EPA has gone well beyond practicable in many of its requirements and needs to reconsider its timelines, expectations and stipulations. If communities are presented with a permit they can meet, that is within their means and advances the concept of continual improvement, they are more likely to successfully invest the necessary funds and labor into implementation.

We appreciate the opportunity to submit comments on the Draft Massachusetts Interstate, Merrimack, and South Coastal Small MS4 General Permit. Please do not hesitate to contact me with any questions. I can be reached at 508-799-1430 or at MoylanR@worcesterma.gov.

Sincerely,

RE: Comments of Homebuilders and Remodelers Association of Massachusetts, Inc. (HBRAMA) on Draft NPDES General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

On behalf of the Homebuilders and Remodelers Association of Massachusetts, Inc. (HBRAMA), I want to thank you for the opportunity to comment on the U.S. EPA's proposed draft National Pollutant Discharge Elimination System (NPDES) General Permit for stormwater discharges from small Municipal Separate Storm Sewer Systems (MS4s) to certain waters of the Commonwealth of Massachusetts (MS4 Permit).

The HBRAMA is a Massachusetts-based trade association representing builder and associate member firms organized in both a state, as well as six local, associations, spread geographically through the Commonwealth. HBRAMA is also an affiliate of the National Association of Home Builders (NAHB). Our members include those who design, construct, and supply single-family homes; build and manage multifamily, light commercial, and industrial structures; develop land; and remodel existing homes. HBRAMA has members in Massachusetts that discharge into affected MS4 systems potentially subject to the Draft MS4 Permit.

As an overall comment, HBRAMA understands the importance of stormwater management to water quality. The HBRAMA, however, is very concerned over the cost of implementing MS4 Permit requirements locally, and how those costs may disproportionately impact the residential building industry at a time when the

240 Cadwell Drive · Springfield, MA 01104 · T: 617-773-3305 · F: 617-773-3346 ·
www.hbrama.com

Commonwealth desperately needs to build more housing. Moreover, a significant concern to HBRAMA is the increasing obligation imposed on municipalities to regulate more complex stormwater management requirements without adequate guidance, resulting in each municipality adopting variations of the requirements, and further resulting in a confusing array of different stormwater standards at the local level. Lastly, we feel that some of the standards are overly conservative, thus resulting in both increased implementation costs as well as the need to overdesign certain stormwater management facilities.

Our more detailed comments are as follows:

1.10.c Stormwater Management Program (SWMP) –Adequate Funding Source

While the draft permit encourages the permittee "…to maintain an adequate funding source.." (i.e., a consistent source of revenue) "…for the implementation of this program," the reality is that the cost burdens for implementing this permit are staggering. As noted in one example found on page 33 of 100 in the EPA Fact Sheet:

> the estimated range in construction cost for phosphorous control plans (PCPs) for the three upper Charles River communities, Milford, Bellingham and Franklin, to fully comply with the proposed PCP requirements to achieve the needed stormwater related phosphorus reductions (assuming no controls in place – worst case) is $ 200 million to $350 million. The estimates are substantially reduced to a range of $85 million to $195 million if aggressive phosphorus source reductions and non-structural controls are implemented to remove the most challenging 15% of the total load reduction needed.

Even if a municipality is given a 20-year implementation timetable, there is no way a municipality can devote such resources to such a plan, given all other competing programs mandating funding under this program, including the "paper burden" in permit implementation including the Notice of Intent (NOI), Stormwater Management Program (SWMP), Spill Prevention plans, in addition to reporting requirements and the development of new ordinances and bylaws. While having streamlined, generic, preformatted templates generated by one agency instead of the many individual communities working independently would standardize and expedite the permit process, EPA's implementation goals are unrealistic for this type of investment. We are not even considering other non-permit programs competing for funding at the local level, including funding to maintain roads, sidewalks, schools, teachers, fire and police personnel and other municipal revenue demands, especially in those cities and towns struggling financially. In sum, encouraging municipalities to maintain an adequate funding source to implement the permit program will not achieve EPA's objective, and

240 Cadwell Drive · Springfield, MA 01104 · T: 617-773-3305 · F: 617-773-3346 ·
www.hbrama.com

if funding becomes mandatory, it will put most municipalities into noncompliance within a very short time period.

Municipal Funding Sources

Of significant concern to our members is the method by which municipalities may seek to generate revenue to pay for the implementation of this permit program. As noted on page 23 of the EPA Fact Sheet, the

> *EPA does not require or recommend a specific funding mechanism or funding alternative. These decisions rest with the operator of the MS4. There are several funding options available to permittees; these include service fees, formation of a stormwater utility, use of the general fund of the municipality, grants, and loans. Each mechanism has its own advantages or disadvantages and a municipality should choose the option that is right for it."*

Any such funding source must provide parity among all users, as it would be unfair to disproportionately impact a residential developer with new fees simply because the developer is the source of new development within a municipality. As noted in the Fact Sheet,

> *fees are usually based on the size of the property and the amount of impervious area associated with that property. Typically, fees are one rate for residential homes and are varied for commercial and industrial facilities, usually based on the impervious area of a property.*

Accordingly, in the scramble to secure scarce local funds, we caution EPA that it needs to encourage a form of revenue generation that is equitable so that the significant need for housing, including affordable housing, is not disproportionately impacted in a manner which further drives up the cost of housing, thereby making it more difficult for persons to afford housing, whether rental or ownership housing.

2.3.5. Construction Site Stormwater Runoff Control
Implementation – Enactment of Local Bylaws and Ordinances

The experience of our membership in dealing with the multitude of various locally-adopted stormwater bylaws and ordinances since the implementation of the MS4 Program has been nothing short of a bureaucratic and costly nightmare. Since each municipality has its own independent authority to promulgate new bylaws and regulations implementing stormwater programs mandated at the federal level, these bylaws have proven to be wildly inconsistent with both federal and state requirements,

240 Cadwell Drive · Springfield, MA 01104 · T: 617-773-3305 · F: 617-773-3346 ·
www.hbrama.com

and such bylaws and ordinances frequently mandate additional burdensome and costly requirements which do not necessarily translate to greater environmental protection. This problem has been the greatest source of frustration with our membership.

As you know, each municipality regulates stormwater through multiple sources which frequently contradict with one another, including: (a) local planning board subdivision regulations; (b) local site plan review bylaws and ordinances; (c) local special permit design standards; (d) local wetlands bylaw and regulatory requirements; and, (e) local board of health regulations. These requirements are in addition to state and federal sources of stormwater regulation, including: (e) state wetlands protection regulatory requirements; (f) EPA NPDES Stormwater requirements; and (g) Army Corps – Massachusetts Programmatic General Permit Requirements, all in addition to MS4 Permit requirements being imposed under inconsistent local stormwater bylaws and ordinances which not only regulate construction O & M, but are now being expanded to regulate post-construction O & M in connection with stormwater.

This inconsistency of application of stormwater requirements is quickly becoming one of the more problematic areas of regulation. From a policy perspective, local regulation of stormwater discharges from new developments or redevelopment in more urbanized areas must not become so burdensome that projects are relocated to greenfield sites, resulting in greater environmental impacts. To remedy this persistent problem, we encourage you to develop a model stormwater bylaw or ordinance in cooperation with the Massachusetts DEP (with input from stakeholders) so that EPA does not continue to add more confusion, inconsistency and cost to an already costly and burdensome stormwater regulatory program cutting across federal, state and local jurisdictions. The development and mandated implementation of a model ordinance which provides consistent performance standards under both federal and state requirements would go a long way in correcting this problem. One other possible alternative would be to create a federal-state general permit which provides that if one meets certain performance criteria, then the applicant simply needs to certify compliance with such criteria.

240 Cadwell Drive · Springfield, MA 01104 · T: 617-773-3305 · F: 617-773-3346 ·
www.hbrama.com

2.3.6. Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management)

A significant concern to the HBRAMA is the proposed performance standard described in Section 2.3.6 calling for the design of stormwater management systems on both new and redeveloped sites to either:

> *1. Retain the first one (1) inch of runoff from all impervious surfaces on site. OR*
> *2. Provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of biofiltration on the first one (1) inch of runoff from all impervious surfaces on site. This standard shall be met through a combination of practices designed to retain runoff on site (environmentally sensitive site design, low impact development techniques) where technically feasible, and stormwater BMPs designed to treat the remainder of runoff that cannot be retained on site due to site constraints. The level of pollutant removal from BMPs shall be calculated consistent with EPA Region 1's BMP Performance Extrapolation Tool.*

This section of the draft MS4 Permit attempts to require municipalities to "develop, implement, and enforce a program to address post-construction stormwater runoff from all new development and redevelopment projects that disturb one or more acres" by imposing standards that are nearly impossible to achieve and are significantly different from the stormwater regulations in Massachusetts, including those within the adopted Massachusetts Stormwater Handbook.

The regulation requires municipalities to impose a local ordinance or bylaw which mandates that: (a) all runoff be retained on site or alternatively - recognizing that many (if not most) sites cannot achieve 100% retention; or, (b) the first 1.0 inch of impervious surface shall be treated with advance Best Management Practices. However, the referenced standard will require 100% TSS removal or close to it; a standard that is not based on attainable practices. The impacts to an applicant are exacerbated in the circumstance of a redevelopment project.

This proposed performance standard is very different from our current state standards in Massachusetts. Specifically, Massachusetts only requires discharges within 100 feet of a wetland to address the "water quality volume." The standard requires not 1.0 inch, rather the first half (1/2) inch of runoff from all impervious surfaces on most sites. This higher standard of 1.0 inch is only required for critically important environmental areas in Massachusetts.[1] To require this standard for all developed and re-developed properties is overly onerous and without documented rationale.

[1] From Massachusetts Stormwater Handbook, Volume 1, Chapter 1:

240 Cadwell Drive · Springfield, MA 01104 · **T**: 617-773-3305 · **F**: 617-773-3346 ·
www.hbrama.com

Further, most sites cannot fully retain the 1.0 inch of impervious areas. In the usual development scenario, the proposed regulation requires bio-retention to a very high standard developed empirically through a white paper prepared by a consultant for the EPA in 2010 without proper and thorough peer review. The referenced standard for most facilities with a discharge would require 100%, or very close to 100%, TSS removal or for all proposed uses. This standard is nearly impossible to achieve as recognized in the Massachusetts Stormwater Handbook, which only requires 80% TSS removal. At the very least, to achieve this standard almost every BMP will be designed two times larger than required under the Massachusetts regulations with the attendant loss of otherwise developable area and cost. Put another way, the standard forces the project to greatly expand the land disturbance which otherwise would not be disturbed but for this onerous standard. To further compound the differences, Massachusetts' requirement is not for all discharges, just simply those alterations located within 100 feet of a wetland. In summary, this regulation is far too onerous, will often be impossible to achieve, and is based on incomplete science without a rational nexus to the problem it seeks to address.

Legal Authority to Regulate Flow

Lastly, we also want to note that HBRAMA agrees with the comments provided to your attention by letter, dated December 30, 2014, from Attorney Jeffrey S. Longsworth, Barnes & Thornburg, LLP, on behalf of the National Association of Home Builders (NAHB), where it was stated that the Draft MS4 Permit impermissibly attempts to regulate stormwater flow, impervious cover and mandate on-site retention standards without appropriate Clean Water Act authority to regulate such flow as a surrogate for pollutants or to mandate on-site activities not directly related to the control of pollutant discharges to U.S. waters. *See e.g.* Section 2.3.6 and related Fact Sheet discussion at pp.

The required water quality volume equals 1.0 inch of runoff times the total impervious area of the post-development project site for a discharge

- from a land use with a higher potential pollutant load;
- within an area with a rapid infiltration rate (greater than 2.4 inches per hour);
- within a Zone II or Interim Wellhead Protection Area;
- near or to the following critical areas:
    - Outstanding Resource Waters,
    - Special Resource Waters,
    - bathing beaches,
    - shellfish growing areas,
    - cold-water fisheries.

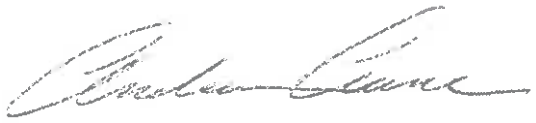
The required water quality volume equals 0.5 inches of runoff times the total impervious area of the post-development site for all other discharges.

240 Cadwell Drive · Springfield, MA 01104 · T: 617-773-3305 · F: 617-773-3346 ·
www.hbrama.com

86 *et seq.* We therefore want to re-emphasize HBRAMA's agreement with the comments by Attorney Longsworth on behalf of the NAHB.

Thank you for the opportunity to comment on these important matters.

Sincerely,



Andrew Crane

Re: Comments on the 2014 Draft NPDES General Permit for Stormwater Discharges from MS4 in Massachusetts

Dear Mr. Tedder,

The Town of Holden Department of Public Works (DPW) has reviewed the Environmental Protection Agency's (EPA) 2014 National Pollutant Discharge Elimination System (NPDES) Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts (Draft Permit). We thank you for the opportunity to provide comments. We also note that the Holden Town Manager and the Holden Board of Selectmen will be submitting comments separately to you.

The Town of Holden (the Town) is a community of approximately 18,000 people and is host to Massachusetts State Routes 31, 122A, 68 and 190. Additionally, approximately one third of the Town is protected open space intended to preserve the water quality of the reservoirs for water supply to the Worcester and Boston metropolitan areas. Holden is a Wachusett Reservoir Watershed community; most of the protected lands are owned or managed by the Massachusetts Department of Conservation and Recreation (DCR), which regulates these areas through the Massachusetts Watershed Protection Act.

The DPW supports the underlying goal of the Draft Permit, which is to improve the water quality of the United States. The DPW is the implementing agency for the Town of the 2003 Phase II MS4 General Permit (2003 Permit) and we have worked diligently and successfully to implement the requirements of the 2003 Permit. Indeed, the Town has shown its commitment to improving stormwater quality by being one of the original founding member towns of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). The Town continues to be a member of the CMRSWC steering committee, and strongly supports the CMRSWC's goal of combining the resources of its member communities in order to provide common, shared, and effective methods of management of stormwater runoff. We note that the CMRSWC will be submitting a set of comments to the EPA, and the Town of Holden fully supports those comments.

To date, the Town has spent between $150,000 and $186,000 per year for compliance with the 2003 Permit. Based on the EPA's cost estimates for complying with the Draft Permit's requirements, provided on Page 76 of the Fact Sheet, the cost of compliance for the Draft Permit could vary from $78,000 to $829,000 per year, depending on the size of the municipality. On behalf of the Massachusetts Department of Environmental Protection (DEP), this past fall, a group of Worcester Polytechnic Institute (WPI) students performed a cost analysis of Holden's current and projected stormwater management activities. The projected stormwater management activities were based exclusively on the Draft Permit's proposed conditions. This cost analysis indicates that Holden's implementation of the Draft Permit requirements will be approximately $260,000 per year, an increase of between 40 and 60-percent of the existing permit compliance annual costs. A copy of the WPI study is provided as Attachment A. The increased cost is substantially a result of requiring written plans, procedures, reports, policies, protocols, inventories and redundant sampling which creates a paperwork burden on the Town that does not contribute to the goal of reducing the discharge of pollutants to the waters of the United States.

The following comments are intended to highlight the concerns that the Town has with a variety of requirements in the Draft Permit that will cause the Town to incur unnecessary costs for tasks that provide little to no appreciable increases in stormwater runoff quality. Additionally, Draft Permit items that create an undo regulatory burden upon the Town in terms of administrative filings, data collection, studies, etc. are discussed:

1. Within the Town of Holden, similarly to other cities in towns in Massachusetts, there are several traditional and non-traditional publicly owned MS4 systems. These include the Wachusett Regional School District, the Holden Housing Authority, the Massachusetts State Police Barracks, and Main Street (Route 122A), a State owned and maintained route. Each of these entities lies within the urbanized area of the Town of Holden, but constitute a separate MS4 from the Town. The Town has no responsibility for or legal authority over, these other MS4s. However, the outreach to these other regulated entities to inform them of their responsibilities under the Draft Permit has appeared to be non-existent. We ask that the EPA reach out directly to these other regulated entities and not rely on the Town to do this work on the EPA's behalf. The EPA's outreach will have a greater effect than if the message is delivered only by the Town.

2. The Notice of Intent (NOI) requires a significant amount of work that cannot be reasonably and accurately performed in the ninety (90) days mandated in Part 1.7.2 of the Draft Permit. We note that per Part 1.7.4, the NOI will be posted and allowed to be publicly commented upon. It is important that cities and towns have an appropriate amount of time to collect the requested information in the NOI, to determine what Best Management Practices (BMPs) will be used to comply with the Draft Permit, and to determine what Town Department will be responsible for implementing the BMPs. It is assumed that the EPA and the members of the public that will be reviewing the NOI will want the NOI to be as complete and accurate as

possible. Indeed, Part 1.7.2. requires the Town's appropriate official to sign the NOI under the pains and penalties of perjury, and to certify that the NOI is "...true, accurate, and complete." We request that the time allowed to submit a NOI from the date of release of the Final Permit be at least 180 calendar days. This 180 calendar day schedule would be similar to that provided to municipalities under the 2003 Permit, and we do not see any reason why it should not be provided for this Draft Permit.

3. There appears to be a discrepancy regarding increased discharges to Outstanding Resource Waters (ORW) between Part 2.1.2 of the Draft Permit and Section II.D.I.c of the Fact Sheet for the Draft Permit (Fact Sheet). Part 2.1.2.a of the Draft Permit states that:

> "Any increased discharge...through the MS4 to waters of the United States is subject to Massachusetts antidegradation regulations at 314 CMR 4.04. The permittee shall comply with the provisions of 314 CMR 4.04 including information submittal requirements and obtaining authorization for increased discharges where appropriate."

Section II.D.I.c of the Fact Sheet states:

> "Increased discharges to outstanding resource waters or special resource waters are not authorized under this permit and the permittee must seek authorization under an individual permit after satisfying the Massachusetts anti-degradation requirements..."

The difference between the language of the Draft Permit and the Fact Sheet needs to be clarified, as the Fact Sheet appears to be much more restrictive than the Draft Permit language regarding increased discharges to ORW.

Further, any prohibition on increased discharges to an ORW, regardless of whether there is a stormwater related water quality impairment associated with the ORW, is overly restrictive for a community such as Holden. Virtually all of the water bodies in Holden are classified as ORW, due to Holden being in the watersheds of the reservoir systems for both the Worcester and Boston metropolitan areas. The ORW classification is provided by the DEP through its Office of Geographic Information (MassGIS) and it covers most of the Town. This restrictive language would prevent virtually any expansion of the Town's MS4 in the future. New Town facilities with impervious areas could not be constructed, and no new subdivision developments could be accepted by the Town as new public roadways, unless those projects discharged to upland areas. Each of those situations would represent an increase in discharges to an ORW. A blanket restriction on increased discharges to an ORW in Holden is extremely restrictive, and we do not believe that the Draft Permit's goal is to end public development in the Town. Nor do we believe that the EPA wishes to require an individual NPDES stormwater permit for each and every increase in impervious area and increased discharge in the Town (and in other Towns that

discharge to an ORW). We strongly urge the EPA to re-evaluate the language and goals of the Draft Permit and Fact Sheet in regards to increased discharges.

4. Part 2.2.2.a of the Draft Permit included Holden within the list of permittees that discharge to a water body impaired by nitrogen. Based on the 2012 Integrated List of Water, Holden's waters listed under Categories 4C and 5 (known as the 303d List) are impaired due to: non-native aquatic plants, low flow alterations, milfoil, myriophyllium spicatum, and ambient bioasays -chronic aquatic toxicity. Neither nitrogen nor nutrients are listed as the cause of impairment for any of the waters within the Town. We believe that the Water Quality Based Effluent Limitations (WQBEL) do not apply to Holden because the Town's MS4 discharge is not to a water whose quality is limited due to nitrogen. Also, Holden's waterways that discharge to the Wachusett Reservoir watershed are constantly being monitored for nitrogen, among other parameters, by the DCR Division of Watershed Management. The sampling location is the Quinapoxet River which is downstream of all of Holden's stormwater outfalls into the Wachusett Reservoir Watershed. We have been provided by DCR with the results of more than 96 grab samples taken between 2007 and 2013; and 34 composite samples taken during storm events from 2011 through 2013. The results from the sampling indicate that the nitrogen levels are very low, ranging between 0.1 and 0.5 mg/l. Holden is in the low to middle end of the watershed nitrogen range. An email from Lawrence Pistrang, Environmental Analyst IV of the DCR Division of Watershed Protection, summarizing these results is attached as Attachment B.

   Additionally, only a small portion of the Town's Urbanized Area drains to the Blackstone River Watershed. Because of these reasons, the Town requests to be removed from the WQBEL requirements. If the Town is not removed from the WQBEL requirements, the Permit should be revised to clarify that the WQBEL requirements only pertain to that portion of the Town's Urbanized Area that is draining to nitrogen impaired watershed. Furthermore, the additional requirements included in Appendix H of the Draft Permit, including providing additional messages to target audiences 3 times per year; requiring nitrogen removal BMPs in new developments and redevelopments; writing procedures for managing fertilizer usage, grass clippings and leaf litter; increasing street sweeping schedules, and; completing a nitrogen source identification report and implementing structural BMPs for Year 5 are unnecessary to meet nitrogen water quality standards and unlikely to result in any appreciable further reduction of nitrogen.

5. The public education program found in Part 2.3.2 requires the Town to show evidence that progress towards the defined educational goals has been achieved. We request that EPA provide specific measures and/or methods for the Town to show evidence for achieving the educational goals. Efforts spent on designing and evaluating methodologies to evaluate the effectiveness of an educational program create a burden to the Town, as its personnel are not specialized in public relations. This requirement does not encourage the best use of Town's resources and does not contribute to the goal of increasing the quality of stormwater runoff.

6. Part 2.3.4.5.b of the Draft Permit requires that all outfall and interconnections be inventoried. The Town has 144 outfalls and expects that adding interconnections will double or triple this number. The Town agrees that adding information such as material, size, shape, and condition to the inventory of outfalls is beneficial. However, we request that inventory of all interconnections be removed from Part 2.3.4.5.b, as there is no benefit to inventorying all interconnections if the point of discharge (outfall), downstream from the interconnection, is being monitored, sampled and investigated. Inventorying the physical conditions of interconnections will create a burden to the Town by duplicating efforts unnecessarily. For example, in Holden, Main Street (Route 122A) is a State owned and maintained route. While pipe and manhole interconnections are beneficial to have, at each intersection of a Town street with Main Street, there is a drainage interconnection due to sheet and channelized flow from the pavement at the intersection. These types of interconnections should not be mapped or sampled. Additionally, we believe one year is not enough time to gather all of this information and request that the update to the inventory of outfalls be completed throughout the duration of the permit.

7. A more detailed map than the 2003 MS4 Permit's system map is required in Part 2.3.4.6.a. The new stormwater system map requires substantially more information, including but not limited to adding pipes and catchment delineations. Also, the time frame to complete this task is two years. The Town requests that additional time be provided for the completion of this requirement. We request that the new system map be completed throughout the duration of the Permit, as this will allow for a practical use of Town resources to complete this requirement.

8. In Holden, various departments and divisions have or share specific responsibilities for the implementation of the 2003 MS4 Permit. Part 2.3.4.7.b of the Draft Permit requires writing a description of each department's responsibilities in a report. We believe a report that stays on the shelf and which hardly gets used simply creates a paperwork burden that is not an efficient way to create awareness of stormwater management responsibilities. We recommend that EPA strives to outreach to a broader range of Town agencies and departments, in order to increase awareness of the Illicit Discharge Detection and Elimination (IDDE) program and convey the importance of implementing the program. Simply reaching out to local Departments of Public Works misses a wide variety of the different town departments that share stormwater responsibilities.

9. The excluded catchments category, as described in Part 2.3.4.7.c of the Draft Permit, does not allow the Town to exclude residential neighborhoods with a very low potential impact to stormwater quality, because of those neighborhoods' proximity to sanitary sewer alignments. Permittees should be allowed to categorize a catchment as excluded even if there is sewer alignments within the catchment based on visual outfall assessment similar to the NPDES Industrial Multi Sector General Permit, or other factors such as age and construction material of the sewer system, levels of groundwater, etc.

10. Part 2.3.4.7.d of the Draft Permit, dry and wet weather outfall screening and sampling, requires, at a minimum, sampling of 7 parameters (ammonia, chlorine, conductivity, salinity, ecoli/enterococcus, surfactants and temperature) for any flowing outfall. We believe this is excessive and request that a visual screening of flowing outfalls should be allowed and sampling should be required only if visible signs of pollutants exists. This will allow the Town to focus efforts on finding and eliminating sources of non-stormwater discharges instead of simply sampling locations where high ground water tables may exist.

11. Under Part 2.3.4.7.e, the catchment investigation (system vulnerability) consisting of dry and wet weather key junction manhole investigations seems to be repetitive to the outfall screening requirement. We agree that it would be necessary to conduct upstream investigations if an outfall shows signs of pollutants. But that upstream investigation is only necessary to determine the source of the pollutants. Simply investigating upstream key junctions without any evidence of a problem is a waste of resources that accomplishes nothing, other than verifying that no problem exists. Dry weather key junction manhole inspections should allow for a visual assessment and not require screening of three (3) parameters (ammonia, chlorine and surfactants) to all catchments. We recommend that wet weather investigations be required only if the outfall/interconnection screening shows signs of pollutants, known contributors of illicit discharges exist, or where a system vulnerability may exists. This will allow the Town to focus efforts on finding and eliminating sources of non-stormwater discharges and will avoid expending efforts and funds unnecessarily.

12. Under Part 2.3.4.8.a, we request that completion of the screening of each outfall be extended to the duration of the permit and not required to be completed in three (3) years.

13. Under Part 2.3.4.9, we request that EPA provide specific guidance on reporting the IDDE program effectiveness and that the EPA develops tracking indicators it would like to be used. Requiring permittees to identify and define tracking mechanism creates a burden to the Town by requesting a task that may be better suited to the organization receiving updates from each town or city on compliance with its IDDE program.

14. For Part 2.3.5, writing procedures for site plan review and inspection and enforcement creates a paperwork and administrative burden for a report that hardly gets used. If the EPA believes that there is a standard set of procedures that should be followed for these types of efforts, then the EPA should be providing this information to its regulated entities, and the Town should be allowed to continue to focus on its implementation of the site plan review, inspection, and enforcement processes.

15. In Part 2.3.6.a.ii.(a), the requirement for new development and redevelopment related to retain or treat the first inch of runoff from all impervious surfaces is in stark

disagreement with and abrogates the Massachusetts Stormwater Handbook standards. These standards are directly incorporated into the Massachusetts Wetland Protection Act regulations (310 CMR 10.00), the Massachusetts 401 Water Quality Certification regulations (314 CMR 9.00), other state regulations, as well as numerous cities' and towns' subdivision standards, site plan review standards, stormwater management bylaws, and local wetlands protection bylaws. Any changes that the EPA wishes to make in the land development regulations and processes in Massachusetts need to be done in conjunction with those existing laws and regulations. Failure to do so will create an untenable situation where project proponents will be faced with contradicting requirements from the various permitting agencies. We request that Part 2.3.6.a.ii.(a) be made consistent with the Massachusetts Stormwater Handbook Standards.

Further, it is imperative for the EPA to clarify whether any requirements placed on redevelopment projects will be applicable to the entire redevelopment site, or to just the portion of the site being redeveloped. For instance, as the Draft Permit is currently written, it appears that a developer wishing to redevelop 1-acre of a 5-acre site would be required to upgrade and retrofit the stormwater management system of the entire 5-acre site, and not simply the 1-acre being subject to redevelopment. This would represent a huge increase in costs for such a developer, and will severely limit the ability of abandoned or little-used parcels to be converted to new, beneficial uses.

16. Part 2.3.6.b requires writing an assessment of current street design and parking lot guidelines to determine if changes can be made to support low impact development (LID) options. This imposes a burden to the Town by spending money on efforts to design new roadway standards, rather than focusing on reducing the discharge of pollutants in stormwater. The Town, where appropriate, has been implementing and supporting LID techniques as recommended in the Massachusetts Stormwater Handbook. We recommend that additional information on LID design and impacts be provided to the Town for its use as feasible.

17. Part 2.3.6.c requires writing an assessment of local regulations to determine the feasibility of allowing greener practices and providing a schedule for implementation of such practices. Similar to Comment 16, this creates a burden to the Town by spending efforts on Land Use Development design. We recommend that this assessment be done at a larger scale and not by individual cities and towns.

18. In Part 2.3.6.d, the estimating and tracking of the annual increase or decrease in the number of acres of impervious areas (IA) and directly connected impervious areas (DCIA) imposes an unnecessary burden to the Town. This requirement requires spending money for efforts on calculations that do not in any way provide a reduction of pollutants discharged through stormwater. Further, the baseline information provided by the EPA is already several years old and not reflective of existing conditions, never mind the conditions that may exist when the Draft Permit is actually finalized and implemented. Also, collection of this data imposes a great

administrative and paperwork burden on the Town, for little benefit. The Town requests that this requirement be removed from the permit. We recommend that if the EPA believes this would be a useful metric for further study, than the EPA should take on the challenge of updating and maintaining this database.

19. Part 2.3.6.d.iii of the Draft Permit requires the inventorying and priority ranking of Town-owned properties to implement a retrofitting program after Year 5 of the permit. Many of the Town owned properties are within areas where adding a structural BMP is nearly unfeasible. To meet this requirement, the Town will be obligated to hire an outside consultant to assess the possibility of modifying the existing infrastructure. This can be cost prohibited. The Town request that this requirement be changed to implement structural BMPs where economically feasible on a site specific basis, and will only result in measurable improvements in stormwater runoff quality.

20. Part 2.3.7.a.iii.(b) of the Draft Permit requires the Town to annually report the volume or mass of material removed from each catch basin draining to water quality limited waters and the total volume or mass of material removed from all catch basins. This requirement creates a burden to the Town by spending efforts on estimates that are virtually impossible to obtain with any degree of accuracy. Based on the realities of how catch basin cleaning occurs, it is not feasible to measure the amount of material removed from any one particular catch basin. Gross estimates may be made from a number of catch basins based upon the size of the catch basin cleaning truck, but individual determination of a catch basin's material is not feasible from an operations point of view. Further, this calculation does not prevent or reduce the pollutant runoff from Town-owned operations. The Town requests that this requirement be removed.

21. The Draft Permit in Part 2.3.7.a.iii.(c) requires the Town to annually report on the number of miles of street cleaned and volume or mass of material removed. This requirement creates a burden to the Town by spending resources and efforts on estimates that are hard to obtain with accuracy. This calculation does not prevent or reduce the pollutant runoff from Town owned operations. The Town requests that this requirement be removed.

22. The standard permit conditions included in the Draft Permit are much different than the standard conditions included in other NPDES permits. It includes criminal penalties which have not been previously listed. The Town has and plans to continue to implement the requirements of the MS4 permit, but disagrees with the new language included in this Appendix B of the Draft Permit.

As described above we believe there are a number of proposals found with this Draft Permit that are either: 1) impractical to implement; 2) add little to no benefit to the environment; 3) cost prohibitive, or; 4) some combination thereof. We believe that a number of changes must be made to the Draft Permit, in order to create a regulation that will work for the municipalities, the EPA, and the environment as a whole. We

believe that many of the requirements of this Draft Permit are best instituted on a nationwide or statewide level, given the greater amount of resources available to EPA and DEP. Without an infusion of state and federal fiscal resources, as currently designed this Draft Permit sets up small towns and cities for failure, as the required fiscal resources needed to implement the Draft Permit are simply not available to them. We strongly suggest that the Draft Permit be pared back to better reflect the resources available at all levels of government.

We thank EPA for providing the opportunity to comment, and look forward to working with you to create a more practical and easy to implement general permit. If you have additional questions regarding these comments feel free to contact me at 508-210-5550 or via email at jwoodsmall@holdenma.gov.

Worcester Community Project Center

Sponsored By: Massachusetts Department of Environmental Protection

Abstract

Stormwater runoff is one of the leading causes of water pollution in the United States. The MS4 permit reduces pollution by regulating the runoff of pollutants into stormwater drains. With the assistance of the MassDEP and the Worcester Community Project Center, we sought to provide the Massachusetts towns of Southbridge, Holden, and Millbury with a cost analysis for implementation of the 2014 draft MS4 permit. In order to achieve this goal, we learned the details of the 2003 permit and 2014 draft permit, interviewed town officials, and performed water quality sampling. After creating our cost analysis, we provided our subject towns with findings and recommendations assessing the feasibility of implementing the permit, and suggestions for best practices each town uses to manage stormwater.

Acknowledgements

We would like to thank our sponsor, the Massachusetts Department of Environmental Protection, for their support and assistance throughout our project. In particular, we would like to thank Frederick Civian, Andrea Briggs, Stella Tamul, and Cheryl Poirier. We would especially like to thank Frederick Civian for his ongoing commitment to answer any questions we had, for helping us produce our cost sheet, and for appearing in our video.

Next, we would like to thank the representatives from Holden, Millbury, and Southbridge, who were extremely generous in allowing us to interview them and perform outfall tests. From Holden, we would like to thank Isabel McCauley, John Woodsmall, and Pamela Harding. We are especially grateful to John Woodsmall for appearing in our video, and to Isabel McCauley for taking us out to all of the outfalls we tested. From Millbury, we would like to thank Robert McNeil and Cindy Allard for allowing us to interview them, and for showing us a smoke test demonstration. From Southbridge, we would like to thank Heather Blakeley, Ken Pickerin, and Mark DiFronzo for allowing us to conduct our interviews and sampling.

Additionally, we would like to thank Robert Lowell and Larry Pistrang from the Department of Conservation and Recreation (DCR) for allowing us to interview them and gain from their experience. We would also like to thank Kelley Freda from the DCR, for contributing a detailed cost estimation.

We would also like to thank the Central Massachusetts Regional Stormwater Coalition, in particular Aubrey Strause and Matthew St. Pierre for giving us data, answering our questions, and allowing us to attend steering committee meetings.

Finally, we would like to thank our advisors Corey Dehner and Anne Ogilvie for their ongoing support and dedication to the success of our projects. Thank you for pushing us to

perform to the best of our ability no matter what happened during the term. We would also like to thank you for the various donuts, pizzas, and coffee to keep us going along the way.

Executive Summary

Background

Water Pollution affects an enormous number of water bodies in the United States. "In 2006, there were over 15,000 beach closings or swimming advisories issued due to bacterial levels exceeding health and safety standards" (Council, 2008). Much of this pollution is due to stormwater runoff. Stormwater runoff occurs when water becomes displaced by weather and flows over impervious surfaces, such as roads and roofs. When stormwater flows over these surfaces, it often collects pollutants such as oils, nutrients, ammonia, sediments, and heavy metals (EPA, 2012). These pollutants can have environmental, aesthetic, and economic ramifications on surface bodies of water. In order to combat stormwater runoff, the United States Environmental Protection Agency (USEPA) has created a system to move stormwater runoff into nearby bodies of water through what is known as Municipal Separate Storm Sewer Systems (MS4). Unfortunately, while these systems are useful for draining stormwater runoff, they are also very effective at directing pollutants into water bodies.

Before 1972, stormwater runoff and sewage drained through the same pipe, which led to frequent overflows (Robert B. Stegmaier, 1942). These overflows led to the pollution of topsoil, and the need for a better solution became apparent. This situation led to the creation of the Clean Water Act (CWA) in 1972 (Andreen, 2003a). In 1990, the USEPA first released the MS4 permit as part of the CWA. The MS4 permit allows municipalities to regulate the discharge of pollutants into stormwater drains. The MS4 permit defines six minimum control measures to reduce pollution caused by stormwater runoff. These control measures are:

1) Public Education
2) Public Involvement and Participation
3) Illicit Discharge Detection and Elimination (IDDE)
4) Construction Site Runoff Control

5) Post-Construction Runoff Control
6) Pollution Prevention and Good Housekeeping

Municipalities fulfill these control measures with Best Management Practices (BMPs). These BMPs can include street sweeping, waste collection, and outfall sampling. The implementation of these BMPs cost municipalities money. Massachusetts has been regulated under the same MS4 permit since 2003. Even though this permit expired in 2008, the USEPA continued to administer it indefinitely until they were able to release a new permit. On September 30, 2014, the USEPA released the 2014 draft MS4 permit. This new draft permit is much more detailed than the 2003 permit and has much more stringent regulations. Due to this increased level of regulation, the 2014 draft MS4 permit will cost much more to implement than the 2003 MS4 permit.

The Massachusetts Department of Environmental Protection (MassDEP), in collaboration with Worcester Polytechnic Institute (WPI), developed this project in order to assess the cost of implementing the 2014 draft MS4 permit in three Massachusetts towns: Southbridge, Holden, and Millbury. Our subject towns are part of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). As of the 2014 fiscal year, The CMRSWC consists of communities that share resources for stormwater management, such as water sampling kits and GPS mapping equipment. Our goal for this project was to provide a comprehensive analysis of the cost of implementing the 2014 draft MS4 permit in Southbridge, Holden, and Millbury Massachusetts.

Methodology

In order to achieve our goal of providing a comprehensive analysis of the cost of implementing the 2014 draft MS4 permit in Southbridge, Holden, and Millbury Massachusetts, we utilized the following methodology.

1) Became educated on the details of the 2003 MS4 permit and 2014 MS4 permit
2) Assessed what Holden, Millbury, and Southbridge, Massachusetts have done to meet the requirements of the 2003 MS4 permit
3) Identified Holden, Millbury, and Southbridge's total current expenditures for stormwater management
4) Identified what changes each of our subject towns will have to make in order to comply with the requirements of the 2014 MS4 permit
5) Provided a detailed analysis of the complete costs for each town to comply with the requirements of the 2014 MS4 permit
6) Created an informational video to explain the costs of implementing the 2014 MS4 permit

Throughout our project, we used various research methods such as document analysis, field work, and interviews in order to learn about the cost of compliance with the MS4 permit. By analyzing various background documents about stormwater management, including the 2003 MS4 permit and 2014 draft MS4 permit, we were able to learn about the need for stormwater management as well as the BMPs typically used to manage stormwater.

We conducted interviews with various municipal officials, including public works directors, fire chiefs, town engineers, and members of town conservation commissions. These interviews allowed us to learn about our subject towns' stormwater programs and the costs associated with these programs. We also conducted an interview with the Department of Conservation and Recreation (DCR), which allowed us to estimate costs of BMPs, which town officials could not provide to us.

During our project, we also performed field work, which included outfall sampling using the CMRSWC kits, using dry and wet weather screening forms, and using the geographical information system (GIS) maps of our subject towns. This fieldwork allowed us to gain a more accurate understanding of the amount of labor involved with screening outfalls, which ultimately assisted us in completing our cost analysis.

After we completed our goals and objectives, we were able to provide findings and recommendations to our subject towns.

Findings and Recommendations

Finding 1: The 2014 draft MS4 permit may cost too much for the towns to effectively implement

The costs associated with stormwater management are very high, yet many towns have a limited budget for stormwater. The MS4 permit may cost too much for towns to individually implement. For implementation of the 2014 draft MS4 permit, Holden should expect to spend $258,790 annually, Millbury should expect to spend $753,173 annually, and Southbridge should expect to spend $343,008 annually.

Recommendation 1: Effective regionalization will allow towns to better implement their stormwater management programs

Due to the high cost of implementing the 2014 draft MS4 permit, we recommend that the towns regionalize. Regional organization, such as through the CMRSWC, can reduce the cost of many materials related to stormwater management.

Finding 2: Using innovative funding techniques can help the towns spend less from their general funds on stormwater management

The CMRSWC has received funding from the Community Innovation Challenge (CIC) grant. The first year of the Coalition's existence was fully funded by the CIC grant program and the subsequent two years of grant funding supplemented the Coalitions expenditures. In FY2014, member towns paid 4,000 dollars to continue as members of the Coalition. Millbury has begun applying for other grants to support implementation of BMPs, which may save them money over time.

Recommendation 2: The towns should seek alternative sources of funding such as additional grants beyond the CIC

Due to the reduction of CMRSWC funding from the CIC, we recommend that the towns apply for other grants. These grants can include the 604(b) grant from the MassDEP. The Towns should apply to these grants as quickly as possible, and the Coalition should lobby for additional future funding from the USEPA and MassDEP.

Finding 3: Using innovative stormwater management techniques can help the towns save money and thus implement the permit more effectively

Millbury uses innovative stormwater BMPs, such as a school art contest, to fulfill the public participation control measure. These BMPs allow Millbury to implement the MS4 permit effectively and at a low cost.

Recommendation 3: The towns should strive to utilize innovative stormwater management techniques

Millbury's use of creative BMPs has saved them money in implementing the MS4 permit. We encourage other towns to do the same, as they may be able to come up with BMPs, which are more efficient and cost-effective than their current BMPs.

Finding 4: Towns that communicate with other towns, even to a small extent, can more effectively manage and fund their stormwater management programs

A previous IQP group from WPI demonstrated that the CMRSWC towns spend less money on stormwater management than towns that work independently. This type of collaboration can also help generate more innovative BMPs, which will save the towns money.

Recommendation 4: Regionalization can help towns save money by sharing information and resources

We recommend that the towns regionalize and attempt to share information and resources. This practice will help them implement the 2014 draft MS4 permit more effectively.

Finding 5: In each of our subject towns, stormwater management information was divided amongst different departments

In many of our subject towns, there was not one person fully dedicated to stormwater management. Multiple departments in each town were responsible for implementing the stormwater management programs. As a result, we often had to request information from more than one department in each town.

Recommendation 5: Having a central source of stormwater management should allow for easier implementation of future MS4 permits and make continuous compliance easier for the towns

We recommend that the towns research the feasibility of either creating a position dedicated to managing stormwater information, or making this responsibility part of a single position. If smaller towns cannot afford to pay for this position, we recommend that multiple towns share a person dedicated to stormwater information. This practice will make it easier to implement the MS4 permit in the future.

Finding 6: The IDDE control measure will be a significant contributor to the increase in cost between the 2003 and 2014 draft MS4 permits

The 2014 draft MS4 permit has many more requirements than the 2003 MS4 permit, especially in the IDDE control measure. Much of the increase in cost between the two permits will be due to the increased stringency of the IDDE measure. The IDDE measure will also have more detailed requirements for practices such as outfall sampling with water testing kits.

Recommendation 6: The CMRSWC should have one person in charge of keeping track of and maintaining the sampling kits

When we performed sampling in the field, the sampling kits were often disorganized and had expired components, which slowed down our work. Having the kits intact will make it easier to sample, and will thus save money on sampling costs.

Finding 7: The current Asus tablet in use by the CMRSWC is slow and ineffective

When we used the tablet in the field, it was often slow to load. Town employees often complained about the delay. When we used a new smart phone, we did not see this delay. The delay caused by the old technology costs the towns in the CMRSWC money on labor costs.

Recommendation 7: The towns should use software, which can collect data offline and then upload it to an online database later, as well as a tablet, which is more up to date. This would allow the DPW workers to work more efficiently, thus saving the town labor costs

We recommend that the Coalition should purchase a new tablet, such as an Apple iPad. The labor costs that the tablet will save will pay for the cost of the tablet very quickly.

Other Recommendations

The Massachusetts Department of Environmental Protection should research the potential of providing standardized materials available to Massachusetts municipalities

Many of the control measures of the permit, such as public education and public involvement and participation, require municipalities to create similar documents. If the MassDEP could create standardized templates for these requirements, it could reduce the cost to towns, as well as give them more time to focus on eliminating pollutants.

The CMRSWC should streamline and update the digital forms. This practice would reduce the time needed to inspect outfalls, thus saving money

While we performed fieldwork in Holden, we found that the dry and wet weather forms had categories relating to pollutants, which are not regulated by the MS4 Permit. These extra categories made the forms time-consuming to fill out. Collecting this additional information causes the towns to spend increased labor costs. By updating the forms, the CMRSWC can reduce labor costs for the towns.

Recommendations for Future Research

We recommend that future project groups research the cost of implementing Total Maximum Daily Load (TMDL) requirements in towns. These requirements may generate a very large cost, which has not been researched well. We also recommend that future research groups

attempt to eliminate some of the biases, which may have appeared in our research. These biases stemmed from our limited sources of budget data, and as a result, some of our cost figures may be inaccurate. We recommend other project groups eliminate this bias by finding multiple sources for town budget data.

Conclusion

The findings and methods that we present should help the towns understand and prepare for the financial implications of implementing the 2014 draft MS4 permit. The towns will have to work hard to comply with this new permit, but this effort will be worth protecting people and the environment from the negative effects of stormwater runoff. Among our most important recommendations, we emphasize the benefits of regionalization, the use of innovative stormwater management and funding techniques, and the centralization of stormwater management in each town. We also recommend that the towns reach out to the MassDEP for advice on implementing the 2014 draft MS4 permit. Although the task of effective stormwater management is daunting, the towns can plan to effectively manage stormwater, thus protecting human health and the environment.
