1.0 Introduction

Pollution affects a staggering number of water bodies in the United States. "In 2006 there were over 15,000 beach closings or swimming advisories issued due to bacterial levels exceeding health and safety standards" (Council, 2008). A 2012 United States Environmental Protection Agency (USEPA) study evaluating 57% of the lakes, reservoirs, and ponds in the United States found that 97.5% of the examined water bodies contained unacceptable levels of pollution (USEPA, 2012).

One illustrative example of the extent of water pollution is in Ohio's Cuyahoga River. The water pollution in the Cuyahoga River was so profound that the river has actually caught on fire multiple occasions, as Figure 1 illustrates. In the 1960s, industries used the river as a dumping ground for contaminants such as oil, industrial waste, sludge, and sewage.

Figure 1. Cuyahoga River on Fire

(Greater Elkhart County Stormwater Partnership)

In 1969, one of these fires captivated national attention, and caused a chain of events, which spawned the creation of the Clean Water Act (EPA, 2013). The Cuyahoga river fires are just one of many cases of such extreme water pollution.

Water displaced by the weather events, also known as stormwater runoff, pollutes the surface waters of the United States. Stormwater runoff occurs when stormwater flows over an impervious surface, an area that water cannot pass through, such as house roofs, streets, and

parking lots. As the stormwater flows over these surfaces, it often collects pollutants such as oils, sediment, and heavy metals (EPA, 2012). These pollutants are detrimental to aquatic life, which in turn, affects the people in the surrounding areas. Pollutants such as nutrients can cause severe harm to aquatic life through the formation of algal blooms. These are alga blooms that become harmful under certain conditions including light availability and an abundance of nutrients. These harmful algal blooms can damage aquatic plants by blocking sunlight and depleting nutrients from the water, which can kill aquatic fauna (Kuentzel, 1969). Beyond the flora and fauna, stormwater runoff pollution also erodes natural structures such as deltas as illustrated in Figure 2.

Figure 2. Example of sediment runoff (Lehman, 2010)

To combat the issue of stormwater runoff, the USEPA created a system to move stormwater runoff into nearby bodies of water this is known as Municipal Separate Storm Sewer Systems (MS4s). In order to minimize stormwater flow over impervious surfaces, the design of the area around MS4s incorporates efficient methods of directing stormwater into the MS4s. The issue with moving the stormwater runoff directly into the bodies of water is that the pollutants that the stormwater runoff carries end up in the body of water.

To mitigate the impact of stormwater runoff, the USEPA has created an MS4 permitting system. The USEPA categorizes these permits are as either MS4 or National Pollutant Discharge Elimination System (NPDES). NPDES permits are a more general category of permits, which apply to facilities that have a wastewater output. The MS4 permits fall under the category of the

NPDES permits, but MS4 permits deal with requirements more specific to stormwater runoff (US EPA, 2014b). Figure 3 shows a simplified example of an MS4. The MS4 permit contains measures, which help mitigate the impacts of stormwater runoff. (USEPA, 2014c)

The MS4 permit contains six minimum control measures that permittees must follow in order to maintain compliance with the permit. These six measures provide general guidelines for stormwater management and public education. On September 30, 2014, the USEPA issued a new draft MS4 permit for permit holders in Massachusetts. In Massachusetts, the USEPA issues the MS4 permit. In the meantime, the Massachusetts Department of Environmental Protection (MassDEP) acts as the cosigner, while the USEPA enforces the permit.

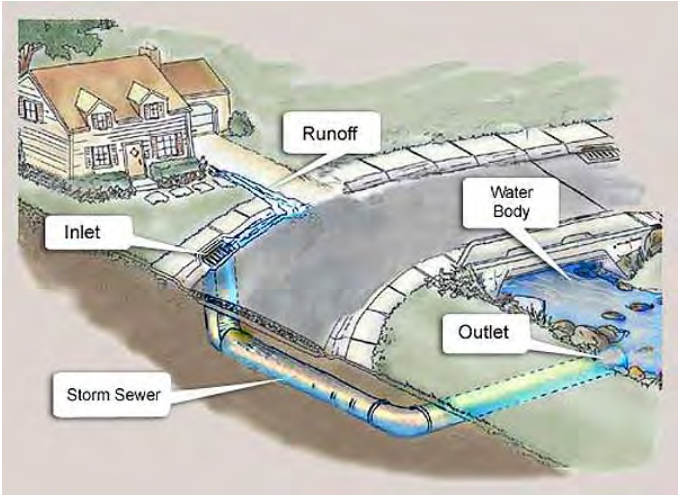

Figure 3. Example of a simple MS4 (Bardstown, 2014)

The MassDEP has developed this project requesting assistance from students with Worcester Polytechnic Institute's (WPI) Worcester Community Project Center. Our project was specifically aimed to assist the Central Massachusetts towns of Holden, Millbury, and Southbridge in understanding the costs of updating to the new 2014 draft MS4 permit. The goal of this project was to assess various municipalities' stormwater management practices for compliance with the MS4 permit, and provide a detailed analysis of the financial cost needed to fulfill the requirements of the 2014 draft MS4 permit. In addition to the cost analyses, we created

an informational video to help selectmen and town meeting members understand the implications of both stormwater runoff and the new MS4 permit requirements.

In chapter 2, we provide a detailed overview of stormwater runoff and its effects, the history and details of the MS4 permit, our sponsor the MassDEP, and the role of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). In chapter 3, we describe the methodology we used to learn the details of the 2014 MS4 Draft permit and assess the total financial expenditures for compliance with its requirements. In our final two chapters, chapter 4 and 5, we outline our findings and provide recommendations for future research to the CMRSWC, the MassDEP, and the towns we worked with, Holden, Millbury, and Southbridge based on our findings.

We hope that this project will have a lasting and meaningful impact on stormwater management in Central Massachusetts. With the assistance of the MassDEP and CMRSWC, we hope our efforts help Central Massachusetts' municipalities prepare for the MS4 permit and protect the waters of the United States (U.S.) from pollution.

2.0 Background

2.1 Introduction

Rainwater runoff poses a serious risk of pollution to the world's surface water bodies. Impervious manmade surfaces such as roads and sidewalks drain pollutants into local water bodies after rain events occur. These pollutants, which can include chemicals, oils, metals, sediment, and bacteria, can directly affect human health by polluting local sources of drinking water (Gaffield, Goo, Richards, & Jackson, 2011). We discuss stormwater runoff and its impacts in more detail in section 2.2 of this chapter. To fully understand the problem of stormwater that the United States (U.S.) faces, we discuss the history of stormwater management in section 2.3

of this chapter. To help mitigate the impacts of stormwater, the United States Environmental Protection Agency (USEPA) released Municipal Separate Storm Sewer System (MS4) permit. This permit helps municipalities reduce pollution in water bodies by using effective stormwater management, which we discuss in more detail in section 2.4 (USEPA, 2014f). The Massachusetts Department of Environmental Protection (MassDEP), a Massachusetts state agency, helps municipalities navigate the intricacies of the MS4 permit. The MassDEP served as our sponsor throughout our project; we introduce them in section 2.5. We discuss the Central Massachusetts Regional Stormwater Coalition (CMRSWC), formed in 2012 to help communities meet the requirements of the MS4 permit (Spain, 2014); in section 2.6.

2.2 Stormwater Runoff

There is a difference between stormwater and stormwater runoff. Stormwater is the water that falls from storms or that which snowmelt produces. Stormwater runoff is the water that travels along impervious surfaces and gathers pollutants. The USEPA defines stormwater runoff as "generated when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not percolate into the ground" (USEPA, 2014g). An impervious surface is a surface which water cannot pass through, such as asphalt and roofs. The stormwater runoff that flows over these impervious surfaces often collects pollutants that contaminate the stormwater and passes those contaminants into local water supplies. Contaminated stormwater runoff may contain oils, nutrients, and sediment. The oils, which usually come from leaking vehicles or car washing, are toxic to aquatic life. The nutrients that come from fertilizer and sewage overflow cause an unnatural increase in the growth of unwanted plant life, which depletes the oxygen in the body of water, causing aquatic life to die (EPA, 2012).

Sediment pollutants are found when land around the water body starts to erode, causing sediment to gather on aquatic life that lives close to the bottom of the water body, which prevents sunlight from getting to the plants (EPA, 2012).

In an effort to mitigate the impacts of stormwater runoff, municipalities may make land use changes, pass by-laws, and/or focus on public education. Municipalities mitigate the impacts of polluted stormwater runoff through Best Management Practices (BMP) and compliance with the MS4 permit, which we explain in section 2.4 below. When land use planners do not consider stormwater runoff, there can be serious environmental, aesthetic, and financial ramifications.

2.2.1 Environmental Impacts of Stormwater Runoff

Stormwater runoff is one of the top causes of water pollution in the U.S. today (Blair et al., 2014). Every two years, the USEPA releases a National Water Quality Inventory Report (NWQIR) on two groups of water bodies: rivers and streams, and lakes, reservoirs, and ponds. The NWQIR is the primary tool that the USEPA uses to keep the public, as well as Congress, informed about the quality of U.S. surface water. The USEPA monitors these bodies of water by regularly testing for various contaminants. These tests primarily look for contaminants such as fecal coliform, Escherichia Coli

Figure 4. Watershed

(S. R. W. Coalition, 2014)

(E. coli), polychlorinated biphenyls (PCB) in fish tissue, total phosphorus, and examine the concentration of dissolved oxygen. Based on these indicators and scientifically determined established safe levels, the USEPA determines if the body of water is impaired (Council, 2008). The USEPA breaks up the different municipalities by watersheds when issuing these reports to the public.

A watershed is the area where all of the connected rivers and ponds merge into one body of water as we illustrate in Figure 4. The Blackstone Watershed encompasses towns around Worcester, Massachusetts and municipalities to the south east of Worcester. In the 2012 NWQIR, the USEPA assessed 28.3% of Rivers and Streams; in the Blackstone watershed, 63.8% were impaired. The majority of the impairment was due to a lack of total maximum daily load (TMDL) management. TMDL is the total maximum amount of pollutants that can be discharged into a body of water while remaining safe for the water's intended use such as swimming or fishing (USEPA, 2013b). Since stormwater has caused so much pollution to bodies of water, the USEPA requires municipalities to use TMDLs, which the state creates, to help restore water bodies from over-pollution (USEPA, 2013b).

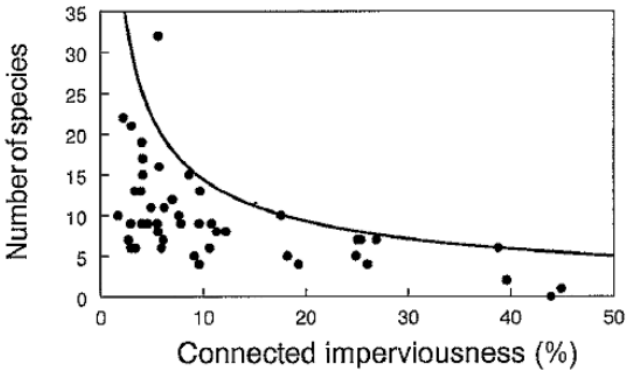

Figure 5: Species vs. EIA

(Council, 2008)

As more areas become urbanized, the amount of impervious area increases. The U.S. is experiencing a urbanization trend of increased urban population; the urban population went from 79.0% in 2000 to 80.7%

in 2010 (Bureau, 2012). This change would increase the Effective Impervious Area (EIA), causing more pollutants to run off into the local bodies of water.

The USEPA performed a study on surface water bodies, assessing, among other things, the amount of different fish species that inhabit that body of water. As Figure 5 illustrates, as the percent of imperviousness increases, the number of fish species in the area exponentially decreases. Figure 5 demonstrates a correlation between the amount of EIA and the presence of bio diverse aquatic system. This correlation is explained by an increase in pollution in the local area, causing the fish to either be poisoned by various pollutants or to suffocate on those same pollutants (Council, 2008).

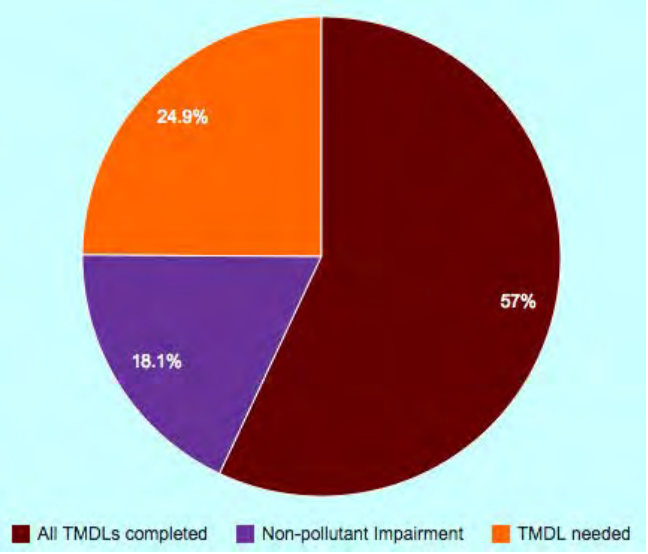

Figure 6. Causes of Lake Impairment (USEPA, 2012)

In addition, in 2012, the USEPA evaluated 57% of lakes, reservoirs, and ponds in the Blackstone watershed area. In this study, the USEPA found that of the 57% evaluated, 97.5% of the lakes, reservoirs, and ponds were impaired. In this case, however, only 24.9% of the lakes, reservoirs, and ponds needed a TMDL to be set in place (Council, 2008). THE USEPA also cited non-pollutant impairment as a problem in the lakes, reservoirs, and ponds in the Blackstone watershed, as seen in Figure 6. Non-stormwater pollutant impairment occurs when unregulated sources of non-stormwater pollution impair a body of water, such as turbidity (US EPA, 2014a).

The pollutants themselves are not the only problem with stormwater flowing into local water bodies untreated. Harmful algal blooms (HABs) are of great concern for aquatic life. HABs not only reduce water clarity, but they also deplete the oxygen in the water, which in turn can kill the natural life in the body of water. Since the HABs create a layer of colored algae on top of the water body, they also have a negative effect on the aesthetics of the water body. In addition, as the water becomes an eyesore, the tourism in the area also is likely to drop (Andersen, 2009).

2.2.2 Low Impact Designs

Low Impact Designs (LIDs) are a way to, "simulate natural hydrologic conditions, by gradually recharging groundwater and slowing runoff that flows to collection systems and receiving water systems" (MassDEP, 2014).

Figure 7. Bioswale

(Service, 2005)

Some of these methods include bioswales, green roofs, and infiltration or retention basins. People who design these areas usually create these designs as LIDs. A LID is a way that the designers try to address stormwater runoff by reducing the amount of impervious surface area and working with the natural landscape. LID includes stormwater BMPs, which we will explain in the next paragraph. LID can also be applied to redesigning areas; in that case, the LID would work more towards rebuilding the landscape rather than working with the existing area (Cahill, 2012).

BMPs are methods and designs that towns use to mitigate the effects of stormwater runoff. Some common BMPs include grassy swales, rain barrels, and vegetated roofs. *Grassy swales* are similar to the bio swales that we will discuss in the next paragraph, except the designers just use grass rather than other plant life. *Rain barrels* collect rainwater from roof runoff. Rather than dumping the runoff into the streets, the rain barrels allow the owner to use the water for watering plants or just dispersing on the ground so that the runoff naturally filters through the ground. *Vegetated roofs* are the same as extensive *green roofs*, which we will discuss later in this section.

Figure 8. Green Roof

(Division, 2014)

Bioswales can be an alternative method to using stormwater drains or simply to augment the drains. Workers place plants and foliage around an area, which is slightly lower than the area around it, as seen in Figure 7. The stormwater then flows into the bioswale, and the plants filter the stormwater for low flow storms. For larger storms, bioswales can direct the flow of stormwater into nearby drainage systems, however average bioswales can handle storms up to 4.3inches per 24hour period (Service, 2005). *Green Roofs* are a layer of dirt and plant life on the roof of a building. This layer above the roof provides shade to the roof, preventing it from reaching extremely hot temperatures; instead, the plant life absorbs most sunlight, which will normally heat the roof (Division, 2014). The layer of dirt also acts as a

Figure 9. Retention Basin

(USGS, 2004)

filtration system for light storms as seen in Figure 8. There are two types of green roofs, intensive and extensive. Intensive is similar to a roof garden, where the plant life is usually flowers, trees, and general garden plants in separate pots. Extensive roofs consist of a layer of dirt and rugged vegetation, which needs little to no maintenance (Division, 2014).

Figure 10. Infiltration Basin (University, 2011)

Infiltration and retention basins filter stormwater in a similar manner. An infiltration basin takes stormwater from the surface, trickles it down slightly below the surface of the ground, and dissipates the stormwater over a larger area, as Figure 9 illustrates. A retention basin is similar to an infiltration system, but instead of keeping the stormwater underground, it turns the stormwater into an artificial lake or pond, which drains slowly, but at a fixed rate, as Figure 10 illustrates (Mays, 2001).

LID	Average Cost
Green Roof (Intensive)	$10/ft^2
Green Roof (Extensive)	$25/ft^2
Rain Barrels	$216
Grassy Swales	$30/ft^2
Bioswales	$16.25/ft^2
Infiltration Basin	$4,500
Retention Basin	$7,500

Table 1. Comparison of LIDs

These methods of handling and filtering stormwater are just some of the ways that engineers and building planners handle the issue of stormwater runoff. Businesses work to mitigate stormwater runoff when it has an economic impact on their business. Below is Table 1[1], which compares the average costs of implementing each of the LIDs mention in this section. In the next section, we discuss the economic impacts of stormwater.

[1] (Brennan, 2014; Center, 2007; Division, 2014; PennsylvaniaDEP, 2006; USEPA, 2013a)

2.2.3 Economic Impacts of Stormwater Management

The goal of improved stormwater management raises questions about cost. Towns use many LID measures to effectively reduce the impact of stormwater runoff. The implementation of these LID measures, i.e. swales, permeable pavement, filter strips, and infiltration trenches, increases the cost of construction projects, as implementation requires careful planning and additional work. However, the economic benefits of these LIDs may in fact defray the cost of their implementation.

The BMPs, which towns use to comply with the requirements of the MS4 permit, can require a large initial financial input. For example, the town of Millbury, Massachusetts estimated that they spent about $75,000 on street sweeping during the 2013 fiscal year (Spain, 2014). The towns must understand the expenditures related to stormwater management in order to effectively fulfill the requirements of the MS4 permit.

Despite the increased cost of construction projects, LIDs can actually save towns money over time. The use of these LIDs minimizes the extent to which stormwater runoff impairs water quality. If there are fewer impaired water bodies, then towns spend less money on treating the water bodies. LIDs may also reduce the effects of flood damage, and eliminate the need for water treatment facilities (Thurston & EnvironetBase, 2012). LID measures can also save money by reducing construction cost. For example, a parking garage can cost approximately $20,000 per space to build. An open parking lot with non-impervious surfaces, however, can cost as little as $2,000 per space to build (Cahill, 2014). In this case, the use of an LID does not just reduce the construction cost; it also reduces the amount of runoff that needs to be treated.

2.3 History of Stormwater Management

October 2012 marked the 40th anniversary of the 1972 Amendments to the Federal Water Pollution Control Act, better known as the Clean Water Act (CWA). Many decades of surface

water pollution preceded the CWA, and some of the causes of pollution are rooted in the industrial surge of the previous two centuries. Unsanitary conditions and polluted drinking water led to health issues, such as yellow fever and cholera (Andreen, 2003b). Even in rural areas, water pollution was a problem. Most towns simply integrated any stormwater management systems into their sewer system. Easy to implement as a combined system, these constructs only involved the conveyance of water away from highly populated areas (Robert B. Stegmaier, 1942). Due to their combined nature, these systems were highly prone to overflow, contaminating topsoil and surrounding water bodies with raw sewage waste (Joseph-Duran, Jung, Ocampo-Martinez, Sager, & Cembrano, 2014). In 1948, the conclusion of World War II allowed the federal congress to bring focus onto more domestic issues. The massive industrial output of the war had taxed rivers, and funding for wastewater treatment had dropped during the years of conflict (Andreen, 2003a).

2.3.1 Evolution of the Clean Water Act

The 1948 Federal Water Pollution Control Act (FWPCA) served as a precursor to the CWA, which would undergo many revisions before the federal government expanded the CWA in 1972. The National Pollution Discharge Elimination System (NPDES) is a permit system added into the FWPCA with the 1972 amendments. Created by the Subcommittee on Air and Water Pollution of the Senate Committee on Public Works, the permit specifies what pollutant discharges the towns must manage. The permitting program specifies that discharges of a pollutant from a point source into a navigable waterway are prohibited unless the discharger has a NPDES. Specifically, the NPDES permit regulates point source discharges of pollutants into surface waters. A point source is defined by the CWA as "any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel [etc.] from which

pollutants are or may be discharged" (U.S.C § 1251, (2014)). Originally, the USEPA intended the NPDES to regulate industrial wastewater and municipal sewage as this was the most abundant sources of liquid pollution (Tyer, 1993). Legislative amendments to the FWPCA in 1977, 1983, and 1987 increased the pollutants regulated under the CWA. As these regulations expanded, the EPA decided to implement stormwater management through a separate permit. Under the 1987 amendments, the Municipal Separate Storm Sewer System (MS4) came into being (MINAN, 2005). The CWA has since then expanded to cover many more pollutants than in its original conception.

2.3.2 What is the NPDES Stormwater Program

One of the main reasons that the USEPA put NPDES permits in place was to regulate how many pollutants can be safely discharged into surface waters (USEPA, 2014d). Congress charged the USEPA with administering the NPDES permit program. Congress first established this program with the enactment of the 1972 amendments to the FWPCA. The USEPA can also authorize state and local governments the power to administer the requirements of the CWA by what is called primacy authority (USEPA, 2014h). Massachusetts, however, does not have primacy authority to enforce the CWA so Massachusetts created its own set of laws that mirror the USEPA's laws. Generally, only industrial, municipal, and commercial facilities have to comply with the NPDES permits since they are the primary dischargers of pollutants into surface waters via point sources. Individuals, generally, do not have to get NPDES permits since their wastewater flows through the sewage system or septic tank.

The types of material that NPDES permits regulate are discharged pollutants from point sources. The CWA defines a point source as a pipe, ditch, channel, tunnel, conduit, well, landfill, etc. (U.S.C § 1251, (pg. 214) (2014)). A point source is a source of runoff that only has a single

point of release. A good example of a point source is a chemical treatment plant that uses a chemical to treat their product and then pumps out any of the runoff from their process into a local river. That pipe, which takes the runoff out of the plant, would be a point-based source, as Figure 11 illustrates.

Conversely, the other source of pollution comes from non-point sources. Non-point sources are sources of water pollution, which do not have a point of release such as rainwater and snow melting. Once the stormwater runoff and the melting snow travel into the local MS4s, the runoff becomes a point source, therefore falling under the regulatory authority of the NPDES permit program. A good example of a point source and a non-point source of pollution is Figure 11.

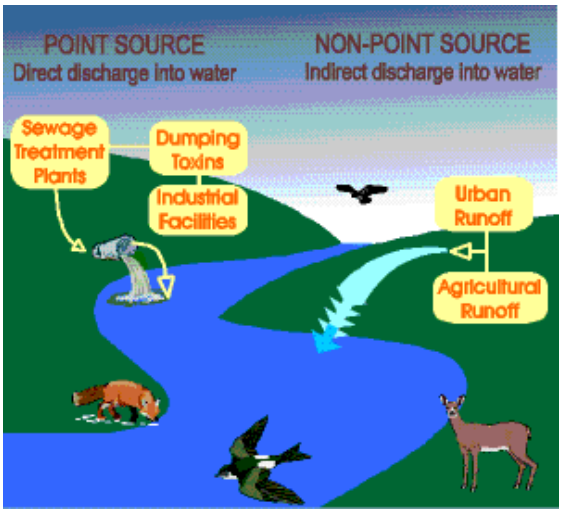

Figure 11. Point and Non Point Sources of Pollution

(College, 2014)

The USEPA and other government bodies, which have primacy authority, require companies and businesses to apply for these NPDES permits when they want to discharge any pollutant into a navigable surface water body through a point source (U.S.C § 1251, (2014))

2.4 The Municipal Separate Storm Sewer System Permit

As part of the CWA, the USEPA issued the MS4 permit in 1990 to reduce the impacts of storm water runoff. The government issues these permits with the sole purpose of addressing the large amounts of stormwater runoff that storms generate. These systems receive stormwater

runoff from the environment, and transport it into nearby bodies of water. These systems do not treat water; they only convey it from impermeable surfaces. With these permits, towns can regulate non-point discharges as point source discharges through the MS4, and create broad stormwater management programs. In 1990, at the inception of the MS4 permitting program, the USEPA issued phase-I MS4 permits on a per-city basis (USEPA, 2014h). These first permits contain measures tailored to individual municipalities, as many large cities had different requirements.

The primary requirement to qualify for a phase-I permit is that the town has a population of at least 100,000. In Massachusetts, there are 2 towns of this size: Boston and Worcester (Massachusetts, 2014b). The phase-II MS4 permit applies to smaller towns with a population of less than 100,000 and contains broad regulations so that it can be applicable to any small municipality. In total, the USEPA has issued approximately 7,450 MS4 permits across the United States from 1990 to 2014 (USEPA, 2014h) (USEPA, 2014b). At their core, these phase-II MS4 permits all integrate practices known as the six minimum control measures. The six minimum control measures are: Public Education, Public Involvement, Illicit Discharge Detection & Elimination, Construction, Post-Construction, and Pollution Prevention/Good Housekeeping.

Although the 2003 MS4 permit has expired, the six minimum control measures remain the primary focus of the 2014 MS4 permit draft. In the following sections, we outline the six minimum control measures and describe some of the BMPs that towns can use to comply with each control measure in the 2014 MS4 permit draft.

2.4.1 Public Education & Outreach

The first minimum control measure addresses the need for public education. Public education plays an important role in reducing pollution levels. Towns can meet the requirements through BMPs such as educational pamphlets, media campaigns, and workshops

The National Environmental Education and Training Foundation (NEETF) found that in 2005, 78% of Americans did not know that runoff from lawns, roads, and agricultural land is the most common source of water pollution. Of further concern, 47% of the public believes that industry accounts for most water pollution (USEPA, 2014b). In order to correct these misconceptions, this control measure requires municipalities to educate the public on the impacts of stormwater runoff and offer residents information on mitigation strategies they can implement at home.

2.4.2 Public Involvement and Participation

The second minimum control measure requires the municipality to form a working partnership with members of the community (USEPA, 2014b). A common way that municipalities fulfill the requirements of this control measure is to create volunteer programs, which engage the public in reducing the pollution caused by stormwater runoff. These programs offer opportunities for volunteers to mark storm drains and participate in cleanup and monitoring programs, as well as to create watershed groups and conservation corps teams (USEPA, 2014b). The officials of each municipality design these opportunities to integrate directly with stormwater programs. When towns implement and utilize this control measure correctly, they can involve the community and create self-monitoring environmental conservation groups.

2.4.3 Illicit Discharge Detection and Elimination

The third minimum control measure deals with the threat of stormwater contamination. Although the MS4 system carries stormwater, it does not treat the stormwater. The MS4 permit defines an illicit discharge as any discharge that is not entirely composed of stormwater. The MS4 stormwater drains are particularly vulnerable to foreign pollutants; the stormwater runoff in these MS4 systems may contain pathogens, nutrients, and various other pollutants. The phase-II MS4 permit requires four primary programs in this control measure, beginning with a full diagram of the MS4 system (USEPA, 2014b). The second program requires the municipality to create a legislative ordinance prohibiting discharges based on pollutant type (USEPA, 2014b). The third is the implementation of reporting techniques such as hotlines, onsite notifications, and outfall water tests (USEPA, 2014b). The fourth is an educational program on the dangers of these illicit discharges (USEPA, 2014b). When used effectively, these programs work to create a system that is both reactive in response to spills and proactive through prevention via education and enforcement.

2.4.4 Construction Site Stormwater Runoff Control

The fourth minimum control measure deals with construction-site stormwater runoff. Of the public works projects that adversely affect the health of a water system, construction site runoff is particularly detrimental. These effects stem from the sediment dissolved in the runoff, including dirt, sand, and other fine particles. When these concentrations of the sediment particles settle in waterways, they block sunlight, and can suffocate many forms of aquatic life (USEPA, 2014a). Phase-II MS4s require the municipalities they regulate to formulate a program to reduce pollutant stormwater runoff for construction exceeding one acre of land. This requirement is

comprised of six components. Collectively, they ensure that construction groups know of their management obligations for proper stormwater pollution management.

2.4.5 Post-Construction Stormwater Management

The fifth minimum control measure refers to post-construction stormwater management. In practice, this control measure is not a continuation of the previous control measure, but a different control measure to monitor BMP effectiveness, as well as the continued prevention of pollution. This control measure is implemented primarily through inspections of on-site facilities, and structures responsible for stormwater management. With these practices in place, areas with new development can continue to manage stormwater runoff pollution after construction has finished.

2.4.6 Pollution Prevention and Good Housekeeping

The final control measure is responsible for the housekeeping of a municipality's stormwater management program. In order for municipalities to maintain good operating conditions within municipal-owned facilities such as the Department of Public Works (DPW) and schools, they must construct a rigorous system of upkeep management. These components can consist of road maintenance and repairs, automobile fleet maintenance, landscape maintenance, as well as building upkeep. Pollution prevention practices can include activities such as street sweeping and storm drain system cleaning (USEPA, 2014e).

2.4.7 General Practices and Municipal Individuality

In order to account for thousands of different municipalities, the MS4 permit authors designed the six minimum control measures to be applicable to any possible situation. Independent of environmental conditions or area development, these measures have to be

comprehensive. Unfortunately, these phase-II MS4 permits rely on a large degree of self-reliance and proactive involvement by the municipalities, but there are resources available to help with this. In order to assist Massachusetts municipalities with MS4 permit compliance, the MassDEP has created a Stormwater Handbook, which contains resources about how a city or town can comply with the minimum control measures (MassDEP, 2014). Additionally, the Massachusetts Watershed Coalition, an organization dedicated to protecting and restoring Massachusetts watersheds, is able to provide many materials to their members, such as brochures and standard operating procedures (Coalition, 2014). However, the officials of each municipality must ultimately take responsibility to implement the practices in the six minimum control measures.

The MassDEP manages a system of computer checks and administering programs for stormwater management in Massachusetts. If the system flags a municipality for irregular readings or reports, inspection by MassDEP officials becomes necessary (Civian, Sept. 26, 2014). Implementation of these control measures requires the municipalities to spend a large amount of money, which raises budget concerns for the 2014 MS4 Draft permit.

2.5 The MassDEP and the Central Massachusetts Regional Stormwater Coalition

The MassDEP is the Massachusetts environmental agency charged with making sure Massachusetts has clean air and water (Massachusetts, 2014a). The central office of the MassDEP serves the entirety of Worcester County (MassDEP, 2013). The MassDEP assists the CMRSWC by providing them with numerous guidance documents, which teach the municipalities how to fulfill the requirements of the MS4 permit (CMRSWC, 2014b). In collaboration with the MassDEP, we sought to provide a cost analysis of implementing the new 2014 MS4 permit in three Massachusetts municipalities. During this project, we worked with

two primary contacts from the MassDEP: Frederick Civian, Statewide Stormwater Coordinator for the MassDEP, and Andrea Briggs, Deputy Regional Director of the Central MassDEP.

2.6 Central Massachusetts Regional Stormwater Coalition

Central Massachusetts is one of many regions in Massachusetts whose municipalities seek to effectively implement the 2014 MS4 permit. The CMRSWC helps its members achieve this goal. The CMRSWC, formed in 2012, initially consisted of 13 municipalities (Spain, 2014). Due to the success and utility of the CMRSWC, it has expanded to 30 municipalities by 2014. All of the municipalities within the CMRSWC are subject to regulations from the USEPA, which require the municipalities to mitigate the impacts of stormwater runoff (CMRSWC, 2014c).

The municipalities within the CMRSWC receive numerous benefits because of their collaboration. The municipalities can share stormwater management tools, such as Leica units and water quality testing kits, thus reducing cost (Coalition, 2014). Their collaboration also reduces redundancies in stormwater management projects, thus allowing the municipalities to use money more efficiently. Although the CMRSWC members try to collaborate as much as possible, the individual towns are ultimately responsible for utilizing the tools developed by the CMRSWC in order to comply with the MS4 permit (Spain, 2014).

2.6.1 Funding of the CMRSWC

The CMRSWC receives funding from the Community Innovation Challenge (CIC) Grant. Massachusetts Governor Deval Patrick started the CIC grant program in 2012 in order to ease the taxpayer burden of community improvements (Massachusetts, 2013a). The CMRSWC received $310,000 in 2012 to help implement the 2003 MS4 permit (Massachusetts, 2013b). The CIC Grant provided the CMRSWC with $105,000 for the 2013 fiscal year. This grant did not cover the total cost of the CMRSWC's efforts, thus each municipality had to provide $2,800 in order to supplement the cost (Spain, 2014). For the 2014 fiscal year, the CIC Grant provided the

CMRSWC with $80,000 (CMRSWC, 2014a). The grants are awarded in December, so at the current time the CMRSWC does not know if they have secured funding for next year.

2.6.2. Organizational Involvement in the CMRSWC

The CMRSWC operates with the help of various agencies and companies. The government agencies, which support the CMRSWC, include the MassDEP, the Massachusetts Department of Conservation and Recreation (DCR) and the USEPA. The CMRSWC also receives support from the private consulting firms of Tata & Howard and Verdant Water. The companies which provide services to the CMRSWC include Maine Technical Source, HACH Company Chemetrics, and People GIS (CMRSWC, 2014d).

2.6.3. Stormwater Consultants

The CMRSWC receives support from the private consulting firms of Tata & Howard and Verdant Water. Tata & Howard is an engineering firm which provides consulting for the management of wastewater, stormwater, and hazardous waste (Tata&Howard, 2014a). Tata & Howard also helped create a system which collects inspection data and maps runoff patterns within the CMRSWC (Tata&Howard, 2014b). Verdant Water operates from Scarborough, Maine, and focuses on industrial and municipal stormwater management. Verdant Water provides Stormwater Pollution Prevention Plans (SWPPPs), Illicit Discharge Detection and Elimination (IDDE) assistance and water quality screening.

The use of these private consulting services to fulfill components of the MS4 permit requires the municipalities to spend a large amount of money. We had to take the cost of these services into account in order to construct our cost analysis. In the next chapter of our report, we describe our methodology for creating our cost analysis.

2.7 Goals and Objectives

In collaboration with the MassDEP and the CMRSWC, we sought to provide the towns of Southbridge, Holden, and Millbury, Massachusetts with a comprehensive analysis of their cost of compliance with the new 2014 MS4 permit.

In order to achieve this goal, we:

1. Became educated on the details of the 2003 MS4 permit and the new 2014 MS4 permit
2. Assessed the degree to which Millbury, Holden, and Southbridge have met the requirements of the 2003 MS4 permit
3. Researched Millbury, Holden, and Southbridge's total current expenditures for stormwater management
4. Identified what changes each of the aforementioned towns will have to make to comply with the requirements of the new 2014 MS4 permit
5. Provided a detailed analysis of the complete costs each town will need to defray in order to comply with the requirements of the new permit.
6. Created an educational video to explain the costs of implementing the 2014 MS4 permit

We discuss our methodological approach to accomplishing these objectives in detail in chapter 3.

3.0 Methodology

3.1. Introduction

In collaboration with the Massachusetts Department of Environmental Protection (MassDEP) and the Central Massachusetts Regional Storm Water Coalition (CMRSWC), we provided the towns of Millbury, Holden, and Southbridge, Massachusetts with a comprehensive analysis of the cost of compliance with the new 2014 Municipal Separate Storm Sewer System (MS4) permit. We focused our project objectives on determining the current and future cost of stormwater management in the subject towns. The MassDEP and CMRSWC proposed this project to increase municipal and agency understanding of the cost of compliance with the MS4 permit; The MassDEP will not use this information for enforcement of the MS4 permit. The MassDEP recruited us to address this problem as independent consultants. The United States Environmental Protection Agency (USEPA) released the new 2014 draft MS4 permit on September 30, 2014. In order to accomplish our goal and objectives, we created the following methodology.

The main goal of our project was to gather information from the towns of Holden, Millbury, and Southbridge Massachusetts in order to help them identify the financial costs of implementing the 2014 MS4 permit draft when it eventually comes into effect. Below we discuss each of the objectives we achieved in order to accomplish our project goal.

3.2. Objective 1: Became educated on the details of the 2003 MS4 permit and the 2014 MS4 permit

In order to create a complete cost analysis of compliance with the 2014 Massachusetts draft MS4 permit, we first sought to understand the requirements of 2014 MS4 permit draft. Understanding the permit also involved an in-depth analysis of the expired 2003 MS4 permit that

the towns have to maintain compliance until the new permit goes into effect. The USEPA issued each of the towns a Phase II permit, as their populations do not exceed 100,000 people (US EPA, 2014).

We analyzed the content of the 2003 MS4 permit minimum control measures so that we would each become more familiar with the minimum control measures. We then contrasted the requirements of the 2003 MS4 permit with those of the 2014 MS4 Draft Permit. As we researched the requirements that are a part of the 2003 MS4 permit, we determined how the permit changed from the 2003 version to the 2014 version with the help of Fred Civian. In addition, we analyzed previous reports written by groups that have worked with the MS4 permit. We interviewed Worcester Polytechnic Institute (WPI) students Xinping Deng, Nicholas Houghton, Haoran Li, and Joseph Weiler, who completed the previous MS4 related project, to gain a better understanding of how to create a cost analysis and work with the towns. We also interviewed them to better understand the efforts that have gone into implementing the permit. After analyzing both permits and interviewing the past IQP group, we were better able to approach the task of creating a cost analysis for our subject towns, see Appendix A for a list of interview questions.

3.3. Objective 2: Assessed what Millbury, Holden, and Southbridge have done to meet the requirements of the 2003 MS4 permit

In order to achieve this objective, we reviewed annual stormwater reports, conducted interviews, and conducted fieldwork. Even though the 2003 MS4 permit expired, understanding what the towns have done to comply with the permit requirements helped us increase our understanding of the additional measures and costs the towns will need to take to maintain compliance once the USEPA implements the 2014 MS4 Draft permit.

In our subject towns, we interviewed Department of Public works (DPW) directors such as Heather Blakeley, John Woodsmall, and Rob McNeil. We also interviewed other municipal officials such as Mark DiFronzo Southbridge's fire chief, Isabel McCauley Holden's Town Engineer, a Conservation Commission member from Southbridge Ken Pickerin, and Pamela Harding Holden's Town Planner. We conducted these interviews to determine what each town currently does to comply with the 2003 MS4 permit. Through our sponsors at the MassDEP, we contacted these towns in order to set up interviews with the municipal officials that oversee compliance with MS4 permit requirements. We focused these interviews on each municipality's efforts to comply with the six minimum control measures. In addition, we asked the interviewees to provide us with any documentation of expenditures, which we used to determine their town's costs. See Appendix A for examples of the interview questions that we asked each of the towns.

The expense reports from the consultants, DPW, and highway department, which the officials provided to us, did not encompass all of the town's expenditures, so we also used these interviews and fieldwork to obtain a more complete understanding of the expenditures. We conducted this fieldwork in order to determine the man-hours needed to conduct sampling tests on site. We used this data for information regarding procedures, costs, and methods used to fulfill the 2003 MS4 permit.

3.4. Objective 3: Identified Millbury, Holden, and Southbridge's total current expenditures for stormwater management

Once we collected data detailing the practices that our subject towns use to manage their stormwater runoff, we aggregated our data to create a cost analysis. Millbury, Holden, and Southbridge are members of the CMRSWC, which utilizes the expertise of the environmental consulting firms Verdant Water and Tata & Howard. We analyzed cost data from any

expenditure that occurred before release of the 2014 draft MS4 permit, but after 2012 to get a general idea of expenses. We analyzed all expenditures from the experience reports mentioned in the previous objective because towns often do more than they report to manage stormwater but are not necessarily aware of the task coming under the rubric of one of the 2003 MS4 permit minimum control measures (Deng, Houghton, Li, & Weiler, 2014). These tasks could include street sweeping, public education, volunteer organizations, and hazardous waste cleanup.

Many municipalities hire construction contractors to make changes to existing Best Management Practices (BMP), if required, or to keep up with maintenance on the town's BMPs. These construction companies may not be a frequent cost, but towns may still face these costs, or similar as-needed costs, while they manage their stormwater. We spoke with stormwater consultants Matthew St. Pierre of Tata & Howard and Aubrey Strause of Verdant Water in order to get a better understanding of how much these municipalities have spent on stormwater management. We also interviewed the municipal officials that oversee the stormwater management programs such as the Directors of the DPW as mentioned in the previous objective. Andrea Briggs put us in contact with them during the course of the project. By interviewing both of these groups of people, we were able to assess stormwater management spending using multiple sources. Drawing on the research that we conducted in the previous objective, we analyzed the methods, which the towns used, and the cost of each method, in order to calculate a total amount that the towns spend on stormwater management.

To compile the data that we gathered from our subject towns, Ms. Strause and Mr. St. Pierre provided us with a chart that the previous IQP group had put together and that Ms. Strause and Mr. St. Pierre had updated, the chart can be seen in Appendix B. This chart had many common costs of towns and ways that towns pay for stormwater management. Once Ms. Strause

provided us with the chart, she was able to take the areas that we were looking at and add them to the chart. By using this chart, towns will be able to directly compare the data that we gathered with the data that the towns would gather from their own cost analyses.

Using the information that we gained from identifying Southbridge, Holden, and Millbury's current expenditures and the previous objective, we were able to compile data from all three municipalities and create a cost analysis.

3.5. Objective 4: Identified what changes each of the subject towns will have to make to comply with the requirements of the 2014 draft MS4 permit

In order to accomplish this objective, we used the knowledge gained in accomplishing objectives one, two, and three to begin calculating the cost of compliance with the 2014 MS4 permit. We performed research to determine the BMPs that the municipalities already have in place to comply with the 2003 MS4 permit. This research included a detailed analysis of the town's annual stormwater reports. In addition, we conducted interviews with town officials and stormwater consultants who have worked with the towns. Examples of the interview questions we used can be found in Appendix A. By identifying what Best Management Practices (BMPs) the towns already use, we were able to determine whether, and in what manner, our subject towns will need to expand their stormwater management efforts to meet the requirements of the 2014 MS4 permit.

In order to identify the necessary changes, we conducted interviews with municipal officials in each town. We also spoke with Frederick Civian; Regional Stormwater Coordinator of the MassDEP. These interviews provided us with insight into each town's level of preparedness toward meeting the requirements of the 2014 MS4 permit.

Ultimately, this objective helped us gain a comprehensive understanding of the financial cost of implementing the 2014 MS4 permit in each municipality. By understanding the BMPs each town uses, we were able to assess what changes they need to make, and by extension, the financial cost of implementing each change. We created a checklist of the common practices such as street sweeping, distribution of pamphlets, and outfall mapping that municipalities use to comply with stormwater permits, and combined this with a similar chart given to us by Mr. St. Pierre and Ms. Strause. We discuss our cost analysis in further detail in objective 5.

3.6. Objective 5: Provided a detailed analysis of the complete costs for each subject town to comply with the requirements of the 2014 draft MS4 permit

In order to complete this objective, we first determined the changes each town will need to make in order to comply with the 2014 draft MS4 permit, as we described in objective four. We then computed the financial cost of the implementation of these changes. In order to perform our cost analysis, we spoke with Mr. St. Pierre, Ms. Strause, and Mr. Civian. These people were able to provide us insight into the typical cost of implementing BMPs, which fulfill the MS4 permit. We were able to determine what equipment each town has, such as street sweepers, outfall mapping equipment, and signage, through interviews that we conducted with municipal officials. The CMRSWC possesses some of this equipment, which the municipalities can use, therefore eliminating the need for the towns to buy and maintain their own equipment. We also determined the human resources each municipality can provide to manage stormwater. This knowledge allowed us to determine the labor costs. This knowledge also allowed us to determine if the towns will need to hire contractors or additional personnel in order to supplement their workforce. Once we had a list of all of the costs of stormwater management from the subject

towns, we were able to estimate the total cost of meeting the requirements of the 2014 draft MS4 permit.

In order to assist us with our cost analysis, Mr. Civian provided us with a chart, which listed every regulation of the 2014 draft MS4 permit. This chart is utilized in Appendices D, E, and F where we used it for each of our three subject towns. We divided this chart into eight separate sheets. Seven of the sheets individually detail the requirements of the six minimum control measures, as well as miscellaneous requirements such as submitting a Notice of Intent (NOI). Within each of these sheets, we divided the costs into annual costs, one-time costs, and intermittent costs, and calculated a total for each. We then took the totals from each of the seven sheets and compiled them into an eighth master sheet. This chart allowed us to create a comprehensive analysis of implementing the 2014 draft MS4 permit in each of our subject towns.

3.7. Objective 6: Created an informational video to explain the costs of implementing the 2014 MS4 Draft permit

Over the course of the project term, we gathered photos, videos, and interviews from Fred Civian, Andrea Briggs, and John Woodsmall and compiled them into an informational video. By gathering this material, we were able to highlight the challenges and importance of stormwater management. These challenges include raising funds and garnering public support for stormwater management.

In order to create this video, we first created an outline. During the outlining process, we reached out to Frederick Civian, Andrea Briggs, Matthew St. Pierre, and Aubrey Strause in order to generate ideas for the content of our video. We then borrowed video recording equipment from WPI's Academic Technology Center (ATC). This equipment included a digital camera, monopod, tripod, GoPro, and a shotgun microphone. We used the GoPro to gather underwater

footage of the outfalls. The shotgun microphone allowed us to eliminate ambient noise from cars during our filming in the field. We also borrowed wireless clip-on interview microphones to get clear audio during our interviews. Once we acquired the equipment, we then began to create our video. We filmed our fieldwork, which included our use of the water sampling kits. We then conducted interviews with stormwater experts that we had contacted previously.

4.0 Cost Analysis

4.1 Introduction

One of our major findings details the benefits of regionalization to effectively implement the 2014 draft Municipal Separate Storm Sewer System (MS4) permit. Due to the high costs that we describe in this chapter, towns should consider joining an established coalition, such as the Central Massachusetts Regional Stormwater Coalition (CMRSWC), or starting a new coalition to serve their specific region.

After completing objectives one through four of our methodology, we were able to construct our cost analysis. In this cost analysis we detail both current stormwater expenditures for the towns of Southbridge, Holden, and Millbury, and potential costs of compliance with the new requirements of the 2014 MS4 Draft permit requirements.

After calculating the current expenditures of our towns, we sought to predict the cost of implementing the 2014 draft MS4 permit in our subject towns. In order to assist us with this portion of our cost analysis, Frederick Civian provided us with a spreadsheet, which lists each of

the requirements of the 2014 draft MS4 permit. We divided this table by the six minimum control measures of the MS4 permit, and then used the resulting spreadsheet to predict the cost of implementing each requirement in our subject towns. See the spreadsheets we used in Appendices D, E, and F.

In this chapter, we first provide some background information on the towns of Holden, Millbury, and Southbridge, Massachusetts. Then we discuss the results of our 2003 MS4 permit and 2014 draft MS4 permits cost analyses. We then explain the results of our comparative analysis of the three subject towns' current costs of implementing the 2003 permit requirements. Next, we describe the results of our comparative analysis of Holden, Millbury and Southbridge's estimated cost of compliance with the 2014 draft MS4 permit requirements.

4.2 Background Information on Millbury, Holden and Southbridge, Massachusetts

The three subject towns for the cost analysis are all located within Central Massachusetts. Despite their similar geographic location as seen in Figure 12, the subject towns vary in size, budget, and population. Southbridge, Massachusetts has a population of approximately 16,800, while Holden has a population of about 17,600, and Millbury has a population of about 13,300.

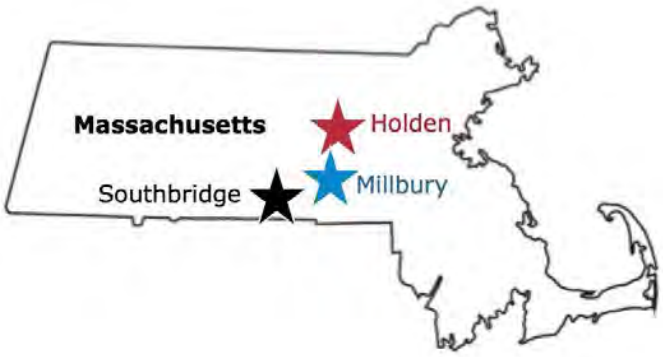

Figure 12: Town Locations in Massachusetts

The towns' geographic area and percentage of impervious surface area also varied. With a higher impervious surface area comes a more expensive stormwater management program since there is more area for the stormwater runoff to run along. As the runoff runs along

impervious area it collects pollutants and the more polluted the runoff becomes. This requires the towns to take more of an effort to reduce the pollution, which leads to a high cost for stormwater management. As our subject towns cover more geographic area, their budget increases except in Southbridge, which has a larger budget than Holden even though Southbridge is significantly smaller. Millbury has the highest percentage of impervious surface area even though they have the smallest total area, which significantly increases their stormwater management costs.

The form of town government can have a large effect on how long towns take to implement the new draft requirements for stormwater management. Both Millbury and Holden have open town meetings as their primary form of government, whereas Southbridge has a Council and an Alderman as their government structure. When we spoke with Robert McNeil, he told us that having open town meetings could cause regulations to take longer to pass since the meetings are open to the public. This, however, does allow for much more public involvement and participation.

Town	Form of Government	Population	Town Budget	Area	Percent Impervious
Southbridge	Council and Alderman	16,799	56,739,257	20.9mi^2	8.69%
Holden	Open Town Meeting	17,636	52,774,844	36.2mi^2	7.04%
Millbury	Open Town Meeting	13,305	39,018,827	16.3mi^2	13.09%

Table 2: Town Information

4.2.1 Current Cost of Public Education and Outreach

The Public Education control measure requires towns to educate their population about the issues the town faces with regard to stormwater and to offer opportunities for the residents to participate in stormwater-related activities. In Table 3, we show how much Southbridge, Holden, and Millbury currently spend on the Public Education control measure.

Town	Population	Cost
Southbridge	16,799	$10,952
Holden	17,636	$1,000
Millbury	13,305	$566

Table 3: Public Education Costs by Town

A first glance at Table 3 may indicate that Southbridge does much more for this control measure than the other towns, but that is not entirely the case. Much of Southbridge's cost comes from the pamphlets and brochures that they create and distribute to their residents. Both Holden and Millbury have savings of about $6,000 annually since they utilize the resources provided to them by the Central Massachusetts Regional Stormwater Coalition (CMRSWC). Holden also uses pamphlets and brochures comply with this control measure, but since they use materials from the CMRSWC, they only have to pay for distribution. Millbury distributes its public education material digitally through their Department of Public Works (DPW) website, saving on distribution and printing costs. Any town that is trying to maintain compliance with this control measure should utilize any already existing education materials, thereby saving money on design, especially if the town is part of the CMRSWC.

Southbridge also holds hazardous waste removal days in order to gather hazardous waste from households. This practice increases the amount Southbridge spends on this public education, but this helps prevent this waste from appearing in runoff, which in the end saves Southbridge money. This practice of preventative action is an example of what other towns can try as a cost-reduction effort.

4.2.2 Current Cost of Public Involvement and Participation

The next minimum control measure is Public Participation. Public Participation requires that towns comply with their own town meeting requirements. The United States Environmental Protection Agency (USEPA) designed this minimum control measure to allow the public to have a voice in the creation of town specific stormwater ordinances and regulations as required by the MS4 permit. In Table 4, we show the costs associated with maintaining compliance with the 2003 MS4 permit for each town.

Town	Cost
Southbridge	$0
Holden	$0
Millbury	$0

Table 4: Public Participation Costs by Town

The table has zero costs for each town, since this control measure only requires that the towns offer a place and time for people to comment and look at the regulations and ordinances before the town puts them into effect. Towns comply with most of this control measure by following basic town meeting requirements laid out outside of the MS4 permit.

4.2.3 Current Cost of Illicit Discharge Detection and Elimination (IDDE)

As illustrated by Table 5, the subject towns have a wide range of costs associated with implementing the 2003 MS4 permit IDDE control measure. Some of the requirements of the IDDE control measure include developing a storm sewer system map and creating a plan to detect and eliminate illicit discharges.

Town	Cost
Southbridge	$2,452
Holden	$3,520
Millbury	$4,678

Table 5: IDDE Costs by Town

Southbridge, Holden, and Millbury have all completed the mapping requirements of the 2003 MS4 permit. Therefore, the towns have not had to map their town in a couple years. The current costs associated with the IDDE control measure in Southbridge reflects outfall sampling since outfall sampling accounts for 97% of the money the town spends on this control measure. Millbury complies with this requirement by using a Best Management Practice (BMP) that includes use of a closed circuit television (CCTV) system and vacuum truck to remove blockages from their storm drain system. This takes up about 86% of the combined cost for this control measure.

Holden also spends much of their money on use of the vacuum truck totaling about 64% of their total costs for this control measure. Isabel McCauley the senior civil engineer for Holden, and John Woodsmall, the director of the department of public works (DPW) for Holden,

estimate that Holden typically spends $3,000-$4,000 per occurrence on the removal of illicit discharges and had to remove one illicit discharge this past year.

We must note, however, that our costs for Holden were based only on data which Ms. McCauley and Mr. Woodsmall were able to provide to us. Environmental Partners Group (EPG) performs many of Holden's costs associated with the IDDE control measure, including outfall mapping and water quality screening. Financial invoices from Holden detailed the town's annual expenditures on EPG services since 2007 at $119,000. However, the invoice descriptions do not specify exactly what service is associated with each line item. Therefore, it was difficult for us to discern between annual costs and one-time costs. We were unable to connect with EPG to obtain a more detailed cost breakdown.

4.2.4 Current Cost of Construction Site Runoff

As illustrated in Table 6, the costs associated with implementing the construction site runoff control measure of the 2003 MS4 permit in Southbridge, Holden, and Millbury is low. The 2003 MS4 permit requirements for this control measure include developing a plan to reduce the discharge of pollutants from construction sites.

Town	Cost
Southbridge	$0
Holden	$0
Millbury	$350

Table 6: Construction Site Runoff Control Cost by Town

Our three subject towns implement this control measure using volunteers from their conservation commissions. The volunteers conduct most of the site inspections for the towns. The use of these volunteers is an excellent way to enforce this control measure without costing the towns any additional money. Another reason the cost of implementing this control measure is so low is that contractors must eliminate any violations at their own expense, as Pamela Harding

of Holden (Holden Senior Planner) and Ken Pickerin (Conservation Commission member) of Southbridge described to us in our interviews.

Our subject towns also already have sediment control ordinances in place. These ordinances do not cost any money to the towns as they are laws, which are already in place, and they do not need to be developed by town lawmakers. Although we did not learn of the particular details of these ordinances, they are similar in the fact that they require sediment and erosion control measures at construction sites.

4.2.5 Current Cost of Post-Construction

Differently from the previous control measure, the USEPA designed the Post Construction Site Stormwater Runoff control measure to ensure continuing pollution prevention, as well as BMP functionality, after construction has been completed. In the 2003 MS4 permit, this control measure states that the permittee must develop, implement, and enforce a program to address stormwater runoff from new development and redevelopment projects that disturb land greater than one acre and discharge into the municipal system (US EPA, 2013). Beyond this function, the control measure requires towns to have an ordinance addressing post-construction stormwater runoff, plans for BMP longevity, and that any control measure the towns put in place will prevent or minimize impacts to water quality (US EPA, 2013).

Town	Cost
Southbridge	$0
Holden	$1,760
Millbury	$0

Table 7: Post Construction Costs by Town

In calculating the costs for each town, we sought to determine what funds the towns spent for stormwater management after they completed development projects. Based on the cost estimation sheets developed in *Cost Analysis For The MS4 Permits* (used in Appendices A, B,

and C) we have found that the annual cost for this control measure is $0 for Southbridge, $1,760 for Holden, and $0 for Millbury as illustrated in Table 7.

These costs can be explained by the ways in which each town implements the post construction site regulations. A representative from Southbridge, Ken Pickerin, is part of the local conservation commission. The Southbridge Conservation Commission (ConCom) is a group of volunteers who inspect construction sites, as well review construction site plans for construction projects. In Southbridge, the ConCom volunteers complete all of the Post-Construction Stormwater Management control measure requirements. Consequently, Southbridge's cost of compliance with the Post-Construction Stormwater Management control measure is zero (Ken Pickerin, 2014).

The town of Holden handles this differently, because they are within the Wachusett watershed and the Department of Conservation and Recreation (DCR) performs a number of the required elements of this control measure without any cost to the town (Robert Lowell, 2014). The $1,760 annual cost is from collaborative efforts between the Department of Conservation and Recreation (DCR) (paid by their agency), and Holden DPW workers paid under Holden. Because of this, Holden does have a notable cost of $1,760 to pay its workforce.

In Millbury, developers of a construction project handle the cost of the post construction control measure for that project. As part of the requirements for development within Millbury, a developer must pay for all required inspection programs themselves (Robert McNeil, 2014). This method is aligned with some of the innovative funding techniques Millbury utilizes, which we discuss in Section 5. Developers who secure the appropriate grants to fund the projects perform many of the projects in the town. As part of the grant, the developers pay for the costs of the post-construction control measures as well.

4.2.6 Current Cost of Good Housekeeping

The final requirement in the 2003 MS4 permit is Good Housekeeping. The USEPA designed this control measure to minimize or prevent the effects of stormwater runoff from municipal operations (US EPA, 2013). Generally, this means the towns must implement maintenance activities, inspection procedures for structural controls, employee training, and the upkeep of BMPs. In the implementation of this control measure, the towns have varying costs.

The annual cost for complying with this control measure for Southbridge is $255,200, while the annual cost for Holden is $180,246, and the annual cost for Millbury is $555,123, as illustrated in Table 8. There is a large degree of variation between the towns on cost of current good housekeeping practices. However, this large variation in expenditures is not unique to these three towns.

Town	Cost
Southbridge	$255,200
Holden	$180,246
Millbury	$555,123

Table 8: Good Housekeeping Costs by Town

In 2011, the USEPA conducted an analysis of the cost of complying with the good housekeeping control measure and found similar results. In this analysis the USEPA found that the Massachusetts towns of Bellingham, Franklin, and Milford, good housekeeping expenditures had a difference of $791,000 between the highest and lowest costs for existing programs (Committee, 2011).

In the town of Southbridge, good housekeeping costs are primarily due to catch basin cleanings, salt and sand road management, a leaf collection program, and an employee training program. Of Southbridge's $255,200, 85% is due to the salt and sand road management, BMP maintenance schedule, street sweepings, and the cleaning of catch basins and outfalls every two years.

In Millbury, the town maintains a schedule of yearly catch basin and outfall cleanings, as well as street sweeping, and the use of salt in their roadway management. Their roadway

management constitutes 83% of the cost for complying with this control measure in Millbury, and represents the largest cost in Millbury's entire stormwater management program. While these costs are part of stormwater management, the actions are not for the stormwater management alone. A few of these procedures are part of other departments, such as the Highway Department (Robert McNeil, 2014), and so the costs do not accurately represent the total budget for a municipality.

4.2.7 Total Current Cost Comparison

When we combined the current costs of the control measure, we were able to obtain an estimation of the total costs of compliance for each town. In implementing their stormwater program, the town of Southbridge spends an estimated $268,604 annually, as illustrated in Table 9. The town of Holden spends an annual $186,526 to fund their stormwater management program, as we illustrate in Table 9. Our third town of Millbury annually spends $584,960 on 2003 MS4 compliance as we illustrate in Table 9. We compiled these total costs from available information provided by the towns.

Town	Cost
Southbridge	$268,604
Holden	$186,526
Millbury	$584,960

Table 9: Total Annual Costs by Town

Based on our research, each town appears to go above what is required for the 2003 MS4 permit, but the magnitude of this differs by town.

For example, Millbury cleans its catch basins and outfalls annually, while Holden cleans them every two years. Despite these differences, both towns maintain compliance with the permit, and do so through different methods. Between each municipality, there are differing divisions of stormwater management responsibility. In our experience interacting with each town, they divide their stormwater management programs amongst multiple departments. Because of this, there is a degree of reporting bias in our cost estimation for each town. These

biases are because different town representatives in different towns are all looking for or maintaining and providing different records. This means that towns may have over or underreported what their actual costs were, even with this, we hope that they can be used by towns in comparing the costs for different categories, if not the total costs.

4.3 Comparative Cost Analysis of 2014 MS4 Draft Permit

In this section, we analyze the cost of compliance with the 2014 draft MS4 permit. We discuss each of the minimum control measures and the costs associated with them on a town-by-town basis in the sections below. To complete the analysis we created a system of charts and created estimations with the assistance of Frederick Civian. The charts detail the costs of each of the requirements of the 2014 draft MS4 permit. There are columns in the charts for information about the control measure, the estimated cost of the specific requirement, the reference number to the MS4 Draft permit, and a justification for our estimation. Within the charts, and this section, we use three different frequencies of costs to describe when costs are applicable: annual, one-time, and intermittent.

Annual costs are costs that the towns will have to spend every year to maintain compliance, such as submitting an annual report, and yearly street sweeping. One-time costs include costs that towns have to pay for only once either in the beginning of the permit term or at some point during the permit term. One-time costs include mapping outfalls, submitting a notice of intent, and labeling outfalls. Finally, intermittent costs are costs that occur inconsistently, such as removing an illicit discharge. Appendices A, B, and C contain the completed cost sheets for Southbridge, Holden, and Millbury.

4.3.1 Future Public Education and Outreach Cost

In the 2014 MS4 Draft permit, requirements for the Public Education minimum control measure have increased. Specifically, in addition to the 2003 MS4 permit Public Education

requirements, the 2014 MS4 Draft permit requires towns to measure the effectiveness of their messages, such as educational materials released to the municipality public. Lawrence Pistrang, Environmental Analyst with the Wachusett Watershed DCR, explained that it will cost towns approximately $8,820 to comply with the measuring effectiveness requirement under this control measure. In both Holden and Millbury, the additional cost of assessing the effectiveness of Public Education control measure would increase their cost by over eight times what they spend currently in this control measure. The increase in cost for would amount to double the town's present expenditures on Public Education. The Public Education minimum control measure has small low-cost administrative tasks, but the bulk of the cost comes from continuing the education efforts and adding an evaluative component to the program.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$19,242	$0	$0
Holden	$9,908	$0	$0
Millbury	$12,106	$0	$0

Table 10: Estimated Public Education Costs

Table 10 shows the cost of compliance of each of the towns, and as we can infer from the values present in the table, the annual costs have increased by 75.2% for Southbridge, 890% for Holden, and 2003% for Millbury. To save money on this control measure, the towns can reuse education materials that already exist within the town or the CMRSWC. The towns can also reduce costs by sharing the metrics and tools used to analyze the effectiveness of their education.

By regionalizing, and working with other towns, every town can save money since towns do not have to work complete these minimum control measures on their own.

4.3.2 Future Public Participation Cost

The Public Participation control measure changed little between the 2003 MS4 permit and the 2014 draft MS4 permit. Consequently, the towns will not have to expend any additional costs to maintain compliance with this control measure. Table 11 shows the expected costs of this minimum control measure based on our estimated costs to update and maintain compliance. The costs do not change for any of the towns since the requirements changed only slightly, the changes that did occur were minor administrative tasks such as adding a section in the annual report, which describes this control measure, and requiring that towns comply with public notice requirements outside of the MS4 permit.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$0	$0	$0
Holden	$0	$0	$0
Millbury	$0	$0	$0

Table 11: Estimated Public Participation Costs

4.3.3 Future IDDE Cost

The IDDE control measure of the 2014 MS4 Draft permit represents a large portion of the cost associated with the permit. Much of this cost is due to more stringent requirements, including mapping, outfall sampling, and priority ranking outfalls. These requirements will

generate many material and labor costs, as the towns will have to sample all of their outfalls, while they currently only sample a small fraction of them.

As we show in Table 12, Millbury and Southbridge share similar annual costs on implementing the IDDE control measure of the 2014 draft MS4 permit. However, Holden's cost is much lower. The main reason for this difference is the variation in number of outfalls between

Town	Annual Cost	One-Time Cost	Intermittent Costs	Number of Outfalls
Southbridge	$19,242	$304,006	$50,440	206
Holden	$7,872	$314,494	$50,440	144
Millbury	$11,523	$306,833	$76,730	267

Table 12: Estimated IDDE Costs

the towns. Much of the annual cost for the IDDE control measure is due to the need for the towns to sample all of their outfalls. Southbridge and Millbury have 206 and 267 outfalls respectively, while Holden only has 144 outfalls.

The one-time cost of implementing the IDDE control measure is similar between our three subject towns. This similarity is because most of the one-time requirements are applicable to all of the towns. For example, all of the towns will be required to update their mapping system, which will cost approximately the same amount for all three towns, as they have a similar number of outfalls to map. The towns will also be required to develop an IDDE ordinance, as well as priority ranking catch basins based on conditions and other factors(US

EPA, 2014a). These requirements are of similar cost as the towns all have a similar number of catch basins, and similar resources from which to develop the ordinance.

The intermittent costs listed are very similar between the towns because many of these intermittent costs are indeterminable at this point. Consequently, for comparison purposes, we operated under the assumption that each town will have to treat one illicit discharge per year. We explain our assumptions in more detail in Appendices D, E, and F.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$0	$770	$0
Holden	$0	$770	$0
Millbury	$350	$858	$0

Table 13: Estimated Construction Site Costs

4.3.4 Future Construction Site Runoff Cost

As we demonstrate in Table 13, the towns are almost identical in the cost that will be required for them to implement the construction site runoff control measure of the 2014 draft MS4 permit. There is only one annual cost associated with this control measure, which is to continue implementing the construction ordinance from the 2003 MS4 permit. Because of this, the town's only have to spend a minimal amount of funds in maintaining this already-establish construction ordinance. Since Millbury is the only town that actually has to spend money to implement this requirement, they are the only town with a future cost associated with it.

The one-time costs of the construction site runoff control measure are all administrative tasks, which should take a similar amount of labor from each town to implement. There is no intermittent cost associated with implementing this measure in any of the towns, as there is only

one intermittent requirement of this control measure, which is to develop and implement a construction site runoff program. In all of the subject towns, the responsibility of this cost primarily falls on independent contractors working on town projects. We found that every town official we spoke informed us that when stormwater runoff issues are found on-site, the responsibility for correcting these issues falls to the developer.

4.3.5 Future Post-Construction Costs

The 2014 MS4 Draft permit, contains numerous additional requirements for the post-construction site runoff minimum control measure. Some of these new requirements include the development, implementation, and enforcement of a post-construction stormwater program for new developments and redevelopments (US EPA, 2014a). Frederick Civian assisted us in analyzing this control measure, and making estimations for the completion of individual items as we demonstrate in Appendices D, E, and F. For the town of Southbridge, we estimated that to implement the requirements of the Post Construction control measure would require an annual cost of $5,280, as we show in Table 14. This cost is joined by a $1,496 cost to update from 2003 MS4 requirements, and an

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$5,280	$1,496	$7,436
Holden	$5,280	$1,496	$7,436
Millbury	$5,280	$1,496	$7,480

Table 14: Estimated Post Construction Costs

estimated $7,436 in intermittent costs as we show in Table 14. We have estimated that Holden will need to pay $5,280 annually, $1,496 in one-time costs, and $7,436 in intermittent costs as we illustrate in Table 14. We estimate our third town, Millbury, will need to pay $5,280 annually, $1496 in one-time costs, and $7,436 in intermittent costs as we show in Table 14. These are all estimated costs that each town should expect to pay, but they may be different depending on how the town plans to implement it. For example, Millbury could expect to reduce its costs by following its current grant funding system. If Millbury imparts these costs onto developers funded by grants, they will be significantly lower (Rob McNeil, 2014). Similarly, if Holden utilizes DCR services; they may be able to forgo some of these costs as well (Robert Lowell, 2014). This section needs some additional detail so we understand where each of the separate costs is coming from.

4.3.6 Future Good Housekeeping Costs

In the new 2014 draft MS4 permit, the Pollution Prevention and Good Housekeeping control measures represent an on average 20% increase in annual costs in comparison to the 2003 MS4 permit cost of compliance. This is because there are many new and specific requirements for this draft permit, where municipalities have to be far more specific in their practices to comply with the permit. We based these cost on our estimates provided in part by Mr. Civian.

We have estimated that the town of Southbridge will have an annual Good Housekeeping cost of $283,458, a onetime cost of $6,292, and an intermittent cost of $0 as illustrated in Table 15. The town of Holden will need to expend an estimated $220,562 annually, as well as $6,292 in one-time costs, but similarly to Southbridge, Holden will have $0 in intermittent costs as

illustrated in Table 15. We have estimated that the town of Millbury will need to pay an annual cost of $693,578, a one-time cost of $6, 292, and no intermittent cost we illustrate in Table 15.

We deduce these costs based on what the towns currently expend in good housekeeping compliance for the 2003 MS4 permit. The 2003 MS4 permit costs, shown in Table 7, represent the current costs for compliance for the subject towns. In the case of annual costs, the largest contributors for this value in each town were their current snow and ice road management. This is a requirement that the USEPA did not update from the 2003 MS4 permit to the 2014 MS4 permit draft.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$283,458	$6,292	$0
Holden	$220,562	$6,292	$0
Millbury	$693,578	$6,292	$0

Table 15: Estimated Good Housekeeping Costs

The annual cost for Millbury is an estimated 275% increase from the average cost of Holden and Southbridge As mentioned earlier in Section 2.4.7, such a large deviation should not come as a surprise. After being interviewed, DPW Director for Millbury Rob McNeil provided us with the costs of salt, the largest contributor to this control measure cost as seen in Appendix F, in the 2014 Fiscal Year.

4.3.7 Total Future Cost Comparison

Beyond the cost of compliance with each of the control measures, there are many miscellaneous requirements that are located elsewhere in the permit. These requirements include: the submission of a notice of intent, total maximum daily load requirements, and the development of a stormwater management program. These costs are difficult to estimate, as some of them have not been performed before (such as meeting Total Maximum Daily Load requirements), and are not implemented as numbers in our cost sheets located in Appendices A (Southbridge 2003 Cost Analysis), B (Holden 2003 Cost Analysis), and C (Millbury 2003 Cost Analysis). The annual miscellaneous costs in each individual town are $15,168, $2,376 in one-time costs and $0 in intermittent costs we illustrate in Table 16 and Appendices A, B, and C. When all of the values in Tables 10 through 15 of this chapter have been summed up in Table 17, we estimate Southbridge's annual cost of compliance with the 2014 Draft MS4 permit to be $343,008 per year. We have also estimated their one-time cost for the 2014 MS4 permit to be $314,940, which we included in Table 17. In terms of intermittent costs, we expect the towns of Southbridge and Holden to have to pay $57,876 per year as we illustrate in Table 17. We estimate the town of Millbury to need to pay $84,210, as indicated in Table 17. In the Town of Holden, their annual costs are $258,790, their one-time costs are $325,428, and their

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$15,168	$2,376	$0
Holden	$15,168	$2,376	$0
Millbury	$15,168	$2,376	$0

Table 16: Estimated Miscellaneous Costs

intermittent costs are $57,876 as we include in Table 17. In the Town of Millbury, we expect the annual costs to total $753,173, their one-time costs to total $320,231, and their intermittent costs to total $84,210 per year, as illustrated in Table 17. These costs reflect the current stormwater management programs in each town that will continue, as well as a multitude of new requirements. We calculated these cost estimates in direct collaboration with Frederick Civian.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$343,008	$314,940	$57,876
Holden	$258,790	$325,428	$57,876
Millbury	$753,173	$320,231	$84,210

Table 17: Estimated Total Costs

5.0 Findings and Recommendations

5.1 Introduction

Having completed our goals, objectives, and cost analysis, we were able to develop many findings and recommendations for the towns of Southbridge, Holden, and Millbury, Massachusetts, the Central Massachusetts Regional Stormwater Coalition (CMRSWC), and other Massachusetts towns. In this chapter, we discuss the results of our research and recommendations for the CMRSWC and the towns so they can be adequately prepared for the 2014 Municipal Separate Storm Sewer System (MS4) draft permit. Our findings detail the cost of implementing the 2014 draft MS4 permit, as well as the difficulties associated with implementing the draft permit in our subject towns. Despite our rigorous methods, our research may not have revealed all potential costs of compliance with the new draft permit. Therefore, the towns should read our cost analysis as an estimate guideline or starting point. We believe, however, that our findings will be accurate and can help our towns effectively implement the 2014 draft MS4 permit.

5.2 Finding 1: The 2014 MS4 permit may cost too much for the towns to effectively implement

Southbridge, Holden, and Millbury, Massachusetts all struggle to finance elements of their stormwater management programs. Currently, Southbridge spends an estimated $ 326,118 annually on their stormwater programs. Comparatively, the towns of Holden and Millbury spend approximately $150,232 and approximately $647,475 respectively on their annual stormwater budgets. We have compiled these reports from information that individual town representatives have provided us as well as our own observations. We also obtained financial information from town archives, such as 2014 annual stormwater reports from each town. In order to ensure the validity of each wage, capital cost, and reoccurring cost, we obtained each value from

representatives of their respective towns. In cases where we could not find specific details, we translated financial estimates for certain services and programs from one town to another and checked the numbers with Frederick Civian, Stormwater Coordinator for the Commonwealth of Massachusetts.

Based on the reports that each town has provided us, each of our subject towns are experiencing difficulties in meeting these requirements, both financially, and with enough workers. Heather Blakeley, the Director of the Southbridge Department of Public Works (DPW), has expressed concern for the town's ability to fund its stormwater management program. Southbridge is running into difficulty with Proposition 2.5, which prevents towns from increasing taxes by more than 2.5% per year, and citizens can vote to reject an increase in taxes. This issue makes compliance with new MS4 requirements more difficult (Heather Blakely, 2014). Based on our interview, Southbridge is especially concerned with the lack of available labor. There are a large number of new requirements in the current MS4 Draft permit, and Southbridge does not have the dedicated labor force to tackle so many new programs (Heather Blakely, 2014).

John Woodsmall, the Director of the DPW in Holden, has expressed similar concerns. He has stated, "A lot of it depends on what the final format of the permit will be, and what the magnitude is in the increase in costs. We're able to absorb some but not too much generally. If it's substantial then that's going to be a real concern." (John Woodsmall, 2014).
Millbury's DPW director Robert McNeil has also indicated a similar situation. He said, "Particularly since it's still in draft form, we have not made any effort to determine the cost of the changes. So I think part of this whole effort, the hope is to work through that. Either [our IQP team] Figure out where the gap is, or what's changing, or work through the [CMRSWC] to

determine what those costs are" (Robert McNeil, 2014). Mr. McNeil also stated in our interview that of all the preparations, funding lacks the most assistance, even though funding is the backbone for the whole system.

After collecting financial data from each town, we were able to create a cost estimate for each town's stormwater management costs as we show in the Finding 1. These cost estimates represent their total costs of compliance with the 2003 MS4 based on currently available information. We were able to contact representatives in the Massachusetts Department of Conservation and Recreation (DCR) during our project. We interviewed Robert Lowell, Stormwater Manager for the DCR, and Lawrence Pistrang, Environmental Analyst for the DCR. They were able to provide us with cost estimates for educational programs, as well as guidelines for estimating the costs of certain requirements. With these resources, we were able to construct a separate cost estimation of complying with the 2014 MS4 Draft permit for Southbridge, Holden, and Millbury. Appendix H contains the blank cost sheets, Appendix D for contains the completed sheets for Southbridge, Appendix E contains the completed sheets for Holden, and Appendix F for Millbury. In total, we expect an annual cost increase of 28% for Southbridge, 39% for Holden, and 30% for Millbury. These costs do not take into account the one-time costs for each town to update mapping systems, ordinances, and other one-time programs. Based on these increases in cost and the current state of the stormwater management programs in each town, we believe that the requirements in the 2014 MS4 Draft permit may cost too much for towns to effectively implement.

5.3 Recommendation 1: Effective regionalization will allow towns to better implement their stormwater management programs

If towns can regionalize their stormwater management programs, they will be able to implement the 2014 MS4 permit more effectively and at a lower cost. In our findings, we have

determined that towns can more effectively manage and fund their stormwater programs if they are part of a regional organization. In our study, the CMRSWC unified 30 towns by providing them an effective and centralized stormwater management resource. With the CMRSWC, the members do not have to produce many of the materials required under the 2014 MS4 Draft permit. Our project did not involve municipalities that were not part of a Coalition. Based on our interviews with DCR representatives and Massachusetts Stormwater Coordinator Frederick Civian, a municipality not part of a regional organization would need to expend an excess of $9,433 to develop these materials in house or hire a contractor. We discuss the benefits of regionalization further in finding 4 and recommendation 4.

5.4 Finding 2: Using innovative funding techniques can help the towns spend less from their general fund on stormwater management

With the new draft permit having so many new requirements, towns will have to use innovative funding techniques such as grants, stormwater taxes, or stormwater utilities to fund all of the necessary changes. When funding large construction projects, towns look outside of the town for assistance. Many towns, however, do not look for additional funding outside of their town for stormwater management. When we interviewed the directors of the DPW in Southbridge and Holden, Heather Blakely and John Woodsmall respectively, both said that they have a line item in the town's general fund that funds the stormwater management program. In addition, when we asked how they planned to fund the required changes, both said they would just seek additional funding from the town. However, our other subject town Millbury did not use the same funding strategy as Southbridge and Holden. Millbury uses a unique method of partially funding their stormwater management, which we learned about when we spoke with the Millbury's DPW director Robert McNeil.

As all towns do, Millbury has contractors bid for projects within the town, such as replacing pipes, building new municipal buildings, and repairing municipal buildings. As a part of this system, Millbury asks some of the contractors to write grant requests for the town. If the town gets the grant, then the town gives the project to the contractor. This is an innovative way for both the town and the contractor to benefit; the town has the project completed with all of, or some of the grant money, and the contractor gets the contract. Innovative ways of funding stormwater management are becoming increasingly necessary, as the Community Innovation Challenge (CIC) grant continues to decrease the amount of funds that the CMRSWC receives.

The CIC grant is an innovative way to get community projects off the ground, but the state government established the grant program to start the projects, not sustain the projects, so every year the funding decreases. The CMRSWC is in its 3rd year of CIC funding, and the funding decreased by 62.9% in the first year and 30.4% in the second year. Therefore, the Coalition should explore other ways to fund their efforts. The CMRSWC member towns help the CMRSWC continue to operate by contributing annual dues. Some towns in the CMRSWC are considering implementing a stormwater tax or a stormwater utility, and in some cases that will be necessary. However, by using innovative funding methods, towns can minimize the amount that their residents have to pay for these measures.

5.5 Recommendation 2: The towns should seek alternative sources of funding such as additional grants beyond the CIC

As we mentioned in Finding 2, towns should start to seek new ways of funding stormwater management. When the United States Environmental Protection Agency (USEPA) releases a new MS4 permit, towns are going to have to find ways to fund the permit, and their current method of funding stormwater management through the general fund can only work for a limited amount of time. Some towns in the CMRSWC have talked about implementing a

stormwater tax, but according to Southbridge's DPW director Heather Blakeley, town residents will be hesitant to vote for this tax. This reservation may be due to the citizens' lack of information of the need for and importance of stormwater management. Another method for funding the necessary changes to stormwater management is to create a stormwater utility. This is most likely the best option for many towns, since it is a small increase in cost to the property owners: $11 per single-family household or some similar number. Gathering this money from all of the properties in the town would significantly help towns pay for stormwater management (USEPA, 2009). The stormwater utility allows the town to gather funding based on a factor such as impervious surface or total area, or just a flat rate. A utility would also not have to through the town approval process, so it may be easier for towns to implement.

As we mentioned in Finding 2, Millbury has contractors look for grants that the town could apply for and has the contractors do the application for the town as part of bidding for a project. This way, the towns can source funding for stormwater management outside of their town with little effort, according to Robert McNeil. When we interviewed Mr. McNeil, he told us that the contractor does almost all of the work in this process, which means that even if the town does not get the grant they did not spend much time and money applying for it. The contractor does most of the actual work and it pays off for them if they can manage to get the grant for the town, since the town is much more willing to fund the project with grant money.

A few examples of grants the towns could apply for is the 604(b) grant from the Massachusetts Department of Environmental Protection (MassDEP), Wastewater grants from the Massachusetts Environmental and Energy Agency (MassEEA), and River Revitalization Grants from the Massachusetts Department of Fish and Game (MassDFG). The 604(b) grant program through the MassDEP serves to help towns determine issues in their current stormwater

management systems. The River Revitalization grant from the MassDFG directs the grant at towns for revitalizing rivers in the towns. The towns should apply for funding as quickly as possible before these funds go away. The Coalition should also lobby for additional future funding from the USEPA and the MassDEP

5.6 Finding 3: Using innovative stormwater management techniques can help towns save money and thus implement the MS4 permit more effectively

Millbury utilizes many innovative methods of stormwater management, which helps them save money in implementing the MS4 permit. During our interview with Millbury's DPW director Robert McNeil, we learned about many of these innovative techniques. Millbury has begun the process of removing sump pump lines from their sewer system and directing them into the stormwater system. The town initiated this process in order to prevent combined sewer overflows (CSOs). In anticipation of the increased flow volume from this project, Millbury has begun installing larger drainpipes. These pipes are much larger than they need to be to handle the flow volume from the current project. The town has installed these larger pipes in case they ever decide to tie more discharges into the stormwater system. If Millbury had installed pipes that were only of adequate size to handle the flow volume from the current project, then they would need to perform additional construction if they ever decided to tie more discharges into the stormwater system. Since Millbury has installed these larger pipes, they have eliminated the need to perform additional construction in the event that they decide to increase the flow volume through the stormwater system. Therefore, by anticipating the need for future construction, Millbury will save money over time, thus reducing their costs for stormwater management.

Millbury also saves money by performing innovative public participation programs. The town promoted an art contest to raise awareness of stormwater management in both their middle school and high school. The middle school art contest involved the entire 5^{th} and 6^{th} grade classes

in Millbury's public schools. The high school art contest targeted about 25 students (Rob McNeil, 2014). However, Mr. McNeil expressed interest in targeting the entire high school, which holds students from 7th through 12th grades, in the future. The town rewarded some of the students by allowing them to paint their artwork on the town's snowplows. The art contest was an effective way to target a large number of people. In addition, the contest only involved about four hours of labor from the town DPW. By keeping the cost of fulfilling the public participation control measure low, the town can focus more of their monetary resources on implementing the Illicit Discharge Detection and Elimination (IDDE) control measure, anticipated to be the most costly requirement of the 2014 draft permit.

5.7 Recommendation 3: The towns should strive to utilize innovative stormwater management techniques

As we have discussed in finding 3, the towns can save money by using innovative stormwater management techniques. The 2014 draft MS4 permit allows for a degree of creativity when designing BMPs. The permit allows the permittee to add a Best Management Practice (BMP) to their Stormwater Management Program (SWMP) at any time. If the towns strive to generate creative ideas, they may end up creating a new BMP, which is far more effective than any BMP, which is currently in use. Therefore, generating innovative ideas can be a tremendously helpful way to reduce the cost of implementing the 2014 draft MS4 permit.

5.8 Finding 4: Towns that communicate with other towns, even to a small extent, can more effectively manage and fund their stormwater management programs

In gathering data for our financial report, we have found that there is a lack of communication and sharing of information between towns to improve their stormwater management programs. Within the municipalities of the CMRSWC, there is a group called the Steering Committee, which meets on a monthly basis to discuss stormwater management within their municipalities. During our IQP term, we were able to attend two of these meetings, and in

both of these meetings, we noted the attendance of DPW Director for Millbury, Robert McNeil, DPW Director for Holden, John Woodsmall, and Town Engineer from Holden, Isabel McCauley. In addition, we noted the attendance of ten other members. These members represented other towns within the Coalition, and from the roster of attendees, we noted representatives from Auburn, Leicester, Millbury, Northborough, Shrewsbury, and Spencer. Of the thirty towns in the CMRSWC, only about 25% of towns were represented. Although there are many new members to the CMRSWC, this still represents a low level of communication between towns on this topic, even among towns that are members of a dedicated stormwater coalition. Despite this, the collaboration within the CMRSWC has benefitted all members. Based on our cost analysis efforts seen in Appendices D, E, and F, towns can save approximately $9,433, not including the thousands in a Global Positioning System (GPS) mapping tools such as a Leica, in the implementation of the new permit as members of the CMRSWC.

In our meetings with representatives within the towns of Millbury and Southbridge, we have found that some cost-saving practices of one town may not appear in another. For example, Southbridge prints and mails all of their public education materials, but Millbury uses digital materials from the CMRSWC. Using the materials from the CMRSWC and digitally distributing them, Millbury saves the $6,500 that Southbridge spends on postage. Millbury also has undertaken a way to gather grant funding that was unique among our subject towns the municipalities. Even though both of these towns are part of the CMRSWC, they were unaware of these cost saving techniques that they could apply to their own stormwater management programs.

In working with these towns in the CMRSWC, we have found that even though they do not always communicate their own techniques, they are able to save money through CMRSWC

membership. There are some requirements within the 2014 MS4 draft that require significant investment within a town, but other requirements that will have little or no financial cost. We found this particularly evident in the Public Education minimum control measure. This control measure requires information materials, such as pamphlets, brochures, or information on a website. Additionally, there are requirements such as a sump pump discharge policy, a municipal Stormwater Pollution Prevention Plan (SWPPP), and various ordinances that do not necessarily need to be uniquely tailored to every municipality. The CMRWSC has templates for these materials, and municipalities can save money by using these materials provided as opposed to developing their own.

5.9 Recommendation 4: Regionalization can help towns save money by sharing information and resources.

The CMRSWC is a great example of towns working together to help each other with stormwater management. Not every town needs to join the same coalition, but towns should form coalitions with neighboring towns to share knowledge and tools. The small $4,000 cost of membership to the CMRSWC more than covers the amount that the towns would normally spend on consultants, testing kits, mapping tools, and educational messages. All towns have to map their MS4 system and test their outfalls. This mapping does not have to happen every year, so a single town buying this equipment would be highly inefficient. Additionally, having to purchase water quality testing kits individually would also be a financial burden, based on the seven different factors to test for in the 2014 MS4 permit draft (US EPA, 2014a).

In the CMRSWC, there are monthly steering committee meetings where members talk about current issue in stormwater management as well as issues that they are facing in their town. This is a great place for the person who is in charge of stormwater to learn more from their peers and discuss the current methods of stormwater management. Towns looking to form their

own coalition should look to the CMRSWC as a model or if they are in the region, they should look into joining the CMRSWC.

5.10 Finding 5: In each of our subject towns, stormwater management information was divided amongst different departments

Since the USEPA released the 2014 draft MS4 permit, the towns recognized the increased importance of updating their stormwater management programs. However, some towns struggle to find all of their stormwater management data. Neither Millbury, Southbridge, nor Holden had a centralized source of stormwater management information. In Southbridge, Heather Blakeley knew some of the general costs of stormwater management, but had to send us to Ken Pickerin for information on the conservation commission and to the fire chief Mark DiFronzo for information on hazardous waste removal. Mr. Pickerin and Mr. DiFronzo both dealt with stormwater management indirectly, which led to some confusion as to what information we needed from them. In Holden, we spoke with Isabel McCauley and John Woodsmall, both of whom were knowledgeable on the stormwater management relating to their jobs, but had to send us to town planner Pamela Harding for information on the conservation commission. In our towns, we eventually received the data that we needed, but always after talking with many different people and looking at many different cost sheets. The people we interviewed were often located between different departments in the town.

In Millbury when we interviewed the director of the DPW, Robert McNeil, he had to check for some of the stormwater data, given that he is in charge of the whole department and there is not a single place for that information. However, the numbers he provided to us were from all from different parts of the town's records, which was the case for all three of our subject towns. Many requirements of the 2003 MS4 permit are likely to be performed by multiple departments, such as ordinance creation and street sweeping being two completely different

programs requiring completely different personnel. For all three of our subject towns, these records were not located in a single place, because the required tasks of stormwater management were handled by multiple departments.

5.11 Recommendation 5: Having a central source of stormwater management would allow for easier implementation of future MS4 permits and make continuous compliance easier for the towns.

Based on our previous finding, having a single person in charge of stormwater management, for example, a stormwater coordinator, would make compliance much easier for towns. According to the Department of Conservation and Recreation's (DCR) Stormwater Coordinator Robert Lowell, the USEPA classifies the Wachusett Watershed as a non-traditional MS4 system. Therefore, looking at the Wachusett Watershed DCR for stormwater management is not too different from looking at a town; there are just some different requirements. When interviewing Mr. Lowell, he was able to access information easily because of his position. Since Mr. Lowell is in charge of stormwater management for the Wachusett Watershed DCR, he had intimate knowledge of how many of the requirements the DCR are meeting and what their plans were for the future with the new 2014 draft MS4 permit. If towns were able to replicate what the Wachusett Watershed DCR does with a stormwater manager, then they would be in a much better position for the any future MS4 permits. We recommend that towns research the feasibility of either creating a full-time position to manage stormwater, or make it part of an already-existing position within the municipality. We realize that small towns may not be able to afford this option, and we suggest some towns research the potential of Regional Stormwater Coordinators. These could be Stormwater Managers for multiple municipalities, whose wages are paid in part by each municipality the manage stormwater for. This option may allow smaller

municipalities to be able to consolidate their stormwater management information within their municipal budget.

5.12 Finding 6: The IDDE control measure will be a significant contributor to the increase in cost between the 2003 and 2014 draft MS4 permits

The IDDE control measure of the 2014 draft MS4 permit will cause a significant increase in the cost of implementation in onetime costs. When researching the permits, we found that the IDDE control measure is much longer and has many more requirements in the 2014 draft MS4 permit than in the 2003 MS4 permit. These more stringent requirements will cause a significant increase in the cost of compliance with the MS4 permit, as we illustrate in Table 18. For example, the town of Southbridge should anticipate a large increase in the cost of testing their outfalls. Southbridge has 206 outfalls. In the 2014 fiscal year, they sampled 25 outfalls. Under the 2003 permit, this effort is enough to fulfill the permit requirements. However, the 2014 draft MS4 permit requires each town to sample all of their outfalls, which will result in an eightfold increase in cost for the town. Many of the other permittees will likely face the same challenge as Southbridge and have to increase their sampling work. Massachusetts's towns should anticipate much higher costs in order to fulfill the new requirements of the IDDE measure.

Town	2003	2014 Draft
Southbridge	$3,520	$7,872
Holden	$4,678	$11,523
Millbury	$2,452	$19,242

Table 18: Annual Cost Comparison of IDDE

5.13 Recommendation 6: The CMRSWC should have one person in charge of keeping track of and maintaining the field sampling kits.

One issue that we often faced during our project was with the field sampling kits. The kits often had disorganized and expired components. For example, there was one day we could not run the ammonia test in the field because of expired components. If town workers discover expired components while they sample in the field, this would delay their opportunity to run the test. The workers would have to take the time to find new components and return to their sampling locations. This delay would raise the labor costs for the towns. It was also difficult to find some of the kits. There was one day we had to travel to Oxford in order to find the Total Dissolved Solids (TDS) meter and the Turbidity test. As we discuss in finding 6, the condition of the sampling kits often made it difficult to perform the tests in the field. The kits often had expired components or were in many different locations. If one person was in charge of tracking and maintaining the kits, the CMRSWC would save time trying to find kits and would not have to perform repeat sampling days at outfalls. Therefore, having one person in charge of the kits will save the CMRSWC money.

5.14 Finding 7: The current Asus tablet in use by the CMRSWC is slow and ineffective

When we were in Holden doing outfall testing, we used the tablet from the CMRSWC, which towns use for mapping and data collection. The tablet was not able to connect to the Internet without Wi-Fi, which made it difficult to use in the field. The current solution to that issue is to have an AT&T wireless hotspot to create a mobile hotspot for the tablet. This was not always reliable since the mobile hot spot could be lost or be out of range of the tablet.

The next issue that we learned about with the tablet system was the software. According to Isabel McCauley, Holden's Town Engineer, the software was slow on the tablet and was hard

for the DPW workers to use. When we used the CMRSWC tools on the tablet in the field, we saw this delay. However, when we tried the same tools on one of our smart phones, an iPhone 5, the tools worked smoothly. The screen of the iPhone was smaller than that of the tablet, but the CMRSWC's software was clearly not the issue, the issue was with the tablet.

5.15 Recommendation 7: The towns should use software, which can collect data offline and then upload it to an online database later, as well as a tablet, which is more up to date. This would allow the DPW workers to work more efficiently, thus saving the town labor costs

There are many issues with using the current CMRSWC tablet. Sometimes there just is no cellular signal, which a new tablet could help with, but not be able to completely fix. For this issue, we recommend that the CMRSWC develop an offline mode for the tablet so that anyone using the tablet can collect data and save it so that when the tablet can connect to the network, either via Wi-Fi or via a cellular network, the tablet can upload any data it saved while in offline mode.

Since the tablet is almost three years old, and there are new tablets that would work better, we recommend that the CMRSWC buy a new tablet on which to use their software. Buying a tablet would decrease the amount of time that anyone using the tablet has to wait for loading and reloading when the tools crash. There are tablets that have built-in cell signal receptors, which may be better so the hot spot is not lost and there is a better signal. The combination of the mobile hotspot and the older tablet causes unnecessary frustration and loss of time. When buying the new tablet, the CMRSWC should invest in model that will be durable and will function well over time and with many different users.

For this purpose, we recommend that the CMRSWC purchase a low-end Apple iPad, since they run much better and have a much better life span compared to an Asus tablet. A low-end iPad would cost about $530 for the lowest end full iPad with a diagonal screen size of 9.7in.

A cheaper option is an iPad Mini, which costs $380 with a diagonal screen size of 7.87in. Either of those options would easily out-perform the current Asus tablet. The Asus tablet costs about $250 with a screen size of about 7in and lasted probably two good years. With either iPad they would continue to function well into four years after they are purchased. While working on the current Asus tablet, we lost about four minutes per outfall having to wait for pages to load and reloading pages. If a town is paying a DPW employee $22/hour to use this tablet and they lose four minutes per outfall, they are losing about $2 per outfall. Since the town has to go to each outfall for some of the new requirements approximating 145 outfalls a town, the town is losing $290 due to the cost of the inadequate technology. Just in that savings from one town, the CMRSCW is making the money back in timesaving, especially since the CMRSWC distributes the tablet to many different towns.

5.16 Other Recommendations

5.16.1 The Massachusetts Department of Environmental Protection should research the potential of providing standardized materials available to Massachusetts municipalities

Based on our findings, we believe the MassDEP should consider making available a collection of materials that municipalities could use for their permit compliance when administering the new 2014 MS4 permit. Within the requirements of the 2014 draft MS4 permit, there are many line items that municipalities must develop and implement. These materials primarily consist of those in the Public Education and Public Involvement control measures, such as pamphlets, brochures, and public notices. Beyond these two control measures there are still a number of material requirements, including Stormwater Pollution Prevention Plans (SWPPPs), outfall-screening procedures, and construction site stormwater plans. These materials will require a significant investment from municipalities to implement (See Appendices D, E, and F for cost estimations in our subject towns). In one case, Mr. Lowell provided our team with a high-end

cost estimate for complying with the Public Education requirement. Based on the requirements of the current MS4 Draft permit, a high-end public education program for a town of approximately 17,000 individuals costs an estimated $19,787 annually (Robert Lowell, 2014). This cost can be different, depending on how the municipality chooses to implement certain requirements. Some towns like Millbury are working to abolish paper materials completely (Robert McNeil, 2014). In regards to the Central Massachusetts Regional Stormwater Coalition (CMRSWC), these materials are made by the CMRSWC for its member municipalities, and are available as part of the paid membership to the CMRSWC. Beyond this Coalition, there is also the Massachusetts Watershed Coalition. Formed in 1991, this Coalition works with community partners across Massachusetts in order to protect and restore watershed ecosystems across the state (Coalition, 2014). As part of its goal, the Mass Watershed Coalition also provides information and other services relating to stormwater to many communities in the state (Coalition, 2014). In the 2014 MS4 Draft permit, Most of the requirements are not specific to individual municipalities. The USEPA made the MS4 permit to be applicable to many different municipalities, and the materials that are required are similarly nonspecific to any municipality. With special attention paid to the success of Coalitions distributing materials, it may be highly beneficial for the MassDEP to develop certain materials in-house, as opposed to municipalities developing them themselves. These would be materials like standard operating procedures, ordinances, and other administrative tools that are required under the 2014 draft permit. The MassDEP should certainly not force municipalities to use these materials, but the materials should be available in electronic and physical forms. Even if only a few towns make use of these materials, they could potentially save tens of thousands of dollars.

5.16.2 The CMRSWC should streamline and update the digital forms. This practice would reduce the time needed to inspect outfalls, thus saving money

While we performed outfall sampling in Holden, we completed wet and dry weather sampling forms. We spent roughly ten minutes per outfall in order to complete these forms. As noted by Matthew St. Pierre of Tata & Howard, these forms have many additional categories. These categories include test results for pollutants that are not regulated by the MS4 permit. It is worth noting that, by having categories that go beyond the regulations of the MS4 permit, the CMRSWC can create a cleaner and less polluted environment. The detail of these forms illustrates the CMRSWC's admirable commitment to protecting the environment. However, the cost of implementing the 2014 draft MS4 permit is significant, and will likely strain many towns' budgets. If the CMRSWC updates these forms and removes the categories unrelated to the draft MS4 permit, it will save the town workers time, and thus streamline the process of outfall sampling. These times savings will also save the towns labor costs.

The CMRSWC should also utilize these updated forms on their digital system. Digital sampling forms are easy to upload to a database or the CMRSWC's website. When we were performing field work in Holden, Ms. McCauley demonstrated how to complete the dry and wet weather sampling forms on the CMRSWC tablet and then upload them to the CMRSWC website. Having a database of these forms makes it easy to see trends in pollution, both within a single town, and between towns, which have shared watersheds. Therefore, the database makes it much easier to perform outfall sampling and inspections, thus saving money. A previous IQP group detailed the efficiency of uploading digital forms to the People GIS database using the Leica tablet. This process circumvented the need to submit the forms outside of the field, and also prevented municipal employees from making repeated trips to outfalls in order to inspect

them (Barat, Chin, & Feraco, 2012). Therefore, the use of a digital database makes sampling and inspection easier and more efficient.

5.16.3 Recommendations for Future Research

In the future, we recommend project groups perform an assessment of the cost of implementing Total Maximum Daily Load (TMDL) measures. According to Frederick Civian, the cost of implementing TMDL measures could be overwhelmingly significant for the towns. Although not much research has been done on TMDL, the USEPA has shown the extent of these costs. The USEPA estimated the cost of implementing TMDL requirements in Bellingham, Franklin, and Milford Massachusetts at $23,595,000, $62,810,000, and $67,363,000, respectively (Group, 2011). A proper assessment of these costs could prove to be valuable to the USEPA, as well as the towns, in the future.

We also recommend future project groups attempt to fill the gaps in our research. We received most of our data from the town officials, with few outside sources except for the DCR. We attempted to contact Environmental Partners Group for information about Holden, but we were unable to reach them. In addition, we had to estimate many of our costs. These factors made our cost numbers difficult to verify as being accurate. Because of this lack of verification, some of our data could have resulted in bias. We recommend that future research groups find a method to eliminate some of the biases in our data, such as by finding budget data from multiple sources.

6.0 Conclusion

Stormwater runoff is one of the leading contributors to water pollution in the United States. In order to combat this pollution, the United States Environmental Protection Agency

(USEPA) created the Municipal Separate Storm Sewer System (MS4) permit. On September 30, 2014, the USEPA released the 2014 draft MS4 permit. Once the USEPA releases the permit in full, towns throughout Massachusetts will have to comply with it, which will lead to substantial spending increases.

In our cost analysis chapter, we discuss the predicted annual costs of complying with the 2014 draft MS4 permit in our subject towns of Holden, Millbury, and Southbridge. From our cost analysis, we predict an annual cost of implementing the 2014 draft MS4 permit of $258,790 for Holden, $735,629 for Millbury, and $343,008 for Southbridge. These costs represent an increase in the annual cost of implementation from the 2003 MS4 permit of 39% for Holden, 26% for Millbury, and 28% for Southbridge.

These cost increases are significant, and we propose several potential methods for defraying the cost increases of effectively implementing the 2014 Draft MS4 to individual towns. In addition, we recommend that towns reach out to the Massachusetts Department of Environmental Protection (MassDEP) for advice on implementing the permit. In our findings and recommendations chapter, we provide recommendations to towns, and the Central Massachusetts Regional Stormwater Coalition (CMRSWC) for effective implementation of the 2014 draft MS4 permit. Among our most important recommendations, we emphasize the benefits of regionalization, the use of innovative stormwater management and funding techniques, and centralization of stormwater management in each town.

The task of effective stormwater management is daunting. However, by implementing the proper procedures, the towns can plan effectively manage stormwater management, thus protecting human health and the environment.

1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$10,952	Pamphlets (6500), Hazardous Waste Collection (3360), Newspaper Article (500), Media Campaign (500), Develop a curriculum for school system (92)	Yes
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2hrs @ $22/hr	No
3	Admin	*Identify parties responsible for each message	2.3.2 a	$22	1hr @ $22/hr, once a year for 8 years	No
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1hr @ $22/hr	No
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	No
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	Included in No. 5	No
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$19,860
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	Minimal cost, can post on website	No
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	In compliance with public meeting requirement	Yes
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	Yes

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	Varies depending on severity of infraction average cost, actual cost may vary	Yes
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	Included in No. 1	Yes
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hr @ $22/hr for scheduling	Yes
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	Yes
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	Varies depending on severity of infraction around 25000-50000	No
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr if records are available	No
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr to determine the information	No
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included in No. 7	No
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included in No. 7	No
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	No
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr for informing EPA/MassDEP orally/written	Yes
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$1,133	15min/outfall (includes travel), 206 outfalls, @ $22/hr	No
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	No
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$1,183	10min/outfall (includes travel), 206 outfalls, @ $22/hr, + materials ($2 stick per outfall + spraypaint + sharpie)	No
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included in No. 14	No
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included in No. 14	Yes
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Enough new requirements to have to add new data elements, cost assuming outside contracting and implementation into GIS map	No
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included in No. 17	No
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included in No. 17	No
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included in No. 17	No
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included in No. 17	No
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included in No. 17	No
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr for continuous additions to stormwater systems	No
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	Yes
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	Complete redevelopment of the program, review and upgrades	No
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	Change ordinance, 13 weeks @ 5hrs/week @ $22/hr, has to go to different committees	Yes
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included in No. 25	No
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories (soupped up from previous "priority" mark in 2003)	2.3.4.7 c i	$13,200	Approx. 1200 catch basins, approx. 30 min/basin @ $22/hr	No
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors (soupped up from previous "priority" mark in 2003)	2.3.4.7 c ii	$26,400	Approx. 1200 catch basins, approx. 1hr/basin @ $22/hr	No
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included in No. 29	No
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	$0 with CMRSWC Membership	Yes
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	Included in No. 34	Yes
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	Possible time extensions, no cost	Yes
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$2,266	206 outfalls, approximately 30min/outfall @ $22/hr	Yes
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$0	Included in No. 39	Yes
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$15,656	206 outfalls, done by contractor, $30/outfall, $23/hr, 2hrs/outfall Testing Kits (0) b/c CMRSWC membership	Yes
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if records are available	No
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr	No
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included in No. 41	No
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$88	Assuming 4 catchments, 1 hr/catchment @ $22/hr	No
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included in No.43	No
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included in No.43	No
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	Assuming using WPI spreadsheet, otherwise about 10min per catchment	No
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	$0 since CMRSWC Membership	No
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included in No. 47	No
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included in No. 47	No
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$176	8hrs @ $22/hr, for scheduling	Yes
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$0	See Miscellaneous No. 50	No
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included in No. 51	No
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included in No. 51	No
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	Yes
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	No
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	$0 since CMRSWC Membership	No
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included in No. 37 and No. 38	No
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	No
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Deadlines, See No. 38 and 37	No
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Deadlines, See No. 28	No
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Deadlines, See No. 28	No
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Deadlines, See No. 28	No
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Deadlines, See No. 28	No
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	No
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$176	8hrs @ $22/hr	No
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	No
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	$0 since CMRSWC Membership	Yes
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$19,242
Estimated One-time Costs	$304,006
Estimated Intermittent Costs	$50,440

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$0	Volunteer based program	Yes
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	See No. 3-12	Yes
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1hrs @ $22/hr, for review of current document	No
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of current document	No
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$88	4hrs @ $22/hr	No
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr	No
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr	No
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr	No
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr	No
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr	No
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr	No
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr	No
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$0
Estimated One-time Costs	$770
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Yes
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, but 8hrs @ $22/hr if not	Yes
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, assumes no controversy and 4 people working	No
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	Included in No. 3	No
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	No
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	No
7	Admin	*all BMPs must be constructed in accordance with the MA Stormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	Yes
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	No
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	Yes
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,100	Submitted by construction company, 50hrs @ $22/hr, if it's new	No
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	5hrs w/ an attorney, 208hrs @ 22/hr, legal authority adds complexity and cost	No
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included in No. 11	No
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	Yes
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @ $22/hr	No
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included in No. 14	No
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included in No. 14	No
17	BMP	*permittee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included in No. 14	No
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	No
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40hrs @ $22/hr	No
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included in No. 19	No
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included in No. 19	No
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included in No. 19	No
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included in No. 19	No
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	Yes
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80hr @ $22/hr, a lot of data required	No
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	See No. 17 in IDDE	No
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	See No. 17 in IDDE	No
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	No
29	Admin	*break out those figures by development, redevelopment or retrofit by permittee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	No
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	No
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hrs, many properties to assess	No
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included in No. 32	No
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii	$0	Included in No. 32	No
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included in No. 32	No
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included in No. 32	No
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included in No. 32	No
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,436

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hrs @ $22/hrs	No
2	Admin	*w/in 1 year inventory all permittee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	Included in No. 1	No
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	No
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	Included in No. 3	No
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	Included in No. 3	No
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	Included in No. 3	No
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	Included in No. 3	No
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	Included in No. 3	No
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc	2.3.7 a ii b	$1,760	80hrs @ $22/hr	No
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	Included in No. 9	No
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	Included in No. 9	No
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	Included in No. 9	No
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	4hrs @ $22/hr	No
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included in No. 13	No
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included in No. 13	No
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22	No
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0	Included in No. 16	No
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/basin @ $22/hr, assuming 10 basins/year	No
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17 & Annual Report	No
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	Included in No. 17	No
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	Included in No. 23	No
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	Included in No. 23	No
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$40,624	Materials + Labor given by town	Yes
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$0	Included in No. 26	Yes
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Development Cost	No
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Development Cost	No
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$0	$0 Since Southbridge owns their own landfill	Yes
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$0	Properly house materials in municipally owned properties	Yes
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	Yes
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0		Yes
36	Admin	*establish procedures for O&M or all permittee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr	No
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Inspect each BMP, assuming 2000/year 15min/BMP @ 22/hr	No
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	No
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr, based on templates from the CMRSWC	No
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	4hrs to update existing SWPPPs, 10hrs for new SWPPPS, @ $22/hr, assume 5 new facilities + 5 old facilities	No
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included in No. 40	No
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included in No. 40	No
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included in No. 40	No
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$10,000	Depends on variations of the extent of impaired waters varies about 10000-25000	No
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	Included in No. 44	No
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included in No. 44	No
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included in No. 44	No
48	BMP	*Good Housekeeping	2.3.7 d 2	$189,540	Snow removal (3300), leaf collection (34020), salt/sand distribution (152220)	Yes
49	BMP	*Preventative Maintenance	2.3.7 d 3	$23,056	Catchment cleaning (23056)	Yes
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included in No. 44	Yes
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included in No. 44	Yes
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included in No. 44	Yes
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included in No. 44	Yes
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$1,980	Given by town	Yes
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included in No. 44	Yes
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,000	30min/inspection, assume 10 facilities with 4 areas each @ $100/area	No
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$2,266	206 outfalls, approx. 30min/outfall @ $22/hr	No
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc	2.3.7 b iii a	$0	Included in No. 44	No
59	BMP	*permittee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	Included in No. 44	No
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	No
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$283,458
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs @ $22/hour, historical properties or endangered species will increase this cost	No
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	No
3	BMP	*Implement measures to protect endangered species	1.9.1	$0	Included under No. 1	No
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	See Miscellaneous No. 50	No
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	Varies	Included under No. 1	No
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	No
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	No
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	No
9	BMP	Develop a SWMP	1.10	$1,760	80hrs @ $22/hr	Yes
10	BMP	Implement a SWMP	1.10	$0	Included under No. 10	Yes
11	Admin	*Update/modify SWMP	1.10	$440	20hrs @ $22/hr	No
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	No
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	No
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	No
15	Admin	***Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Yes
16	Admin	*List all receiving water bodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	No
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	No
18	Admin	*List all outfalls that discharge to each water body	1.10.2	$0	Included under No. 9	No
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	No
20	Admin	*List all interconnected MS4s and receiving water body	1.10.2	$0	Included under No. 9	No
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	No
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	No
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	No
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	No
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	No
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	No
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	No
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	No
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	No
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	No
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	Yes
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	No
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	No
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	No
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	No
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	No
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	No
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included in No. 9	No
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hrs, of paperwork for new BMP	Yes
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	No
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	See Miscellaneous No. 50	No
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	No
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	40hrs at $22/hr, week of work annually	No
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	No
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	No
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"	4.3 b	$0	See Miscellaneous No. 50	No
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Part of annual report, see No. 46	No
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Part of annual report, see No. 46	No
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Part of annual report, see No. 46	No
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$14,200	The Consultant fee for creating the annual report increased based off of the increase in requirements	Yes
51	Admin	*The status of any required plans	4.4 b iii	$0	Part of annual report, see No. 50	No
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Part of annual report, see No. 50	No
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Part of annual report, see No. 50	No
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Part of annual report, see No. 50	No
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Part of annual report, see No. 50	No
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Part of annual report, see No. 50	No
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Part of annual report, see No. 50	Yes
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Part of annual report, see No. 50	Yes
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Part of annual report, see No. 50	No

Estimated Annual Costs	$15,168
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Appendix E

Control Measure	Annual	One-Time	Intermittent
Public Education and Outreach	$9,908	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$7,872	$314,494	$50,440
Construction Site Stormwater Runoff Control	$0	$770	$0
Post Construction Stormwater Management	$5,280	$1,496	$7,436
Good Housekeeping	$220,562	$6,292	$0
Non-Control Measure			
Miscellaneous	$15,168	$2,376	$0
Totals	**$258,790**	**$325,428**	**$57,876**

KEY:	
Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$1,000	Pamphlets to homes, $500 and businesses,$500	Yes
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2 hrs @ $22/hr	No
3	Admin	*Identify parties responsible for each message	2.3.2 a	$22	1 hr @ $22/hr	No
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1 hr @ $22/hr, once a year for 8 years	No
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	No
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	Included in No. 5	No
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$9,908
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	Minimal cost, can post on website	Yes
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	In compliance with public meeting requirement	No
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	Yes

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	Varies depending on severity of infraction average cost, actual cost may vary	Yes
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	Included in No. 1	Yes
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hrs @ $22/hr, for scheduling	Yes
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	Yes
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	Varies depending on severity of infraction, around $25,000-$50,000	No
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr, if records are available	No
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr, to determine the information	No
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included in No. 7	No
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included in No. 7	No
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	No
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr, for informing EPA/MassDEP orally/written	No
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$792	15min/outfall (includes travel), 144 outfalls, @ $22/hr	No
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	No
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$528	10min/outfall (includes travel), 144 outfalls, @ $22/hr, + materials ($2 stick per outfall + spraypaint+sharpie)	No
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included in No. 14	No
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included in No. 14	Yes
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Enough new requirements to have to add new data elements, cost assuming outside contracting and implementation into GIS map	No
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included in No. 17	No
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included in No. 17	No
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included in No. 17	No
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included in No. 17	No
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included in No. 17	No
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr, for continuous additions to stormwater systems	No
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	Yes
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	Complete redevelopment of the program, review and upgrades	No
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	Change ordinance, 13 weeks @ 5 hrs/week @$22/hr, has to go to different committees	Yes
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included in No. 25	No
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories	2.3.4.7 c i	$17,028	Approx. 1548 catch basins, approx. 30 min/basin @ $22/hr	No
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors	2.3.4.7 c ii	$34,056	Approx. 1548 catch basins, approx. 60min/basin @ $22/hr	No
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included in No. 29	No
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	8hr @ $22/hr, work day to complete process, ($0 W/CMRSWC Membership)	Yes
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	See No. 34	Yes
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	possible time extensions	Yes
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$1,584	144 outfalls, approx. 30min/outfall @ $22/hr	Yes
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$0	Included in No. 39	Yes
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$4,968	144 outfalls, approx. 1.5hr/outfall @ $23/hr, Paperwork for wet weather sampling (2,266), Testing Kits (0) b/c CMRSWC membership	No
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if records are available	No
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr	No
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included in No. 41	No
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$88	Assuming 4 catchments, 1 hr/catchment @ $22/hr	No
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included in No.43	No
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included in No.43	No
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	Assuming using WPI spreadsheet, otherwise about 10min per catchment	No
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	$0 since CMRSWC Membership	No
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included in No. 47	No
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included in No. 47	No
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$176	8hrs @ $22/hr, for scheduling	Yes
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$0	See Miscellaneous No. 50	No
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included in No. 51	No
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included in No. 51	No
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, 1.5hr/illicit, 3 illicit	No
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, 1.5hr/illicit, 3 illicit	No
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	$0 since CMRSWC Membership	No
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included in No. 37 and No. 38	No
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	No
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Deadlines, See No. 38 and 37	No
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Deadlines, See No. 28	No
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Deadlines, See No. 28	No
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Deadlines, See No. 28	No
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Deadlines, See No. 28	No
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	No
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$176	8hrs @ $22/hr	No
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	No
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	$0 since CMRSWC Membership	Yes
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$7,872
Estimated One-time Costs	$314,494
Estimated Intermittent Costs	$50,440

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$0	Volunteer based program	Yes
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	See No. 3-12	Yes
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1 hr @ $22/hr, for review of current document	Yes
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of current document	No
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$88	4hrs @ $22/hr	No
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr	No
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr	No
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr	Yes
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr	No
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr	No
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr	No
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr	No
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$0
Estimated One-time Costs	$770
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Yes
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, but 8hrs @ $22/hr minimum	Yes
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, assumes no controversy and 4 people working	No
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	See No. 3	No
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	No
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	No
7	Admin	*all BMPs must be constructed in accordance with the MA stormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	Yes
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	No
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	Yes
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,100	Submitted by construction company, 52hrs @ $22/hr, if it's new	No
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	legal authority adds complexity and cost, 5hr w/ an attorney, 208hrs of labor @ $22/hr	No
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included in No. 11	No
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	Yes
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @ $22/hr	No
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included in No. 14	No
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included in No. 14	No
17	BMP	*permitee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included in No. 14	No
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	No
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40 hrs @ $22/hr	No
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included in No. 19	No
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included in No. 19	No
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included in No. 19	No
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included in No. 19	No
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	Yes
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80 hrs @ $22/hr, a lot of data required	No
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	See No. 17 in IDDE	No
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	See No. 17 in IDDE	No
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	No
29	Admin	*break out those figures by development, redevelopment or retrofit by permitee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	No
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	No
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hr, many properties to assess	No
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included in No. 32	No
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc)	2.3.6 d iii	$0	Included in No. 32	No
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included in No. 32	No
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included in No. 32	No
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included in No. 32	No
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,436

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hr @ $22/hr	No
2	Admin	*w/in 1 year inventory all permitee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	Included in No. 1	No
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc.	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	No
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	Included in No. 3	No
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	Included in No. 3	No
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	Included in No. 3	No
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	Included in No. 3	No
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	Included in No. 3	No
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc.	2.3.7 a ii b	$1,760	80hrs @ $22/hr	No
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	Included in No. 9	No
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	Included in No. 9	No
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	Included in No. 9	No
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	8hrs @ $22/hr	No
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included in No. 13	No
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included in No. 13	No
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22	No
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0		No
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/basin @ $22/hr, assuming 10 basins /year	No
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17/Annual Report	No
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	Included in No. 17	No
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	included in No. 23	No
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	included in No. 23	No
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$10,560	Materials + Labor	Yes
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$0	See No. 26	Yes
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Development Cost	No
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Development Cost	No
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$0	$0 Since Southbridge owns their own landfill	Yes
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$0	Properly house materials in municipally owned properties	Yes
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	Yes
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0		Yes
36	Admin	*establish procedures for O&M or all permitee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr	No
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Inspect each BMP, assuming 2000/year 15min/BMP @ $22/hr	No
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	No
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr, based on templates from the CMRSWC	No
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	4hrs to update existing SWPPPs, 10hrs for new SWPPPS, @ 22/hr, assume 5 new facilities and 5 old facilities	No
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included in No. 40	No
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included in No. 40	No
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included in No. 40	No
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$10,000	depends on variations of the extent of impaired waters	No
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	Included in No. 44	No
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included in No. 44	No
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included in No. 44	No
48	BMP	*Good Housekeeping	2.3.7 d 2	$180,246	$7,040 catch basin cleaning, $10,560 street sweeping, $152,200 salt/sand, $5,956 maintenance, $4,470 audits	Yes
49	BMP	*Preventative Maintenance	2.3.7 d 3	$0		Yes
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included in No. 44	Yes
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included in No. 44	Yes
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included in No. 44	Yes
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included in No. 44	Yes
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$1,980		Yes
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included in No. 44	Yes
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,200	30 minutes per inspection , assume 10 facilities with four areas each @ $100/hr	No
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$1,584	144 outfalls, approx. 30min/outfall @ $22/hr	No
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc.	2.3.7 b iii a	$0	Included in No. 44	No
59	BMP	*permitee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	Included in No. 44	No
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	No
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0		No

Estimated Annual Costs	$220,562
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs at $22/hr, historical properties or endangered species will increase this	No
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	No
3	BMP	*Implement measures to protect endangered species	1.9.1	Varies	Included under No. 1	No
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	See Miscellaneous No. 50	No
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	Varies	Included under No. 1	No
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	No
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	No
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	No
9	BMP	Develop a SWMP	1.10	$1,760	80hrs at $22/hr	Yes
10	BMP	Implement a SWMP	1.10	$0		Yes
11	Admin	*Update/modify SWMP	1.10	$440	20hrs at $22/hr	No
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	No
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	No
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	No
15	Admin	***Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Yes
16	Admin	*List all receiving waterbodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	No
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	No
18	Admin	*List all outfalls that discharge to each waterbody	1.10.2	$0	Included under No. 9	No
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	No
20	Admin	*List all interconnected MS4s and receiving waterbody	1.10.2	$0	Included under No. 9	No
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	No
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	No
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	No
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	No
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	No
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	No
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	No
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	No
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	No
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	No
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	Yes
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	No
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	No
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	No
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	No
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	No
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	No
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included under No. 9	No
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hr, paperwork for new BMP	Yes
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	No
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	See No. 50	No
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	No
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	Week of work annually, 40hrs at $22/hr	No
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	No
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	No
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"	4.3 b	$0	See No. 50	No
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Part of annual report, see No. 46	No
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Part of annual report, see No. 46	No
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Part of annual report, see No. 46	No
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$14,200	Consulting fee for annual report	No
51	Admin	*The status of any required plans	4.4 b iii	$0	Part of annual report, see No. 50	No
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Part of annual report, see No. 50	No
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Part of annual report, see No. 50	No
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Part of annual report, see No. 50	No
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Part of annual report, see No. 50	No
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Part of annual report, see No. 50	No
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Part of annual report, see No. 50	Yes
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Part of annual report, see No. 50	Yes
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Part of annual report, see No. 50	No

Estimated Annual Costs	$15,168
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Control Measure	Estimated Annual Costs	Estimated One-time Costs	Estimated Intermittent Costs
Public Education and Outreach	$12,106	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$11,347	$306,481	$76,972
Construction Site Stormwater Runoff Control	$350	$858	$0
Post Construction Stormwater Management	$5,280	$1,496	$7,480
Good Housekeeping	$693,578	$6,292	$0
Non-Control Measure			
Miscellaneous	$12,968	$2,376	$0
Totals	**$735,629**	**$317,503**	**$84,452**

KEY:			
Yearly	No. = Reference Number		
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work		
As Needed	X Requirement = The short name for a requirement		
	Requirement = Section in the 2014 MS4 permit draft		
	Cost = Cost of completing the requirement		
	Justification = List of methods used to complete the requirement, as well supporting data from sources		
	In Place (Y/N) = Is the requirement listed currently in place		

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$3,176	Art Contest (3000) for materials, 8 hr(s) @ $22/hr	Y
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2hrs @ $22/hr, a minor administrative cost	N
3	Admin	*Identify parties responsible for each message	2.3.2 a	$44	2hrs @ $22/hr, a minor administrative cost	N
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1hr @ $22/hr, a minor administrative cost, once a year for 8 years	N
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	N
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	No significant cost	N
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$12,106
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	No significant cost, website hosting	Y
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	No significant cost	Y
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	[Varies depending on infraction, ranges from ($0-50,000) provided by DCR Director Larry Pistrang]	Y
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	See No. 1, part of identification process	Y
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hrs @ $22/hr, for scheduling	N
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	N
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	[Varies depending on infraction, ranges from ($0-50,000) provided by DCR Director Larry Pistrang]	Y
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr, assuming records are easily available	N
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr, to determine the information	N
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included under No. 7	N
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included under No. 7	N
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	N
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr, informing EPA/MassDEP orally/written	N
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$1,469	2hrs @ $22/hr, about 15min/outfall, 267 outfalls	N
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	N
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$2,003	2hrs @ $22/hr, about 10min/outfall, 267 outfalls, materials included ($2 stick per outfall + spraypaint+sharpie)	N
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included under No. 14, materials are available from the Coalition	N
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included under No. 14, materials are available from the Coalition	N
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Will likely require complete redevelopment of the map system, this numbers based on Millbury estimations for People GIS	N
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included under No. 17	N
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included under No. 17	N
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included under No. 17	N
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included under No. 17	N
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included under No. 17	N
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr, for continuous developments and additions to stormwater systems	N
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	N
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	A complete redevelopment of the program, smaller towns can expect a cost of 10,000	N
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	65hrs @ $22/hr, will have to change ordinance and allow a representative to go to different committees	Y
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included under No. 25	N
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories	2.3.4.7 c i	$13,310	1210 catch basins, about 30min/basin @ $22/hr	N
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors	2.3.4.7 c ii	$26,620	1210 catch basins, about 1hr/basin @ $22/hr	N
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included under No. 29	N
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	No cost with Coalition Membership	N
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	Included under No. 34	N
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	Minimal cost, possible time extensions to test applicable outfalls	N
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$979	267 outfalls, about 10min/outfall @ $22/hr	N
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$1,469	267 outfalls, about 15min/outfall @ $22/hr	N
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$8,811	267 outfalls, about 1.5hr/outfall @ $22/hr, along with applicable water quality testing kit costs (none with Coalition)	N
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if files readily available	N
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr, for development of procedure	N
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included under No. 41	N
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$26,620	1210 catchments, 1 hr/catchment @ $22/hr	N
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included under No. 43	N
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included under No. 43	N
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	See Miscellaneous No. 50	N
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	No cost with Coalition Membership	N
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included under No. 47	N
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included under No. 47	N
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$22	1hr @ $22/hr, for scheduling	Y
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$88	4hrs @ $22/hr, for scheduling	N
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included under No. 51	N
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included under No. 51	N
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	N
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	N
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	8hrs @ $22/hr, one work day to complete process, no cost with Coalition membership	N
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included under No. 37 and No. 38	N
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	N
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Included under No. 37 and No. 38, deadlines	N
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Included under No. 28, deadlines	N
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Included under No. 28, deadlines	N
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Included under No. 28, deadlines	N
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Included under No. 28, deadlines	N
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	N
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$0	8hrs @ $22/hr, administrative work	N
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	N
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	No cost with Coalition membership	Y
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$11,347
Estimated One-time Costs	$306,481
Estimated Intermittent Costs	$76,972

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$350	Compare to previous cost, Millbury cost provided by Laurie Connors	Y
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	as provided by Laurie Connors, Town planner	Y
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1hr @ $22/hr, included under No. 2	Y
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of the established document included under No. 2	Y
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$176	4hrs @ $22/hr, included under No. 2	N
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr, included under No. 2	N
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr, included under No. 2	N
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$350
Estimated One-time Costs	$858
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Y
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, amendment would be 8 hr(s) @ 22/hr minimum	N
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, difficult to assess cost, assumes no controversies or unresolved issues and four people working	N
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	Included under No. 3	N
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	N
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	N
7	Admin	*all BMPs must be constructed in accordance with the MA Sstormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	N
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	N
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	N
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,144	52hrs @ $22/hr and submitted by construction company if it is new	N
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	208hrs @ $22/hr, Submitted by construction company, legal authority and complexity add costs, including maybe 5 people inc/attorney	N
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included under No. 11	N
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	N
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @$22/hr, including fire chief	N
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included under No. 14	N
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included under No. 14	N
17	BMP	*permitee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included under No. 14	N
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	N
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40hrs @ $22/hr	N
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included under No. 19	N
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included under No. 19	N
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included under No. 19	N
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included under No. 19	N
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	N
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80hrs @ $22/hr, data intensive, devising system and updating yearly, assumes 4 people working	N
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	Included in IDDE No. 17	N
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	Included in IDDE No. 17	N
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	N
29	Admin	*break out those figures by development, redevelopment or retrofit by permitee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	N
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	N
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hr, involving schools, DPW, fire, police etc. assume 13 weeks work time	N
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included under No. 31	N
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii	$0	Included under No. 31	N
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included under No. 31	N
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included under No. 31	N
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included under No. 31	N
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,480

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hrs @ $22/hr,	N
2	Admin	*w/in 1 year inventory all permitee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	included under No. 1	N
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc.	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	N
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	included under No. 3	N
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	included under No. 3	N
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	included under No. 3	N
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	included under No. 3	N
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	included under No. 3	N
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc.	2.3.7 a ii b	$1,760	80hrs @ $22/hr, to write procedures	N
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	included under No. 1	N
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	included under No. 1	N
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	included under No. 1	N
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	8hrs @ $22/hr,	N
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included under No. 13	N
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included under No. 13	N
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22, will likely require significant investment	N
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0	See below	N
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/catch basin, for example put 10 catch basins assume only 10 more than 50% each year	N
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17/Annual Report	N
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See No. 17/Annual Report	N
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See No. 17/Annual Report	N
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	See No. 17/Annual Report	N
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See No. 17/Annual Report	N
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	See No. 17/Annual Report	N
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	See No. 17/Annual Report	N
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$0	Included under No. 27, already in place, Based on Estimations for one annual sweep	Y
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$165,000	Already implemented, Based on Estimations provided by Rob McNeil	Y
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Developmental cost	N
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Developmental cost	N
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	N
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	Included under No. 28	N
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$33,200	400tons @ $83/ton, based on numbers provided by Rob McNeil	Y
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$476,449	Properly house materials in municipally owned properties, performed yearly	Y
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	N
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0	Announcement to DPW workers involved with snow procedures	N
36	Admin	*establish procedures for O&M or all permitee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr,	N
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Assuming 2000 per year, 15 minutes per structure	N
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	N
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr,	N
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	Assume 4 hrs to update existing SWPPPs, 10hrs for new SWPPPS, 70 hr(s) @ 22/hr, assume 5 new facilities a	N
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included under No. 40	N
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included under No. 40	N
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included under No. 40	N
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$0	Implementation of a number of control measures, cost will depend upon type of enforcement	N
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	extra work, depends on variations of the extent of impaired waters	N
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included under No. 44	N
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included under No. 44	N
48	BMP	*Good Housekeeping	2.3.7 d 2	$0	Included under No. 44	N
49	BMP	*Preventative Maintenance	2.3.7 d 3	$0	Included under No. 44	N
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included under No. 44	N
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included under No. 44	N
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included under No. 44	N
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included under No. 44	N
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$0	Included under No. 44	N
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included under No. 44	N
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,000	20hrs @ $100/hr, assume 30min/inspection and 10 facilities with four areas each	N
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$2,937	267 outfalls, about 30min/area @ $22/hr	N
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc.	2.3.7 b iii a	$0	Already included as operating costs, should be green	N
59	BMP	*permitee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	costs for maintenance procedures	N
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	N
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0	Minimal investment for records keeping	N

Estimated Annual Costs	$693,578
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs @ $22/hr, historical properties or endangered species will increase this cost	Y
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	N
3	BMP	*Implement measures to protect endangered species	1.9.1	$0	cost varies. included under No. 1	N
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	minimal cost, Included under No. 50	N
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	$0	Varies, Included under No. 1	N
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	N
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	N
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	Y
9	BMP	Develop a SWMP	1.10	$1,760	80hrs @ $22/hr,	Y
10	BMP	Implement a SWMP	1.10	$0	Included under No. 9	Y
11	Admin	*Update/modify SWMP	1.10	$440	20hrs @ $22/hr,	N
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	Y
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	Y
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	N
15	Admin	**Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Y
16	Admin	*List all receiving water bodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	N
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	N
18	Admin	*List all outfalls that discharge to each water body	1.10.2	$0	Included under No. 9	N
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	N
20	Admin	*List all interconnected MS4s and receiving water body	1.10.2	$0	Included under No. 9	N
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	N
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	N
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	N
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	Y
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	N
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	Y
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	N
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	N
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	Y
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	N
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	N
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	N
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	N
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	N
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	N
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	N
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	N
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included under No. 9	N
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hr, paperwork for new BMP	N
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	Y
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	Included under Public Education No. 7	N
42	Admin	EPA or MassDEP may require the permitte to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	Y
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	40hrs at $22/hr	N
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	N
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	Y
46	Admin	*the permitee "shall document all monitoring results each year in the annual report"	4.3 b	$0	Included under Public Education No. 7	N
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Included under No. 46	N
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Included under No. 46	N
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Included under No. 46	N
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$12,000	Consulting fee for annual report, increased from $3000 based on Matt's estimated	Y
51	Admin	*The status of any required plans	4.4 b iii	$0	Included under No. 50	N
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Included under No. 50	N
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Included under No. 50	N
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Included under No. 50	N
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Included under No. 50	N
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Included under No. 50	N
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Included under No. 50	Y
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Included under No. 50	Y
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Included under No. 50	N

Estimated Annual Costs	$12,968
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Appendix G

Sample Interview Material

Preamble

We are a group of students from Worcester Polytechnic Institute (WPI). We are conducting this interview in order to learn more about the cost of implementing the new 2014 MS4 permit. By participating in this interview, you will help us assess the total cost of compliance for _____(Town Name). If you want, we are able to keep your responses anonymous so you cannot be identified in this report. Your participation in this interview is completely voluntary and you can abstain from answering any question or stop the interview at any point. If you would like, we can provide you with a copy of the results at the end of our project. This project is a collaboration between the Massachusetts Department of Environmental Protection (MassDEP) and WPI, and all of us appreciate your participation.

Sample Interview Questions

1. Does your municipality use a contractor for stormwater management?
    a. If so, may we have their contact information?
2. How much does your municipality spend on public education?
    a. Does your municipality provide pamphlets?
    b. Does your municipality have public access television programs about stormwater management?
    c. How much do you spend on posting signage?

    d. Do you use social media to provide information? If so, how much does it cost?

3. How much does your municipality spend on public participation?
    a. Do you hold town meetings about stormwater management?
4. How much does your municipality spend on illicit discharge and elimination?
    a. Does your municipality use the database?
    b. How much does it cost you to map your catchment basins?
    c. Does your municipality have retention ponds for stormwater? If so, do you maintain them?
    d. How often does your municipality street sweep?
    e. How much does it cost you to remove illicit discharges?
    f. How much does it cost you to train municipal employees to use the detection equipment?
5. How much does your municipality spend on construction site runoff control?
    a. How much does it cost to notify municipal residents about impending construction projects?
    b. How much does it cost you to inspect construction sites?
6. How much does your municipality spend on post-construction site runoff control?
    a. How much does it cost for you to inspect the construction sites after completion of the construction?
7. How much does your municipality spend on good housekeeping?
    a. How much does it cost your municipality to maintain stormwater management BMPs every year?
    b. How much does it cost to train your employees to maintain BMPs?

c. How much does it cost you to inspect your best management practices?

d. How much does it cost you per year to street sweep?

8. Could you provide us with a cost report for your municipality?

    a. Itemized report stormwater spending?

9. Do you believe that your town effectively implemented the requirements of the 2003 MS4 permit?

10. To what extent do you believe your town is prepared to implement the requirements of the new MS4 permit?

    a. What challenges do you foresee in implementing the new MS4 permit?

    b. How do you plan to provide additional funding for implementing the new permit?

Appendix H

Control Measure	Estimated Annual Costs	Estimated One-time Costs	Estimated Intermittent Costs
Public Education and Outreach	$0	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$0	$0	$0
Construction Site Stormwater Runoff Control	$0	$0	$0
Post Construction Stormwater Management	$0	$0	$0
Good Housekeeping	$0	$0	$0
Non-Control Measure			
Miscellaneous	$0	$0	$0
Totals	**$0**	**$0**	**$0**

KEY:

Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a			
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a			
3	Admin	*Identify parties responsible for each message	2.3.2 a			
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c			
5	Admin	*Show evidence that messages are achieving results	2.3.2 e			
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e			
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a			
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b			
3	Admin	*Put in annual report these public participation activities	2.3.3 c			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2			
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2			
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2			
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2			
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3			
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b			
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b			
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b			
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b			
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b			
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c			
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5			
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b			
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b			
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c			
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c			
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6			
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i			
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i			
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i			
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii			
22	BMP	*Include various recommended elements	2.3.4.6 a iii			
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b			
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c			
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7			
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a			
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b			
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories (soupped up from previous "priority" mark in 2003)	2.3.4.7 c i			
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors (soupped up from previous "priority" mark in 2003)	2.3.4.7 c ii			
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii			
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii			
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii			
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii			
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d			
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i			
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii			
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii			
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv			
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v			
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi			
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e			
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e			
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i			
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i			
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i			
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i			
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii			
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a			
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b			
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii			
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f			
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f			
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f			
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f			
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g			
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h			
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a			
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a			
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b			
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c			
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i			
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii			
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii			
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e			
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9			
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9			
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10			
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i			
2	Admin	*w/in 1 year inventory all permittee owned facilities in these "good housekeeping" categories	2.3.7 a ii			
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc	2.3.7 a ii a			
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a			
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a			
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a			
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a			
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a			
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc	2.3.7 a ii b			
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b			
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b			
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b			
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c			
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c			
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c			
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a			
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b			
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b			
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b			
20	Admin	*describe these actions in the annual report	2.3.7 a iii b			
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b			
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b			
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b			
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b			
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b			
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c			
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c			
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c			
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c			
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c			
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c			
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d			
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e			
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e			
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e			
36	Admin	*establish procedures for O&M or all permittee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f			
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f			
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv			
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v			
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b			
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b			
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a			
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b			
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c			
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c			
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c			
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1			
48	BMP	*Good Housekeeping	2.3.7 d 2			
49	BMP	*Preventative Maintenance	2.3.7 d 3

REGARDING RECORDED NITROGEN, DATED 1/7/15

Subject: Fwd: nitrogen data
From: Isabel McCauley <imccauley@holdenma.gov>
Date: 2/27/2015 10:57 AM
To: John Woodsmall <jwoodsmall@holdenma.gov>

-------- Forwarded Message --------
Subject:nitrogen data
Date: Wed, 7 Jan 2015 13:04:00 -0500
From: Pistrang, Larry (DCR) <larry.pistrang@state.ma.us>
To:'imccauley@holdenma.gov' <imccauley@holdenma.gov>

I don't know how this will be received, but hope that EPA will realize that watershed communities are very different from the general population. The existence of long-term data and the knowledge that sampling will continue indefinitely WITHOUT the need for town funds should hopefully make them happy and waive the nitrogen specific requirements, especially since all concentrations (dry weather or wet weather) are very low.

DCR Division of Watershed Management staff have collected routine nutrient samples monthly or more frequently from the Quinapoxet River for many years. The sampling station is downstream of all of Holden's stormwater outfalls except for the few that discharge to water resources that flow south into Worcester. From 2007 through 2013 a total of 96 grab samples were collected by DCR staff and analyzed at the MWRA Deer Island Lab for a variety of parameters including NH_3, NO_2, and NO_3. Results are shown below. All concentrations are in mg/L.

Dry weather routine grab samples – Quinapoxet River (2007-2013):

PARAMETER	RANGE OF VALUES	AVERAGE VALUE
NH_3	<0.005 – 0.071	0.013
NO_2	<0.005	<0.005
NO_3	0.020 – 0.640	0.247

Samples were also collected during storm events from 2011 through 2013. Flow-based composite samples were collected during rising limb and falling limb conditions. A total of 34 composite samples were collected by DCR staff and analyzed at the MWRA Deer Island Lab. Results are shown below.

Wet weather flow-based composite samples – Quinapoxet River (2011-2013):

PARAMETER	RANGE OF VALUES	AVERAGE VALUE	AVE OF RISING LIMB ONLY

NH_3	<0.005 – 0.036	0.009	0.010
NO_2	<0.005	<0.005	<0.005
NO_3	0.101 – 0.433	0.231	0.249

I hope this helps. Let me know if there is anything else I can provide to assist you.

Re: Comments on the Draft NPDES General Permit for Stormwater Discharges from MS4 in Massachusetts

Dear Mr. Tedder:

As the Town Manager and chief executive officer of Holden, I am pleased to have an opportunity to submit comments to the Environmental Protection Agency (EPA) regarding the National Pollutant Discharge Elimination System (NPDES) Draft General Permit (Draft Permit) for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts. Thank you for the opportunity to provide these comments. I note that the Holden Department of Public Works will be submitting a separate set of comments, and that I hereby incorporate those comments into mine. I am submitting these comments in an effort to bring to light the substantial impacts this draft permit will have on our community.

The Town of Holden is a community of nearly 18,000 people and is host to Massachusetts State Routes 31, 122A, 68 and 190. Approximately one third of the Town is protected open space intended to preserve the water quality of the reservoirs supplying drinking water to the Worcester and Boston metropolitan areas. Holden is a Wachusett Reservoir Watershed community; most of the protected lands are owned or managed by the Massachusetts Department of Conservation and Recreation (DCR). Land use activities on private lands abutting the tributaries to the Wachusett Reservoir are regulated by the DCR through the Massachusetts Watershed Protection Act, in addition to a variety of other local and state land use laws and regulations.

The Town of Holden strongly supports the goal of ensuring that the Waters of the United States are clean and are protected from untreated stormwater runoff. Since the introduction of the original Phase II MS4 General Permit in 2003, the Town has supported the underlying goal of improving the quality of the Waters of the United States located in the Town. The Town has worked diligently and successfully to implement the requirements of the original 2003 Small MS4 Permit. Indeed, the Town was one of the thirteen (13) original members of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). The Town continues

to be a member of the CMRSWC, and works with its partner towns to develop a common message and framework for dealing with stormwater runoff.

I write to you to express our my concerns with the extremely large and overreaching burden that the Draft Permit will inflict upon the Town of Holden, as well as other cities and towns in Massachusetts. The Draft Permit as currently constituted will result in large increases in compliance costs related to administratively focused tasks, studies, and reports that will create no quantifiable increase in water quality in the Town's receiving waters. Other facets of the Draft Permit impose tasks upon the Town that it is wholly unsuitable to perform. Further, the Draft Permit imposes strict conditions on development and redevelopment projects that are in conflict with current Massachusetts Stormwater Standards, as well as existing local bylaws and regulations.

For instance, the Draft Permit requires the Town to craft a number of different stormwater educational messages, each tailored to a specific audience. While not an entirely unreasonable requirement, the Draft Permit then requires the Town to develop and implement ways to measure the effectiveness of those messages on the intended audience. The Draft Permit provides no suggestion as to how this should be done, but it is clear from the Draft Permit language that simply keeping track of the number of pamphlets distributed, or the number of web page views, for instance, will not be considered an adequate way of measuring effectiveness. This requirement will force the Town to hire a public relations company to design the messages, as well as to conduct surveys to determine if they are effective or not. This type of activity is simply not a good way to spend limited money on stormwater cleanup, and will provide no indication of an improvement in water quality. The EPA should remove the requirements for determining the effectiveness of the public education measures. Additionally, the EPA should work to develop a common educational campaign for the State as a whole, either working through the Massachusetts Department of Environmental Protection (MADEP), the DCR, and/or with other environmentally focused non-profit organizations. While regional efforts such as the CMRSWC will certainly help with meeting this condition of the Draft Permit, an overall state wide coordinated stormwater messaging campaign would be much more effective than 100, 200, or more separate stormwater campaigns.

I am also concerned with the impediments to land re-development costs that the Draft Permit appears to impose. In the sections of the permit dealing with new and redevelopment land projects, the Draft Permit appears to require the upgrading of the stormwater management system of an entire site, even if only a portion of the site is actually undergoing redevelopment. Further, the requirement of the Draft Permit to treat the first 1-inch of stormwater runoff is conflict with the MADEP Stormwater Standards, which requires the 1-inch treatment volume only for discharges to critical environmental areas. The imposition of both the 1-inch treatment volume for all new land development projects, as well as the retrofitting of the entirety of a site undergoing land redevelopment activities will greatly increase the cost of construction of both types of projects. For redevelopment projects, this requirement may indeed make a project no longer cost effective. While we certainly do not encourage unchecked land development activities, the added construction costs due to the Draft Permit must be weighed against the general economic harm that may occur from those added costs. Massachusetts already has some of the highest construction costs in the United States, and these costs have had a dramatic impact upon the ability of cities and towns in the State to provide affordable housing for its citizens. We urge the EPA to reassess this requirement to treat the 1-inch stormwater runoff on the entirety of a redevelopment site.

We further urge the EPA to consider the conflict created between the Draft Permit and the existing Massachusetts Stormwater Standards and other local land development bylaws and regulations. The EPA should be working conjointly with the MADEP to determine what is best for Massachusetts in term of stormwater standards for new and redevelopment projects.

The current Draft Permit provides a level of detail of the activities to be completed to achieve permit compliance that has been previously not seen. For instance, there are at least 250 different actionable items that the Town has to demonstrate compliance with. Additionally, the Draft Permit lists criminal penalties for failure to comply with these items. Many of these items are of limited benefit. For instance, requiring the Town to sweep streets a second time in the year, primarily in order to collect leaves is unreasonable. We believe the EPA needs to re-examine this list of activities. We urge the EPA to craft permit requirements that are based on quantifiable improvements in stormwater runoff quality, rather than mandating a set of actions that may or may not result in any appreciable improvement in runoff quality.

There are number of areas within the permit where it appears the EPA is using cities and towns to act as data collection surrogates for the EPA. Collecting data on volume of street sweepings, catch basins cleanings, amount of directly connected impervious areas (DCIA), and wet weather sampling serves little purpose in increasing stormwater runoff quality. While this data may be interesting to collect for research purposes, there is a cost associated with the collection efforts. The cost in money and time to collect this data should not be borne by the Town, as there is no appreciable benefit to runoff quality. It is simply an academic exercise. If the EPA is interested in collecting these types of information for further research and analysis, then it should bear the burden and cost of collecting the information. It should not simply be required of the Town to perform this type of work on the behalf of the EPA.

Finally, of particular concern to us is the overall projected cost of compliance with the Draft Permit. As part of a project performed for the MADEP, a group of Worcester Polytechnic Institute students performed a cost analysis of the Town's current and projected stormwater permit compliance costs. This cost analysis indicated that the Town currently spends approximately $150,000 to $186,000 per year on stormwater related measure. This cost analysis further indicated that the Town could expect new annual costs to be approximately $260,000 per year, or an increase of 40- to 60-percent above current costs. Further, this new annual cost does not include monies necessary to perform structural retrofits on existing Town owned management systems.

The Town has been a strong supporter of improving stormwater quality, and has consistently funded the activities needed to comply with the 2003 MS4 permit. The Town did expect that the Draft Permit would require an increased expenditure of money related to new stormwater compliance costs. However, the amount of the projected increase is unreasonable, especially given the unreasonableness of many of the items that are driving the cost increase, and the lack of quantifiable improvements to runoff quality. The EPA must examine further the cost implications of the Draft Permit, and work to find ways to reduce this additional burden to cities and towns. While the EPA has indicated that it understands that there will be additional permit compliance costs, it has not sought out ways to reduce that burden. Rather, the EPA champions the establishment of stormwater utilities to raise dedicated funding for stormwater management. While a stormwater utility is indeed one way to raise money for stormwater management, such a utility simply represents a way to levy an additional tax or fee on the residents and business owners of the Town. A stormwater utility may raise money, but it does nothing to limit the amount of money that is needed by the Town to comply with the

Draft Permit. We strongly urge the EPA to examine all of the new mandates that it is requiring cities and towns to comply with in the Draft Permit.

In conclusion, I am quite concerned with the large expansion of the EPA's involvement in the Town's stormwater management program. The EPA is mandating a number of activities that will be expensive to implement, are not within the core function of a municipality in Massachusetts, and will have not result in any readily apparent increase in stormwater runoff quality. The Town of Holden is a strong and consistent advocate for clean water, whether it is drinking water, stormwater, or wastewater. However, any increases in costs due to permit compliance must be balanced against the financial capability of Holden, and other cities and towns to absorb those additional costs. The Town of Holden expected that permit compliance costs would go up under the Draft Permit. However, the scale of the cost increases, as well as the reasons for those increases, is not something that can be easily defended or explained to the general public. If the EPA wishes to increase stormwater runoff quality, they must adopt a more cooperative approach to the problem, and work with the cities and towns of Massachusetts to create a permit with more realistic requirements that create measurable improvements in stormwater runoff quality. Until such time that occurs, or until the Federal and/or State governments step forward with the additional funding necessary to gain permit compliance, cities and towns will be stuck in an adversarial relationship with the EPA, and will be unable to adequately fund their stormwater management programs.

We thank the EPA for providing this opportunity to comment on the Draft Permit, and we look forward to working with the EPA in the future to create a more practical and cost effective stormwater permit.

Sincerely,

Jacquelyn M. Kelly

Re: Comments on the Draft NPDES General Permit for Stormwater Discharges from MS4 in Massachusetts

Dear Mr. Tedder:

The Town of Holden's Board of Selectmen is pleased to have an opportunity to submit comments to the Environmental Protection Agency (EPA) regarding the National Pollutant Discharge Elimination System (NPDES) Draft General Permit (Draft Permit) for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts. We thank you for the opportunity to provide these comments. We also note that the Holden Department of Public Works will be submitting a separate set of comments, and that we hereby incorporate those comments into our own. The Board of Selectmen is submitting these comments in an effort to bring to light the substantial impacts this draft permit will have on our community.

The Town of Holden is a community of nearly 18,000 people and is host to Massachusetts State Routes 31, 122A, 68 and 190. Approximately one third of the Town is protected open space intended to preserve the water quality of the reservoirs supplying drinking water to the Worcester and Boston metropolitan areas. Holden is a Wachusett Reservoir Watershed community; most of the protected lands are owned or managed by the Massachusetts Department of Conservation and Recreation (DCR). Land use activities on private lands abutting the tributaries to the Wachusett Reservoir are regulated by the DCR through the Massachusetts Watershed Protection Act, in addition to a variety of other local and state land use laws and regulations.

The Town of Holden strongly supports the goal of ensuring that the Waters of the United States are clean and are protected from untreated stormwater runoff. Since the introduction of the original Phase II MS4 General Permit in 2003, the Town has supported the underlying goal of improving the quality of the Waters of the United States located in the Town. The Town has worked diligently and successfully to implement the requirements of the original 2003 Small MS4 Permit. Indeed, the Town was one of the thirteen (13) original members of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). The Town continues to be a member of the CMRSWC, and works with its partner towns to develop a common message and framework for dealing with stormwater runoff.

We write to you to express our concerns with the extremely large and overreaching burden that the Draft Permit will inflict upon the Town of Holden, as well as other cities and towns in Massachusetts. The Draft Permit as currently constituted will result in large increases in compliance costs related to administratively focused tasks, studies, and reports that will create no quantifiable increase in water quality in the Town's receiving waters. Other facets of the Draft Permit impose tasks upon the Town that it is wholly unsuitable to perform. Further, the Draft Permit imposes strict conditions on development and redevelopment projects that are in conflict with current Massachusetts Stormwater Standards, as well as existing local bylaws and regulations.

For instance, the Draft Permit requires the Town to craft a number of different stormwater educational messages, each tailored to a specific audience. While not an entirely unreasonable requirement, the Draft Permit then requires the Town to develop and implement ways to measure the effectiveness of those messages on the intended audience. The Draft Permit provides no suggestion as to how this should be done, but it is clear from the Draft Permit language that simply keeping track of the number of pamphlets distributed, or the number of web page views, for instance, will not be considered an adequate way of measuring effectiveness. This requirement will force the Town to hire a public relations company to design the messages, as well as to conduct surveys to determine if they are effective or not. This type of activity is simply not a good way to spend limited money on stormwater cleanup, and will provide no indication of an improvement in water quality. The EPA should remove the requirements for determining the effectiveness of the public education measures. Additionally, the EPA should work to develop a common educational campaign for the State as a whole, either working through the Massachusetts Department of Environmental Protection (MADEP), the DCR, and/or with other environmentally focused non-profit organizations. While regional efforts such as the CMRSWC will certainly help with meeting this condition of the Draft Permit, an overall state wide coordinated stormwater messaging campaign would be much more effective than 100, 200, or more separate stormwater campaigns.

The Board of Selectmen is also concerned with the impediments to land re-development costs that the Draft Permit appears to impose. In the sections of the permit dealing with new and redevelopment land projects, the Draft Permit appears to require the upgrading of the stormwater management system of an entire site, even if only a portion of the site is actually undergoing redevelopment. Further, the requirement of the Draft Permit to treat the first 1-inch of stormwater runoff is conflict with the MADEP Stormwater Standards, which requires the 1-inch treatment volume only for discharges to critical environmental areas. The imposition of both the 1-inch treatment volume for all new land development projects, as well as the retrofitting of the entirety of a site undergoing land redevelopment activities will greatly increase the cost of construction of both types of projects. For redevelopment projects, this requirement may indeed make a project no longer cost effective. While the Board of Selectmen certainly does not encourage unchecked land development activities, the added construction costs due to the Draft Permit must be weighed against the general economic harm that may occur from those added costs. Massachusetts already has some of the highest construction costs in the United States, and these costs have had a dramatic impact upon the ability of cities and towns in the State to provide affordable housing for its citizens. We urge the EPA to reassess this requirement to treat the 1-inch stormwater runoff on the entirety of a redevelopment site. We further urge the EPA to consider the conflict created between the Draft Permit and the existing Massachusetts Stormwater Standards and other local land development bylaws and regulations. The EPA should be working conjointly with the MADEP to determine what is best for Massachusetts in term of stormwater standards for new and redevelopment projects.

The current Draft Permit provides a level of detail of the activities to be completed to achieve permit compliance that has been previously not seen. For instance, there are at least 250 different actionable items that the Town has to demonstrate compliance with. Additionally, the Draft Permit lists criminal penalties for failure to comply with these items. Many of these items are of limited benefit. For instance, requiring the Town to sweep streets a second time in the year, primarily in order to collect leaves is unreasonable. We believe the EPA needs to re-examine this list of activities. We urge the EPA to craft permit requirements that are based on quantifiable improvements in stormwater runoff quality, rather than mandating a set of actions that may or may not result in any appreciable improvement in runoff quality.

There are number of areas within the permit where it appears the EPA is using cities and towns to act as data collection surrogates for the EPA. Collecting data on volume of street sweepings, catch basins cleanings, amount of directly connected impervious areas (DCIA), and wet weather sampling serves little purpose in increasing stormwater runoff quality. While this data may be interesting to collect for research purposes, there is a cost associated with the collection efforts. The cost in money and time to collect this data should not be borne by the Town, as there is no appreciable benefit to runoff quality. It is simply an academic exercise. If the EPA is interested in collecting these types of information for further research and analysis, then it should bear the burden and cost of collecting the information. It should not simply be required of the Town to perform this type of work on the behalf of the EPA.

Finally, of particular concern to the Board of Selectmen is the overall projected cost of compliance with the Draft Permit. As part of a project performed for the MADEP, a group of Worcester Polytechnic Institute students performed a cost analysis of the Town's current and projected stormwater permit compliance costs. This cost analysis indicated that the Town currently spends approximately $150,000 to $186,000 per year on stormwater related measure. This cost analysis further indicated that the Town could expect new annual costs to be approximately $260,000 per year, or an increase of 40- to 60-percent above current costs. Further, this new annual cost does not include monies necessary to perform structural retrofits on existing Town owned management systems.

The Town has been a strong supporter of improving stormwater quality, and has consistently funded the activities needed to comply with the 2003 MS4 permit. The Town did expect that the Draft Permit would require an increased expenditure of money related to new stormwater compliance costs. However, the amount of the projected increase is unreasonable, especially given the unreasonableness of many of the items that are driving the cost increase, and the lack of quantifiable improvements to runoff quality. The EPA must examine further the cost implications of the Draft Permit, and work to find ways to reduce this additional burden to cities and towns. While the EPA has indicated that it understands that there will be additional permit compliance costs, it has not sought out ways to reduce that burden. Rather, the EPA champions the establishment of stormwater utilities to raise dedicated funding for stormwater management. While a stormwater utility is indeed one way to raise money for stormwater management, such a utility simply represents a way to levy an additional tax or fee on the residents and business owners of the Town. A stormwater utility may raise money, but it does nothing to limit the amount of money that is needed by the Town to comply with the Draft Permit. We strongly urge the EPA to examine all of the new mandates that it is requiring cities and towns to comply with in the Draft Permit.

In conclusion, the Holden Board of Selectmen is quite concerned with the large expansion of the EPA's involvement in the Town's stormwater management program. The EPA is mandating a number of activities that will be expensive to implement, are not within the core function of a municipality in Massachusetts, and will have not result in any readily apparent increase in stormwater runoff quality. The Town of Holden is a strong and consistent advocate for clean water, whether it is drinking water, stormwater, or wastewater. However, any increases in costs due to permit compliance must be balanced against the financial capability of Holden, and other cities and towns to absorb those additional costs. The Town of Holden expected that permit compliance costs would go up under the Draft Permit. However, the scale of the cost increases, as well as the reasons for those increases, is not something that can be easily defended or explained to the general public. If the EPA wishes to increase stormwater runoff quality, they must adopt a more cooperative approach to the problem, and work with the cities and towns of Massachusetts to create a permit with more realistic requirements that create measurable improvements in stormwater runoff quality. Until such time that occurs, or until the Federal and/or State governments step forward with the additional funding necessary to gain permit compliance, cities and towns will be stuck in an adversarial relationship with the EPA, and will be unable to adequately fund their stormwater management programs.

We thank the EPA for providing this opportunity to comment on the Draft Permit, and we look forward to working with the EPA in the future to create a more practical and cost effective stormwater permit.

Re: Comments on Draft Massachusetts MS4 Storm Water Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. I am writing on behalf of the Hoosic River Revival, an organization based in North Adams. Our mission is to bring the North Adams section of the Hoosic River back to life . The river is flowing in aging, 15 ' high and 45 ' wide concrete flood chutes; it is inaccessible, unattractive, and 'impaired' due to the flood chutes and to the excessive amount of storm water / sewer overflow leaking through the crumbling, cracked walls into the river.

This permit is an important step in promoting these urgently-needed changes, and we strongly support its promulgation.

- it incorporates **water-quality requirements** that directly address the pollutants that are causing specific Water Quality Standard violations.;
- it provides **more specific requirements and deadlines** than was required under 2003 permit.;
- Important for North Adams, the permit gives towns **adequate time and substantial flexibility** in choosing approaches to compliance that are most appropriate for local conditions;
- **Towns can work regionally** (including through storm water consortiums) to achieve economies of scale, develop and fund storm water utilities, and ensure that private entities assume their share of the responsibility for storm water management.

We appreciate the work EPA has done to improve on the 2003 permit and the 2010 proposals. However, the process has taken a very long time. We **strongly support prompt issuance of the final permit**. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date

Thank you for considering our comments on this very important permit.

Sincerely,

Judith M Grinnell

Attention: Comments on the 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

Dear Mr. Tedder:

I am writing on behalf of the Town of Hopkinton, Massachusetts to provide comment on the USEPA's 2014 Draft Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit (the proposed Permit).

The Town of Hopkinton is one of the 28 members of the Central Massachusetts Regional Stormwater Coalition (the CMRSWC), but is unique in that we are subject to a number of impaired water-driven proposed permit provisions that don't apply to other CMRSWC communities. These impairments include:

1. The Charles River Watershed phosphorus Total Maximum Daily Loading (TMDL), described in Part 2.2.1(b)(i) and Appendix F;
2. The Charles River bacteria TMDL (segment 72-01), described in Part 2.2.1(b)(iii) and Appendix F;
3. Water bodies with nitrogen impairments for which no TMDL has yet been developed, described in Part 2.2.2(a)(i) and Appendix H; and
4. Water bodies with phosphorus impairments for which no TMDL has yet been developed, described in Part 2.2.2(b)(i) and Appendix H.

The net impact of these impairment-driven provisions in the proposed Permit is that the Town would be required to develop a Phosphorus Control Plan (for discharges in the Charles River watershed), a Nitrogen Source Identification Report, and a Phosphorus Source Identification Report. We would also be required to implement additional or enhanced Best Management Practices (BMPs) including public education, illicit discharge detection and elimination (IDDE) elements, and controls to be implemented through regulatory mechanisms. Finally, we would be mandated to develop plans to utilize structural BMPs on municipal properties to reduce loadings of the phosphorus and nitrogen impairments from our Urbanized Area.

Beyond the challenge in responding to these multiple parameters and impairments, we are concerned with our ability to utilize structural BMPs in the areas appropriate to respond to those impairments. In many areas, our drainage infrastructure components and easements do not include the physical space required to

install the types of BMPs appropriate to remove nitrogen, for example, even if we were to seek an expanded easement (which has an additional administrative and legal cost beyond the cost of design and construction of the BMP). We are also concerned that many of our soils are not suitable for the use of the infiltration-based structural BMPs that would be needed to comply with these loading reductions.

For the phosphorus impairment to the Charles River, we note that only a small area in the southeast corner of our community is located within this watershed. Nearly all of the land within Hopkinton's small portion of the Charles River watershed was not considered Urbanized Area in the 2003 MS4 Permit (it was added based on 2010 Census data), and we will only be starting to evaluate this new Urbanized Area within the proposed Permit.

We are advocates for the use of green infrastructure where it can be maintained in a cost-effective way in order to provide ongoing stormwater treatment. However, this proposed mandate will exceed our internal capacity as a small community to perform such an inventory, perform a cost/benefit analysis of the BMPs appropriate for each impairment, finance the design and construction of the BMPs, and evaluate the effectiveness of each. Without an approved TMDL outlining a target load for the impairments listed in Part 2.2.2, our efforts would not substantially contribute to improvements in the respective watersheds. Costs to use a third-party to perform these assessments will siphon budget from critical infrastructure operations and maintenance activities that have a strong, direct bearing on water quality improvements.

For these reasons, we support maximizing the use of pollution prevention tools, LID, public education, and other non-structural BMPs to the maximum extent practicable before looking to structural BMPs as the solution. We request the ability to continue to evaluate potential sources of nitrogen and phosphorus discharged to Hopkinton's MS4 and report our progress on mitigating identified sources, in lieu of the proposed stringent and inflexible provisions in Section 2.2.2 (and the associated Appendix H) of the proposed Permit.

We are considering the option of hiring an Environmental Compliance Engineer in FY16 to assist with stormwater management and other regulatory programs. However, compliance with the proposed Permit would exceed that new staff member's available time. We therefore also support an extended timeline for the implementation of some proposed Permit provisions, including activities associated with discharges to water quality-limited water bodies.

The Town of Hopkinton reserves the rights: to submit additional comments to any Response to Comments prepared by the USEPA after the close of the public comment period for proposed Permit; to submit additional comments on the Final Massachusetts MS4 Permit to address any and all changes made by the USEPA based on comments it receives; and/or to appeal any provision of the Final Massachusetts MS4 Permit when it is issued, regardless of whether that provision has been specifically noted in these comments.

We look forward to the requested flexibility and modifications being integrated into the Permit in its final form.

Sincerely,

John Westerling, MPA
Director, Department of Public Works

Re: Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

On behalf of the Housatonic Valley Association (HVA), I would like to thank you for the opportunity to provide comments regarding the draft proposed Massachusetts Small MS4 Permit. HVA is a nonprofit watershed organization representing the three state Housatonic Watershed. As part of our responsibilities, we conduct water quality monitoring and river assessments, educational programs to adult and schools, and work with communities in maintaining or improving the health of the Housatonic River.

As such, we are aware of the seriousness of the impacts of stormwater runoff and applaud the efforts by EPA to address this issue. In particular, we are encouraged that the new permit requirements incorporates water-quality requirements that directly address the pollutants that are actually causing water quality standard violations in each town. The new permit also requires post-construction requirements for new development and redevelopment which should help future projects from continuing the poor stormwater management practices of the past. EPA has also addressed the problem of establishing a high standard for infiltration of stormwater which is a major cause of stormwater contamination. HVA strongly agrees with the present draft requirements for municipalities to conduct better monitoring and planning, improve implementation, raise public awareness of stormwater issues, and to design and maintain better stormwater management measures. We agree that this approach will result in major improvements in the management of stormwater in Massachusetts, and we will see a marked improvement in the Commonwealths waterways

A major improvement with this present draft provides towns with flexibility in choosing approaches to compliance that are most appropriate for local conditions. However we feel that many communities, even those who want to 'do the right thing' in developing effective storm water Best Management Practices (BMP) have a serious financial obstacle in implementing these requirements. There still needs additional discussions and assistance to provide municipal assistance for implementation these BMP requirements.

We believe that many communities in the commonwealth would implement the new requirements, but at the present time do not have the required financial resources to do so. There needs to be a form of assistance. Federal language from the 'Quick Guide to Developing Watershed Plans to Restore and Protect Our Waters', EPA 841-R-13-003, May 2013, states "Due to the complex and diffuse nature of nonpoint source pollution, the substantial costs to address it, and frequent reliance on voluntary action by individual landowners, successfully addressing nonpoint source pollution to achieve water quality standard often requires years of support from a coalition of stakeholders, programs, and funding sources." We feel this same principals need to apply to implementing these vital MS4 requirements.

Finally, while we strongly endorse the overall approach and requirements of this permit, there are some areas where improvements are still needed:

- The stormwater bylaw requirements should apply to projects as small as a quarter or half an acre. Most urbanized towns, especially in eastern Massachusetts, have very few large development and redevelopment projects, and projects under an acre would not be required to employ *any* stormwater management measures unless they are located in wetland resource areas. This will make it exceedingly difficult for many towns to comply with the proposed prohibition against new and increased stormwater discharges from MS4s.

- In addition to conducting an annual evaluation of BMP compliance and effectiveness, permittees should be required to take corrective action where the evaluation shows that goals and objectives are not being met. An effective iterative approach to improving stormwater management requires that problems be addressed, and not simply identified.

- MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements. This includes requiring new development and redevelopment projects and retrofits on town-owned property to implement BMPs that are most effective at reducing bacteria where the waters they discharge to (via an MS4) do not meet bacteria Water Quality Standards. These requirements are consistent with the proposed requirements for other stormwater pollutants.

We appreciate the effort that EPA has done in developing this critical permit process. We feel that if the requirements are implemented, it would make a substantial improvement to the waters of Massachusetts. We strongly urge its implementation. However if it is to reach the full potential, municipalities needs assistance.

Thank you for considering our comments on this very important issue.

Sincerely,

Dennis Regan

Re: Draft Regulations for MS4 Permit, public comment

Dear Mr. Tedder,

With a 20+ year career in Community Development, and someone who considers myself an active environmentalist working on sustainability and smart growth issues, I am deeply concerned about the potential unintended consequences of the newly proposed MS4 NPDES Stormwater Regulations. The regulations will seriously impact communities' ability to have multimodal *Complete Streets*, impairing green transportation goals, while also drastically reducing our maintenance capacity as costs are driven upward.

It appears from my reading of the requirements and other analysis provided by WPI that the impact of Section 2.3.6.a.ii.(a).1. will be that we can no longer build sidewalks or bikelanes and routine roadway maintenance costs will be driven up to unacceptable levels. The regulation essentially says that:

> *"new and redeveloped sites shall be designed to either: 1. Retain the first one (1) inch of runoff from all impervious surfaces on site. OR 2. Provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of biofiltration on the first one (1) inch of runoff from all impervious surfaces on the site."*

If this regulation effectively ends all future sidewalk and bike lane expansions this runs directly counter to our environmental aspirations as green transportation options will be effectively eliminated from future systems. While bike lanes and sidewalks slightly increase pavement area, they add great value to our collective infrastructure systems when people can choose to walk and bike for their health and to reduce their carbon footprint in lieu of using their automobile.

Moreover, having to infiltrate with bio-swales all runoff of rain from a 1" storm along existing roadways is near impossible when water, sewer, gas, and in some cases electricity are directly under our roadways. Where exactly will we have the room to create these earthen drainage depressions? The regulation appears to be triggered when one acre or more of impervious area is created and/or reconstructed. This means that it will prevent communities from using techniques that include reclamation of pavement – a technique

used by communities to stay on top of maintenance while also keeping costs down. Normally, I can understand how we might all be willing to accept some increases in costs from new regulations when they furthers our collective environmental goals. However, this regulation will exponentially increase municipal costs coming from already strained budgets and in many cases may make roadwork technically unfeasible due to Right-of-Way constraints. If we can't afford to maintain our roads, this seems to pose a serious conundrum.

I urge you to consider exempting existing roadways from this requirement when pavement reclamation is being used and when the expansion of impervious area is for GREEN Transportation elements like sidewalks and bike lanes.

Thank you for your consideration of my request.

Sincerely,

Michelle Ciccolo

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. The Ipswich River Watershed Association (IRWA) has been working since 1977 to protect and restore the Ipswich River. The river is the lifeblood of Massachusetts' North Shore providing daily drinking water to 350,000 people and businesses. It supports hundreds of shellfishing jobs in its estuary and is one of the most important recreational resources in the region providing extensive boating, swimming and fishing opportunities. All of these important uses are dependent on high water quality.

Unfortunately, this critical resource is currently at risk due to stormwater pollution. We have been monitoring water quality for over 20 years as part of our state and EPA-approved Riverwatch Program. When coupled with other state and local water quality monitoring programs, these data indicate that water quality remains a significant problem throughout the watershed and nearly all of it is due to contaminated municipal storm drain discharges. These problems have not improved despite implementation of the state's Stormwater Policy and EPA's 2003 MS4 permit clearly indicating that additional regulatory and enforcement measures are needed. **The proposed new permit is a critically needed step in promoting these urgently-needed changes, and we strongly support its promulgation.**

The 2014 permit represents a significant improvement over the 2003 permit, and is likely to be much more effective in reducing pollution caused by stormwater in small MS4 areas. We applaud and agree with the detailed comments provided by the Massachusetts Rivers Alliance, Mass Audubon and our watershed peer groups so will not repeat them here. We strongly urge you to finalize the permit as expeditiously as possible and hope you will strengthen it in the areas identified by our peer groups.

Additionally, I would like to emphasize a few key points that our especially important to our organization.

- We have just been notified that the multi-million dollar shellfishery in our river is at risk of closure **imminently** the Massachusetts Division of Marine Fisheries due to bacterial contamination from municipal stormwater outfalls. We urge you to maintain and strengthen the critical bacterial monitoring and illicit connection requirements in the permit.

- We urge you to reduce the development area of the stormwater bylaw requirements so that they apply to projects as small as a quarter acre. Most urbanized areas subject to the small MS4 have very few large development and redevelopment projects, and most construction today is under an acre. It is these smaller projects that are responsible for the majority stormwater pollution throughout our watershed and they should be adequately regulated.

- We have documented a dramatic increase in conductivity levels throughout our watershed and are aware that the use of highway salt has increased dramatically in our area in recent years. We strongly encourage you apply the proposed new requirements for chloride apply to **all** MS4's, not just to the relatively few water bodies that have been assessed for chloride.

Finally, we would like to address the cost issues of complying with the new proposed permit conditions. While we are certainly sensitive to the issue of increasingly stressed municipal budgets, we feel the financial concerns expressed by municipalities are significantly over estimated. There are a multitude of economically efficient models for complying with the relatively modest requirements of the proposed permit and there are many local and regional stormwater consortiums, organizations and other resources available to help municipalities meet the requirements of the new permit at a very reasonable cost. In our case for example, we helped the town of Ipswich implement a comprehensive stormwater program following the 2003 permit that *exceeded* its requirements at zero cost to the community and estimate that full compliance with the proposed permit will be less than $3,000 per year if the town would avail itself of support services currently available to it.

We appreciate the hard work that the EPA has done and again, strongly urge you to finally implement the final permit as soon as possible. Thank you for considering these comments on this extremely important issue.

Sincerely,

Wayne Castonguay
Executive Director

Subject: Comment on 2014 Draft MS4 Permit

Hello Newt –

I wanted to make a comment on the Draft MS4 permit. I have noticed that there are Cape Cod municipalities that have a Nitrogen Related Water Quality Impairment (often Estuarine Bioassessments) that have been omitted from the Table in 2.2.2.a.i.1 on page 18. Although the language at the bottom of page 17 and top of page 18 seems to suggest that receiving waters that have impairments associated with elevated Nitrogen but no TMDL would need to comply with Appendix H even if they aren't listed on the Table on page 18, it would be more clear for permittees if the Cape Cod towns with Nitrogen-related impairments and no TMDL were all listed on the table on page 18.

Newton Tedder
US EPA – Region 1
5 Post Office Square
Suite 100
Mail Code – OEP06-4
Boston, MA 02109-3912

Dear Mr. Tedder,

I appreciate the opportunity to provide the following comments and suggestions on the proposed 2014 Draft Massachusetts Small MS4 Permit MAR041000.

SPECIFIC SECTIONS:

1.4.g Discharge from Potable Water Source.
Add disclaimer in parenthesis "(excluding storage tank cleanout/cleaning residuals and washwaters)" or something to that effect.
Purpose is to clarify the intent of this exemption as much as possible and prevent the discharge of water storage tank cleanout sludges & washwaters into an MS4 system and downstream waterways. Such discharges are extremely high in solids and heavy metal content.

1.10.1 …permittee post SWMP online…
Clarify the following requirements:

a) **That any municipality with a website needs to post the SWMP.**
   This is in order to prevent an individual department of the permittee responsible for maintaining the SWMP from failing to post it online by claiming that they do not have their own departmental website or control of the IT personnel that may be needed to post it to the municipal website. Public availability of the SWMP is critical for its success and if a municipality has a website this needs to be posted and available for review.
b) **Said online posted SWMP shall also include the following key elements:**
   a. **MS4 system Map per 2.3.4.6**
   b. **Outfall Inventory per 2.3.4.5**
   c. **Catchment Areas**

   This information is critical to be easily and immediately available to facilitate full public involvement and participation. In particular this makes it feasible for the permittee to promptly respond to any potential problems or unauthorized discharges identified by all concerned parties.

2.3.1.a …continue to comply with MS42003 requirements…
Add a requirement for a 3rd Party Review/Audit of compliance with existing requirements under the MS4-2003 permit.
The purpose of the 3rd Party Review is to ensure that all previous requirements are still being met. BMPs implemented several years earlier will fail over time (such as catch

basin markings which fade or fall off). Further institutional memories fade and personnel change such that the detailed understanding of the scope of a particular BMP are lost especially among a routine annual status report. A 3rd Party review is necessary to ensure a fresh set of eyes to look at the BMP implementation without any undue influences from competing priorities of the permittee.

2.3.2.c …distribute..Public Education Materials
Require that at least one of the two educational messages to each audience over the permit term is physically & specifically (i.e. actively) delivered/distributed
The purpose is to ensure that the message is specifically received by the intended parties. The % of the target audience receiving is quite small/trivial when any message is passive (i.e. link on a website, handout in a pile at town hall, etc) as for most target audiences they would have no reason to visit the website or handout site in the first place, and thus would never even get a chance to see the message. Further the message needs to be specific or distinct to have any reasonable chance to be received and effective to the highest percentage of the target audience. A stormwater message is lost if it is muddled or simply thrown in or added at the end of an informational document provided for another purpose as the target audience for that document is not looking for information on stormwater.

2.3.3 Public Involvement & Participation
Please see comments for 1.10.1. For this to be truly effective key information needs to be easily available and accessible. Too many times interested parties are discouraged from participation if the relevant information is incomplete, or only accessible and available upon multiple visits and/or with scheduling with the right staff who know where the information might be.

2.3.4 IDDE Program
a) Add a requirement to provide a clear mechanism for public reporting of non-stormwater discharges including following with up to reporter.
b) Add a requirement for a municipal permittee to clearly specify the roles & responsibilities for IDDE of its specific Departments such as the Department of Public Works, Board of Health, and Conservation Commission.
The purpose of these requirements is to minimize illicit discharges. All too often concerned and educated members of the public are turned away or disincentived from doing anything about controlling illicit discharges as they report concerns or conditions and nothing happens (no direct followup with them and no visible improvement in conditions). Members of the public are routinely out on the rivers & streams and are familiar with the watersheds and can easily spot and identify discharges of concern. These are the eyes of the public that should be empowered and are additional no cost resources available to improve conditions.

2.3.4.10 IDDE Training
Add "and make available to members of the public residing within the MS4 service area" after employees.

This serves to help eliminate illicit discharges even more by educating concerned residents of the service area and allows further prescreening of concerns to ensure efficient use of available resources.

2.3.6 Stormwater Management in New Development and Redevelopment
a) Add a section clarifying the requirements and applicability for the permittee in regards to roadway resurfacing activities including the SWMP BMP requirements under both the existing 2003MS4 Permit and the 2014MS4 permit.
This serves to ensure that the SWMP BMP requirements are applied as part of all roadway resurfacing activities as well as the MA DEP Stormwater Management Standards as applicable to the specific type of resurfacing activity. This is important, as for example, a BMP requiring catch basins to be marked would require that all the catch basins are remarked after the roadway is resurfaced.
b) Add a section requiring the responsibilities of the permittee to be understood and implemented by all its specific departments, including Department of Public Works, Conservation Commission, Planning Board, and Zoning Board of Appeals. Further include requirement for each department to annually acknowledge its understanding of its role in implementing and the requirements of the MS4 permit and SWMP.
Most projects do not come under the jurisdiction of the permittee's MS4 implementing department and thus miss opportunities to achieve compliance. For example the DEP Stormwater Standards are only applicable to projects with Wetlands Protection Act jurisdiction. Generally speaking attempts to address MS4 stormwater compliance through permitting opportunities via other Departments are unsuccessful as it is not "their permit" or "specific responsibility or expertise" to maintain. Instead they may or may not be referred back to the implementing Department, but with no jurisdiction, they not surprisingly are never implemented.

2.3.7.a.iii.d Infrastructure Operation & Maintenance – Street Sweepings and Catch Basin Cleanings
Add sentence "These materials must be managed in compliance with current DEP policies: a) http://www.mass.gov/eea/agencies/massdep/recycle/regulations/management-of-catch-basin-cleanings.html and b) #BWP-94-092: Reuse & Disposal of Street Sweepings. Permittee shall certify compliance with these policies annually via the MS4 annual report."
It is critical that these practices are followed to ensure that stormwater & receiving waters are not negatively impacted. The MS4 permit is an opportunity to ensure compliance and raise ongoing awareness of these requirements.

2.3.7.a.iii.e Infrastructure Operation & Maintenance – Snow Disposal
a) Add "including bordering vegetated wetlands and intermittent streams" as the end of the first sentence.
This is to avoid any confusion as to what constitutes "a surface water" as deposition of sediment, trash, and oil laden snow will cause impacts to all waterbodies and will

eventually get downstream. Further this is consistent with MA DEP Policy BRPG01-01 regarding snow disposal.
b) Add additional sentence "Permittee shall certify compliance with MA DEP Snow Disposal Guideline BRPG01-01 annually via the MS4 annual report."
It is critical that these practices are followed to ensure that stormwater & receiving waters are not negatively impacted. The MS4 permit is an opportunity to ensure compliance and raise ongoing awareness of these requirements.

3.0.b Surface Drinking Water Supplies – Additional Requirements
Add additional sentence "At a minimum low cost devices such as outlet hoods should be added to all catch basins within the applicable catchment areas".
This is to minimize contamination from oil & petroleum products into these sensitive areas which can become negatively impacted from only small quantities. All too often "as feasible" becomes never as it is interpreted if it costs any money, even if minor, it is not feasible. The MS4 permit should establish some minimum standard for MEP requirements particularly in sensitive areas such as these.

4.1 Program Evaluation
Add section requiring a 3rd Party evaluation and certification of the implementation of the 2003MS4 BMPs.
Please see comments for 2.3.1.a.

4.1.a Program Evaluation
Add a sentence after the first one. "This compliance evaluation shall be performed by a 3rd Party in Year 4 & Year 8 of the permit term."
Please see comments for 2.3.1.a.

Appendix A Definitions
Add definition "Salt – For purposes of this MS4 Permit, salt shall mean any chloride containing material used to treat paved surfaces for deicing. The term includes sodium chloride, calcium chloride, magnesium chloride, and brine solutions."
This is to clarify and ensure adverse impacts from elevated chloride levels are avoided to the maximum extent practicable.

Appendix F – A.III.1.a.i.1 Bacteria/Pathogen Enhanced Public Education
Appendix H – III.3.a.i.1 Bacteria/Pathogen Enhanced Public Education
Add statement requiring posting of pet waste requirements and provision for pet waste bags, removal, & disposal at any dog parks operated by and/or physically located on land owned by the permittee within impacted catchment areas.
This is to ensure proper management of pet wastes within locations with the highest densities of such waste.

GENERAL:

a) **Enforcement of Permit.**

To truly be effective this MS4 permit must be enforced where conditions warrant particularly where egregious violations are known to have occurred. The permitee will not take the conditions seriously nor appropriate the necessary resources if it knows there is no risk of negative actions. Further the public will not take heed or interest or waste its time trying to improve & address conditions if it knows via lack of action that the MS4 permittee will not be held accountable and thus improvements will not be made.

b) Need for Specific EPA Outreach to Conservation Commissions & Planning Boards on MS4 Requirements.

To truly be effective the Conservation Commissions and Planning Boards of the Permittee's need to be aware of requirements of the MS4 permit and TMDLs. The majority of permittable actions occur under their jurisdictions and as such they have the greatest opportunity to have them properly addressed. The greatest chance to improve conditions during redevelopment & ensure compliance during new development is when an applicant is required to obtain a permit for the project to proceed and obviously have some funding mechanism available to undertake the proposed project.

Thank you again for your consideration and the opportunity to provide comments & suggestions.

Submitted @ hearing 11/19/2014

Lawn Horticultural

November 19, 2014

Good Afternoon:

My name is Jim Skillen. I am a consultant for the Lawn and Horticultural Products Work Group (LHWPG). The LHPWG, operating under the auspices of the Consumer Specialty Products Association, Inc., provides a unified voice for companies engaged in the unique market of lawn and horticultural products. Established in 2013, the LHPWG serves as a resource to all government entities engaged in regulating the specialty fertilizer marketplace. LHPWG member companies manufacture more than 75 percent of domestically produced conventional specialty fertilizers utilized in the United States; including consumer household, lawn and garden, golf courses and other professional turf and lawn care. These specialty fertilizer products are licensed; registered and sold to consumers in all 50 states. They also rely on scientific research to guide their product formulations and product decisions. Our members have a vested interest in any regulation of specialty fertilizer, in any jurisdiction.

The brief comments I am making today are based on an analysis of this proposal that is being done by our consultant, Environmental & Turf Services, Inc. (ETS), based in Maryland. ETS is an independent environmental consulting firm that specializes in environmental risk assessment and water quality monitoring of pesticides and fertilizers. Its founder and head, Dr. Stuart Cohen, worked as a scientist for 11 years in the U.S. EPA's Office of Pesticides & Toxic Substances in Washington DC. ETS presents its work at professional scientific society meetings and publishes its work in the peer-reviewed literature.

Our principal concern is with the EPA's proposed reduction factor of 0.50 (i.e., 50% load reduction) ". . . to be applied to the average annual phosphorus load export rate from pervious lawn areas that "previously" received phosphorus-containing fertilizers but will no longer receive unnecessary applications of phosphorus-containing fertilizers" (pp. 32-34 of Attachment 1 – Fact Sheet Massachusetts Small MS4 (US EPA, 2014)).

We are very familiar with the literature on this subject, and we conclude that the true load reduction factor should be much less than 0.5, and in reality it should be closer to zero. Brief highlights of the ETS analysis follow. But first it is important that we acknowledge the overall helpful attitude that Newton Tedder and Mark Voorhees of EPA Region 1 have demonstrated. They have been cordial and very responsive to ETS' request for the supporting information on this topic. We appreciate it.

The Published Literature Supports a Lower Reduction Factor

The main point we'd like to make is that the consensus of published literature does not support the reduction factor that the EPA has proposed. Without scientific support from peer-reviewed studies, the EPA's proposed reduction factor for phosphate loading needs revision.

- The EPA's Key Reference does not support the 50% Reduction Factor. Table 21 of Attachment 1 to the Fact Sheet follows. It was obtained from Schueler (2011), and it is the ultimate basis for the 50% number ([0.2 mg/L]/[0.4 mg/L] x 100 = 50%).

Nutrient	TP (mg/L)	TN (mg/L)
Phosphorus Fertilized	0.4	2.5
Phosphorus-free or Non Fertilized	0.2	1.5

Table 21. Suggested EMCs to Characterize Runoff from Lawns (Schueler, 2011)

The EPA states that this table represents estimates from the Chesapeake Bay watershed model. We could find no information to support this statement. Instead, Schueler (2011) states that the basis for the numbers in his table is explained in Appendix A.2 (p. 79) of his document. But Appendix A.2 is only five sentences long and it focuses more on very limited surveys of fertilizer use (citing Swann [1999] and Law et al. [2004] and a distributional analysis of national TP water quality monitoring results (Pitt et al., 2004). Finally, Schueler (2011) is neither an EPA-produced document, nor was it published in the peer-reviewed literature, counter to the guidance from the President on scientific integrity (http://www.whitehouse.gov/the-press-office/memorandum-heads-executive-departments-and-agencies-3-9-09).

- Studies Published in the Scientific Literature do not Support a 50% Reduction Credit. Three of the studies actually demonstrate no significant differences or an ***increase*** in total phosphorus (TP) in runoff from unfertilized plots in relation to fertilized plots. This phenomenon was observed by Bierman et al. (2010) in year 2 of their study in Minnesota (control plots greater); year 3 of Bierman et al. (2010, no difference), in a 2-year New York study by Soldat et al. (2008; no difference); and greater P in runoff from control plots vs. treated plots in Wisconsin (Kussow 2008 and 1996).

Based on our reviews, there is no scientific basis for a reduction as high as 50%. The data suggest that a 0% reduction would be equally justified.

Minnesota Watershed Analysis

Minnesota was the first state to implement lawn fertilizer phosphorus restrictions (2004-2005). Therefore it is appropriate and informative to evaluate the water quality monitoring data from the state to assess impacts of the restrictions.

Water quality monitoring data collected prior to the statewide restriction (i.e. prior to 2005) were compared with data collected after the statewide restriction (i.e. 2005 and later) at eight watersheds throughout Minnesota to determine if there is a statistically significant difference in

the P concentrations at these stations pre- vs. post-regulatory restriction. The eight monitoring stations were chosen based on a representative range of TP concentrations (i.e., low, medium, and high concentrations).Three of the eight stations showed a statistically significant difference between the pre and post statewide zero phosphorus restriction. Two of these stations are located in the southwest portion of the state in the Redwood River and Chippewa River watersheds and the other is located in the northwest portion of the state in the Clearwater River watershed. The Student's t-test results indicate the phosphorus concentrations before and after the statewide restriction were not statistically significant at the remaining five stations. Residential and mixed residential areas were dominant in four of the eight watersheds analyzed and only one of these four watersheds exhibited a significant decline in total phosphorus. It is possible that a more intensive and extensive analysis might yield a different conclusion, but our analysis of these eight subwatersheds does not indicate that the restriction of P on residential lawns has shown a significant decline in P in surface water.

Hydrologic Modeling

On October 9, 2014, Mark Voorhees sent ETS several documents including modeling output related to the phosphorus reduction credit described in the MA NPDES MS4 permit. The EPA Stormwater Management Model (SWMM) and the P8 Urban Catchment Model were used to estimate runoff yields from various hydrologic soil groups and conditions. However, upon review of the modeling output sent to us by Mr. Voorhees, we noticed a discrepancy between Table 22 of the permit's fact sheet's attachment and the modeling output. Table 22 lists P8 fair condition runoff yields of 0.378 MG/ha/yr and 0.467 MG/ha/yr for hydrologic soil groups (HSG) C and C/D, respectively. The output, however, indicates these runoff yields should be 0.267 MG/ha/yr and 0.407 MG/ha/yr for HSG C and C/D, respectively. This will change the overall average runoff yield and phosphorus load export rate (??) (PLER) for these hydrologic soil conditions. We look forward to the opportunity to work with Mr. Voorhees to determine the reason for the discrepancy and the potential impact on the results.

We plan to use the ETS Report currently in development to explain these conclusions in greater detail. In the meantime, I would be happy to try to answer any questions you have.

Thank you for the opportunity to submit these brief comments.

Reference: Draft MS-4 Permits-Small Municipal
Separate storm sewer systems

January 2, 2015

Dear Mr. Tedder,

This letter is to offer comments on the above NPDES Draft General Permits pertaining to the Upper Blackstone Basin. Being neither a lawyer nor a scientist, my thoughts are based on my 40-plus years of real-life experience with water quality and wetlands issues, including serving on the Worcester Conservation Commission (9 years), the Lake Quinsigamond Commission (8 years) and membership in many environmental organizations, including the Blackstone Headquarters Coalition, Mass COLAP, and Mass Audubon.

Although Worcester will be regulated separately by an MS-4 permit (we are waiting), our local waterways are greatly affected by waters flowing into the city from several adjacent towns, especially Holden and Shrewsbury. For example, Tatnuck Brook, a very clean brook upstream, flows southerly from Holden through wetlands and several Worcester ponds with water quality issues (sedimentation, weeds, urban runoff, hazardous waste, and at last one obsolete dam).

Another example is Lake Quinsigamond, a 1000-plus acre great pond, whose waters abut Shrewsbury, Worcester and Grafton. Millions of public and private dollars have been invested in the restoration and the protection of this extraordinary multi-use resource and its tributaries, at least two of which are designated cold water fisheries. The lake and its aquifer are fed by ponds and wetlands in Boylston north of the lake proper. The southerly portion of the lake in Shrewsbury is heavily infested with weeds and sediment where it flows into the Quinsigamond River in Grafton. The aquifer in the north end of the lake is the public drinking water supply for Shrewsbury (subsurface wells).

Obviously, this interconnection imposes a serious challenge to the regulators and to the local communities to devise and implement plans to protect and preserve these invaluable water resources at reasonable cost. I believe this draft permit accomplishes that objective. It certainly is a significant improvement over the previous permit. Other communities downstream will indirectly benefit from upstream waterway improvements.

In addition to EPA's suggestions for compliance, I would offer other ideas. One: each community should retain a conservation agent, even part-time, or shared, to assist the Conservation Commission in enforcement of its orders and the MS-4 permit. Second: the larger communities should enact a local wetlands protection bylaw, piggy-backing on the state law. Such a bylaw can be more stringent than the state law; it could , for example, specify setbacks, stormwater protection zones, and proscribe a tighter definition of a jurisdictional wetland. Towns could enact earth removal bylaws or zoning regulations, separately, or in combination with the above. In my experience, local bylaws work well when enforced.

Thank you for the opportunity to comment on this most important issue.

Hopefully, the final version will be issued in timely fashion. The sooner the better.

Sincerely,

Lawrence Freed

Subject: Comments on the 2014 Draft Massachusetts MS4 Permit – Leicester, Massachusetts

Dear Mr. Tedder:

The Town of Leicester appreciates the opportunity to make comments on the 2014 Draft Massachusetts Municipal Separate Storm Sewer System (MS4) Permit. As with many communities in Massachusetts, the Town of Leicester continues to be concerned with the amount of money, manpower, and time that will be required to comply with this draft permit. Over the past several years the Town has taken significant steps towards directing its stormwater program to comply with predicted permit mandates. Some of these steps include upgraded stormwater mapping, a SWPPP for the DPW garage, a fertilizer inventory for Municipal operations, communications meetings with Town Departments, increased street sweeping and catch basin cleaning, and being a standing member of the Central Massachusetts Regional Stormwater Coalition. The Town is currently planning a schedule of activities to continue improving its stormwater management practices.

The Town applauds the notion of there being buffer time between the finalization of the permit and the permit effective date. The Town would like the EPA to consider extending that buffer time to one year from the final permit date to the effective permit date. This will give the Town time to get budgets in line with the requirements of the new permit. This will also give additional time for the Highway Department to educate the Board of Selectman on the importance of the permit and the need to allocate appropriate resources for permit compliance. Finally, the extra time will give groups like the Central Massachusetts Stormwater Coalition the opportunity to strategize the best ways to use its pooled resources to help member Communities comply with the permit.

The EPA has estimated between $78,000 and $829,000 per year increase in municipal budgets just to implement the six minimum control measures. These additional costs alone have the

Town's Highway Department trying to stay ahead of future requirements to lessen future cost burdens. The costs that have the Town most concerned are for compliance with the TMDL and water quality limited waters. No estimates have been provided from EPA for the costs of this compliance.

The Town of Leicester has the following comments regarding the 2014 Draft Massachusetts MS4 Permit. The comments address Permit sections in order as they appear in the Permit.

2.0 Non Numeric Effluent Limitations

Comments in this section cover 2.2.1 Discharges Subject to Requirements Related to an Approved TMDL and 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements. Concerns over cost for compliance with these sections have been mentioned earlier in these comments and will not be discussed further in this section. The Town of Leicester appears on the following lists in these sections.

- Lake or Pond Phosphorus TMDL
- Long Island Sound Nitrogen TMDL
- Water Quality Limited for Nitrogen
- Water Quality Limited for Phosphorus

The first question the Town has is will the requirements for the phosphorus and nitrogen TMDLs overrule the water quality limited water requirements, and should the Town only be concentrating efforts on the TMDL requirements?

The three phase lake and pond phosphorus control plan extends past the 5 year permit expiration date. Explanation will need to be provided as to how this control plan will be administered following the termination of this proposed permit.

The viability of some of the credits for nutrient removal are questionable. The part that is questionable is the fact that some of these factors including leaf litter collection will be difficult to track and nearly impossible to keep leaves out of shorelines and the waterbodies themselves. The question of waste generated by geese, especially in the vicinity of Rochdale Pond is a concern of the Town and this can most likely be contributed to nutrient impairment. This contributor should not be the responsibility of the Town to regulate.

The equations presented in calculating reductions of nutrient removal are difficult to follow and will most likely involve the need for specialized consultants to perform this work.

Ultimately, these sections in the draft permit need to be reworked so not only the Town of Leicester, but all other MS4 in the Commonwealth of Massachusetts can productively reduce pollutant loads to local waterbodies in a financially sustainable manner.

Control Measures

2.3.2 Public Education and Outreach – The Town has no comment on this control measure.

2.3.3 Public Involvement and Participation – The Town has no comment on this control measure.

2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program – In general, the Town believes this control measure is cumbersome and will require far more resources than the Town can currently provide. The Town currently is taking proactive steps in anticipation of this control measure including upgrading mapping, statement of IDDE responsibilities and the IDDE control plan. The establishment of the initial illicit discharge potential assessment and priority ranking system within one (1) year from the effective date of the permit is an aggressive timeframe and the Town would ask for consideration of extending that timeframe. The Town would ask that any data collected from outfall screening prior to the permit effective date be used in analysis for the IDDE program.

The limitation of wet weather sampling from March through June increases the already difficult task of collecting wet weather samples. The Town asks that wet weather sampling be completed at any time of the year at the discretion of the Town that the storm is of appropriate intensity.

The Town requests that confirmation of removal of illicit discharges require follow up dry weather sampling only and not dry and wet weather follow up sampling.

2.3.5 Construction Site Stormwater Runoff Control – The requirements in this section should correlate with the Massachusetts Stormwater Handbook Standards.

2.3.6 Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management) – The requirements in this section should correlate with the Massachusetts Stormwater Handbook Standards. The requirement to retain the first one (1) inch of runoff from all impervious surfaces from new development and redevelopment will be difficult for developers to attain and may decrease future development in the Town of Leicester.

With all the additional requirements in the previous sections, focusing on reports for street design, parking guidelines, retrofit opportunities, estimates and reductions of directly connected impervious area will be quite cumbersome financially and on manpower within the Town. The

Town requests that these issues are documented as appropriate and as opportunities arrive during construction projects and redevelopment and should be documented as such in Annual Reports. Mandatory yearly reports should not be required under this permit.

2.3.7 Good House Keeping and Pollution Prevention for Permittee Owned Operations – Volume or mass of material removed from catch basins on a yearly basis should not have to be reported.

Finally, the Town of Leicester supports the idea of the EPA providing education opportunities for Administrators, Managers, Selectman, etc. on the importance of the stormwater management and awareness of the MS4 Permit. An important step in the right direction was made at the Massachusetts Municipal Association's Annual Conference in which EPA presented on stormwater catering to the audience mentioned above. The Town of Leicester supports the idea of improved stormwater quality, but also believes that EPA should share in the burden of Municipal and public education.

Sincerely,

Town of Leicester

Re: Comments on the draft NPDES General Permit for Stormwater Discharges from Small MS4s in Massachusetts

Dear Mr. Tedder,

Section 2.3.2.e. states that 'the program shall show evidence of focused messages as well as evidence that progress toward the defined educational goals of the program has been achieved'. Additionally there is guidance on the messages that are suggested to be delivered as well as the four audiences to deliver the messages to.
We believe this section falls short in guidance for measuring of these messages and urge EPA to either provide suggested measurement tools for each of the listed messages or to remove this from the permit. We have thought long and hard about many of these messages and cannot come up with reasonable and practical methods for measuring many of these messages. These measurements could also prove to be very time-consuming with limited benefit. Alternatively and preferably we would suggest that the EPA work with watershed groups and state agencies to evaluate the effectiveness of messages.

Section 2.3.4.5.b. states that 'The permitee shall physically label all MS4 outfall pipes (excluding interconnections) with their unique identifier by the end of the permit term'.
We recommend that this be removed from the permit. There is a reasonably high cost to placing these identifiers at all the outfalls which includes varying types depending on the outfall and what it can be placed on. The labor costs for installing these signs in these areas will be particularly costly. For example a submerged outfall without a headwall will require a sign with sign post to identify its location whereas an outfall with a headwall may allow for a less obtrusive marker such as a stick on label of some sort. Over time these will need to be replaced as they become worn or damaged adding to the burden. In addition they can lead to 'sign pollution' as many of these exist along or near nature trails where installation of a sign may not be appropriate. Finally, there does not appear to be a significant added benefit toward the labeling. With proper mapping of the Stormwater system it is usually a simple process to identify a specific outfall if a report comes in. In addition with the majority of people carrying smartphones with GPS capabilities and technology ever improving the ability to tie a field location to an outfall is readily available without the expense and maintenance burden of signage and labels. We recommend that the reliance on proper mapping and photographic ID records be used in lieu of the signing at each outfall.

Section 2.3.4.7.e. identifies a number of system vulnerability factors.
We agree with the vulnerability factors with the exception of a few. The crossing of storm and sanitary sewer alignments is the first that we are in disagreement with. The reason we do not feel that this factor is valuable is that would essentially identify the entire town for municipalities that have sanitary sewer systems. This adds an extreme burden to the wet-weather sampling program which is very limited in the time of year that these can be performed in. This will likely force towns to go externally for compliance for this sampling which adds an extreme financial burden. We would suggest this system vulnerability factor be adjusted to state 'The crossing of storm and sanitary sewer alignments where the sanitary system is shallower that the storm drain system.' We believe this will capture the problems that the wet-weather sampling is looking to identify.
The second factor that we feel is overly burdensome is where sanitary and storm drain infrastructure is greater than 40 years old. This gain will identify almost the entire system for municipalities creating an overly burdensome wet-weather program. This could be coupled with the above vulnerability factor to read as follows 'The crossing of storm and sanitary sewer alignments where the sanitary system is shallower that the storm drain system and either of the systems is known to be greater than 40 years old.'
On a side note, due to the methods of record-keeping of Municipalities in Massachusetts it is common for municipalities to know the age of their sanitary sewer system but the drainage system records tend to be sparse and the age unknown.

Section 2.3.4.7.e.ii. states that 'Either method must, at a minimum, include an investigation of each key junction manhole even where no evidence of an illicit discharge is observed at the outfall.'
Key junction manhole testing can be erroneous and due to safety issues we currently do not allow our volunteers to sample in manholes. We would recommend that the language be adjusted to read as follows 'Either method must, at a minimum, include an investigation of each key junction manhole ~~even~~ where ~~no~~ evidence of an illicit discharge is observed at the outfall.'

Section 2.3.4.7.e.ii.b. states that wet-weather sampling will be required in areas that meet one or more vulnerability factors.
Based on these factors this will result in at least most of the outfalls being in this category. The limited time-frame that these samples are allowed to be taken (March to June) will essentially put the town in the position of monitoring every storm that occurs and visiting the outfalls during these storms to obtain samples. Even with this it may not be possible to complete all that are required within the time-frame given. We recommend the time period be extended so that wet-weather event sampling can be performed between March and November.

Section 2.3.6.a.ii.(a).1. States that 'new and redeveloped sites shall be designed to either: 1. Retain the first one (1) inch of runoff from all impervious surfaces on site. OR 2. Provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of biofiltration on the first one (1) inch of runoff from all impervious surfaces on the site.'
We have significant concerns with this requirement as written, which are described below;

1. *There is discrepancy with the Mass DEP Stormwater handbook which is directly referenced in numerous permitee documents as the standard to follow.*
2. *This significantly impacts the town's ability to reclaim, rebuild, or reconstruct a roadway. If we are to reclaim an acre of roadway which is a very common practice it appears that this regulation would be triggered. The ability to conform with this regulation within the confines of the town owned right of way which is already fully-loaded with underground utilities would essentially preclude the town from being able to perform the appropriate maintenance for roadways in the condition that requires reclaim, rebuilding, or reconstructing. It would be precluded based on both the exponential increase in cost as well as the infeasibility of being able to install such a structure that would perform to this standard with the confines of the right-of-*

way. We recommend that the language changed to include on rebuilding of roadways where a significant amount of the roadway subbase is being removed and replaced. This will allow towns to continue the common practice of reclamation which recycles the existing asphalt into the gravel base, and is then regraded and paved.

3. *MassDOT has recently put out a complete streets initiative that promotes the increase in pedestrian and bicycle accommodations. The nature of this initiative will result in widened roadways and the installation of sidewalks to accommodate the mode shift. This mode shift is in an attempt to promote public health and greener forms of transportation. The proposed EPA regulation again would result in an exponential increase in cost and in most cases present an infeasible scenario to municipalities. The ending result would be the inability for the town to promote this initiative which we believe is for the better good. Again, we urge the EPA to exempt municipal linear projects from this requirement.*

Section 2.3.7.a.iii.(a & b) provides detail on the requirements of a municipality to develop a detailed plan of their catch basin cleaning program to ensure that they are never greater than 50% full.
We recommend that an option be given to the municipalities to either comply with the provided detail that could result in more strategic planning at a lesser cleaning rate, or to clean all catch basins under the control of the municipality a minimum of once per year.

***Section 4.0** We recommend that the EPA prepare a table of all reporting requirements and deadlines to assist municipalities in organizing and performing the work within the permit.*

Appendix F (3) states that in order to receive the phosphorus credit for no fertilizers containing phosphorus the permitee must provide written certification to EPA annually that no fertilizers containing phosphorus have been applied to any area in the watershed to earn the credit.
Our concern is that any application at all eliminates the opportunity for a phosphorus credit. We recommend that partial credit be allowable for no phosphorus use. For example a town may build a new field that needs to have phosphorus applied as part of the starter fertilizer until it is established and applies that fertilizer with trained and licensed applicators. A credit will allow the permitee to get credit for the remaining areas that are no phosphorus zones while allowing flexibility in initial establishment of turf.

Appendix F (4) states that a leaf litter credit can be obtained if the town remove all landscaping wastes and organic debris weekly from roadways and parking lots. *This should be clarified to state that all permitee controlled roadways and parking lots as there are many private roads and parking lots that are not within the permitees control.*

Thank you for the opportunity to comment on this draft. Please contact us with any questions or clarifications at 781-274-8305 or via email at jlivsey@lexingtonma.gov or dpavlik@lexingtonma.gov.

Respectfully,

John R. Livsey, P.E.

EXECUTIVE SUMMARY

FOCUS

Our principal concern is with the EPA's proposed reduction factor of 0.50 (i.e., 50% load reduction) ". . . to be applied to the average annual phosphorus load export rate from pervious lawn areas that "previously" received phosphorus-containing fertilizers but will no longer receive unnecessary applications of phosphorus-containing fertilizers" (pp. 32-34 of Attachment 1 – Fact Sheet Massachusetts Small MS4 (US EPA, 2014a)). [We also provide some comments on stormwater runoff modeling.]

We are very familiar with the literature on this subject, and we conclude that the true load reduction factor should be much less than 0.5, and it should probably be very close to zero. Brief highlights of our analysis follow. But first it is important that we acknowledge the overall helpful attitude that Newton Tedder and Mark Voorhees (US EPA, Region 1) have demonstrated. They have been cordial and very responsive to ETS' request for the supporting information on this topic. We appreciate it.

THE PUBLISHED LITERATURE SUPPORTS A LOWER REDUCTION FACTOR

- The EPA's Key Reference does not support the 50% Load Reduction Factor. Table 21 of Attachment 1 to the EPA Fact Sheet follows. It was obtained from Schueler (2011), and it is the ultimate basis for the 50% number ([0.2 mg/L]/[0.4 mg/L] x 100 = 50%).

Table 21 from the US EPA Fact Sheet Attachment. Suggested EMCs to Characterize Runoff from Lawns (Schueler, 2011)

Nutrient	TP (mg/L)	TN (mg/L)
Phosphorus Fertilized	0.4	2.5
Phosphorus-free or Non Fertilized	0.2	1.5

The EPA states that this table represents estimates from the Chesapeake Bay watershed model. We could find no information to support this statement. Instead, Schueler (2011) states that the basis for the numbers in his table is explained in Appendix A.2 of his document. But Appendix A.2 is only five sentences long and it focuses more on very limited surveys of fertilizer use and a distributional analysis of national TP water quality monitoring results; i.e., it offers no evidence

that total phosphorus (TP) in runoff is reduced 50% when no P is applied compared with typical applications. Finally, Schueler (2011) is not from the Chesapeake Bay watershed model, and it is neither an EPA-produced document, nor was it published in the peer-reviewed literature, counter to the guidance from the President on scientific integrity (http://www.whitehouse.gov/the-press-office/memorandum-heads-executive-departments-and-agencies-3-9-09).

- Studies Published in the Scientific Literature do not Support a 50% Reduction Credit. Phosphorus runoff studies have been done on cool-season turfgrasses in New York, Wisconsin, and Minnesota, at the same or similar latitudes as Massachusetts. Results contained in six of the studies actually demonstrate no significant differences or an ***increase*** in total phosphorus (TP) in runoff from unfertilized plots in relation to fertilized plots.

Based on these results, combined with the issues raised with the Schueler (2011) draft, a reduction credit closer to 0% seems to be more appropriate than 50%.

A MINNESOTA WATERSHED ANALYSIS DOES NOT DEMONSTRATE A REGULATORY BENEFIT

Minnesota was the first state to implement lawn fertilizer phosphorus restrictions (2004-2005). Therefore it is appropriate and informative to evaluate the water quality monitoring data from the state to assess impacts of the restrictions.

Water quality monitoring data collected prior to the statewide restriction (i.e., prior to 2005) were compared with data collected after the statewide restriction (i.e., 2005 and later) at eight watersheds throughout Minnesota to determine if there is a statistically significant difference in the P concentrations at these stations pre- vs. post-regulatory restriction. The eight monitoring stations were chosen based on a representative range of TP concentrations (i.e., low, medium, and high concentrations) and three other criteria. Three of the eight stations showed a statistically significant difference between the pre and post statewide zero phosphorus restriction, i.e., concentrations declined. The Student's t-test results indicate the phosphorus concentrations before and after the statewide restriction were not statistically significant at the remaining five stations. Residential and mixed residential areas were dominant in four of the eight watersheds analyzed. *However, only one of*

these four residential watersheds exhibited a significant decline in total phosphorus. It is possible that a more intensive and extensive analysis might yield a different conclusion, but ***our analysis of these eight subwatersheds does not indicate that the restriction of P on residential lawns has shown a significant decline in P in surface water.***

HYDROLOGIC MODELING INCONSISTENCY

The EPA used its Stormwater Management Model (SWMM) and the P8 Urban Catchment Model to estimate runoff yields from various hydrologic soil groups and conditions. However, upon review of the modeling output sent to us by Mr. Voorhees (US EPA, Region 1), we noticed a discrepancy between Table 22 of the permit's fact sheet's attachment and the modeling output. Table 22 lists P8 fair condition runoff yields of 0.378 MG/ha/yr and 0.467 MG/ha/yr for hydrologic soil groups (HSG) C and C/D, respectively. The output, however, indicates these runoff yields should be 0.267 MG/ha/yr and 0.407 MG/ha/yr for HSG C and C/D, respectively. This will change the overall average runoff yield and phosphorus load export rate (PLER) for these hydrologic soil conditions.

TABLE OF CONTENTS

LIST OF TABLES

I. INTRODUCTION AND PURPOSE

On September 30, 2014, the Region 1 office of the US EPA proposed a new regulation relevant to the protection of water resources from excess phosphorus. Specifically, the EPA proposed a draft NPDES general permit for stormwater discharges from small Municipal Separate Storm Sewer Systems (MS4s) to regulated waters in Massachusetts.

This document mostly provides critical comments on one component of the proposal, the 50% phosphorus (P) reduction credit when transitioning from use of lawn fertilizers with P to lawn fertilizers without P. More specifically, "The reduction factor of 0.5 (i.e., 50%) is equal to the anticipated reduction in the annual mean TP concentration in runoff from lawn areas as a result of applying phosphorus-free fertilizer or not applying fertilizer at all to previously fertilized lawn areas." (pp. 33-34 of Attachment 1 – Fact Sheet Massachusetts Small MS4 (US EPA, 2014a)). The main purpose of these comments is to demonstrate that this 50% credit is too high. We also provide comments on the stormwater runoff modeling.

II. THE KEY REFERENCE CITED TO SUPPORT THE 50% CREDIT IS SERIOUSLY FLAWED

The US EPA's P reduction proposal for lawn care relies heavily on a table in a draft report by Schueler (2011) of the Chesapeake Stormwater Network.[*†] This is Table 21 of Attachment 1 of the proposed EPA Fact Sheet (p. 3; US EPA, 2014a), and it follows.

Table 1. Table 21 from the Attachment to the EPA Fact Sheet: Suggested EMCs to Characterize Runoff from Lawns (Schueler, 2011)[**]

Nutrient	TP (mg/L)	TN (mg/L)
Phosphorus Fertilized	0.4	2.5
Phosphorus-free or Non Fertilized	0.2	1.5

The numbers in the table are purported to be event mean concentrations of phosphorus and nitrogen in runoff from lawn turf. Thus the basis for the EPA's 50% P reduction factor is this equation based on the table:

$$[0.4 \text{ mg/L} - 0.2 \text{ mg/L}]/[0.4 \text{ mg}/4] \times 100 = 50\%$$

Although Schueler (2011) claimed the basis for his table was provided in Appendix A.2 of his document, that is not correct. If it were the basis for the table, one would have expected Appendix A.2 to present the results of runoff studies that compared test plots treated with P compared with zero-P treatments. Appendix A.2 did not do that. Instead, information was presented that is only indirectly relevant, as follows.

Schueler's justification for the numbers in Table 2 (above) begins with the following statements.

> "The EMC for residential land uses was split into two categories based on lawn care: high input and low input turf (HI and LO). The EMCs represent the 25th and 75th percentile values in the National Stormwater Quality Database (Pitt et al, 2004), because the distribution of data from residential runoff is approximately a normal distribution."

[*] The EPA states that this table represents estimates from the Chesapeake Bay watershed model. We could find no information to support this statement.
[†] Apparently, this report was only published as a review draft, and a final version was never published.
[**] Table 1 above is identical to Table 21 in the US EPA (2014) attachment, and it is identical to Table 8 in the original source, Schueler (2014).

The purpose stated in the first sentence - - which is appropriate - - is not supported by the second sentence. Thus the attempt to split event mean concentrations (EMCs) into high input and low input should have been supported by concentrations measured in runoff from high input and low input turf plots or lawns. But this was not done. Instead, the author assumed that the distribution of the 25th and 75th percentile concentrations was due to high fertilizer input when, in fact, it was due to an uncharacterized combination of the following runoff-generating factors: the soil type, the vegetation cover, rainfall duration and intensity, temperature, slope, fallen leaves, evapotranspiration, and fertilizer input. Consequently, no linkages were established between the 75th percentile and use of P on lawns nor the 25th percentile and low or zero P.

Schueler (2011) then made the following references to frequency/incidence of fertilizer use.

> "Two estimates of fertilization are available for the area that range between 50% and 65% (Swann, 1999, Law et al, 2004). Making assumptions about past lawn care education and stewardship efforts, it is recommended that the lower 50% rate be used (half of all residential turf cover is high input and the other half is low input)."

This analysis is irrelevant for two reasons. (1) Again, the extent of fertilizer use in a watershed is only one of many factors that determine the amount of P in runoff (see the immediately preceding paragraph above). Therefore this information has little or no relevance to the determination that TP in runoff is reduced by 50% when comparing normal fertilizer application with zero-P fertilizer application. (2) Even if consumer use patterns were relevant to the numbers in Table 1 above, it should be noted that Law et al. (2004) applies to two small subwatersheds within one Maryland County, and Swann (1999) applies to part of the Chesapeake Bay watershed. It is likely that less turf fertilizer is applied annually in Massachusetts due to the shorter growing season.

III. EMPIRICAL RESULTS FROM THE SCIENTIFIC LITERATURE

We reviewed papers based on research at Cornell, the University of Minnesota, and the University of Wisconsin, institutions that have been very active in the investigation of phosphorus fate in turfgrass (section II of the Appendix). All of the studies we reviewed were conducted on cool season turfgrasses in northern climates; i.e., they are relevant to Massachusetts. Our focus was runoff concentrations from P applied at typical rates compared with zero P applications.

It has been demonstrated, in cool season grasses, that significantly more phosphorus runs off from treated fertilized plots than zero-P plots when ***excess*** P is applied, e.g., at 3X normal rates. It has also been demonstrated, in cool season grasses, that, in general, there is no more P runoff from test plots treated at 1X normal rates relative to text plots with zero-applied P. At least six of the studies present results where more P ran off the zero-P plots relative to the 1X plots.

Thus the literature we reviewed does not support the application of a 50% P reduction credit for lawns/turf. Rather, a number closer to 0% would be more appropriate. Key aspects of the studies reviewed in section II of the Appendix are summarized in Table 2 below. See also our comments in section II above on a key reference cited by the EPA (Schueler, 2011).

Table 2. Summary of Literature Review from Section II of the Appendix: Phosphorus in Runoff from Cool Season Turfgrass

Document Title	Author(s), Year	Study Design	Key Conclusions
Fertilizer Source Effect on Ground and Surface Water Quality in Drainage from Turfgrass	Easton and Petrovic, 2004	The authors conducted a two year mass-balance field study to determine the effect of the nutrient source on turfgrass runoff and leachate. The test plots were in central New York on soils ranging from sandy loam to silt loam texture.	They observed that rapid establishment and shoot density from fertilizer applications tended to reduce overall losses of nutrient runoff and leaching. They found that typical P application sources for homeowners applied at typical rates produced an average P runoff concentration during the first year (0.5 mg/L; immediately after establishment) that was slightly higher than the 0.3 mg/L for the control plot using normal P applications (i.e., 0.5 lb P/1000 sq ft). However, the second year average P runoff concentration (0.43 mg/L) was lower than the control plot concentration (0.5 mg/L). They concluded, "in many cases we observed equal or higher overall losses of N and P in runoff and leachate from the unfertilized control, supporting the argument that following the establishment period fertilization can reduce water contamination from N and P."
The Fate and Transport of Phosphorus in Turfgrass Ecosystems	Soldat and Petrovic, 2008	The authors reviewed the literature on the fate and transport of P in turfgrass ecosystems from several sources.	Kelling and Peterson (1975) found that unfertilized lawns in Wisconsin produced P concentrations in runoff of 0.4 mg/L (no P applied), whereas the P concentration on fertilized lawns was only 0.5 mg/L (7.2% loss of applied P). Gaudreau et al. (2002) compared fertilized and unfertilized plots in Texas. They reported P runoff concentrations using inorganic P at normal P applications (i.e., 25 kg/ha or 0.5 lb P/1000 sq ft) in some control plots (2.6 mg/L) were higher than P concentrations in the fertilized plots (1.1 mg/L). Similarly, using two times the normal rate (i.e., 1 lb P/1000 sq ft) the runoff P concentration in some control plots were higher (2.6 mg/L) compared with 1.1 mg/L from some of the fertilized plots using inorganic P.
The Effects of Soil Phosphorus and Nitrogen and Phosphorus Fertilization on Phosphorus Runoff Losses from Turfgrass	Soldat et al., 2008	A two year study was conducted to better understand nutrient runoff losses from turfgrass in order to improve fertilizer recommendations for turfgrass on New York-located experimental test plots. The two objectives were: 1) examine the effects of N and P fertilization of established turfgrass on P runoff losses; and 2) examine the effect of soil P level on P runoff losses from established turfgrass	There was 23% reduction of phosphorus in runoff for dissolved P without P fertilization (2.10 mg/L) and in the plots where P was applied (2.74 mg/L), a significant difference. However, the TP runoff concentrations were was not significantly higher in the P fertilized plots: TP runoff concentrations 3.86 mg/L in no P fertilized plots compared with 3.34 mg/L for the P-applied plots.

Document Title	Author(s), Year	Study Design	Key Conclusions
Management Practices Affecting Nitrogen and Soluble Phosphorus Losses from an Upper Midwest Lawn	Kussow, 2008	This was a six year study of nutrient losses from a Kentucky bluegrass lawn treated with and without phosphorus fertilizers in Madison, WI.	Runoff volume increased by 31-38% and phosphorus losses increased up to 58% at the no fertilizer treatment plot relative to the fertilized plots after two years. In the final two years of the study, runoff soluble phosphorus only decreased by a statistically insignificant 13% when phosphorus was not applied compared with the plots that received phosphorus. In fact, the application of urea, which contained no phosphorus, resulted in the greatest soluble phosphorus loss in runoff (1.29 kg/ha/yr).
Phosphorus Runoff from Turfgrass as Affected by Phosphorus Fertilization and Clipping Management	Bierman et al., 2010	This was a three year study which examined the effects of phosphorus runoff from various fertilizer treatments from turf in Minnesota. Treatments varied from no fertilizer to high P fertilizer (three times the recommended rate of P).	During the second year the total phosphorus runoff from the no-fertilizer treatment exceeded the phosphorus runoff from those plots receiving fertilizer. During the final year, total phosphorus losses increased with an increase in the phosphorus rate used in the fertilizer; however, losses were similar for those plots treated with the recommended rate of P and no-P treatment.
Potential Contributions of Mature prairie and Turfgrass to Phosphorus in Urban Runoff	Steinke et al., 2014	This study compared phosphorus runoff from non-fertilized, native prairie vegetation to phosphorus runoff from fertilized turfgrass plots in Wisconsin.	The average phosphorus load from fertilized turfgrass was significantly less than the average phosphorus load from the prairie vegetation that was not fertilized.
Phosphorus Losses from Turfgrass and the Urban Environment	Soldat (2012)	This is a summary of phosphorus runoff studies in urban environments.	This summary emphasizes the importance of soil tests to determine whether phosphorus is needed and concedes that while turf fertilizer does contribute to phosphorus loss from urban environments, building and road construction contribute a much greater portion of P loss.
Report to the Minnesota Legislature: Effectiveness of the Minnesota Phosphorus Lawn Fertilizer Law	Minnesota Dept. of Agriculture, 2007	This is a review of the Minnesota phosphorus restriction law which was enacted in 2002 and amended in 2004. The law prohibits the use of phosphorus in lawn fertilizers unless soil tests indiciate it is needed.	This review concluded that although the amount of phosphorus applied to lawns in fertilizers decreased by almost half between 2003 and 2006, "changes in water quality resulting from the law have not been documented at this time." Furthermore, the review concedes that sources such as sediment from construction areas, animal waste, and grass clippings all contribute to phosphorus in runoff in urban areas.

IV. AN ANALYSIS OF MINNESOTA WATER QUALITY TRENDS

The following discussion briefly summarizes the data analysis presented in section III (pp. 10-16) of the Appendix.

Minnesota was the first state to enact statewide restrictions on P in lawn fertilizers (Minnesota Statutes, Chapter 18C). Basically, phosphorus-containing fertilizers are prohibited from applications to lawns unless a specific need is established. To our knowledge, there have been no attempts to document statewide improvements in water quality as a result of implementation of the P restriction. Consequently, we conducted a preliminary analysis of this issue as follows.

The State of Minnesota has an extensive surface water monitoring database. A scientifically valid approach, probably the most scientifically valid approach, is to examine the monitoring data in a hydrologic context, i.e., in terms of drainage basins or watersheds. Accordingly, we selected monitoring station locations using four criteria based on HUC (Hydrologic Unit Code) 8 watersheds and TP results, as follows, and as described in the Appendix.

The watershed pollutant load monitoring network (2007-2011) map for TP was used as a starting point to select the surface water monitoring sites based on the range of TP concentrations. For the first criterion, each of the eight monitoring sites selected was located in separate HUC 8 watersheds in various parts of Minnesota (Figure 2). The second criterion was the time frame in which monitoring data was obtained, i.e., the monitoring data sets were required to have data available prior to P restrictions and post-2005. Next, each HUC 8 watershed for each of the surface water monitoring stations was completely within the boundary of the State of Minnesota. Fourth, we selected stations that collectively represent a wide geographic range within the state of Minnesota.

Three of the eight monitoring stations/watersheds demonstrated significant declines in TP concentrations over the period evaluated. All three of those stations are located in watersheds classified as having medium or high TP concentrations. This preliminary conclusion might be sufficient to generate a hypothesis worth testing, i.e., that the new law caused a decline in TP concentrations in the three watersheds. However, the law only targeted residential lawn P use, and the fact that residential land use does not dominate in two of the three watersheds indicates no clear benefit of the law (Minnesota

Statutes, Chapter 18C); i.e., only one of the monitoring stations in a predominantly residential or mixed use area demonstrated a decline in TP.

It is possible that a more intensive and extensive analysis might yield a different conclusion, but our analysis of these eight subwatersheds does not indicate that the restriction of P on residential lawns has shown a significant decline in P in surface water. This conclusion indicates the EPA Region 1 proposed P reduction credit may not significantly help achieve the TMDL goal.

V. HYDROLOGIC MODELING

On October 9, 2014, Mark Voorhees (US EPA, Region 1) sent ETS several documents including modeling output related to the phosphorus reduction credit described in the MA NPDES MS4 permit. The EPA Stormwater Management Model (SWMM) and the Program for Predicting Polluting Particle Passage through Pits, Puddles, & Ponds (P8) Urban Catchment Model were used to estimate runoff yields from various hydrologic soil groups and conditions. SWMM is used worldwide for its applications to drainage system design and sizing for flood control, flood plain mapping, design strategies for combined sewer overflows, waste load allocation studies, and evaluating BMP effectiveness (US EPA, 2014b). P8 was developed in the early 1990s by environmental engineer William W. Walker, Jr., Ph.D, to evaluate runoff from current or potential urban developments (Walker, 2014).

Two P8 simulations of fair and good conditions and one SWMM simulation were modeled at various hydrologic soil conditions (A, B, C, C/D, and D). The average runoff results of these three simulations were used to calculate phosphorus load export rates for soil groups A, B, C, C/D, and D (i.e. average of runoff yields X average annual mean total phosphorus concentration = phosphorus load export rate).

Upon review of the modeling output sent to us by Mr. Voorhees, we noticed a discrepancy between Table 22 (mislabeled as Table 172) of the permit's fact sheet's attachment and the modeling output. Table 22 of the attachment provides annual runoff yields and overall average runoff yields from the model simulations. Results for the P8 fair condition runoff yields in Table 22 are 0.378 MG/ha/yr and 0.467 MG/ha/yr for hydrologic soil groups (HSG) C and C/D, respectively. However, the model output in the Excel spreadsheet titled "Summary runoff and P yield 7 16 13" given to us by Mr. Voorhees indicates these runoff yields should be 0.267 MG/ha/yr and 0.407 MG/ha/yr for HSG C and C/D, respectively. If the P8 fair condition simulation results used in the table are incorrect, the average runoff yield and phosphorus load export rate for soil conditions C and C/D as described above are incorrect.

The EPA should examine this apparent inconsistency and, if an error has been made, determine its significance.

VI. CONCLUSIONS

The Schueler et al. (2011) draft report appears to be the basis for the proposed TP reduction factor of 0.50 (i.e., 50% load reduction) if a transition is made from phosphorus (P)-containing turf fertilizers to zero-P fertilizers. However, there is no valid basis - - and only a minimal explanation - - for how the numbers were derived.

A review of the P-runoff literature for cool season turfgrasses yields the following conclusions:

- When P-runoff concentrations from treated plots exceeded those from control (untreated) plots, the former often received non-typical turfgrass fertilizers and/or fertilizers applied at 2X or 3X normal rates.

- Conversely, most studies conducted with typical turfgrass fertilizers applied at normal rates tend to yield TP-runoff concentrations that are similar or lower for the treated plots compared with the control plots. This is a manifestation of the fact that a well-maintained stand of turfgrass is a good pollution BMP.

An analysis of water quality trends in Minnesota should yield conclusions relevant to this issue, due to its enactment ad implementation of statewide restrictions on the use of P-containing fertilizers on “lawns and turf” (implemented ca. 2004-2005). In a reconnaissance-level analysis, long term monitoring results from a diverse range of eight HUC 8 watersheds yielded no results that indicate a clear environmental benefit of the restrictions.

Regarding the EPA’s SWMM and P8 hydrologic modeling: some inconsistencies between the modeling results in the unpublished spreadsheet and those presented in the proposal package - - the Fact Sheet attachment - - should be resolved.

EXECUTIVE SUMMARY

State regulatory agencies and legislatures have been enacting restrictions that limit and eliminate phosphorus (P) in lawn fertilizers. The first state to implement such legislation statewide was Minnesota. In 2004, it passed zero-P legislation that took effect in 2005, following more limited restrictions that had been enacted previously. Since then, at least 10 additional states, and dozens of local governments in Florida, have enacted lawn fertilizer restrictions that target P and/or nitrogen. This is being done in an atmosphere whereby, in many areas of the country, there are perceptions that lawn fertilization is bad for the environment.

P is usually a limiting nutrient in freshwater systems, usually at low concentrations. This consideration is usually the policy driver for statutory and regulatory actions by state legislatures and agencies, frequently in the context of the establishment of Total Maximum Daily Loads (TMDLs) pursuant to §303(d) of the Clean Water Act. The restrictions imposed on P applied to turfgrass are based on the assumption that the runoff from the treated turfgrass will impact water quality. However, test plot and field-scale study results indicate that the irreducible concentrations of P in runoff from control sites are usually not significantly different than the concentrations from sites treated with typical turfgrass fertilizers at typical application rates.

Thus the purpose of this paper is to examine these issues more closely, albeit with a rather limited scope. Specifically, we reviewed the results of test plot and field-scale studies that examined P losses in runoff from turf. Further, we evaluated surface water quality monitoring results from eight watersheds in Minnesota, and compared concentrations before and after the restrictions cited above.

Literature Review

Twelve papers were reviewed relevant to phosphorus runoff from cool season turfgrasses at latitudes equivalent or similar to those that transit Massachusetts.

It has been demonstrated, in cool season grasses, that significantly more phosphorus runoff can occur from treated fertilized plots than zero-P plots when excess P is applied, e.g., at 3X normal rates. It has also been demonstrated, in cool season grasses, that, in general, there is no more TP runoff from

test plots treated at 1X normal fertilizer rates relative to test plots with zero-applied P. At least six studies yielded results whereby more P ran off the zero-P plots relative to the 1X plots.

A multiple subwatershed scale analysis in Minnesota concluded that there was no difference in TP runoff concentrations comparing a Minnesota town with P use restrictions implemented five years prior to similar implementation by another town. An environmental benefit of reduced SRP concentrations in the town with longer-term restrictions was concluded by the authors, but the lower concentrations of TSS was a confounding factor that weakened the conclusion.

Preliminary Trend Analysis of Minnesota Water Quality Monitoring Data

Restrictions on application of P-containing fertilizers began in Minnesota in 2002 at the local level, and statewide implementation of restrictions occurred in 2005. Therefore surface water monitoring sites from the Minnesota dataset at watershed Hydrologic Unit Code (HUC) Level 08 were selected for data analysis of pre- and post-phosphorus restrictions (ca. 2002-2005).

We selected surface water monitoring stations that represent a range of TP concentrations (i.e., low, medium, and high concentrations) and that are located near urban areas to compare the impact of the statewide P restrictions.

Three of the eight monitoring stations/watersheds we evaluated demonstrated significant declines in TP concentrations over the period evaluated. All three of those stations are located in watersheds classified as having medium or high TP concentrations. This preliminary conclusion might be sufficient to generate a hypothesis worth testing. However, the law only targeted residential lawn P use, and the comparisons do not demonstrate a clear benefit of the law (Minnesota Statutes, Chapter 18C); i.e., only one of the monitoring stations in a predominantly residential or mixed use area demonstrated a decline in TP.

It is possible that a more intensive and extensive analysis might yield a different conclusion, but our analysis of these eight subwatersheds does not indicate that the restriction of P on residential lawns has shown a significant decline in P in Minnesota surface water.

TABLE OF CONTENTS

LIST OF FIGURES AND TABLES

I. INTRODUCTION AND PURPOSE

State regulatory agencies and legislatures have been enacting restrictions that limit and eliminate phosphorus (P) in lawn fertilizers. The first state to implement such legislation statewide was Minnesota. In 2004, it passed zero-P legislation that took effect in 2005 (www.mda.state.mn.us/phoslaw), following more limited restrictions that had been enacted in 2002 and implemented in 2004. Since then, at least 11 additional states (ME, WI, MI, IL, NY, WA, MD, VA, NJ, and VT: http://www.cga.ct.gov/2012/rpt/2012-R-0076.htm; MA is a recent addition to this list: http://www.mass.gov/eea/docs/agr/docs/draft-nutrient-management-regulations.pdf), and dozens of local governments in Florida, have enacted lawn fertilizer restrictions that target P and/or nitrogen. This is being done in an atmosphere whereby, in many areas of the country, there are perceptions that lawn fertilization is bad for the environment.

These statutes, regulations, and ordinances have not been enacted without controversy. For example, Hochmuth (2014) demonstrated that the dozens of local fertilizer ordinances in Florida lacked a scientific basis. Bierman et al. (2010) found that, in year 2 of a three-year study, total annual runoff depths were significantly greater for the *no*-fertilizer treatment compared with all other treatments. Lehmann et al. (2009) chose a title for their paper about the benefits of a P restriction - - "Reduced River Phosphorus Following Implementation of a Lawn Fertilizer Ordinance" - - that implies a more definitive conclusion than stated by the authors in the paper. Finally, Kussow (2008) found that there was no significant decrease in runoff-soluble P when zero-P fertilizers were applied compared with applications of fertilizers with P.

Thus, the purpose of this paper is to examine these issues more closely, albeit with a rather limited scope. Specifically, we reviewed the results of test plot and field-scale studies that examined P losses in runoff from turf. Further, we evaluated surface water quality monitoring results from eight watersheds in Minnesota, and compared concentrations before and after the restrictions cited above.

II. PHOSPHORUS IN RUNOFF FROM TURF IN FIELD RESEARCH PLOTS

This is not a comprehensive review. Rather, its focus is research done at the two institutions that are most active in research on phosphorus in turfgrass. There is also a focus on those papers most relevant to the 50% P reduction credit.

A. Literature

The following studies were all performed on cool season turfgrasses in northern climates, and at the same or similar latitudes as Massachusetts. Thus they are relevant to the Massachusetts MS4 proposal.

Easton and Petrovic (2004) conducted a two year mass-balance field study to determine the effect of nutrient source on turfgrass runoff and leachate. The test plots were in central New York on soils ranging from sandy loam to silt loam texture. They observed that rapid establishment and shoot density from fertilizer applications tended to reduce overall losses of nutrient runoff and leaching.

In many cases, they found that N and P losses in runoff were equal or higher from the unfertilized control than from the treatment plots. This supports the observation that fertilization, following the establishment period, can reduce water contamination from N and P. They found that only one fertilizer source (swine compost – which is not typically applied to turf -- in the first year) produced significantly higher P concentrations (2.4 mg/L) than the unfertilized control (0.3 mg/L). Mass loss of P in the first year of the study for the different fertilizer types under normal applications (23.6 kg P/ha or ~0.5 lb P/1000 sq ft) ranged from 0.2 – 0.8 kg/ha compared with control (unfertilized) at 0.2 kg/ha. The second year of the study showed that the P-mass loss of the unfertilized control (1.3 kg/ha) was significantly ***higher*** than all other fertilizer sources, except for the swine compost (1.2 kg/ha) at twice the normal application rate (i.e., 47.2 kg P/ha or ~0.9 lb/1000 sq ft). The second year showed a range of P-mass loss values for the different fertilizer types ranged from 0.6 - 1.0 kg/ha at normal application rates (23.6 kg P/ha or ~0.5 lb P/1000 sq ft) compared with control (unfertilized) at 1.3 kg/ha.

Table 1 below shows runoff concentrations associated with the typical P application sources for turfgrass. The average P runoff concentration for treated plots in the first year is 0.5 mg/L, compared

with 0.3 mg/L for the control plot. The second year shows an average P runoff concentration of 0.43 mg/L for treated plots, which is lower than the control plot concentration of 0.5 mg/L.

Table 1. Phosphorus Concentrations in Runoff from Easton and Petrovic (2004) - Normal P Use Rate (~0.5 lb P/1000 sqft; 23.6 kg/ha)*

Study Year	Control (mg/L)	Biosolid (mg/L)	Readily Available (mg/L)	Controlled-Release (mg/L)
1	0.3	0.8	0.3	0.4
2	0.5	0.6	0.3	0.4

The study concludes:

> *"It is generally accepted that fertilizer is needed for rapid turfgrass establishment and growth. Increased shoot density, infiltration, and reduced sediment and runoff loss support the argument that fertilization ultimately results in less water contamination. While the initial concentrations and losses were generally higher from the fertilized treatments, rapid establishment and dense growth obtained with fertilizer application tended to reduce overall losses. In many cases we observed equal or higher overall losses of N and P in runoff and leachate from the unfertilized control, supporting the argument that following establishment fertilization can reduce water contamination from N and P."*

Soldat and Petrovic (2008) reviewed the literature on the fate and transport of P in turfgrass ecosystems from several sources. In their review of the Kelling and Peterson (1975) paper, they found that unfertilized lawns in Wisconsin produced a P concentration in runoff of 0.4 mg/L, whereas fertilized lawns yielded a P concentration of only 0.5 mg/L (7.2% loss of applied P). This is only a ***0.1 mg/L increase, albeit insignificant,*** in P concentration from the unfertilized plots relative to the fertilized plots. In general, they found that P losses from fertilized plots ranged from <1 to 18% of the amount of P applied, higher when more was applied and the greatest when twice the normal application of P was used.

Soldat and Petrovic (2008) reported result for Gaudreau et al. (2002), a natural plot-scale study over a 2-yr period. They compared runoff results from fertilized and unfertilized plots. The range of applications on the fertilized plots ranged from normal (i.e., 25 kg/ha or 0.5 lb P/1000 sq ft) to four times the normal rate (i.e., 2 lb P/1000 sq ft or 100 kg/ha). The runoff P concentration for control plots ranged from 1.1 to 2.6 mg/L compared with 1.1 to 16.6 mg/L from the plots with normal applications (i.e., 25 kg/ha) using inorganic P. Additionally, twice the application rate for inorganic P (i.e., 50 kg/ha or

* Swine and dairy compost results are not included because they are not typical turfgrass fertilizers.

1 lb P/1000 sq ft) produced P concentrations in runoff of 1.1 to 30 mg/L. Therefore, these results demonstrate that some of the fertilized plots using normal P application rates produce P runoff concentrations (1.1 mg/L) lower than the control/unfertilized plots (2.6 mg/L).

Soldat et al. (2008) conducted a two year study to better understand nutrient runoff losses from turfgrass in order to improve fertilizer recommendations for turfgrass. This New York-located study included experimental test plots with two objectives: 1) examine the effects of N and P fertilization of established turfgrass on P runoff losses; and 2) examine the effect of soil P level on P runoff losses from established turfgrass. Although the dissolved P concentrations (DP) (2.10 mg/L) from the no-P fertilization plots was significantly less than the plots where P was applied at a rate of 50 kg/ha/yr (2.74 mg/L), the results showed only a 23% reduction of phosphorus in runoff without P fertilization. However, the TP runoff concentrations were not significantly higher in the P fertilized plots. In addition, Soldat et al. (2008) cited the Kussow (1996) study in which there was a 47-59% reduction in runoff P losses from fertilized turf compared with unfertilized control in Wisconsin.

Bierman et al. (2010) researched the effects of various turf fertilizer treatments on phosphorus (P) runoff over the course of three years in Minnesota. Treatments varied from no fertilizer to high P fertilizer (three times the recommended rate of P). In the first year, phosphorus runoff increased with an increase in phosphorus rate. During the second year, however, the total phosphorus runoff from the no-fertilizer treatment exceeded the phosphorus runoff from those plots receiving fertilizer. This was due to a decline of the turf quality and greater runoff depth at the plots not receiving fertilizer. During the final year, total phosphorus losses increased with an increase in the phosphorus rate used in the fertilizer; however, losses were similar for those plots treated with the recommended rate of P and no-P treatment.

Steinke et al. (2014) examined phosphorus runoff from non-fertilized, native prairie vegetation as well as from fertilized turfgrass plots in Wisconsin. The average phosphorus load from fertilized turfgrass was significantly less than the average phosphorus load from the prairie vegetation. Furthermore the study goes on to say that “phosphorus losses from urban areas appeared to be primarily correlated with runoff depth, not vegetation type, because correlation coefficients revealed 86 and 45% of the Year 1 and Year 2 total P loads were directly accounted for by runoff volumes”. As shown

in Bierman et al (2010) a reduction in phosphorus applications to turf can lead to greater runoff depth and ultimately greater phosphorus loss in runoff.

Soldat (2012) emphasizes the importance of soil tests to determine whether phosphorus is needed and concedes that, while turf fertilizer does contribute to phosphorus loss from urban environments, building and road construction contribute a much greater portion of P loss. Therefore, "legislation restricting the use of phosphorus fertilizer is likely to have a limited effect on urban water quality".

Kussow (2008) measured nitrogen and phosphorus loss from turf plots treated with synthetic fertilizer containing phosphorus, organic fertilizer containing phosphorus, and no fertilizer. The test plots were in Wisconsin. The turf plot receiving no fertilizer treatment resulted in more phosphorus loss in runoff than the fertilizer treatments. Runoff volume increased by 31-38% and phosphorus losses increased up to 58% at the no fertilizer treatment plot relative to the fertilized plots after two years. In addition, not fertilizing increased nitrogen runoff losses from mulch mowed plots by 25% compared to fertilized plots, indicating fertilizer plays an important role in maintaining turfgrass stand density. In the final two years of the study, runoff of soluble phosphorus did not decrease significantly when phosphorus was not applied compared to the plots that received phosphorus. Furthermore, the relationship between phosphorus application rate and runoff soluble phosphorus was also not statistically significant.

Vlach et al. (2008) is a case study from the University of Minnesota's Assessment of Stormwater Best Management Practices. (There is no indication it has been peer reviewed.) The authors studied total nitrogen, total suspended solids, total phosphorus and soluble reactive phosphorus in runoff from home lawns in six sub-watersheds in Minnesota from 2001 to 2006. Three of the sub-watersheds were located in Plymouth, Minnesota, where phosphorus in fertilizers was banned in 1999. The other three sub-watersheds were located in Maple Grove, Minnesota, in which phosphorus fertilizer restrictions were not implemented until 2004. The study showed no significant difference between mean total phosphorus and mean total nitrogen concentrations in runoff between the Plymouth and Maple Grove locations despite the use of phosphorus fertilizers in Maple Grove. Mean soluble reactive phosphorus concentrations were significantly higher in runoff from the Maple Grove watersheds compared with the Plymouth watersheds (0.135 mg/L vs 0.112mg/L).

However, there is another confounding factor that must be considered. An inverse relationship was found between soluble reactive phosphorus and total suspended solids concentrations. Runoff from Maple Grove consisted of significantly higher concentrations of soluble reactive phosphorus but significantly lower concentrations of total suspended solids. The study indicated street sweeping only occurred once annually in Plymouth whereas in Maple Grove, street sweeping occurred three to four times each year. Therefore, the lack of street sweeping in Plymouth likely resulted in more particulates in runoff and lower soluble reactive phosphorus concentrations due to sorption to the particulates. This is supported by the significantly higher concentration of total suspended solids in runoff from the Plymouth watersheds compared with Maple Grove.

Finally, in 2007, the Minnesota Department of Agriculture reviewed the effectiveness of the MN phosphorus fertilizer law and concluded that, although the amount of phosphorus applied to lawns in fertilizers decreased by almost half between 2003 and 2006, "changes in water quality resulting from the law have not been documented at this time." (See our analysis of this issue in Section III of this document.) Furthermore, the review concedes that sources such as sediment from construction areas, animal waste, and grass clippings all contribute to phosphorus in runoff in urban areas (MN Department of Agriculture, 2007).

B. Conclusions about Phosphorus in Runoff from Turf

It has been demonstrated, in cool season grasses, that significantly more phosphorus runoff can occur from treated fertilized plots than zero-P plots when excess P is applied, e.g., at 3X normal rates. It has also been demonstrated, in cool season grasses, that, in general, there is no more TP runoff from test plots treated at 1X normal fertilizer rates relative to test plots with zero-applied P. At least six studies yielded results whereby, more P ran off the zero-P plots relative to the 1X plots.

We did not include Schueler (2011) in our literature review because it did not provide a valid basis for Table 8, "Suggested EMCs to Characterize Lawn Management in WTM Model," and it was a draft document.

III. A PRELIMINARY EVALUATION OF THE IMPACT OF MINNESOTA PHOSPHORUS LAWN FERTILIZER RESTRICTIONS ON SURFACE WATER MONITORING RESULTS

As stated in the introduction, Minnesota was the first state to enact statewide restrictions on P in lawn fertilizers (Minnesota Statutes, Chapter 18C; 2004, implemented in 2005). The law technically does not restrict the sale of fertilizer containing phosphorus. Rather, it requires that only zero-P (≤0.67% P_2O_5) be used on "lawns and turf" unless one of the following four exceptions is applicable:

- a soil test or plant tissue test shows a need for phosphorus;
- a new lawn is being established by seeding or laying sod;
- phosphorus fertilizer is being applied on a golf course by trained staff; and
- phosphorus fertilizer is being applied on farms growing sod for sale.

To our knowledge, there have been no attempts to document statewide improvements in water quality as a result of implementation of the P restriction. Consequently, we conducted a preliminary analysis of this issue as follows.

A. Selection of Monitoring Sites and Sampling Periods

The State of Minnesota has an extensive surface water monitoring database. A scientifically valid approach, probably the most scientifically valid approach, is to examine the monitoring data in a hydrologic context, i.e., in terms of drainage basins or watershed. Accordingly, we selected monitoring station locations based on watersheds and TP results, as follows.

A watershed is defined as the land area in which all of the water on that land drains to the same location. The scale of a watershed changes based on the outlet. For example, the amount of land in which water drains to the Mississippi River is much larger than the land area which ultimately drains to the Susquehanna River. The USGS divided the United States into a hierarchy of watersheds or Hydrologic Unit Codes (HUCs) at six levels: 2-digit, 4-digit, 6-digit, 8-digit, 10-digit, and 12-digit HUCs. Each level represents a different resolution. There are 21 HUC 2 regions subdivided into 222 HUC 4 subregions, 352 HUC 6 accounting units, 2,000+ HUC 8 cataloging units, 22,000 HUC 10 units, and 160,000 HUC 12 units. HUC 12 units have the highest spatial resolution and delineate smaller watersheds than those described by the HUC 2 and HUC 4 units (USGS, 2013; http://nhd.usgs.gov/wbd_facts.html). There are 81 HUC 8

watersheds in Minnesota. The average size of the HUC 8 watersheds is 988 square miles, based on the State area of approximately 80,000 square miles.

Surface water monitoring sites from the Minnesota dataset at watershed Hydrologic Unit Code (HUC) Level 08 were selected for data analysis of pre- and post-phosphorus restrictions (ca. 2002-2005). Some of the 81 HUC 8 watersheds in Minnesota also receive drainage from bordering states (see Figure 1). Therefore these were excluded from the analysis.

It was important to select surface water monitoring stations that represent a range of TP concentrations (i.e., low, medium, and high concentrations) and that are located near urban areas to compare the impact of the statewide P restrictions. The Minnesota Pollution Control Agency (MPCA) website was a valuable resource that was used to select the monitoring stations and obtain the results of the monitoring data (*http://www.pca.state.mn.us/index.php/water/water-types-and-programs/surface-water/streams-and-rivers/watershed-pollutant-load-monitoring-network.html#products-data*). The maps and monitoring results were obtained from their website for data comparison.

The watershed pollutant load monitoring network (2007-2011) map for TP (Figure 2) was used as a starting point to select the surface water monitoring sites based on the range of TP concentrations. For the first criterion, each of the eight monitoring sites selected was located in separate HUC 8 watersheds in various parts of Minnesota (Figure 2). The second criterion was the time frame in which monitoring data was obtained, i.e., the monitoring data sets were required to have data available prior to P restrictions and post-2005. Next, each HUC 8 watershed for each of the surface water monitoring stations was completely within the boundary of the State of Minnesota. Fourth, we selected stations that collectively represent a wide geographic range within the state of Minnesota, as evidenced by Figures 1 and 2. See Table 2 for the monitoring stations selected.

Following monitoring site selection, the TP results were isolated from the other water quality results for graphical presentation and statistical analyses (see below). The TP concentrations were used in the statistical comparison pre- and post-phosphorus restrictions. See Appendix A for the graphical presentation and statistical analyses of the TP results for each station.

Figure 1. Selected Monitoring Stations within HUC 8 Watersheds

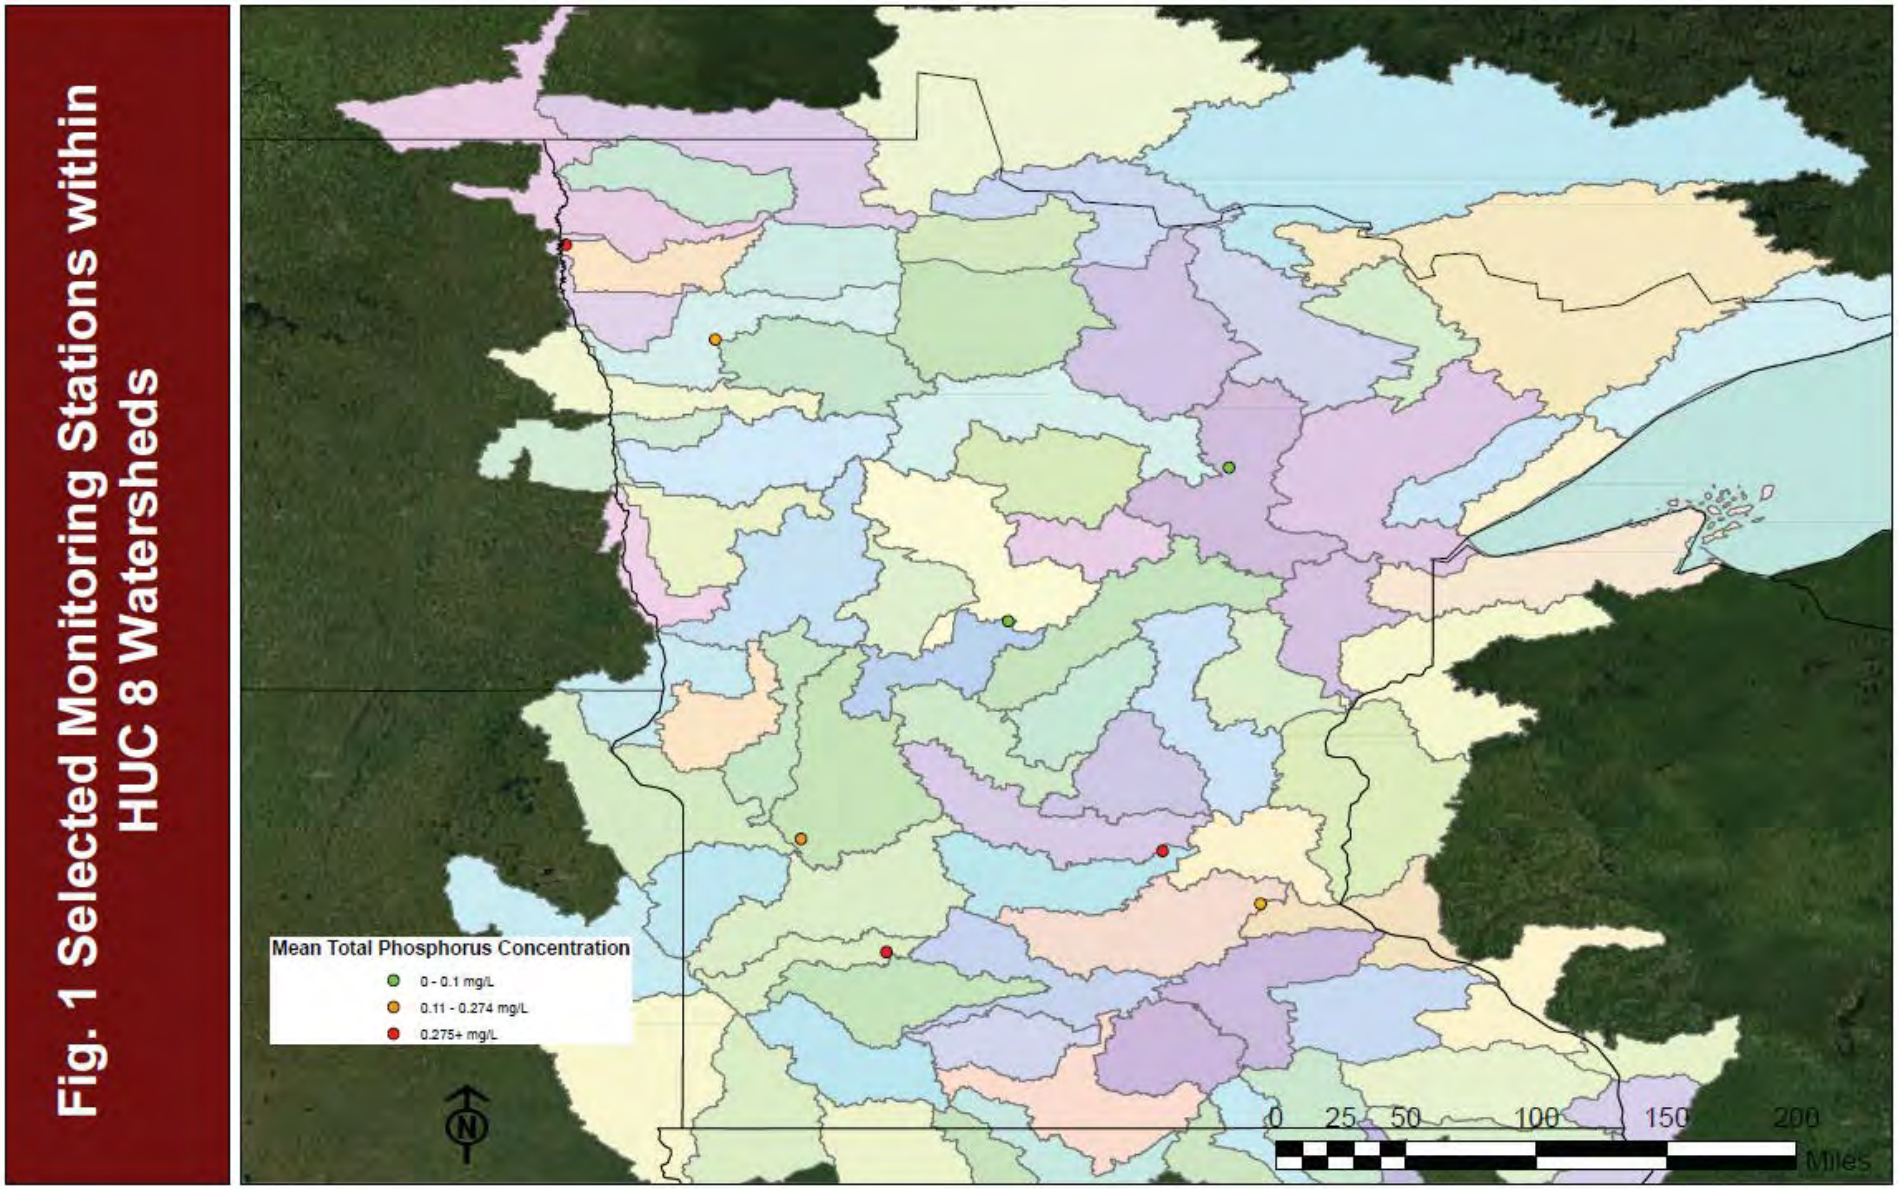

Figure 2. Mean TP Concentrations and Monitoring Station Locations

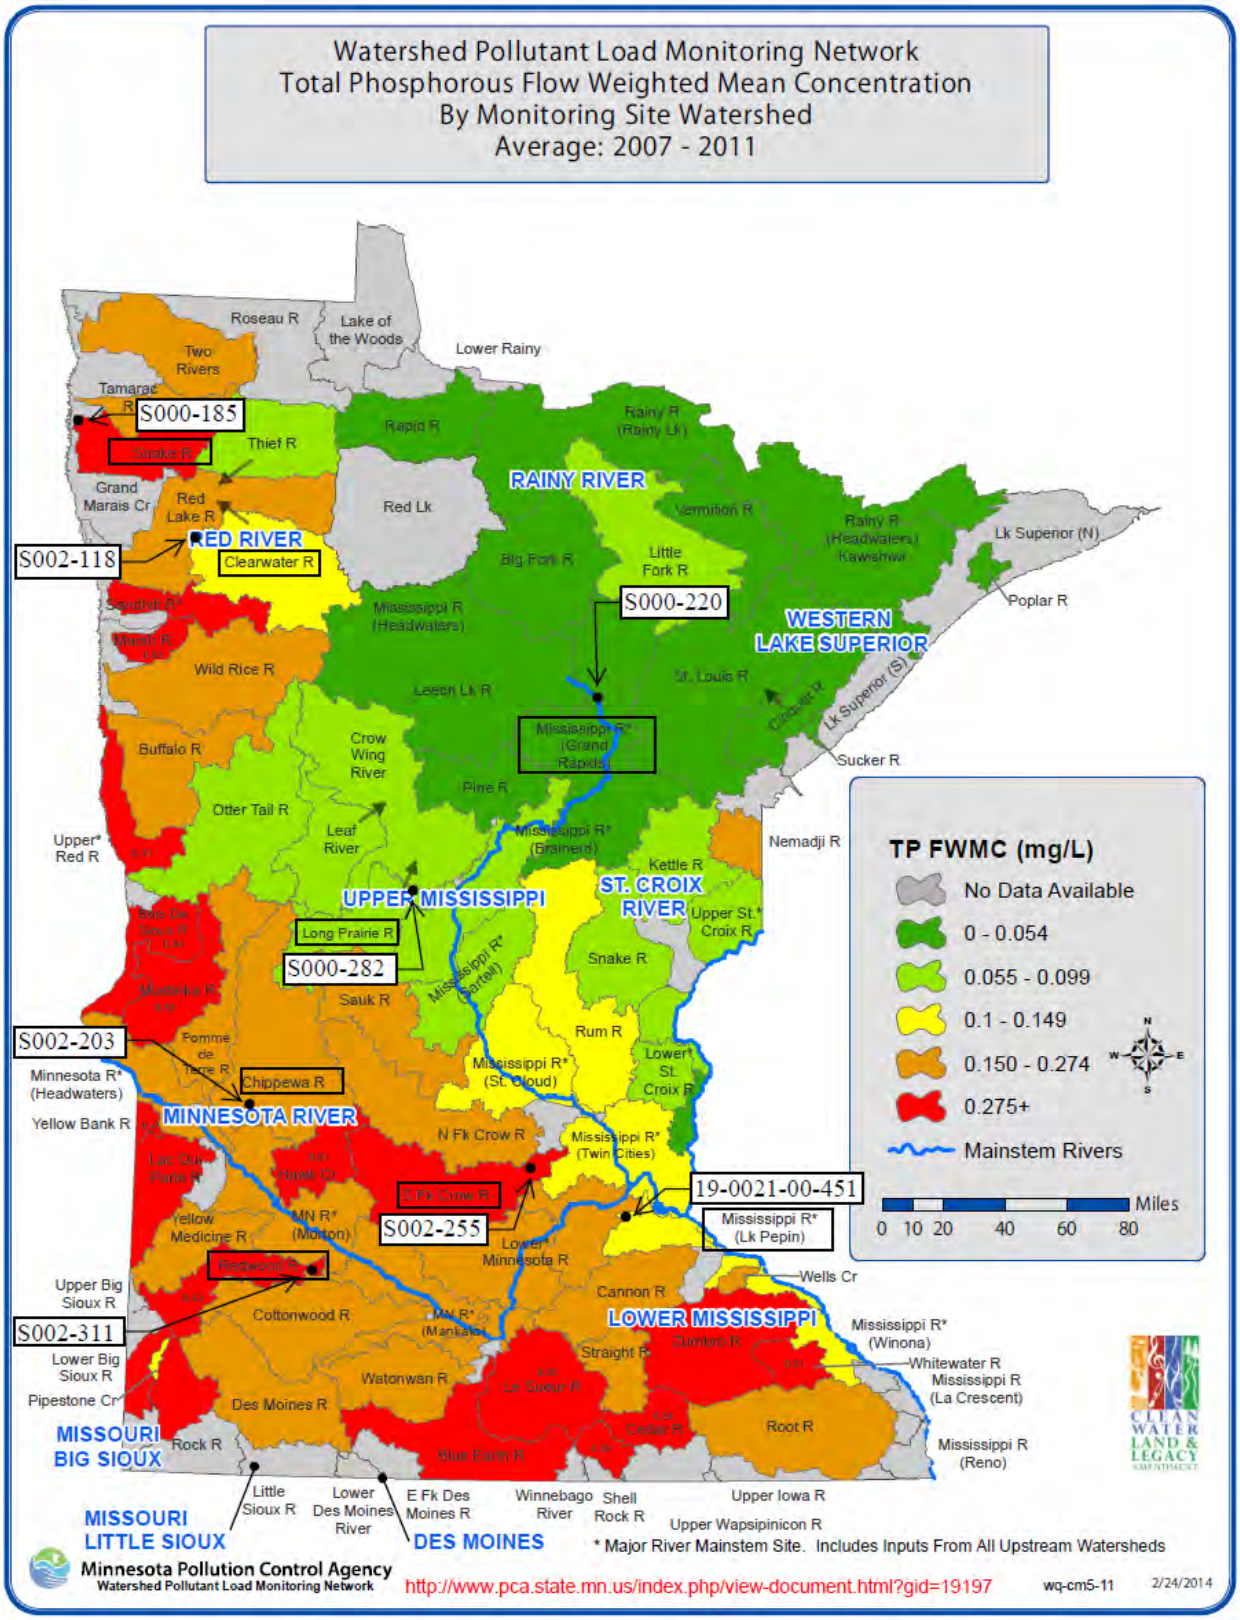

Table 2. Monitoring Stations Selected

Monitoring Station IDs	TP Concentration Rank	Watersheds/Rivers	HUC 8 #	Total Monitoring Dates

B. Statistical Analyses

The Student's t-test (two tailed) was used to analyze surface water monitoring data collected at eight stations throughout Minnesota. Data collected prior to implementation of the statewide restriction (i.e. prior to 2005) were compared with data collected after the statewide restriction (i.e. 2005 and later) to determine if there is a statistically significant difference in the P concentrations at these stations pre- vs. post-regulation restriction. Note that the monitoring data at several stations included data as far back as 1971. We do not know the regulatory environment regarding phosphorus in fertilizers at that time. Including the older data could skew the statistical results by including other unknown variables or influences. Therefore, we chose to compare an equal number of years before and after the statewide zero phosphorus restriction in 2005. For example, if a dataset without any data gaps contained data from 1971 through 2010, our statistical analysis compared data obtained from 1999-2004 and 2005-2010, six years before and six years after the restriction. See Table 2 for monitoring years that were included in the statistical analyses.

C. Results of the Statistical Analyses

Three of the eight stations showed a statistically significant difference between the pre and post statewide zero phosphorus restriction ($p<0.05$; Table 3). Two of these stations are located in the southwest portion of the state in the Redwood River and Chippewa River watersheds and the other is located in the northwest portion of the state in the Clearwater River watershed (see Figure 2). The

Student's t-test results indicate the phosphorus concentrations before and after the statewide restriction were not statistically significant at the remaining five stations.

Table 3. Minnesota Monitoring Stations Student's t-test Results

Station IDs	Data collection year*	p-value	Significantly Lower After Restrictions?
S000-282	1995-1996, 1999-2004 vs. 2005-2012	0.4810	no
S000-220	1996, 1999-2002, 2004 vs. 2005-2010	0.6901	no
19-0021-00-451	1998-2004 vs. 2005-2011	0.1486	no
S002-118	1996-2004 vs. 2005-2013	0.0011	yes
S002-203	1998-1999, 2001-2004 vs. 2005-2010	0.0035	yes
S001-255	1998, 2001-2003 vs. 2007-2010	0.5824	no
S000-185	1992, 1994, 1998-2004 vs. 2005-2013	0.4977	no
S002-311	1997-2004 vs. 2005-2012	0.0130	yes

*t-tests were calculated for equal numbers of years *in which data were collected* prior to 2004 and after 2005 – see text discussion (e.g., data for X years prior to the law and X years after the law were counted if available. If data were not collected in a given year it was *not* counted as a year before or after the law.). QC duplicate sample results were averaged.

D. Discussion

A detailed, GIS-based, quantitative spatial/land use analysis was not done. However, a qualitative analysis was done, as follows. An inspection of each station's location using Google Earth™ (Appendix B) was done. These observations were combined with land use information obtained from the State's watershed website (Minnesota Pollution Control Agency: Minnesota watersheds) to characterize the subwatersheds around the monitoring stations (Appendix C). Table 4 summarizes key findings from Table 3 and Appendix C.

Table 4. Qualitative Relationship of TP Trends and Land Use

Monitoring Station	Significant Decline in TP*	Does Residential Land Use Dominate?
S000-282	No	Mixed
S000-220	No	No
19-0021-00-451	No	Yes
S-002-118	Yes	Yes
S-002-203	Yes	No
S-001-255	No	Mixed
S-000-185	No	No
S-002-311	Yes	No

* See Table 3.

E. Conclusion

Three of the eight monitoring stations/watersheds demonstrated significant declines in TP concentrations over the period evaluated. All three of those stations are located in watersheds classified as having medium or high TP concentrations. This preliminary conclusion might be sufficient to generate a hypothesis worth testing. However, the law only targeted residential lawn P use, and the comparisons in Table 4 do not demonstrate a clear benefit of the law (Minnesota Statutes, Chapter 18C); i.e., only one of the monitoring stations in a predominantly residential or mixed use area demonstrated a decline in TP.

It is possible that a more intensive and extensive analysis might yield a different conclusion, but our analysis of these eight subwatersheds does not indicate that the restriction of P on residential lawns has shown a significant decline in P in Minnesota surface water. Further, a combination of this analysis with the literature review summarized in section II above indicate that the use of lawn fertilizers in Minnesota prior to 2005 was not likely a significant source of phosphorus load to the surface water systems in the MPCA data set.

APPENDIX C. Monitoring Station and Watershed Descriptions

[The monitoring station ID numbers follow the order in Table 3.]

The 'General Watershed Descriptions' and 'Land Use Characteristics' were copied directly from the Minnesota Pollution Control Agency's website (http://www.pca.state.mn.us/index.php/water/water-types-and-programs/watersheds/watershed-overview-map.html). In addition, we reviewed photos of each station's location (Appendix B) and provided a general observation for each as noted in this appendix.

Appendix C. Watershed Descriptions

Monitoring Station IDs	General Watershed Descriptions*	Land Use Characteristics*
S000-282	The Long Prairie River watershed covers approximately 551,612 acres (862 square miles) and is located in the central part of the Upper Mississippi River Basin in central Minnesota. The watershed encompasses all or parts of Douglas, Otter Tail, Todd, Morrison, and Wadena counties. ETS' description of this station's land use. This sampling site is located less than one mile south of Motley, MN. In addition, there are two residences and a couple of industrial businesses located in close proximity.	The Long Prairie River watershed includes more than 240 lakes greater than 10 acres in size and 884 miles of rivers and streams. The Long Prairie River begins in Douglas County and flows through Todd and Morrison counties before entering the Crow Wing River south of Motley. The dominant land use within the watershed is agricultural (57%), while grasslands and forests make up 17% and 14% respectively, water 8% and 4% is urban. The watershed is within the North Central Hardwood Forest as well as the Northern Lakes and Forests ecoregions. One lake and several stream reaches are currently impaired.
S000-220†	The Mississippi River – Grand Rapids watershed covers 1,316,071 acres and contains 1,908 miles of stream/rivers and 552 lakes greater than 10 acres. The watershed drainage comprises parts of Aitkin, Carlton, Cass, Itasca, and St. Louis Counties. Some of the major cities are Grand Rapids, McGregor, Remer. ETS' description of this station's land use. This sampling site is located in a mostly forested area approximately 6 miles southeast of Grand Rapids, MN.	Land use consists of 56% forested, 27% grass and wetland, 7% agricultural, 7% water, and 3% urban. The watershed has 4 nutrient-impaired lakes and 2 impaired stream reaches (2008). Nearly 89% of the land is privately owned; 4.76% is publicly owned. The watershed contains numerous heavily developed lakes. The majority of the lakes are important recreational resources and economic benefits to the watershed.
19-0021-00-451	The Mississippi River - Lake Pepin watershed includes 205,747 acres that drain several small, coldwater streams in bedrock-dominated bluff country. The largest of these streams is Wells Creek (45,954-acre watershed), which winds through 18 miles of bluff lands and joins the Mississippi near Old Frontenac, southeast of Red Wing. Hay Creek is a popular trout stream (30,405-acre watershed) that flows from south to north, joining the Cannon River bottoms at Red Wing. Three other named streams are all designated trout waters, and drain directly to the Mississippi River: Bullard Creek (10,245-acre watershed), Gilbert Creek (16,007-acre watershed) and Miller Creek (11,168-acre watershed). ETS' description of this station's land use. This sampling site is a lake monitoring station. The samples are pulled from the Alimagnet Lake, which is within the park with the same name and is surrounded by a residential community, Burnsville, MN.	The Mississippi River - Lake Pepin watershed consists of forests, bluff lands, and cultivated lands. The top of the watershed is rolling cropland interspersed by many small tributaries that drop steeply through forested valleys with scattered goat prairies atop cliffs. The tributaries join to form the named streams, which drain directly into the Mississippi River. The watershed is only about 50 miles southeast of downtown St. Paul. As a result, the watershed is subject to development pressures. Agriculture is the primary land use in the watershed (approximately 70%). About 10% of the land is in grass. Corn and soybeans make up over half the tilled acreage of the area, with barley, oats, and pasture land present. Forage production is strong because of the large number of dairy cows in the region. Of the grassland, 90% is in pasture and a small percentage (<10%) is in a management intensive rotational grazing system. Most of the remaining acreage is deciduous forest. Frontenac State Park, Lake Pepin, and the coldwater fisheries are significant natural resources that provide recreation and revenue in the region.

Monitoring Station IDs	General Watershed Descriptions*	Land Use Characteristics*
S002-118	The Clearwater River watershed drains an area of 886,600 acres in the Red River of the North basin. The Clearwater River begins its course in western Clearwater County near the town of Ebro. The river flows to the northwest and southwest, eventually emptying into Red Lake River near Red Lake Falls. The watershed occurs in the Glacial Lake Agassiz Plain, North Central Hardwoods, Northern Lakes and Forests, and Northern Minnesota Wetlands Level III Ecoregions. ETS' description of this station's land use. This station is located near Riverside Park and surrounded by a residential community in Red Lake Falls, MN.	The Clearwater River watershed characteristically has a poorly defined floodplain and low gradient that combine with extensive drainage, widespread conversion of tallgrass prairie to farmland, and urban/suburban development to leave the basin subject to frequent floods that affect urban and rural infrastructure and agricultural production. Precipitation in the watershed ranges from 21 to 25 inches annually. Above-normal amounts of precipitation in the late fall of the year or from May to October lead to high levels of soil moisture, periodically producing the snow-melt and summer floods that are known to affect the further reaches of the overall Red River Basin. The main resource concerns in the watershed are wind and water erosion, nutrient management, wetland management, surface water quality, flood damage reduction, and wildlife habitat. Many of the resource concerns relate directly to flooding and increased sediment and pollutant loadings to surface waters. Predominate land uses / land covers are row crops (33%), forest (24%), grass/pasture/hay (21%), wetlands (14%), and residential/commercial Development (4%). Agricultural land use in the basin accounts for approximately 54% of the overall watershed acres. Development pressure is moderate in most areas, with occasional farms, timberland, and lakeshore being parceled out for recreation, lake or country homes.
S002-203†	The Chippewa River watershed covers 2,085 square miles and drains portions of eight counties in west central Minnesota. The northeast part of the watershed tends to be hillier, wooded, and more easily eroded, while the southwest portion tends to be flatter with more agricultural. The watershed begins in the southern part of Otter Tail County and ends 130 miles south in the flatter agricultural land at Montevideo. ETS' description of this station's land use. This sampling site is located in an agricultural area, approximately 5 and a quarter miles due east of the small town of Milan, MN.	The geology of the Chippewa River watershed includes a complex mixture of moraines and till, lake deposits, and outwash plains. The hilly moraines result in a high potential for erosion of sediment into streams. Nearly 90% of the land is privately owned. Agriculture accounted for approximately 68% of the available acres in 1996. Corn and soybeans make up a majority of raised crops, and small grains, hay, and grasslands make up the majority of the balance.

Monitoring Station IDs	General Watershed Descriptions*	Land Use Characteristics*
S001-255	Generally, the South Fork Crow River watershed covers 818,428 acres. It is located in south-central Minnesota and encompasses parts of Kandiyohi, Renville, Meeker, McLeod, Sibley, Wright, Carver, and Hennepin counties. The South Fork Crow River joins with the North Fork Crow at Rockford, and then joins the Mississippi River near Dayton. The majority of the watershed is within the Western Cornbelt Plains ecoregion, with a small portion extending into the North Central Hardwood Forest ecoregion. Major cities include Willmar, Hutchinson, Delano and Glencoe. ETS' description of this station's land use. This site is located in an area surrounded by industrial businesses and residential housing.	The South Fork Crow River watershed includes many lakes, streams, and wetlands. Buffalo Creek, a major tributary, flows into the South Fork Crow River downstream of Lester Prairie. Land use in the South Fork Crow River watershed is largely agricultural, with row crops and pasture/grass lands accounting for approximately 83% of the overall watershed acres. Several lakes and parts of the South Fork Crow River do not meet water quality standards for beneficial uses such as aquatic recreation, drinking, and swimming. The main lake pollutant is phosphorus, causing algae blooms in summer months, and portions of the South Fork Crow and its tributaries are listed for pollutants such as bacteria, turbidity and low dissolved oxygen.
S000-185†	The Snake River begins its 50-mile course in Marshall County and drains an area of 611,800 acres. The river flows southwest from the headwaters, continuing westward and collecting the South Fork Snake River and passing through the towns of Warren and Alvarado. Downstream of Alvarado, the Snake turns northwest, then collects the Middle River upstream of its confluence with the Red in Fork Township. ETS' description of this station's land use. This sampling site is located in a purely agricultural area in the northwestern portion of MN, near the North Dakota border, and 15 miles due north of the small community of Oslo, MN.	Above-normal amounts of precipitation in the late fall of the year or from May to October lead to high levels of soil moisture, periodically producing the snow-melt and summer floods that are known to affect the further reaches of the overall Red River Basin. Agriculture accounts for approximately 84% of the overall watershed acres. Development pressure is moderate in most areas, with occasional farms, timberland, and shorefront being parceled out for recreation, lake, or country homes. The Red River basin generally has a poorly defined floodplain and low gradient that combine with extensive drainage, widespread conversion of tallgrass prairie to farmland, and urban/suburban development to leave the basin subject to frequent floods that affect urban and rural infrastructure and agricultural production. The main resource concerns in the watershed are wind and water erosion, nutrient management, wetland management, surface water quality, flood damage reduction, and wildlife habitat. Many of the resource concerns relate directly to flooding and increased sediment and pollutant loadings to surface waters.

Monitoring Station IDs	General Watershed Descriptions*	Land Use Characteristics*
S002-311	The Redwood River is located in southwestern Minnesota in the counties of Lincoln, Lyon, Murray, Pipestone, Redwood, and Yellow Medicine. It begins near Ruthton in northeast Pipestone County, and flows about 125 miles northeast through Redwood Lake and to the Minnesota River at North Redwood. The watershed covers 451,250 acres or 705 square miles. There are 11 incorporated communities located within the watershed, including Marshall, Redwood Falls, Tyler, Russell, and Vesta, and three unincorporated communities. <u>ETS' description of this station's land use.</u> This sampling site is located in southwestern portion of MN along Clear Creek, which is heavily tree lined and surrounded by the agricultural community of Seaforth, MN.	The entire Redwood River watershed has 85.5% (approximately 385,665 acres) of the land in cultivation, 7% in grassland, 1.5T in water, and 0.6% in wetlands. Altitudes descend from west to east, with the Coteau des Prairies serving as a watershed divide. Natural drainage patterns in the area were established by valleys formed from glacial meltwaters. End moraines, which were formed during the recession of the last glacier, are the most prominent features.

*http://www.pca.state.mn.us/index.php/water/water-types-and-programs/watersheds/watershed-overview-map.html

† These sites are located in mostly agricultural or forested areas.

Mr. Newton Tedder
US EPA Region 1
Suite 100, Mail Code OEP 06-4
5 Post Office Square
Boston, MA 02109

RE: Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder:

The Lawn and Horticultural Products Work Group (LHWPG) on behalf of its members is pleased to submit comments to the Office of Ecosystem Protection, Environmental Protection Agency, Region 1 (EPA), expressing our concerns about specific parts of the Notice of Availability of a Draft National Pollutant Discharge Elimination System (NPDES) general permit for stormwater discharges from small Municipal Separate Storm Sewer Systems (MS4s) to certain waters of the Commonwealth of Massachusetts.

Statement of Interest

The LHPWG, operating under the auspices of the Consumer Specialty Products Association, Inc., (CSPA) provides a unified voice for companies engaged in the unique market of lawn and horticultural products. LHPWG member companies manufacture more than 75 percent of domestically produced conventional specialty fertilizers utilized in the United States; including consumer household, lawn and garden, golf courses and other professional turf and lawn care. These specialty fertilizer products are licensed; registered and sold to consumers and professional applicators in all 50 states. Our members rely on years of their own and independent scientific research to guide their product formulations and product decisions. Our members have a vested interest in any regulation of specialty fertilizer, in any jurisdiction. In order to improve our understanding of the computer modeling utilized by EPA Region 1 in support of the proposed MS4 NPDES permit we contracted with Environmental & Turf Services, Inc. (ETS), based in Maryland to assess the model and provide comments on how it impacts our member's products. ETS is an independent environmental consulting firm that specializes in environmental risk assessment and water quality monitoring of pesticides and fertilizers. Its founder, Stuart Cohen Ph.D., CGWP, worked as a scientist for 11 years in the U.S. EPA's Office of Pesticides & Toxic Substances in Washington DC. A Report with Appendix from ETS entitled "*Comments on Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts*" that details their concerns with the computer model and reviews the most current scientific literature available on nutrient losses from turf grasses is attached.

General Comments:

The use of specialty fertilizer on lawns has been under the microscope for more than a decade. There should be no debate; healthy turf grass protects the environment. It is a fact supported by independent university and government research. Unfortunately, the many universally recognized benefits of turf grass have been summarily dismissed. These are some of the recognized and proven benefits:

1) Turf grasses help cool air temperatures through evapotranspiration.
2) Particles from the atmosphere are trapped by turf grasses.
3) Noise is absorbed by grassed areas.
4) Air pollutants, such as carbon dioxide and sulfur dioxide, are absorbed by turf grass.
5) Turf grass thatch acts as a barrier deterring chemicals from entering the soil.
6) Turf grasses produce oxygen.
7) Turf grasses prevent erosion and loss of soil during heavy rain.
8) Turf grasses increase groundwater infiltration which helps recharge aquifers.
9) Turf grasses reduce the volume of storm water run-off.
10) Turf grasses capture and absorb nutrients.
11) Turf grasses are planted as a BMP to scour nutrients in farm fields after harvest.
12) Turf grasses are planted as a buffer strip around the perimeter of farm fields to reduce soil erosion.
13) Turf grasses buffers are used for fire prevention.
14) Turf grass buffers are used to improve home security via sight lines.
15) Turf grass buffers improve sight lines and safety along roads.
16) Turf grass provides a safe playing surface for a variety of outdoor sports.
17) Turf grass production and maintenance is a multibillion dollar industry which provides jobs and economic growth.

Turf grass and humans are somewhat alike in that both need proper nutrition to remain healthy. Proper application of a fertilizer product formulated for turf will provide the proper amount of primary plant nutrients [(N) Nitrogen, (P) Phosphorus & (K) Potassium] to help maintain plant health. Products are formulated differently to meet the nutritional requirements of different turf grass species. Nutritional requirements are based upon years of careful research. Our members know better than anyone the important role plant nutrients play in helping to protect the environment and the potential problems related to excess use of nutrients. We know, through years of consumer research and sales data collected by our members that consumers do not over apply fertilizer to their lawns; in fact**,** they do not apply enough fertilizer to maintain healthy turf.

Specific Comments:

No Scientific justification of the 50% P Load Reduction Factor.

On March 9, 2009 President Obama issued an Executive Order on Scientific Integrity to all Executive Departments and Agencies which stated…

> "(b) Each agency should have appropriate rules and procedures to **ensure the integrity of the scientific process** within the agency (emphasis added);
>
> (c) When scientific or technological information is considered in policy decisions, the information should be subject to well-established scientific processes, **including peer review where appropriate**, and each agency should appropriately and accurately reflect that information in complying with and applying relevant statutory standards; (emphasis added)"

We were surprised to discover that EPA Region 1 did not rely on peer reviewed sources and instead utilized *CSN Technical Bulletin No. 9* by Tom Schueler (2011) as the foundation for their 50% Load Reduction Factor. We believe there is no scientific justification for this decision. Schueler (2011) is not a peer reviewed publication and often cites other reports/studies that were not subject to the peer review process. The use of the Schueler (2011) publication as a primary source by EPA Region 1 violates the President's Executive Order on Scientific Integrity (2009).

Peer reviewed research documents that nutrient losses (TN & TP) and storm water runoff (gallons) from plots of poorly maintained **un**fertilized turf are **greater than** nutrient losses and storm water runoff from plots of thick, healthy fertilized turf grass. EPA Region 1 should reevaluate the proposed P Load Reduction Factor and should not be engaged in promoting "no fertilization" of turf grass areas.

Members of the LHPWG are very familiar with the peer reviewed literature on run-off from turf grass lawns and would ask EPA Region 1 to review some of the following to ensure compliance with the previously mentioned Presidential Executive Order. In 2005, some of our current members worked with the American Chemistry Society Division of Agrochemicals and sponsored a symposium entitled "The Fate of Nutrients and Pesticides in the Urban Environment" in Arlington, Virginia. In 2008, the American Chemical Society published the proceedings of the Symposium "The Fate of Nutrients and Pesticides in the Urban Environment." The papers published in this publication are without question, directly on point and deal specifically with nutrient runoff from turf grass plots. These research projects actually collected samples of runoff from turf plots that were constructed for that purpose. Samples were collected for several years. This research is directly on point and should be used by EPA or any other agencies as the basis for any modeling of nutrient losses from turf grass via storm water runoff. The Bierman *et al* paper entitled "Phosphorus Runoff from Turfgrass as Affected by Phosphorus Fertilization and Clipping Management" published in 2010 was partially funded by the **Environmental Protection Agency** through Section 319(h) of the Federal Clean Water Act.

The LHPWG believe if the EPA Region 1 office had reviewed peer reviewed literature available (see references in the attached Report) a different conclusion would surely have been reached. We request that EPA Region 1 reevaluate the proposed P Load Reduction Factor and refrain from promoting the non-fertilization of turf grass areas.

Phosphorus Restrictions

EPA Region 1 supports phosphorus restrictions in specialty fertilizers, the agency included a provision in the NPDES MS4 Permit that required the permit holder to pass an ordinance restricting the use of phosphorus in specialty fertilizer. The ordinance was tied to the P Load Reduction Factor.

Minnesota was the first state to restrict the use of phosphorus is specialty fertilizers. The 2004 legislation was based upon "research" conducted by Mr. John Barten, an employee of the Hennepin Regional Park District in Maple Plain, Minnesota. The "study" used to support the legislation was not published in any peer reviewed journal. The legislation was effective on January 1, 2005.

In the last eleven years, fourteen more states have restricted the use of phosphorus in specialty fertilizers. We are not aware of any peer reviewed scientific literature that demonstrates a measureable reduction in phosphorus as a result of these restrictions. The state of Minnesota issued a report in 2007 to the legislature; the report did not document any water quality improvements.

EPA's Office of Water recently cited a study by Lehman *et al* (University of Michigan) that purports to document a 28% reduction in phosphorus levels in the Huron River after the Ann Arbor phosphorus ordinance was adopted from the base years (2003 - 2005).

The following is a quote from the paper entitled "Evidence for Reduced River Phosphorus Following Implementation of a Lawn Fertilizer Ordinance" written by Lehman *et al*:

> "It would be tempting to conclude that the phosphorus reductions were caused by implementation of the ordinance, and that may indeed be the case. However, we must bear in mind that the ordinance was enacted in the context of public education efforts that encourage citizens to be more mindful of yard waste discharges into storm drains, to exert more diligence regarding buffer strips of vegetation along stream banks, and to exhibit more environmental awareness in general."

Dr. Lehman recognized that there are a number of other activities that are ongoing within the City of Ann Arbor, Michigan that may have contributed to the phosphorus reductions that he and his team measured in the Huron River. The Lehman *et al* study uses Huron River average water quality data for total nitrogen and total phosphorus from calendar years 2003-2005 as the baseline for their study which was conducted in 2008 and 2009. We believe the following changes in city practices account for the reduction in the amount of phosphorus entering the Huron River.

1. According to Mr. Kirk Pennington, Field Operations Supervisor, the city of Ann Arbor replaced two of the five ELGIN Pelican sweepers with newer units that are more efficient than the older units. According to Mr. Mark Kinter, Technical Consultant with the Elgin Sweeper Company, an Elgin Whirlwind with vacuum (2005) is 12.5% more efficient and an Elgin Pelican with vacuum assist (2007) that is 10.5% more efficient than the older units. An aggressive street sweeping program is recognized by EPA as one of the most efficient ways

for a municipality to reduce total phosphorus loading to surface waters according to their research.

2. Also in 2005, the city of Ann Arbor, began to actively manage their local resident goose population. According to Ms. Casey M. Reitz, Permit Specialist, Wildlife Division, the city applied for a "nest destruction" permit from the Michigan Department of Natural Resources and Environment to mitigate the environmental impact of resident flocks of geese. The city of Ann Arbor also applied for a "nest destruction" permit in 2007, 2008, 2009 and 2010. According to peer reviewed research a resident flock of geese can be responsible for up to 25 to 38% of the total phosphorus loading within a small watershed. In some extreme cases a resident flock can contribute as much as 50% of the phosphorus loading.

These two important activities undertaken by Ann Arbor during the time of the study cannot be discounted when analyzing any resulting phosphorous reduction. We believe that these activities provided for the phosphorus reductions found by Dr. Lehman and his team. We are not aware of any municipality in the United States with a fertilizer ordinance that has been able to document nutrient reductions as a result of the fertilizer ordinance, which provides further support for our position that lawn fertilizer is not a significant source of nutrient runoff.

We asked ETS to evaluate the effectiveness of the phosphorus restriction enacted in Minnesota. The legislation passed in 2004 and went into effect in 2005. ETS evaluated the water quality monitoring data for 8 subwatersheds [Hydrologic Unit Code (HUC) Level 08] units in Minnesota before the restrictions were enacted and after the restrictions were put into place. The results were as follows:

From page 33 of 58 of the Report.

"These observations were combined with land use information obtained from the State's watershed website (Minnesota Pollution Control Agency: Minnesota watersheds) to characterize the subwatersheds around the monitoring stations (Appendix C). Table 4 summarizes key findings from Table 3 and Appendix C.

Table 4. Qualitative Relationship of TP Trends and Land Use

Monitoring Station	Significant Decline in TP*	Does Residential Land Use Dominate?
S000-282	No	Mixed
S000-220	No	No
19-0021-00-451	No	Yes
S-002-118	Yes	Yes
S-002-203	Yes	No
S-001-255	No	Mixed
S-000-185	No	No
S-002-311	Yes	No

* See Table 3."

From page 34 of 58 of the Report

"Three of the eight monitoring stations/watersheds demonstrated significant declines in TP concentrations over the period evaluated. All three of those stations are located in watersheds classified as having medium or high TP concentrations. This preliminary conclusion might be sufficient to generate a hypothesis worth testing. However, the law only targeted residential lawn P use, and the comparisons in Table 4 do not demonstrate a clear benefit of the law (Minnesota Statutes, Chapter 18C); i.e., **only one of the monitoring stations in a predominantly residential or mixed use area demonstrated a decline in TP** (emphasis added)."

We believe the only conclusion you can draw from this analysis is that nutrient losses of phosphorus to the environment from the use of specialty fertilizers on lawns in Minnesota, whether by over application (applying too much) or misapplication (applying off target) was not a **statistically significant source of phosphorus** to these watersheds. If phosphorus nutrient losses from the use of specialty fertilizers on lawns was a statistically significant source in Minnesota it would be readily apparent in the monitoring results.

We know this is true because thick healthy turf protects the environment and proper fertilization is necessary to maintain healthy turf. EPA region 1's proposal will negatively impact watersheds within Massachusetts. Using P-free specialty fertilizers or promoting no fertilization of turf grass in Massachusetts will result in more pollution and higher volumes of stormwater runoff.

Dr. Wayne R. Kussow from the University of Wisconsin- Madison has done a significant amount of turf grass research on phosphorus losses. He carefully constructed turf plots designed to collect stormwater runoff to evaluate the effects of P fertilization. He collected stormwater runoff from these turf plots for six years. This is the data from a single rainfall event.

June 30, 1997 Rainfall Event [1.43"]

lbs. P 1,000 sq.ft.	Runoff gallons	Conc. lbs. P / Gal	P Load Lbs. P / Acre	% Runoff
0.0	**146.0**	0.0000283	**0.00413**	**63.7**
0.5	67.4	0.0000363	0.00245	29.4
0.8	57.3	0.0000491	0.00282	25.0
1.3	**54.9**	0.0000443	**0.00243**	**24.0**

Notes: All plots are 8' X 32' [0.0059 acres]

1.43"/12.0" * 0.0059 acres * 325,900 gallons/ acre ft. = 229.1 gallons of water fell on each plot of turf. Please note that 63.7 % (146.0 gallons) of the precipitation that fell on the turf plot that did not receive any phosphorus was lost to runoff. Only 29.4 % (67.4 gallons) of the precipitation was lost as runoff from the site that received 0.5 lbs. of P per 1,000 sq. ft. of turf.

Dr. Brian Horgan; an Associate Professor and Extension Turfgrass Specialist at the University of Minnesota was one of the authors of the Bierman *et al* study (see Report references). The University of Minnesota also designed and constructed a turf grass research facility to capture runoff from turf grass plots and their data supports Kussow's data. You can see Dr. Horgan (on video) explain why stormwater runoff and nutrient losses are greater from unhealthy turf as opposed to healthy turf [http://www.gcsaa.tv/view.php?id=179]. The facility in Minnesota was constructed to collect turf grass data after the P restrictions were put into place. The results in Minnesota provided additional validation for Dr. Kussow's research in Wisconsin. Please note the research in Minnesota was partially funded by the **Environmental Protection Agency** through Section 319(h) of the Federal Clean Water Act.

Hydrologic Modeling

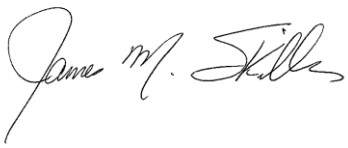
ETS has identified a discrepancy between Table 22 (mislabeled as Table 172) of the NPDES MS4 permit's fact sheet's attachment and the modeling output. Table 22 of the attachment provides annual runoff yields and overall average runoff yields from the model simulations. Results for the P8 fair condition runoff yields in Table 22 are 0.378 MG/ha/yr and 0.467 MG/ha/yr for hydrologic soil groups (HSG) C and C/D, respectively. However, the model output in the Excel spreadsheet titled "Summary runoff and P yield 7 16 13" given to ETS by Mr. Voorhees indicates these runoff yields should be 0.267 MG/ha/yr and 0.407 MG/ha/yr for HSG C and C/D, respectively. The discrepancy needs to be addressed.

Conclusion

There is no scientific justification for the 50% P Load Reduction Factor, because the peer reviewed scientific literature does not support it. The Agency is tasked with using peer reviewed scientific literature when available and it is clearly available. It is our opinion that the 50% P Load Reduction Factor should be deleted. EPA and or EPA Region 1 should not promote fertilizer use recommendations for turf grass, this should be left to State University and Extension Service specialists. Specialty fertilizer use is typically less than 3% of the total nutrient use in most states and is not a statistically significant source of nutrients to the environment.

Thank you for the opportunity to comment on the proposed NPDESMS4 permit. Please do not hesitate to contact me should you require any additional information.

Sincerely,



James M. Skillen on behalf of the LHPWG

Re: Comments on the Draft NPDES General Permit for Stormwater Discharges from Small MS4s in Massachusetts

Dear Mr. Tedder:

The Town of East Longmeadow has prepared the following comments and questions, referenced by page (from the copy of the draft permit provided on EPA's website) and by the permit section number. We have focused our comments on sections of the permit where we believe there is a substantial need for improvement to allow feasible, cost effective implementation of the Clean Water Act and NPDES program goals.

Part 1: Introduction

- (Page 3, Part 1.4): The listing of non-stormwater discharges should be expanded to include "uncontaminated discharges from residential sump pumps". For many years the EPA has been pushing communities to reduce infiltration/inflow entering their sanitary sewer systems. Private inflow removal, which includes residential sump pumps, has been a significant component of I/I reduction and a common solution has been to redirect the sump pump discharges to an available stormwater system. This redirection of private inflow has been an important component of a number of EPA Consent Orders, Consent Decrees and other enforcement actions and a number of communities have addressed this issue with full EPA knowledge and disclosure through the addition of stormwater laterals to allow private property owners a location to discharge their sump pumps. To not explicitly allow these discharges in the draft stormwater regulations after endorsing this solution as

an I/I reduction strategy for many years creates a significant contradiction in regulatory approaches between two units of the same federal agency.

- (Page 7, Part 1.10): This section requires permittees to modify or update their existing BMPs and measurable goals in their Stormwater Management Programs (SWMP) to meet the terms and conditions of the new permit. Does that mean that permittees cannot delete ineffective or impractical BMPs from the MS4-2003 SWMP while they are updating the SWMP? Part II.D.2 of the MS4-2003 allowed modification of the SWMP under certain conditions and Part 4.1 of the draft General Permit generally continues these requirements. As written, we interpret these sections to prohibit subtraction (deletion) of components or controls of the SWMP. While we agree communities should be encouraged to build on their current program for the new permit, EPA should recognize it has been over a decade since BMPs were first identified and therefore municipalities should be provided an opportunity to meet the new permit conditions using the most cost-effective, appropriate BMPs for the community in 2015 and beyond. We recommend the final permit be revised to explicitly allow flexibility in deleting ineffective BMPs that were committed to in 2003 during development of the updated SWMP that meets the new General Permit requirements.

Part 2.1: Water Quality Based Effluent Limitations

- (Page 10, Part 2.1.1.b & c): Please clarify the statement "or its tributaries in some cases." Does EPA intend to say that if a discharge from a MS4 to a tributary of a waterbody that is subject to an approved TMDL, or to a tributary of a waterbody that is impaired, that the MS4 is subject to the same requirements as if the MS4 were discharging directly to the impaired waterbody, even if the tributary is not listed in the most recent Massachusetts Integrated List of Waters as impaired or subject to a TMDL?

- (Pages 11-22, Part 2.2): It appears that EPA has applied TMDL and impaired waters requirements to receiving waters that are outside of the Regulated Area by including those municipalities in the watershed-specific list. We request that prior to issuing the final permit, EPA revise the lists provided in the permit (both this section and Appendices F & H) as appropriate to correct this.

    - What documents govern interpretation of TMDL and impaired waters applicability? Is it individual TMDL reports, the 303 (d) list / most recent Final Massachusetts Integrated List of Waters, or the tables provided in Part 2.2? See previous comment regarding applicability to tributaries that are not listed as impaired in the current Massachusetts Integrated List of Waters. Please state the source in the final permit.

- (Page 24, Part 2.3.2.e): It will be a significant challenge for East Longmeadow to measure effectiveness of stormwater educational messages and the overall education program at the local level, and it will be very difficult to determine if efforts provide meaningful results. It may not be an efficient use of funds to individually pay for independent effectiveness measurement programs that could be equally or more effective if done collaboratively. EPA should be measuring effectiveness of MS4 education program at a state or regional level. We recommend removing this requirement from the permit and suggest that EPA work with state agencies, regional stormwater groups, or watershed groups to evaluate the effectiveness of educational efforts. However, if this requirement must be included in the final general permit, we recommend this section be revised to encourage a collaborative effort between communities, regional stormwater groups, and/or watershed groups and clarify that EPA will consider these efforts as meeting permit conditions as long as they are completed in accordance with Part 2.3.1.b . In addition, if this requirement remains in the final permit, we respectfully request EPA provide additional guidance on measuring and tracking effectiveness of MS4 education programs at a local, regional, and state level.

Part 2.3.4 Illicit Discharge Detection and Elimination

- (Page 26, Part 2.3.4.4.b): Developing the inventory of SSOs would typically be completed as part of developing the written SWMP. We recommended EPA extend the timeline for completing the inventory of all SSOs to be within one year of the effective date of the permit.

- (Page 26-27, Part 2.3.4.5.b & c) and (Page 27, Part 2.3.4.5 c): Outfall inventory and dry weather inspections completed under the MS4-2003 should not need to be repeated since the objectives of the regulations have already been addressed through these initial activities. Redoing work is an unnecessary and inappropriate expenditure of limited public funds. We recommend coordinating the timelines of the inventory required by Section 2.3.4.5 and dry weather screening required in 2.3.4.7.d.iii to both be completed within three years. The most costly part of these requirements is the labor, and therefore we recommend revising requirements to allow performing dry weather screening and the outfall inventory concurrently, which will allow communities to reduce the number of time consuming visits to each outfall to save on labor costs.

- (Page 27, Part 2.3.4.5.b): EPA requires permittees to physically label all MS4 outfall pipes and interconnections with others MS4s with a unique identifier by the end of the permit term. With over 300 outfalls, it is prohibitively expensive

to label every outfall with no apparent direct water quality benefit for this effort. In addition, this labeling will have significant negative aesthetic impacts since many of these outfalls are located in rural areas and placing a signpost in these areas will create unnecessary visual pollution. We request that the EPA clarify the goals of the outfall labeling exercise and revise the permit accordingly.

  - Is the purpose of this exercise to provide a visual clue for citizens and businesses, alerting them to the presence of the otherwise unseen stormwater drainage system? If so, this can be easily achieved without labeling every outfall or interconnection. This goal could be more cost-effectively achieved through labeling a small number of "example" high visibility outfalls. To the average citizen a label that says "outfall number X" is alarming without supporting education. These small number of high visibility outfalls could be labeled not only with a unique identifier, but also with more information about stormwater impacts to surface water quality, recreation, public health, etc. The information could also include a website or contact information.

  - Is the purpose of this exercise to make it easier for EPA enforcement and environmental groups to identify outfalls and collect samples separately from the community's effort? If so, this goal could be more cost-effectively achieved by requiring communities to provide GPS coordinates or GIS data to EPA, as communities update their mapping. Because permittees are required to collect GPS locations of outfalls, submitting ether GIS files or latitude and longitude coordinates for each outfall would be adequate to meet this need.

  - Is the purpose of this exercise to make it easier for communities to identify their outfalls in the field as IDDE efforts progress? If so, we recommend this can be achieved more cost-effectively through other MS4 permit requirements, including developing an accurate drainage system map and developing a complete outfall/interconnection inventory including photographs showing each outfall.

  - There are some outfalls that may be impracticable for a municipality to label, as they are not readily accessible due to being located on private property with no easements. Also, due to the location of many outfalls, these markers are easy targets for vandalism or theft, which will add costs to replace.

- (Page 28-36, Part 2.3.4.7 and 2.3.4.8): The IDDE requirements are lengthy, cumbersome, and costly. The requirements are so onerous it will be very difficult to attempt full compliance.

- For example, it is likely that much of our system will be categorized as Problem Catchments. While we will not be required to complete dry weather sampling, we will be required to complete investigations of 100% of the problem catchments within five years, which may not be achievable or feasible. Catchment investigations will include opening manholes in roadways with heavy traffic, thereby necessitating police details and putting the safety of inspectors at jeopardy and causing traffic delays. We need to be able to expend our limited budget on finding and fixing non-stormwater discharge inputs instead of excessive planning.

- (Page 29, Part 2.3.4.7.c): While the IDDE Program has potential for measurable water quality improvements, the elaborate multi-step ranking process will not result in a cost-effective, pragmatic implementation strategy. The prioritizing and ranking process and milestones should be streamlined to reduce the onerous planning effort and result in the same environmental benefit. We request that EPA revise the process as such:

  - Classify each catchment into one of the four categories (excluded, problem, high priority, and low priority).

  - Rank all catchments together (regardless of category) using the criteria presented

  - Determine the total number of dry weather and wet weather inspection points (outfalls, interconnections, and key junction manholes) in each catchment area and schedule catchments for investigation based on category and priority ranking as well as staffing and financial considerations.

    Generally speaking, the goal should be to focus on which catchments are likely to have illicit discharges and which ones are unlikely to have illicit discharges. Then the likely catchments should be prioritized by severity.

- (Page 33 – 35, Part 2.3.4.7.e.ii): The draft General Permit is requiring communities to implement a manhole inspection methodology that "must, at a minimum, include an investigation of each key junction manhole within the MS4, even where no evidence of an illicit discharge is observed at the outfall." This is an onerous requirement with little potential benefit to improve water quality for the amount of effort. Inspecting manholes is valuable only when an outfall has dry weather or wet weather indicators (visual, olfactory, screening) of an illicit discharge. This procedure is ideal to find the problem during the time the discharge is occurring. In addition, there are substantial safety risks associated with inspecting key junction manholes. The majority of these

manholes will be in roadways with heavy traffic, putting staff and contractors at risk during inspections and necessitating police details. These efforts will also cause traffic nuisance conditions. To improve the benefit of the inspections and reduce the overall risk, we request that EPA revise this section of the permit to only apply the manhole inspection methodology when evidence of an illicit discharge is observed at the outfall.

- (Page 32 - 33, Part 2.3.4.7.d iv and vi): EPA has provided benchmarks that "indicate sewer inputs to the MS4", however, these benchmarks have typically been used for comparing results from dry weather sampling. What benchmarks does EPA want permitees to compare to for wet weather sampling results? Please clarify in the final permit.

- (Page 33, Part 2.3.4.7.e.i): EPA has provided "System Vulnerability Factors" for permittees to identify catchments that have a higher potential for illicit connections under wet weather conditions. Almost every catchment in our community will have the presence of these factors. Much of our drainage system is greater than 40 years old. Therefore we will be required to complete wet weather investigations of a high percentage of catchments. We request EPA re-consider the vulnerability factors and revise this list to be simplified and more focused, as there are currently too many factors. For example, remove the factor related to age being 40 years or greater as the other factor related to overall condition is more meaningful. Age is not necessarily an indicator of condition. Crossings of storm and sanitary sewer alignments and possible common trench construction situations can be seen when viewed from a map perspective, but oftentimes sewer lines are many feet below the drainage system, which will not likely result in exfiltrated sewage entering the drain line. The focus should be on situations where the sewer line is at a higher elevation than the drainage system or where it is within a few feet.

- (Page 35, Part 2.3.4.7.e.ii.b): Wet weather monitoring in accordance with the wet weather screening and sampling requirements to meet the deadlines specified in the goals and milestones section will be an all-consuming effort for DPW staff each spring, particularly when nearly all catchment areas have System Vulnerability Factors as described in the previous comment. There are a limited number of storm events that occur between March and June during business days and hours of operation. Field staff would have to monitor weather forecasts daily and attempt to do wet weather outfall monitoring during nearly every spring storm during business hours and beyond. One way to alleviate this burden could be to extend the wet weather monitoring season to include March through November. Recent increases in severity and frequency of storms in New England has been well documented. Extending the monitoring period would enable us to spread staff time over a longer period and also utilize labor from summer interns.

- (Page 37, Part 2.3.4.8.c): We request that EPA simplify this section and limit the IDDE burden by putting an annual cap on implementation of the Catchment Investigation (Part 2.3.4.7.e) equal to 10% of all outfalls with System Vulnerability Factors per permit year and perform the remaining catchment investigation procedure on up to 10% of inspection points (outfalls, interconnections, and key junction manholes). This would accomplish the goal of investigating our entire stormwater system within 10 years of the permit effective date, starting with the highest priority areas. Because the labor and screening cost are driven by the number of "inspection points" not catchments, the cost will be better distributed over multiple permit years. This change provides extra time to spread out the IDDE Program costs and considerable staff commitment.

Part 2.3.6 Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management

- (Page 40, Part 2.3.6.a.ii): We are very concerned that EPA has revised the post-construction stormwater management performance standards to be inconsistent with the Commonwealth's Stormwater Management Handbook (hereafter referred to as the Handbook). This is problematic for a number of reasons:

    - The Handbook was developed through an extensive public process, including receiving stakeholder input from engineers, contractors, communities, and the public, and the provisions were carefully vetted to ensure they are feasible and reasonable. While the MS4 permit has a public comment process and response to comments, this is not the same effect as obtaining stakeholder and expert consensus through numerous meetings and public outreach efforts to develop a state-wide stormwater management handbook with design guidelines and maintenance recommendations. Because comments EPA receives will be focused on the MS4 program, they will lack the substantial input on design details associated with a 1" requirement. We are concerned that EPA may issue a final permit that does not include the necessary technical considerations associated with retaining 1" or providing the equivalent level of pollutant removal.

    - The Handbook provides various considerations for redevelopment projects that recognize stormwater management for redevelopment is much more difficult and costly, and the Handbook allows flexibility for these types of projects. As the draft MS4 general permit is written, these flexibilities are not allowed, and therefore redevelopment projects will be required to expend significant money to comply and, in some cases, this requirement may make redevelopment infeasible and

push projects to green field sites. Additionally, this standard is applied to "the first one (1) inch of runoff from all impervious surfaces on the site" which unfairly applies this new standard to unimproved portions of the site.

- Has EPA considered how this standard will apply to improvements to municipal roadways, even if these improvements do not significant increase the existing impervious area? Roadway projects often exceed one acre of land-disturbing activity and even if they don't are often included in Capital Improvement Plans, which could be considered a "common plan of development" and therefore even though individual projects disturb less than one acre, the combined plan results in a disturbance of one or more acres. These roadway projects may merely be mill and overlay efforts that are necessary for public safety and long-term roadway maintenance. Will municipal roadway projects that don't significantly increase existing impervious area be required to meet this 1" standard?

- Even if mill and overlay projects are allowed without requiring new post construction stormwater management requirement, it is important to also allow communities to complete more extensive roadway improvement projects that do not significantly increase the impervious area to proceed without these new requirements. In many cases, it is much more appropriate to reclaim a road surface to depths of 18-inches or more to create a stable, long lasting pavement base. These projects have more extensive temporary impacts than mill and overlay projects but have no greater post-construction impacts and therefore should not be subject to more stringent post-construction requirements.

- For many roadway improvement projects, complying with post-construction requirements will be infeasible due to limited area for structural BMP installation on right of ways and limitations on installation caused by the existing drainage layout and elevations. Implementation of stormwater management systems within the right of way for the purpose of water quality and/or flow attenuation should be up to the discretion of the permittee and based on the receiving water-specific retrofit feasibility assessment and implementation requirements in Section 2.2 of the Permit. If these changes are not made to the draft regulations, many communities will be forced to significantly scale back their roadway improvement projects due to significantly increased costs or outright inability to comply with the new regulations. This will have a crippling effect on our ability of to properly maintain and improve our ever deteriorating roadways.

- This proposed new requirement is troubling since East Longmeadow has already adopted our local stormwater ordinance per the requirements of the MS4-2003. This bylaw references the ten MA Stormwater Management Standards as local "performance standards". Our bylaw exempts projects regulated by the Massachusetts Wetlands Protection Act to avoid redundant permitting and reduce costs and effort on both the applicant and the community's part. This new MS4 requirement will mean we must update our local code, which will be a costly and laborious effort. An update to our stormwater bylaw and regulation will require a public participation process, with numerous meetings, obtaining and responding to stakeholder comments, and review by Town Counsel followed by Town Meeting approval.

  We strongly recommend that if EPA desires this level of post-construction stormwater management, it work with MassDEP to initiate a public process to vet the technical components of the requirement, feasibility, and revise the Massachusetts Stormwater Handbook instead of adding this requirement to the MS4 general permit. If this is not possible, at a minimum, we strongly urge EPA to revise the requirement to match the Massachusetts Stormwater Handbook's considerations for redevelopment and revise the requirement to exempt municipal roadway projects when they are conducted in accordance with a SWPPP per MCM #4.

- (Page 41, Part 2.3.6 b & c): We recommend EPA revise the compliance timelines for part b and part c to be completed concurrently within four (4) years of the permit effective date. While these are slightly different efforts, review of local code (bylaws, ordinances, regulations, design guidelines, etc.) is time consuming and takes substantial effort, and therefore it is most efficient to review local code only once during the permit term. We recommend requirements relating to review of local code (regulations) be on the same compliance schedule.

- (Page 42, Part 2.3.6.d): We believe the goal of this exercise is to utilize impervious cover percent as a measure of watershed health, as the impervious cover model does. However, tracking annual changes in impervious cover will be significantly difficult, costly, and time consuming with no benefit to water quality. Therefore, we suggest the assessment be done only in the first and last years of the permit term (or every five years) and be supported by statewide GIS mapping initiatives to understand the short-term change and utilize these data to feed into planning impervious cover management under future MS4 permits.

Part 2.3.7 Good House Keeping and Pollution Prevention for Permittee Owned Operations

- (Page 44, Part 2.3.7.a.iii (b)): Because East Longmeadow, like most communities, has not surveyed or measured the distance to the bottom of each catch basin sump, it will be difficult to know when a sump is "50 percent full" and therefore we recommend a revised approach to this requirement. We request EPA allow communities to either annually clean catch basins or, if a community wants to reduce the frequency of cleaning to less than once a year, we request EPA require communities to use an easily measurable benchmark, such as ensure that deposits are no less than 2 feet below the invert of the outlet pipe, as an alternative for catch basins with a total sump depth of at least four (4) feet (i.e., deep sump catch basins). Another consideration for this requirement is that, if a community is sweeping more than once per year, there should be no need for all catch basins to be cleaned annually? More frequent sweeping results in decreased sediment and other loadings to catch basins, and therefore we request that communities that increase their sweeping to at least two times per year be allowed to reduce catch basin cleanings to reflect this.

Part 4: Program Evaluation, Record Keeping, and Reporting

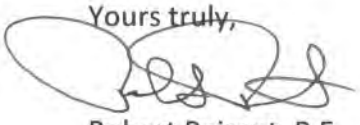
- (Page 51-52, Parts 4.3 and 4.4): There are numerous reporting requirements listed throughout the permit and also listed in these parts. To make it easier for permittees to correctly identify all requirements and timeframes for completion (deadlines), we request EPA prepare a table of all reporting requirements and deadlines to include in this section.

Other/Overall:

- Recordkeeping. The administrative burden of maintaining detailed written records for all permit activities, such as maintenance, inspection and training records should be minimized wherever possible. We suggest that EPA maintain flexibility on the level of detail required for this tracking effort that will be meaningful and yet not detract from the staff time for operation tasks as opposed to administration tasks. Cost efficient approaches to demonstrating compliance with the Good Housekeeping requirements might involve monthly summaries of highlights from staff time cards, employee diaries, and planning calendars.

We thank you for the opportunity to comment on the draft Massachusetts Small MS4 General Permit. Please contact me with any questions at 413-525-5400 ext. 1201 or robert.peirent@eastlongmeadowma.gov.

Yours truly,



Robert Peirent, P.E.
Superintendent

Subject: Massachusetts Small MS4 Draft General Permit Comments

Dear Mr. Tedder:

The City of Lowell and the Lowell Regional Wastewater Utility (LRWWU) appreciate the opportunity to comment on the above referenced permit. LRWWU shares EPA's goal of waters that meet their designated uses and agree that control of stormwater discharges is important to achieving that goal. However, we disagree with the approach taken by EPA in this draft permit.

The permit poses an undue burden on small Municipal Storm Sewer System (MS4) operators. LRWWU believes that Environmental Protection Agency (EPA) Region 1 has exceeded the authority given by the CWA to regulate municipal stormwater discharges, and has under-estimated the cost of compliance were the permit provisions to be implemented. The new requirements for Illicit Discharge Detection and Elimination (IDDE) and Sanitary Sewer Overflows (SSOs) are of particular concern, as well as the application of water quality-based effluent limitations. Our detailed comments are attached to this cover letter, with our concerns summarized below.

IDDE/SSOs

In the draft MS4 permit, EPA places significant emphasis on SSOs as illicit discharges, the result being that EPA appears to be "double-regulating" SSOs and also delegating Clean Water Act (CWA) authority to MS4s. For example, the draft permit requires the same reporting requirements as those found in the NPDES standard conditions of the individual permits for the POTWs that operate the collection systems. Therefore, this is information that EPA and the Massachusetts Department of Environmental Protection (MassDEP) are already receiving. It would be redundant to require MS4s to report SSOs.

Furthermore, the draft permit is inconsistent with integrated planning approach to municipal wastewater and stormwater management. This approach allows municipality to develop plans to meet CWA requirements that prioritize work so that the most critical public health and environmental protection issues are corrected first, whether they are due to overflows or stormwater discharges. The provisions of the draft permit would require an MS4 to address SSOs more aggressively than other sources of stormwater pollution.

EPA and delegated states have the responsibility under the CWA to take enforcement action to address SSOs. In Massachusetts, where EPA has primacy over the NPDES program, the expectation would be that collection systems with SSOs should be under some type of an enforceable schedule.

In cases where the MS4 is also owner/operator of the collection system and SSOs are already being addressed either through CMOM, permit (reporting), or state/federal enforcement action, then no further regulatory burden should be placed on that municipality. In fact, those circumstances are good candidates for the integrated planning approach. However, the lack of an enforceable schedule does not relieve the municipality of its responsibility to comply with its NPDES permit for wastewater discharge. Nor does it require the municipality to address SSOs through the stormwater program.

In cases where the MS4 is not also the owner/operator of the collection system and SSOs are already being addressed either through CMOM, permit (reporting), or state/federal enforcement action, then there should be no expectation for the MS4 to also require corrective action under the stormwater program. Where no enforceable schedule exists, then a legally defensible response would be for the MS4 to file a citizen's suit under SEC. 505 of the Clean Water Act (CWA) against the collection system operator for violations of the CWA **and** EPA for failure to act to correct those violations. The penalties available under the CWA are typically much greater than most municipal codes allow, so this action would provide more incentive for corrective action than penalties established in an MS4s IDDE ordinance.

The specific requirements related to SSO control should not be included in the final MS4 permit.

Wet-Weather Sampling Requirements for IDDE

The draft permit includes substantial wet weather monitoring requirements to detect illicit discharges, primarily SSOs. Neither the Center for Watershed Protection's IDDE Manual nor EPA's MS4 improvement guide recommend wet-weather sampling to detect illicit discharges. In fact, both documents note that wet-weather sampling is a poor method of identifying illicit discharges, since they are often overwhelmed by high volumes of storm water runoff and thus making it nearly impossible to detect during wet weather. This is especially true for SSOs, since stormwater runoff from dense urban areas often has high bacterial loads making it difficult to distinguish between SSOs and other illicit discharges. Other indicators of sewage – surfactants, ammonia and chlorine – would be very dilute in wet weather SSOs. The wet-weather monitoring requirements under the IDDE program place an unreasonable burden on permittees without providing definitive identification of illicit discharges.

We note that Phase II regulations allow, but do not specifically require monitoring. The MS4 Permit Improvement recommends a comprehensive water monitoring and assessment program to measure the effectiveness of the Stormwater Management Plan (SWMP), assess the quality of receiving waters, characterize stormwater discharges, and identify pollutant sources and illicit discharges. However, the MS4 Permit Improvement Guide acknowledges the different purposes of dry and wet weather sampling.

The wet-weather sampling requirements under the IDDE program should not be included in the final permit.

Cost of Compliance with IDDE Requirements

In the fact sheet, EPA estimates that the cost for compliance with the IDDE requirements of the Draft permit will be between $17,000 and $98,000 per year depending on the size of the MS4 system. However, other than referencing the Sustainable Stormwater Funding Evaluation Final Report (Horsley Witten, 2011), EPA provides no other basis for the estimates. For many MS4s, the mapping and analytical costs alone may exceed the $98,000 estimate. If additional personnel are required, then the costs to the MS4 would be much greater. Considering the unproven benefit of the IDDE requirements, these costs would place an undue burden on MS4s.

Water Quality Based Effluent Limitations (WQBELs)

The CWA requires that permits for MS4s "include a requirement to effectively prohibit non-stormwater discharges into the storm sewers and require controls to reduce the discharge of pollutants to the maximum extent practicable (MEP), including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants."

Unlike industrial stormwater there is not an explicit requirement that MS4 discharges meet water quality standards [Sec. 301(a) (1) (C)]. However, EPA, Region 1 is interpreting the "such other provisions...appropriate for the control of such pollutants" to allow the permitting authority to impose non-numeric water quality-based effluent limits. A careful reading of the CWA would suggest that Region 1's interpretation is incorrect because "such other provisions..." is included in a list of measures related to MEP and not a stand-alone requirement.

The MS4 permitting process is intended to be iterative; that is as control technology and management practices improve, MEP reductions would increase and MS4s would be held to higher standards. The most notable "jump" in MEP has been seen in post-construction stormwater management requirements, where infiltrative and other green infrastructure practices have been required in recent MS4 permits. By continuing to implement improved practices, the impact of municipal stormwater on receiving streams would be reduced.

The narrative Water Quality-Based Effluent Limits (WQBELs) proposed in the draft permit seem to be arbitrary and, in some cases, redundant. Since the CWA does not require that municipal stormwater discharges to meet water quality standards, and the proposed WQBELs do not appear to add significant value, these requirements should not be included in the final permit.

We respectfully request that EPA Region 1 enter our comments in the administrative record for this draft permit and look forward to a final permit that addresses our concerns.

Sincerely,

Michael Stuer

LRWWU Engineering Manager

Draft MA MS4 General Permit Comments

1.10. STORMWATER MANAGEMENT PROGRAM (SWMP)

1.10.2. Contents of the Stormwater Management Program

The City of Lowell's and the Lowell Regional Wastewater Utility's comments pertain to a number of items on this list and LRWWU expects that some of those provisions may change based on comments received from all sectors. We request that the contents of the SWMP be modified to reflect any changes to the referenced provisions.

2.1. WATER QUALITY BASED EFFLUENT LIMITATIONS

Sec. 402(p)(3) of the CWA contains the permit requirements for municipal and industrial stormwater discharges. Paragraph (A) clearly states that permits for industrial stormwater discharge meet all of the requirements of both Sec. 402 (National Pollutant Discharge Elimination System) and Sec. 301 (Effluent Limitations) which ultimately requires the application of both technology-based effluent limitations (TBELs) and water quality-based effluent limitations (WQBELs). Conversely, Paragraph (B) specifies the permit requirements for municipal stormwater discharge:

> *(i) may be issued on a system- or jurisdiction-wide basis;*
>
> *(ii) shall include a requirement to effectively prohibit non-stormwater discharges into the storm sewers; and*
>
> *(iii) shall require controls to reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants.*

The CWA clearly makes a distinction between industrial and municipal stormwater discharge permit requirements. Permit requirements and effluent limitations for industrial stormwater discharges are subject to Sec. 301 and Sec 402, while permit requirements for municipal stormwater discharges are subject only to Sec. 402(p)(3)(B).

The draft permit erroneously states, "Pursuant to Clean Water Act 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to an exceedance of water quality standards…" As seen above, sub-paragraph (iii) makes no such reference to "causing or contributing to an exceedance of water quality standards." The fact sheet states, "EPA has determined that §402(p)(3)(B)(iii) allows EPA to include more stringent permit requirements than those established as MEP in order to meet water quality standards." Again, we believe that this interpretation is in error since, as evidenced by the actual language of the CWA, "other such provisions" refers to "control of pollutants" and is included in the list of maximum extent practicable (MEP) controls and practices. Therefore, the CWA does not provide a legal basis for the inclusion of WQBELs in the draft MS4 permit.

2.1.1. Requirement to Meet Water Quality Standards

For the reasons stated above, we believe that this provision should be removed from the final permit.

2.1.2. Increased Discharges

The concept of increased discharge from an MS4 is questionable, since the source of discharge is ultimately precipitation to the watersheds that comprise the MS4. EPA's fact sheet suggests that new impervious area or a new outfall constitute increased discharge. We disagree. First, any new development or re-development (including new impervious area) is subject to the Post-Construction Stormwater Management requirements of Part 2.3.6, which include infiltration standards that are intended to mimic pre-development conditions. As a result, new impervious area would be required to employ best management practices (BMPs) that must minimize any increase in surface runoff. Second, the construction of a new outfall within an existing MS4's jurisdiction does not by itself increase the volume of runoff; thus; it cannot be considered the source of increased discharge.

2.2. DISCHARGES TO CERTAIN IMPAIRED WATERS

2.2.1. Discharges Subject to Requirements Related to an Approved TMDL

The draft permit requires that MS4s subject to an approved TMDL must implement specified provisions to be consistent with the terms of the TMDL. The fact sheet refers to the definition of TMDL in 40 CFR § 130.2 as the sum of all waste load allocations for point and non-point sources. This is certainly inclusive of stormwater discharges. Further, 40 CFR § 122.34 (e)(1) requires compliance with any more stringent effluent limitations that are based on an approved total maximum daily load (TMDL). Therefore, we agree that MS4 discharges subject to TMDLs must meet the TMDL requirements.

2.2.2. Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements

EPA cites CWA § 402(p)(3)(B)(iii) as the basis for the additional requirements placed on MS4s that discharge to impaired waters without an approved TMDL for the pollutants of concern. As explained in our comment on Part 2.1 of the draft permit, we believe that EPA Region 1's interpretation of the CWA is in error and therefore this provision should be removed from the permit.

2.3. REQUIREMENTS TO REDUCE POLLUTANTS TO THE MAXIMUM EXTENT PRACTICABLE (MEP)

2.3.2. Public Education and Outreach

We believe that public education is essential to the long-term success of an MS4's SWMP and we are generally in agreement with the draft permit requirements for Public Education and Outreach.

2.3.4. Illicit Discharge Detection and Elimination (IDDE) Program

The conditions proposed in the draft permit go significantly beyond the elements specified in 40 CFR §122.34(b)(3), including burdensome provisions that are unlikely to identify illicit discharges and include requirements that duplicate existing requirements placed on collection system operators through either NPDES permits or enforcement actions.

2.3.4.4 Sanitary Sewer Overflows

The draft permit requires the MS4 to eliminate an SSO as "expeditiously as possible" and in the interim minimize the discharge of pollutants. An SSO is an unauthorized discharge from a sewer collection system, which is permitted separately from the MS4. Such discharges are violations of the CWA and the legal liability for the violation, as well as the responsibility for corrective action, lies with the collection system operator, with EPA and/or the delegated state having both the authority and the responsibility for CWA enforcement in regard to those violations.

We agree that the MS4 must report any SSOs that it discovers to EPA, the Massachusetts Department of Environmental Protection and the collection system operator. We further agree that the MS4 must be notified of any SSOs that discharge to its system. However we do not agree that it is the MS4's responsibility to maintain the detailed inventory as described in *Paragraph B* of this part. All of that information should be compiled, kept and reported by the collection system operator. The reporting requirements under *Paragraph C* duplicate the reporting that is already required of the collection system operator pursuant to its NPDES permit. EPA is asking for information that it is already receiving; and it is assigning responsibility to manage SSOs to the wrong entity. Collection system operators are responsible for managing SSOs; that arrangement is sufficient.

We recommend that the provisions pertaining to SSOs acknowledge the role of the sewer collection system operator, focus on appropriate notification for SSOs that the MS4 discovers, include reference to EPA's integrated approach to municipal planning, and include appropriate legal remedies for MS4 situations where EPA fails to take adequate enforcement action against the collection system so as to eliminate the SSOs.

2.3.4.5. – Outfall/Interconnection Inventory

The draft permit requires the MS4 to develop an inventory of all outfalls and interconnections within its jurisdiction no later than one year from the effective date of the permit. This is a significant change from the 2003 permit and one year is an insufficient amount of time to develop a comprehensive inventory. Instead we suggest that the permit allow two years to develop the inventory.

The draft permit also requires physically labelling all outfalls by the end of the permit term. This may not be possible for all outfalls due to accessibility. Additionally, most MS4s do not have the resources to complete this task within one permit term. We suggest that the permit require no more than 50 % of the accessible outfalls be labeled within this permit term, with the remainder to be labeled within the term of the next permit.

2.3.4.6 System Mapping

We agree that a map of the MS4 system is an important part of not only the IDDE program but the overall SWMP. However, the two-year compliance schedule is unrealistic for most MS4s, including ours. We suggest that the timeframe for map development be extended to four years.

2.3.4.7 Written Illicit Discharge Detection and Elimination Program

The permit requires that the MS4 complete the written program within one year of the effective date of the permit. This is clearly not enough time given the complexity and detail required by paragraphs (a) through (h). Instead we suggest that MS4s be allowed three years to develop the written program.

2.3.4.7.4.c. Assessment and Priority Ranking of Catchments

Does the priority ranking provision require that the written program include the priority list or rather the method by which the list is derived? The catchments themselves would not be delineated within a year, since they are part of the mapping requirement that allows two years to complete. The permit language should be clarified in this regard.

We understand that an MS4 could have identified problem catchments based on either previous olfactory/visual evidence or previous sampling results. But we disagree with the methodology for using those results. This provision requires that, in the event that sampling results are to be used, then ammonia and surfactants must both exceed the screening level **and** either elevated bacteria level or detectable chlorine must be present in order to characterize a catchment as a "problem." This is somewhat confusing and we recommend a table or chart to simplify. Additionally, some MS4s may have a suite of parameters slightly different than those proposed in this part.

We suggest that such MS4s be allowed the discretion to use parameters that have been proven to be effective in characterizing catchments or identifying illicit discharges. Similarly, with high priority catchments, we suggest a table or chart to simplify, and that MS4s be allowed discretion to use alternative parameters. It is important to recognize that there are several effective methods for identifying illicit discharges; allowing MS4s to use their discretion to select the most effective methods for detection of illicit discharges would be practical and prudent.

The priority ranking factors for catchments (2.3.4.7.c.ii) seem reasonable, however, with regard to dry weather receiving water quality, the concentrations given for the indicator parameters are thresholds. We suggest language that would rank catchments based on actual concentrations of indicator parameters, not just an exceedance of a threshold value.

Part 2.3.4.7.c.iii of the permit requires that the illicit discharge potential assessment and priority ranking be completed within one year of the effective date of the permit. Until the mapping is complete, this data may be associated with outfalls as opposed to catchments and could not be updated based on catchments until the mapping is complete. Note that we've suggested four years instead of two for map development. Therefore, the requirement for assessment and priority ranking of potential illicit discharges should be allowed a four-year implementation period.

2.3.4.7.d. Outfall and Interconnection Screening and Sampling

The draft permit requires both dry and wet weather screening of outfalls for evidence of illicit discharges and SSOs. Dry weather screening is an effective way to identify illicit discharges. However, wet weather screening is not an effective way to identify either illicit discharges or SSOs. The volume of an illicit discharge is likely to be very small compared to the volume of stormwater runoff during a wet weather event. The bacterial concentration found in runoff from urbanized areas is oftentimes very similar to that of dilute sewage. The other indicators of sewage will be significantly diluted by the infiltration and inflow component of the SSO. Requiring wet weather screening is burdensome and ineffective, therefore **all** requirements pertaining to wet weather screening should be removed from the draft permit.

Permittees should be allowed discretion in selecting sampling parameters for screening. The list provided in paragraph 2.3.4.7.d.v. should be referred to as guidance as opposed to required parameters. We note that the IDDE guidance manual suggests that only three to five parameters are necessary to characterize an illicit discharge.

2.3.4.7.e. Catchment Investigation Procedure

The System Vulnerability Factors (SVFs) include several references to collection systems and SSOs. The focus on SSOs diverts an MS4's limited resources away from detection of illicit discharges and towards SSO identification and correction which are responsibilities of the collection system operator. We recommend that MS4s develop specific SVFs that target dry sources of contamination that are not otherwise addressed by the collection system management, operation, and maintenance program.

2.3.4.8 IDDE Program Implementation Goals and Milestones

Requiring dry weather screening of every MS4 outfall and interconnection within three years is an unrealistic requirement, given the number of outfalls that would need to be screened, the time necessary to conduct the screening, and the limited number of days that meet the requirements for dry weather screening. We suggest MS4s be given the entire permit term to meet the dry weather screening requirement.

Requiring the Catchment Investigation Procedure in all catchments regardless of the likelihood of illicit discharges is a "shotgun approach" that dilutes an MS4's effectiveness in finding and eliminating illicit discharges. The procedure should be limited to problem or high priority catchments.

2.3.5. Construction Site Stormwater Runoff Control

The City of Lowell and LRWWU find the requirements for the construction site runoff control program to be reasonable.

2.3.6. Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management)

Part 2.3.6.a.ii.a establishes stormwater management standards for newly developed and re-developed sites. The definition of re-development should be clarified. The current draft states that runoff from all impervious surfaces should be retained or treated. This requirement could effectively impede redevelopment in favor of new development by requiring retrofits for existing developed areas, which may have high costs or limited feasibility, in addition to any new or replaced impervious. The stormwater management standard also focuses heavily on infiltration and provides few feasible options in areas with clay soils or high water tables. We suggest that language be added to the permit that recognizes site limitations and provides MS4s with flexibility in those cases.

Part 2.3.5.a.ii.b precludes infiltration BMPs from industrial sites and those with documented soil contamination. We agree that infiltration should generally not be encouraged in these areas; however, the focus of the performance standard on infiltration and EPA Region 1's BMP Performance Extrapolation Tool used to calculate removal efficiencies includes few BMP options that do not promote infiltration. The permit should provide MS4s flexibility in this regard in order to promote brownfield/greyfield development in lieu of greenfield development.

Part 2.3.6.c requires a feasibility analysis of several green infrastructure practices by Year 4 of the permit; however, many of these practices will be necessary sooner to comply with the stormwater performance standard. The timeframes should be adjusted so that the feasibility of practices is determined prior to required implementation.

2.3.7. Good House Keeping and Pollution Prevention for Permittee Owned Operations

The requirements are generally consistent with the City of Lowell's and LRWWU's existing practices.

Appendix H Requirements related to discharges to certain water quality limited waterbodies

Appendix H, Part II.1.a.i.2 states that post-construction stormwater management in phosphorus impaired waters should focus on infiltration, which seems redundant with a base standard that already focuses heavily on retention and infiltration. Also, compliance with the requirement that BMPs be optimized for phosphorus removal seems to be subjective and intrinsic to other performance standard requirements.

Appendix I – EPA New England Bacterial Source Tracking Protocol

Permittees are required to adopt a screening and sampling protocol that is consistent with *Appendix I*. The purpose of the protocol is to provide a common framework for watershed groups, MS4s and regulatory agencies to conduct bacterial source tracking. Given that the protocol relies primarily on visual observations and the use of field test kits and portable instrumentation, our interpretation is that the MS4 is allowed the flexibility to select the sampling parameters and design a protocol that allows the MS4 to effectively track sources of illicit discharge.

Board of Public Works
The Town of Ludlow, Massachusetts

RECEIVED 12/22/14 NWT

December 17, 2014

Mr. Newton Tedder
U.S. Environmental Protection Agency, Region 1
5 Post Office Square, Suite 100 Code OEPo6-4
Boston, MA 02109-3912

Re: Massachusetts Draft EPA Storm Phase II Regulations

Dear Mr. Tedder,

The Town of Ludlow Board of Public Works has voted at its meeting on Tuesday December 16, 2014, to authorize the Ludlow Director of Public Works to provide our department's concerns regarding the proposed new Stormwater Phase II regulations. The following is a list of the most troubling portions of the proposed new Stormwater Phase II regulations.

1) Pavement maintenance work triggers retaining first inch of stormwater or stormwater treatment. Under the new regulations, when a town disturbs more than one acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) such as road reclamation projects, the new regulations require that the first inch of storm water be retained or all the stormwater must be treated. This essentially means a town now not only has to resurface the road, but has to completely redesign and re-construct the entire stormwater collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for stormwater storage or pay for the expense of stormwater treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way.

   As municipalities are aware, the funds available for pavement maintenance are less than half of what are needed to simply preserve the condition of the current infrastructure. This means that Massachusetts roads are falling apart faster than they can be repaired. The above added costs will compound the problem and create more failing roads and more erosion. Municipalities will be forced to use the lesser pavement rehabilitation techniques which will result in less pavement life, wasting available limited pavement maintenance resources.

   There must be an exemption for pavement maintenance projects. The above regulations should not be applied to maintenance projects. If a new road is being constructed or a lane is being added, these stormwater management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should be allowed without requiring extensive stormwater management upgrades.

198 Sportsmen's Road, Ludlow, Massachusetts 01056 Tel. (413) 583-5625, Fax (413) 589-1488

2) Chloride Reduction. Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to litigation. **The chloride reduction regulations should be limited to recommending that municipalities follow the latest accepted Best Management Practices.**

3) Requirement for tracking impervious area. The EPA in its permit guidance documents implicitly admits that the simple presence of impervious areas is not a direct correlation to stormwater quality. Tracking the amount of impervious areas does not have a direct correlation to water quality; therefore the MS4's should not have to expend resources tracking changes in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities.

4) Cost of implementation. An article published in Construction Outlook a publication of UCANE recently published EPA cost estimates of compliance between $70,000 and $829,000 per year depending on population and size. At the information session on the draft 2014 Stormwater Permit held on October 16, 2014 in Springfield, Newton Tedder from the EPA commented that he believes most cities and towns will have to pass a stormwater utility in order to pay for the costs to comply with the new Storm Phase II regulations. The EPA must be admitting that the new regulations are an undue burden and so costly that the municipalities cannot afford them with existing revenues. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to raise municipal expenses to comply with the new regulations. The regulations, reporting requirements and the overall implementation costs must be reduced to a sustainable and rational level.

5) Signage at outfalls. Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources. The signs will encourage theft or vandalism and will provide little to no use in management of the storm drain system. All regulated organizations are required to have maps with locations of all outfalls. The availability of low cost GPS devices makes these outfalls easily located by just about anyone.

Thank you for your consideration, if you would like additional information, contact me at jtgaucher@ludlow.ma.us or (413)583-5625.

Very truly yours,

J.T. Gaucher, P.E., Director
Ludlow Department of Public Works

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. The Massachusetts Rivers Alliance is a private non-profit 501(c)(3) organization dedicated to the protection and restoration of rivers in Massachusetts. We have 57 organizational members, including watershed and conservation groups around the state, as well as a growing membership of about 500 individuals and families. This permit addresses issues of great concern to our members, and we encourage prompt issuance of the final permit.

Stormwater remains a major impediment river health in Massachusetts: Polluted runoff from roads, parking lots and other impervious surfaces is a substantial contributor to violations of water quality standards in most Massachusetts rivers, streams, and lakes. EPA NPDES stormwater programs have been in place for Phase I and Phase II municipalities, construction sites, and industrial stormwater dischargers since the early 2000s. The Phase II MS4 permit took effect in 2003, and covers stormwater impacts from urban land uses and municipal practices covering a large portion of the land area in Massachusetts. However, compliance has been mixed during the extended first permit term, with insufficient progress in reducing impairments of water bodies for stormwater pollutants.

At the same time, Massachusetts has experienced significant flooding and pollution problems associated with stormwater in recent years, and scientists expect the cycles of flooding and drought to become more pronounced as climate change progresses. Massachusetts communities need to take on the difficult task of addressing these problems and upgrading their aging infrastructures to meet this challenge. **This permit is an important step in promoting these urgently-needed changes, and we strongly support its promulgation.**

General Comments

The draft permit represents a significant improvement over the 2003 permit, and is likely to be much more effective in reducing pollution, flooding and erosion caused by stormwater in urbanized areas. The draft permit generally strikes a reasonable balance between prescriptive requirements and flexibility. More specific deadlines and requirements for Illict Discharge Detection and Elimination (IDDE), municipal pollution prevention and good housekeeping, and other requirements clarify what is expected of MS4s and should improve rates of compliance. At the same time, the permit appropriately requires MS4s to develop their own plans for many aspects of the permit. Allowing MS4s to tailor their programs to local circumstances is good practice, given the variation in land use characteristics and current stormwater impacts. This flexibility will encourage communities to prioritize the most urgent problems and the most cost-effective solutions.

- The permit provides **more specific requirements and deadlines** in many cases, which should result in better compliance than was achieved under 2003 permit.

- The permit incorporates **water-quality requirements** that directly address the pollutants discharged in urban stormwater and that will invigorate efforts to correct long-standing exceedances of water quality standards.

- The permit gives permittees **adequate time and substantial flexibility** in choosing approaches to compliance that are most appropriate for local conditions. In response to comments on the 2010 proposed permit, EPA eliminated some requirements that permittees felt were overly prescriptive. In general, the permit emphasizes good planning, implementation and evaluation by permittees, and minimizes the use of rigid, one-size-fits-all approaches.

- **Permit requirements for greater public access and opportunities to comment** on towns' stormwater management programs will increase public support for these programs. Greater public scrutiny will also encourage more effective plans and more consistent implementation.

- **The post-construction requirements will curb land use practices that have led to our current problems in urban areas, and will begin to reverse the effects of many decades of poor stormwater management approaches.** EPA has chosen a balanced and effective strategy, by setting a high standard for infiltration for both new development and redevelopment and providing a safety valve where site conditions make meeting that standard infeasible.

The permit requirements challenge municipalities and their residents and businesses to do better monitoring and planning, to improve implementation, to raise public awareness of stormwater issues, and to design and maintain better stormwater management measures. If communities can meet these challenges, the permit **will result in a sea change in the management of urban stormwater in Massachusetts**.

Ten years into implementation of national stormwater standards, we have now had enough experience with urban stormwater management across the country that the ***costs, difficulty and uncertainty associated with urban stormwater programs have been substantially reduced.***

- **Contractors have gained experience** with stormwater programs under the 2003 permit and the Massachusetts Stormwater Policy, and are better able to support their clients in complying with the new permit.

- Several **regional stormwater consortiums** have been funded by the state under the Community Innovation Challenge Grants program. The Central Massachusetts Regional Stormwater Coalition, for example, has developed numerous shared resources for its member communities that provide training and support compliance with SWPPP, public education and many other permit requirements. These resources are publicly available on their website.

- There have been major investments **in new stormwater approaches** in many cities, including well-documented pilot projects, which have provided valuable information on the effectiveness and costs of various BMPs. These innovative programs have particularly demonstrated the value of Low Impact Development and Green Infrastructure methods in stormwater management.

- There are numerous **professional training programs**, including EPA's webinars, to help permittees understand and comply with the new requirements.

- EPA has also **encouraged or supported a variety of methods to reduce compliance costs** – including guidance, templates, tools, and encouraging collaboration in meeting requirements.

The permit puts **substantial responsibility on permittees to develop, implement and report on plans** for a variety of activities. Many of the requirements simply represent good municipal management practices. Some municipalities' current practices may not be up to these standards, however, and some permittees may therefore struggle to meet all the requirements for plan development and implementation on the proposed schedules. Other municipalities should be able to meet the permit schedules without a problem, especially those that made good efforts to comply with the 2003 permit requirements. **We urge that EPA provide model plans and links to resources for all of the MEP and Water Quality-based planning requirements**, as well as for the Public Outreach and Education requirements, to support compliance with these requirements.

Permittees can take steps to reduce compliance costs and to fund the required investments in stormwater programs and infrastructure. They can take advantage of many support services provided by EPA, MassDEP, local watershed groups and regional planning agencies and others, cooperate with neighboring communities where appropriate, and ensure that developers and other private parties are bearing their fair share of the burden both for preventing and for reducing stormwater pollution. Municipalities can fund their stormwater programs by

establishing stormwater utilities, and by taking advantage of new funding that will be provided by the Water Infrastructure Financing Act.

We applaud the emphasis on LID in the post-construction requirements. The state-of-the-art for LID and Green Infrastructure approaches has advanced significantly, as municipalities, developers, and consultants gain more experience with these techniques. Costs have come down, and practitioners have a better understanding of performance potential and design, build and maintenance practices required to make these techniques effective.[1] The time has come to take advantage of these advances, and strongly encourage use of these more sustainable and cost-effective approaches to achieve stormwater management goals.

While we strongly endorse the overall approach and requirements of this permit, **we have identified some areas where improvements are needed**.

- **The stormwater bylaw requirements should apply to projects as small as a quarter or half an acre.** Most urbanized towns, at least in the Boston area, have very few large development and redevelopment projects, and projects under an acre would not be required to employ *any* stormwater management measures unless they are located in wetland resource areas. This will make it exceedingly difficult for many towns to comply with the proposed prohibition against new and increased stormwater discharges from MS4s. MS4s have the flexibility to provide for simplified permitting where appropriate for smaller projects or projects with lower impacts. Simply excluding all projects less than one acre would allow too much new development and redevelopment to proceed without adequate stormwater management.

- In addition to conducting an annual evaluation of BMP compliance and effectiveness, **permittees should be required to take corrective action** where the evaluation shows that goals and objectives are not being met. An effective iterative approach to improving stormwater management requires that problems be addressed, and not simply identified.

- **MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements**. This includes requiring new development and redevelopment projects as well as retrofits on town-owned properties to implement BMPs that are most effective at reducing bacteria where the waters they discharge to (via an MS4) do not meet bacteria Water Quality Standards. These requirements are consistent with the proposed enhanced BMP requirements for other stormwater pollutants.

- **The compliance schedule for the Charles River Phosphorus TMDL is too long**, requiring only planning during the first five-year permit term. We recommend that the permit require TMDL compliance within 10 years. In addition, some basic pollution prevention, good housekeeping and new development/redevelopment requirements

[1] We believe that the language in the permit Fact Sheet, p. 35, incorrectly suggests that maintenance of LID controls may be more expensive or difficult than maintenance required for traditional stormwater controls.
[2] U.S. EPA, Office of Water, Water Permits Division, Summary of State Stormwater Standards, June 30, 2011 draft.
[3] The 2013 Western Kentucky University Stormwater Utility Survey lists over 1,400 stormwater utilities nationwide. Six states have more than 100 utilities each, and they have been adopted in communities of all sizes. Massachusetts

should be implemented during the first five years, to prevent things getting worse while MS4s develop more extensive plans to reverse problems at existing development.

- **We strongly recommend additional requirements to reduce widespread chloride pollution:** There is a growing body of evidence that widespread and increasing use of salt is contributing to high levels of chloride in our rivers, causing significant ecological harm. We recommend that requirements for development of a Salt Reduction Plan, tracking salt use and addressing application of salt on private development be required of all permittees, and not just for the limited number of waters that have been assessed for chloride impairments.

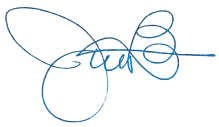
More detailed discussion of these recommendations and additional comments on specific sections of the permit are provided in an Attachment to this letter.

Massachusetts is falling behind many other states in tackling our urban stormwater problems. EPA's 2011 survey of state stormwater standards shows that a number of states have already adopted quantitative retention and treatment standards for all MS4s.[2] Currently, such standards only apply statewide in Massachusetts to sites in wetlands resource areas, through the state's Stormwater Policy. Compared with many other regions, we are only just beginning to adopt stormwater fees and utilities here – an important method for funding the investments required to manage urban stormwater effectively.[3] It is time for Massachusetts to catch up with best practices in its stormwater regulations.

We appreciate the careful work EPA has done to improve on the 2003 permit and the 2010 proposals, based on experience with the 2003 permit and comments on the 2010 proposals. However, the process has taken a very long time. **We strongly support prompt issuance of the final permit**, to end a long period of drift and uncertainty associated with delay in issuing this permit. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date

Thank you for considering our comments on this very important permit.

Sincerely,



Julia Blatt
Executive Director

Cc: Fred Civian, MassDEP

[2] U.S. EPA, Office of Water, Water Permits Division, Summary of State Stormwater Standards, June 30, 2011 draft.
[3] The 2013 Western Kentucky University Stormwater Utility Survey lists over 1,400 stormwater utilities nationwide. Six states have more than 100 utilities each, and they have been adopted in communities of all sizes. Massachusetts currently has only 6 stormwater utilities, despite the passage of state legislation explicitly authorizing local utilities.

Attachment: Comments on Specific Permit Provisions

1.7.2 Notice of Intent

We support the provision for electronic submission and the provision of a standard template. Many NOIs submitted for the 2003 permit were incomplete or uninformative, and did not provide measurable goals.

- We recommend adding a statement that applicants not submitting an NOI using the electronic template be required to use the template for its written NOI or otherwise provide all of the information required by the template, to maintain consistency across permittees in the types of information and level of detail required.
- We support the provision that allows any interested person to petition to have an MS4 be required to submit an individual permit or alternative NPDES general permit.
- An additional section is needed to describe plans for addressing water-quality limited waters without a TMDL, to the extent not covered in the MEP requirements.
- We recognize that some aspects of the SWMP will be difficult to specify within the time allowed for NOI submission. Where components of the SWMP cannot yet be determined, steps to be taken to design those elements should be described in the NOI.

1.10 Stormwater Management Plan (SWMP)

We support the requirement that the SWMP be made readily available to the public, including posting online unless the permittee does not have a website. This requirements should apply to all plans, monitoring results and annual reports as well. Any MS4s that cannot post these documents to a website should be required to make them available at a public library or other easily-accessed place. Requiring that all permit compliance documents be easily accessed by the public is an important factor in making the permit effective. Local environmental groups, watershed groups, and interested citizens can play an important role in encouraging effective plans and monitoring performance.

We support requirements for measurable goals for each BMP, including milestones and timeframes for implementation, defined qualitative or qualitative endpoints, and associated measure of assessment. These specific goals will support more effective monitoring of progress and compliance, by EPA and MassDEP, by the public and by the permittee itself.

We support encouraging permittees to maintain adequate funding sources for implementation of the program. We further r**ecommend that some description of plans for funding be required in SWMP**, including general description of planned or expected funding sources, any plans to develop a stormwater utility, and a schedule for resolving funding uncertainties.

We support the requirement for an annual evaluation of the SWMP, including evaluation of BMP implementation and effectiveness. This evaluation is critical to encouraging an interactive approach to improving stormwater management. **It is also necessary to specify steps to be taken if the evaluations show that some permit goals and objectives are not being achieved.**

Where ambient water quality and outfall monitoring shows persistent problems with bacteria pollution, where tracking Directly Connected Impervious Area and Impervious Area (DCIA and IA) shows little progress or even increased IA, where annual self-evaluations are not informative or persuasive, or there is other evidence of lack of effort or progress, it is critical that permittees be challenged to step up performance. In addition to the annual evaluation, **we recommend that permittees be required to correct any deficiencies identified**. Annual reports should (1) identify permit requirements that the permittee is not currently in compliance with, (2) identify any Best Management Practices (BMPs)that are not achieving the planned outcomes, and (3) describe planned changes in BMPs or other actions to correct course. Clearly, not every BMP will perform as expected, and implementation may fall short for a variety of reasons. The permit needs to encourage honest self-evaluation and iterative improvements, by asking for corrective actions as well as for evaluation. We concur with the permit language changes suggested in comments submitted by the Neponset River Watershed Association, which address the need for such corrective action.

We also recommend that EPA provide detailed guidance on methods for evaluating the effectiveness of each type of BMP, and examples of corrective actions that must be taken where BMPs are not achieving their goals and objectives. The BMPs involved in stormwater management vary widely in their characteristics, from those that have a direct and observable impact on water quality (e.g. IDDE requirements) to those that are very important but less easily evaluated in terms of their ultimate effect on stormwater impacts (e.g. Public Outreach and Education). A catalog of appropriate outcome measures for each BMP requirement, and a checklist of BMP improvements that must be considered where BMPs are not achieving the desired objectives, would be very helpful to permittees in initial development of their SWMPs and in their annual evaluations.

2.1 Water Quality Based Effluent Limitations

2.1.1 Requirement to Meet Water Quality Standards

The current draft permit language provides an overly-broad shield against requirements to comply with water quality standards. Section permit (2.1.1.d) appropriately requires that permittees eliminate conditions found to be causing or contributing to violation of an applicable water quality standard as expeditiously as possible, but no later than 60 days of becoming aware of situation. **This requirement is undermined**, however, by the language in Section 2.1.1 which states that a MS4 is deemed to be in compliance with this general requirement if it is complying with TMDL ***(2.1.1(c), 2.2.2 and Appendix H)*** or impaired waters requirements ***(2.1.1, 2.2.1(b) and Appendix F)*** of the permit. Plans approved to address discharges of stormwater pollutants to waters with a TMDL or impairment may not be sufficient to address a newly-discovered discharge. Instead of being provided a blanket exemption, the permittee should be required to, if feasible, eliminate the condition within 60 days OR review the existing SWMP provisions related to the pollutant of concern, determine whether additional activities or BMPs are required to address the newly-discovered discharge, and revise the relevant SWMP provisions (BMPs and goals) as needed, within 60 days.

2.1 Water Quality-Based Effluent Limitations

We support the addition of the water-quality based requirements to this permit. This approach provides much-needed attention, guidance and clarity to the existing requirement that MS4 discharges not cause or contribute to violations of the Massachusetts Water Quality Standards.

Waters with TMDLs (2.1.1, 2.2.1(b) and Appendix F)

We recommend requiring that these requirements apply to any discharges to waters that become subject to new TMDLs during the permit term. Compliance plans should be developed and SWMPs revised to include the new requirements within the first two years after the effective date of any new TMDL.

We recommend accelerating the schedule for discharges to waters subject to the Charles River TMDL for phosphorus. Appendix F sets a very lengthy compliance period for the Charles River phosphorus TMDL, which requires only *planning* for the entire 5 years of the permit. This means many years would pass before any actual reductions in phosphorus loadings from MS4s would be required. We strongly recommend that the permit require compliance with the TMDL within 10 years and that the milestones for Phases 1 – 3 be adjusted accordingly. Specifically, the Additional Enhanced BMPs described in Appendix H for phosphorus-impaired waters related to Public Outreach and Education, Stormwater Management for New Development and Redevelopment, and Good Housekeeping and Pollution Prevention for Permittee-Owned Operations should be required during the first two years of the permit period for MS4s discharging to waters with phosphorus TMDLs. A lengthy planning period is not required to implement these basic provisions. We concur with recommendations by the Charles River Watershed Association for changes in the Phosphorus Control Plan schedules and milestones.

We recommend strengthening the additional requirements for permittees discharging to waters with a TMDL for bacteria, to include:

- Revising post-construction bylaws or ordinances to require retention of 1" of runoff from all impervious areas for smaller projects, e.g. those disturbing ½ acre or more (or other extension to smaller developments/redevelopments.
- Requiring that new developments and redevelopments prioritize effective BMPs for controlling pathogens in stormwater discharges.
- Emphasizing retrofit opportunities for BMPs that are effective in reducing bacteria in stormwater in inventories of permittee-owned properties.

We concur with comments submitted by the Neponset River Watershed Association that provide detailed recommendations for strengthening the requirements for waters with bacteria/pathogen TMDLs.

Impaired Waters without TMDLs (2.1.1(c), 2.2.2 and App H)

Monitoring of urban stormwater has shown the consistent presence of certain pollutants in urban stormwater, which are targeted in this permit. EPA rightly notes that waters classified as

impaired for a particular pollutant do not have capacity for additional loadings of that pollutant, and that any loadings contributed by the MS4 cannot be authorized under the permit. **We support requiring that extra measures be taken to control individual stormwater pollutants for MS4s discharging to water-quality limited waters**. This is a sensible way to direct efforts at the most serious water pollution problems in individual waterways.

We recommend that the Proposed 2014 MA Integrated List of Waters be used instead of Final 2012 list, if it has been approved by the effective date of the permit.

We support allowing rebuttal of the presumption that specific pollutants are present in MS4 discharges. Where permittees can demonstrate that the target pollutant is not present in their discharges, it is reasonable to provide permittees a mechanism to exempt themselves from the additional requirements of Appendix F.

The specific Appendix F requirements to address each pollutant are generally reasonable. The permit defines additional requirements that are targeted to address the relevant stormwater pollutant of concern. These include additional public outreach and education messages, requirements that the pollutant be prioritized in post-construction stormwater management BMPs and in inventories of retrofit opportunities on permittee-owned properties, and other pollutant-specific practices. In addition, permittees are required in some cases to develop a source identification report and define specific plans to reduce levels of the targeted pollutant in discharges.

We recommend strengthening the additional Appendix H Part III requirements for permittees discharging to waters that are impaired for bacteria/pathogens, to include the additional MEP requirements suggested above for waters with TMDLs for bacteria/pathogens.

We recommend making some requirements for chloride pollutant reduction more broadly applicable. Application of salt in Massachusetts has expanded dramatically during the past two decades – the state now applies a greater tonnage of salt than any other in the United States. There has been no coordinated study on chloride and conductivity in Massachusetts' streams, and the listing of only six streams as impaired for chloride in the Massachusetts Year 2014 Integrated List of Waters vastly underestimates the number of streams impaired by chloride. The few rivers that have long-term records on conductivity (e.g. Charles, Mystic) show significant increases of conductivity associated with salt application during the past decade. Research from outside of Massachusetts is shedding greater light on the problem.[4] Given the broad application and well-documented toxicity of this pollutant, we recommend that all MS4s be subject to the Appendix H chloride requirements, unless they demonstrate the lack of chloride in their discharges through monitoring. Appendix H Part IV requirements for chloride should be included in the standard Good Housekeeping requirements in 2.3.7 and also be incorporated as requirements in post-construction bylaws in 2.3.6. See specific recommendations for Sections 2.3.6 and 2.3.7 below.

[4] Kaushal et al. (2005) highlights that urbanized streams of Baltimore with >35% impervious cover are consistently reaching chronic toxicity levels of 230 mg/l chloride – implications are that cities further north with greater snowfall are likely even more impaired at the same impervious cover. (Corsi et al. 2014) assessed 30 monitoring sites on 19 streams from throughout the United States and found that 29% of sites exceeded the US-EPA chronic water-quality criteria on an average of more than 100 days per year.

2.1.2 Increased discharges

This section notes that any increased discharges must be authorized under the Massachusetts antidegredation regulations 314 CMR 4.04 and that associated conditions must be incorporated in the MS4 permit by reference. **We recommend that any such conditions or requirements also be documented in SWMPs and evaluated in annual reports.**

2.3 Maximum Extent Practicable (MEP) Requirements

We support the provision allowing shared implementation of one or more of the minimum control measures (2.3.1.b), with the stipulation that the permittee remains responsible for compliance with all permit obligations. There are many areas in which collaboration among MS4s can reduce the cost of or improve the effectiveness of stormwater management activities, including joint outreach and education and sharing monitoring equipment.

2.3.2 Public Outreach and Education

We support the more specific requirements for outreach and education for specific target audiences. Requirements for municipalities to begin a public outreach campaign targeting not just their residents, but also commercial businesses, institutions and industries, will help all parties realize the role they can play in reducing stormwater pollution. Requiring evaluation of the effectiveness of specific measures, before subsequent outreach to the same target audience, will encourage permittees to make incremental improvements over the permit period.

2.3.3 Public Participation

We recommend clarifying that there should be opportunities for the public to review and comment on the NOI, on the SWMP and on annual reports, including self-evaluations, as well as opportunities for the public to participate in implementation through volunteer monitoring, clean up days, etc. The permit should require that all permit-related documents be readily available to the public, and should encourage public input on the SWMP, the results of annual self-evaluations, and other components of the annual report. The goal of public participation is to involve residents and local businesses actively in developing and taking a role in implementing the SWMP, which goes beyond occasional involvement in one or more isolated implementation activities. This involvement will encourage more effective programs, better performance, and stronger public support for SWMPs.

2.3.4 Illicit Discharge Detection and Elimination (IDDE)

We support the more detailed IDDE requirements in this permit. Requirements to prioritize, investigate and eliminate the very serious problem of illicit connections to storm drains (such as illegal tie-ins of sanitary sewer pipes) will reduce dangerous pathogen levels and help restore designated uses such as swimming and boating. The draft permit:

- Recognizes that different catchments present different threats to water quality, and reflects the need to prioritize investigations and remedial actions.

- Ultimately requires investigation in every catchment. This ensures that contamination throughout the system is identified and corrected. Some contamination may be contributing to pollution of groundwater or otherwise not showing up in outfall monitoring. Investigations should therefore not be limited to catchments for "problem" outfalls, although outfall monitoring provides valuable information for prioritizing investigations.
- Sets deadlines for investigating catchments. These deadlines will help ensure continued progress.

We recommend requiring that system maps be provided in GIS format (2.3.4.6.b), unless the permittee certifies that they lack access to GIS mapping capability at reasonable cost. Maps provided in GIS format are much more useful to EPA and to outside parties, as well as to the permittee itself, and are easier to update.

We recommend that MS4 managers be encouraged to incorporate water quality data from other agencies and environmental groups in their prioritization of catchments (2.3.4.7.c), as suggested in comments submitted by the Mystic River Watershed Association.

We recommend that permittees be required to provide in annual reports any screening data completed under the 2003 permit that supports request for exemption from 2.3.4.8.a screening/sampling requirements

Where a permittee is currently under an enforcement order from EPA or MassDEP and has an approved IDDE plan under that order, **the permit should clarify that that the permittee is required to meet all the new requirements of Section 2.3.4, or to describe in their SWMP how their current approved plan is as effective or more effective** than the requirements of Section 2.3.4.

2.3.5 Construction

We recommend that permittees be required to update their existing ordinances or regulatory mechanisms or create new ordinances/regulatory mechanisms within 2 years of the permit effective date, as needed to incorporate all of the requirements of this Part.

We endorse the Section 2.3.5(c)v requirement for procedures for receiving and considering information from the public during site plan reviews.

We recommend that some of the requirements of Section 2.3.5(c)v be moved to the Section 2.3.6 requirements for Post-Construction, or be repeated in both Sections 2.3.5 and 2.3.6.. These include requirements for site plan review and evaluation of opportunities to use LID and green infrastructure. These requirements are highly relevant to the design of effective post-construction stormwater management.

2.3.6 Stormwater Management in New Development and Redevelopment

We endorse the requirement for retention of 1" of runoff for all development and redevelopment sites, and the application of that requirement to the entire site area. This provision is critical to preventing future development and redevelopment from making conditions worse. This requirement ensures that the first flush, which contains the highest pollutant levels, is retained. It will increase the rate of infiltration, which will maintain underground water levels and base flow. This approach appropriately encourages redevelopers to evaluate their entire site and to treat site stormwater holistically and comprehensively to improve existing conditions. This is critical if redevelopment is to result in significant reductions in stormwater runoff and pollutant loadings – often the only opportunity for real improvements in many densely-developed areas.

Some concerns have been expressed about differences between the current MA Stormwater Policy Requirements and the 1" retention requirement in the draft permit. Critics note that municipalities and developers are now used to applying the MA Stormwater Policy requirements, and they oppose going beyond those requirements in the MS4 permit. This is not a good argument for halting progress in regulatory requirements. We note that there was substantial opposition to the MA Stormwater Policy at the time it was adopted, with critics arguing that the infiltration and other requirements would be impossible to meet. Yet as is so often the case with new regulations, a new standard of practice was established by the MA Stormwater Policy and the costs of meeting standards came steadily down with experience. The MA Stormwater Policy has played an important role in advancing stormwater management in Massachusetts, but it has not adequately addressed the problem of urban stormwater pollution. The 1" standard is now required by the Boston Water & Sewer Commission and the Town of Franklin, among others, and very few exceptions have been necessary.

We also endorse the provision that allows for treatment equivalent to that provided by retention, where specific site conditions make compliance with the 1" requirement infeasible. Infrequently, it may be infeasible to achieve a 1" retention standard, due to soil conditions, high groundwater levels, or contamination. It makes sense to provide an alternative compliance path for these sites, rather than to preclude new development entirely or discourage redevelopment, thereby freezing in place the poor stormwater management practices of the past. Section 2.3.6.a.ii(a) **should make it clear that treatment in lieu of 1" retention is allowed only if specific site conditions make full 1" retention not feasible, and retention should be used to the maximum extent feasible before relying on treatment.** We concur with the revisions suggested by the Charles River Watershed Association for this section.

We also suggest that EPA allow offsite compliance options for MS4s subject to nutrient TMDLs as alternatives where site conditions make full compliance with the 1" retention standard infeasible. Developing an effective trading system and mitigation provisions will require careful design to ensure true equivalence in the level of pollution and runoff control provided. However, allowing more options for meeting performance standards can result in substantially better environmental results at lower cost. We recommend that EPA develop guidance for offsite mitigation, and for permit requirements that address a single pollutant (e.g. phosphorus) with an aggregate load requirement, watershed-wide trading rules.

EPA has chosen an overall effective approach, by setting a high performance standard and providing offsite alternatives and requiring treatment when site conditions make meeting that standard infeasible. The permit should require 1" retention to the maximum extent feasible; allow for offsite mitigation or trading for the volumes that cannot be feasibly retained onsite; and finally, provide for equivalent treatment only where a combination of onsite retention, offsite mitigation or trading cannot meet the full 1" retention requirement. This is a far better approach than setting a lower standard for all sites where some but not all sites would have difficulty meeting the standard, and simply waiving requirements where site conditions make full compliance with the 1" infeasible.

The Section 2.3.6.a.ii(b) prohibition on infiltration BMPs at industrial sites is too broad. We recommend that this restriction be limited to industrial sites where there is processing or materials storage outdoors that might be exposed to precipitation or result in spills that would be exposed to precipitation.

We recommend a requirement that bylaws include pollution prevention requirements for new development and redevelopment. These should include requirements similar to those specified for permittee-owned facilities in Section 2.3.7. They **should also include source-reduction requirements to reduce chloride pollution**, including descriptions of winter deicing practices, prohibiting disposal of snow in surface waters, and prohibiting exposed (uncovered) storage of salt or deicing chemicals.

We recommend that EPA provide additional guidance on how BMPs should be chosen and constructed. EPA's BMP Performance Extrapolation Tool (PET) covers only some of the pollutants found in stormwater – Total Phosphorus, TSS and Zinc (with Total Nitrogen to be added). Additional guidance is needed on selection of methods for verifying equal to or greater treatment performance for other stormwater-related pollutants (bacteria, oil and grease (hydrocarbons) chloride, and metals). In addition, the permit should allow for use of other resources for demonstrating performance, with the proviso that the applicant verify that any guidelines used that are not consistent with EPA's BMP PET are more up-to-date or relevant to the specific site-conditions than those incorporated in the BMP PET.

We support requiring permittees to assess local practices and requirements that affect impervious cover (2.3.6.b) and use of green roofs, infiltration BMPs, and water capture/reuse (2.3.6.c), as well as opportunities to modify or retrofit the permittee's property and infrastructure to reduce impervious area (2.3.6.d). These requirements will remove local barriers to more cost-effective approaches to stormwater management and will promote more proactive management of municipal stormwater. **We recommend that all assessments, recommendations and schedules be included in the SWMP as well as in the annual reports,** or otherwise be made publicly available. In the current draft permit, only the 2.3.6.b report on local street design and parking lot requirements that affect impervious cover is required to be included in the SWMP.

We request that EPA provide training, technical assistance, guidance or model reports and methodologies for these evaluations, including by working with watershed associations and regional planning agencies. The quality and effectiveness of these assessments will be substantially enhanced by strong technical support.

We also support requiring tracking of IA and DCIA (2.3.6.d)**.** Tracking these aggregate results will help permittees and EPA assess whether their programs are in fact resulting in a decrease in DCIA. The adage that "We manage what we measure" applies to this requirement – without such tracking metrics, it would be difficult to assess the overall effectiveness of a permittee's SWMP.

2.3.7 Good Housekeeping

We support the requirements for enhanced stormwater management and pollution prevention for municipal facilities and operations. Many of the requirements of this section are based on good asset management and operating practices for any municipal function. Where permittees are required by the permit to upgrade their normal infrastructure planning, inspection, maintenance, pollution prevention and other good housekeeping practices, they will experience the improved overall functioning as a side benefit.

We recommend that some of the chloride reduction requirements described in Appendix H be made part of the Good Housekeeping MEPs, rather than being limited to MS4s discharging to waters classified as impaired for chloride. Specifically, the standard Good Housekeeping requirements should include tracking and reporting of types and amounts of salt used for all permittee-owned and maintained surfaces; training for staff and contractors on appropriate application rates and best practices; and preventing exposure of salt storage piles to stormwater.

4.0 Program Evaluation, Record Keeping, and Reporting

See comments on Section 1.10 regarding recommendations for making program evaluations more effective.

Re: Comments on Draft MS4 Permit

Dear Mr. Tedder:

The Massachusetts Watershed Coalition welcomes the opportunity to comment on the EPA's Draft General Permit for Small MS4s in Massachusetts. We strongly support the proposed rules that can renew the health of streams, lakes and water supplies across the state.

The MWC partners with community groups, municipal officials, state and federal agencies to protect and restore local waters and ecosystems. Our programs focus on stormwater pollution, low impact development and sustainable watersheds. MWC has helped many communities to adopt stormwater bylaws and regulations. We also assist homeowners, schools, churches, businesses, youth groups and town boards to design and install stormwater solutions. MWC is heartened by the EPA draft 2014 MS4 permit that is an essential step forward in the evolution of nonpoint source pollution control.

Community surveys by MWC and others find people are very concerned about water pollution and survey respondents strongly support measures to protect cherished brooks, ponds and lakes. Municipal boards and departments are well-aware of these concerns and are eager to prevent and reduce polluted runoff. Local builders and businesses know clean water is vital and will help communities avoid stormwater damages. As you know, cost and control are central matters for community-wide efforts to improve stormwater management.

The six MCMs required for municipal Stormwater Management Programs (SWMPs) supply a proactive means to reduce stormwater damages. There are constant opportunities to prevent and reduce polluted runoff through the community planning and development process. Many opportunities can be realized as people learn how streets can be disconnected from streams.

We praise the public education and public participation MCMs that can inform and engage more people in stormwater management. Likewise, we strongly support the IDDE, the Construction Site Control, and the Good Housekeeping MCMs, which can enable municipalities to eliminate pollutant sources at minimal expense. We also endorse the Post Construction MCM provisions including:

- Design of BMPs to remove pollutants from the first inch of storm runoff
- Installation of BMPs in accord with MassDEP's excellent Stormwater Handbook
- Long term operation and maintenance plans for structural BMPs
- Permittee review of development guidelines to limit creation of impervious cover
- Encouraging permittees to consider/promote green infrastructure practices

Additionally, we are especially enthusiastic about the provisions of 2.3.6 d regarding Directly Connected Impervious Areas. These requirements can help people know where the sources of polluted runoff occur, thereby enabling communities to select the best places to capture more pollutants for less cost. Since many municipalities are unaware of the DCIA maps and statistics supplied by the EPA stormwater website, it would be helpful to further describe these tools in the final MS4 permit. This description could also explain how communities can use the Simple Method to estimate DCIA pollutant loads. MWC has applied the Simple Method to approximate the loading from street catchment areas. This simple technique can help communities estimate pollutant loads and determine priorities for BMP retrofits of MS4 properties and infrastructure.

Much polluted runoff (not all) can be easily halted at low cost. MS4 guidance could stress use of inexpensive retrofits (i.e., it can be as beneficial to capture TSS for a dollar a pound as it is to pay $100 a pound to capture TSS through expensive BMPs). MS4 guidance can also address BMP maintenance costs and explain how the removal of sources of nonpoint pollution is a win-win for communities and local taxpayers.

We urge more use of plain talk the general public understands. MS4 outreach can shift attention from technical terms to the main point that billions of pounds of pollutants are unknowingly dumped into New England waters by millions of homeowners, businesses and well-intended municipal officials and personnel. The decades-old struggle to halt nonpoint pollution will move forward faster when people know road runoff is killing fish, as well as feeding invasive weeds and toxic algae blooms that pose health risks or spoil water-based recreation for their families.

We applaud MS4 permit provisions and the public benefits to be achieved, but are concerned about delay in permit issuance. We understand there are myriad legal, logistical and political issues that must be resolved to facilitate new rules. Please do not wait until 2016 to explain the working details of the MS4 permits. The coming year can be well-used to better inform people about the intent and positive outcomes from these rules. Clean water advocates are ready to assist EPA to help communities understand and be prepared to implement MS4 permits.

Thank you for your consideration of these comments.

Sincerely,

Ed Himlan

Re: Comments to the Massachusetts Draft Small Municipal Separate Storm Sewer System (MS4) NPDES

Dear Mr. Tedder:

The City of Manchester has reviewed the Massachusetts Draft Small Municipal Separate Storm Sewer System (MS4) NPDES and offer the following comments,

1. Page 2, section I, Stormwater discharges to the subsurface subject to state Underground Injection Control (UIC) regulations, it refers to structural controls that dispose of Stormwater into the ground. As all of the current BMPs are methods that have been thoroughly tested for removal capacities, none of the BMPs have been evaluated for pollutant transfer through groundwater base-load movement. The UNH Stormwater Center studies have exhaustively reviewed removal capacity of various structures. A range of percentages of nutrients and metals are removed from the Stormwater that enters the treatment unit to the stormwater that exits the treatment unit. What is lacking is the impact the infiltration has on base-load aquifer and the eventual movement and re-entry back into the water way. No down–gradient wells were dug and the groundwater tested before the implementation of these structures and no subsequent measures were made to determine the shift of pollutant concentration from the surface water to the moving groundwater. It appears logical the

surface mitigation “BMPs” transfer the pollutant load into the subsurface, but delay the eventual release of these pollutants due to soil characteristics, particle adsorption, and attenuation principles. It is not out of the realm of possibilities that the pollutant loads concentrated in the aquifer base-load will eventually be re-released back into the very water ways the BMPs were expected to protect in the first place. It could be expected that a slight gradual reduction in water way pollutant is seen in the first few years with a flattening in concentration in subsequent years with an even bigger increase in later years. It is imperative that the UIC regulations take into consideration groundwater movement, pollutant transfer and mass balance of removed pollutants before assuming that BMPs are the answer to current stormwater concerns.

2. Page 3, Section 1.4, Non-Stormwater Discharges outlines a defined category from a. through r. Stormwater concerns are the runoff from streets, the fertilizers from lawns, runoff from buildings and washout of nutrients from stagnant wetlands. When one reviews this list it covers most, if not all, Stormwater concerns. The only difference is the non-stormwater discharge is now created by manmade actions vs. rainfall. Rainfall is a naturally occurring condition. The regulated communities need a listing of Stormwater related discharges as there is definitely confusion between non-stormwater discharge listing and what could potentially be Stormwater.

3. Page 6, Section 1.9.1, Documentation of Endangered Species, is a huge burden to place on small communities. It should be the obligation of the EPA to forward any NOI request to the State and Federal Fish and Wildlife services and they can attach an addenda to the final permit of what the endangered species are in their jurisdiction and where there habitat is located.

4. Page 7, Section 1.10, SWMP refers to Appendix B. Appendix B indicates under B.1, Duty to Comply that the permit holder must comply with the effluent standards and prohibitions established under 307(a) of the CWA. These standards and prohibitions were not established or intended for non-point source discharges such as urban runoff, but made for drainage pipes and manmade ditches. Many Urban Ponds are impacted solely from street

runoff without the contribution of concentrated Stormwater from conveyance drainage pipes or manmade ditches and should be clearly excluded from this requirement.

5. Page 9, Section 2.0, Non-Numeric Effluent Limitations can't be developed until a determination is made as to how much pollutant concentration structural BMPs contribute to the water quality over the long term. These concerns are outlined in Section 1.

6. Page 10, Section 2.1.1, Requirement to Meet WQ Standards does not take into account contribution from adjacent areas outside the jurisdiction of the MS4 Permittee or from non-stormwater classified contributions. The individual parameters may indicate a potential problem, but the reality is that the source of the problem may be an unregulated entity outside the MS4 program. Agriculture and private residences are exempt under stormwater regulations. However through fertilization, car washing activities and general practices associated with each (as outlined in the non-stormwater listing) will show the largest impact to ammonia, potassium, phosphorus, surfactants, metals and pH. Conductivity will also increase because of the salts associated with these exempt stormwater sources. A watershed approach where all communities contribute to the solution via load allocation based on either population or land mass would offset the problem of interjurisdictional contribution. This draft MS4 permit does not account for non-MS4 communities, state and federal highways, and exempt entities. Until all entities are regulated, especially agriculture, it will be impossible to show improvements to water quality criteria on a consistent basis.

7. Page 17, Section 2.2.2, Discharges to certain WQ limited waters. The second paragraph states, *"If the discharge from as MS4 to a water quality limited waterbody where pollutants typically found in Stormwater (nutrients (nitrogen or phosphorus), solids, bacteria/pathogens, chloride… the Permittee shall comply with the provisions in Appendix H."* Shall is a mandatory statement, yet the opening paragraph of Appendix H reads, *"The estimates of nitrogen load reductions resulting from BMP installation are intended for informational purposes only and there is no associated Permittee-specific required nitrogen load reduction in the Draft Permit. Nitrogen load reduction estimates calculated consistent with the methodologies below may be used by the Permittee to comply with future permit*

requirements providing the EPA determines the calculated reductions are appropriate for demonstrating compliance with future permit requirements." These two statements are in total conflict with each other. The draft permit dictates that the Permittee shall comply with Appendix H and Appendix H indicates that the load reductions are intended for information only and not associated with any Permittee-specific load reduction in the draft permit. Appendix H even goes further to indicate that this will only apply to future permit requirements (wording indicates that it only applies to the next issued permit which is at least five-years after from the issuance of this final permit. The draft defined the iterative approach addressing pollution reductions outlined in Appendix H, yet Appendix H indicates the Permittee only need comply with future permit requirements providing the EPA determines the calculated reductions are appropriate for demonstrating compliance with future permit requirements. In all the workshops attended the regulatory community indicates that pollutant reductions are only target values, and if the BMP proves not to meet these values, more reduction will be necessary to meet TMDL goals. This is not consistent with the determined calculated reduction as outlined in Appendix H. The permit lists 75 communities that fall under the Nitrogen impairment. It would be hard for these communities to determine which is the applicable route to take with the conflicting wording regarding compliance.

8. Page 22, Section 2.3.1, Control Measures creates a legal nightmare for communities when looking at inter jurisdictional issues. The second bullet describes control measures from one community to be at least as stringent as the corresponding community. This would require an intermunicipal agreement between the towns with detailed legal wording. Many towns that have had to develop inter-municipal agreements due to regional plants have in cases taken years to come to an agreement. The final bullet indicates if one community fails to fulfill the compliance of its permit obligations that the compliant community now becomes responsible for the non-compliant portion of the non-compliant community's flow that passes through the compliant community. Many urban ponds receive watershed runoff from outside their jurisdictional boundaries and this may be from other MS4, non-MS4, and state and federal roadways. We have seen this in many NH communities and have made comment to the NH MS4 in this regard. There are concerns with naturally occurring metals (aluminum being the biggest), deposition from acid rain that MS4 communities will not be

required to reduce, agricultural discharge from both small and large farms (only cattle feed lots are regulated) and the interstate highway systems. A realistic determination of contribution from state-wide sources should be an appendix to this draft permit. This would encourage MS4 communities to do their part, outline the total contribution by non-MS4 regulated entities, and allow the regulatory agencies to set reasonable targets for MS4 regulated communities that deals with their contribution and not all the extraneous contribution. It may be that a targeted watershed approach with slow and steady progress would be a better solution that targeting a handful of communities and saddling these with the burden of cleaning up all the water that passes through their jurisdiction. There has yet to be an answer to these concerns as voiced in the NH MS4 comments that were submitted over two years ago.

9. Page 22, Section 2.3.2, Public Education works for three out of the four groups. Business, developers and industrial facilities already practice good environmental governance and they will be receptive to this outreach. Residences are generally governed by the educational status of the home owner. The City of Manchester has over 25,000 accounts where outreach has been ongoing for several years. Residents will always choose to use a cheaper fertilizer (usually the less environmental friendly version), will not spend economic resources to do onsite infiltration, do not have the scientific knowledge or want to spend the money on chlorine neutralizing pool chemicals and will continue to work on their vehicles in their driveways to save money from expensive automotive shops. Manchester has expansive kiosks at the four urban ponds and the Crystal Lake swimming area that we have maintained since 2000. A couple of times the City set up a survey booth at the swimming area and one of the urban ponds that has a walking path around the entire pond. The kiosk outlines the types of fish in the pond, the types of vegetation, invasive species, pond facts, history of the pond and a pond map. When the people who frequent the pond on nearly a weekly basis or more throughout the summer were asked what information was contained in the kiosk, few knew more than one item, most knew the kiosk was there, but never stopped to see what it contained for information, and few frequent users didn't even know the kiosk existed. If people who frequent a pond (because they get joy out of it being there) have exposure to an information board over the course of about 26 weeks and with the majority not knowing what the board contains, how can one expect a couple of annual mailings to

home residences to produce any better impact. Item e. of this section to show evidence of progress should only be geared to the three receptive groups. If there are successful programs out there, then EPA needs to include an attachment to demonstrate where it has worked and what the measures that were used that showed progress.

10. Page 26, Section 2.3.4.5 Outfall Inventory is a good step that all communities would like to have completed, however the time frame outlined in item b. and c. are too short in duration. Section b provides for a one-year (two-years for new permittees) to complete. Towns like Taunton, Fall River and Carver all have 40 or more square miles of land to inspect. As these are MS4 communities they have one-year to complete the dry weather screening process to include sensory observations and sampling (if necessary). The process is made more cumbersome by the required Vulnerability System Factors required investigation outlined in 2.3.4.7, Section e(i) also requiring yearly reporting. The City of Manchester, NH has 35 square miles of land mass and we are required to do two inspections every five-year permit cycle and find that to be a burdensome compliance requirement without the vulnerability system factor component. It would be a challenge to find appropriate staff if Manchester had to do this requirement annually. Once every three-years has proven effective here in New Hampshire.

11. Page 32, Section 2.3.4.7, Written IDDE Program Item d(i), refers to the New England Bacterial Source Tracking Protocol. The protocol relies primarily on visual observations and the use of field test kits and portable instrumentation during dry and wet weather screening investigations of Stormwater outfalls. As outlined in comment 10 above, a reference is made to the tracking protocol, but item c. clearly states sensory observations. Unless one has time to dig into sections, cross references and ultimately documents, it is evident that the magnitude of certain requirements is being hidden deep within the appendices. Not only are kits and meters required, but when human sanitary sewage is confirmed a sample must be collected for Pharmaceutical and Personal Care Products. Screen also requires surfactant, ammonia, TRC and bacterial analysis in conjunction with visual assessment. Quantitative analysis is required for acetaminophen, caffeine, cotinine, carbamazepine and 1,7-dimethylexanthine. Also associated QAPP protocols must be developed and used for each compound. This goes far and above the requirements of the 303(d) and 305(b) listings

as none of these parameters are listed for impairment. This whole protocol needs to be revised and conform to the intent of MS4 screening.

Respectfully submitted,

Ricardo Cantu – Superintendent

RE: Comment on the Draft Massachusetts MS4 Permit

Dear Mr. Tedder:

As the Regional Planning Agency for Metro Boston, MAPC works with municipalities on a broad range of planning issues, including water resources and transportation, with an overall mission to promote smart growth , preserve and enhance our natural resources, and encourage regional collaboration.

In the area of water resources, over the last decade MAPC has provided technical assistance to many communities to support their efforts to implement Stormwater Management Plans under their MS4 permits, with a focus on adopting and implementing local bylaws to manage stormwater sustainably using low-impact development (LID) techniques.

One of our key transportation initiatives focuses on helping municipalities to adopt Complete Streets policies, which promote green transportation by improving accommodation of pedestrians and bicycles. Achieving this goal often involves the addition of bicycle lanes and/or sidewalks within existing roadway rights-of-way. Complete Streets encourage more walking and biking, reduce vehicular trips, cut greenhouse gas emissions and other pollutants, and improve public health.

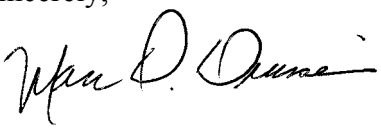
Although we generally support the improvements to stormwater management that would result from the draft MS4 permit, MAPC is concerned that the permit as proposed could have an unintended detrimental effect on the ability of communities to advance their green transportation goals through implementation of Complete Streets guidelines. Our concern focuses on the draft MS4's requirement that all projects retain or treat one inch of precipitation. This provision is not consistent with Massachusetts Stormwater Standards, which require treatment of varying rainfall amounts in relation to a site's soil conditions. Such a "one size fits all" approach does not take into account the significant constraints to implementing stormwater recharge on sites with poor soils. In addition, rights-of-way have even more space constraints than typical development sites, and usually have other utilities co-located within them. In addition, under the Massachusetts Stormwater Standards, redevelopment projects are required to comply to the "maximum extent practicable," which recognizes these and other site constraints.

To address this potential conflict between two laudable public policy goals – clean water and green transportation infrastructure – we request that EPA revise the MS4 permit requirement to provide more flexibility to accommodate Complete Streets projects. A standard similar to the

existing redevelopment requirements of the Massachusetts Stormwater Standards would be more appropriate for these projects, and provide a reasonable balance between two important environmental goals.

Thank you for your consideration of these comments.

Sincerely,



Marc D. Draisen

Re: **Comments on Draft Massachusetts Small MS4 General Permit**

Dear Mr. Tedder:

On behalf of Mass Audubon, I submit the following comments on the U.S. Environmental Protection Agency's (EPA) draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts. This permit will update authorizations for many communities to discharge stormwater under the National Pollution Discharge Elimination System (NPDES) pursuant to the federal Clean Water Act.

These comments are focused on the important role that Low Impact Development (LID) can play not only in cleaning up stormwater pollution but also for a host of other benefits to our natural and human communities. Mass Audubon is a member of the Massachusetts Rivers Alliance, which is providing more detailed comments on many other aspects of the permit.

Mass Audubon supports the permit overall, while recognizing that room remains for refinements and that flexibility will need to apply in administering the final permit. We also recognize that municipalities are faced with tremendous challenges in addressing not only the needs for upgrading their aging water, wastewater, and stormwater infrastructure but also many other demands on their limited finances. The 2014 draft permit is improved in many respects over previous versions. It includes specific requirements to better address the pollutants that are causing violations of water quality standards, while providing adequate time and substantial flexibility for municipalities to apply approaches most appropriate for local conditions. It also improves public access to information and opportunities for input into their communities' stormwater management programs. This permit is overdue, and Mass Audubon urges EPA to proceed expeditiously with finalizing it.

Context – Stormwater Management Challenges and Climate Change

A great deal of progress has been made in cleaning up waterways nationally and in Massachusetts over the past several decades. This progress has been particularly apparent in regards to point source discharges from industry and wastewater treatment facilities. Progress on cleaning up stormwater-related pollution has been much slower, and in many locations the problem is getting worse rather than better due to runoff from ever increasing amounts of impervious surfaces across the landscape. EPA Region 1 has found that stormwater is implicated in at least 55% of the violations of water quality standards in Massachusetts' waterways.

Meanwhile, climate change is causing an increase in intense storm events, while also leading to more frequent droughts. A new approach is needed to address these challenges.

Low Impact Development

Communities need a cost-effective way to support sustainable economic development. We urge that the final permit and related EPA programs strongly support broad adoption of land use plans and rules that promote the preservation and restoration of green infrastructure and the use of LID techniques[1]. We need to shift our thinking about land and water management. We need to move away from viewing stormwater as a waste product that needs to be funneled downstream as quickly as possible, and instead work with the landscape to capture precipitation, keep it as clean as possible, and recharge our aquifers and streams. Water is too precious a resource to waste, and LID offers tremendous opportunities to take a new approach that works with our natural resources in ways that support our economic as well as environmental health.

First and foremost, more attention needs to be paid to the free ecosystem service functions and values provided by natural green infrastructure such as forests and upland vegetated buffers around wetlands and waterways. These areas provide vital functions for capturing, filtering, and infiltrating precipitation across our watersheds. By planning ahead for growth and development, and modifying local land use rules to support LID designs and techniques, communities can maximize the preservation of this natural infrastructure while minimizing the creation of new impervious surfaces and stormwater outfalls. And LID retrofitting for existing impervious surfaces or on redevelopment sites can help restore some of these functions and capture stormwater for productive uses such as landscape irrigation.

Mass Audubon's *Losing Ground: Planning for Resilience* report (2014, www.massaudubon.org/losingground) found that the rate of land development has slowed in recent years to 13 acres per day compared to over 40 acres per day in the 1980s and 90s. This represents considerable progress, but it also reflects a period of time (2005-13) that included the great recession when development was at a low point. We are already seeing the rate of development picking up, and it is important that this new development be done in a more efficient manner that better preserves natural green infrastructure. If we continue to build sprawling developments that consume large areas of forest while creating lengthy roads and

[1] A new report just issued documents the need for regulatory agencies to further incentivize the use of LID (aka Green Stormwater Infrastructure) and improvements to the compilation of data collection and sharing. *Accelerating Cost-Effective Green Stormwater Infrastructure: Learning From Local Implementation,* February 2015, Nell Green Nylen and Michael Kiparsky, UC Berkeley School of Law.

stormwater outfalls that communities cannot afford to maintain, this is not sustainable environmentally or economically.

Municipalities should be strongly encouraged to adopt conservation subdivision design and other project design regulations that provide more flexibility in dimensional requirements; reduce the length of roads and driveways; allow for narrower roads; minimize parking area requirements; and encourage use of pervious materials rather than regular pavement. Unfortunately, many existing local land use regulations effectively require excessive amounts of land alteration and creation of impervious surfaces, or allow those approaches by-right while making more creative LID designs difficult or uncertain to permit. More needs to be done to encourage and support communities in updating their land use rules to more thoroughly embrace LID as the preferred approach for all new and redevelopment. Local regulations can also require retention of trees and other existing natural vegetation on development sites and minimize the amount of cut and fill that alters natural topography and drainage characteristics.

LID can avoid or at least minimize the creation of new outfalls on many development sites, and for redevelopment or retrofitting can effectively disconnect existing impervious surfaces from the MS4 outfalls system.

LID techniques are not only becoming more cost effective to construct, but they can help the community make progress toward the required water quality improvement targets. Where development proceeds with traditional catch basin and piping systems this creates new outfalls or additional contributions to existing ones, which then often become part of the community's MS4 responsibilities. Full use of LID on new development can avoid and minimize these increased burdens, which otherwise may mean the community is always playing "catch-up," since any improvements to existing systems continue to be offset by new contributions of additional stormwater flows from new development. The fact sheet for the draft permit mentions that LID techniques require maintenance costs. It is true that maintenance is required for LID stormwater BMPs (although not, generally, for retention of natural landscapes). But maintaining traditional piping, catch basins, and detention areas is expensive, and often inadequately funded. In many instances, an LID approach can be cost-effective for the developer, the municipality, and property owners.

LID and Green Infrastructure also have a host of other environmental, community quality of life, health, energy, and property value benefits. There is ample evidence of this, as well as examples from across the nation that municipalities can learn from. Relationship to Massachusetts Stormwater Standards

The Massachusetts Stormwater Standards, while helpful, do not address the full scope of stormwater management needed to achieve water quality standards. The state rules are applied primarily through application of the Massachusetts Wetlands Protection Act, which is limited in jurisdiction to work within state wetlands resource areas or adjoining buffer zones. Projects located outside of these areas, regardless of size or scope, do not require a wetlands permit and therefore the local conservation commission cannot require that stormwater emanating from upland sites meet the standards. This is true even when stormwater from new or redevelopment in uplands will flow into existing local stormwater conveyance systems that discharge to wetlands or waterways. Therefore, it is important that the MS4 permit require communities to more comprehensively regulate stormwater from all new and redevelopment, regardless of whether or not the entire site and scope of work is located within uplands.

Conclusion

The Massachusetts Water Infrastructure Commission (2012) found that addressing stormwater maintenance and upgrade needs over the next 20 years could cost in the range of $18 billion dollars. At the same time, many communities are facing more frequent, intense flooding events along with potential water supply shortages, and streams are drying up due to excessive water withdrawals and/or loss of infiltration capacity. By using our landscape in a smarter, more efficient way, we can reduce these burdens. Precipitation can be filtered, infiltrated, and used for irrigation and to recharge water supplies and rivers, while the need for expensive engineered structures to treat and convey ever increasing flows from more intense storm events can be minimized. This is not a panacea, but continuing the path of developing larger and larger areas

of impervious surfaces channeled into inadequate storm drainage systems will only increase the challenges communities face. We urge a shift in thinking about land and water management, and a strong embrace of LID principles and techniques.

Thank you for considering these comments.

Sincerely,

Re: MassDEP Comments on EPA's Draft 2014 MS4 permit

Dear Mr. Tedder,

This letter provides comments and suggestions to EPA on the draft Municipal Separate Storm Sewer permit (MS4) published for review in the Federal Register on September 30, 2014. There are many important and positive elements in this 2014 draft MS4 permit. EPA has solicited considerable input on its draft permit and we believe that such a collaborative approach is warranted and appropriate. EPA should be commended for using the public review process to revise and build upon previous proposals to publish this much improved draft MS4 permit.

In developing these comments, MassDEP has drawn from experiences in addressing stormwater issues and is also taking the views of stakeholders who care about the program and how it is implemented into consideration. Although MassDEP's signature block is on the publicly issued draft permit as a co-issuing authority, the final decision of whether the Commonwealth will co-issue the MS4 permit with EPA will be made when the terms of the final permit are clearer. We are providing EPA these comments in a constructive spirit of seeking changes that will clarify and streamline the permit, to help make it more effective in improving water quality while remaining mindful of how best to assist municipalities in implementation.

Stormwater is the single largest source of pollution to the Commonwealth's rivers, streams, lakes and ponds, and MassDEP appreciates EPA's efforts to improve the effectiveness of the 2003 permit. The changes proposed with our comments will preserve the environmental gains contemplated by the draft permit while doing so in a more achievable, efficient and cost-effective manner. We look forward to working with EPA on the final permit terms.

Costs

As regulators, EPA and MassDEP each must acknowledge that resources at the local level are scarce and focus on actions that will yield the most environmental benefit. Moving toward an integrated and efficient set of federal and state stormwater rules is a key part of meeting those very real challenges. As described in detail below, EPA should consider the permit's requirements in light of this perspective.

The costs to implement the proposed MS4 permit are a major issue to be considered in the specific terms of the permit. Recent work suggests that costs can be both high and can vary significantly based on the activity.

In 2011-2012, EPA's months-long Sustainable Stormwater Funding Project estimated the expenditures at that time of stormwater work to meet the six minimum control measures of the 2003 permit for three Massachusetts Towns:

- Bellingham existing costs: $212,439 per year
- Franklin existing costs: $940,590 per year
- Milford existing costs: $668,241 per year

Next, EPA estimated how those costs would increase if the MS4 program requirements were expanded as proposed in its 2010 draft. Using the 2010 draft of the MS4 permit as a base, and including an additional contingency amount for unanticipated expenditures, EPA estimated the following costs for complying with the six minimum control measures:

- Bellingham proposed 2010 permit costs: from $729,286 per year to $865,563 per year
- Franklin proposed 2010 permit costs: from $1,436,347 per year to $1,704,455 per year
- Milford proposed 2010 permit costs: from $729,286 per year to $1,244,470 per year

In other words, EPA estimated MS4 costs for implementing the 2010 draft permit requirements would increase in these 3 Towns by approximately $60,000 to $760,000 per year. While it is unclear how much those costs will change for implementation of the 2014 permit terms, there are reasons to believe that the increases will be in the same order of magnitude as the estimates from 2010.

In this 2014 draft permit, EPA provided some cost information in the Fact Sheet which is lower than the cost information from 2010, including estimates for implementing each of the six minimum control measures. EPA estimated a range of costs for implementing the 2014 draft permit from $66,000 to $518,000 per year. These figures exclude contingency costs. Adding contingency costs, as EPA did for those 3 Upper Charles Towns in the estimates done for the draft 2010 permit, would represent a more reasonable annual cost estimate.

In addition, EPA's cost estimates do not include work related to meeting impaired waters or TMDL requirements. That work will include both operational expenditures (e.g., tracking pollution loadings for every new development and redevelopment project subject to impaired waters or TMDL permit rules) and the capital cost of BMPs to reduce pollutants to meet impaired water or TMDL goals. Those capital costs will be significant, although they have not been estimated for the 2014 draft permit implementation. Although not a precise correlation, when EPA estimated capital costs associated with implementing the proposed Residual Designation

Authority requirements in the Sustainable Stormwater Funding Project, Bellingham's capital costs were estimated to be over $23 million; Franklin's over $62 million; and Milford's costs over $67 million.

With Massachusetts' Towns facing continual budget pressures for many necessary programs, EPA should recognize that costs will have significant effect on communities and the final permit should be adjusted to eliminate unnecessary requirements and to consider the timing needed for such significant resources.

EPA's Rules Should Harmonize its MS4 rules requirements with the Commonwealth's Stormwater Standards.

The municipalities subject to this proposed permit play a critical role in managing municipal stormwater discharges that flow into our water bodies. MassDEP recognizes the importance of actions such as identifying and eliminating illicit discharges, requiring modern stormwater Best Management Practices (BMPs) for new developments and redevelopment projects, and ensuring proper operation and maintenance of stormwater systems and BMPs. In 2008 MassDEP promulgated more protective stormwater rules as part of the Commonwealth's Wetlands Regulations. Building on the first Massachusetts Stormwater Standards issued as policy in 1997, the 2008 revisions increased infiltration and treatment requirements, mandated consideration of Low Impact Development techniques and made a number of other protective changes for projects within areas of wetlands jurisdiction.

In order to meet EPA's 2003 MS4 requirements for locally enforceable mechanisms to manage construction and post-construction stormwater impacts, some Massachusetts Towns adopted the Massachusetts Stormwater Standards instead of developing a separate set of stormwater rules. That was a wise decision. MassDEP believes that EPA should build on that successful experience by using the Massachusetts Stormwater Standards as the basis for its successor MS4 permit, rather than requiring a second federal-only layer of permit requirements on top of the existing Massachusetts Stormwater Standards.

It is critical for municipalities, developers, and environmental advocates that EPA and MassDEP work together toward our common environmental goals. Uniting together behind the framework of the Massachusetts Stormwater Standards as the tool that all of us in Massachusetts will use to reduce stormwater pollution discharges will make that essential job easier for everyone. MassDEP recommends that EPA move in the direction of harmonizing the federal requirements with the Massachusetts stormwater rules as much as possible, and avoid establishing new and separate stormwater management criteria. MassDEP provides additional comments on the benefits of this harmonization below.

Towns Must Be Given Sufficient Time and an Adaptive Schedule for Implementing Improvements and Pollution Reduction Goals.

The timing of when municipalities must begin to implement pollution reduction goals determined through the TMDL (Total Maximum Daily Load) process is crucial. MassDEP suggests that EPA take into account Towns' comments regarding the time needed to achieve those goals. It took decades to build the Commonwealth's existing impervious areas (such as roadways, rooftops and parking lots that contribute to stormwater pollution). Those areas not only add contaminants to stormwater, they also redirect flow and in some cases prevent recharge through natural percolation to the groundwater. Changing the urban environment in Massachusetts to

mitigate these effects, achieve TMDL load reduction goals and improve water quality in our receiving waters will likewise take years of steady effort.

MassDEP supports EPA's proposal to allow time for Towns to develop plans for stormwater-related water quality improvements recommended in the TMDLs, to implement those plans and thereby achieve TMDL reduction goals. That process should be adaptive and recurring so that as these improvements are being made Towns have the ability to consider pollution reductions from others sources. EPA should assure Towns will have the adaptive flexibility needed to concentrate on the most cost-effective pollution reduction measures, whatever their source.

MassDEP Supports Efficient Implementation: Developing Outreach Materials and Modeling Tools.

MassDEP encourages EPA to create models, templates, and other transferrable tools for cities and towns to use in implementing the permit. Providing standard tools, templates, models, reporting forms and informational brochures will make the implementation of the permit more efficient and cost-effective for Towns. General informational materials or templates that can be customized will facilitate the availability of accurate information from local authorities, as well as reduce costs by each city or town to produce these materials.

In addition to MassDEP's support of the draft permit's elements and the general points outlined above MassDEP has the following additional comments and recommendations for improvements.

The Matrix of Applicable Standards Included in the Draft Permit is Confusing.

There is a significant shift in approach from the BMP-based program envisioned in the 2003 permit to the current draft which includes additional provisions to ensure that discharges from small MS4s do not cause or contribute to an exceedance of water quality standards. These requirements add to the maximum extent practicable reductions required through implementation of BMPs and recast water quality standards as enforceable "effluent limitations" of the permit. This approach moves the MS4 program well away from a BMP-based program with a maximum extent practicable (MEP) standard by adding new "water quality based effluent limitations" to this part of the stormwater program. The Fact Sheet for the draft permit relies on a federal decision, Defenders of Wildlife v. Browner, 191 F.3rd 1159, 1165 (9th Cir. 1999) to support the incorporation of the new water quality based effluent limitations. However, the Defenders of Wildlife case held that reductions to the maximum extent practicable are the standard for MS4 discharges. Id. at 1165. MassDEP requests that EPA clarify that MS4 dischargers must meet the water quality based effluent limitation provisions in the permit to the maximum extent practicable, and also acknowledge feasibility and costs to achieve those reductions as part of that standard.

EPA's choice of applicable standard has cost implications. MassDEP has concerns that water quality-based effluent limitations will ultimately require additional resources to support additional pollution control technologies or other measures beyond the maximum extent practicable standard set forth in the federal Clean Water Act. These measures may be extremely costly and it is possible that they would not make any substantial improvement in water quality. MassDEP urges EPA New England to modify the permit requirements to ensure that its intent is clear and the applicable standards and associated municipal obligations are unambiguous.

Administrative and Reporting Requirements Should Be Streamlined

The permit includes many administrative and reporting requirements. MassDEP has identified 252 actions, reporting and tracking requirements, not including actions, reports and tracking needed for impaired waters and TMDL goals. MassDEP suggests that EPA minimize those that do not have a direct relationship to stormwater pollution reductions. Further, administrative reporting and tracking conditions should be consolidated and streamlined as much as possible, making compliance work easier and less costly for Towns.

Without revisions that address this administrative burden, cities and towns would spend considerable time, energy and resources on reports and other administrative tasks. A permit that focuses municipal resources and efforts on actions that directly reduce stormwater pollution is more likely to achieve sustained environmental benefits.

Detailed below are some specific proposals that are examples of what EPA should consider to reduce the overall administrative burden of compliance with the MS4 permit.

- Tracking TMDL Reductions gained by each project. EPA's proposed method to track TMDL-related pollution reductions is a labor-intensive mathematical calculation of mass reduction down to what appears to be grams per year from every municipally-regulated land use development and redevelopment. Further, monitoring of the receiving waters is a better measure of success for the TMDL-related components of the MS4 permit. A related concern is that the proposal opens up the issue of whether the use of scientifically validated methods for modeling pollution loadings measured in multiple pounds per year over square miles is appropriate for measuring ounces of pollution loadings over sites as small as one acre. Instead, EPA could require Towns to show progress toward meeting the percentage reduction targets commonly used in TMDLs.

- Illicit Discharge Detection and Elimination (IDDE). The proposed IDDE requirements – which include the individual ranking of the catchment for every outfall (except excluded catchments) using 12 different System Vulnerability Criteria, mandating higher rankings for catchments in areas served by a sewer or stormwater system 40 years of age or more – divert monies that could be used to eliminate illicit connections. Instead municipalities are expected to create and maintain a complex tracking and ranking system. EPA could simplify these requirements to concentrate its regulatory attention solely on requiring cities and towns to identify and remove Illicit Discharges from *Problem Catchments* and *High Priority Catchments* and remove requirements for *Low Priority Catchments*. EPA also should refine its definitions of what constitutes *High Priority Catchments*. Since virtually all sewer or stormwater systems in Massachusetts are at least 40 years old, using that age as a determinative criterion results in categorizing entire MS4 systems *High Priority*. That kind of broad requirement does not help Towns to narrow their attention, focus and budgets on areas that need immediate attention.

- Tracking materials removed from each catch basin. The requirement that Towns track and annually report the volume or mass of material removed from each catch basin draining to all water quality limited waters will, in a Town with limited resources, reduce funds available for cleaning catch basins.

- New inspector qualifications; retaining "as built" drawings. Requiring Towns to develop and report the qualifications necessary to perform construction site inspections, or to review and keep "as built" drawings for each BMP constructed, will not necessarily increase inspections or ensure that BMPs are constructed or maintained properly.

- Align MS4 construction conditions with federal Construction General Permit standards and State Stormwater Standards. EPA should consider limiting its changes to the Construction minimum control measure to requiring Towns to adopt by reference the federal Construction General Permit and/or Standard 8 of the Massachusetts Stormwater Standards. Both of those systems are being used routinely throughout the Commonwealth by regulators and developers alike. The imposition of either one provides greater environmental protection than that currently required in the 2003 permit and does it more efficiently.

- Align definitions with State Standards. EPA should use the definitions of development and redevelopment already used in the Massachusetts Stormwater Standards. Among other benefits, that action would ensure that the scope of redevelopment requirements would be limited to the area being redeveloped.

Using the Framework of the Massachusetts Stormwater Standards Will Further Reduce Stormwater Pollution and Reduce the Administrative Burden for Towns and Developers Alike.

MassDEP's strongly urges EPA to use the framework of the Massachusetts Stormwater Standards in the post-construction minimum control measure. Since 1997 all 351 Massachusetts Towns have used the Massachusetts Stormwater Standards to manage stormwater in wetlands jurisdictional areas. Many Towns are already using the Massachusetts Stormwater Standards for their local stormwater bylaws, and this proposed change would require these Towns to abandon their current practices and adopt a new and unfamiliar federal mandate.

Developers, Conservation Commissioners and Agents and other Town officials routinely use these standards, which require on-site infiltration, treatment and various other measures to reduce pollution from stormwater in wetlands jurisdictional areas. Adding this different federal standard creates a cost, time and administrative burden for every for every development and redevelopment project that occurs in both areas of wetlands and subject to MS4 regulation, requiring developers to show that their proposals now meet two different sets of stormwater rules .

In its 2010 and 2011 draft MS4 permits, EPA wisely proposed to build on that solid foundation of expertise and familiarity by requiring Towns to use the MA Stormwater Standards in Urbanized Areas as part of its MS4 requirements. Layering different federal stormwater rules on top of the successful and commonly understood state stormwater standards creates a significant administrative burden for all 260 MS4 Towns.

From a technical standpoint, EPA's proposal to use a different metric for treatment ("Provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of biofiltration . . ." instead of the Massachusetts requirement to reduce TSS by 80%) creates an additional

technical burden for every Town, developer and practitioner subject to both state and proposed federal stormwater rules.

All MS4 Towns are already using the definitions of new development and redevelopment from the MA Stormwater Standards. Although EPA does not define those terms in its proposed MS4 permit (which itself is a problem), in its MS4 public meetings EPA has used those terms differently than they are used in the MA Stormwater Standards. Explicit or implicit creation of different definitions of those terms will create confusion and inefficiencies. Adoption of the framework of the MA Stormwater Standards will solve that problem.

If EPA believes that the current runoff depth requirements in the Standards are not protective enough (for example, new developments must treat at least ½ inch of runoff) it can simply increase those volumetric numbers used in the Standards. That kind of change (for example, increasing the Massachusetts' Stormwater Standards' required infiltration depths of 0.6" for Class A, 0.4" for Class B, 0.25" for Class C and 0.1" for Class D soils) would be easily understood and could be readily incorporated into Towns' and developers' existing expertise and practice, and does not require a new and overlapping federal mandate to increase environmental protection.

EPA Should Take the Lead in Developing Water Pollution Credit Trading Programs

As Towns face the challenge of meeting EPA's draft MS4 permit requirements for reducing pollutants described in approved TMDLs, MassDEP believes that EPA should take the lead in developing and implementing watershed-wide water pollution credit trading programs. Establishing such programs can allow Towns to reduce pollution reduction costs by creating opportunities and incentives for those pollution reductions to occur at locations where pollution reductions costs are lower. For example, a large commercial or agricultural operation implementing cost-effective nutrient controls for stormwater could "credit" (trade or sell) those reductions to municipalities where further reductions may be more expensive and more difficult to achieve. MassDEP believes that the promise of watershed-wide water pollution credit trading programs is more likely to be fulfilled if EPA takes an active role in developing such a system.

A Number of Corrections to the Impaired Waters and TMDL Sections Are Needed

MassDEP has the following specific recommendations regarding TMDL issues found in the Fact Sheet and Appendix F.

Draft Fact Sheet:

Page 30, pp 2: Lists of the final Bacteria and Nitrogen TMDLs appears to be incorrect.

- Final watershed- wide Bacteria TMDLs are: Neponset, Buzzards Bay, Cape Cod, Charles, Narragansett/Mt Hope Bay, North Coastal, Shawsheen, South Coastal, Taunton. Individual waterbodies with final pathogen TMDLs are: Little Harbor (Cohasett), Palmer River, and Three Bays, Frost Fish Creek and Muddy Creek on Cape Cod
- Final Nitrogen TMDLs are *certain waterbodies* in: Nantucket, Cape Cod and Buzzards Bay watersheds

Page 30, pp 2: It is important to note that the approved Massachusetts Estuary Program (MEP) Nitrogen TMDLs estimated a Nitrogen stormwater waste load allocation (WLA) from impervious areas within 200 feet of the embayment, but that load was not directly measured. EPA should consider how estimated load affects its requirements in Appendix F.

Page 30, pp 3: Currently there are 14 approved pathogen TMDLs, not 15.

Page 31, pp 2: *"Evidence suggests"* should be supported by reference(s).

Page 31, pp 2: The revision of the current (2000) Long Island Sound (LIS) TMDL is not expected to be finalized soon. It is not appropriate to base MS4 nitrogen reduction requirements on an anticipated future, unapproved TMDL. This is particularly important when EPA states in the draft MS4 permit Fact Sheet that Waste Load Allocations for MS4 sources in the LIS TMDL currently in place may already be met. .

Page 34, pp 1: The draft Fact Sheet states that duckweed amounts in the Assabet River are still excessive based on 2012 data. More recent MassDEP and USGS data show a significant reduction in duckweed at all monitoring stations. EPA should update the information in the Fact Sheet to reflect this new information.

Page 34, pp2: The Draft Fact Sheet states that dam removal has not been completed. This is correct, but it also should be acknowledged that the Towns have rejected the dam removal recommendations in the TMDL and removal at a future time is unlikely.

Appendix F:

Page 26, pp 1: Appendix F states *"MassDEP and EPA shall work with the permittee to develop a monitoring plan or other assessment plan the permittee will use to evaluate the effectiveness of the Lake Phosphorus Control Plan (LPCP) or other work the permittee has conducted in restoring the waterbody. The permittee shall work with MassDEP and EPA to develop the alternative analysis plan and keep the written plan as part of their SWMP. Until the production of o written olternative analysis plan with input and assistance from MassDEP and EPA, the permittee remoins subject to the requirements described in Parts II.1-2 above."*

Comment: Due to resources constraints the amount of input and assistance available from MassDEP's monitoring staff to help permittees develop individual alternative analysis plans may be very limited.

Page 27, pp 1: Incorrect list of approved Pathogen TMDLs - Pathogen TMDLs are *not* approved for: Blackstone River Watershed, Concord River Watershed, Ipswich River Watershed, and the Merrimack River Watershed. In addition, there is an approved Pathogen TMDL for the Neponset watershed, but not for the Boston Harbor watershed.

Page 27, pp 1: Appendix F acknowledges *"the goal for these bacteria or pathogen TMDLs is for the bacteria or pathogen concentration in each waterbody to meet the water quality standards for the designated uses of the water body. The WLA for all waters with applicable bacteria or pathogen TMDLs is set at the state water quality standard for the indicator organism for that water body at the time of TMDL development."*

Comment: The water quality standards for pathogens (bacteria) and in some cases the indicator organism has changed since the development of many of the pathogen TMDLs. MassDEP monitors and assesses bacteria impairment based on the current water quality standards and consolidated assessment and listing methodology (CALM). To determine if the waterbody is meeting standards and can be de-listed from the impaired list (i.e., meets the TMDL) MassDEP would not necessarily be assessing the indicator organism listed in the TMDL and this MS4 permit. In addition, EPA has recently requested many states to ensure that their Surface Water Quality Standards comply with recently developed EPA criteria for bacteria; these new criteria, in some cases, are different than those in the MA SWQS. This discrepancy should be spelled out in the MS4 permit so the permittee is monitoring for the correct indicator organism to assure that compliance with current water quality standards can be assessed.

Page 38, pp 1: It should be noted that Cape Cod communities are currently focused on challenging decisions related to complex and expensive nutrient management issues for their estuaries. The source of the overwhelming majority of the nitrogen load on the Cape has been identified as discharges from septic systems. MassDEP, EPA, and the Cape Cod Commission are coordinating on an update to the existing area wide management plan (in accordance with Section 208 of the federal Clean Water Act) in an effort to design options for municipal comprehensive wastewater management planning to address these significant water quality issues. EPA should take care in these communities that the burden of this new MS4 permit does not delay or overshadow this regional effort, particularly when it has been acknowledged in all of the approved MEP TMDLs that the stormwater WLA is insignificant compared to wastewater sources.

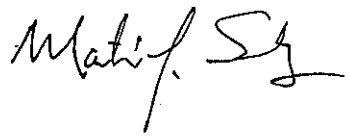
Page 43, pp 1: There is some evidence that the upper basin states that contribute to the Long Island Sound (LIS) watershed may already be complying with the current LIS TMDL requirements for nutrient load reductions. The LIS TMDL workgroup is currently evaluating the status of the TMDL implementation progress and effectiveness. MassDEP questions whether the new MS4 permit's TMDL requirements ought to apply to Massachusetts given the Commonwealth's contribution may already have been sufficiently reduced.

Page 53, pp 1: Appendix F states: *"There are currently five approved metals TMDLs for a waterbody segment in Rhode Island that that identifies urban stormwater discharges in Massachusetts as sources that are contributing metals (Cadmium, Lead, Aluminum, Iron) to the impaired segment. The TMDLs include the Upper Ten Mile River, Lower Ten Mile River, Central Pond, Turner Reservoir and Omega Pond TMDLs[1]. Table F-12 lists municipalities in Massachusetts identified in the TMDLs as containing MS4s contributing metals to the impaired waterbody segments in Rhode Island, the impaired receiving water, the approved TMDL name, and the pollutant of concern. "*

Comment: MassDEP has previously commented on Rhode Island's draft TMDL with regards to metals impairment and concluded the following: Based on the most recent state line data Massachusetts flows would not impair Ten Mile segments for metals (total aluminum, dissolved cadmium, total iron, dissolved lead) and consequently will not move forward with a TMDL. It should also be noted that since the sampling was carried out in 2007 the Attleboro and North Attleboro plants have new NPDES effluent limits for metals. The load reductions for metals in the RIDEM TMDL at the state line are not representative of the current condition with respect to permitted facilities in Massachusetts. As such, it's inappropriate to impose MS4 metals reduction requirements to these Massachusetts communities.

MassDEP thanks EPA Region 1 for the considerable time and energy it put into developing this draft MS4 permit and its willingness to continue to consult with MassDEP. Whether MassDEP ultimately adopts and issues the MS4 permit under the Massachusetts Clean Waters Act will be a matter very carefully considered as the terms of the final permit become clearer. In any case, MassDEP will provide technical assistance to municipalities to support successful permit implementation and water quality improvements. Thank you for your consideration of these comments.

Sincerely,



Martin Suuberg

Re: NPDES General Permit from Small MS4s Comments

Mr. Tedder,

The following represents a list of comments and/or concerns, from the Massachusetts Department of Transportation's Highway Division (MassDOT) with the ***Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4s) in Massachusetts***, as noticed by the EPA on September 30, 2014 in the Federal Register. Even though MassDOT is seeking a separate individual permit for stormwater discharges, we would like to take this opportunity to share our comments on the various requirements included in the Draft General Permit as they will ultimately have impacts on municipal roadway projects funded by MassDOT.

1. **Notice of Intent (NOI) Form:** The new electronic NOI Form requires extensive detailed information on the various Best Management Practices (BMPs) that will be used to meet the six minimum control measures and water quality based requirements. In the 2003 permit, this level of detail was provided in the Stormwater Management Plan (SWMP), instead of at the NOI stage. Requiring a detailed description of all the proposed BMPs within 90 days is unrealistic. The NOI submittal should be scaled back to only require basic information relative to the storm sewer system and let the more detailed information be provided in the SWMP instead, thereby allowing up to a year to evaluate and determine the most appropriate and feasible BMPs that will be used to meet the six minimum control measures and water quality based requirements.

2. **First Year Schedule:** The number of major activities and plans that must be completed in the first year of the Permit is impractical. There are at least ten (10) major plans or action items required in the first year or sooner. We suggest that the deadlines for several tasks be extended to at least two years, and especially for the preparation of the Operations and Maintenance (O&M) Plans, Pollutant Source Identification Plans, and Stormwater Pollution Prevention Plans (SWPPPs).

3. **No Net Loading Increase:** Section 2.1.2.b states that there shall be no net increase in discharges from the MS4 to impaired waters listed in Categories 5 or

Ten Park Plaza, Suite 4160, Boston, MA 02116
Tel: 857-368-4636, TTY: 857-368-0655
www.mass.gov/massdot

4B on the most recent Massachusetts Integrated Report of Waters unless the permittee demonstrates there will be no net increase in loading for the specific impairment and provides documentation in the SWMP.

EPA should better define what level of activity would constitute a meaningful increased load warranting a detailed pollutant load analysis. For example, sidewalk construction or adding a bike lane should not be considered a significant increase in pollutant load. Many minor roadway widening projects are designed to promote intermodal transit and reduce greenhouse gases and these environmental benefits should also be included in the equation along with water quality impacts. If every minor roadway modification throughout the State requires a detailed pollutant load assessment and statement of findings, this will divert our efforts and limited resources away from construction of stormwater BMP retrofits. Also, with minor roadway widening projects, there are often site constraints and limited right-of-way that greatly affect our ability to modify drainage systems and capture and treat roadway runoff in order to meet a no net increased load requirement. We suggest that linear road improvements be allowed a maximum extent practicable threshold or that existing roads be exempt from this requirement.

4. **Section 2.2.1 – Discharges to Impaired Water Bodies with an Approved Total Maximum Daily Load (TMDL):** Tables F-1 and F-2 of Appendix F indicate that various Towns subject to the Charles River (or other lake) phosphorus TMDL, would need to achieve phosphorus reductions as much as 50% or more from existing baseline loads within their MS4 areas or entire Town. Given that only 40-65 percent of the phosphorus in stormwater can be removed utilizing stormwater BMPs, it would seem that nearly all of the existing impervious cover (IC) area would need to be treated to achieve an average existing load reduction of 50% or more. Even though the draft Permit allows up to 15 or 20 years to accomplish the reduction, depending on the watershed, this goal still seems highly unlikely and impractical given the range of site constraints that prevent the implementation of stormwater retrofit BMPs at various locations. We suggest that the phosphorus reduction target should only apply to the permittee-owned property. Also, the draft permit needs to include maximum extent practicable language to address when reduction targets simply cannot be met due to site constraints or the exorbitant costs required to meet these targets.

5. **Section 2.2.2 - Chloride Impaired Water Bodies:** This section does not provide a list of municipalities that are located in chloride impaired watersheds similar to the lists provided for phosphorus and nitrogen related impairments.

6. **Section 2.3.4.7.c.iv. – Written Illicit Discharge Detection and Elimination (IDDE) Program:** This section states that "Wet weather screening and sampling, shall proceed during or after a storm event of sufficient depth or intensity to

produce a stormwater discharge but only during the spring (March to June) when groundwater levels are relatively high." …. "The permit does not require a minimum rainfall event prior to wet weather screening. However, the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather."

Wet weather sampling can be very costly and difficult to implement as it is weather dependent and it appears to be required for every outfall in a catchment that has one or more vulnerability factors (VFs). Essentially any developed area, regardless of density or age, would seem to have at least one vulnerability factor and, thus, wet-weather sampling would be required just about everywhere there is some minimal level of development. We suggest that this requirement be targeted to only those areas with the highest likelihood for wet weather illicit connections. Perhaps only areas that have three or more VFs, or known problem areas, be subject to wet weather sampling and, then, based on these results, the permittee can assess the need to conduct additional wet weather testing in other areas with fewer vulnerability factors. Permittees should be allowed to develop their own vulnerability factors or screening process to identify and target areas where wet weather sampling would seem to be needed the most while focusing on pathogen-impaired waterbodies. Permittees could provide EPA with a dry and wet weather screening program based on those alternative screening and vulnerability factors.

EPA should share the specific data that shows the cost/ benefit of wet weather sampling for the purposes of identifying illicit sources and the level of pollutant reduction that is realized when sampling and possible removal occurs as a result of wet weather sampling so that local officials can justify this significant extravagant use of taxpayer dollars.

7. **Section 2.3.6(a)ii Stormwater Management in New Development and Redevelopment:** In light of recent MassDOT projects (e.g., Casey Overpass and the Longfellow Bridge in Boston), EPA should reconsider imposing a strict standard of "retaining 1-inch of runoff from all impervious area" as it relates to redevelopment activity. This is a very high, and likely impractical, standard for a redevelopment activity to meet given that existing site constraints can limit how much area and what type of treatment can be provided. Towns and MassDOT must be able to continue maintenance of roads, which often includes reclaiming, rebuilding or reconstruction of the road. Given the linear nature of the road and confined right-of-way space, the amount of runoff that can be captured, especially in open drainage situations is often quite limited. The use of infiltration type stormwater treatment BMPs also may not be practical, due to limited space, soil conditions and adjacent resources or properties. The suggested alternative of attaining a pollutant removal efficiency equivalent of treating 1-inch of runoff through bio-infiltration does not seem to make this standard any more feasible.

We suggest an exemption for roadway maintenance activity and a maximum extent practicable standard for roadway reconstruction projects.

As mentioned earlier, to promote public health and greener forms of transportation, MassDOT recently issued a Complete Streets Initiative to increase pedestrian and bicycle modes of transportation. This often requires minor road widening for bike lanes and the installation of sidewalks to accommodate the mode shift. To meet the proposed EPA 1-inch stormwater treatment requirement, the costs for these types of projects would increase exponentially and in most cases would prevent municipalities from attempting to promote greener forms of transportation. In the end, this proposed stormwater treatment requirement may negate any potential public health and environmental benefits that may have resulted from this initiative. Again, we urge the EPA to exempt municipal linear projects from this requirement.

8. **Section 2.3.6(d) – Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management)**: This section states "All BMPs installed as part of the site's stormwater management system shall be constructed consistent with the Massachusetts Stormwater Handbook Volume 2, Chapter 2."

   Certain elements of the Massachusetts Stormwater Handbook, such as BMP design features, are outdated. For example, some often-used BMPs, such as permeable pavements, are not included in the Handbook. Other states, such as Rhode Island and the Chesapeake Bay area states, are developing more updated design handbooks in response to TMDLs and stormwater requirements. The wording should be changed to reference the MA Stormwater Handbook as well as other more recent EPA and state manuals that have updated BMP design guidelines. Making reference to the MA Stormwater Standards is fine, but there should be flexibility to design/construct updated methods and practices. Also, the MS4 must be allowed to build BMPs to the maximum extent practicable which may not fully meet the stormwater handbook design requirements but will still have a positive water quality impact.

9. **Section 6.1 – Public Education and Outreach**: Section 6.1 clarifies for Transportation MS4s that the potential targeted audiences for public education and outreach purposes may be different than that for municipalities and would be limited to the motoring public (users of the road), employees and contractors. We suggest the number of educational messages for each audience over the permit term be limited to two, similar to that required for municipal MS4s.

10. **Section 6.4 New Discharger:** Section 6.4 requires additional clarity in defining what might be considered a "new discharger." Is this referring to a new entity, or a new facility, or both? Does this pertain to only transportation agencies? As

currently written, the draft Permit seems to suggest that any new roadway segment, parking lot or other facility that is not directly adjacent to an existing MassDOT facility might be considered a "new discharger" and subject to its own separate individual permit. Under nearly all cases, any proposed new MassDOT facility would likely be connected and accessed by an existing MassDOT roadway, however, it is conceivable that a scenario could arise where a new depot facility, for example, might be accessed from a municipally maintained roadway and not a MassDOT roadway. We suggest that the language be made clear so as to avoid confusion and eliminate the possibility that any new MassDOT facility or roadway would be considered a "new discharge" and be subject to its own individual separate permit outside of the proposed MassDOT's overall individual permit for its roadway network within urbanized areas.

11. **Appendix H. Attachment 1** describes how nitrogen load reduction credits can be calculated for certain structural BMPs (Table 4-3) and illicit connection removal. Although the draft Permit states that this is for informational purposes only at this stage, EPA should allow municipalities to take credit for other structural and non-structural load reduction activities and BMPs beyond this limited list. Moreover, the pollutant reduction performance curves for the structural BMPs do not seem to relate to a specific design or type of BMP. These BMP treatment curves also only account for treatment of the contributing impervious area and underestimate or ignore the treatment of runoff from pervious areas when runoff from impervious surfaces is comingled with pervious areas (e.g. agricultural areas, lawns, etc.). We recommend that EPA provide more detail on credits for individual BMPs by developing curves for specific treatment BMPs (as provided for phosphorus) and provide a means for accounting of contributing pervious area that does not require the permittee to do iterative calculations.

    In addition, Appendix H should include provisions for the permittee to use alternative methods to calculate BMP performance for nitrogen by developing a long-term simulation modeling approach, similar to what Appendix F does for calculating phosphorus treatment.

12. **Appendix H. Attachment 1** describes how nitrogen loads should be calculated for contributing drainage areas but only accounts for two land cover conditions: pervious and impervious. Similar to the phosphorus load calculation methodology (Appendix F) different land uses also affect nitrogen loads, and not just whether its impervious and pervious land cover. Therefore, we believe this same level of detail should be applied to the nitrogen load calculation methodology. We recommend using water quality data from highway runoff sampling as reported in the U.S. Geological Survey (USGS) and Federal Highway Administration's (FHWA) Highway-Runoff Database (Granato and Cazenas,

2009) that includes stormwater sampling data from different MassDOT roadways to characterize nitrogen loads from highways.

Thank you very much for the opportunity to comment on this critically important permitting program. If you have any questions or comments, please contact Henry Barbaro, Stormwater Program Supervisor, at 857-368-8788.

Sincerely,

Kevin M. Walsh

Re: Objections to Proposed draft Massachusetts new EPA Storm Phase 2 regulations

Dear Mr. Tedder

The following is a list of the most troubling portions of the proposed new Storm water Phase Two regulations.

1) Pavement maintenance work triggers retaining first inch of storm water or storm water treatment. Under the new regulations, when one disturbs more than 1 acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) or more which will include road reclamation projects, the new regulations require that the first inch of storm water be retained or all the storm water must be treated. This essentially means one now not only has to resurface the road one has to completely redesign and re-construct the entire storm water collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for storm water storage or pay for the expense of storm water treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way.

As everyone is aware, the funds available for pavement maintenance are less than half of what are needed to simply preserve the condition of the current infrastructure. This means that Massachusetts roads are falling apart faster than they can be repaired. The above added costs will compound the problem and create more failing roads and more erosion.

Municipalities will be forced to use the wrong pavement rehabilitation technique at the wrong time which will squander the available limited pavement maintenance resources.

There must be an exemption for pavement maintenance projects. The above regulations should not be applied to maintenance projects. If a new road is being constructed or a lane is being added, these storm water management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should not trigger rebuilding the world.

2) Chloride Reduction. Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to legal action. Yes, usage of chlorides could all stop tomorrow, but at what cost to human life. If the EPA will protect an endangered salamander, it should be equally as concerned with the loss of human life. The chloride reduction regulations should be limited to recommending that municipalities follow the latest accepted Best Management Practices.
3) Requirement for tracking impervious area. The EPA in its permit guidance documents implicitly admits that the simple presence of impervious areas is not a direct correlation to storm water quality. Sites with paved areas can store/detain or treat storm water so that the presence of paved areas on storm water quality is mitigated. Similarly, the MADEP considers roof water runoff "clean" and can be infiltrated into the ground without pre treatment. Tracking the amount of impervious areas does not have a direct correlation to water quality; therefore the MS4's should not have to expend resources tracking changes in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities. Any attempt at limiting /restricting development through the veiled attempt at controlling impervious area is outside the purview of the Clean Water Act.
4) Cost of implementation. An article published in Construction Outlook a publication of UCANE recently published EPA cost estimates of compliance between $70,000 and $829,000 per year depending on population and size. This is very troubling because they have been known to significantly under-estimate the actual cost. At the meeting, Newton Tedder from the EPA commented that he believes most cities and towns will have to pass a storm water utility in order to pay for the costs to comply with the new Storm Phase Two regulations. Obviously, the EPA is admitting that the new regulations are an undue burden and so costly that the municipalities cannot afford them with existing revenues. It seems unlikely that the intent of Congress in passing the Clean Water Act was to authorize the EPA to mandate additional taxes and create its own hidden tax structure to accomplish its charge of cleaning the water. The EPA was charged with cleaning the water and operating within its budget as set by Congress. The States and local cities and towns must do the same. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to capriciously raise the cost of compliance with the new regulations. The local governments will be happy to work with the EPA to achieve progress on storm water. However, punishing regulations will not encourage cooperation from state and municipal partners.

The Congress of the United States should act to restrain the EPA from imposing uncontrolled and expensive tax burdens on the subjects it regulates. Taking reasonable actions to improve water quality is one thing, but being mandated to accomplish everything overnight is unfathomable. All levels of government must be cognizant of costs. The regulations, reporting requirements and the overall implementation costs must be reduced to a sustainable and rational level.

5) Signage at outfalls: Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources. The signs will encourage theft or vandalism and will provide little to no use in management of the storm drain system. All regulated organizations are required to have maps with locations of all outfalls. The availability of low cost GPS devices makes these outfalls easily located by just about anyone.

Sincerely,

Gerald Coppola

Re: September 2014 Draft general Permit

Dear Newton:

The Town of Maynard is currently subject to the Small MS4 permit. We have reviewed EPA's September 2014 draft general permit and have developed the comments below. We anticipate the requirements having significant budget and personnel impacts on the Town and appreciate EPA's careful review of the comments.

The Town of Maynard is entirely within the 2010 US Census Urbanized Area and is therefore subject to the US EPA's National Pollutant Discharge Elimination System (NPDES) Phase II Small Municipal Separate Storm Sewer (MS4) General Permit. The Town's land area is within the Assabet River watershed. A total maximum daily load (TMDL) has been developed for Sudbury Assabet Concord (SuAsCo) watershed to address phosphorus impairments.[1]

The Town has developed the following list of potential comments and/or concerns with the *Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts (Draft MS4 Permit)*, as noticed by the EPA on September 30, 2014. We understand that the EPA is accepting public comments on the Draft MS4 permit until February 27, 2015.

[1]MassDEP, 2004. *Assabet River Total Maximum Daily Load for Total Phosphorus.*
http://www.mass.gov/eea/agencies/massdep/water/watersheds/total-maximum-daily-loads-tmdls.html#20

GENERAL COMMENTS

NOI Form: The amount of detailed information required to complete the new electronic NOI Form is extensive and includes information that, in the previous permit cycle, was provided in the Stormwater Management Plan (SWMP). Having a detailed understanding of all the proposed BMPs that will be used to meet the six minimum measures, as well as those to be used to meet the water quality based effluent limitations, within 90 days is impractical. We recommend that the NOI submittal should be scaled back to provide only basic information relative to storm sewer system and leave the more detailed descriptions of the proposed BMPs to meet the six minimum measures and water quality based requirements for the SWMP, which permittees have up to a year to complete.

Timeline: First Year Requirements: The number of major activities and related plans that need to be completed in the first year of the Permit is impractical. Our review of the permit indicates that there are over ten major plans or action items need to be completed in the first year after issuance of the final permit, or sooner including:

- NOI preparation
- SWMP preparation
- Inventory of municipally-owned parks, buildings, facilities and equipment
- O&M plans for municipal facilities
- Inventory of the Town's infrastructure requiring rehabilitation and/or repair
- Sanitary Sewer Overflow (SSO) inventory
- Outfall/interconnection inventory (including condition assessment)
- Phosphorus Control Plan (PCP)
- Updated Illicit Discharge Detection and Elimination (IDDE) Plan
- Storm Water Pollution Prevention Plans (SWPPPs) for relevant municipal facilities
- Updated written protocols for erosion control inspections and infrastructure maintenance.

Comment: We suggest that the time frame to complete these activities, especially the O&M Plans, outfall/ interconnection inventory and condition assessment, PCP and SWPPP preparation be extended to at least two years from the effective date.

Pollutant Load Calculations - Appendix F and Appendix H: There is a significant amount of work to complete the calculations, tracking and accounting to address impaired waters. It will be difficult for Maynard to prepare all this information and complete the data management relative to pollutant load reductions and credits without a consultant or full time staff member, which the Town of Maynard cannot afford to employ at this time.

Comment: EPA should provide significant support to municipalities if they are to prepare this information on their own. Training sessions and outreach assistance is recommended.

SECTION SPECIFIC COMMENTS

Section 1.9.1 - Documentation Regarding Endangered Species: Before submitting an NOI for coverage, applicants must determine whether they meet the Endangered Species Act (ESA) eligibility criteria for following the steps in Appendix C of the permit.

Comment: Is EPA confident that Fish and Wildlife will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI? Is it reasonable to think that communities can meet this requirement within the 90 day NOI time period?

Section 1.9.2 - Documentation Regarding Historic Properties: It is unclear what documentation will be needed to demonstrate no impact to historic properties. The screening procedure outlined in Appendix D suggests that any subsurface excavation activity related to the stormwater program, which is highly likely as part of any future repair, upgrade or replacement of stormwater infrastructure, will require consultation with State Historic Properties Office (SHPO) to certify that there will no impact to historic properties and the documentation of this consultation/ certification must be included in the NOI and the SWMP in order to be eligible for permit coverage.

Comment: The SHPO certification requirement regarding subsurface excavation activity imposes two major problems: 1) the extent of possible future repairs and related excavation activity will not be fully understood at the time of NOI submittal, and 2) to obtain SHPO certification for each potential excavation activity will result in extensive added coordination time, costs and project delays if field investigations are required to obtain this certification. Also, is EPA confident that SHPO will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI?

Section 2.1.2.b Prohibition for Increased Discharges to Impaired Waters: This section states that there shall be no net increase in discharges from the MS4 to impaired waters listed in Categories 5 or 4B on the most recent Massachusetts Report of Integrated Waters unless the permittee demonstrates there is no net increase in loading for the specific impairment and provides documentation in the SWMP. This requirement is inconsistent with the language in Appendix F Sections IV and V which states that stormwater management for new and redevelopment shall be required to optimize pollutant removal for the pollutant of concern but not necessarily prohibit any additional increase.

Comment: In the absence of a TMDL, we feel that there is not sufficient basis for requiring no net increases and places an unnecessary burden on the MS4.

Section 2.2.1 – Discharges to Impaired Water Bodies with an Approved TMDL: Tables F-1 and F-2 of Appendix F indicate that various towns would have phosphorus reductions targets as high as 50% or more.

Comment: Given that the reported phosphorus removal efficiencies are generally in the range of 40 and 65 percent for structural stormwater BMPs and much lower for non-structural measures, this would essentially mean that nearly all, or a large majority of existing IC area, would need to be treated with structural BMPs. This is not only impractical given the wide range of site constraints that will be encountered in implementing stormwater retrofit BMPs but would also be quite costly. We suggest that EPA provide guidance for municipalities to realistically meet the targets including increased credits for

non-structural measures if they are considered truly worthy actions.

Section 2.3 - Requirements to Reduce Pollutants to the Maximum Extent Practicable (MEP):

Comment: Completing the multitude of requirements included in this section in a 5-year permit cycle is not realistic. We suggest that the number of requirements be reduced substantially and be spread over two permit cycles or allow up to 10 years to complete this section's requirements.

Section 2.3.4.5/6 Outfall Inventory and System Mapping: These sections requires the outfall and interconnection inventory to be completed within the first year and system mapping to be completed within two years of the effective date of the permit.

Comment: This time frame is very short for the undertaking. While Maynard has mapped the majority of the outfalls, developing a plan for mapping entire stormwater systems in a programmatic and efficient way is important. Towns will need to plan for this capital expense and budget for it. The time frame should be expanded to match up with TMDL and Impaired Waters control plans to use tight resources most effectively. Allow staggered mapping by higher priority waters across the town.

Section 2.3.4.7.iii – Priority Ranking: This section states that the initial illicit discharge potential assessment and priority ranking based on existing information shall be complete within one year from the effective date of the permit.

Comment: Since the drainage mapping will not be complete until two years after the permit effective date and since much of the ranking is based on this information, we suggest that a two and a half or three year time frame be required instead to align with the mapping schedule instead of asking the town to develop the ranking once based on current information and then updating it based on the more detailed information one year later.

Section 2.3.4.7.d.iv – Written Illicit Discharge Detection and Elimination Program: This section states that "The permit does not require a minimum rainfall event prior to wet weather screening. However, the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather."

Comment: Wet weather sampling is extremely costly and difficult to implement, especially when limited to 4 months of the year as specified. Unless there is clear evidence that there is a wet weather contamination threat, wet weather sampling should not be mandated. Bacteria levels in stormwater are highly variable and individual samples could easily show a spike which could falsely indicate an illicit connection. This could be extremely costly to try to track down with no results. It is requested that EPA provide: data on past wet weather sampling results that would show the number of outfalls sampled during wet weather for which illicit connections were found that were not also found during the dry weather screening process, cost of the stormwater sampling for all the outfalls sampled, percentage illicit connections that had wet weather contamination, not stormwater contamination found that was not indicated during dry weather sampling, and source of the contaminants found (i.e. one time dumping verses continuous illicit connection).

Section 2.3.4.7.e.ii – Catchment Investigation Procedure: This section describes the manhole inspection methodology.

Comment: We feel that it excessive amount of work to investigate every junction manhole if there is no dry weather flow or indication of any illicit discharges. Investigating upstream of outfalls requires work in the middle of roads, sidewalks, private property and will require police details and substantial field work and disruption. Time and money may be better spent on training municipal staff and contractors during their regular field work and maintenance, as well as the focused educational materials regarding what is an illicit connection for the residents/businesses/property owners. We request that EPA provide data showing that investigating upstream drainage systems when there is no evidence of illicit connections at the outfalls results in the identification of illicit connections worthy of the associated cost.

Section 2.3.4.7.g– Follow-up Screening: This section requires follow up screening (dry weather with additional wet weather where performed previously) once every five years after the initial review.

Comment: We request EPA provide evidence that spending this on-going expense will have a significant water quality impact.

Section 2.3.6(d) – Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management: This section states "All BMPs installed as part of the site's stormwater management system shall be constructed in accordance with the Massachusetts Stormwater Handbook Volume 2, Chapter 2."

Comment: The Massachusetts Stormwater Handbook is outdated for many of the changing BMP design features. Some BMPs such as permeable pavements are not even included in the Handbook. Other states are developing more updated design handbooks in response to TMDLs and stormwater requirements such as Rhode Island and the Chesapeake Bay area states. In addition, limiting designers to meeting the Massachusetts Stormwater Handbook will discourage designers to install BMPs that do not meet the standards but still provide treatment (as indicated by the EPA pollutant treatment curves). The wording should be changed to reference the MA Stormwater Handbook, as well as EPA, and other state manuals with recent updates that provide good BMP design guidelines.

Section 2.3.6.d.: This section requires permittee to track impervious area and disconnected impervious area each year.

Comment: Requiring a municipality to have an accurate database of the impervious cover broken down by what is directly connected or disconnected is an onerous requirement without an explanation of the use or benefit of such detailed data. Statewide and/or regional impervious cover data layers provide a much more cost effective estimate of impervious cover for the purpose planning, understanding trends, and identifying hot spots.

Section 2.3.7.a/b – Operations and Maintenance (O&M) Programs and Stormwater Pollution Prevention Plan (SWPPP): This section requires written O&M procedures for the municipal facilities that have specific activities listed within the first year and SWPPPs within the first two years.

Comment: This requirement includes collecting, organizing and updating information on each facility and will be difficult to effectively complete within one/two years, in addition to the other first years tasks. We suggest extending the time for completion of these documents to three years.

Appendix H, Attachment 1 – Street Sweeping and Catch Basin Cleaning Credits: The credits included in the permit are based on information from Center for Watershed Protection Street Sweeping program in the Chesapeake Basin, dated 2008.

Comment: The credits provided for street sweeping are extremely low and there is not mention in the permit of the extensive benefits of street sweeping for removing extensive amounts of debris and sediment in addition to actual pollutant loads. The credits do not provide incentive to utilize this source control method that not only removes contaminants and trash, it also contribute to the long term longevity of the BMPs that are listed as most valuable for phosphorus removal; infiltration BMPS. We recommend that this be researched further including the region specific USGS street sweeping study completed recently in Cambridge Massachusetts to determine the appropriate credits. If, in fact, the water quality benefit is shown to have such an insignificant impact then these costly practices should not be required.

Appendix F Section 2 Reporting: The equation used to calculate yearly phosphorus loads requires the permittee to estimate the amount of development that has occurred since 2005.

Comment: It is unreasonable to expect a Town to perform this estimate. We suggest that TMDL standards apply to today's level of development or that EPA update Tables F1 and F2 to reflect conditions at the date of the finalize permit.

Appendix F, Attachment 1 and 2: The loading rate Table 2-1 indicates in a footnote to assume Hydrologic Soil Group (HSG) D soils if soils are unknown to estimate pervious loading rates. Attachment 1 text on page 1 says to assume HSG C/D.

Comment: Please clarify. We suggest to assume C soils or use the surrounding soil types as an indicator. HSG D and C/D are too conservative for our region. Suggest only including this table in one location to avoid confusion.

Appendix F Attachment 3 Semi-Structural/Non-structural BMP Performance Credits: The section states that the cumulative runoff reduction is being used to estimate cumulative phosphorus load reduction credit for the semi-structural/non-structural BMPs which have an infiltration benefit by disconnecting IA and providing soil amendments to increase permeability.

Comment: The infiltration BMP curves show that phosphorus reductions are greater than runoff volume reductions. Therefore, it is conservative to use runoff volume as a direct surrogate when in fact

phosphorus reductions are likely higher. We suggest an additional phosphorus treatment factor in addition to solely the runoff reduction.

Appendix F Attachment 3 Table 3-18: The porous pavement BMP performance table gives credits based on the depth of filter course.

Comment: We would expect that the credit would be dependent on the relative watershed size to filter course depth. Please clarify.

Appendix F Attachment 3 Table 3-21: Table 3-21 references a "Grass Swale" when BMP is called a "Water Quality Wet Swale" in the main text.

Comment: The different naming and design descriptions are confusing. Is the BMP meant to be wet or dry swale? Are there results if the swale is not underdrained? This BMP gets very poor performance. A slightly modified swale designs could get much better results and should be included and encouraged.

Thank you very much for allowing us to comment on this 2014 draft general permit

Re: Request for 90 Day Extension of Comment Period for Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder,

The Massachusetts Coalition for Water Resources Stewardship (MCWRS) respectfully requests a **90 day extension** of the public comment period for the Draft Massachusetts Small MS4 General Permit.

MCWRS is a non-profit organization dedicated to promoting watershed-based policies and regulations that effectively manage and conserve water resources. Our membership includes municipalities, public agencies that transport and treat drinking water, wastewater and stormwater, quasi-government agencies, environmental engineering firms and legal firms with vested interests in environmental regulation and permitting.

Representatives from our organization attended several of EPA Region 1's informational meetings and the public hearing on the Draft MA MS4 General Permit over the past months. The meetings and the draft permit raised many questions and issues to evaluate. MCWRS feels this complex document requires extensive further analysis. We request that the December 29, 2014 due date be extended to allow for comprehensive and meaningful review and comment. Given that this permit will have a significant impact on our members and the regulated community throughout the Commonwealth we hope you will grant this extension.

Thank you for your consideration in this matter and feel free to contact MCWRS if you have any questions.

Sincerely,

Philip D. Guerin
President

Re: Massachusetts Small MS4 Draft General Permit Comments

Dear Mr. Tedder:

The Massachusetts Coalition for Water Resources Stewardship (the Coalition) appreciates the opportunity to comment on the Small MS4 draft general permit for Massachusetts. The Coalition, and its members, promote the use of scientifically based, fiscally responsible approaches to realize environmental and community goals, as well as watershed-based policies and regulations to effectively manage and conserve water resources. Nearly 40 Coalition members are municipalities and districts[1] who will be among the 200 or so communities charged with implementing the provisions of this permit. In previous comments on the New Hampshire Small MS4 Draft Permit (August 15, 2013) and in the comments that follow, we hope to guide Region 1 in crafting a stormwater permit that addresses water resources issues but remains reasonable, considerate of the realities of municipal operations and finances, and is consistent with statutory limitations on municipal stormwater pollution control stipulated in the Clean Water Act. Unfortunately, many of our concerns expressed in comments on the New Hampshire permit remain unaddressed and the Massachusetts draft permit fails in terms of reasonableness, consideration of municipal realities, and concurrence with the law.

General Comments:

While the goal of the Clean Water Act is laudable and supported by the Coalition, we consider the requirements in the MA Small MS4 general permit to be overly prescriptive, burdensome, and most likely unachievable for most communities.

[1] The following municipalities and districts are members of the Coalition: Charles River Pollution Control District, Cherry Valley Sewer District, City of Attleboro, City of Beverly, City of Chicopee, City of Haverhill, City of Holyoke, City of Marlborough, City of New Bedford, City of Peabody, City of Salem, City of Worcester, Greater Lawrence Sanitary District, Lowell Regional Wastewater Utility, South Essex Sewerage District, Springfield Water and Sewer Commission, Town of Bellingham, Town of Concord, Town of Danvers, Town of Dedham, Town of East Longmeadow, Town of Fairhaven, Town of Framingham, Town of Franklin, Town of Holden, Town of Marblehead, Town of Medway, Town of Milford, Town of Millbury, Town of North Reading, Town of Southbridge, Town of Uxbridge, Town of Wellesley, and Upper Blackstone Water Pollution Abatement District

Schedule Constraints: The schedules set forth in the draft permit are not reasonable or feasible when considered in the context of municipal realities. Schedules for some aspects of the permit may appear reasonable but become unreasonable when the permit is viewed in its entirety and it becomes clear that schedules for most parts of the permit overlap.

Significant Administrative Burden: The permit, as drafted, would create a significant administrative burden for municipalities that would detract from their ability to provide direct benefits to water quality through such concrete activities as increased street sweeping, increased catch basin cleaning, and removal of illicit discharges. The permit goes overboard in terms of monitoring, measuring, and quantifying changes in pollutant loads. More environmental progress would be gained if communities could focus resources on actual, physical improvements to stormwater systems and not on pollutant accounting. Per the Clean Water Act municipalities are obligated to remove pollutants from stormwater to the maximum extent practicable and that should be the objective of the permit. The ongoing assessment of receiving waters is a function of MassDEP, not individual communities.

Funding Challenges: Many of the deadlines provided in the draft permit do not allow sufficient time to allocate funding within set municipal budget cycles to complete the tasks required. No item in the permit should be required to be completed during the first permit year except the preparation of the Stormwater Management Plan (SWMP).

Integrated Planning Opportunities: There should be language within the permit that references EPA's Integrated Planning framework and how integrated planning can be utilized to address a community's stormwater/MS4 requirements. That language should be specific about how an integrated planning approach could be applied through the permit and how permit conditions, including implementation schedules, would be modified under an integrated plan.

Section-Specific Comments:

1. Section 2.1 Water Quality Based Effluent Limitations and 2.1.1-Requirement to Meet Water Quality Standards: Section 2.1 (page 9) states that "Pursuant to Clean Water Act Section 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to exceedances of water quality standards…". Similarly, the Fact Sheet, at page 4, states "Section 402(p)(3)(B)(iii) of the CWA also authorizes EPA to include in an MS4 permit 'such other provisions as [EPA] determines appropriate for the control of … pollutants'" and that "[t]his provision forms a basis for imposing water quality-based effluent limitations (WQBELs)" citing to *Defenders of Wildlife v. Browner.* 191 F.3d 1159 (9th Cir. 1999), and EPA's preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec 8, 1999); and at page 16, that "EPA interprets this latter clause (i.e. "such other provisions as [EPA] determines appropriate for the control of . . . pollutants" at Section 402(p)(3)(B)(iii) of the CWA) to authorize the imposition of water quality based effluent limitations." This interpretation distorts entirely the meaning of CWA Section 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision, and is incorrect. When Section 402(p) of the CWA was added

in 1987, it established a comprehensive new scheme for regulation of stormwater. It differentiated the technology-based requirements for MS4s relative to the rest of the NPDES program by creating a new "maximum extent practicable standard," in contrast to the traditional BAT/BCT standard that applied to industrial stormwater and other wastewater discharges. The opening clause of CWA § 402(p)(3)(b)(iii) states that, unlike industrial stormwater permits, MS4 permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable . . . ." A subordinate clause states that such controls shall include "management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Each of those controls is subject to the limitation in the first clause that they shall be required "to the maximum extent practicable." EPA's interprets this provision contrary to its plain meaning and in a manner which suggests that the final clause referring to "such other provisions as the Administrator or the State determines appropriate" is independent and coequal with the requirement to reduce pollutants to the "maximum extent practicable." Region 1's reading distorts the syntax of § 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision.

The Region also suggests, incorrectly, that the Ninth's Circuit's opinion in *Defenders of Wildlife v. Browner* supports this misreading of the statute. While in dicta at the end of its decision, the court suggested that the "such other provisions" clause allowed EPA the discretion to include "either management practices or numeric limitations" in MS4 permits, the court did not say that the discretion to include numeric limitations or to require compliance with water quality standards could be exercised without regard to the "maximum extent practicable" limitation in the statute. That issue was not presented by the facts of the case before it, and it was not addressed in the court's opinion. Had the court so ruled, it would have been contrary to the plain language of the statute and subject to reversal on appeal.

Federal courts have consistently ruled that the MEP standard is the only standard that MS4 discharges are required to meet. *Natural Resources Defense Council, Inc. v. U.S. EPA*, 966 F.2d 1292, 1308 (9th Cir. 1992) (CWA § 402(p)(3)(B) "retained the existing, stricter controls for industrial stormwater dischargers but prescribed new controls for municipal stormwater discharge); *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1165 (9th Cir. 1999) (CWA § 402(p)(3)(B) "replaces" the requirements of § 301 with the MEP standard for MS4 discharges, and it creates a "lesser standard" than § 301 imposes on other types of discharges); *Environmental Defense Center v. EPA,* 319 F.3d 398 (9th Cir. 2003), vacated, rehearing denied by, and amended opinion issued at 344 F.3d 832 (9th Cir. 2003) (CWA "requires EPA to ensure that operators of small MS4s 'reduce the discharge of pollutants to the maximum extent practicable'"); *Mississippi River Revival, Inc. v. City of St. Paul,* 2002 U.S. Dist. LEXIS 25384 (N.D. Minn. 2002) ("the CWA specifically exempts municipal stormwater permittees" from the requirement to ensure that water quality standards are met).

In addition, EPA's citation to the Preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec. 8, 1999) to support its interpretation of Section 402(p)(3)(B)(iii) of the CWA as authorizing the imposition of water quality based effluent limitations is disingenuous. The Preamble to the Phase II rule at 64 Fed. Reg. 68788, states only that EPA disagrees with commentators who challenged EPA's interpretation of the CWA as requiring water quality based effluent limits for MS4s. The Preamble gives no legal rationale. Like the fact sheet, at page 4, the Preamble to the Phase II rule cites to *Defenders of Wildlife*. As noted above, *Defenders of Wildlife* does not support the proposition that EPA can require MS4 operators to comply with WQBELs regardless of practicability.

EPA has taken the position in the defense of the Phase II rule in *Environmental Defense Center* that:

> MS4 requirements… rest on the "maximum extent practicable" ("MEP") standard which CWA Section 402(p)(3)(B)(iii), 33 U.S.C. § 1342(p)(3)(B)(iii), prescribes for Section 402(p) municipal storm sewer permits. 40 CFR § 122.34(b). Thus, while the regulations suggest numerous ways in which small MS4s ought to control their stormwater discharges, *the MS4s are not, in the end, required to do anything that is not "practicable."* 2000 U.S. 9th Cir. briefs 70014, 70020 (June 26, 2001). (Emphasis supplied)

Given the plain language of Section 402(p)(3)(B)(iii), any application of the Phase II rule to require that MS4 discharges need to meet WQBELs regardless of "practicability" would be *ultra vires*.

The cited section of the Clean Water Act makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable (MEP) as the standard to which pollutants must be removed from municipal MS4s. The language in section 402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. Section 402(p)(3)(B)(iii) of the Act states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA tries to imply. The proper wording throughout the permit that would be consistent with the Act would be for the permittee to meet water quality standards to the maximum extent practicable. For Congress to bother to include such language in the Act is clear and unassailable evidence that lawmakers understood that there are limitations in the ability of municipalities to meet water quality standards in stormwater discharges. These limitations are spelled out in the statutory standard of MEP applied only to municipal stormwater discharges. NPDES stormwater permits for municipalities will continue to be contentious as long as EPA refuses to recognize that the MEP standard applies as the only mandate for pollutant removal from MS4s. Water quality standards and TMDL waste load allocations may be goals but are not the required

standards that must be achieved in municipal stormwater.

2. Section 2.1.2 Increased Discharges: New and additional stormwater flow to impaired waters regardless of concentration would be prohibited under this draft permit. This requirement could only be overcome by demonstrating that the pollutant of concern is not present in the new/increased discharge or that the total load of pollutants to the impaired waters will not increase. Even the most innocuous "new discharge," say a new single family home with a driveway and stormwater-minimizing design, will produce some pollution and will add some additional load, be it insignificant, to a receiving water. The language in this section could thus be interpreted to mean no new development in MS4 areas draining to impaired waters. Many urban areas of Massachusetts have nothing but impaired waters. This section could effectively preclude new development in such communities. That is an impact that goes far beyond EPA and federal authority. This language must be modified to stipulate thresholds on new/additional pollutant loads being significant and not merely all new loads.

3. Section 2.2.1.b (pages 11-15) and Appendix F, Part A: The permit requires compliance with TMDL waste load reductions associated with stormwater. It mandates a progressive reduction in pollutant loads with 100% reduction achieved within 15 years. The permit neglects to recognize that most TMDL's developed for Massachusetts waters are lacking in sound science and are instead based on very generic models of watershed loading. In many cases there is a dearth of actual sampling data from the TMDL regulated waters or data may be 25 or more years old. Even in the more rigorous Charles River TMDL for phosphorus, the model used to determine needed phosphorus reduction produced results that are not supported by actual test data. The TMDL's which drive pollutant removal requirements in the draft permit are wholly inadequate for this purpose and cannot legitimately justify specific pollutant load removal for the vast majority of waters. To be consistent with the Clean Water Act and avoid reliance on unsubstantiated pollutant load reductions, municipalities should be required to remove the pollutant of concern to the maximum extent practicable by implementing feasible BMPs, including structural and non-structural measures, that have been demonstrated through generally accepted research to be effective at removing that pollutant. Municipalities cannot do any more than what is feasible and should not be squandering limited resources chasing highly tenuous pollutant "numbers".

4. Section 2.2.1.c (pages 15-17) and Appendix F, Part B: Massachusetts municipalities should not be held to comply with out-of state TMDL requirements. TMDLs are determined by state environmental agencies. While there may be an "open" regulatory process for TMDL development it is highly unlikely that process and its requisite public notification was extended to potentially impacted communities outside of the state. The interests of Massachusetts municipalities were not represented by anyone during TMDL development in Rhode Island, Connecticut, New York, Vermont or New Hampshire. Massachusetts cities and towns are now being subjected through this draft permit to regulatory programs in other states to which they had no opportunity to participate. Even within Massachusetts, the majority of TMDLs were developed in the early 2000's at a

time when their link to future stormwater permits was unknown. Massachusetts TMDLs, with few exceptions, were offered as stand-alone documents with little bearing on anything that a municipality would be required to do. Had it been clear that these documents would have substantial and costly implications for cities and towns the TMDL development process would have fallen under much greater scrutiny and the haphazard, unscientific way they were created would likely have been challenged. The TMDL program in Massachusetts is so hopelessly flawed in terms of science and public process that it should not be utilized for NPDES permitting at all, let alone be the primary focus of a MS4 general permit.

5. Section 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements (pages 17-22) and Appendix H: This section assumes that there has been sound and defensible science used to determine the cause of impairments of numerous water bodies. That has rarely been the case. State agencies including Massachusetts DEP have rarely had the resources to perform legitimate water quality investigations of lakes, ponds and rivers. Very often an assessment of a water body is based on the most cursory information (visual observation of weeds or algae) and lacks the detailed sampling and analysis needed to truly determine conditions and causes. Yet this unscientific assessment will now result in communities expending significant resources developing nitrogen source identification reports and phosphorus source identification reports along with the planning, implementation and tracking of structural BMPs for removal of these pollutants. For some communities, the "water quality limited waters" driving these added expenses could be 75 miles downstream. It is ludicrous to imagine that stormwater generated in a small community of 5,000 people could have a significant impact on a coastal bay nearly 100 miles distant yet that is what is being described in this section. There needs to be both better science and common sense applied before cities and towns are held to "fix" problems that often do not exist.

6. Section 2.3.2 Public Education and Outreach: While EPA provides more time to conduct the public education program in this draft of the permit, it is important to keep in mind that the majority of the public does not understand how stormwater can become polluted and how it can contribute to water quality issues. Most of the public still believes that catchbasins in their roads transport stormwater to a treatment facility prior to discharge. In addition, most people do not understand the concept of a watershed, or the concepts related to the water cycle (rainfall, runoff, infiltration, and evapotranspiration). A significant amount of awareness-raising must be done across the United States prior to an individual community education/outreach campaign in order to truly stimulate behavior changes in the general public. Many municipalities see a large influx of visitors during the tourist season and thus education must extend well beyond the immediate locality to be truly effective. Stormwater education is a national need and should be spearheaded by EPA nationally through a consistent education campaign and not simply left to municipalities.

7. Section 2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program (pages 25-37): Overall the IDDE program as described is highly prescriptive and very burdensome.

While IDDE is necessary and valuable for a strong stormwater management program, the extent to which a municipality can comply with the edict mandated in the draft permit is questionable. The schedule mandated by the permit is unreasonable for an initiative that constitutes a major capital project requiring significant expenditures and coordination. The described program needs to be tempered by the Maximum Extent Practicable standard and thus subject to that which is feasible.

8. Section 2.3.4.1 Definitions and Prohibitions (page 25): EPA needs to modify its definitions to differentiate illicit discharges caused by mis-connected sewer laterals or direct introduction of contaminants into the MS4 by illegal dumping from those caused by systemic failures within the sanitary sewer or MS4. It is one thing to track, identify, and remove an illicit connection but altogether different to track, identify, and correct a failed sanitary sewer or similar system defect. The former are generally easy to locate and repairable within a relatively short time while the latter are extremely difficult to locate and repair and may involve wholesale replacement of large parts of the sanitary sewer collection system. The language in section 2.3.4 implies a "one size fits all" approach to IDDE and it clearly is not in terms of locating and removing the illicit discharge.

9. Section 2.3.4.4 a through e: This Sanitary Sewer Overflow reporting requirement is redundant and should be removed from the Small MS4 permit. MassDEP already requires SSO reporting through statewide regulations. For purposes of this MS4 permit, the term SSO needs to be defined. Relative to stormwater management and MS4 permitting the only SSO that should be considered are those that discharge through a stormwater outfall into a receiving water. SSOs that enter basements or are contained on street surfaces or upland areas have no link to an MS4.

10. Sections 2.3.4.5 and 2.3.4.6 (page 26-28): Outfall and interconnection inventory and system mapping are necessary and valuable components of stormwater management. However, the timeframe to complete these more detailed studies is likely inadequate, especially for smaller communities that may lack GIS and GPS capabilities. Communities should identify feasible schedules for completing this work within their SWMP.

11. Section 2.3.4.7.d.i (page 32): The Coalition objects to the requirement that the permittee adopt a screening and sampling protocol consistent with a January 2012 draft document (EPA New England Bacterial Source Tracking Protocol). If this protocol is to be used in a regulatory context as proposed for this permit, it should be subject to rule making, peer reviewed, and scrutinized by others outside of the Agency and become a Final, not a draft, before making its use mandatory. Otherwise, the draft document may be useful as a suggested reference only.

12. Section 2.3.5 – Construction Site Stormwater Runoff Control, and 2.3.6 – Stormwater Management and New Development and Redevelopment (Post Construction Stormwater Management). These provisions require permittees to develop, implement, and enforce a

program to reduce pollutants and any stormwater runoff discharge to the MS4. EPA has no authority to make local land-use decisions by compelling permittees to make specific choices with regard to ordinances or other regulatory mechanisms. EPA is exercising federal land-use mandates on a local basis in violation of the 10th Amendment of the Constitution.

These provisions would also apply to public road reclamation and resurfacing projects involving more than ¼ mile of 30 foot wide pavement (approximately 1 acre equivalent). By doing so, this permit would cripple local road maintenance budgets by effectively requiring redesign and construction of entirely new stormwater collection and control systems for all but the smallest road resurfacing project. Maintaining safe, passable roads is among the highest priorities of local government and one that is currently grossly underfunded. Taking limited funds and utilizing them for stormwater improvements for virtually every significant resurfacing project will greatly curtail meaningful improvements to local roads. Resurfacing and pavement maintenance projects should be exempted from this requirement to meet stormwater standards. The standards might be applicable to road reconstruction projects but only to the extent that they are practicable.

13. Section 2.3.6.d (pages 42-43) Directly Connected Impervious Area: The requirement to monitor and track impervious cover is a burdensome and inappropriate requirement for most municipalities. It has the appearance of a research effort and not a tool that will benefit stormwater management by the community. Compiling and tracking impervious area will require manpower and costs that would be better utilized implementing better stormwater control systems. If Region 1 is that interested in tallying impervious cover acreage, the Coalition suggests it directly fund and coordinate with colleges and universities to accomplish the task through graduate and undergraduate GIS projects.

    Region 1's effort to regulate impervious surfaces raises the legal issue on whether such surfaces are "point sources" under the NPDES permit program. Impervious surface, on its own, cannot be subject to regulation under the NPDES permit program because impervious surfaces are neither a "point source" nor a "pollutant." Instead, it is a feature of the landscape that indirectly influences how water is carried on and off land. Congress predicated the stormwater permitting program and Section 402(p) of the CWA on "point source" discharges of "pollutants" from certain categories of dischargers, including MS4s and industrial activities. If Region 1 were to interpret "point source" to include impervious surfaces, it renders that term meaningless and contrary to Congressional intent to define the term and distinguish between "point sources" and "nonpoint sources." In addition, Region 1's authority to control pollutant discharges does not encompass the ability to mandate land-use decision-making. While local authorities can develop a regulation, for example, to limit impervious surfaces or other stormwater flows into the MS4, EPA is limited to regulating the discharge of pollutants from the MS4 and cannot force MS4s to do what EPA is not otherwise authorized to do, including imposing restrictions on local land use decisions. While on November 26, 2014, EPA released a guidance memorandum in which it asserts authority to mandate retention standards based upon the amount of impervious surface at a site, that authority is necessarily limited to

discharges from MS4 storm system (i.e., the ”point source”) into navigable waters. In short, impervious surfaces are not “point sources” under the NPDES permit program. CWA Section 304 prohibits unauthorized point source discharges, but Congress left the regulation of nonpoint source pollution to the states.

The Coalition appreciates the opportunity to comment on Massachusetts Draft Small MS4 General Permit. We urge EPA to consider modifications to the permit that will make it more sustainable and reasonable for municipalities and consistent with the Clean Water Act.

Sincerely,

Philip D. Guerin

Subject: Comment on the 2014 Draft Massachusetts MS4 General Permit

Dear Mr. Tedder and Ms. Velez:

The City of Medford is committed to working towards the improvement of the surface water quality within our boundaries. Since the issuance of the 2003 MS4 stormwater discharge permit we have done extensive work in screening and analytical monitoring of our approximately 111 outfalls along the Mystic and Malden Rivers during both dry and wet weather; and we have investigated, identified and successfully removed illicit discharges. The City is currently under an administrative order, issued by EPA in August 2009.

We have reviewed the new Draft MA MS4 General Permit "General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts" issued by the EPA in 2014. The following are our comments on sections of the draft permit:

- Section 2.3.2 Public Education and Outreach:
Per paragraph e. "The permittee shall identify methods that will use to evaluate the effectiveness of the educational messages and the overall education program." It would be helpful if the EPA had already developed educational messages and methods of distribution that have been proved successful. Communities have been conducting public education and outreach for many years under their MS4 permit which they have been reporting to the EPA. That is plenty of material for the EPA to have evaluated, and present the effective educational messages and outreach methods.
We object to having to evaluate the effectiveness of the educational program, which is an unnecessary burden.

- Section 2.3.4.7.c. Assessment and Priority Ranking of Catchments:
Per 2.3.4.7.c.ii the assessment and priority ranking of catchments shall be performed based on certain screening factors. One of them is "age of surrounding development and infrastructure": " (…) areas where the sanitary sewer system is more than 40 years old will probably have a high illicit discharge potential". Given that the majority of sewer infrastructure in Massachusetts is much older than 40 years old, this "priority" ranking factor is quite ineffectual in the assessing and ranking of catchment areas. In Medford, where 98% of the sewer system is older than 40 years, the permit essentially ranks the whole City as a priority catchment area. Which again defeats the purpose of "ranking" the catchment areas within the City: a citywide blanket ranking of "high priority" does not help to identify the catchment areas more susceptible to illicit discharges.

- Section 2.3.4.7.d. Outfall and Interconnection Screening and Sampling:
The permit should explicitly state that the screening and sampling of interconnections is the responsibility of the upstream municipality.

Per paragraph iii. "If no flow is observed, but evidence of dry weather flow exists, the permittee shall revisit the outfall during dry weather within one week of the initial observation (…)". How does EPA

differentiate between evidence of dry weather flow vs. evidence of wet weather flow? Please explain the phrase "evidence of dry weather flow". This term should be revised to state "evidence of illicit flow". The main function of an outfall is to convey flow in wet weather. Given that outfalls show evidence of flow that is primarily due to wet weather, the persistence of the permit to even suggest that a dry outfall should be revisited is perplexing. An outfall that is found dry in dry weather should not require any kind of follow-up investigation.

Paragraph iv. requires wet weather screening and sampling of all outfalls. Per same section " (…) the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather. " The permit essentially requires that every outfall in the City will be screened and sampled during wet weather. Wet weather analytical monitoring is a difficult and expensive task, which almost always is inconclusive. We have performed wet weather sampling, and the sampling results were never helpful in finding illicit discharges. It is the most inefficient way to conduct IDDE investigations. We have been hearing this from numerous other Massachusetts municipalities. The wet weather sampling requirements will drain our resources without giving us meaningful results.

The question becomes what is the rationale behind wet weather sampling? When the question has come up in public meetings EPA's response was some sort of low probability scenario that in absolutely no way justifies the time and money municipalities are required to invest. Additionally, EPA has told us that wet weather sampling is sought in order to provide some "range" of data to EPA. If EPA is interested in capturing such data for its own research project, then perhaps EPA itself could undertake the sample and analysis.

Perhaps, wet weather screening and sampling should be required in catchment areas that have already exhibited significant problems based on dry weather flows, CCTV work and other investigations. But certainly not in every catchment where problems are not present.

More to the point, what data is there to support the efficiency and effectiveness of wet weather screening and sampling? New England communities have been sharing their wet weather investigations data with EPA. Prior to finalizing the permit, we would like EPA to share this data with us, specifically how much money has been spent on wet weather sampling, how many locations have been sampled, and how many point sources and volume of illicit discharges were found.

- Section 2.3.4.7.e. Catchment Investigation Procedure:

The System Vulnerability Factors that should be used to identify areas with "risk of sanitary inputs to the MS4 under wet weather conditions" are so general and all inclusive that using them would rank the whole city of Medford as high risk. Under our current administrative order, we have performed extensive dry and wet weather screening and sampling, that shows that the majority of catchment areas in the city are low risk.
Incidentally, in the majority of Massachusetts municipalities sewer and drain infrastructure is older than 40 years in medium and densely developed areas. Again, this is a very ineffective tool to rank the different catchments. Based on those, wet weather screening and sampling would be required for every outfall; the results are guaranteed to be inconclusive in identifying illicit discharges and connections.

From what date is the 40 years calculated from? We would like the EPA to explain why "40" years was selected as threshold in the age vulnerability factor. We request that the 40 year old vulnerability factor is removed, or at a minimum the age is increased. We have seen much older pipes that are in perfectly good condition.
We request being allowed to group criteria and develop ranking that allows us to target the most significant issues first.

Furthermore, the key junction manhole inspection methodology is very broad and would essentially require a large number of manholes to be investigated, even though "no evidence of an illicit discharge is observed at the outfall". This is yet another instance where it is difficult to justify the enormous effort municipalities are required to undertake, and the efficiency of the approach is highly questionable.

We have stated our objections to wet weather investigations requirements in a previous comment above.

- Cost:
In a time of budget cuts the requirements of the permit will significantly add to the cost of compliance, and it will not be cost-effective. We estimate that the cost to meet the requirements of the new permit will be approximately $300,000 more than the cost of compliance with the 2003 permit. This is a significant cost increase. We believe EPA should re-evaluate the cost of permit compliance for communities like Medford, and examine if it is cost effective.

Overall we believe that our resources should be better spent and invested in problems we have already identified and need to solve. During regular maintenance and mapping of drain manholes, we have identified areas with potential problems. We will concentrate and work on these known problems. Continuous investigations and sampling should not be our priority at this point. Additionally, SSOs are the major contributor of pollutants to our rivers. Infiltration/ inflow are the major sources of the SSOs. We know where some of the infiltration/inflow problems are; we are and should continue investing our resources on removing these. We should invest our resources in removing catch basins tied to sewer lines, construct drain mains and tie the catch basins to the drain system. Additionally, due to the increased cost required to comply with the new permit, several works planned for the near future will see diverted funds and thus stall.

Sincerely,

_____

RE: Draft NPDES General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. The concerns enumerated below constitute "reasonably ascertainable issues" developed on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), and practical experience implementing the program over the preceding eleven (11) years of the existing permit term. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit. The initial comments refer to conditions associated with "Requirements to Reduce Pollutants to the Maximum Extent Practicable" (the six Minimum Control Measures [MCM]); the latter comments refer to conditions related to "Water Quality Based Effluent Limitations (WQBELs)." General comments follow thereafter.

Comments

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **MCM 1 – Public Education and Outreach**: Although not explicitly required under the permit, EPA has repeatedly suggested that introducing stormwater quality-related topics in school curricula would be an appropriate and cost-effective means of achieving MCM-1 objectives. Experience has demonstrated that statutory subject requirements within most school systems makes it very difficult to introduce non-mandatory (or non-MCAS related) material. Cost estimates related to achieving the minimum requirements of this MCM appear to be under-representing the broad audience targets and should not assume school programs as the basis for cost estimates.
2. **MCM 3 - IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant

sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm drain and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification*: Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.

b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification*: Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification:* Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

3. **MCM 3 - IDDE Mapping:** New mapping requirements relating to sewer infrastructure under the IDDE MCM are a significant concern, as they not only require mapping of all storm drain components, but now must include sanitary sewer infrastructure "where available" and knowledge of asset conditions relative to both storm and sewer systems in order to implement procedures related to prioritization and execution of catchment investigations on the basis of the System Vulnerability Factors. This level of asset inventory, condition assessment, mapping and documentation represents an effort that could take much longer than the two (2) year deadline in the permit. Based on the dynamic and cumulative documentation relative to investigations and program progress, it is also clear that communities are virtually required to develop this mapping and condition assessment as part of a GIS database. For communities that have not begun or are in early stages of GIS development, two years is certainly an inadequate amount of time. The "where available" language relative to sewer mapping (Section 2.3.4.6 (a) (ii)) is itself problematic because it is not clear to what extent the MS4 operator, who may be different than the sanitary sewer system operator, is required to obtain, develop or update sanitary sewer mapping elements that could influence catchment prioritization or wet weather screening obligations through the course of the permit term. *Proposed Modification:* Extend deadlines for storm system mapping requirements to Years 4 or 5 and make all sanitary sewer mapping voluntary or "recommended" rather than required.
4. **MCM 3 - Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties under separate permit programs in the event of an SSO excursion. *Proposed Modification:* Elimination of this requirement.
5. **Affordability; Estimated Program Cost Increases**: EPA directs MS4 owners to the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report for reference regarding anticipated program cost increases (administrative, operating and capital) under a variety of scenarios. This document, and subsequent evaluations conducted for other Upper Charles River watershed communities including Medway and Millis, indicates that program administrative/operational costs alone will range from double to quadruple

existing expenditures. More recent updates to these figures for the communities that were the subject of EPA's detailed analysis indicate that, if anything, these estimates are under-representing the magnitude of cost increases. Capital costs to comply with the TMDL requirements embedded in the permit are estimated in the tens of millions of dollars. The enormous gains in water quality under the Clean Water Act in the first two decades after passage were achieved through a locally affordable program aimed at primarily wastewater-related point source discharges, and underwritten by state and federal funding equivalent in many cases to 90% of the program capital cost. Stormwater-related pollutant contributions to receiving water bodies are much more difficult to control and will achieve an incremental water quality improvement compared to the wastewater discharges that were the target of initial infrastructure investments. It is inconceivable that the estimated costs of this MS4 program can be affordably sustained by a limited number of property owners within communities subject to the most stringent pollutant reductions. Water quality improvements have local, state and national benefits. A program that EPA and other environmental organizations (regulatory, advocacy/non-profit or commercial) recognize as this important should have some kind of legislative or Congressional support that provides adequate funding to promote programs that can achieve water quality improvements in a more equitable and financially sustainable manner.

6. **Regional or Alternative Implementation Opportunities**: Many of the sustainable funding alternatives explored in the 2011 report refer to opportunities for working with designated dischargers (DD) in some capacity. The Residual Designation Authority (RDA) Draft Permit has not progressed in some time, and there is little information available as to the likelihood of this permit ever becoming final. In addition, under current conditions, it applies to a very small number of communities (Bellingham, Franklin and Milford). Private properties are a major contributor of pollutants to MS4 discharges, however, this RDA mechanism is an unwieldy approach to incorporating private activity into pollutant control. If the permit were to be finalized as it currently stands, these three communities are likely to experience detrimental economic development impacts due to the additional cost of operating in their towns compared to immediately abutting communities. Without passage, however, private property owners have no incentive to collaborate with local authorities regarding operation of sites that were designed and constructed in accordance with local stormwater regulations in place at the time of development. It is unrealistic to include any of the funding scenarios that include cooperation or collaboration with a group of designated dischargers that do not exist today, are unlikely to be designated in the near future, and are unlikely to voluntarily engage in a complex and costly program without measurable benefit to them directly.
7. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer

management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

8. **Definitions – Redevelopment**: The term "redevelopment" is nowhere defined in the permit or appendices. Given that EPA is requiring "redevelopment" projects to meet the new development design guidelines for stormwater management (and particularly in reference to the one-inch retention/treatment provision), it is important to know what constitutes redevelopment versus rehabilitation, restoration, maintenance or repair projects. This is particularly of concern as it relates to transportation-related projects such as pavement programs (full depth reconstruction, pavement overlays, chipping, etc.), and the possibility that routine maintenance could trigger requirements for significant drainage improvements that would not otherwise be appropriate or necessary for operational purposes. *Proposed Modification*: Define redevelopment to exclude roadway projects that do not add significant new paved acreage.
9. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.
10. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of

impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.

11. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MassDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MassDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.
12. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MassDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.
13. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b),the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in it's best interest.
14. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The

cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO Long Term Control Plan programs.

Water Quality Based Effluent Limitations (WQBELs)

15. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.
16. **Phosphorus Load Export Rates – Appropriate Use:** Regarding Appendix F and attachments, the Phosphorus Load Export Rates (PLERs) are general and approximate at best. The composite PLERs are good for screening / planning purposes or comparative purposes. They are not accurate for determining hard design of control measures. For example, they can be used to evaluate whether a proposed change in land use is expected to increase or decrease pollutant loads. But to use a PLER to conclude that the loading rate is actually X lbs/yr, or will change from Y lbs/yr to Z lbs/yr with land use or other changes, is not a recommended technical practice. Loading rates are ordinal rather than cardinal, i.e., they can tell you if one is higher than another, but not exactly how much higher one is than another. It appears that EPA assumes that

over the entire Commonwealth of Massachusetts, using PLERs will represent the average condition. That may be true, but EPA is requiring that the PLERs be used to make decisions on a much smaller watershed and sub watershed scale, which is inappropriate.

17. **PLERs - Derivation:** It is not clear how the values for PLERs in the EPA documents are derived, however, a literature search shows that there is a large range of values for any given land use. For example, the PLER for medium density residential is given as 0.55 lb/ac/yr in Table 1-1 (App. F Attachment 1), but the range of PLERs for medium density residential in the scientific literature can be an order of magnitude around the value. Please provide further information regarding derivation of the PLERs since these values have significant impact on program implementation for regulated communities.
18. **PLERs – Blanket vs. Site Specific:** PLERs found in older literature generally do not reflect the presence of stormwater BMPs, low impact development (LID) planning, etc., and therefore may overestimate pollutant loads for current land uses. In addition, composite PLERs are a particular concern for communities that have previously instituted stricter local development standards for stormwater management many years ago (in some cases, decades) where assumed PLERs may be much greater than actual conditions. *Proposed Modification:* Rather than limiting appeals of assumed baseline watershed phosphorus loading to updates of land use information, allow permittees the option to develop their own alternative methodology for determining baseline phosphorus loads and reduction requirements based on more detailed data and/or site specific information.
19. **Phosphorus Contribution of Illicit Discharge:** It is not clear in either the permit or the fact sheet what method was employed to calculate estimated contribution of phosphorus load through illicit discharges, and consequently the load reduction that would be achieved through elimination of IDDE. Since this calculation figures into the total overall phosphorus load reduction allocated to each Charles River community, it is impossible to comment on how equitable this approach can be. Please provide further documentation regarding the method used to complete this calculation.
20. **Ambiguity in Determining Contributing Drainage Area:** It is not clear in Appendix F and its pertaining attachments whether the permittee will be using the impervious area or the directly connected impervious area (DCIA) in the PLER calculations, which includes factoring in DCIA in determining PCP area. The phosphorous loads should be determined from the DCIA of a target catchment, but this is not explicitly mentioned in either Appendix F or its attachments. The only explicit mention on DCIA is in Appendix F under sections "Phosphorous Source Identification Report" and "Nitrogen Source Identification Report" which simply state that the source identification report should include the "Impervious area and DCIA for the target catchment." There is no mention of how this DCIA information needs to be used, for example, in determining either the PCP area, total development area, impervious area (IA) for calculating phosphorous reduction credits for non-structural BMPs, or in distributing the total drainage area into impervious

area for BMP load and volume calculations. In all the above instances, DCIA should be considered, rather than total impervious area. This needs to be clarified in the new permit.

21. **Determining Infiltration Rate for Structural BMPs:** Attachment 3 of Appendix F specifies identification of infiltration rate for a particular BMP when determining the design volume of a structural BMP to achieve a known phosphorous load reduction target from a contributing drainage area. However, it is not clear how the infiltration rate needs to be determined. It is stated that the infiltration rates represent the saturated hydraulic conductivity of the soils. Since saturated hydraulic conductivity of soils is a function of its hydrologic soil group, it is important to mention how this rate needs to be determined for a combination of soil types. Please provide further guidance to determine infiltration rates for an infiltration type structural BMP, such as an infiltration trench or infiltration basin.
22. **Choosing BMP Performance Curve for Multiple Combination of BMPs:** Attachment 3 of Appendix F provides several BMP performance curves for different types of structural BMPs. However, the permittee may choose a combination of BMPs to achieve a desired phosphorous load reduction. It has been noted through literature search that a combination of BMPs may be more effective in capturing larger storms, and hence will be more effective in providing desired phosphorous load reductions from these storm events. For example, if a bio-retention system is coupled with a secondary spillway to a porous pavement, it has been found from literature that this combination is effective in capturing the first 1" rain (first flush) and higher flows, respectively. In such a situation, it is not clear what BMP performance curve should be referenced and how the curve(s) need to be used by the permittee. Please provide further documentation regarding the method to determine BMP performance curves for a combination of BMPs.
23. **Appendix H. II (1)(a)(i)(3) Additional /Enhanced BMPs for Phosphorus-Impaired Waters:** Under the Good House Keeping requirement, it requires permitees to increase frequency of street sweeping at least twice a year for **all municipal streets and parking lots.** This requirement should be related exclusively to those streets within the impaired catchment, not all streets/ parking lots in the Town. It might be what was intended, but that is not how the language reads and should be modified.

Other Issues

24. **Non-Stormwater Discharges**: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." Explicit guidance is necessary regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges.

25. **Town Administration Outreach**: In most communities responsibility for permit compliance resides with Public Works or similar agency officials. Boards of Selectmen and/or Town Managers are often not involved in program administration outside of procurement or appropriation processes for identified projects. Their lack of understanding and support to local implementing agencies has been a continuing challenge. EPA and/or DEP must increase their involvement in educating Town officials about the extent, costs, operational impacts and policy determinations incumbent on program administrators to ensure continued organizational support, particularly for funding strategies.
26. **Legal Analysis for PCP:** EPA and MassDEP should provide greater guidance related to this requirement. This analysis is likely to have many common components from municipality to municipality and appears to be an appropriate area for regulators to expand upon the examples provided in the fact sheet and a likely topic for model by-laws/ordinances. In addition, the permit and fact sheet regularly cite the cost-benefit of regional or collaborative effort to implement many of the MS4 requirements. As such, model Inter-municipal Agreements or other legal vehicles to achieve mutual objectives should be developed and shared with regulated communities.
27. **Funding Source Assessment for PCP:** The language associated with this required component of the PCP is ambiguous. Although the permit does not require adoption of a stormwater utility, all of the components of this program clearly are driving the regulated community to that EPA-preferred solution. The funding source assessment does not, in fact, make an explicit connection between cost-estimates required elsewhere in the PCP and the manner by which the "funding plan" will meet those costs. This "assessment" only requires a community to identify the means through which they intend to fund the program – adequately funded or not. The "estimated cost for implementing Phase I of the PCP" requirement states that the "estimate can be used to assess the validity of the funding source assessment...." This is a circular reference that doesn't spell out what enforcement mechanism EPA will use to ensure that the "funding plan" and the "cost estimates for implementation" are essentially equivalent. It is disingenuous for EPA's fact sheet to state that "a municipality should choose the option that is right for it" when both EPA and the regulated community have expressed the recognition that traditional funding methods (e.g. General Funds) will not be adequate to meet the program demands. The permit must be definitive around the issue of costs vs. funding so that communities understand the regulatory liability associated with an inadequately funded program.
28. **Floor Drain Inventory:** It is appropriate and appreciated that this requirement has been removed from the Draft Permit.
29. **Errors:** A number of errors in referencing were noted in the document. The ones we noticed are listed below, there may be more. Please carefully check all cross references in the preparation of the Final Permit and correct the following errors:

- Page 12 – change references from Table F-5 to Table F-6

- Page 14 – change references from Table F-6 to Table F-8
- Page 14 lists reference to Buzzards Bay but there is no Nitrogen TMDL for Buzzards Bay watershed on DEP's website
- Page 14 list does not include Wareham although Wareham is in Buzzards Bay watershed
- Page 15 change reference from Table F-7 to F-9
- Page 17 – reference to Table F-10 is incorrect (that is a table of Assabet towns)
- Appendix F page 5 of 53 – footnote No. 4 incorrectly references Table F-2 for PCP area scope inclusive of MS4 only (should be Table F3) and references Table F-1 for jurisdiction-wide PCP area (should be F-2)

RE: Merrimack Valley Stormwater Collaborative Public Comment on 2014 Draft NPDES General Permit for MS4 Systems in Massachusetts

Dear Mr. Tedder:

On behalf of the Merrimack Valley Stormwater Collaborative, I am writing to provide comments on the draft MS4 permit for Massachusetts, notice of which was published by EPA in the Federal Register on 9/30/2014.

The Merrimack Valley Planning Commission (MVPC) is the facilitating agency for the Collaborative, which is a coalition of the diverse 15 cities and towns in the MVPC region created to coordinate intermunicipal strategies in stormwater management. The Collaborative was formed this past summer to promote more effective and cost efficient implementation of local stormwater management programs. Our efforts are focusing on public education & outreach, staff training and implementation of best management practices, all elements in development of effective and efficient stormwater programs for our communities.

While some members of the Collaborative will be submitting individual community comments on the draft permit, this letter is intended to provide a general sense of issues and concerns raised collectively by Collaborative members in review of the draft permit.

Overall, the Collaborative agrees with the purposes and intent of enhancing water quality. The Merrimack Valley's waterways are among our most cherished resources and we as

160 Main Street, Haverhill, MA 01830 phone - 978.374.0519 • fax - 978.372.4890

Commonwealth communities must continue the decades-long progress in cleaning up our rivers, lakes, streams, coastal estuaries and bays. Issuance of a new permit updating the 2003 permit is long overdue. The delays and false starts in permit renewal have led to some frustration, cynicism and confusion at the local level about the federal role in MS4 oversight.

However, Collaborative community members also contend that the draft permit with a multitude of administrative requirements, many overly prescriptive and well beyond the scope of the 2003 permit or even current MS4 requirements for other states, stretches the bounds of reasonableness in local application. EPA, in collaboration with MassDEP should reduce the requirements so that implementation can be more affordably and effectively administered by cities and towns.

Municipal Capacity & Budget Constraints

Local officials are operating their departments and agencies with constrained budget resources. They are obligated to implement stormwater management in the most cost effective manner, given the extent of competing local government demands in education, public safety, facilities and infrastructure upgrades and general welfare. Municipal officials will have to make compelling cases for additional resources to wary chief executives and legislative bodies. They cannot risk making major expenditures in anticipation of the new requirements without some sense of confidence in federal EPA and MassDEP follow-through coordination, commitment to implementation and assistance to MS4 permittees.

Many of our communities have small DPW staffs with limited capacity to take on the extensive additional administrative burdens. The magnitude of the draft permit's administrative requirements will inevitably require most communities to engage expensive consultants or hire more full-time staff. Mandates to track and record the volume or mass of material removed from each catch basin (Part 2.3.7 (a) (iii) (b) would create unnecessary paperwork for questionable data collection. Further, the draft permit with the requirement, for example, that communities "shall" adopt a housekeeping metric that catch basins be no more than 50 percent full, seems to put communities at unreasonable risk of non-compliance if even one catch basin exceeds that threshold.

For most communities, the projected costs of compliance for the draft permit administration are overwhelming. One of our larger communities estimates that cost of compliance annually to be an additional $1 million. That is just not feasible given current fiscal circumstances and the trade-offs communities are forced to make in preparing municipal budgets.

EPA should encourage good faith efforts by communities in tailoring stormwater management programs to community conditions and not be overly prescriptive in defining specific steps for

housekeeping, operations and maintenance. For example, mandates of pet waste collection stations at parks (Part 2.3.7 (a)(ii)(a) seem inappropriate for a community that bans dogs from public parks. Similarly, while enhanced mapping and inventory requirements may be well intended, many of our communities could better allocate funding toward priority maintenance or capital improvement projects.

Clarification, State-Federal Regulatory Consistency and Streamlining Needed

Some of the smaller, more rural communities where only portions of the town are within the designated MS4 zone, have questions about how to cost-effectively implement an illicit discharge detection and elimination program in a system with limited infrastructure or where catchment systems cross boundaries. Communities do not have the luxury of spending limited funds unnecessarily and are justifiably insistent in seeking before the permit becomes effective clarity and assurances from EPA regarding MS4 implementation and oversight enforcement. The approximately 250 administrative requirements seem overwhelming to communities and could be reduced enabling limited resources to be focused on implementation action priorities and outcomes in minimizing pollution.

Confusion also lies in the apparent contradiction between MassDEP standards and EPA draft permit about treatment and infiltration threshold definitions and requirements for stormwater management in new developments. Clarification is needed as to the applicability of recharge requirements when only a portion of a site is being redeveloped. Also, EPA should confirm that roadway maintenance projects would not trigger expansion of stormwater treatment. These questions and inconsistencies will certainly result in additional administrative and potential legal expenses. The final permit should provide clarity for communities and consistency with MassDEP in regulatory thresholds and requirements.

Time Line for New Permit

In light of the existing uncertainties and implementation questions and given the level of investment needed for compliance, this draft permit does not allow nearly enough time for municipalities to set up an adequate revenue source to fund a fully compliant program. The Collaborative communities strongly urge EPA to extend the timeline for the MS4 permit effective date, NOI filings and compliance. Cities and towns are finalizing Fiscal Year 2016 budgets. The local budgetary cycle requires Town Meeting or City Council votes to adopt fiscal year budgets in the Spring for the July 1st, 2015 thru June 30th, 2016 year. Any major new expenses generated by a final permit effective as envisioned in Fall 2015 are likely to provoke financial turmoil in City/Town halls. We note that EPA has phased in many of the proposed

requirements including the additional GIS mapping and IDDE implementation. More time, however, will be needed for communities to establish updated programs.

Given the local budget cycle, EPA should establish an effective date of Fiscal Year 2017 for the permit and extend timeframes for municipalities to file the NOI, prepare stormwater management programs and undertake the many administrative mandates. A minimum of two years should be provided from the permit effective date simply to allow municipalities time to plan, staff and budget accordingly, and additional time for implementation beyond five years. Communities will need adequate time to work in determining costs and appropriate funding sources, to obtain the necessary local approvals (City Councils/Town Meetings), to secure funding levels and staffing that can sustain a compliant program, and finally to establish workable intermunicipal Collaborative programs for sharing personnel, equipment and/or testing labs.

Thank you for considering these comments in issuing the final MS4 permit for Massachusetts.

Sincerely,

Dennis A. DiZoglio
Executive Director

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. The **Merrimack River Watershed Council** has worked since 1976 to improve the water quality of the Merrimack River, and we are proud to note the improvements that have been made since then, when it was considered among the top ten most polluted in the country. Your agency deserves much credit for your efforts to reduce the point source pollution that was the problem at that time.

But now, polluted stormwater is the most serious water pollution problem in the Merrimack River and indeed, in all of Massachusetts' rivers, today. Improving water quality for the Merrimack is critical, since nearly 600,000 residents in the watershed use the river for drinking water. We have just completed two EPA-funded Urban Waters grants focused on stormwater and water quality, in partnership with the lead agencies NMCOG and Groundwork Lawrence. EPA Region 1 has found that stormwater causes or contributes to at least 55% of the violations of water quality standards in the state's rivers, streams, and lakes. NOAA projects that climate change is only going to exacerbate stormwater concerns due to increased flooding events in New England.

The Combined Sewer (or Sanitary Sewer) Overflow problems in our aging cities causing excessive nutrient loading and pathogens, are a reflection of the need for Massachusetts communities to maintain or upgrade their aging infrastructures, to safeguard both public safety and the environment into the future. **This permit is an important step in promoting these urgently-needed changes, and we strongly support its passage.**

While some may complain that the process for stormwater management is too expensive, evidence shows that the expense lies in ignoring stormwater problems until they are too late. Post-structural engineering fixes are the costliest of all.

The 2014 permit represents a significant improvement over the 2003 permit, and is likely to be much more effective in reducing pollution, flooding and erosion caused by stormwater in urbanized areas.

- The permit incorporates **water-quality requirements** that directly address the pollutants that are actually causing specific Water Quality Standard violations in each town.

- The permit provides **more specific requirements and deadlines** in many cases, which should result in better compliance than was achieved under 2003 permit.

- The permit gives towns **adequate time and substantial flexibility** in choosing approaches to compliance that are most appropriate for local conditions.

- **Permit requirements for greater public access and opportunities to comment** on towns' stormwater management programs will increase public support for these programs, which is essential if towns are to raise the resources necessary to deal with polluted stormwater. Greater public scrutiny will also encourage more effective plans, more consistent implementation, and more enforcement.

- **The post-construction requirements for new development and redevelopment will prevent future projects from continuing the poor stormwater management practices of the past.** EPA has chosen a balanced, effective strategy, setting a high standard for stormwater infiltration (the most cost-effective way of removing pollutants from stormwater), providing a safety valve where site conditions make meeting that standard infeasible.

In short, the permit requirements ask municipalities to do better monitoring and planning, to improve implementation, to raise public awareness of stormwater issues, and to design and maintain better stormwater management measures. If successful, the permit **will result in major improvements in the management of urban stormwater in Massachusetts, and we will see the results in cleaner and healthier rivers, streams, lakes, ponds, and coastal waters**.

We also note that good planning **can help towns reduce compliance costs and fund the required investments in stormwater programs and infrastructure**. Towns can take advantage of help and support from EPA, MassDEP, watershed groups, and regional planning agencies; work regionally (including through stormwater consortiums) to achieve economies of scale, develop and fund stormwater utilities, and ensure that private entities assume their share of the responsibility for stormwater management.

Finally, while we strongly endorse the overall approach and requirements of this permit, we **have identified several areas where improvements are needed:**

- In addition to conducting an annual evaluation of BMP compliance and effectiveness, enforcement must be a requirement of any MS4 holder. Simply, permittees should be required to take corrective action where the evaluation shows that goals and objectives are not being met. An effective iterative approach to improving stormwater management requires that problems be addressed and violations enforced, not simply identified.

- Section 1.5, Permit Compliance, should be rewritten to state that non-compliance 'shall' be grounds for an enforcement action, and 'shall' result in the imposition of injunctive relief and/or penalties.

- Section 1.10.2. should require that the SWMP contains description of the consequences for violations or non-compliance, the process for resolving violations, and the mechanism for enforcement action.

- Section 2.3.2.d.iii. Public Education and Outreach. Developers and Construction. It would be helpful to include information on Construction By Design as well as the benefits of river and wetland setbacks to aid in stormwater management.

- Section 2.3.4.2.a. Elimination of Illicit Discharges. There needs to be a sentence here on the requirement for MS4 enforcement, including penalties, for any illicit discharges.

- Section 4.1. Program Evaluation. The EPA or MassDEP should provide a description of the costs and penalties associated should an MS4 permit-holder not be in compliance.

- MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements. This includes requiring new development and redevelopment projects and retrofits on town-owned property to implement BMPs that are most effective at reducing bacteria where the waters they discharge to (via an MS4) do not meet bacteria Water Quality Standards. These requirements are consistent with the proposed requirements for other stormwater pollutants.

- The new requirements proposed for projects discharging to water impaired for chloride should apply to all MS4s. While relatively few water bodies have been assessed for chloride, evidence suggests that this is a significant problem in most, if not all, urbanized areas.

We appreciate the careful work EPA has done to improve on the 2003 permit and the 2010 proposals, based on experience with the 2003 permit and comments on the 2010 proposals. However, the process has taken a very long time. We **strongly support prompt issuance of the final permit**, to end a long period of drift and uncertainty associated with delay in issuing this permit. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date

Thank you for considering our comments on this very important permit.

Sincerely,

Dr. Caroly Shumway
Executive Director

Subject: support for new Stormwater Permit regulations

Dear Mr. Newton,

I'm writing to express my strong support for the new EPA draft stormwater permit regulations that are currently under consideration. As a member of my local watershed organization and an active participant in their storm drain labeling program over the past several years, I'm aware of the need to address in a serious way this source of pollution that affects local streams and other water bodies. While our city implemented a new stormwater management fee several years ago, it's not clear what those funds are being used for and my sense is that they need to be pushed to take this issue seriously.

Among the features of the new regulations that I support are (1) requirements to prioritize, investigate and eliminate possible cross-connections between storm drains and the sanitary sewer system, which there have been indications of in Westfield in the past, (2) the requirement that all new development or redevelopment of over an acre infiltrate the first inch of runoff or provide an equal measure of pollutant reduction, reducing the cost of stormwater management for cities and towns, (3) requirements that would address issues related to the use of road salt in winter, (4) requirements that focus attention on particular pollutants that are causing or contributing to violations of state water quality standards, and (5) requirements for permitees to regularly assess the effectiveness of their practices and to consider alternatives that might be more effective. All of these measures seem to me to be common-sense ways of addressing this issue.

Thanks for your work on these issues and happy holidays!

Re: Draft Small MS4 Permit Comments

Dear Mr. Tedder;

The Town of Milford appreciates the opportunity to comment on the USEPA's Draft Small MS4 Permit. Our comments are the result of many discussions about how the proposed permit requirements will impact the communities in the Charles River Watershed, and in particular Milford, from both an environmental and economic perspective. As you know, most Massachusetts municipalities struggle with limited and competing resources and the requirements of this permit will have far-reaching implications. Our comments are presented below.

1. The Six Minimum Control Measures do not align with the Ten Massachusetts Stormwater Management Standards, which is the uniform standard for development in Massachusetts.
    a. In terms of the municipal review and permitting process, it would be useful to have one overall set of standards.
    b. A waiver for requirements aimed at large developments should be granted if a community incorporates the Mass Stormwater Standards as part of their Planning Board Site Plan Review process. There is redundancy between the two permitting processes.
2. Section 2.3.1 allows for a municipality to share responsibility of meeting the Six Control Measures with another entity, i.e., a Regional Stormwater Utility.
    a. In the case of towns subject to TMDLs and reduction goals who join a Regional Stormwater Utility, will removal goals still be evaluated separately or could an average goal among the communities in the Utility be considered?

    b. If one member of a Utility does not achieve compliance, will all members be penalized?
    c. Regionalization will benefit regulators and permittees alike. Incentives should be provided to permitees who regionalize. Incentive might include the ability for members to trade credits within the Utility, or direct credits to each member of a Utility.
3. Under the IDDE program, re-testing (every 5 years) should not be required if all sources have been identified and confirmed, AND where new development has not occurred since the last IDDE evaluation.
4. Communities with nutrient or bacteria TMDL requirements should be allowed to include sampling for those pollutants as part of the IDDE program in order to demonstrate actual values. This would streamline the sampling requirements, be more efficient, and reduce sampling costs. Additionally, the timeline for the PCP should be adjusted pending the results of the sampling.
5. The requirement under the IDDE program to complete an Outfall Inventory in the first year and system wide mapping by the second year:
    a. The existing outfall inventory should be acceptable for the first year submittal, with updates made annually in conjunction with the system wide mapping.
    b. The system wide mapping is a large task, especially with the documentation of system attributes required. The timeframe for this task should be 5 years.
    c. A time extension should be granted to Towns that do not have full-scale GIS capabilities, to allow for implementation of the technology prior to beginning the mapping effort.
    d. The individual costs to Towns for this mapping effort is very high, and higher for Towns without GIS systems in place. Grants for mapping and technology upgrades should be made available.
6. The Draft Permit, in Section 2.3.4.7.c.i states “Catchments with no potential for illicit discharges may be excluded from the IDDE program.”
    a. Areas without sewer service should be classified as having low or no potential for illicit discharges (especially if systems are Title 5 compliant). However, 2.3.4.7.c.ii identifies septic systems 30 years old or older as having a high IDDE potential. Excluding situations where failure or breakout occurs, an older septic system does not necessarily have high IDDE potential.
    b. With respect to removal of IDDE sources, if privately owned septic systems are identified in a high potential IDDE area, there is no mechanism for the Town to require an upgrade of those systems. How does EPA recommend a Town addresses this issue? Will there be Federal funds available to homeowners to upgrade systems?
    c. With respect to the removal of specific pollutants (e.g., P) for communities with a TMDL, how is the credit for removal of non-compliant septic systems calculated? Is it based on confirmatory sampling or just a straight credit per system?
7. The public education requirement identifies four populations that should be targeted.

a. Does outreach to schools fulfill the requirement of reaching residents? Define the minimum requirements of a school-based outreach program (i.e., number of students, type of presentation, etc.).
b. Most large commercial, industrial, institutional, and construction sites are required to meet the Ten Massachusetts Stormwater Management Standards during development, including an O&M plan. Assuming that they meet their permit requirements, is there a need for the Town to target them with additional outreach? Wouldn't outreach efforts be better used elsewhere? As each community is different, towns should be able to develop individualized outreach plans – keeping the same requirement for 8 messages total over the permit period – to best address the audience in that community.
c. Outreach efforts should allow for televised meetings or stormwater education segments on local radio and TV cable shows.
d. Outreach efforts should include discussion of ALL water resources – wastewater, drinking water, and stormwater - and how they are interrelated.

8. Many of the Towns subject to TMDLs and pollutant reduction goals have been voluntarily implementing BMPs over the years since this conversation started. For example, some towns have worked towards reducing impervious area, made changes to development guidelines, required stricter pre-treatment prior to discharge, and conducted habitat restoration projects. What will be the mechanism for these communities to get credit for these efforts, specifically with respect to estimated pollutant loadings?
9. The Draft permit relies heavily on biofiltration, yet soil conditions in many towns are not conducive to infiltration. Milford, for example, is primarily HSG C and D. The Draft says that retention is permitted, but that will not help with nutrient removal.
    a. It is not practical to expect communities with poor soils or high groundwater to be able to achieve the same results as communities with HSG A and B.
    b. The cost-benefit analysis of removal rates should be part of the PGP for communities in the Charles. At a certain point the costs of structural BMPs will exceed the environmental benefit.
10. The Phosphorous TMDL for the Upper Charles:
    a. The TMDL was back-calculated from the TMDL developed for the Lower Charles, rather than being based on sampling. The accuracy of the TMDL for the Upper Charles should be revisited by EPA. It is not reasonable to expect the individual permittees to conduct independent TMDL studies.
    b. The phosphorous loading for the Upper Charles communities is based on a model that assumed loadings by land use category. These loading are not reflected in sampling results. Sampling data from the CRWA indicates that TP at 35CS (River mile 3.5) in Milford has not exceeded 0.1 mg/L since September 2003. EPA should document (with sampling results) the actual nutrient and bacteria levels in the Upper Charles.
11. The 2009 TMDL report prepared by CRWA identified the target concentration for P as 0.1 mg/L.

a. In the TMDL report, the mean value at all sampling sites in Milford was less than 0.1 mg/L, indicating a P load much less than the modeled value. We disagree with EPAs estimates of P loading to the Charles from Milford.
b. The TMDL report excluded the segment of the Charles from Echo Lake to Main St. in Milford, stating that the water quality impairments in that section were NOT due to nutrients. If this long section is not impaired due to nutrients, then the EPA loading values are definitely over-estimated.
c. Milford requests the EPA revise the phosphorous loading calculation for Milford, in light of actual sampling data and the conclusions in the TMDL report.

12. The Draft Permit allows little flexibility once the SWMP is developed. For communities subject to a TMDL, there should be a way to re-evaluate and make adjustments to the long term plan every 5 years. For example, if the BMPs implemented result in a pollutant removal rate higher than the goal, the permittee should be allowed to request a reduction in their efforts (i.e., reduce number of BMPs from the original plan).
13. There is no TMDL for nitrogen in the Charles, yet there is a requirement for those communities to reduce nitrogen. This requirement unfairly targets these communities. Furthermore, implementation of BMPs for phosphorous and the Mass Stormwater Standards will effectively reduce nitrogen, so this requirement should be removed.
14. Right now a Performance Evaluation is required annually after Year 6 for the Upper Charles communities. Many of these communities are built out and will not have large increases in impervious area over the course of a year. It would preferable to make the Performance Evaluation period every 3 years, so that the permittees' resources can be focused on implementation of the BMPs.
15. Attachment 1 to Appendix F allows for an increase in the required P reduction if the baseline P load established is more than that estimated in the Permit. What methods are acceptable to demonstrate a decrease in the baseline concentrations?
16. EPA has not proposed viable funding alternatives for permittees. The potential costs for many communities to comply with the Permit, especially those in the Charles River Watershed, are in the $50-100 million range.
    a. Using Milford as an example: *The Upper Charles River Stormwater Sustainable Funding Report* (2011) estimated a cost of $75.8 million to comply with the Phosphorous Reduction requirements. EPA Fact Sheet Attachment 1 – Charles River Basin Nutrient (Phosphorous) TMDLs estimates an average cost of $31 million for Milford to comply. Using EPA's estimated $/kg/yr, the cost of the PCP to ALL of the Charles River Communities has been underestimated.
    b. Given the projected costs of implementing this program, communities will be forced to increase square footage of development (increased tax revenue) while maintaining impervious footprints, i.e., building up. For many towns, this will greatly impact the character of the community. This would be an unfortunate, unintended consequence of the Permit.
    c. The way the Draft Permit is written, the ability of communities to attract and keep business is seriously impacted by the potential cost of this program. Additionally, communities with a strong commercial base are penalized by having stricter

discharge requirements (and higher compliance costs), even though surrounding communities with less commercial base also benefit from those businesses.

d. Funding for stormwater is currently limited to small grants (e.g., the 319 grants) or low-interest loans through the State Revolving Fund (SRF). Both programs are highly competitive. As this is a Federal mandate, a Federal program to offer financial assistance to communities should be provided.
e. We propose communities be able to "back-end-load" their PCP in order to evaluate the cost/overall effectiveness of BMPs used before committing to spending a large sum of money.

17. Since this Draft Permit addresses Phosphorous Reduction in the Upper Charles communities, we request EPA not pursue an RDA for Milford, Franklin, and Bellingham. Under the requirements of this permit, in particular the requirements for development and re-development, the nutrient reductions should be achieved under a municipal program.

We appreciate the opportunity to comment on this Draft Permit and thank EPA for your efforts to meet with communities and discuss the impacts of the proposed permit.

Sincerely;

Vonnie M. Reis, P.E.

Re: Town of Milford, MA Comments
Draft MS4 Permit

Dear Mr. Tedder:

The Town of Milford, MA has taken the opportunity offered by the Public Comment period extension on the EPA Draft MS4 permit to compile additional comments. Our original comment letter was submitted on December 23, 2014. Our additional comments are as follows:

1. Comment: Section 2.1 states (and other sections reference) that the "permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to an exceedance of water quality standards". Discharges from the MS4 should certainly not be the cause of an exceedance, but simply contributing a measurable concentration of a pollutant does not necessarily constitute a violation of water quality standards. EPA is simply presuming that the MS4 contribution is significant, not rendering a demonstration, as required by federal law and applicable NPDES rules, that the MS4 is a significant contributor.

   Recommendation: All references to contributing to an exceedance of water quality standards should be deleted from the permit, or at least qualified to state that the contribution in the discharge has to be in excess of water quality standards.

2. Comment: Section 2.1 states that "Pursuant to Clean Water Act Section 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to exceedances of water quality standards…". The cited section of the Clean Water Act makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable (MEP) as the standard to which pollutants must be removed from MS4s. The language in section 402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. Section 402(p)(3)(B)(iii) of the Act states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA tries to imply. For Congress to bother to include such language in the Act is clear and unassailable evidence that lawmakers understood that there are limitations in the ability of municipalities to meet water quality standards in stormwater discharges. These limitations are spelled out in the statutory standard of MEP applied only to municipal stormwater discharges. Water quality

standards and TMDL Waste Load Allocations (WLAs) may be goals but are not the required standards that must be achieved in municipal stormwater.

In Milford, the draft permit requires MS4s to implement specific BMPs to meet phosphorous reductions to meet TMDL WLAs, as well as evaluate/implement additional BMPs as needed. Specific percent reductions in phosphorous loads and WLAs are essentially numeric limitations. If EPA's approach to stormwater permitting is indeed an iterative BMP approach to MEP, and one that has been upheld in the courts, then the permit needs to be consistent in its language so that this intent is clear. At present, the draft permit contains conflicting language that first suggests the BMP approach to MEP is sufficient and then requires compliance with water quality standards, including numeric limitations set by TMDLs.

Furthermore, TMDLs are developed with the sole purpose of addressing discharges to impaired waters; therefore, EPA's inclusion of additional requirements/BMPs to address discharges to impaired waters in the MS4 permit is duplicative and inappropriate.

Recommendation: The permit must be revised to be consistent with the Act, which would be for the permittee to be required to use an iterative BMP approach to MEP standards. Requirements related to TMDLs and setting specific numeric limitations must be removed from the permit since these are inconsistent with the Act.

3. Comment: Section 2.2 of the permit sets forth onerous requirements for MS4 discharges to impaired waters, but in most cases, the impairments and TMDLs are based on extremely limited, and even suspect, water quality data. Science tells us that phosphorus can induce the growth of aquatic plants and algae thereby making a water body less suitable for recreation and possibly having negative impacts on fish and aquatic wildlife; therefore, phosphorus reduction is a reasonable goal. However, specific sources of this phosphorus, the ability to cost-effectively reduce phosphorus, and the actual level of reduction needed are not well understood, especially for stormwater. The lack of current and valid data used in TMDLs clearly shows that specific percent reduction requirements for phosphorus called for in these reports are highly suspect. We recognize that comments on a draft permit are not the forum for correcting weak or faulty TMDLs; however, given the questionable nature of these studies, the town should not be held to meeting TMDL reduction requirements through this permit.

   Recommendation: Prior to including requirements related to impaired waters in the MS4 permit, the EPA must provide sufficient scientific data to confirm that:

   - The receiving waters are actually impaired for the pollutant of concern.
   - That the MS4's discharges are causing or are a significant contributor of that pollutant.
   - That there is scientific evidence that the required BMPs will actually result in a reduction of that pollutant.

   Since permit-required sampling of MS4 discharges to impaired waters must include analysis for the pollutant of concern during wet weather, this data can be used (in conjunction with catchment delineation) to produce an outfall-specific estimate of each discharge's pollutant loading. Outfalls with an elevated pollutant loading would then be evaluated, prioritized, and mitigated as part of an iterative BMP approach to MEP standards.

4. Comment: Sections 2.1 and 2.2 of the draft permit set forth requirements that place the responsibility on the permittee to prove that its MS4 is not causing or contributing to a water quality violation. Under 40 CFR Section 122.44(d)(1)(ii), a *permitting authority* determines whether a discharge "causes, has the reasonable potential to cause, or contributes to" an excursion of water quality standards. The "reasonable potential

analysis is required to account for dilution, the various sources of the pollutant of concern and current/proposed treatment improvements affecting pollutant levels in rendering a decision on the need to control a particular facility." Once such a determination is made, the *permitting authority* determines whether a pollutant reduction is required. Likewise, under Section 303(c), the state (or EPA) determines which sources require control under the TMDL program. Neither the CWA nor EPA's regulations provide a basis to presume an impairment contribution or to transfer the assessment procedure to the permittee.

Furthermore, deriving water quality-based limitations for any NPDES permit without an adequate effluent characterization, or an adequate receiving water exposure assessment would result in the imposition of unjustifiable limits on that discharge.

Recommendation: Any and all provisions in the permit that place the responsibility to conduct "reasonable potential" analyses on the permittee must be deleted.

5. Comment: The permit requires Milford to achieve a 43% reduction in phosphorus loading, or an estimated reduction of 708 kilograms per year. The various non-structural BMPs have phosphorus reduction rates that typically range from 1% to 10%; therefore, the remaining % reduction will need to be achieved through structural BMPs. The only structural BMPs capable of achieving the reductions called for in the TMDLs are infiltration trenches/basins. Consequently, in order to comply with the MS4 permit, Milford would have to site, design, and construct hundreds of these BMPs at an incredible capital cost to the Town. In addition, once constructed, Milford would have to maintain these hundreds of BMPs at an equally incredible annual operating cost.

   It is also possible that limitations – such as soil types, depth to groundwater, presence of contaminants, etc. – may prevent the Town from constructing BMPs in locations needed to provide the required reductions. As such, constructing enough BMPs in needed locations may not be even technically feasible.

   Since the permit is based on MEP, and achievement of the required reductions is not "practicable", the proposed permit requirements exceed statutory authority.

   Recommendation: The permit must be revised to provide more "practicable" reductions in phosphorus loadings, or at a minimum, substantially more time for MS4s to comply with the reduction requirements.

6. Comment: The cost to comply with many of the permit mandates is tremendous. In particular, implementation of requirements related to discharges to water quality limited waters with and without approved Total Maximum Daily Loads (TMDLs), as well as requirements and schedule for Illicit Discharge Detection and Elimination (IDDE). These requirements will necessitate significant increases in staff, equipment, and professional services resulting in substantial negative financial impacts on the Town, and tax-payers.

   Recommendation: Additional funding assistance is necessary and should be made available. Without a federal and state financial commitment, it will be difficult to convince local voters, rate payers and decision makers to fund these mandated stormwater programs. We urge EPA to make available a dedicated funding source for all municipalities covered by stormwater permits, as well as remove prohibitions against using available grant and loan programs for stormwater compliance.

7. Comment: The implementation of the draft permit requirements for discharges to impaired waters is costly, overly burdensome, and has questionable direct impact on the improvement water quality. Subject to the Charles River TMDL, very large expenditures are mandated, but even if Milford was to implement every aspect

of this permit, and future permits, our waterbodies could remain impaired. This permit mandates more work than could possibly be funded under any reasonableness standard and, but offers no evidence that these huge expenditures will eliminate the impairments.

Recommendation: The EPA must provide a more defined and reasonable level of effort to comply with requirements associated with discharges to impaired waters. This should include a way for the MS4 to demonstrate that its MS4 discharges are within water quality standards, and be excused from further required actions regardless of whether the receiving water is still impaired.

8. Comment: The requirements for written programs, policies, procedures, and reports do not have direct water quality benefits and should have a lower priority. Significant financial and staff resources will be required to prepare and submit all of the required written documentation. With limited resources, the focus of the permit should be on performance, not documentation. There are over 50 phrases in the main body of the permit and many more in the appendices (not including the actual annual reporting requirements in Section 4.4) that require information be included in the Annual Report.

   Recommendation: An efficiency and effectiveness review should be performed on the entire permit; preferably by an outside party who can assist the EPA in prioritizing those items where written documentation and annual reporting will provide a measurable benefit. The permit should be revised to reflect these improvements.

9. Comment: Once the permit is finalized, the Town will be required to submit a Notice of Intent (NO1) to comply with the permit within 90 days. This requirement is similar to the 2003 permit; however, a significant amount of new information is required to be included in the NOI. Much of that information will not be known until the Town revises its stormwater management program, which is not due until the end of the first year of the permit. It will also be difficult for the Town to adequately respond in its NOI until it completes its stormwater management program assessment, which will also not be done until the end of permit year one.

   Recommendation*:* The NOI requirements should be revised to remove elements of the stormwater management program that will be addressed during the assessment and updating of the existing program. These requirements can be included in the requirements for the written stormwater management plan and/or first Annual Report.

10. Comment: Section 1.7.4. Page 5. The draft permit still does not define the responsibility for addressing comments received in response to EPA's posting of the Notice of Intent for public comment. The permit needs to state whether the Town of Milford or the EPA will be responsible for this task.

    Recommendation: Since EPA is publishing the Public Notice for all MS4s and similar comments are likely to be submitted for many NOIs, it is recommended that the EPA be responsible for addressing public comments.

11. Comment: Section 2.1.2. This requires the Town to obtain authorization from MassDEP for increased discharges. It is not clear what this "authorization" will entail. This provision could also threaten new construction and redevelopment within Milford's impaired watersheds (Category 5 or 4b), because of the prohibition against new discharges to these waters unless it can be demonstrated that there is no net increase in pollutants. Without historic data, it is not possible to measure "increased discharges of pollutants" from new or redeveloped land.

Recommendation: This provision should be modified to allow increased discharges that meet water quality standards regardless of impairments. The permit should also allow compliance with anti-degradation provisions via pollutant load reductions in other areas of the same watershed (instead of prohibiting the increased discharge altogether).

12. Comment: Section 2.3.4.4. Page 26. Sanitary sewer overflows are already prohibited and regulated at both the Federal and State level under existing mechanisms governing wastewater facilities. Including SSOs in the MS4 permit results in the Permittee being regulated by multiple permits for the same issue. This will cause confusion, unnecessary expenditures and potentially conflicting requirements for compliance.

    Recommendation: The MS4 permit should only contain language related to SSOs potentially contributing to illicit discharges and that these potential illicit discharges should be investigated, eliminated, and documented under the IDDE Program.

13. Comment: Section 2.3.4.4b mandates that the Town identify SSOs over the previous five-year period within 120 days and Section 2.3.4.4c requires 24-hour verbal notice and five (5) day written notice of an SSO to EPA and MassDEP. The Town already reports all SSOs to the EPA and MassDEP in accordance with current MassDEP and EPA regulations, which are exactly the same as those stated in these Sections. Adding these requirements to the MS4 permit duplicates an existing effort and, therefore, is unduly burdensome for the permittee.

    Recommendation: This section should be rewritten to simply reference, not duplicate, current EPA/MassDEP requirements for verbal and written SSO reporting.

14. Comment: 2.3.4.5. Page 26. It is unclear whether outfall/interconnection inventories completed prior to the effective date of the new permit will count toward compliance.

    Recommendation: Revise this Section to allow prior inventories to count toward compliance, providing they met the intent of Section 2.3.4.5.

15. Comment: Section 2.3.4.7.c.i & 2.3.4.8.c.i. Pages 30 & 37. The definition of and implementation milestones for "Problem Catchments" significantly disadvantage MS4s that have proactively undertaken outfall sampling in advance of it being required by this permit. Proactive MS4s with sampling data, especially those in urban areas, will have far more outfalls that must be designated as Problem Catchments and given only five years to complete IDDE. Conversely, MS4s that have made no effort to sample their outfalls will have no (or very few) Problem Catchments, but are given 5-10 years to complete IDDE. As written, the permit punishes proactive MS4s by imposing far more stringent IDDE milestones than those for MS4s that have not performed sampling.

    Recommendation: The definition and implementation milestones for “Problem Catchments” need to be revised to remove this inequity.

16. Comment: Section 2.3.4.7.c.iii. Page 31. The draft permit mandates that the initial illicit discharge potential assessment and priority ranking must be completed within one year from the effective date. However, mapping of the MS4 infrastructure and Catchment Delineations will not be completed until two years from the effective date. The mapping requirement contained in the 2003 permit was limited to MS4 outfalls only and, therefore, "existing" mapping is insufficient to complete the required 2.3.4.7.c.iii assessment/ranking.

Recommendation: The required catchment assessment and ranking in 2.3.4.7.c.iii needs to be revised so as to align with the mapping and have a completion date of two years from the effective date.

17. Comment: Section 2.3.4.7.d.iv. Page 32. The limitation on when wet-weather screening should take place ("March to June") does not make sense for IDDE. Although wet-weather screening is intended to identify illicit discharges that only occur during peak flows, whether it should be performed in conjunction with high or low groundwater is determined by the System Vulnerability Factors (SVFs). For example, if the SVFs indicate structural defects and exfiltration potential, high groundwater would actually inhibit the investigation. In this case, sampling should be performed during a heavy rainfall event at low groundwater. Conversely, if the SVFs indicate capacity restrictions and SSO potential, then sampling during high groundwater would be appropriate.

    Recommendation: The permit should be revised to state that wet-weather sampling should be performed during conditions appropriate for the identified SVFs for each catchment area, and provide examples similar to those above to assist MS4s in making an informed decision about when to sample.

18. Comment: Section 2.3.4.7.d.iv. Page 32. The requirements related to wet-weather monitoring are not provided in sufficient detail. Inspection must be performed during wet weather, defined as sufficient intensity to produce a discharge. However, it is not clear whether a discharge must be observed at every outfall to achieve compliance. Does the Permittee have to return to an outfall repeatedly until a discharge is observed, even if it was monitored during a substantial rainfall event? To require the Permittee to mobilize staff, equipment, and laboratory services an unlimited number of times to observe flow at each outfall places an unreasonable burden.

    Recommendation: The permit should be revised to provide specific minimum storm parameters, for both time and rainfall amount. The minimum storm event should be one sufficient to anticipate discharges at all functional outfalls. The requirement for discharges to be observed at every outfall should be eliminated.

19. Comment: Section 2.3.4.7.d.v. Page 32. Based on the response from you at the MS4 Information Session on October 28, 2014, analysis for conductivity is being required as a measure of salinity. Requiring both salinity and conductivity testing for the same purpose is a waste of MS4 resources.

    Recommendation: The permit should be revised to require either salinity or conductivity, but not both. In addition, the permit needs to state the applicable benchmark and required action for the chosen parameter, as is provided for other sampling parameters in Section 2.3.4.7.d.vi.

20. Comment: Section 2.3.4.7.d.v & 2.3.4.7.vi. Pages 32 & 33. The level of accuracy for each required sampling parameter is not provided. For example, at what detection level is chlorine to be considered "detectable" in Section 2.3.4.7.vi.

    Recommendation: The permit must be revised to clarify the required level of accuracy for each sampling parameter.

21. Comment: Section 2.3.4.7.e. Page 34. The System Vulnerability Factor (SVF) for "any sanitary sewer and storm drain infrastructure greater than 40 years old in medium and densely developed areas" is too inclusive. In Milford, where infrastructure is typically in excess of 40 years old, this SVF serves as a "catch all" to require wet-weather sampling in virtually all catchment areas. Infrastructure age, by itself, is not an indicator of illicit potential. For example, some of our oldest sewers are in better condition than those built 40 or more years

later. It is typically other factors, such as poor structural condition, that are the source of elevated illicit potential, not solely the age of the infrastructure.

Recommendation: This SVF should be revised to include only those sewers and drains that are known to have specific concerns, not all sewers/drains older than an arbitrarily selected age.

22. Comment: Section 2.3.4.7.e. Page 33. The SVF for "crossing of storm and sanitary sewer alignments" is too inclusive. On streets with both sanitary sewers and storm drains, the likelihood that a catch basin connection crosses a sanitary sewer or a sanitary sewer service connection crosses a storm drain is extremely high. This would mean that nearly all catchments would trigger this vulnerability factor and therefore require wet weather sampling.

    Recommendation: This SVF should be revised to include only those catchments that are known to have specific concerns, not all catchments where storm and sanitary sewer alignments cross.

23. Comment: Section 2.3.4.7.e. Page 34. The SVF for "any sanitary sewer infrastructure defects such as leaking service laterals, cracked, broken or offset sanitary infrastructure...or other vulnerability factors identified through Infiltration/Inflow Analyses, Sanitary Sewer Evaluation Surveys, or other infrastructure investigations" is too inclusive. Again, in Milford, where infrastructure is typically in excess of 40 years old, most sewers have some defects, which again would mean that nearly all catchments would trigger this SVF and therefore require wet weather sampling. In most cases, individual sewer defects do not portend illicit connections.

    Recommendation: This SVF should be revised to include only those catchments known to have specific concerns related to the sewer system, and not all catchments with sewers that have minor defects.

24. Comment: Section 2.3.4.7 f & g. Pages 35 & 36. The second paragraph of Section f contains the same requirements as Section g, except for the timeline.

    Recommendation: The permit should be revised to either delete one of the paragraphs, or clarify the intended difference between the two requirements.

25. Comment: Section 2.3.4.8.c. Page 36. The draft permit requires that the IDDE Catchment Investigation Procedure be implemented in "every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges." If there is no evidence of any sewer input at an outfall, IDDE field investigation is a complete waste of resources.

    Recommendation: This requirement should be changed to say that outfall screening or sampling, whichever is appropriate, should be repeated some number of times at varying times/conditions to confirm there is no sewer input. If no sewer input is confirmed during dry and wet weather screening or sampling, IDDE field investigation will not be required.

26. Comment: Section 2.3.4.8.c.i-iii. Pages 36 & 37. The milestones stated for the IDDE effort in 2.3.4.7 are unrealistic for urban MS4s. For some MS4s with ongoing IDDE programs, it has taken many years to locate and remove illicit connections from even one catchment area, let alone 100% of catchment areas. This is especially burdensome in areas where nearly every outfall will exceed the benchmarks for at least one IDDE sampling parameter or System Vulnerability Factor. The draft permit requires IDDE to be completed for the entire MS4 within ten years. This requirement is both cost-prohibitive and potentially technically unattainable during that limited period of time.

Recommendation: The permit should be revised to allow for additional time to locate illicit discharges. It is recommended that EPA extend the timeframe for completing the Catchment Investigation Procedure in 100% of the area served by all MS4 catchments from within ten years of the permit effective date to within 20 years of the permit effective date. The permit should also indicate that, as long as the MS4 is making reasonable efforts to locate the source of the discharge, the MS4 will be in compliance even if the source is not located within the allotted timeframe.

27. Comment: Section 2.3.6.a.ii.a. Page 40. The requirement to retain/treat the first one inch of rainfall applies to "runoff from all impervious surfaces on site." Without a definition for the term "site" (see comment below), this implies runoff from the entire parcel on which the one acre-or-more disturbance occurs. It is not reasonable or cost-feasible to require a large parcel to treat runoff from "all impervious surfaces" on that parcel when they disturb only a small portion of it. Take, for example, a large user that occupies hundreds or even thousands of acres. If it was to disturb one acre, the draft permit would require the user to retrofit its entire drainage system to retain/treat the first inch of runoff.

    Recommendation: Language in this section needs to be revised to limit the regulated area to all impervious areas within the development or redevelopment area, not the entire parcel. Alternatively (or additionally), the definition of "site" needs to defined so that it refers to the area within the limits of work for a development, redevelopment, or other construction project.

28. Comment: Section 2.3.6. The requirements to have pollutant removal equivalent to that of a bio-filtration system must be removed, as a "one size fits all" model for pollutant removal is too restrictive. A "Maximum Extent Practical" principle is more appropriate. For example, the Town's annual roadway reclamation or re-surfacing projects should not fit into the "one inch recharge" scenario, even though projects are greater than one acre of disturbance.

    Recommendation: EPA should define the words "development" and "redevelopment," which would allow exclusion of lateral projects such as roadway improvements.

29. Comment: Section 2.3.6.a.ii. Page 40. This section sets different standards than those existing in the MassDEP's Stormwater Policy and associated handbooks. Having two different sets of standards will cause conflicts for MS4s and developers and will likely subject communities to legal action. In addition, the ordinances/bylaws of most Massachusetts MS4s reference the MA Stormwater Standards.

    Recommendation: If the EPA wants more stringent standards, this should be done through working with the MassDEP to affect changes to existing State regulations instead of enacting a second, different, and conflicting set of requirements through the MS4 permit.

30. Comment: Section 2.3.6.a.ii. Page 40. The requirement to inventory all Town-owned properties for possible recharge areas is not practical.

    Recommendation: At most, the Town can select five priority sites per year to evaluate, which will also result in a better assessment of viable sites.

31. Comment: Section 2.3.6.b&c. Page 41. Both of these sections require review of local bylaws. It is not cost-effective to perform two separate reviews and prepare two separate "assessments" related to the reduction of impervious area.

Recommendation: Sections b and c should be combined into one assessment report, covering both reviews.

32. Comment: Section 2.3.7.b. Requiring individual Stormwater Pollution Prevention Plan (SWPPP) for each municipal site is repetitive and overly burdensome. The Town has one Hazard Mitigation Plan and one Open Space plan, both of which are renewed every five years. It makes sense to also have one SWPPP renewed every five years. One, single comprehensive SWPPP should be allowed for all municipal operations, with site-specific elements covered as needed.

    Recommendation: The permit should be revised to allow a single SWPPP document with site-specific sections as needed to cover all sources of potential pollution.

33. Comment: Section 4.3. Page 51. Now that outfall monitoring has been incorporated into Section 2.3.4.7, there is no need for a separate Section 4.3.

    Recommendation: Requirements stated in Section 4.3 should be incorporated into Sections 2.3.4.7 or 4.4, as appropriate.

34. Comment: All Appendices. The appendices do not contain proper page numbering.

    Recommendation: Page numbers should include a reference to the Appendix (e.g., "A-21") so as to avoid duplication with the main permit document.

35. Comment: Appendix A. No definition is provided for the following critical terms: Directly Connected Impervious Area, Disturbance, Illicit Discharge, Increased Discharger, Redevelopment, or Site. Interpretation of these terms could be a significant source of controversy, especially for Planning Boards charged with the implementation of the requirements for new development and redevelopment.

    Recommendation: Definitions of these terms should be added to Appendix A.

36. Comment: App. H 1.2, 11.2, 111.4, IV.5, V.5. To require the collection of at least 30 flow-weighted samples over a period of two to three years from each stormwater outfall discharging (or tributary) to an impaired water in order to demonstrate that the discharges meet water quality standards is excessive and cost-prohibitive.

    Recommendation: All sections of the permit with this provision should be revised to require sampling of outfalls during not more than ten rainfall events. The EPA should provide a list of rainfall events of varying volume or intensity during which outfall sampling must be performed.

37. Comment: Appendix I. Multiple Sections. Appendix I should not be included in the permit. It should be provided as a reference/example document only. The protocol presented in the Appendix is not required by the permit and is only one of many methods that could be used to comply with IDDE requirements. Its inclusion as an Appendix to the permit is inappropriate. In addition, because this protocol is specific to a single method, some of the information that is included is incorrect. For example, holding times presented in Appendix I, Attachment 1, Table 1 are listed incorrectly due to an assumption that analyses are being performed onsite (see Specific Conductance, which actually has a holding time of 28 days, not "Immediate").

Information presented in Appendix A, Table 1 and Step V, are also not appropriate for inclusion in a NPDES permit. The parameters and thresholds presented in Table 1 are already included as Section 2.3.4.7.d.vi. The information regarding instrumentation is reference material and should not be included in a permit. Step V should be removed in its entirety because it does not belong in a permit. It should be in a Fact Sheet or reference/example document.

Recommendation: The permit should be revised to delete Appendix I in its entirety. EPA should provide an online source to the IDDE protocol in Section 2.3.4.7.

Thank you again for the opportunity to comment on the Draft MS4 Permit.

Sincerely;

Vonnie M. Reis, P.E.

Re: Massachusetts Small MS4 Draft General Permit Comments

Dear Mr. Tedder:

The Town of Millbury appreciates the opportunity to comment on the Small MS4 draft general permit for Massachusetts. Our Town is a member and active participant in several water-focused organizations such as the Massachusetts Coalition for Water Resources Stewardship (MCWRS), the Central Massachusetts Regional Stormwater Coalition (CMRSWC), and the Massachusetts Water Works Association (MWWA).

Each of these organizations promote the use of scientifically-based, fiscally responsible approaches to realize environmental and community goals, as well as watershed-based policies and regulations to effectively manage and conserve water resources.

In the comments that follow we hope to guide EPA Region 1 in crafting a stormwater permit that addresses water resources issues but remains reasonable, considerate of the realities of municipal operations and finances, and is consistent with statutory limitations on municipal stormwater pollution control stipulated in the Clean Water Act. Unfortunately, many of our concerns expressed previously remain unaddressed and the Massachusetts draft permit fails in terms of reasonableness, consideration of municipal realities, and concurrence with the law.

General Comments:

While the goal of the Clean Water Act is laudable and supported by the Town of Millbury, we consider the requirements in the MA Small MS4 general permit to be overly prescriptive, burdensome, and most likely unachievable for most communities.

Schedule Constraints: The schedules set forth in the draft permit are not reasonable or feasible when considered in the context of municipal realities. Schedules for some aspects of the permit may appear reasonable but become unreasonable when the permit is viewed in its entirety and it becomes clear that schedules for most parts of the permit overlap.

Significant Administrative Burden: The permit, as drafted, would create a significant administrative burden for municipalities that would detract from their ability to provide direct benefits to water quality through such concrete activities as increased street sweeping, increased catch basin cleaning, and removal of illicit discharges. The permit goes overboard in terms of monitoring, measuring, and quantifying changes in pollutant loads. More environmental progress would be gained if communities could focus resources on actual, physical improvements to stormwater systems and not on pollutant accounting. Per

the Clean Water Act municipalities are obligated to remove pollutants from stormwater to the maximum extent practicable (MEP) and that should be the objective of the permit. The ongoing assessment of receiving waters is a function of MassDEP, not individual communities.

Funding Challenges: Many of the deadlines provided in the draft permit do not allow sufficient time to allocate funding within set municipal budget cycles to complete the tasks required. No item in the permit should be required to be completed during the first permit year except the preparation of the Stormwater Management Plan (SWMP).

We encourage the Agency to update its own guidelines about how regulated communities are expected to balance compliance with the Permit (in its final form) with the ability to afford that compliance without experiencing economic hardship. Since 1997, the Agency has generally considered a maximum combined annual water and wastewater bill of 4.5% of mean household income (MHI); that is 2% for drinking water and 2.5% for wastewater services - to be affordable. In their May 2013 *"Affordability Assessment Tool for Federal Water Mandates"* report, the United States Conference of Mayors, the American Water Works Association, and the Water Environment Federation argue that MHI is a poor indicator of economic distress, bears little relationship to poverty within the community, does not capture variation across diverse populations, and does not account "for the historical and future trends of a community's economic, demographic, and/or social conditions", especially during recessions and recovery from them, such as Massachusetts is presently experiencing. Municipal revenues are decreasing, and further restrictions on development or redevelopment are not in the best interest of communities struggling to maintain the level of service expected by residents.

Even so, if we were to use MHI as the basis for evaluating a community's ability to afford a stormwater management program to comply with the proposed Permit, the 4.5% MHI cap would easily be exceeded if stormwater costs were included, along with drinking water and wastewater, in the calculation. This is true whether a community funds its program traditionally through the tax base or has developed a sustainable funding mechanism such as a stormwater utility or stormwater enterprise fund. In some rural Massachusetts towns, the cost of stormwater compliance will exceed the cost of wastewater compliance and the total cost for compliance with water regulations may well be closer to 10% of MHI. Leaders and administrators in these towns will have a difficult task, indeed, to convince their residents and business owners that some of the provisions in this proposed Permit will result in water quality improvements commensurate with the expense.

Finally, several members of our community have calculated (or begun the process of calculating) their increased cost of compliance with the proposed Permit as compared to the 2003 MS4 Permit. In 2014, as part of an ongoing partnership between the CMRSWC, the Massachusetts Department of Environmental Protection (MassDEP), and the Worcester Polytechnic Institute's Integrated Qualifying Project (IQP) program, the communities of Holden, Millbury, and Southbridge participated in a project to quantify current and projected stormwater program costs. The IQP report team assumed that provisions the proposed Permit would be implemented as drafted, and evaluated the cost of new and expanded provisions as well as maintaining compliance with other Permit provisions. Among the conclusions, the IQP report team calculated the annual costs for implementation of the proposed Permit for the towns of Holden ($258,790), Millbury ($753,173), and Southbridge ($343,008). These projected costs represent increases of 39%, 30%, and 28% over current annual stormwater program budgets, respectively, and do not include other one-time or intermittent costs (such as capital expenditures like equipment), or the costs of design and construction of projects that may be required to eliminate illicit discharges. Even allowing for the imprecision inherent in a project of this scale, the consistency in comparative relative increases calculated for three communities tells a story that will be repeated across the Commonwealth.

We agree that clean water supports our communities in many, many ways; notwithstanding this, the absence of guidance on how to best afford the increased costs of stormwater management cannot be ignored.

Integrated Planning Opportunities: There should be language within the permit that references EPA's Integrated Planning framework and how integrated planning can be utilized to address a community's stormwater/MS4 requirements. That language should be specific about how an integrated planning approach could be applied through the permit and how permit conditions, including implementation schedules, would be modified under an integrated plan.

Section-Specific Comments:

1. Section 2.1 Water Quality Based Effluent Limitations and 2.1.1-Requirement to Meet Water Quality Standards: Section 2.1 (page 9) states that "Pursuant to Clean Water Act Section 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to exceedances of water quality standards…". Similarly, the Fact Sheet, at page 4, states "Section 402(p)(3)(B)(iii) of the CWA also authorizes EPA to include in an MS4 permit 'such other provisions as [EPA] determines appropriate for the control of … pollutants'" and that "[t]his provision forms a basis for imposing water quality-based effluent limitations (WQBELs)" citing to *Defenders of Wildlife v. Browner*. 191 F.3d 1159 (9th Cir. 1999), and EPA's preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec 8, 1999); and at page 16, that "EPA interprets this latter clause (i.e. "such other provisions as [EPA] determines appropriate for the control of . . . pollutants" at Section 402(p)(3)(B)(iii) of the CWA) to authorize the imposition of water quality based effluent limitations." This interpretation distorts entirely the meaning of CWA Section 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision, and is incorrect. When Section 402(p) of the CWA was added in 1987, it established a comprehensive new scheme for regulation of stormwater. It differentiated the technology-based requirements for MS4s relative to the rest of the NPDES program by creating a new "maximum extent practicable standard," in contrast to the traditional BAT/BCT standard that applied to industrial stormwater and other wastewater discharges. The opening clause of CWA § 402(p)(3)(b)(iii) states that, unlike industrial stormwater permits, MS4 permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable . . . ." A subordinate clause states that such controls shall include "management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Each of those controls is subject to the limitation in the first clause that they shall be required "to the maximum extent practicable." EPA's interprets this provision contrary to its plain meaning and in a manner which suggests that the final clause referring to "such other provisions as the Administrator or the State determines appropriate" is independent and coequal with the requirement to reduce pollutants to the "maximum extent practicable." EPA Region 1's reading distorts the syntax of § 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision.

   The Region also suggests, incorrectly, that the Ninth's Circuit's opinion in *Defenders of Wildlife v. Browner* supports this misreading of the statute. While in dicta at the end of its decision, the court suggested that the "such other provisions" clause allowed EPA the discretion to include "either management practices or numeric limitations" in MS4 permits, the court did not say that the discretion to include numeric limitations or to require compliance with water quality standards could be exercised without regard to the "maximum extent practicable" limitation in the statute. That issue was not presented by the facts of the case before it, and it was not addressed in the court's opinion. Had the court so ruled, it would have been contrary to the plain language of the statute and subject to reversal on appeal.

   Federal courts have consistently ruled that the MEP standard is the only standard that MS4 discharges are required to meet. *Natural Resources Defense Council, Inc. v. U.S. EPA*, 966 F.2d 1292, 1308 (9th Cir. 1992) (CWA § 402(p)(3)(B) "retained the existing, stricter controls for industrial stormwater dischargers but prescribed new controls for municipal stormwater discharge); *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1165 (9th Cir. 1999) (CWA § 402(p)(3)(B) "replaces" the requirements of § 301 with the MEP standard for MS4 discharges,

and it creates a "lesser standard" than § 301 imposes on other types of discharges); *Environmental Defense Center v. EPA*, 319 F.3d 398 (9th Cir. 2003), vacated, rehearing denied by, and amended opinion issued at 344 F.3d 832 (9th Cir. 2003) (CWA "requires EPA to ensure that operators of small MS4s 'reduce the discharge of pollutants to the maximum extent practicable'"); *Mississippi River Revival, Inc. v. City of St. Paul*, 2002 U.S. Dist. LEXIS 25384 (N.D. Minn. 2002) ("the CWA specifically exempts municipal stormwater permittees" from the requirement to ensure that water quality standards are met).

In addition, EPA's citation to the Preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec. 8, 1999) to support its interpretation of Section 402(p)(3)(B)(iii) of the CWA as authorizing the imposition of water quality based effluent limitations is disingenuous. The Preamble to the Phase II rule at 64 Fed. Reg. 68788, states only that EPA disagrees with commentators who challenged EPA's interpretation of the CWA as requiring water quality based effluent limits for MS4s. The Preamble gives no legal rationale. Like the fact sheet, at page 4, the Preamble to the Phase II rule cites to *Defenders of Wildlife*. As noted above, *Defenders of Wildlife* does not support the proposition that EPA can require MS4 operators to comply with WQBELs regardless of practicability.

EPA has taken the position in the defense of the Phase II rule in *Environmental Defense Center* that:

> MS4 requirements… rest on the "maximum extent practicable" ("MEP") standard which CWA Section 402(p)(3)(B)(iii), 33 U.S.C. § 1342(p)(3)(B)(iii), prescribes for Section 402(p) municipal storm sewer permits. 40 CFR § 122.34(b). Thus, while the regulations suggest numerous ways in which small MS4s ought to control their stormwater discharges, *the MS4s are not, in the end, required to do anything that is not "practicable."* 2000 U.S. 9th Cir. briefs 70014, 70020 (June 26, 2001). (Emphasis supplied)

Given the plain language of Section 402(p)(3)(B)(iii), any application of the Phase II rule to require that MS4 discharges need to meet WQBELs regardless of "practicability" would be *ultra vires.*

The cited section of the Clean Water Act makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable (MEP) as the standard to which pollutants must be removed from municipal MS4s. The language in section 402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. Section 402(p)(3)(B)(iii) of the Act states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA tries to imply. The proper wording throughout the permit that would be consistent with the Act would be for the permittee to meet water quality standards to the maximum extent practicable. For Congress to bother to include such language in the Act is clear and unassailable evidence that lawmakers understood that there are limitations in the ability of municipalities to meet water quality standards in stormwater discharges. These limitations are spelled out in the statutory standard of MEP applied only to municipal stormwater discharges. NPDES stormwater permits for municipalities will continue to be contentious as long as EPA refuses to recognize that the MEP standard applies as the only mandate for pollutant removal from MS4s. Water quality standards and TMDL waste load allocations may be goals but are not the required standards that must be achieved in municipal stormwater.

2. Section 2.1.2 Increased Discharges: New and additional stormwater flow to impaired waters regardless of concentration would be prohibited under this draft permit. This requirement could

only be overcome by demonstrating that the pollutant of concern is not present in the new/increased discharge or that the total load of pollutants to the impaired waters will not increase. Even the most innocuous "new discharge," say a new single family home with a driveway and stormwater-minimizing design, will produce some pollution and will add some additional load, be it insignificant, to a receiving water. The language in this section could thus be interpreted to mean no new development in MS4 areas draining to impaired waters. Many urban areas of Massachusetts have nothing but impaired waters. This section could effectively preclude new development in such communities. That is an impact that goes far beyond EPA and federal authority. This language must be modified to stipulate thresholds on new/additional pollutant loads being significant and not merely all new loads.

3. Section 2.2.1.b (pages 11-15) and Appendix F, Part A: The permit requires compliance with TMDL waste load reductions associated with stormwater. It mandates a progressive reduction in pollutant loads with 100% reduction achieved within 15 years. The permit neglects to recognize that most TMDL's developed for Massachusetts waters are lacking in sound science and are instead based on very generic models of watershed loading. In many cases there is a dearth of actual sampling data from the TMDL regulated waters or data may be 25 or more years old. Even in the more rigorous Charles River TMDL for phosphorus, the model used to determine needed phosphorus reduction produced results that are not supported by actual test data. The TMDL's which drive pollutant removal requirements in the draft permit are wholly inadequate for this purpose and cannot legitimately justify specific pollutant load removal for the vast majority of waters. To be consistent with the Clean Water Act and avoid reliance on unsubstantiated pollutant load reductions, municipalities should be required to remove the pollutant of concern to the maximum extent practicable by implementing feasible BMPs, including structural and non-structural measures, that have been demonstrated through generally accepted research to be effective at removing that pollutant. Municipalities cannot do any more than what is feasible and should not be squandering limited resources chasing highly tenuous pollutant "numbers".

4. Section 2.2.1.c (pages 15-17) and Appendix F, Part B: Massachusetts municipalities should not be held to comply with out-of state TMDL requirements. TMDLs are determined by state environmental agencies. While there may be an "open" regulatory process for TMDL development it is highly unlikely that process and its requisite public notification was extended to potentially impacted communities outside of the state. The interests of Massachusetts municipalities were not represented by anyone during TMDL development in Rhode Island, Connecticut, New York, Vermont or New Hampshire. Massachusetts cities and towns are now being subjected through this draft permit to regulatory programs in other states to which they had no opportunity to participate. Even within Massachusetts, the majority of TMDLs were developed in the early 2000's at a time when their link to future stormwater permits was unknown. Massachusetts TMDLs, with few exceptions, were offered as stand-alone documents with little bearing on anything that a municipality would be required to do. Had it been clear that these documents would have substantial and costly implications for cities and towns the TMDL development process would have fallen under much greater scrutiny and the haphazard, unscientific way they were created would likely have been challenged. The TMDL program in Massachusetts is so hopelessly flawed in terms of science and public process that it should not be utilized for NPDES permitting at all, let alone be the primary focus of a MS4 general permit.

5. Section 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements (pages 17-22) and Appendix H: This section assumes that there has been sound and defensible science used to determine the cause of impairments of numerous water bodies. That has rarely been the case. State agencies including Massachusetts DEP have rarely had the resources to perform legitimate water quality investigations of lakes, ponds and rivers. Very often an assessment of a water body is based on the most cursory information (visual observation of weeds or algae) and lacks the detailed sampling and analysis needed to truly determine conditions and causes. Yet this unscientific assessment will now result in

communities expending significant resources developing nitrogen source identification reports and phosphorus source identification reports along with the planning, implementation and tracking of structural BMPs for removal of these pollutants. For some communities, the "water quality limited waters" driving these added expenses could be 75 miles downstream. It is ludicrous to imagine that stormwater generated in a small community of 5,000 people could have a significant impact on a coastal bay nearly 100 miles distant yet that is what is being described in this section. There needs to be both better science and common sense applied before cities and towns are held to "fix" problems that often do not exist.

6. Section 2.3.2 Public Education and Outreach: While EPA provides more time to conduct the public education program in this draft of the permit, it is important to keep in mind that the majority of the public does not understand how stormwater can become polluted and how it can contribute to water quality issues. Most of the public still believes that catchbasins in their roads transport stormwater to a treatment facility prior to discharge. In addition, most people do not understand the concept of a watershed, or the concepts related to the water cycle (rainfall, runoff, infiltration, and evapotranspiration). A significant amount of awareness-raising must be done across the United States prior to an individual community education/outreach campaign in order to truly stimulate behavior changes in the general public. Many municipalities see a large influx of visitors during the tourist season and thus education must extend well beyond the immediate locality to be truly effective. Stormwater education is a national need and should be spearheaded by EPA nationally through a consistent education campaign and not simply left to municipalities.

7. Section 2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program (pages 25-37): Overall the IDDE program as described is highly prescriptive and very burdensome. While IDDE is necessary and valuable for a strong stormwater management program, the extent to which a municipality can comply with the edict mandated in the draft permit is questionable. The schedule mandated by the permit is unreasonable for an initiative that constitutes a major capital project requiring significant expenditures and coordination. The described program needs to be tempered by the Maximum Extent Practicable standard and thus subject to that which is feasible.

8. Section 2.3.4.1 Definitions and Prohibitions (page 25): EPA needs to modify its definitions to differentiate illicit discharges caused by mis-connected sewer laterals or direct introduction of contaminants into the MS4 by illegal dumping from those caused by systemic failures within the sanitary sewer or MS4. It is one thing to track, identify, and remove an illicit connection but altogether different to track, identify, and correct a failed sanitary sewer or similar system defect. The former are generally easy to locate and repairable within a relatively short time while the latter are extremely difficult to locate and repair and may involve wholesale replacement of large parts of the sanitary sewer collection system. The language in section 2.3.4 implies a "one size fits all" approach to IDDE and it clearly is not in terms of locating and removing the illicit discharge.

9. Section 2.3.4.4 a through e: This Sanitary Sewer Overflow reporting requirement is redundant and should be removed from the Small MS4 permit. MassDEP already requires SSO reporting through statewide regulations. For purposes of this MS4 permit, the term SSO needs to be defined. Relative to stormwater management and MS4 permitting the only SSO that should be considered are those that discharge through a stormwater outfall into a receiving water. SSOs that enter basements or are contained on street surfaces or upland areas have no link to an MS4.

10. Sections 2.3.4.5 and 2.3.4.6 (page 26-28): Outfall and interconnection inventory and system mapping are necessary and valuable components of stormwater management. However, the timeframe to complete these more detailed studies is likely inadequate, especially for smaller communities that may lack GIS and GPS capabilities. Communities should identify feasible schedules for completing this work within their SWMP.

11. Section 2.3.4.7.d.i (page 32): The Town of Millbury objects to the requirement that the permittee adopt a screening and sampling protocol consistent with a January 2012 draft document (EPA New England Bacterial Source Tracking Protocol). If this protocol is to be used in a regulatory context as proposed for this permit, it should be subject to rule making, peer reviewed, and scrutinized by others outside of the Agency and become a Final, not a draft, before making its use mandatory. Otherwise, the draft document may be useful as a suggested reference only.

12. Section 2.3.5 – Construction Site Stormwater Runoff Control, and 2.3.6: Stormwater Management and New Development and Redevelopment (Post Construction Stormwater Management). These provisions require permittees to develop, implement, and enforce a program to reduce pollutants and any stormwater runoff discharge to the MS4. EPA has no authority to make local land-use decisions by compelling permittees to make specific choices with regard to ordinances or other regulatory mechanisms. EPA is exercising federal land-use mandates on a local basis in violation of the 10th Amendment of the Constitution.

    These provisions would also apply to public road reclamation and resurfacing projects involving more than ¼ mile of 30 foot wide pavement (approximately 1 acre equivalent). By doing so, this permit would cripple local road maintenance budgets by effectively requiring redesign and construction of entirely new stormwater collection and control systems for all but the smallest road resurfacing project. Maintaining safe, passable roads is among the highest priorities of local government and one that is currently grossly underfunded. Taking limited funds and utilizing them for stormwater improvements for virtually every significant resurfacing project will greatly curtail meaningful improvements to local roads. Resurfacing and pavement maintenance projects should be exempted from this requirement to meet stormwater standards. The standards might be applicable to road reconstruction projects but only to the extent that they are practicable.

13. Section 2.3.6.d (pages 42-43) Directly Connected Impervious Area: The requirement to monitor and track impervious cover is a burdensome and inappropriate requirement for most municipalities. It has the appearance of a research effort and not a tool that will benefit stormwater management by the community. Compiling and tracking impervious area will require manpower and costs that would be better utilized implementing better stormwater control systems. If EPA Region 1 is that interested in tallying impervious cover acreage, the Town of Millbury suggests it directly fund and coordinate with colleges and universities to accomplish the task through graduate and undergraduate GIS projects.

    Region 1's effort to regulate impervious surfaces raises the legal issue on whether such surfaces are "point sources" under the NPDES permit program. Impervious surface, on its own, cannot be subject to regulation under the NPDES permit program because impervious surfaces are neither a "point source" nor a "pollutant." Instead, it is a feature of the landscape that indirectly influences how water is carried on and off land. Congress predicated the stormwater permitting program and Section 402(p) of the CWA on "point source" discharges of "pollutants" from certain categories of dischargers, including MS4s and industrial activities. If Region 1 were to interpret "point source" to include impervious surfaces, it renders that term meaningless and contrary to Congressional intent to define the term and distinguish between "point sources" and "nonpoint sources." In addition, Region 1's authority to control pollutant discharges does not encompass the ability to mandate land-use decision-making. While local authorities can develop a regulation, for example, to limit impervious surfaces or other stormwater flows into the MS4, EPA is limited to regulating the discharge of pollutants from the MS4 and cannot force MS4s to do what EPA is not otherwise authorized to do, including imposing restrictions on local land use decisions. While on November 26, 2014, EPA released a guidance memorandum in which it asserts authority to mandate retention standards based upon the amount of impervious surface at a site, that authority is necessarily limited to discharges from MS4 storm system (i.e., the "point source") into navigable waters. In short, impervious surfaces are not "point sources" under the

NPDES permit program. CWA Section 304 prohibits unauthorized point source discharges, but Congress left the regulation of nonpoint source pollution to the states.

The Town of Millbury appreciates the opportunity to comment on Massachusetts Draft Small MS4 General Permit. We urge EPA to consider modifications to the permit that will make it more sustainable and reasonable for municipalities and consistent with the Clean Water Act.

Sincerely,

RE: Comments on Draft Stormwater Permit-NPDES Permit

On behalf of the cities and towns of the Commonwealth, the Massachusetts Municipal Association (MMA) is writing to provide testimony on the 2014 draft Massachusetts Small Municipal Separate Storm Sewer System (MS4) General Permit.

Cities and towns understand the need to protect water resources. Our members are committed environmentalists who take their role as stewards of this important natural resource very seriously. Communities throughout Massachusetts began working toward the reduction and elimination of pollutants in municipal stormwater discharges well before the initiation of the NPDES Phase II permit program in 2003. Communities have long understood the need to look holistically at how water resources are managed in the Commonwealth to promote public health, safety and economic growth for our citizens.

In the past, the federal government partnered with communities to the benefit of our health and environment. Today, as evidenced by recent regulatory initiatives and unfunded requirements, that is not the case, and localities are suffering as a result. Strict stormwater standards are placing a financial burden on cities, towns and local taxpayers at a time when local budgets are already stretched to the limit. The MS4 program is certainly one of the most burdensome unfunded mandates imposed on localities by the federal government. The EPA's estimate is that MS4 communities can expect to spend up to $829,000 each year to implement stormwater programs in their communities. These proposed regulations would double or even quadruple many stormwater budgets.

In 2009, the state created a Special Water Infrastructure Finance Commission as a means of developing a long-range plan for the state and its cities and towns to maintain their waterworks. In its report, the commission conservatively estimated that it would cost communities approximately $18 billion over the next 20 years to meet federal stormwater requirements. This is on top of the $10.2 billion gap in the resources needed to adequately maintain drinking water systems, and an $11.2 billion shortfall for resources needed to maintain wastewater infrastructure. The federal government must provide funding opportunities to assist local governments as they struggle to implement the requirements associated with this program.

The new draft of the Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit would require communities to institute more advanced stormwater testing, monitoring and management programs, yet is completely silent on funding or mitigation of the additional costs to communities.

The proposed permit is clearly written in a one-size-fits-all format and provides little or no flexibility. It does not reflect the diversity among MS4 communities. Each of these communities has taken various steps to successfully comply with the original 5-year permit. The steps implemented during the original permit period differ from community to community and vary in intensity. The proposed MS4 permit takes none of this into account and leaves no flexibility in its level of compliance. Communities are grappling with these huge financial challenges and must be permitted to target their limited resources on areas that will have the biggest impact and the largest investment return.

One of the provisions in the 2003 general permit was the ability for cities and town to tailor Best Management Practices (BMPs) to achieve the maximum benefit utilizing available financial resources and manpower. In this draft permit, there is considerably less flexibility. For instance, the requirement to manage the first inch of run-off from all impervious surfaces or provide equivalent pollutant removal (when one disturbs more than one acre) would force communities to redesign and reconstruct roadways and related stormwater systems when they had planned to simply do a road maintenance project or repaving on a 1/4 mile of road of average width. This would dramatically increase the cost of keeping roads in a state of good repair or, more likely, eliminate any road remaining maintenance programs. Currently communities do not have adequate resources to maintain their roads, before considering the onerous mandates envisioned in the new draft permits.

The EPA must exempt road maintenance projects from this requirement because the extraordinary burden imposed by the new permit process would eliminate the capacity to perform important routine maintenance on other local roads. If pavement management projects such as crack sealing and resurfacing require stormwater system redesign, the prohibitive cost would actually increase the number of failing roads, create more erosion and pollution because those maintenance projects will simply become unaffordable, and would, in the long-term, cost taxpayers even more money. According to the U.S. Department of Transportation, once a road is in a state of good repair, every $1 dollar invested to keep it properly maintained saves $6 to $10 dollars in avoided repair costs that become necessary to rebuild the road when it fails. Ironically, the mandates in the draft permit process would consume all of the funds needed to maintain other roads in a state of good repair, and weaken our infrastructure.

We appreciate the agency's moderation of the initial catch basin requirements. However, the requirement to document and clean catch basins which are 50% full, and the proposed permit's vulnerability factor criteria would undermine this change, and would require communities to investigate all catch basins rather just than those with a high potential for illicit connections. Further, the proposed permit would require local personnel to document the amount of mass material removed in each catch basin when this limited staff time would be better spent cleaning catch basins. The paperwork and documentation requirements would likely decrease the catch basin cleaning frequency. Again, the new regulatory approach would result in a higher cost to perform this function.

The requirement to put signage on all outfalls is especially burdensome, given that communities have literally thousands of outfalls and the requirement would do nothing to eliminate illicit discharges. The EPA must also streamline requirements of outfall testing to prioritize catchment samplings or substitute end-of-pipe sampling with strategic in-stream sampling, which can be more effective and efficient. The agency must also provide training and test kits to municipalities, so that communities would not be forced to hire expensive consultants. The EPA recently did this for NGOs and should, at a minimum, provide the same opportunity for the regulated community. The cost to monitor and sample all outfalls is extraordinary, and would place a severe financial burden on our cities and towns.

Another concern is the aggressive schedule that the EPA proposes for implementation of the program. It is unrealistic to provide permitees only 90 days to file their Notice of Intent (NOI) after their permit is finalized, and equally unrealistic to dictate that the NOI the formal Stormwater Management Program must be complete within one year. Communities would be forced to hire expensive environmental consultants for assistance to complete numerous elements of the program because of lack of staff and technical expertise from years of both state and federal cutbacks in grant funding and local aid. Hiring these consultants would require compliance with statutory procurement requirements and could be extremely time consuming.

The initial 5-year permit requirements were accomplished in-house. This would not be possible under the draft permits as proposed, and communities would be forced to cut other services or raise taxes to pay for these new requirements.

These are just a few examples of the significant problems with the proposed MS4 permits.

The draft permit also requires each municipality to distribute educational materials to multiple audiences and to document the method of distribution, the evaluation methodology and the effectiveness of the education program. We all believe education is important, however the draft permit does not provide any guidance on effective messaging or how to measure it. Putting the burden on communities to develop, write, test, and assess educational material is ineffective and wasteful, and is another ill-advised cost-shift. The educational campaign should be the EPA's responsibility, not individual communities – they do not have the in-house capacity or expertise. The EPA should be responsible for messaging and should create assessment tools and downloadable EPA-approved materials that can be individualized to communities. These EPA-approved materials could then be made available in the guidance documents. These materials should also include educational videos from the EPA for delivery to a municipal audience through municipal cable stations.

In the absence of EPA leadership on this issue, a number of Massachusetts communities are already combining messaging by forming stormwater coalitions. There are at least 5 such coalitions in eastern Massachusetts, serving over 85 communities, combining resources and expertise, reducing the individual burden to communities. The EPA should work with the coalitions to provide material, resources and support.

The agency has also increased the number of communities that would be regulated under the proposed permit, while limiting community access to certain federal grants. For example, in the past Water Quality Act, Section 319 has provided stormwater improvement grants. Now those

grants can no longer be used in MS4-regulated communities. This is at least one source of funding that could help communities meet stormwater requirements, yet the funding is unavailable. The agency should change the language in the 319 programs to allow MS4 communities access to those funds.

Preliminary projections indicate that the proposed permit requirements would collectively cost the impacted communities and local taxpayers tens of millions of dollars per year to comply. As noted above, the requirements under the proposed permit are well beyond the normal operating budgets of our cities and towns. Because of Proposition 2½, many communities would be forced seek overrides to increase the local property tax burden, or would be compelled to dramatically reduce funding for existing programs and services – education, public safety, public works. That is the simple reality caused by unfunded mandates in a tax-limited environment.

In short, we express our deep and serious concerns regarding these costly new permit requirements. These requirements would certainly divert scarce resources away from core essential services necessary for the protection of public health, safety and education. The costs of the operational, structural and staffing changes necessary to monitor and meet the requirements of these permit mandates would have a severely negative financial impact on communities across the Commonwealth.

For these reasons, we ask you to defer action on the submission of NOIs until municipalities have had the opportunity to engage the regulatory agencies in an open dialogue regarding these onerous and unaffordable permit requirements. We urge the EPA to amend its approach, and incorporate goals that are more realistically attainable and within the financial constraints of the current economic climate, or wait until adequate federal funding is available to ensure that these requirements do not translate into a harmful unfunded mandate on cities, towns and taxpayers.

If you have additional questions, please do not hesitate to contact MMA Senior Legislative Analyst Thomas Philbin at 617-426-7272 at any time. Thank you very much.

Sincerely,

Geoffrey C. Beckwith
Executive Director & CEO

RE: Comments on Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. This permit involves particularly important issues for the Mystic River Watershed Association (MyRWA) – given the degree to which the waters of the Mystic River and its tributaries are negatively affected by pollution from storm sewers, leaking or improperly connected sanitary sewers, and stormwater runoff.

By way of background, the Mystic River Watershed Association is a 501(c)(3) nonprofit organization founded in 1972 by a group of concerned citizens. MyRWA's mission is to protect and restore clean water and the natural environment to a healthy state in the Mystic basin's 22 communities and to promote responsible stewardship of our natural resources through educational initiatives. As a small organization, MyRWA accomplishes its mission by forging strong links with citizens' groups, universities, businesses and government agencies.

On behalf of our organization's members and supporters, we write to thank you for proposing an amended general permit for Municipal Separate Storm Sewer Systems (MS4s) in towns and smaller cities across the Commonwealth of Massachusetts. We believe that the proposed MS4 permit represents **a significant stride** towards compliance with the federal Clean Water Act (33 U.S.C. § 1251 *et seq.*), its Massachusetts counterpart and related regulations.

I. Background

Polluted stormwater is the most serious water pollution problem in Massachusetts today. EPA Region 1 has found that stormwater causes or contributes to at least 55% of the violations of water quality standards in the state's rivers, streams and lakes. Climate change presents an additional, important reason to improve stormwater management. Most scientists expect the recent cycles of flooding and drought to become more pronounced in coming years. As a result, Massachusetts communities will need to better maintain or upgrade their aging infrastructures – to safeguard both public safety and the environment well into the future.

The conditions in the Mystic River Watershed are representative of urbanized streams throughout Massachusetts. Rivers, streams, lakes and ponds within the watershed have high levels of *E. coli* derived from sewage associated with underground infrastructure that is failing. Recreational users are frequently on water with *E. coli* levels that are above standards of the federal Clean Water Act and the Massachusetts Clean Waters Act. High levels of phosphorus have caused frequent cyanobacteria blooms, accelerated the spread of invasive plants and led to low dissolved oxygen levels. Conductivity levels in the water bodies show significant increase over the past decade – median values at multiple water bodies hover at the chronic toxicity levels.

II. Support for the Permit: General

This permit is an important step in promoting these urgently-needed changes, and we strongly support its promulgation – consistent with the comments below. We'd like to emphasize that, if in fact it is promulgated in 2015, this permit revision will end up being more than five years overdue (and we'd note that the statutory deadline for review and revision is every five years). *See* 33 U.S.C. § 1342(b)(1)(B).

The 2014 permit represents a significant improvement over the 2003 permit. It is likely to be far more effective in reducing pollution, flooding and erosion caused by stormwater in urbanized areas like the cities and towns in the Mystic River Watershed.

- The proposed Draft General Permit for Small MS4s in Massachusetts (the "2014 permit" or the "new permit") incorporates **water-quality requirements** that directly address the pollutants that are actually causing specific Water Quality Standard violations in each affected city and town in the Mystic River Watershed.

- In many cases, the 2014 permit provides **more specific requirements and deadlines**, which should result in more timely and effective compliance than was experienced under 2003 permit.

- The 2014 permit affords to municipalities **adequate time and substantial flexibility** to choose compliance strategies that are best suited to local conditions. We applaud EPA's decision, in response to comments on the proposed 2010 small MS4 permit (which in the end was not issued), to eliminate certain requirements that were overly prescriptive and inflexible.

- The new permit's provisions for **greater public access and opportunities to comment** on cities' and towns' stormwater management programs will increase public knowledge about and support for these programs – an outcome essential to achieving a commitment to allocate the resources needed to deal with polluted stormwater. Greater public scrutiny will also encourage the development of more effective plans and more consistent program implementation.

- The carefully crafted requirements for a permittee's **Illicit Discharge Detection and Elimination (IDDE) programs will help guide MS4s to effectively combat the significant systematic problem of non-stormwater discharges.** We find that the scope, timescales and approach of these rules – in particular, the requirements for system mapping and sampling – to be thoughtful and appropriate.

- **The post-construction requirements for new development and redevelopment will help to prevent future projects from continuing the poor stormwater management practices of the past.** In general, EPA has chosen a balanced and effective strategy, setting a high standard for addressing stormwater infiltration (the most cost-effective way to remove pollutants from stormwater), while providing a safety valve where site conditions make meeting that standard infeasible. (We offer more detailed comments on this below).

In short, the new permit requirements ask municipalities to do better monitoring and planning, to improve implementation, to raise public awareness of stormwater issues and to design and maintain better stormwater management measures. If successful, the new permit **will result in major improvements in the management of urban stormwater in Massachusetts, with the results evident in cleaner and healthier rivers, streams, lakes, ponds and coastal waters**.

Good planning, it needs to be emphasized, **will help cities and towns reduce the cost of funding compliance investment in stormwater programs and infrastructure**. Communities can take advantage of help and support from EPA, the state Department of Environmental Protection (DEP), watershed groups and regional planning agencies. They also can work regionally to achieve economies of scale (for example, by forming and participating in stormwater consortiums); to develop and fund stormwater utilities; and to ensure that private entities assume their share of the responsibility for stormwater management.

III. Areas for Improvement: General

Although we strongly endorse the overall approach and requirements of the new permit, we have identified **some areas where improvements are needed:**

- **The stormwater bylaw requirements should apply to projects of a quarter or half an acre.** Most urbanized cities and towns, including many in the Mystic River basin, host very few large development and redevelopment projects. Indeed, development in these communities generally is sited on parcels smaller than an acre. However, under the new permit, projects of this size would not be required to employ *any* stormwater management measures unless they are located in wetland resource areas. This loophole will make it exceedingly difficult for many communities to comply with the proposed prohibition against new and increased stormwater discharges from MS4s.

- In addition to conducting an annual evaluation of adherence to and effectiveness of best management practices (BMPs), **permittees should be required to take corrective action** where the evaluation shows that goals and objectives are not being met. An effective iterative approach to improving stormwater management requires that problems be addressed, and not simply catalogued, as they are discovered.

- **MS4s discharging to waters impaired for bacteria or pathogens should be subject to additional requirements**. This includes ensuring that new development and redevelopment projects and retrofits implement only those BMPs that are most effective at reducing bacteria, where the waters into which these projects discharge (via an MS4) fail to meet Water Quality Standards for bacteria or pathogens. This is consistent with the requirements that EPA has proposed for other stormwater pollutants.

- **The new requirements proposed for projects discharging to waters impaired for chloride (road salt) should apply to all MS4s.** Field evidence increasingly identifies road salt as a major problem in urban areas like MyRWA's. We strongly recommend that chloride-control measures be included in all of the new permit requirements.

- **The requirement for retention of 1″ of runoff for all development and redevelopment sites should be applied to the entire site area.** This concept is vital to preventing future development and redevelopment from making conditions worse. The language of the new permit should be clarified to achieve this end. This requirement ensures that the first flush, which is likely to contain the highest pollutant levels, is retained or treated. This approach appropriately encourages a developer to evaluate its entire site and to look for opportunities throughout the site for increased infiltration. This is necessary in order to ensure that redevelopment projects significantly reduce stormwater runoff and pollutant loadings. In densely-developed municipalities like those in the Mystic River basin, real improvement in controlling runoff will not happen unless this requirement is applied to the entire site area, and not just to the often very small confines of the redevelopment project itself. Although total retention volume will be higher when the entire site is included, we believe that any challenges that may arise can be **adequately addressed via the "safety valve" provision** of Section 2.3.6.a.ii(a), which covers instances in which specific site conditions make compliance with the 1″ requirement infeasible. The new permit should make it clear that treatment in lieu of 1″ retention will be allowed only if specific site conditions render full 1″ retention impossible or infeasible.

- **We recommend that permittees be required to update their existing ordinances or regulatory mechanisms or create new ordinances/regulatory mechanisms within 2 years of the permit effective date**, as needed, to incorporate all of the requirements of Section 2.3.5.

- **The compliance schedule for the Charles River Phosphorus TMDL is too long.** We support the schedule proposed by the Charles River Watershed Association (CRWA) to require TMDL compliance within 10 years. We believe that, to return the river to a healthy state, it is extremely important to reduce the pollutant input as soon as possible and to provide permittees with a variety of financial instruments that encourage investment in required infrastructure.

IV. Particular Areas of Comment

MyRWA offers the following more detailed comments on areas of the new permit that are of particular concern to its members.

A. Public Involvement and Participation

1. We support the provisions of Section 2.3.1.b, which enable the development and implementation of permit conditions collectively among more than one entity (e.g., among neighboring MS4s) – if certain conditions are satisfied. This flexibility is key to facilitating stormwater management responses on regional and watershed bases. To

further encourage cooperation of this type (and the efficiencies that it engenders), private community stakeholders such as landowners and community organizations could be listed as eligible partners for satisfying permit requirements. In particular, watershed associations can play an important role in the public education and outreach efforts called for in Section 2.3.2.

2. Section 2.3.2 is fundamental to the overall success of MS4s in meeting permit discharge requirements, as widespread education will facilitate the adoption of EPA-recommended stormwater management practices. With this in mind, we suggest that the notification requirement of Section 2.3.2.c be strengthened to (i) require outreach to each audience at least once every two years, rather than a frequency based on the total permit period (as we've seen, the statutorily required five-year permit period in practice may be more than doubled); and (ii) require that the distribution of each educational message be communicated via the Web and by one other distribution mechanism listed (e.g., via news item, brochure, poster).

3. MyRWA strongly supports Section 2.3.3.b, which requires that the permittee provide an annual opportunity for public review of the Storm Water Management Plan (SWMP) and its implementation. We know that the level of public participation this invites will be crucial to the quality of design, support and performance of SWMPs. Although all of the public participation mechanisms listed in Section 2.3.3.c are positive and appropriate, we additionally recommend specifying that the permittee consider public comments on the Notice of Intent (NOI) and SWMP, as well as those relating to annual reports and self-evaluations filed under the new permit. These documents (including annual reports and data) should be made available conveniently online by the permittee and also should be listed in the communications described in Section 2.3.2.

B. <u>Compliance and Reporting</u>

1. The standard permit conditions of Appendix B provide for reasonable non-compliance by permittees under exceptional circumstances, in each case requiring notification to EPA either before or after the incident. We recommend that Section B.12.b (anticipated non-compliance) and B.13.c (bypass notice) be highlighted in the body of the new permit and that permittees be additionally required to notify the public in the event of non-compliance or bypass. These public notifications should be made to the same website as the one in which the SWMP is posted, as specified in Section 1.10.1.b of the new permit. Without this addition, the strong reporting requirements of the new permit could potentially be undermined in cases where the information about

permit compliance being made available to the public is incomplete due to these incidents.

2. We strongly support the provisions of Section 4.4, which require that the reporting and evaluation of permit compliance and SWMP effectiveness be included in permittees' annual reports. We recommend that the significance of this annual reporting as a mechanism for corrective action and iterative improvement of stormwater management be reinforced and highlighted by modification of Section 4.1.c. This section, which provides for EPA to modify permit compliance measures in a written response to annual reports, should be extended to (i) require a written response by EPA to each annual report, whether or not changes are recommended, and (ii) provide for a brief public comment period of 30 days, which would allow community stakeholders to review and propose changes to EPA's response.

3. Section 4.4 outlines the required elements and timing for submission of annual reports. We strongly suggest that this section encourage the submission of the annual report via an electronic format developed by EPA. Development of an electronic template for annual reports – as has been done with the NOI – will dramatically increase the capacity of regulators and the public to review compliance data. An electronic format allows for quick data compilation across many reports, increasing transparency and facilitating review by understaffed agencies.

C. Illicit Discharge Detection and Elimination (IDDE)

1. We recommend that Section 2.3.4.4.b provide a definition for "sanitary sewer overflow" (SSO). The experience of this organization is that permittees are not clear on what is and is not an SSO. Frequently municipal staff will not identify basement backups of sewage as an SSO. Also, if a combined sewer area backs up onto street and fills a parking garage – should this be reported as an SSO? See comment below.

2. We recommend the inclusion of additional language to deal with overflows not considered in this permit. There are multiple areas within the Mystic River Watershed where a section of the community is serviced by a combined sewer. We have now seen multiple incidents where constraints in the system have caused CSOs to flood residential streets. We do not believe that these incidents are being properly reported, have been identified as a public health threat or have received prioritization for correction.

3. We recommend that reports of SSOs be uploaded to the permittee website in a timely manner to keep the public informed. These reports currently are not visible to the

public. It would be natural to place these reports on the same page dedicated to NOI and Annual Reports.

4. We recommend that the requirement in Section 2.3.4.4.b to identify all known locations where SSOs have discharged to the MS4 in the past five years be extended to the past ten years. Research performed by MyRWA has shown that reporting of SSOs is inconsistent across storm events and chronically underreported. Because major rain events are sporadic (indeed, it's not clear that one has occurred in the region since March 2010), a five-year window will be too short for planning purposes, resulting in few SSO locations being catalogued in response to permit requirements. The devastating March 2010 incidents would not be included, for instance.

5. We strongly agree with EPA's recommendation – set forth in reference to Section 2.3.4.6.b in the fact sheet for the new permit – that GIS be the preferred format for permittee system maps. GIS maps prepared using an industry-standard format would be an invaluable resource to the permittee as well as to outside stakeholders, provided that these files are made publicly available (which they should be). Indeed, this provision should be incorporated into the new permit itself – preferably listed as a requirement, except in cases where permittees obtain certification from EPA that to do so would be technically infeasible.

6. Consistent with our comments on Section 2.3.1.b (inter-entity permit conditions), we recommend that the language of Section 2.3.4.7.b. be extended to encourage regional cooperation on IDDE program implementation. Already, the section outlines conditions for multiple departments to jointly execute IDDE programs, requiring that responsibilities be defined and cooperative processes be established. Additionally, we suggest that permittees be allowed to collaborate with nearby MS4s to develop IDDE programs, subject to the same requirements that apply to collaborating departments. Such cooperation could expedite implementation by permittees as well as increase the effectiveness of IDDE programs.

7. We strongly recommend that Section 2.3.4.7.c. include language that encourages MS4 managers to actively seek out data from other agencies and environmental groups to assist with prioritization of catchments (limited reference to outside data is found in Section 4.4.b.v.). Many watershed groups (including MyRWA) have collected water quality data on local water bodies and stormwater outfalls and this data can be extremely useful in prioritizing problem and priority catchments. In the past 15 years, MyRWA has collected 984 bacteria samples from stormwater outfalls and nearly 3,000 bacteria samples from receiving waterbodies. Other parties with significant data resources on water quality include the Massachusetts Department of Public Health,

which has data on swimming beaches, and the Department of Conservation and Recreation. Without some encouragement, we believe that many permittees will rely only on the very modest levels of past monitoring, and will miss the opportunity to prioritize efforts to improve the condition of the water body as quickly as possible.

8. We recommend that the requirement in Section 2.3.4.7.d.v to analyze pollutants identified as contributing to impairments (as specified in Appendix G) be removed. MyRWA's experience in measuring phosphorus levels in stormwater at outfalls and in-stream shows that the results are highly heterogeneous over time. Factors that determine the level of phosphorus include seasonality, intensity of rainfall, timing within the storm (e.g., first flush) and period of dry weather preceding storm (e.g., wash-off dynamics). Our experience would indicate that in the case of phosphorus, results are as likely to be misleading as informative. We expect that the results from measuring other parameters will suffer from the same problem. Unless the permittee installed an autosampler at the site and collected a series of samples or composites, it is not possible to flag or prioritize areas- this is a case where GIS modeling does a much better job.

9. We regard Section 2.3.4.8.a as a particular strength of the new permit, as it requires dry weather sampling of all eligible catchments within a specific timeframe, with sampling data to be made public through the annual report. Although the exemption for permittees already performing monitoring under the 2003 MS4 permit or as a result of an enforcement action is appropriate, we recommend specifying that all data collected under existing monitoring be submitted in the annual report required by the new permit.

10. We recommend that the new regulations explicitly state that all permittees are expected to meet all requirements of Section 2.3.4, even MS4s that are currently under an enforcement or similar order from EPA or a state environmental agency in which an IDDE plan has been approved. An MS4 which, because of such an order, does not follow all requirements of Section 2.3.4 should describe in its SWMP how its current, approved plan is at least as effective as what Section 2.3.4 requires.

11. Section 2.3.4.7.c.i defines specific water sampling criteria for MS4s to follow in identifying "Problem" and "High Priority" catchments for investigation in the IDDE program. The proposed criteria are based on the simultaneous exceedance of certain thresholds in bacteria, surfactants, and ammonia. Our own analysis (see Appendix 1 below) suggests that (i) only a very small fraction of catchments are likely to qualify for prioritization under these criteria, and (ii) ammonia in particular is not significantly associated with clear indicators of sewage discharge concentration. We

believe that a prioritization scheme that requires *all* of these parameters to be exceeded creates an artificially high threshold that will result in the identification of very few storm sewers as "Problem" or "High Priority" catchments. Indeed, if a large stormwater drainage were to have 50,000 *E.coli* mpn/100 ml (i.e., massive contamination) and null values on ammonia, surfactants and chlorine, the current prioritization scheme would not target it.

We therefore suggest that:

a. Problem catchments be identified based on exceeding a bacteria threshold that is in excess of 2,500 *E. coli*/100 ml (or the *Enterococcus equivalent);*

   or

   Problem catchments in freshwater environments be identified based on exceeding the recommended bacterial and surfactant thresholds, regardless of ammonia level. Problem catchments in marine environments should focus solely on *Enterococcus.*

b. High Priority catchments be identified based on exceeding the bacterial threshold, catchment size and public health risk associated with pollution at the receiving body (e.g., drinking water supply, beach).

D. Discharges to Water Quality Limited Bodies with TMDLs

We recommend requiring that the requirements of Sections 2.1.1 and 2.2.1(b) and Appendix F apply to any discharges to waters that become subject to new TMDLs during the permit term – and not simply limited to TMDLs approved prior to the start of that term. There are currently no approved TMDLs in the Mystic River Watershed. Given the extended timelines for revision of the MS4 permit regulations (long past the required five-year interval), efforts to improve conditions in the degraded Mystic River will be inappropriately delayed if deployment of TMDLs must await a (possibly distant) effective date of a future permit. Such an approach will also exacerbate the differences in water quality and invested resources between sites that have received assistance in developing TMDLs and places like the Mystic River that have not benefitted from that attention. Compliance plans should be developed and SWMPs revised to include the new requirements within the first two years after the effective date of any new TMDL.

20 Academy Street, Suite 306 · Arlington, MA · 02476-6401 · (781) 316-3438 · www.MysticRiver.org

E. Discharges to Water Quality Limited Bodies Lacking TMDLs

1. Monitoring of urban stormwater shows consistent presence of certain pollutants that are targeted by EPA's proposed new permit. EPA is correct in pointing out that waters impaired for one or more of these pollutants do not have the capacity for additional loadings of those pollutants, and, therefore, that any loadings contributed by the MS4 cannot be allowed under the new permit. We support requiring that extra measures be taken to control pollutants discharged by MS4s into water-quality limited waters for which a Total Maximum Daily Load (TMDL) has not been established for any such pollutant (see Sections 2.1.1(c) and 2.2.2, and Appendix H). This is a sensible way to ensure that emphasis is placed on addressing the most serious water pollution problems in the Mystic River basin.

2. MyRWA supports EPA's general approach here, which requires specific, additional maximum extent practicable (MEP) requirements for MS4 discharges to water quality-limited waters. And we do not support an alternative approach – requiring permittees to develop a specific plan for each relevant pollutant. Such a requirement would be far too complex, time-consuming and costly. Rather, where necessary to protect impaired waters, EPA should demand specific targeted enhancements to the MEP requirements.

3. MyRWA also recommends the following:

    a. The Proposed 2014 Massachusetts Integrated List of Waters should be used for this assessment, not the Final 2012 list, if the 2014 list has been approved by the effective date of the new permit.

    b. A permittee should be allowed to rebut the presumption that specific pollutants are present in its MS4 discharges. A successful permittee would thus be exempt from the additional requirements of Appendix F.

    c. The additional Appendix H Part III requirements for permittees discharging to waters that are impaired for bacteria/pathogens should be strengthened to include these additional MEP requirements:

        i. Revising post-construction bylaws or ordinances to require retention of one inch (1") of runoff from all impervious areas for smaller projects (e.g., those disturbing one-half acre or more). This is particularly important in heavily-developed, urbanized areas like much of the Mystic River basin;

ii. Requiring that new developments and redevelopments give priority to BMPs that are effective in controlling pathogens in stormwater discharges; and

iii. Emphasizing BMP retrofit opportunities that effectively reduce bacteria in stormwater on permittee-owned properties.

d. Pursuant to Section 2.1.2, any increased discharges must be authorized under the Massachusetts anti-degradation regulations (314 CMR 4.04). Conditions imposed by those regulations should be incorporated by reference in the new permit. Finally, any such conditions or requirements also should be documented in the relevant SWMP and evaluated in the permittee's annual report.

F. Post-Construction Stormwater Management

1. We support EPA's application of the so-called one-inch (1") retention standard for site development or re-development (that is, that the site be engineered to retain – without promoting runoff – the first inch of rain in a storm). As is well known, this "first flush" of runoff is often far more polluted than what follows. If this runoff is not retained, treated or otherwise controlled, it poses a serious threat to the bottom-line goal of achieving clean water.

2. To ensure that the new permit is effective and that we do not inadvertently find ourselves undermining existing progress, we believe that it is important to apply the 1" retention requirement to an entire site, once the determination has been made that it applies to the developed or re-developed area of that site. The reasons for this are several. First, typically, in densely-developed areas like much of the Mystic basin, little possibility for increased infiltration will arise unless the entire site – that is, the area in which much of the development already exists – is treated. Second, this approach will encourage developers to consider additional efficiencies, ones that would not be an option if they were not required to address the entire site. Finally, if the one-inch requirement were to apply only to the confines of a new development/redevelopment, total runoff from the entire site (and thus water pollution) would most likely increase.

3. To address the possibility (infrequently seen) that specific site conditions that render compliance with the 1" retention requirement infeasible – due, for example, to soil conditions, high groundwater levels or existing contamination – we endorse the availability of an alternative compliance path. In this way, development/redevelopment will not be obstructed unnecessarily, with inefficient

and environmentally unsound stormwater management practices frozen in place. Section 2.3.6.a.ii(a) should clarify that this "safety valve" is available only if specific, articulable site conditions make full 1" retention infeasible. It also should make it clear that, where infeasibility is found, the alternative compliance path must apply to the entire site, not simply the area where new development/redevelopment is planned.

4. We also suggest that EPA consider allowing off-site mitigation and trading, but only where an on-site approach covering the entire site is infeasible. Off-site mitigation and trading can encourage cost-effective MS4-wide strategies for reducing pollutant loads, and controlling volume and rates of runoff. However, developing effective mitigation provisions and trading systems is complicated – these require careful attention to design to ensure true equivalence in the level of pollution and runoff control provided, and to avoid the creation of loopholes. Thus, this approach should be considered only if on-site strategies are physically impossible or at least significantly more expensive than off-site mitigation.

G. Chloride (Road Salt)

The new requirements proposed for MS4s should apply to *all* MS4s – not just to MS4s that discharge to waters impaired for chloride (road salt). Although relatively few water bodies have been assessed for chloride, a growing body of evidence points to the conclusion that this is a significant problem in most, if not all, urbanized areas[1] – a problem that so far has been virtually ignored. Research from the northern United States as well as the analysis of water quality data from the Mystic River basin is summarized in Appendix 2 below. Given this data, we strongly recommend that measures to control chloride discharge be moved from Appendix H to the Good Housekeeping section of the new permit.

H. BMPs and LID

1. We support requirements for measurable goals for each BMP, including milestones and timeframes for implementation, defined qualitative or qualitative endpoints, and associated measure of assessment (section 1.10). We support the requirement for an annual evaluation of BMP implementation and recommend that it include an assessment of effectiveness as part of the annual SWMP. This evaluation is critical to encouraging an interactive approach to improving stormwater management. We also recommend that EPA provide detailed guidance on methods for evaluating the effectiveness of each type of BMP, and examples of corrective actions that might be

[1] *See* Robinson, et al. 2003. Water quality trends in New England rivers during the 20th century, Water-Resources Investigations Report No. 03-4012 (USGS: National Water-Quality Assessment Program), 13.

taken where BMPs are not achieving their goals and objectives. The BMPs involved in stormwater management vary widely in their characteristics, from those that have a direct and observable impact on water quality (e.g., IDDE requirements) to those that are very important but less easily evaluated in terms of their ultimate effect on stormwater impacts (e.g., public outreach and education). A catalog of appropriate outcome measures for each BMP requirement and a checklist of BMP improvements that should be considered where BMPs are not achieving the desired objectives would be very helpful to permittees in the initial development of their SWMPs and in their annual evaluations.

2. In the annual evaluation of BMPs as part of the SWMP (section 1.10.2), we recommend that permittees be required to identify any BMPs that are not achieving the planned outcomes. This may include a description of planned changes in BMPs as well as other actions to improve performance – including, if necessary, the evaluation and implementation of alternative BMPs. We also recommend that new regulations enable the public to petition EPA for a declaration that a BMP is ineffective and requires remedial action.

3. EPA's BMP Performance Extrapolation Tool (PET), cited in section 2.3.6.a.ii(a), covers only some of the pollutants often found in stormwater: total phosphorus, total nitrogen, total suspended solids, and zinc. We recommend that EPA provide additional guidance on how it plans to select methods for verifying treatment performance with regard to other stormwater-related pollutants (e.g., bacteria, oil and grease, chloride, metals). The new permit also should allow for use of other resources able to demonstrate performance – but with the proviso that the permittee verify that any guidelines used which are not consistent with EPA's BMP PET be shown to be more relevant to the specific site conditions than those incorporated in the BMP PET.

4. We recommend that EPA provide additional guidance on how BMPs should be chosen, as well as how they should be constructed (section 2.3.6.a.ii(d)). To ensure that BMPs are as effective as possible at removing or treating pollutants of concern, we recommend that BMPs be selected and constructed in accordance with the Massachusetts Stormwater Handbook.

5. We support the emphasis on low-impact development (LID) in the post-construction requirements (section 2.3.6.c). State-of-the-art LID has advanced significantly in recent years, the result of greater experience with these sustainable techniques. Costs have come down and there is a clearer understanding of performance potential, as well as the design, construction and maintenance practices needed to render these techniques effective. We believe that the language in the permit Fact Sheet (at p. 35)

inappropriately suggests that maintenance of LID controls may be more expensive or difficult than that required for traditional stormwater controls. No such implication should be carried over into the final version of the new permit.

6. We agree that permittees should be required to assess local practices and regulations that affect impervious cover and the use of green roofs, infiltration BMPs, and water capture/reuse, as well as to assess opportunities to modify or retrofit their property and infrastructure to reduce impervious area and directly connected impervious area (section 2.3.6.d). These requirements will remove local barriers to more cost-effective approaches to stormwater management and will promote more proactive management of municipal stormwater.

I. Pollution Prevention

We support inclusion of pollution prevention in public education and outreach (Section 2.3.2). In addition, we support the requirements for pollution prevention for municipal facilities and operations, including development of a Stormwater Pollution Prevention Plan (SWPPP) (Section 2.3.7). Finally, as noted above, we recommend that some of the chloride reduction requirements described in Appendix H be made part of the Good Housekeeping requirements in section 2.3.7, rather than being limited to MS4s discharging to waters classified as impaired for chloride. These Good Housekeeping requirements should include tracking and reporting of types and amounts of salt used on all permittee-owned and maintained surfaces; developing a plan to minimize and reduce salt application; annually calibrating municipal and contractor equipment; training for staff and contractors on appropriate application rates and best practices; and preventing the exposure of salt storage piles to stormwater.

We appreciate the careful work EPA has done to improve on the 2003 permit and the 2010 proposal, work that is based on its experience with the 2003 permit and comments on the 2010 proposal. However, this process, as noted, has taken a very long time. We **strongly support prompt issuance of the final 2014 permit**, to end the long period of drift and uncertainty associated with delay in issuing this permit. We urge EPA to work quickly to respond to comments and complete a final permit at the earliest possible date.

Thank you for this opportunity to comment on this critically important set of regulatory revisions and permit. If you have any questions or require additional information please contact me at (781) 316-3438 or at EK@mysticriver.org.

Sincerely,

EkOngKar Singh Khalsa, Executive Director
Mystic River Watershed Association

Appendix 1: Catchment prioritization

The catchment prioritization strategy defined in Section 2.3.4.7.c.i of the new permit is designed to focus permittee screening efforts on outfalls and interconnections likely to be affected by illicit discharges. To this end, criteria are established based on three water quality attributes (bacteria, surfactants and ammonia) considered likely indicators of sewage. These criteria demarcate "Problem" and "High Priority" catchment classifications.

However, our analysis of MyRWA's freshwater hotspot sampling data at outfalls in the Mystic River watershed and 2009-2010 data from EPA's Regional Applied Research Effort (RARE) suggests two modifications to the proposed classification scheme.

1. *Problem catchments should be identified on the basis of E. coli and surfactant exceedance alone, regardless of ammonia concentration.*

   In 148 MyRWA samples collected in freshwater environments in which all three of these indicators were measured from 2008-2014, only 5% of samples exceeded the proposed criteria in all three indicators simultaneously. Given that this watershed is known to be impaired and to be afflicted by illicit discharges, this is strong evidence that the proposed prioritization strategy will be too restrictive for most watersheds, leading to the prioritization of few catchments.

   
   We performed a logistic regression analysis of 88 EPA RARE samples with simultaneous measurements for these three indicators and acetaminophen, which is perhaps the most direct available tracer of sewage discharge. We found that *E. coli* and surfactants are each individually predictive of acetaminophen concentration, and that exceedance of both these criteria simultaneously would be expected to produce an ~80% probability that acetaminophen concentration will be above average. However, the additional finding that ammonia levels are in exceedance of the proposed criterion does not significantly alter the acetaminophen level predicted under the regression model. These results suggest that the additional criteria based on ammonia concentration has the effect of

selecting a random (and overly restrictive) subset of the likely-contaminated catchments. Observe in the above bar graph that the "All exceeding" category is associated with a reduced probability of acetaminophen exceedance than that of "*E. coli* and surfactants exceeding" (~80%).

Moreover, we find in both the MyRWA and EPA data that *E. coli* concentration in the presence of a simultaneous surfactant and ammonia exceedance is actually lower than would be expected based on the exceedance of either individually. This suggests that ammonia, possibly through correlation with antiseptic chemicals like chlorine, may actively counteract or at least anti-correlate with the levels of the key bacterial indicator.

2. *High Priority catchments should be identified based on the E. coli/Enterococcus criteria alone, in combination with catchment size and the public health risk inherent in the receiving population.*

   In 148 MyRWA samples with all three of these indicators measured from 2008-2014, 100 exceeded the proposed bacterial threshold of 235 CF/mL. In 58% of those cases, neither ammonia nor surfactant levels exceeded their proposed thresholds. This indicates that a large fraction of catchments will exhibit problematic bacterial levels, regardless of the status of other salient indicators. Being an urban watershed, there is minimal concern that the bacterial source is agricultural. Given that bacteria is the contaminant that will ultimately pose the greatest public health risk, it makes sense to focus on identifying catchments exceeding this indicator, regardless of their performance on indicators of secondary significance.

We believe that the above recommendations are consistent with the trends indicated by the historical sampling data from both MyRWA and EPA, and will lead to improved prioritization and more efficient IDDE program execution by MS4s.

Appendix 2: Chloride

Application of salt in Massachusetts has expanded dramatically during the past two decades. Because a coordinated study on chloride and conductivity in Massachusetts streams has never been conducted, it is reasonable to conclude that the listing of only six streams as impaired for chloride in the Massachusetts Year 2014 Integrated List of Waters vastly underestimates the extent of impairment.

Research from outside of Massachusetts suggests that chloride levels in urbanized areas routinely exceed EPA's chronic toxicity levels. Kaushal et al. (2005) points out that urbanized streams in Baltimore with >35% impervious cover consistently reach chronic toxicity levels of 230 mg/l chloride. Corsi et al. (2014) assessed 30 monitoring sites on 19 streams (including 15 in urban areas) throughout the U.S. and found that 29% of the sites exceeded the EPA's chronic water-quality criteria, on average, by more than 100 days per year.

Despite this evidence of widespread impairment at the national level, the new permit would require an affirmative showing that chloride has impaired the Mystic River and its tributaries – backed by significant monitoring – before any remedial measures can be deployed. This imposes the burden of proof on the wrong parties. The result will be a delay in efforts to address a pollutant whose toxicity is well documented that right now is being widely applied to the streets and roads in the Mystic Watershed.

Conditions in the Mystic River Watershed

In order to assess direct evidence of impairment of water bodies in Massachusetts, MyRWA analyzed three sets of conductivity data on the freshwater rivers, streams and lakes collected by our own organization and the Massachusetts Water Resources Authority (MWRA) from 1994 – 2014. Analysis suggests that chloride levels regularly exceed chronic threshold limits identified by EPA (230 mg/l) and have increased significantly in the past two decades in most parts of the watershed.

1. *Analysis of data from MyRWA baseline sites*

The first data set is from the MyRWA baseline monitoring program. It includes monthly samples from 15 years at 10 freshwater sites. MyRWA calculated chloride levels based on specific conductivity measurements and the relationship between conductivity and chloride. We examined two alternative linear regression models describing the relationship between chloride and conductivity – one from Heath and Morse (2013) on chloride in Wilmington, Mass., and another calculated by MyRWA in 2015 using lab results returned for chloride and conductivity in a recent study (discussed later in this Appendix). The MyRWA study applies the most conservative linear regression model (which yields lower estimates of chloride).

Figures 1 and 2 below show the chloride levels calculated for the MyRWA baseline sites. Figure 1 shows estimates for complete years. Figure 2 displays data only from April through October for each year – which more clearly shows the accumulation of chloride in the system.

When analyzing data for months with little or no salt application (Figure 2), we can see that chloride concentrations often reach levels at or above the EPA's chronic toxicity criteria of 230 mg Cl/l for the Aberjona and Malden rivers and for Alewife and Mill brooks. When looking at full-year data (Figure 1), we notice that EPA's acute toxicity criteria of 860 mg Cl/l is even exceeded on several occasions.

But what is more worrying is that chloride levels are increasing at most of the baseline sites. The situation is particularly alarming for the Meetinghouse and the Mill Brooks, where the rate of increase is highest. If these alarming trends continue, chloride levels will be well above chronic toxicity criteria most of the time.

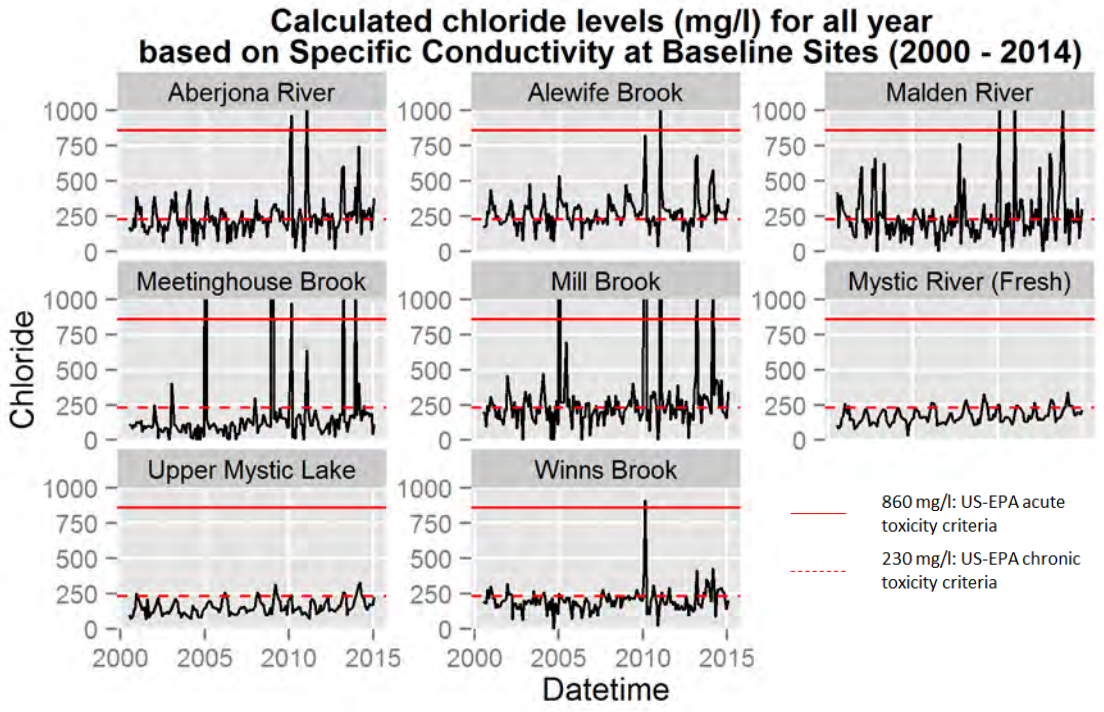

Figure 1: Calculated Chloride levels (mg/l) for complete years based on Specific Conductivity at MyRWA baseline sites (2000 - 2014)

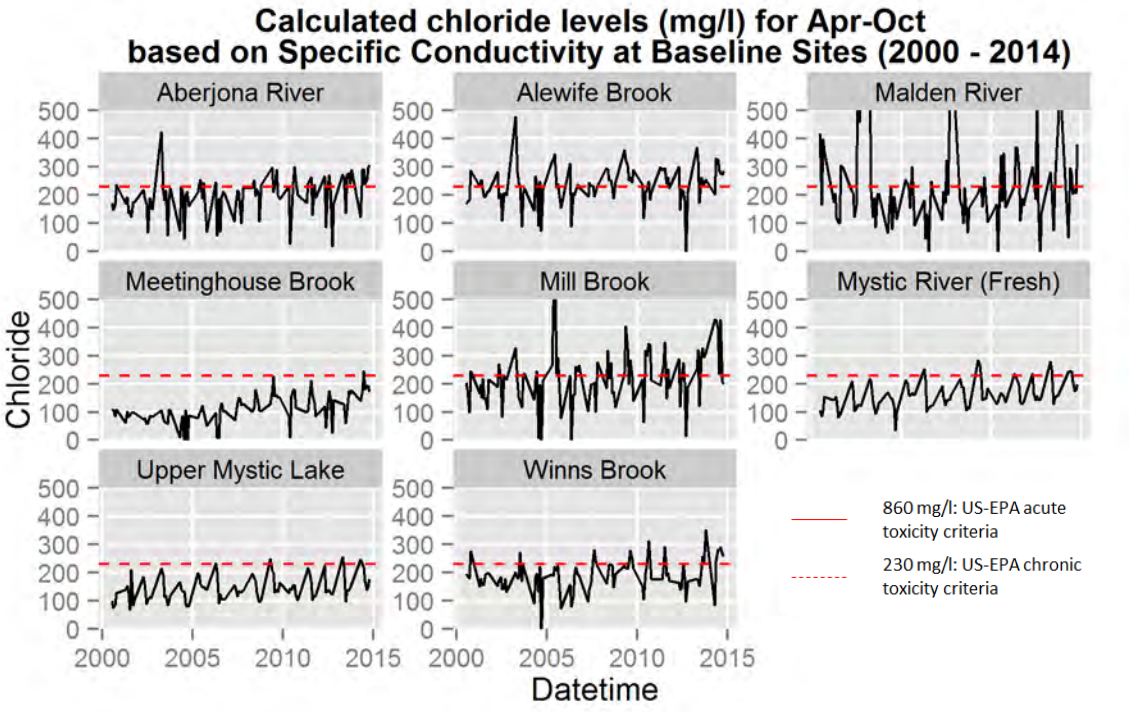

Figure 2: Calculated Chloride levels (mg/l) for April-October based on Specific Conductivity at MyRWA baseline sites (2000 - 2014)

2. *Analysis of data from MWRA sites*

Figures 3 and 4 below display chloride levels calculated for MWRA sites. As with MyRWA's baseline sites, results here also are shown both for complete years (Figure 3) and for the April-through-October period (Figure 4).

MWRA sites are located along the Mystic and Malden rivers and Alewife Brook. Their precise location is shown on the map at the end of this Appendix (Figure 8).

To avoid the possibility that a saltwater wedge from the Amelia Earhart Dam would affect the results, MyRWA analyzed only data collected from surface samples. Likewise, MWRA sites close to the dam have been excluded from the analysis, because they clearly had been influenced by saltwater.

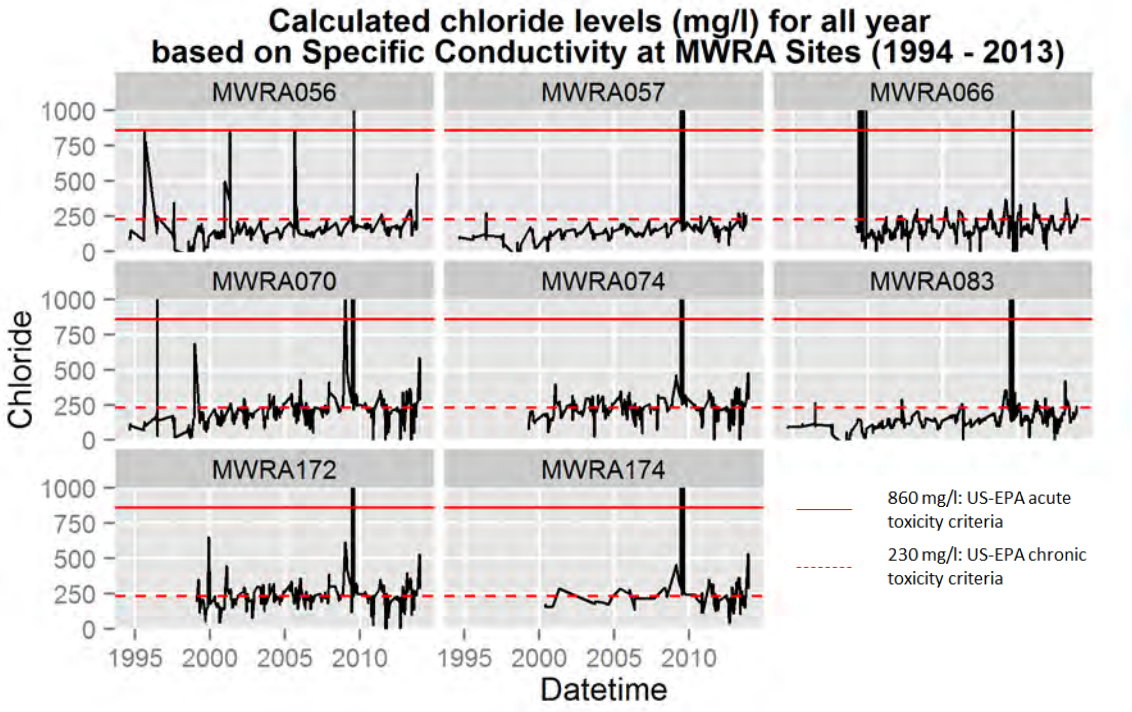

Figure 3: Calculated Chloride levels (mg/l) for complete years based on Specific Conductivity at MWRA sites (1994 - 2013)

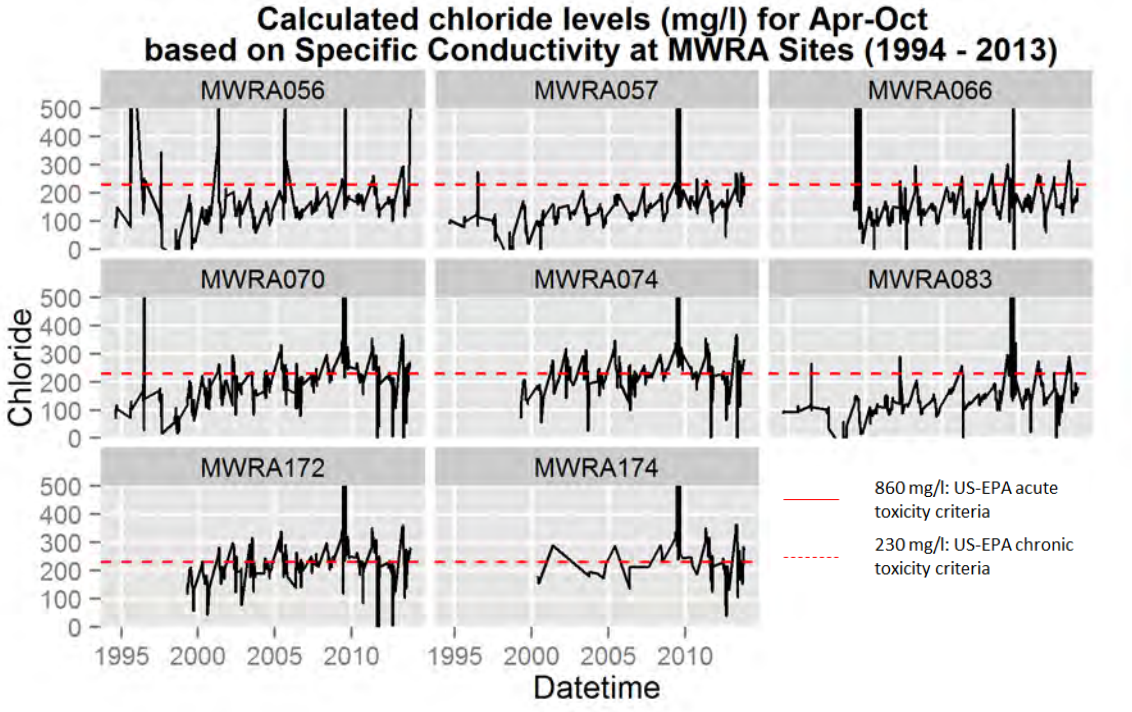

Figure 4: Calculated Chloride levels (mg/l) for April-October based on Specific Conductivity at MWRA sites (1994 - 2013)

The analysis of these chloride levels is also quite alarming, as it shows concentrations at numerous sites regularly reaching EPA's chronic toxicity criteria of 230 mg Cl/l, as well as numerous exceedances of EPA's acute toxicity criteria of 860 mg Cl/l. Data from MWRA's sites is more heterogeneous and thus trends are more difficult to establish than for the baseline sites, but several sites show a steady increase in chloride levels over the years, especially sites MWRA 057 (Mystic River at Alewife Brook) and MWRA083 (Mystic River upstream of Alewife Brook).

It is the combination of these two observed trends that is particularly worrying: (i) chloride levels are increasing at several sampling sites, and (ii) concentrations regularly reach and even exceed chronic toxicity criteria.

3. November 2014 and February 2015 chloride survey and calculation

At the end of 2014, MyRWA collected data on chloride and conductivity in Alewife Brook, slightly downstream of MyRWA station ALB006 (see Figure 8 below). A YSI-EXO sonde was deployed for 10 days and continuously monitored specific conductivity. In addition, 5 surface grab samples were collected and analyzed for chloride and specific conductivity on each of the first 5 days. In February 2015, 8 surface grab samples were collected throughout the watershed and also analyzed for chloride and specific conductivity . These results allowed us to establish a relationship between chloride and specific conductivity (Figure 5):

*Chloride (mg/l) = 0.311 * Specific Conductivity (uS/cm) – 65.279*

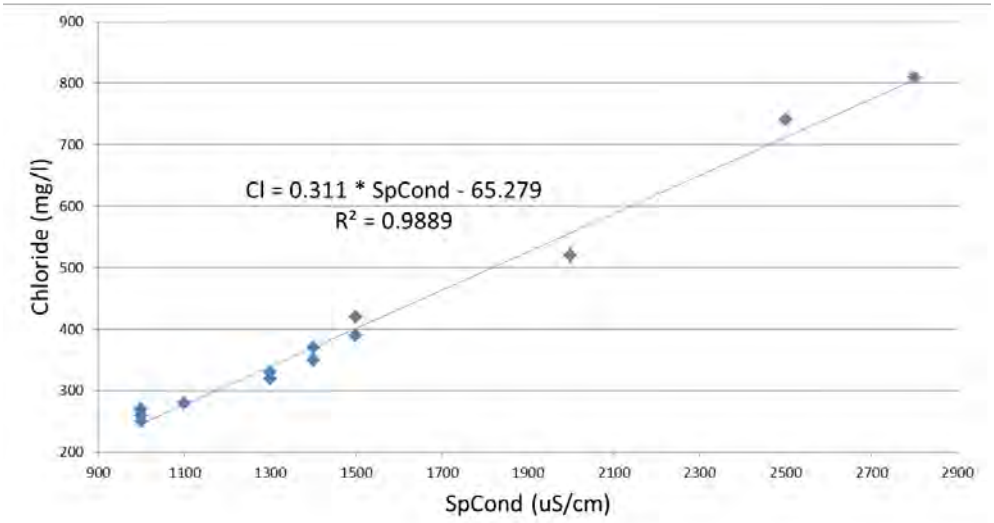

Figure 5: Proposed Chloride / Specific Conductivity relationship based on MyRWA samples (Nov 2014 and Feb 2015)

This relationship was then used to calculate estimated levels of chloride from specific conductivity data from the YSI-EXO sonde, as shown in Figure 6 below. The results clearly show chloride concentrations well above the EPA's chronic toxicity criteria of 230 mg Cl/l for a period of more than four days in November 2014.

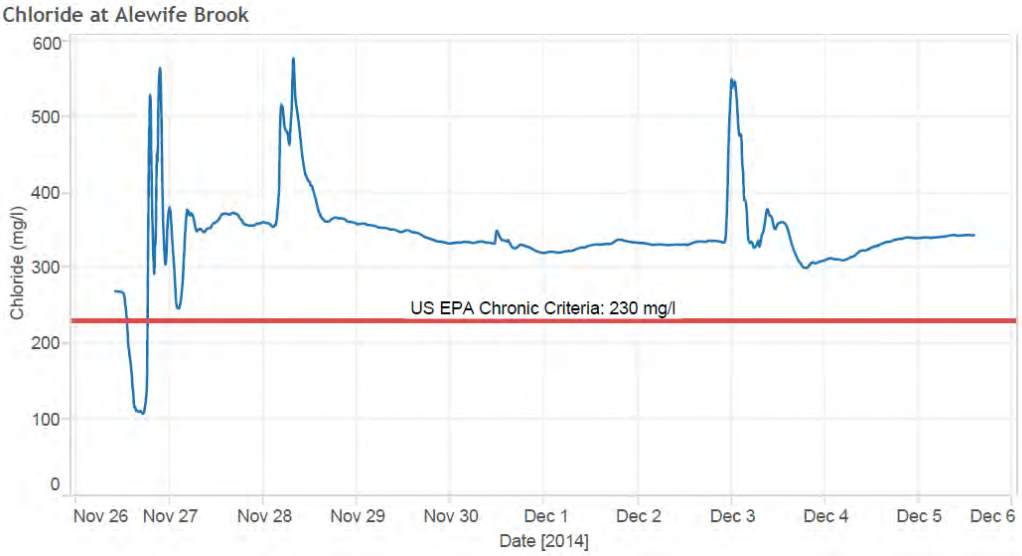

Figure 6: Calculated levels of Chloride (mg/l) in the Alewife Brook - Nov, 26 through Dec, 5 2014

Finally, specific conductivity data converted to chloride levels from the YSI-EXO sonde recorded at Alewife Brook (same station as in November 2014, presented previously) in June 2014, as shown in Figure 7. The result also clearly shows that the US-EPA chronic toxicity criteria is largely exceeded for several days, even when no road salt was applied since March 2014.

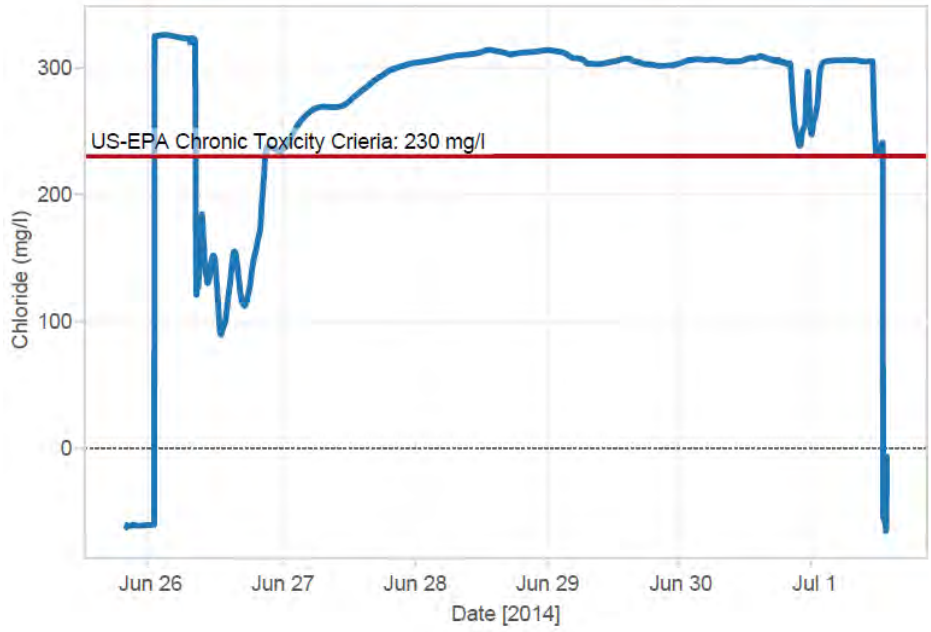

Figure 7: Calculated levels of Chloride (mg/l) in the Alewife Brook - Jun, 25 through Jul,1 2014

MyRWA plans to repeat these studies or conduct similar ones. Recording continuous specific conductivity data over several days will enhance our understanding of the level of chloride contamination throughout the watershed. Additional surface grab samples analyzed for specific conductivity and chloride will help improve the reliability of these two parameters, and the relationship between then, which was described above.

Re: Comments on 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

The National Association of Clean Water Agencies (NACWA) appreciates the opportunity to comment on the U.S. Environmental Protection Agency's (EPA) Draft 2014 Massachusetts General MS4 Permit (permit). NACWA represents the interests of nearly 300 publicly owned wastewater and stormwater utilities nationwide, including eight public agency members in Massachusetts.

NACWA supports the comments on the permit submitted by the Central Massachusetts Regional Stormwater Coalition (CMRSWC). CMRSWC's concerns are representative of those communities that will be most affected by the permit, should it be finalized, and thus should be seriously considered. NACWA especially agrees with CMRSWC's comments regarding the following three issues in the permit:

- **Affordability**: When complying with increased regulatory requirements as outlined in the draft permit, updated affordability guidelines are necessary to help regulated communities achieve compliance without experiencing economic hardship. NACWA has long advocated for changes to EPA's 1997 affordability guidance, and CMRSWC's comments on this point are particularly relevant from a municipal stormwater perspective.

- **Administrative Burden**: The permit, as drafted, would create a significant administrative burden for municipalities that often are unable to access funding for more personnel and technical expertise to implement sophisticated monitoring and reporting requirements. CMRSWC's comments about the need to reduce requirements for "written"

documentation in recognition of the transition many municipalities are making to electronic documentation is especially relevant. Overly burdensome administrative requirements detract from the ability of municipal stormwater agencies to implement the core functions of their programs which protect water quality.

- **Maximum Extent Practicable (MEP) Standard and Water Quality Based Effluent Limitations**: MEP is the statutory standard that governs the level to which municipalities are responsible for limiting and reducing pollution in stormwater. It is a unique standard designed specifically for municipal stormwater discharges and includes consideration of the limits of technology and cost/benefit analyses. Courts have routinely held that it does not include strict compliance with water quality standards. Any attempt in a federal permit to supersede MEP in favor of water quality based effluent limitations is both illegal and contrary to congressional intent, and would set a troubling precedent if included in the general permit. NACWA fully supports CMRSWC's comments on this issue.

NACWA believes that elements of the draft permit, including the issues specifically identified above, have the potential to set precedent for stormwater permits around the country. Accordingly, NACWA strongly encourages EPA to address the concerns raised by the regulated community over these issues in the final permit.

Again, NACWA appreciates the opportunity to provide input on the draft permit. Please contact me at bmannion@nacwa.org or 202/533-1839 if you have any questions.

Sincerely,

Brenna Mannion
Director, Regulatory Affairs and Outreach

I. INTRODUCTION

Pursuant to 40 C.F.R. § 124.19(e), The Leading Builders Of America, NAIOP-The Commercial Real Estate Development Association, The National Association Of Home Builders, The National Multifamily Housing Council, and The Real Estate Roundtable[2] (*Amici*) file this amicus brief in support of Petitioner, the U.S. Department of the Army, Joint Base Lewis McChord (JBLM).

The JBLM petitioned this Environmental Appeals Board (the "Board" or EAB) for review of a National Pollution Discharge Elimination Permit (NPDES) permit (Permit No. WAS-026638) (the Permit) for the JBLM Municipal Separate Storm Sewer System (MS4). Petitioner argues that the Environmental Protection Agency (EPA) lacks authority to include certain prescriptive stormwater management requirements in the Permit, including those relating to post-construction stormwater discharge limitations and EPA's attempt to regulate stormwater flow into the MS4, not the discharge of pollutants from the MS4.

Amici agree with Petitioners arguments and further suggest that the EPA exceeded its authority for several reasons. First, the Clean Water Act (CWA) limits EPA's NPDES authority to regulating the discharge of pollutants from point sources to waters of the United States. Second, EPA cannot regulate post-construction stormwater discharges because it does not have authority under the CWA to regulate "flow" in lieu of pollutants or impervious surfaces in lieu of point source discharges. Furthermore, EPA's authority over discharges of pollutants does not allow it to control land use decisions or to control the facility itself. Finally, EPA did not follow

[2] The *Amici* listed above filed a motion today to request that the EAB approve the following additional associations' participation as amicus curiae in this filing: Associated Builders and Contractors, Associated General Contractors of America, Building Owners and Managers Association, International Council of Shopping Centers, and The National Association of Realtors.

the necessary administrative rulemaking procedures for regulating post-construction stormwater discharges into the JBLM MS4.

II. INTERESTS OF AMICI

Amici and their many members across the country have a long-standing interest in the Clean Water Act's and EPA's NPDES stormwater permitting program. Their interests here include developing, constructing, managing, owning, purchasing and selling newly and redeveloped properties that are located within and discharge stormwater into MS4s, including at military bases such as JBLM.

Since 2009, EPA engaged *Amici* or their members to inform its national strategy for controlling discharges from newly or redeveloped sites. Specifically, EPA has: (1) required many members of the Amici to respond to Information Collection Requests (*see* http://cfpub.epa.gov/npdes/stormwater/rulemaking/icr.cfm); (2) enrolled Amici and/or members to participate as small entity representatives in EPA's Small Business Enforcement Fairness Act review of future regulatory options (*see* EPA Docket No. EPA-HQ-OW-2009-0817 *and* http://cfpub.epa.gov/npdes/stormwater/rulemaking.cfm); and (3) invited Amici and their members to engage in public outreach sessions. But now, in permits such as the JBLM permit before the EAB, EPA is attempting to carry out the objectives of its national rulemaking effort through individual permits, forcing *Amici* to engage in a permit-by-permit review.

Amici and their members would be adversely affected by potentially precedent-setting mandates found in the JBLM NPDES permit. *Amici* have successfully intervened in similar litigation elsewhere to challenge comparable mandates to those raised in this case as contrary to EPA's Clean Water Act and NPDES permitting authority (*see e.g., Va. Dep't of Transp. v. U.S. EPA*, 2013 WL 53741)

Amici support the issues raised in Petitioner's permit challenge, but their interests are not entirely consistent with nor fully represented by Petitioners. If EPA's permit is allowed to stand, MS4 operators (such as Petitioners) must regulate new or redevelopment within the MS4 with direct and significant impacts on *Amici* and their members. Further, the new MS4 mandates in the JBLM Permit would apply to newly or redeveloped properties *ad infinitum* (unaffected by or impacted by the termination of an NPDES construction stormwater permit).

III. STANDARD OF REVIEW

Pursuant to 40 C.F.R. § 124.19(a)(4)(i), Petitioner must demonstrate that the permit decision either is based on a clearly erroneous finding of fact or conclusion of law, or involves a matter of policy or exercise of discretion that warrants review. *In re Guam Waterworks Auth.*, NPDES Appeal Nos. 09-15 & 09-16, slip op. at 9 & n.7 (EAB Nov. 16, 2011).

IV. ARGUMENT

A. EPA'S AUTHORITY OVER JBLM IS LIMITED TO THE DISCHARGE OF POLLUTANTS ONLY.

Congress enacted the Clean Water Act "to restore and maintain the chemical, physical, and biological integrity of the Nation's waters." 33 U.S.C. §1251(a). CWA § 301(a) prohibits "the discharge of any pollutant" by any person, except as authorized by the Act. 33 U.S.C. § 1311(a). To regulate these discharges, CWA Sections 301 and 304 authorize EPA to establish "effluent limitations," defined as restrictions placed upon pollutants that "are discharged from *point sources* into navigable waters." *Id.* §§ 1311, 1314(b), 1362(11) (emphasis added); *see also id.* § 1342(a)(1).

Under CWA § 301, EPA must develop effluent limitations for "pollutants." 33 U.S.C. § 1311. "'[P]ollutant' means dredged spoil, solid waste,… chemical wastes, biological materials,… heat,… rock, sand, cellar dirt and industrial… waste discharged into water." 33 U.S.C. § 1362(6).

The Supreme Court has held that the term "means" in a definition is restrictive; it excludes anything unstated. *Colautti v. Franklin*, 439 U.S. 379, 393 n.10 (1978); *National Wildlife Federation v. Gorsuch*, 693 F.2d 156, 172 (D.C. Cir. 1982). Therefore, EPA cannot add to the list.

CWA Section 402 provides an exception to CWA Section 301's prohibition by allowing pollutant discharges to be authorized by a National Pollutant Discharge Elimination System (NPDES) permit. 33 U.S.C. § 1342(a). Thus, the Clean Water Act, through the NPDES permit program, limits the discharge of pollutants into waters of the United States based upon the capabilities of the practices or technologies available to control such discharges. 33 U.S.C. §§ 1311(b)(2), 1314(b), 1316(b)(1)(B).

The Clean Water Act and related Supreme Court decisions make clear that the permitting authority granted to EPA under Section 402 is limited solely to the discharge of pollutants. As explained below, several permit conditions imposed by EPA Region 10 through the JBLM MS4 permit at issue exceed the Agency's Clean Water Act authority because they are not directly related to the "discharge of pollutants from an MS4" but rather focus on other unregulated characteristics of stormwater – such as its quantity, flow, or velocity – or on the amount of impervious surface area for new or redeveloped properties that may drain into the MS4.

1. The Clean Water Act Clearly Limits EPA's Authority to the Discharge of Pollutants.

EPA's NPDES permitting authority over MS4s is limited to controlling the *discharge of pollutants from* the MS4 system to the maximum extent practicable (MEP). The limits of this authority does not stretch to encompass any agency role to independently regulate stormwater flow or volume absent pollutants, or to mandate that the MS4 establish new laws to achieve an end that EPA itself cannot independently achieve.

EPA properly identifies the statutory limitation on its powers:

> CWA Section 402(p)(3)(B), 33 U.S.C. § 1342(p)(3)(B)(iii), *requires* the Region to issue permits for stormwater discharges from regulated MS4s that contain controls designed to "reduce the discharge of pollutants to the maximum extent practicable, including management practices, control techniques and system, design and engineering methods, *and* such other provisions that [the permitting authority] determines appropriate for *the control of such pollutants.*" 33 U.S.C. § 1342(p)(3)(B)(iii). (Response Brief at 11) (emphasis supplied).

However, EPA then attempts to expand its authority beyond the discharge of pollutants from a point source by maintaining that Congress also provided authority for the agency to "control and regulate stormwater itself." In attempt to support its reasoning, EPA (gratuitously) asserts "that all stormwater contains pollutants." *Id*. This assertion is irrelevant. Even if all stormwater contains pollutants, Congress did not give EPA authority to regulate rainfall before it picks up pollutants, is channelized into a point source, and is discharged to a water of the U.S. Congress specifically limited EPA's MS4 permitting powers to "reduce the discharge of pollutants from the MS4" to the MEP. As the CWA further states, Congress reiterated that all such methods of MEP must be to "control of such pollutants." 33 U.S.C. § 1342(p)(3)(B)(iii).

Congress' mandate to EPA to focus on the discharge of pollutants is not unique to the MS4 program, but is inherent in the overarching NPDES permit program within which the MS4 provisions fit. CWA § 402(a) authorizes the "issu[ance of] permit[s] for the discharge of any pollutant, or combination of pollutants." 33. U.S.C. § 1342(a). Section 402(p)(3)(B) then sets forth specific conditions applicable to discharges from MS4s. 33 U.S.C. § 1342(p)(3). The language Congress used in CWA § 402(p)(3)(B) is important because it only prohibits "non-stormwater" discharges *into* storm sewers while then directing EPA to develop "controls to reduce the discharge of pollutants" *from* MS4s "to the maximum extent practicable." *Id.*

In addition, Congress did not require MS4 discharges to comply strictly with state water quality standards (33 U.S.C. § 1311(b)(1)(C). In *Defenders of Wildlife v. Browner,* 191 F.3d

1159, 1165 (9th Cir. 1999), the Ninth Circuit Court of Appeals found that Congress did not mandate strict compliance with state water quality standards, but that Congress provided EPA with limited discretionary authority contained in 33 U.S.C. § 1342(p)(3)(B)(iii), to require such other provisions that the Administrator determines are appropriate "for the control of such pollutants." *Id.* at 1166 (emphasis added). Hence, Congress delegated to EPA the authority to regulate pollutant discharges from MS4s through a combination of the MEP technology standard and limited discretionary authority to impose additional limitations on pollutants being discharged from the MS4.

Congress did not provide EPA with unbridled authority. Rather, the CWA "authorizes the EPA to regulate, through the NPDES permitting system, *only* the discharge of pollutants." *Waterkeeper Alliance, Inc. v. EPA*, 399 F.3d 486, 504 (2d Cir. 2005) (emphasis added)." As the D.C. Circuit has explained, "[t]he statute is clear" and contains no language that "undercuts the plain meaning of the statutory text;" EPA may not "meddl[e] inside a facility" because it only has authority over the discharge of pollutants from a point source, and "Congress clearly intended to allow the permittee to choose its own control strategy." *American Iron and Steel Institute v. EPA*., 115 F.3d 979, 996 (D.C. Cir. 1997).

In short, EPA "is powerless to impose conditions unrelated to the discharge itself." *N.R.D.C. v. EPA.,* 859 F.2d 156, 170 (D.C. Cir. 1988) (EPA cannot regulate point sources themselves, only the discharge of pollutants); *Service Oil, Inc. v. EPA*, 590 F.3d 545, 551 (8th Cir 2009) ("the Clean Water Act gives EPA jurisdiction to regulate… only *actual* discharges—not potential discharges, and certainly not point sources themselves.")(emphasis in original).

2. The Clean Water Act's Definition of Pollution and Pollutant Demonstrate the Limits of EPA's Authority Over Discharges of Pollutants.

The definition of "*pollution*" underscores that Congress only provided EPA with authority over the discharge of pollutants. Congress defined "pollution" as "the man-made or man-induced alteration of the chemical physical, biological and radiological integrity of water." 33 U.S.C. § 1362(19). The Supreme Court of Washington, in a case affirmed by the U.S. Supreme Court, succinctly provided that under CWA § 1362(19) "man-induced alteration of streamflow level is 'pollution.'" *State of Washington, Dept. of Ecology v. PUD No. 1 of Jefferson County*, 121 Wash.2d 179, 187 (1993), *aff'd* 511 U.S. 700 (1994); *see also United States v. Tennessee Water Quality Control Board*, 717 F.2d 992, 998-99 (6th Cir. 1983) ("Although alterations in the properties of the water are 'pollution'… all alterations do not fit the narrower definition of 'pollutants'… ."). Hence, EPA's efforts to restrict volume and flow from the JBLM MS4 to protect against down-stream erosion and "pollution" are go beyond the Agency's authority to control the discharge of pollutants through the NPDES permit program.

The Supreme Court has affirmed the importance of the distinction between "pollutants" added to a waterbody versus "pollution" already contained therein. In *Los Angeles County Flood Control District v. Natural Resources Defense Council, Inc.,* the Supreme Court described the difference between the discharge (addition) of pollutants to a water body and the movement of pollutants within a waterbody. 568 U.S. ___ (2013)(Slip Opinion at 3)(further explaining the Court's decision in *South Florida Water Management Dist. v. Miccosukee Tribe* 541 U.S. 95, 109-112 (2004)). Quoting the Second Circuit, the Court explained that "[i]f one takes a ladle of

soup from a pot, lifts it above the pot, and pours it back into the pot, one has not 'added' soup or anything else to the pot*." Id.* (internal quotations omitted).[3]

Thus, when substances redistribute within a waterbody, that substance is not being "added" to the waterbody under the CWA. In light of the Court's holding that the movement of pollutants within a waterbody does not constitute an "addition" or discharge, the EPA cannot now credibly take the position that it can regulate flow to prevent streambank erosion down-stream or the impacts of sediment already contained in the streambanks.

3. Flow is Not a Pollutant.

Petitioners properly reference (Petition at 35) *Virginia Department of Transportation v. U.S. Environmental Protection Agency*, 2013 U.S. Dist. LEXIS 981 (E.D.Va. Jan. 3, 2013) (hereafter referred to as "*Accotink,*" the name of the creek at issue in that case). In that case, the federal district court held that the Clean Water Act did not confer authority to regulate stormwater flow because stormwater is not a "pollutant," under that term's statutory definition. *Id.* at 5. The court rejected EPA's argument that stormwater flow could be regulated as "proxy" or "surrogate" to effect levels of pollutants already present within a waterbody, while acknowledging that it may be appropriate, in different circumstances, to impose stormwater flow restrictions as a means to regulate *specific pollutant levels demonstrated to be discharged into a waterway within the stormwater flow*. *Id.* at 5-6.

In its Response Brief (at 10), EPA improperly attempts to limit the applicability of *Accotink* to the development of Total Maximum Daily Loads (TMDLs) under CWA §303(d), but this argument is unavailing. The *Accotink* court's logic – based upon the Act's explicit focus on

[3] *See also National Wildlife Federation v. Gorsuch*, 693 F.2d 156, 174-75 (D.C. Cir. 1982) (upholding EPA's interpretation of "addition" that required pollutants be introduced "from the outside world."); *but see AES Sparrows Point LNG v. Wilson*, 589 F.3d 721, 731-32 (4th Cir. 2009) (explaining that under CWA section 401(a)(1), the word "discharge" does encompass water flowing into areas where dredging was to occur.)

controlling pollutant discharges into waters of the U.S. – applies with equal force in the context of the NPDES permitting program, because both the NPDES permit program and TMDLs that are incorporated into NPDES permits are expressly limited to the authority conferred by the CWA to regulate the "discharge of pollutants." After citing a line of cases – all of which focus on the "discharge of pollutants" (*see* Response Brief at 12) – EPA attempts to confuse that central issue by concluding that the mere fact that *Accotink* was framed as a TMDL controversy somehow eliminates its applicability to NPDES permitting cases even though the limitation on statutory authority at issue in *Accotink* over the discharge of pollutants is equally and directly applicable to NPDES permitting as it is to setting TMDLs that must be implemented through effluent limitations in those permits. 33 U.S.C. §§ 1311(a), 1313(d), 1314, 1342(a).

After failing to distinguish *Accotink's* applicability to the discharge of pollutants in NPDES permits, EPA's Response Brief proceeds to discuss performance standards relating to post-construction without relating those standards to the actual discharge of pollutants. *See* Response Brief Section IV.B. The word "pollutant" appears to vanish from EPA's effort to regulate stormwater flow, other than a passing and unsupported gratuitous statement that preventing stormwater flows will avoid the discharge of pollutants. Response Brief at 14. Nowhere does EPA explain its legal authority for preventing stormwater discharges from occurring or the specific relationship between the discharges it would allow and any need to control any specific pollutants contained therein. CWA §402(p)(3)(B)(iii) does not authorize EPA to eliminate or control stormwater flow or mandate the prevention of stormwater discharges, but rather requires the pollutants in the discharge to be reduced to the MEP standard.

Further, EPA freely admits that the entire purpose of the post-construction-related flow restrictions is not to limit pollutant discharges, but to "regulate the rate at which stormwater flows off the site to prevent large scale impairment of water quality and aquatic habitat through streambank erosion." *Id.* at 15. That requirement does not relate to the discharge of pollutants and raises again the central issue in *Accotink* – the limits of EPA's Clean Water Act authority.

While EPA may argue that limiting stormwater flows helps it to achieve the goals of the Clean Water Act, it is still bound by the specific limitations in the Act that require it to focus on the discharge of pollutants from point sources to waters of the U.S. Executive agencies may not sidestep specific legislative requirements in their zeal to achieve a statute's overall objective. *See Rodriguez v. United States*, 480 U.S. 522, 525-26 (1987)("No legislation pursues its purposes at all costs. Deciding what competing values will or will not be sacrificed to the achievement of a particular objective is the very essence of legislative choice – and it frustrates rather than effectuates legislative intent simplistically to assume that whatever furthers the statute's primary objective must be the law."); *Nat'l. Mining Assoc. v. U.S. Army Corps of Engineers,* 145 F.3d 1399 (D.C. Cir. 1998)("In a press release accompanying the adoption of the Tulloch Rule, the White House announced: "Congress should amend the Clean Water Act to make it consistent with the agencies' rulemaking." White House Office on Environmental Policy, Protecting America's Wetlands: A Fair, Flexible, and Effective Approach (Aug. 24, 1993). While remarkable in its candor, the announcement contained a kernel of truth. If the agencies and NWF believe that the Clean Water Act inadequately protects wetlands and other natural resources by insisting upon the presence of an "addition" to trigger permit requirements, the appropriate body to turn to is Congress. Without such an amendment, the Act simply will not accommodate the Tulloch Rule.").

B. EPA'S CLEAN WATER ACT AUTHORITY OVER DISCHARGES OF POLLUTANTS APPLIES TO POINT SOURCES ONLY.

Under the Clean Water Act, the term "discharge of a pollutant" means "the addition of any pollutant to navigable waters from any *point source*." 33 U.S.C. § 1362(12) (emphasis added). In the JBLM MS4 permit, EPA has attempted to regulate everything from the discharges of pollutants from point sources over which it has authority, to specific land use decisions (*e.g.,* requiring cluster development) over which the Clean Water Act grants no authority. EPA's authority to control pollutant discharges does not encompass the ability to mandate land use decision-making. This is not to say that JBLM could not develop a standard or regulation to, for instance, limit impervious surfaces or other stormwater flows into the MS4. But EPA is limited to regulating the discharge of pollutants from the MS4 and cannot force JBLM to do what EPA is not otherwise authorized to do, including imposing restrictions on local land use decisions.

1. EPA Has No Authority To Regulate The "Facility."

The Petitioner has challenged certain provisions of the permit as exceeding EPA's authority. (Petitioner's Brief at 5). One provision provides that the Permittee must "manage stormwater from developed areas in a manner that preserves and restores the area's predevelopment hydrology," and another "requires site design that minimizes the project's roadway surfaces and parking areas, incorporates cluster development, and ensures that vegetated areas are designed to receive stormwater dispersion from all developed project areas." (Petitioner's Brief at 5-6).

In this matter, the "facility" is the Joint Base. However, EPA's authority is necessarily limited to the discharges from the base's storm sewer system (the point source) into navigable waters. The permit provisions above fail to recognize this limitation; they meddle inside the facility itself. Managing stormwater to restore the area to its predevelopment hydrology exceeds

EPA's Clean Water Act authority because it goes beyond the regulation of a point source to regulate activities on the land and "flow." Moreover, EPA has failed to show any relationship between pre- or post-development stormwater flows or the relationship of those flows to any actual pollutant discharges. Similarly, regulating "site design," and requiring "cluster development" well exceeds EPA's jurisdiction over the point source "discharge itself." *N.R.D.C.,* 859 at 170.

2. EPA Has No Authority To Make Local Land Use Decisions.

The Supreme Court has repeatedly rejected assertions of federal authority under the CWA that usurp the "quintessential state and local power" found in the "[r]egulation of land use." *Rapanos v. U.S.*, 547 U.S. 715, 738 (2006) (Scalia, J. plurality) (citations omitted). *See also Solid Waste Agency* v. *U.S. Army Corps of Eng'rs,* 531 U.S. 159, 174 (2001) (rejecting expansive reading of CWA jurisdiction because of "significant constitutional questions raised" by "impingement of the States' traditional and primary power over land and water use"). These cases turned on the interpretation of the jurisdictional phrases "the waters of the United States" and "navigable waters," and held that even by using those terms to broadly define the proper subject matter of federal jurisdiction under the CWA, Congress did not authorize federal regulators to supplant local land use decision-making. *Rapanos*, 547 U.S. at 738-39 ("We ordinarily expect a 'clear and manifest' statement from Congress to authorize an unprecedented intrusion into traditional state authority. The phrase 'the waters of the United States' hardly qualifies." (citation omitted)); *Solid Waste Agency*, 531 U.S. at 174 ("We thus read the statute as written to avoid the significant constitutional and federalism questions raised by respondents' interpretation.").

The JBLM Permit goes even further than the "*de facto*" federal regulation of land use prohibited under Supreme Court precedent. *Rapanos*, 547 U.S. at 738 ("The extensive federal jurisdiction urged by the Government would authorize the Corps to function as a *de facto* regulator of immense stretches of intrastate land—an authority the agency has shown its willingness to exercise with the scope of discretion that would befit a local zoning board.") By compelling the permittees to make specific choices with regard to post-construction performance standards, EPA is exercising federal land use mandates on a local basis. The Permit is issued under the auspices of the NPDES permitting program that relates to the "discharge of pollutants," a term that is statutorily defined as the "addition of any pollutant to navigable waters." 33. U.S.C. § 1362(12). Thus, the NPDES permitting program is – as it must be – directly limited in its reach by the jurisdictional limits applicable to the CWA as a whole, which bar the federal regulation of local land use.

3. EPA Has No Authority To Regulate Impervious Surfaces.

In the JBLM permit (at pages 16-20), EPA is attempting to regulate impervious surfaces even though such surfaces are not "point sources" under the NPDES permit program. CWA Section 301 prohibits unauthorized point source discharges, but Congress left the "regulation of nonpoint source pollution to the states." *Cordiano v. Metacon Gun Club, Inc*. 575 F.3d 199, 219 (2d Cir. 2009); *Defenders of Wildlife v. U.S. Envtl. Prot. Agency*, 415 F.3d 1121, 1124 (10th Cir. 2005) (explaining that the CWA deals with nonpoint source pollution merely by "requir[ing] states to develop water quality standards for intrastate waters."); *U.S. v. Plaza Health Labs, Inc*. 3 F.3d 643, 647 (2d Cir. 1993) (providing that the "control of pollutants from runoff is applied pursuant to section 209 and the authority resides in the State or other local agency.") (quoting S. Rep. No. 92-414, 972 U.S.C.C.A.N. 3668, 3744). The CWA focuses on point sources rather than

nonpoint sources because "differences in climate and geography make nationwide uniformity in controlling non-point source pollution virtually impossible. Also, the control of non-point source pollution often depends on land use controls, which are traditionally state or local in nature." *Oregon Natural Desert Assoc. v. United States Forest Service*, 550 F.3d 778, 785 (9th Cir. 2008) (quoting Poirier, *Non-point Source Pollution*, § 18.13); *see also Rapanos v. United States*, 547 U.S. 715, 738 (2006) (recognizing that the "[r]egulation of land use . . . is a quintessential state and local power.").

The CWA defines "point source" as "any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel, conduit, well, discrete fissure, container, rolling stock, concentrated animal feeding operation, or vessel or other floating craft, from which pollutants are or may be discharged." 33 U.S.C. § 1362(14). Impervious surfaces such as roofs, parking lots, and roads are not point sources. Impervious surfaces do not channelize water. Instead, sheet flow that travels across impervious surfaces is considered non-point runoff, which is not regulated under the stormwater permitting program.

If EPA now interprets "point source" to include impervious surfaces, it renders that term meaningless and clearly contradicts congressional intent to define the term and differentiate "point sources" from "non-point sources." As noted by the Second Circuit Court of Appeals, "the phrase 'discernible, confined, and discrete conveyance' cannot be interpreted so broadly as to read the point source requirement out of the statute." *Cordiano v. Metacon Gun Club, Inc.,* 575 F.3d 199, 219 (2d Cir. 2009). Such a broad interpretation would be contrary to the text and structure of the CWA. The Act defines the term "point source," and leaves all other flows of water to be considered "nonpoint sources," the regulation of which is left to the states. *Id*. at 219-220. EPA's NPDES regulations define the extent to which surface runoff can in certain circumstances

constitute point source pollution. The definition of "[d]ischarge of a pollutant" includes "additions of pollutants into waters of the United States from: surface runoff *which is collected or channeled by man.*" 40 CFR § 122.2 (emphasis added). By implication, surface water runoff which is neither collected nor channeled constitutes nonpoint source pollution and, consequentially, is not subject to the CWA permit requirement. *See Hardy v. N.Y. City Health & Hosps. Corp.,* 164 F.3d 789, 794 (2d Cir. 1999) (relying on "the familiar principle of *expressio unius est exclusio alterius,* the mention of one thing implies the exclusion of the other").

C. EPA HAS FAILED TO FOLLOW THE NECESSARY PROCEDURES TO REGULATE POST-CONSTRUCTION STORMWATER AT JBLM.

EPA's attempt to regulate broadly through the JBLM Permit must fail because the Agency cannot point to any grant of authority for such actions. MS4s cannot be coerced to adopt EPA's six minimum control measures, which include the post-construction controls. EPA also cannot require new or redeveloped properties to meet stormwater discharge standards because EPA has not expanded its stormwater program to include such sites. Finally, EPA cannot manipulate the state certification process found in CWA Section 401 to transform a flexible stormwater guide into federally enforceable law. This manipulation has the added effect of violating both state and federal administrative law principles by using guidance that was never intended by its author to be imposed uniformly on all dischargers to circumvent the rulemaking process and the statutory limits on EPA's authority.

1. EPA Cannot Coerce MS4s into Implementing the Six Minimum Control Measures.

EPA's Phase II regulation established six minimum control measures that the Agency believed would provide a flexible, iterative mechanism for MS4s to meet the MEP standard.[4] 40 CFR § 122.34(b). The post-construction minimum control measure in particular contemplates that the MS4 operator will "use an ordinance or other regulatory mechanism to address post-construction runoff from new and redevelopment projects." 40 CFR § 122.34(b)(5). Even assuming EPA has the authority to mandate the passage of local ordinances (which would violate the 10th Amendment to the Constitution), it certainly does not follow from any such grant of authority from Congress in CWA § 402(p)(3)(B)(iii) that EPA can dictate the contents of that local ordinance to establish stormwater retention, flow and velocity mandates that it does not otherwise have authority to develop on its own. [5]

The six minimum control measures faced legal challenges from regulated MS4s in *Environmental Defense Center, Inc. v. EPA,* 344 F.3d 832 (9th Cir. 2003)(*EDC*). In *EDC*, the municipal petitioners argued that the federal government could not force them to regulate third parties in furtherance of a federal program. *Id.* at 847. The Ninth Circuit Court of Appeals rejected the municipal petitioners' challenge by concluding that EPA was not coercing small MS4s into general permits with the six minimum control measures because such permittees could, instead, request an individual permit pursuant to 40 CFR § 122.26(d). *Id.* ("Therefore, by presenting the option of seeking a permit under § 122.26(d), the Phase II Rule avoids any

[4] The six minimum control measures are: (1) public education and outreach; (2) public participation/involvement; (3) illicit discharge detection and elimination; (4) construction site runoff control; (5) post-construction runoff control; and (6) pollution prevention/good housekeeping. *See* 40 CFR § 122.34(b)

[5] The Supreme Court has held that Congress may not "commandeer the legislative process of the States by directly compelling them to enact a federal regulatory program." *New York v. United States*, 505 U.S. 144, 161 (1992) (relating to solid waste disposal). *See also Printz v. United States*, 117 S. Ct. 2365, 2383 (1997) (the federal government may not compel the states to enact or administer a federal program, relating to regulation of guns).

unconstitutional coercion.") In fact, EPA had argued in that case that small MS4s could avoid constitutional issues by seeking such a permit to avoid the six minimum control measures. *Id.* at 849 (note 23).

In the current case, EPA has mandated compliance with the six minimum control measures as a condition in an individual permit issued pursuant to 40 CFR § 122.26(d). The Petitioner has not been provided with alternative permitting options to avoid the six minimum control measures. Thus, while the Ninth Circuit avoided having to further analyze constitutional issues raised by the six minimum control measures because the municipal petitioners were presented with the option of obtaining an individual permit, JBLM does not have that option because EPA has issued it an individual permit. Thus, the issue raised in EDC but dismissed as not ripe then is clearly ripe for MS4s similarly situated to JBLM in light EPA's strategy for using the adjudicatory process of permit issuance to pursue this strategy. *See* next section below.

2. EPA Should Await the Results of its National Post-Construction Stormwater Rulemaking.

Since at least 2009, EPA has believed that it must promulgate new rules and regulations to expand the existing stormwater program to establish its own post-construction stormwater performance standards. *See* 74 Fed. Reg. 68,617 (December 28, 2009); *see also* EPA's rulemaking webpage at http://cfpub.epa.gov/npdes/stormwater/rulemaking.cfm; *and* EPA Semiannual Regulatory Agenda – Fall 2013 (RIN 2040-AF13) (http://www.regulations.gov/#!documentDetail;D=EPA-HQ-OA-2013-0784-0001 at13). EPA still has not yet proposed any rulemaking, but is attempting through its individual permitting process to implement such a program absent the necessary rulemaking effort. 5 U.S.C. §§ 551 et seq. Despite EPA's stated intention that it must promulgate new regulations to expand the stormwater program to create post-construction discharge standards, EPA Region 10 states that a

rulemaking is not necessary and, instead, it can rely exclusively on the "adjudicatory process of permit issuance" to establish discharge limitations for developed sites. Response Brief at 25-26. That assertion should be rejected while EPA is actively pursuing a rulemaking to address post-construction discharges.

EPA has no authority to regulate developed sites that are otherwise exempt from permitting pursuant to CWA Section 402(p)(1). Section 402(p)(1) is a broad exemption from NPDES permitting for all stormwater discharges except those identified in Section 402(p)(2). Developed sites and impervious surfaces are not listed in Section 402(p)(2) or in EPA's Phase I or Phase II regulations implementing the stormwater permitting program. Active construction activities that disturb at least five acres of land have been subject to permitting under EPA's industrial stormwater permit program (40 CFR § 122.26(b)(14)(x)) since 1990 and those disturbing at least one acre of land pursuant to 40 CFR § 122.26(b)(15) since 1999. In each instance, the permittee may terminate permit coverage when the site is stabilized. *Id.* Currently, EPA does not have authority or regulations to control stormwater discharges from developed sites that are not "associated with industrial activity." 40 CFR § 122.26(b)(14).

The CWA sets forth specific processes that allow EPA to designate new sources or categories of sources for NPDES permitting. It may designate an individual site ("a discharge") that contributes to a violation of a water quality standard or is a significant pollutant discharger on a site-specific basis. Or, as it did for the Phase II expansion, EPA may designate classes or categories of pollutant discharges for permitting through a process Congress laid out in CWA § 402(p)(5)-(6) that requires studies, a report to Congress, and formal regulation.

EPA initiated a rulemaking in 2009 to expand the stormwater permit program to include new or redeveloped sites. That rulemaking is ongoing despite several delays, but EPA has not abandoned that rulemaking effort and it is directly applicable and relevant to EPA's actions in the challenged permit. EPA should be prohibited from using the "adjudicatory process of permit issuance" to attempt to implement a regulatory approach outside its current regulations. Congress clearly set forth the process for expanding the stormwater program through CWA Sections 402(p)(5)-(6). The Agency should not be allowed to short-circuit that process through a permit-by-permit approach.

3. EPA Misinterpreted Section 401 By Not Complying With All of the State's Conditions, Principally the Condition That EPA Provide Flexibility in Adherence to the Western Washington Stormwater Manual.

EPA argues that it was compelled to require JBLM to comply with the Stormwater Management Manual for Western Washington (SMMWW)(Wash. Dep't. Ecology, *Stormwater Management Manual for Western Washington* (2012)) because the State included its use as a condition of the State's section 401 certification. (EPA Response Brief 26-28). EPA's assertion is not entirely correct. Section 401(a) provides that an applicant for a federal license or permit must obtain a certification from the state that any discharge will comply with certain sections of the Act. 33 U.S.C. § 1341(a). Similarly, Section 401(d) allows a state to set "forth effluent limits and other limitations" to ensure that the federal permit will comply with water quality standards and "any other appropriate requirement of State law." 33 U.S.C. § 1341(d).

The case law is clear that a licensing or permitting agency (in this case EPA) does not have authority to reject the conditions that a state develops under Section 401.[6] *E.g. Snoqualmie Indian Tribe v. FERC*, 545 F.3d 1207, 1218 (9th Cir. 2008); *American Rivers, Inc. v. F.E.R.C.*, 129 F.3d 99, 107 (2nd Cir. 1997) (explaining that an agency does not have "authority to decide which conditions are within the confines of § 401(d) and which are not."). At the same time, however, EPA cannot issue a NPDES permit that contains requirements that exceed the Agency's Clean Water Act authority. Here, however, EPA attempts to manipulate the Section 401 conditions under the auspices of authority it does not possess.

In Ecology's January 2012 letter, it provides that the "permit must retain runoff controls… that are functionally equivalent to *2005 Stormwater Management Manual for Western Washington* requirements… .(emphasis added). Subsequently, in its final certification, Ecology required EPA to cite to the 2012 SMMWW. However, in the JBLM Permit, EPA has required compliance with the 2012 Manual, but left out the "functionally equivalent" language. For example, Part II.B.5(b) provides that "Stormwater Site Plans must be prepared consistent with Chapter 3, Volume 1…of the [SMMWW]… ." Similarly, Part II.B.5(c) explains that BMP's must be selected, designed and maintained in accordance with Volume IV…of the [SMMWW]" (JBLM Permit No. WAS-026638, 16-18). To the extent that EPA relies on Washington's Section 401 certification as a basis to require JBLM to comply with the SMMWW, it has violated CWA § 401(d) by rejecting the State's flexible condition to retain runoff controls that are "functionally equivalent" to its manual.

[6] This is not to say that section 401 allows an agency to include a state condition that exceeds the agency's statutory licensing or permitting authority. See *American Rivers, Inc. v. F.E.R.C.,* 129 F.3d 99, 110 (2nd Cir 1997) (explaining that if FERC would violate its authorizing statute by including a state's section 401 condition in a license, FERC had the authority to refuse to issue the license).

4. EPA Used Its Misinterpretation to Justify Its Transformation of State Guidance Into Federally Enforceable Law, Violating Federal and State Administrative Law Statutes.

It is a well-settled principle of law that an agency cannot use guidance documents to impose regulatory obligations. The federal Administrative Procedure Act (APA) requires agencies to undertake a specific process involving notice and public comment; opportunity for public hearing; and response to comments. 5 U.S.C. § 553. The APA broadly defines a rule as an "agency statement of general or particular applicability and future effect." 5 U.S.C. § 551(4). Nonetheless, agencies are frequently tempted to bypass these procedural safeguards for any number of reasons. As the D.C. Circuit observed:

> The phenomenon we see in this case is familiar. Congress passes a broadly worded statute. The agency follows with regulations containing broad language, open-ended phrases, ambiguous standards and the like. Then as years pass, the agency issues circulars or guidance or memoranda, explaining, interpreting, defining and often expanding the command in the regulations…An agency operating in this way gains a large advantage. "It can issue or amend its real rules, i.e., its interpretive rules and policy statements, quickly and inexpensively without following any statutorily prescribed procedures." …The agency may also think there is another advantage – immunizing its lawmaking from judicial review.

Appalachian Power Co. v. EPA, 208 F.3d 1015, 1020 (D.C. Cir. 2000) (citations omitted). This phenomenon now arises within the JBLM Permit. EPA has added unprecedented and unauthorized post-construction stormwater obligations to this permit by simply mandating JBLM's use of the SMMWW, a state guidance that declares on its face that it is non-regulatory in nature. *SMMWW* at 1-7.

The APA requires an agency to follow a prescribed set of procedures when it promulgates a rule. A "rule" is defined as "the whole or part of an agency statement of general or particular applicability and future effect designed to implement, interpret, or prescribe law or policy…." 5 USC § 551(4).

In *Appalachian Power*, EPA developed a "guidance document" to assist state air permitting officials with addressing "periodic monitoring" in the context of Title V permits. *Appalachian Power*, 208 F.3d at 1019. This guidance purported to interpret a previously issued regulation. In reality, however, EPA's guidance would have required states to "amend[] federal emission standards in individual permits, something not even EPA could do without conducting individual rulemakings to amend the regulations containing the federal standards." *Id.* at 1019.

Despite EPA's protestations that the guidance was not binding, the court nonetheless held that, because the guidance would, in pertinent part, "lead[] private parties or State permitting authorities to believe that [EPA] will declare permits invalid unless they comply with the terms of the document, then the agency's document is for all practical purposes 'binding.'" *Id.* at 1021.

Thus, EPA sought to impose new permitting requirements onto Clean Air Act Title V permit holders through the permit in a manner outside its statutory authority. EPA's illegal actions in *Appalachian Power* mimic its unlawful attempt to include in JBLM's Permit obligations it has no authority to require. However, instead of using a "ukase"-styled guidance document of its own creation, it unlawfully seeks to render the SMMWW (a state guidance document that the state clearly intends to be non-binding) into a federally enforceable directive.

Similarly, like the federal government, the state of Washington has its own Administrative Procedure Act (WAPA), which defines a rule as: "any agency order, directive, or regulation of general applicability (a) the violation of which subjects a person to a penalty or administrative sanction; (b) which establishes, alters, or revokes any procedure, practice, or requirement relating to agency hearings…" RCW 34.05.010(16). In *Washington Education Association v. Washington State Public Disclosure Commission*, 150 Wash.2d 612 (2003), the Washington Supreme Court recognized that in order to effectively promulgate a rule, an agency "must adhere to formal rule-

making procedures." *Id*. at 619. "Interpretive statements" or guidelines, on the other hand, are advisory only, and are "not governed by formal adoption procedures." *Id.* at 618-619. The Washington Supreme Court, in a 5-4 decision, ultimately held that the guidance at issue was properly characterized as such because the language used in the guidance was not framed in a compulsory manner and there was no evidence that the guidance was or would be enforced by the issuing agency. *Id.* at 622.

The SMMWW appears to be framed similarly to the guidance document described in *Washington Education Association.* The Washington Department of Ecology (Ecology) clearly states that "[t]he manual does not have any independent regulatory authority" and is "a guidance document which provides local governments, State and Federal agencies, developers and project proponents with ***a*** stormwater strategy to apply at the project level." *SMMWW* 1-7 (emphasis supplied). Ecology notes that: "[f]ollowing this Manual is not the only way to properly manage stormwater runoff." *Id.* The SMMWW then contains a detailed explanation that compliance with it creates a *presumption* of compliance. If a municipality determines that an alternative stormwater management method is more appropriate, it is free to employ that method; but it will need to demonstrate to the Ecology that this alternate method "will not adversely impact water quality." *SMMWW* 1-8 – 9.

EPA's inclusion of the SMMWW in the JBLM Permit impermissibly transforms it into enforceable law. *See, e.g., Texas Oil & Gas Ass'n v. EPA*, 161 F.3d 923, 928 (5th Cir. 1998)(describing how the "rubber hits the road" upon incorporation into a NPDES permit)(citations omitted). Here, EPA has taken a state document, intended solely as guidance and created without mandatory formal procedures, and turned it into a federally enforceable permitting obligation.

V. CONCLUSION

For the foregoing reasons, *Amici* respectfully request that the EAB remand the JBLM Permit.

Respectfully submitted,

Re: Comments Regarding the Environmental Protection Agency Region 1's Draft Small Municipal Separate Storm Sewer System NPDES General Permit in Massachusetts

Dear Mr. Tedder:

On behalf of the National Association of Home Builders (NAHB), I submit the following comments regarding the Environmental Protection Agency Region 1's Draft Small Municipal Separate Storm Sewer System NPDES General Permit for Massachusetts ("Draft MS4 Permit")(79 Fed. Reg. 58,775; September 30, 2014). NAHB has affiliate members in Massachusetts that discharge into affected MS4 systems potentially subject to the Draft MS4 Permit.

The Draft MS4 Permit impermissibly attempts to regulate stormwater flow, impervious cover and mandate on-site retention standards without appropriate Clean Water Act authority to regulate such flow as a surrogate for pollutants or to mandate on-site activities not directly related to the control of pollutant discharges to U.S. waters. *See e.g.* Section 2.3.6 and related Fact Sheet discussion at pp. 86 *et seq.*

In *Virginia Department of Transportation v. U.S. Environmental Protection Agency*, 2013 U.S. Dist. LEXIS 981 (E.D.Va. Jan. 3, 2013), the federal district court held that the CWA did not confer authority to regulate stormwater flow because stormwater is not a "pollutant," under that term's statutory definition. *Id.* at 5. The court rejected EPA's argument that stormwater flow could be regulated as "proxy" or "surrogate" to affect levels of pollutants already present within a waterbody, while acknowledging that it may be appropriate, in different circumstances, to impose stormwater flow restrictions as a means to regulate *specific pollutant levels demonstrated to be discharged into a waterway within the stormwater flow*. *Id.* at 5-6.

EPA's efforts to regulate purely on-site activities was the subject of NAHB's challenge to the Agency's Construction and Development Effluent Limitations Guidelines rulemaking. That case was settled and EPA agreed to modify best management practice mandates to ensure they related directly to the discharge of pollutants from point sources to waters of the U.S. *See* revised C&D ELG rulemaking *Federal Register* Notice at 79 Fed. Reg. 12.661 (March 6, 2014).

Representative legal arguments related to EPA's limited authority to regulate stormwater flows, impervious surfaces, or mandate retention standards are set forth in the attached *amicus* brief in which NAHB participated, filed before the EPA Environmental Appeals Board in *In re: Joint Base Lewis-McChord Municipal Separate Storm Sewer System* (NPDES Appeal No. 13-09; NPDES Permit No. WAS-026638). NAHB incorporates the attached brief in these comments.

I very much appreciate the opportunity to comment on behalf of NAHB on the Draft MS4 Permit. Please accept these comments as if filed timely. Less than 24 hours have passed since the deadline and, in conjunction with the holidays, we do not believe that EPA has suffered any burdens related to our delayed filing. If there is any concern or problem in EPA accepting these comments, please contact me immediately to discuss EPA's concerns.

Respectfully,

Jeffrey S. Longsworth, Partner
Barnes & Thornburg, LLP

Re: Comments on Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder:

NAIOP Massachusetts, the Commercial Real Estate Development Association, appreciates the opportunity to submit comments on the Draft Massachusetts Small Municipal Separate Storm Sewer System (MS4) General Permit. NAIOP represents the interests of more than 1,600 members involved with the development, ownership, management, and financing of more than 175 million square feet of office, research & development, industrial, multifamily, mixed use, retail, and institutional space in the Commonwealth.

NAIOP believes that the MS4s should drive the implementation of stormwater controls, given the role that MS4 systems play in conveying contaminated stormwater to water bodies. It is however, critical to ensure that municipalities have the **financial and technical resources** to implement the draft permit's requirements and that those **requirements are implemented consistently, fairly, and cost-effectively**.

Unfortunately, while there are some improvements over the 2010 version, the Draft Permit, as currently drafted, does not seem to achieve these goals. Municipalities will be required to undertake a significant number of tasks (particularly during the first year) without any funding. Given how cash-strapped many of the municipalities are, it is highly likely that they would turn to commercial property owners to fund these costs. This would have a dramatic impact on economic development. Without a source of funding the requirements cannot be achieved and economic development is at risk. And without clear guidance as to allocation of costs to all user categories, the temptation to charge only commercial properties will be strong.

Furthermore, throughout the Draft Permit there are different requirements for different municipalities. As a result, there will be inconsistent local regulations as municipalities respond to these requirements. From a policy perspective, local regulation of stormwater discharges from new developments or redevelopment in more urbanized areas must not become so burdensome that projects relocate to greenfield sites, resulting in other and more serious environmental effects. As a more practical matter, the creation of hundreds of separate, uncoordinated local stormwater bylaws or ordinances will create additional complexity and confusion and potentially undermine the effectiveness of the MS4 program. To ensure consistency, EPA should provide further guidance to municipalities as they prepare local stormwater regulations, including a

model bylaw/ordinance. There also needs to be a standardized approach for towns to implement the accounting/reporting requirements of BMP use/effectiveness and pollutant load reductions.

NAIOP's general concerns with the Draft Permit are:

Redevelopment Standards Should Only Apply To Area Disturbed – At several public meetings, there appeared to be a lack of clarity on how "redevelopment" and "larger common plan of development" are defined. The Draft Permit proposes that local stormwater regulations should be developed to regulate stormwater discharges from new development or redevelopment, and proposes that those regulations should apply to any disturbance of one acre or more. In the case of redevelopment, disturbing a portion of an existing development should not subject the entire existing development to local regulations applicable to brand-new projects. A clarification is needed that only disturbed areas over one acre would be subject to the local regulations proposed. Incremental increases in impervious area should only trigger application of the regulations proposed if the impervious area increases more than five acres over any five year period. The model bylaws suggested above should also clarify this.

Credit Should Be Given For Existing BMPs – The MS4 is responsible only for those discharges to the public storm drain system. If a development or property discharges directly to a waterbody it would not come under the MS4's jurisdiction. So, if a property is helping the watershed through BMPs, the local MS4 should receive credit for it in terms of meeting watershed pollutant reduction goals. Not only is this sound public policy, but it would also decrease overall costs associated with the program.

Wet Weather Sampling Cost/Benefit Analysis Is Needed - The updated permit still requires costly system sampling. A cost/benefit analysis for wet weather sampling should be performed by EPA. It should address how many discharges were actually discovered through wet-weather sampling and how greater sampling equates to a reduction in pollution. In NAIOP's experience, resources are better spent implementing more BMPs that actually help control pollutants.

Longer Timelines Are Needed – As stated above, much of the work required under the Draft Permit is front-loaded. The number of activities, plans, and submittals that need to be completed in the first year of the Permit is impractical. The NOI is extremely detailed and there will be a significant learning curve. Longer timelines are needed (as well as technical assistance). We suggest that the timeframe to complete the O&M Plans, outfall/interconnection inventory and condition assessment, Pollutant Source ID Plans, and SWPPP preparation be extended to two years from the effective date. The level of preparation required to complete the new electronic NOI Form is extensive and not practical for a 90-day turn-around. The information is significant, almost as much as required for the Stormwater Management Plan (SWMP) under the previous permit.

We suggest the original NOI submittal require only preliminary information relative to the 6 minimum measures and not the specific listing of proposed BMPs that would potentially be used to meet water quality based effluent limitation requirements. A year or more should be allowed to develop potential options for BMPs.

Pollutant Reduction Requirements For Impaired Waters May Not Be Feasible - Complying with pollutant load reduction requirements for TMDL locations could be close to impossible for some new developments if they must have a NET reduction with the new development. There is nothing in place for off-site trading or credits, so it is unclear how inner city redevelopments and new developments could achieve some of the high requirements for pollutant load reductions.

Street Sweeping Credits Should Be Higher – NAIOP was surprised to see how low the credits for street sweeping are in the Draft Permit. With the current level of credits, there is little incentive to use this extremely effective pollutant source control method. The USGS Cambridge Street Sweeping Survey provides a thorough analysis of this effective BMP. Street sweeping is the number one source control method and should, therefore, be given additional credits.

Definition Of Impervious Is Needed - Appendix A should be amended to include a definition of "impervious." Pervious pavement and green roofs should be exempted from that definition in order to encourage reduction of stormwater discharges. A clear impervious definition would also help municipalities more easily assess fair rates for residential and commercial development projects if the municipality chooses to create and fund a stormwater utility.

Definition Of Disturbance Is Needed - The term "disturbance" must be clearly defined to avoid inconsistency or confusion as to what activities trigger application of local stormwater regulations. For instance, customary O&M activities such as repaving of existing parking lots or repairing or replacing roofs should not be deemed "disturbance."

NAIOP also has the following technical questions and comments on the Draft Permit:

1. Can the EPA verify that the Natural Heritage and Endangered Species Program (NHESP) and/or Fish and Wildlife have the resources to respond within a 90 day time frame in order to provide the documentation necessary to certify no impact to Endangered and Threatened Species fo**r** the number of communities that will need this review as part of developing their NOI?

2. Additional guidance or clarification is needed regarding the specified documentation regarding historic properties particularly if future activities or conditions need to be considered as part of this certification. The screening procedure in Appendix D suggests that any subsurface excavation activity related to any future repair, upgrade or replacement of stormwater infrastructure will require consultation with the State Historic Preservation Officer (SHPO) to certify that there will no impact to historic properties and the documentation of this consultation and certification must be included in the NOI and the SWMP in order to be eligible for permit coverage.

   If certification is required for any potential future subsurface excavation activity at the time of NOI submittal, this presents two major problems: 1) the extent of possible future repairs and related excavation activity will not be fully understood at the time of NOI submittal; and 2) obtaining the SHPO certification for each potential excavation activity will result in extensive added coordination time, costs and project delays if field investigations are required to obtain this certification. Also, will the SHPO have the

resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI?

3. Section 2.1.2.b states that there shall be no increased discharges to impaired waters listed as Categories 5 or 4B on the most recent Integrated Waters list unless the permittee demonstrates there is no net increase in loading for the specific impairment and provides documentation in the SWMP. This implies that all future development would need to demonstrate no increase at all in pollutant loads. This is inconsistent with the language in Appendix F Sections IV and V, which states that stormwater management for new development and redevelopment shall be required only to optimize pollutant removal for the pollutant of concern.

4. Tables F-1 and F-2 of Appendix F indicate that various towns would have to reduce their baseline phosphorus loads by as much as 50% or more. Given that phosphorus removal efficiencies for various stormwater BMPs are typically in the range of 40 and 65 percent, Towns would essentially need to treat nearly 100 % of their existing impervious area. This is both impractical and unrealistic, given site constraints and extensive costs (even if a compliance schedule of up to 20 years is provided).

5. Section 2.3.4.5 requires an extensive outfall/interconnection inventory of the entire MS4 system to be completed in the first year, including location, condition, and framework for tracking, inspections, screenings, etc. As mentioned earlier, there are many complicated tasks to be completed in the first year, and MS4s will need significant dedicated staff to complete them. The proposed inventory will require additional field data to be collected that was not part of the 2003 Permit and will involve significant staff time as well as office/database management planning needs that will take some time.

6. Section 2.3.4.6 states that the storm sewer system mapping is to be completed within two years of the effective date of the permit. This time frame is very short for this level of effort. While many towns have mapped their outfalls, mapping the entire storm sewer system entails a much higher level of effort. Towns will need to plan for this capital expense and budget for it. The time frame should be expanded to match up with TMDL and Impaired Waters control plans to use limited municipal resources most effectively. Allowing staggered mapping by higher priority waters across the town also would help.

7. Section 2.3.4.7.iii states that the initial illicit discharge potential assessment and priority ranking based on existing information shall be complete within one year from the effective date of the permit. Since the drainage mapping will not be complete until two years after the permit effective date and since much of the ranking is based on this information, a two and a half or three year time frame should be allowed to align with the mapping schedule.

8. Section 2.3.4.7.c.iv of the Illicit Discharge Detection and Elimination Program states that "wet weather screening and sampling shall be conducted at every outfall, and/or within the catchment during or after a storm even of sufficient depth or intensity to produce a

stormwater discharge but only during the spring (March to June) when groundwater levels are relatively high." What is the reason for sampling when groundwater is high?

9. Requiring wet weather sampling for any outfall that has one or more vulnerability factors is onerous given that this is a very labor intensive activity. Essentially every outfall in a developed area will have at least one vulnerability factor as the list is very inclusive and does not necessarily identify or prioritize outfalls that are most likely or susceptible to illicit connections. This requirement should be changed to include outfalls that have three or more vulnerability factors or for which there has been observed direct evidence of a potential illicit connection during previous outfall screening and dry weather sampling.

10. Where wet weather sampling is conducted, what criteria should be used to distinguish whether the observed parameter levels are the result of an illicit connection or due to general stormwater quality? What sampling data would clearly indicate an illicit connection given that wet weather sampling results can be highly variable? The results from one event could be quite different than that from another given differing antecedent and precipitation conditions. This could lead to false positives and costly investigations in trying to track down a potential source based results from one event.

11. The catchment investigation procedure as described Section 2.3.4.7.e.ii will be very labor intensive and require a large amount of work. EPA should explain why it is necessary to investigate every junction manhole if there is no dry weather flow or indication of any illicit discharges. This requires work upstream in the middle of roads, sidewalks, private property and will require police details and substantial field work to find each junction. Time and money could be better spent on training municipal staff and contractors during their regular field work and maintenance, as well as the focused educational materials regarding identifying and eliminating illicit connections for the residents, businesses, and property owners. It is suggested that investigations can be completed if there is no flow or evidence of illicit discharges upstream. There may be dry weather groundwater flow that is clean. Time and money would be better spent on implementing structural and non-structural BMP practices to improve stormwater quality.

12. The requirement to provide As-built plans for structural BMPs as stated in Section 2.3.6.a.ii. (f).iii will add substantial added costs relative to the potential benefit. Other alternative methods of documenting the critical elements and functionality of the BMPs such as photo-logs with an engineering inspection report or certification should be allowed.

13. The equation used to calculate yearly phosphorus loads in Section 2 of Appendix F requires the amount of development that has occurred since 2005 to be determined. This is an unreasonable request to expect a town to retroactively determine how much development has occurred since 2005 and perform baseline load calculations. The TMDL reduction targets should either be applied to the current state of development or update Tables F1 and F2 to reflect conditions at the effective date of the permit.

14. The loading rate table 2-1 in Attachments 1 and 2 of Appendix F indicates in a footnote to assume HSG D soils if soils are unknown to estimate pervious loading rates. Text on page 1 of attachment 1 says to assume HSG C/D soils. Using default assumptions of D or C/D soils are too conservative for our region, Type C soils or surrounding soil types should be used to calculate loading rates

15. The text in Attachment 3 of Appendix F regarding Semi-Structural/Non-Structural BMP Performance Credits (page 5) states that the cumulative runoff reduction is being used to estimate cumulative phosphorus load reduction credit for the semi-structural/non-structural BMPs which have an infiltration benefit by disconnecting IA and providing soil amendments to increase permeability. The infiltration BMP curves show that phosphorus reductions are greater than runoff volume reductions. Therefore, it is conservative to use runoff volume as a direct surrogate when in fact phosphorus reductions are likely higher. Consider an additional phosphorus treatment factor in addition to solely the runoff reduction.

16. The porous pavement BMP performance table (Table 3-18) in Attachment 3 of Appendix F gives credits based on the depth of filter course. Does the credit not depend on the relative watershed size to filter course depth?

17. Table 3-21 on page 50 in Attachment 3 of Appendix F references a "Grass Swale" when BMP is called a "Water Quality Wet Swale" in the main text. It is unclear whether this in reference to a wet or dry swale. Are there results if the swale is not under-drained? This BMP gets very poor performance; slightly modified swale designs could get much better results.

18. Table 3-29 in Attachment 3 of Appendix F shows load reductions by converting or diverting impervious to pervious area. It would be helpful to explain the basis for determining the load reduction for diverting to pervious areas.

19. Attachment 1 of Appendix H describes load reduction credits for certain structural BMPs (Table 4-3) and illicit connection removal. Towns should be allowed to take credit for other structural and non-structural load reduction activities and BMPs beyond this limited list. For the structural BMPs, the treatment credits are grouped into only two types of BMPs: runoff reduction and stormwater treatment. These limited categories generalize the treatment potential of each BMP and do not account for the actual processes of a given BMP and a given design of that type of BMP. The curves provided give a range of performance based on BMP relative to sizing, but sizing is based only on contributing impervious area. This does not account for the treatment of runoff from pervious areas when comingled with that contributed from impervious surfaces or in the case where BMPs are used to treat runoff solely from pervious areas (e.g. agricultural areas, lawns, etc.). In addition, the methodology provided as a work around to calculate performance when pervious areas are contributing to the BMP is difficult and time-consuming and requires treatment for each BMP to be calculated individually instead of look-up tables or automation. In addition, Appendix H does not include provisions for the use of

alternative methods to calculate BMP performance such as using a long-term simulation modeling approach, as Appendix F does for calculating phosphorus treatment.

20. Table 1 in Attachment 1 of Appendix H provides annual nitrogen load export rates for only two land covers/ land uses: pervious and impervious. However, the equivalent methodology for phosphorus load calculations (Appendix F) includes a more detailed accounting of loads from not only different land uses, but also impervious and pervious land covers within those land uses. This same level of detail should be applied to the nitrogen load calculation methodology.

In closing, NAIOP believes that the MS4s are the appropriate place to regulate stormwater. In order to ensure its success, NAIOP strongly supports federal and state assistance for municipalities to fund this important program. Thank you again for the opportunity to submit comments. Please contact us if you have any questions or need additional information.

Sincerely,

NAIOP Massachusetts, The Commercial Real Estate Development Association

RE: Comments on Draft Massachusetts Small Municipal Separate Storm Sewer System (MS4) General Permit

Dear Mr. Tedder:

The Town of Needham ("the Town") is in receipt of the Draft Massachusetts Small Municipal Separate Storm Sewer System General Permit for stormwater management. This letter sets forth our concerns for consideration when developing the final permit. The draft permit requires additional unfunded mandates to the Town. The new permit will result in new costs to our operations in addition to existing significant regulatory expenses. The EPA has acknowledged this "substantial investment by permittees to reduce the discharge of pollutants from their systems..." (EPA Fact Sheet – Massachusetts Small MS4, II.C.1). However, the EPA does not offer any financial assistance other than providing suggestions on how municipalities can increase fees to the end users.

In our review of the permit, the following additional requirements will result in significant capital costs to the Town imposed by the new draft permit:

- Phosphorous control plan and associated removal costs (Appendix F – Section A.I.1). Both structural and non-structural controls pose significant capital expense to the Town. The plan requires a 47% reduction in phosphorus discharges to the Charles River. Much of the land area generating this discharge is not under the direct control of the Town. The Town is concerned that it does not have the jurisdiction to impose provisions to require private property owners to remove such a significant amount of phosphorous based upon the broad theoretical and non-site specific science that the EPA has provided to support this requirement. The Town requests that this limit be reconsidered and a more site specific and targeted approach be considered. The Town may expect

challenges from property owners absent a clear scientific approach to support the requirement.

- The EPA method for calculating phosphorous loading appears to have been established to provide a simple means for all communities within the country to calculate the amount of phosphorus generated. While the Town understands this approach, there should be some flexibility within the permit to allow for a community to go beyond this method to better estimate phosphorous loadings. The Town of Needham is in the process of creating a watershed management plan to investigate drainage patterns, soil types, and areas suitable for infiltration and intends to develop a protocol for testing surface and outfall locations to determine actual loading rates to the Charles River. The Town would prefer an approach that is site specific to Needham in order to reduce costs.

- To remove phosphorous, infiltration would seem to be the most long term cost effective approach. The EPA has acknowledged that infiltration of the first inch of runoff will result in the removal of phosphorus from stormwater from the contributing area thereby removing it from receiving waters. In order to infiltrate the first inch of runoff, soils within the town would need to be reviewed to determine their ability to infiltrate. Soils with NRCS hydrologic soil group designation of type A and B could be considered for infiltration. General groundwater levels would also have to be determined in these areas. The Town would have to require properties with these soil types and sufficiently deep water tables to infiltrate the first inch of runoff created within the property boundaries. To account for the urbanized nature of the areas where infiltration BMPs would be installed, a factor of 2 was applied to typical unit costs for BMPs. Based on this, the costs for constructing infiltration strategies would be in the range of $8 to $24 per cubic foot of storm water treated depending on the particular site constraints and the chosen BMP. Using an average cost of $16 and applying this factor to the volume of storm water created from the first inch of a rain falling on impervious surfaces for these areas, the estimated cost to provide infiltration would be $79,382,000.

- For areas that are determined to be unsuitable for infiltration, but are in the vicinity of a drainage system in the street, impervious surfaces could be connected and the flow conveyed to a location that does have infiltration capacity. The cost for providing infiltration of the first inch of runoff from these impervious surfaces would include the cost of additional drainage infrastructure, including pumping facilities and force main if needed, and a communal infiltration facility sized to handle the flow. The estimated cost for providing this infrastructure would be $74,166,000.

- For the remaining areas that have no onsite infiltrative capacity nor have drainage systems in the vicinity, both a drainage collection system and transportation system to a sub-basin with capacity would be required along with a

communal infiltration facility. The cost for providing infiltration of the first inch of runoff from these areas would include the cost of additional drainage to tie into existing infrastructure and the additional capacity in communal infiltration facilities. A few small pumping facilities were also included for cases where gravity drains may not be possible. The estimated cost for providing the infrastructure to facilitate these areas would be $69,143,000.

- In addition to infiltration, water quality units will be required as part of the system as well as infrastructure to facilitate sampling for continued monitoring of each sub watershed. It is assumed that two water quality units will be needed for each acre of impervious area and one six foot diameter manhole per sub watershed area to facilitate sampling for a cost of $52,560,000.

The combined capital cost of providing infiltration and water quality improvements to address phosphorus for the entire Town in accordance with the approach outlined above would be $275,251,000.

In addition to the capital costs for water quality improvements estimated above, the Town will incur annual operational and maintenance costs. To adequately maintain the communal infiltration systems, pumping facilities and water quality units the Town would incur annual costs of approximately $4,398,000. These costs include labor, electricity, replacement parts, contract maintenance costs (the Town cannot afford to significantly increase its current staffing level to accomplish the additional burden).

The Town would also incur other maintenance costs associated with phosphorous control. Currently the Town contracts out its road sweeping. It is estimated that additional street sweeping by vacuum methods will be required by the draft permit to adequately clean streets to prohibit roadway phosphorous from discharging to the drainage system and subsequent receiving waters. The estimated cost of these services on an annual basis is $70,000.

The new permit also requires TV inspection of the drainage system within 5 years on a priority basis (see Draft MS4 General Permit IDDE Program Flow Chart). Outfall sampling would also be required including testing conductivity, turbidity, pH, chlorine, surfactants, potassium, ammonia, and E. coli for 295 locations. In addition, outfalls discharging directly to impaired waters, or those included in a waste load allocation in an approved TMDL, dry weather discharges must also be screened for pollutants identified as causing the impairment. Outfall sampling alone would result in a cost of $165,000. Ongoing illicit discharge detection and elimination will add an undetermined amount to this annual cost.

According to the draft permit, the entire area of Needham would now be considered urbanized. The 2003 permit excluded some areas of Town that are non-urbanized. The Town disagrees with the new requirement because there are areas, as recognized by the 2003 permit, that contain low density housing along and vast areas of open space and federally controlled tracts of land such as the Charles River Natural Valley Storage Area. The Town should not be required to address stormwater from these areas.

Additional costs associated with hiring a contractor to re-develop a predictive catch basin cleaning program requiring cleaning of catch basin sumps at 50% capacity will dramatically increase catch basin cleaning frequency and costs. The Town currently does not have adequate staff to handle this additional work in-house (Section 2.3.7.a.iii.b). The Town requests that this additional requirement be eliminated. The Town currently performs TV inspection of 10% of its drainage system annually and appropriates funds to remove sediment from its catch basin sumps (at 100% capacity), drainage pipes, and brooks & culverts every year. Annual operating costs to provide the additional work would include yearly cleaning for 4,312 Catch basins at an estimated cost of $80/basin. The annual cost would be $345,000 and the 5 year cost would be $1,725,000.

Monitoring impervious areas throughout the Town and the costs associated (2.3.6.b; 2.3.6.d; 5.1.3; 6.3) with it on an annual basis is overly burdensome and costly. The Permit will require the Town to track impervious cover and "evaluate opportunities to manage and reduce stormwater discharges by reducing the amount of impervious cover..." The Town of Needham is 13 square miles in area. Tracking this vast area will add significant cost to the Town or force the Town to hire a contractor to perform this work. Either way it is either a time drain on staff or cost drain on the Town. The Town requests that this requirement be eliminated or reduced to once every 10 years.

The foregoing is not intended to be all inclusive of the Town's concerns, but is intended to demonstrate some of the impacts that the Town anticipates will occur to the Town's budget and the reasons for the Town's concern. The new NPDES MS4 requirements result in costs that will significantly impact the Town's ability to provide public services. The Town understands the intent of this program and agrees in spirit; however, our Town, as with most others, is already under considerable financial constraint and is concerned that it will be unable to secure the additional funding needed to comply with the new regulations without assistance.

Thank you for your consideration of these comments. Should you have any questions, please contact Richard P. Merson, Director of Public Works at 781-455-7550 or myself at 781-455-7500

Very truly yours,

For Kate Fitzpatrick

Re: Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for the opportunity to comment on EPA Region 1's proposed General Permit for Small MS4s in Massachusetts. The Neponset River Watershed Association (the Association) is a small non-profit organization covering 13 municipalities which wholly or partly drain into the Neponset River. The River runs south to north from the Foxborough Reservoir to Dorchester Bay.

The problem of unmanaged or inadequately managed stormwater is the most important ongoing water pollution problem in our watershed. Although we do also have severe water pollution due to historic toxic industrial pollutants that remain in our rivers, streams and ponds, we no longer have CSOs in the watershed and SSOs are much rarer that they used to be. Virtually our entire watershed is subject to a Bacteria TMDL, which contains a strict Waste Load Allocation that applies to both direct and indirect stormwater discharges.

Overall, we are extremely happy with EPA's proposed MS4 permit and view it as a great improvement over the 2003 permit currently in effect. Watershed associations throughout Massachusetts have been working together to analyze the MS4 proposal and have come to a consensus on what we like about the proposal as well as recommendations for improvements. Our watershed association is part of this consensus. Therefore, rather than simply repeat comments that you will be receiving from other watershed associations, we would like to concentrate most of our recommendations to three issues:

A. Proposed provisions which fail to require readily available BMPs that would maximize reduction of TMDL pollutants and which fail to give equal priority to bacteria reduction compared to reduction of nutrients, even where there is a Bacteria TMDL but no nutrient TMDL;

2173 Washington Street, Canton, MA 02021
781.575.0354 | staff@neponset.org | www.neponset.org

B. EPA's excellent MS4 permit proposals for municipal stormwater ordinances apply only to projects of one acre or more, of which there are very few in our largely "built-out" urban and suburban watershed. Without a lower size threshold for permitting, as well as at least a review of and minimal standards for projects as small as 5,000 s.f., this proposal is unlikely to significantly reduce stormwater pollution from new development and redevelopment.

C. Failure of the permit to require implementation within reasonable time periods of the results and conclusions reached by permittees in the many evaluations they are required to undertake. Of greatest concern is the permit's failure to require additional or alternative BMPs if permitees or EPA finds pursuant to Part 4.0 that current BMPs are not achieving the goals and objectives of the SWMP.

In addition, we will be offering in Section D. of our comments additional recommendations on improvements to other miscellaneous provisions of the proposed permit.

NOTE: ***Language quoted below from the proposed MS4 permit is italicized; recommended new or revised language below is italicized and highlighted.***

A. Proposed MS4 Permit Provisions relating to Bacteria

1. **Some MS4 permit requirements that are not generally applicable should apply to discharges to waters subject to TMDLs**. EPA may not wish to adopt some of the recommendations for improvements to the MS4 permit contained in this comment letter. We would ask that where that is the case, you consider applying such recommendation to activities which result in discharges to waters subject to TMDLs, so that the MS4 permit is at least "consistent" with TMDLs (MassDEP in the MA Stormwater Handbook requires that projects subject to the Wetlands Protection Act propose BMPs that are consistent with TMDLs). EPA has approved all final TMDLs; if you are unsatisfied with any TMDL provision, including its stormwater WLAs, your proper recourse is to propose revisions to that TMDL.

   That being said, we support EPA's BMP-based approach in the proposed MS4 permit and concede that compliance with the WLA in our Bacteria TMDL is difficult to achieve and even more difficult to measure. We would simply ask that the final MS4 permit require permittees to implement all practicable BMPs that will move them in the direction of achieving compliance with TMDL bacteria WLAs, and that this be an objective included in their SWMPs. See also our comments under Section C., below, where we recommend that specific revised or additional BMPs be required where current BMPs are found under Part 4 of the permit to be ineffective at achieving SWMP goals and objectives. This is particularly important for TMDL pollutants.

2. **IDDE is not the only cause of stormwater-related bacterial pollution.** Various areas of the Neponset River, its tributaries, and its lakes and ponds are impaired by as many as eleven separate pollutants. Aside from the statewide mercury TMDL, the only pollutant subject to a TMDL (which applies virtually throughout the watershed) is bacteria. For new development and redevelopment, EPA's proposed requirement that the first inch of rain be retained on-site will, if retained in the final permit, go a long way toward reducing bacteria in our watershed, as LID and recharge are by far the most effective BMPs for bacteria

reduction. We believe that EPA is right in not differentiating between new development and redevelopment in the implementation of this requirement since it provides sufficient flexibility for both types of projects.

We are very concerned, however, that should EPA back off of its proposed "1-inch rule" in the final Permit, various other provisions will give priority to reduction of other pollutants such as phosphorus and nitrogen over bacteria. These include provisions in Part 2.3.6.and in Appendices F and H as they relate to Post-Construction Stormwater Management. Although it is true that BMPs designed to reduce phosphorus will also generally have a positive impact on bacteria, the most effective BMPs for bacteria and phosphorus are not always identical. Furthermore, there are portions of our watershed that are in attainment for phosphorus but are still subject to our Bacteria TMDL. *The MS4 permit should always give at least equal priority in the implementation of all 6 MEPs to BMPs that are most effective at reducing that TMDL pollutant.*

At EPA's Public Meeting on this MS4 proposal held on October 22, 2014 in Westborough, EPA staff opined that the problem of pathogen pollution is being adequately dealt with by the proposed permit's provisions on IDDE. We respectfully disagree. While we concur that IDDE may usually be the single most important factor, we have found that *bacteria discharges coming out of some MS4s in our watershed cannot be accounted for simply by IDDE*. That finding is based on four separate lines of evidence:

a. The findings and requirements of the Neponset Bacteria TMDL, issued jointly by EPA and MassDEP;
b. The results of our own water sampling, performed under an EPA and MassDEP QAPP, which for decades has provided the only data on which EPA's 303(d) list for our watershed is based;
c. The BMP Survey work we have performed over the last 5 years under a series of 604(b) grants and subject to an EPA/DEP QAPP; and
d. Published studies.

a. The "*Final TMDL of Bacteria for the Neponset River Basin*," as well as its 2012 "*Addendum*," list both direct and indirect stormwater discharges as significant causes of bacteria nonattainment, and set an equivalent LA and WLA for each. *If indirect discharges from sheet flow are a significant cause of bacterial pollution in our watershed, then it is only logical that untreated sheet flow going into MS4s is also significant* (especially since most of the towns in our largely developed watershed have limited indirect stormwater discharges). MassDEP officially accepts that pollutants (including bacteria) in sheet flow are a significant source of pollution where TMDLs exist. It states in the Massachusetts Stormwater Handbook that applicants under the Wetlands Protection Act must select BMPs that are "consistent with" applicable TMDLs. MassDEP has repeatedly reassured us verbally that this requirement applies equally to bacteria as to other pollutants covered by other TMDLs. *It is incumbent on EPA to propose revisions to our TMDL if it now believes that IDDE is the only source of bacteria pollution entering MS4s, rather than proceeding on that assumption in this MS4 permit.*

b. In 2014, 25 of our 41 sampling sites showed bacteria in excess of water quality standards on six different dates during dry weather, a clear suggestion that illicit sewage connections may exist in many areas. In wet weather, however, there were 8 sites (about a third of the

total) which had never violated bacteria standards in dry weather but which did violate those standards in wet weather. It is highly likely that at least a substantial portion of the bacteria at those sites came from sheet flow stormwater runoff unrelated to illicit discharges.

c. The BMP survey work referred to above involved collecting wet-weather outfall samples for bacteria at locations where BMP retrofits were being proposed. These were sites where we felt confident no illicit discharges were present based on visual observation of the outfall and the collection system. In addition to sampling for bacteria, we also sampled for surfactants and ammonia as indicators of possible illicit connections. Out of 82 sets of outfall samples collected, 44 sets or 54% showed elevated bacteria levels, but no surfactants or ammonia above EPA IDDE thresholds. This indicates that even where illicit connections are absent, "clean" stormwater discharges will violate our bacteria TMDL more than 50% of the time.

d. A number of recent research studies support the idea that the source of bacteria in stormwater and surface water is not limited to sewage or other active illicit discharges. A small sampling of this literature includes:

- "*Escherichia coli concentrations and loads in an urbanized catchment: The Yarra River, Australia*," Daley, E. et. al. (Journal of Hydrology 497 (2013) 51 – 61). Researchers in this study in Australia analyzed E. coli in an urban river located in Melbourne, and sampled flow from contributing stormwater outfalls. The study found that E. coli concentrations were not well correlated with ammonia, indicating an input of E. coli in the river coming from something other than sewage.
- "*Tracking Bacterial Pollution Sources in Stormwater Pipes,*" Jones, Stephen H. et. al. (A Final Report of the NH Estuaries Project/Office of State Planning, April, 2003). This study was produced at UNH and consisted of sample collection during wet weather from storm drains, tributaries, and the harbor in Hampton, NH. E. coli bacteria in the wet weather samples was analyzed using DNA analysis to determine the source species. Birds were determined to be the most commonly identified source of E. coli in the samples from storm drain pipes (36%), followed by humans (20%), wildlife (15%) and pets (7%). 22% could not be identified.
- "*Microbial source tracking in a small southern California urban watershed indicates wild animals and growth as the source of fecal bacteria*," Jiang, Sunny C. et.al., Appl Microbiol Biotechnol (2007) 76-927-934 DOI 10.1007/s 00253-007-1047-0). A small, urban, residential watershed in California with fecal coliform and enterococci contamination ranging from 2-4 orders of magnitude over State of California standards was examined for the source of microbial contamination in this 2007 study. Techniques were used to identify the species of origin for E. coli and Enterococcus bacteria as well as determine the levels of human viruses in water samples, another indicator of human fecal contamination. Water samples were collected directly from runoff entering a catch basin as well as a stormwater outfall. Results showed that human sewage was not a major contributor to fecal bacterial impairment. Birds were identified as the major source of fecal pollution.

- "*Identification of the sources of fecal coliforms in an urban watershed using antibiotic resistance analysis,*" Whitlock, John E. et. al.; Water Research 36 (2002) 4273-4282). This study used antibiotic resistance analysis to determine the source species (human, wild animal, or pet) of E. coli in stormwater in a Florida watershed. Wild animal was identified as the species of origin for 7 out of 11 sampling events with high E. coli concentrations. The conclusion of this study is that in general wild animals are the dominant fecal contributors to this watershed when fecal coliform levels are elevated. During times of low fecal coliform levels, human and dog fecal contamination was identified as the major source indicating that these species are responsible for low level background contamination but spikes in bacteria are more related to wild animals.

We believe this data clearly demonstrates that stormwater runoff into MS4s, and not just illicit connections, is a major source of bacteria contamination in the watershed.

3. Recommendations on Revision of Permit Language relating to Bacteria

- Part 2.3.6.a.ii.(a) -- the "1 inch" rule. Subsection 1. provides great potential for major reductions of bacteria from new development and redevelopment over 1 acre by ensuring that during roughly 85% of rain events there will be no flow discharged from outfall pipes, thus providing treatment for bacteria washed from impervious surfaces, and minimizing the regrowth of bacteria inside closed drainage systems and the frequency with which remaining regrowth bacteria is discharged to streams. Application of the 1" rule for all areas subject to bacteria TMDLs is a critical strategy for achieving TMDL compliance in addition to IDDE.

  We are less certain, however, as to what the option described in subsection 2. means. **We believe that the following recommended language is consistent with but clearer than the language in the proposed Part 2.3.6.a.ii.(a)(2) and we recommend that the following be substituted for the proposed language in that Part**:

  2. To the extent that it is not technically feasible to retain the entire first one (1) inch of runoff on-site due to site constraints, the stormwater management system shall retain as much of the first inch on-site as is technically feasible, and use stormwater BMPs designed to treat the remainder of the runoff to provide a level of pollutant removal equal to or greater than that provided through the use of biofiltration….

The last sentence in the proposed subsection 2. goes on to states: "*The level of pollutant removal from BMPs shall be calculated consistent with EPA Region 1's BMP Performance Extrapolation Tool."* Unfortunately, that Tool applies only to TP, TN, TZ and TSS. Subsection 2. needs to be include guidance on what must be done to demonstrate an "equivalent or greater" level of pollutant removal for other contaminants, particularly those for which an applicable TMDL exists as well as for contaminants being discharged to "water quality limited waterbodies." **We recommend that EPA adopt the following language at the end of Section 2.3.6.1..ii.(a)2.:**

For pollutants not covered by the BMP Performance Extrapolation Tool, non-infiltration BMPs must be selected and designed to maximize pollution reduction based on their predicted effectiveness as rated in the most recent Massachusetts

Stormwater Handbook (the Handbook) and/or the Boston Water and Sewer Commission(BWSC)'s Stormwater Guidance (the Guidance). For structural stormwater BMPs proposed by an applicant that are not included in the Handbook or Guidance, or for which a pollutant removal effectiveness rating is not provided, effectiveness may be documented through prior studies, literature reviews, or other means and receive approval from the municipal stormwater permitting authority. That authority may also issue a Guidance(s) identifying BMPs or combinations of BMPs that will provide maximum pollution reduction for one or more pollutants.

SEE ATTACHMENT at the end of these comments listing BMPs found to be effective at bacteria reduction.

- Appendices F and Appendix H as they relate to the requirements of Part 2.3.6. Appendix F, Section A. III. for Bacteria and Pathogen TMDLs requires "*additional or enhanced BMPs*" only for Public Education and Illicit Discharges. However, Appendix F. Section A.IV.(for nitrogen on Cape Cod) and Section A.V. (for phosphorus in the Assabet watershed) also require additional and enhanced bacteria BMPs for local stormwater bylaws described in Part 2.3.6.1.a., and for retrofit and priority ranking described in Part 2.3.6.1.b. There is no good reason why the same BMPs should not also be required in Appendix F. Section A.III. for areas with Bacteria TMDLs.

  Appendix F Section A. III. should include the following provisions:

  Part. 2.3.6, Stormwater Management in New Development and Redevelopment: the requirement for adoption/amendment of the permittee's ordinance or other regulatory mechanism shall include a requirement that new development and redevelopment stormwater management BMPs be optimized for bacteria removal; and that the retrofit inventory and priority ranking under 2.3.6.1.b. shall include consideration of BMPs that infiltrate stormwater where feasible.

  Appendix H should be amended to say, after the Table of Contents:

  Notwithstanding the requirements in Section I – V., below, reduction of pollutants discharged to Certain Water Quality Limited Waters shall not receive priority over discharges to Impaired Waters with an Approved TMDL, as identified in Appendix F.

- **Appendix F Section A-3, Table F-8 should be amended to include the following waterbodies** (listed as impaired for bacteria as of the most recent Integrated Waters list and in the Bacteria TMDL or TMDL Addendum for the Neponset River):

MA Stream Segment	*Name*
73-25	*Pecunit Brook*
73-28	*Mother Brook*
73-32	*Unnamed Tributary, outlet of Town Pond, Stoughton to the confluence with Steep Hill Brook Stoughton*
73-33	*Unnamed Tributary locally known as*

B. Requiring local stormwater management permits for new development and redevelopment of ½ acre or more and for all projects listed as a Land Use of Higher Potential Pollutant Loads, as well as requiring some level of review for projects as small as 5,000 s.f.

As noted above, there are very few projects of an acre or more in our largely "built out" urban and suburban watershed. We therefore recommend that smaller projects also be covered by the required new provisions for stormwater management ordinances. **We recommend that Part 2.3.6.a.(ii)(a) of the MS4 permit require permittees' new development and redevelopment ordinances to contain the following provisions:**

- ***permits shall be required for project of ½ acre or more, as well as for projects of more than a de minimus size that are "land uses of higher potential pollutant loads" as defined in the MA Wetlands Regulations; and***
- ***projects between 5,000 s.f. and ½ acre shall require a lower level of administrative review. Such reviews shall occur outside of the formal permitting process with more limited submission requirements and performance standards. If any such review results in the permitting authority identifying a project that it believes needs to be conditioned through the issuance of a permit, the authority shall be authorized to require the applicant to apply for such a permit;***

Should EPA be unwilling to require these provisions in all circumstances, we urge you to consider requiring them:

- for projects which discharge to MS4s that discharge to waters subject to TMDLs;
- where permittees or EPA conclude pursuant to Part 4.0 that the 1 acre threshold is not achieving the goals or objectives of the permit or the SWMP; and
- for projects above a de minimus threshold that are land uses with higher potential pollutant loads."

[See recommended revisions to Part 4.4.v.iii. as it applies to Part 2.3.6.a.(ii)(a) on p.12.]

We also recommend that EPA issue Bylaw Guidance that includes the following provisions contained in the Stormwater Bylaws and Regulations that will be voted on at the upcoming Westwood, MA Spring Town Meeting:

Section 5. Applicability

A. … There are two levels of reviews based on the amount of proposed land to be disturbed as part of a single project they are as follows:

(1) Administrative Land Disturbance Review is required for projects disturbing between 5,000 square feet and one-half acre (21,780 square feet) of land.

(2) Land Disturbance Permit is required for disturbance of one-half acre (21,780 square feet) or more of land or proposed use is listed as a land use of higher potential pollutant loads as defined in the Massachusetts Stormwater Management Standards."

Section 6. Administrative Land Disturbance Review Procedure

A. Application. A completed application for an Administrative Land Disturbance Review shall be filed with Stormwater Authority. Approval must be obtained prior to the commencement of land disturbing activity … The Administrative Land Disturbance Review Application package shall include:

…

(2) Narrative describing the proposed work including existing site conditions, proposed work and methods to mitigate any stormwater impacts

(3) …(P)lan that include:

a. Existing site features including structures, pavements, plantings, and stormwater management systems etc.,

b. Proposed work including proposed stormwater management systems and limits of disturbance

c. Basic erosion and sedimentation controls.

…

D. Stormwater Authority may:

(1) Approve the Administrative Land Disturbance Review Application if it finds that the proposed plan will protect MS4 system, water resources and meets the objectives and requirements of this by-law;

(2)Approve the Administrative Land Disturbance Review Application with conditions, modifications or restrictions that Stormwater Authority determines are required to ensure that the project will protect water resources and meets the objectives and requirements of this by-law;

(3) Require submission of a Land Disturbance Permit Application if the project will disturb land beyond administrative review thresholds or in the opinion of the Stormwater Authority requires more extensive review."

Such Bylaw Guidance could also include the following performance standards for "Administrative Review" projects, contained in the Neponset River Watershed Association's Model Stormwater Bylaws and Regulations.

> Performance Standards for projects subject to Administrative Land Disturbance Review. Applicants shall retain as much of the first one (1) inch of runoff on-site as is practicable and, to the extent it is not practicable for a portion of the runoff, that portion shall meet the requirements listed in (a) – (d), below, to the maximum extent practicable. "Practicable" shall be defined as available and capable of being done after taking into consideration costs, existing technology, proposed use, and logistics in light of overall project purposes. Project purposes shall be defined generally (e.g., single family home or expansion of a commercial development).
>
> > (a) Comply with the Massachusetts Stormwater Management Standards as further defined in the Massachusetts Stormwater Handbook;
> > (b) To the extent that the project will discharge, directly or indirectly, to a water body subject to one or more pollutant-specific Total Maximum Daily Loads (TMDLs), implement structural and non-structural stormwater best management practices (BMPs) that are consistent with each such TMDL;
> > (c) Avoid disturbance of areas susceptible to erosion and sediment loss; and
> > (d) Use LID techniques where adequate soil, groundwater and topographic conditions allow. These may include but not be limited to reduction in impervious surfaces, disconnection of impervious surfaces, bioretention (rain gardens) and infiltration systems.

C. Implementing Results of Required Evaluations, Reports, etc. and adding to or replacing BMPs found to be ineffective

We believe that overall the requirements of the proposed MS4 permit are strong and, with some exceptions, we do not propose that they be strengthened as they apply in most circumstances. However, where ambient water quality and outfall monitoring shows persistent problems, where tracking DCIA and IA shows little progress or even increased IA, or where annual self-evaluations do not show compliance with (or, in some cases, even address) important permit requirements, it is certainly reasonable to require permittees to implement, and not just evaluate, additional or replacement BMPs.

The lack of a requirement to implement corrective measures when existing BMPs are not working fully (Part 4.1.b. only "*allows*" permittees to change BMPs) is a major flaw in the language proposed under Part 2.1.2,b. on increased discharges to impaired waters; Part 4.1 on Program Evaluation; and Part 4.4 on Annual Reports. (Language that we recommend to correct this problem is given below.) Requiring permittees to implement alternative BMPs that they themselves identify is

certainly a better way to proceed than exercising the authority granted to EPA and MassDEP under Part Part 4.1.c. to "*require the permittee to add, modify, repair, replace or change BMPs or other measures as needed to address impacts to receiving water quality…or to satisfy conditions of this permit.*"

It is also critical that EPA provide guidance on how to do evaluations of BMP effectiveness. A catalog of appropriate outcome measures for each BMP and a checklist of alternative BMPs would be very helpful to permittees for initial development of their SWMPs and for their annual evaluations. Particularly important is the failure in Parts 2.1.2, 4.1.b. and 4.4.b to require additional or alternative BMPs for:

- discharges to waters with TMDLs where the current BMPs do not constitute all practicable measures that are capable of moving permittees as close as possible to compliance with direct stormwater discharge Wasteload Allocations. The proposed permit language requires permittees to evaluate the adequacy of BMPs for discharges to waters subject to TMDLs "pursuant to Part 2.2.1 and Appendix F." Unfortunately, Appendix F requirements fall far short of what is necessary to move permittees as close as possible to achieving the WLA for stormwater contained in the Neponset Bacteria TMDL. As noted above, we are reconciled to the fact that achievement of the stormwater WLA in the Neponset Watershed Bacteria TMDL will be very difficult to meet unless 100% of stormwater is infiltrated on site. The MS4 permit, as proposed, however, only requires that permitees attempt to achieve 100% infiltration for development and redevelopment projects over an acre, but not for smaller projects or for municipal retrofits. Thus additional or alternative BMPs should be evaluated and, as appropriate, implemented pursuant to to Part 4.1.b. and 4.4.b.in these circumstances

- discharges to waters "requiring" (but not yet having) TMDLs. (Category 5 waters) where current BMPs are not achieving compliance with the ban on increased discharges contained in Part 2.1.2.

Finally, it is also very important that permitees be required to implement within a reasonable time period the results of the various evaluations, procedures and prioritizations they must perform pursuant to Parts 2.3.6.b.–d. and 2.4.7. EPA establishes clear, year by year implementation guidelines and schedules for IDDE and should do the same for other MEPs and other permit requirements.

In light of the above, we recommend that the following revisions be made to the final permit:

- **Add to the end of Part 2.1.2.b.:**

  Such demonstrations shall be included in each Annual Report.

- **Add to Part 2.3.6.b., after the 3rd sentence:**

  Such schedules shall provide no more than 4 years for full implementation.

- **Add to Part 2.3.6.c., after the second sentence in the second paragraph:**

  Such schedule shall provide no more than 4 years for full implementation.

- Add to the end of Part 2.3.6.d.iii.:

  Permittee shall, over the next four years, implement the modifications and retrofits included in the inventory developed pursuant to this subsection.

- Amend 2.3.7.a. to state (in appropriate subsections):

  After the filing of the first year annual report, the permittee shall begin implementation of the procedures and activities required under this subsection. With the exception of ongoing activities and procedures, these activities and procedures shall be fully implemented by the time of the filing of the third annual report.

- Substitute the following for the proposed Part 4.1.b:

  The permittee shall evaluate the appropriateness of the selected BMPs in achieving the objectives of each control measure and defined measurable goal and provide a rationale for its conclusions. Should a BMP be found to be ineffective or inappropriate, the permitee shall also evaluate whether there are changes to such BMPs and/or replacement BMPs that could reasonably be expected to better achieve these objectives and goals. The permittee shall include its evaluation and any BMP modifications in each Annual Report.

  If there are any change(s), addition(s) or substitution(s) to existing BMPs listed in an Annual Report, permittee shall begin to implement them immediately after the filing of its Annual Report, with full implementation to be completed in no more than two years thereafter. Re-evaluations shall occur in the Annual Report following implementation of each new or revised BMP.

  To the extent that EPA or MassDEP concludes that the above required analyses have not been performed properly or in good faith, or that the conclusions reached are not supported by the analysis, they may exercise their discretion pursuant to subsection 4.1.c. to "order a permittee to add, modify, replace or change BMPs or other measures described in the annual reports as needed to address impacts to receiving water quality caused or contributed to by discharges from the MS4 or to satisfy conditions of this permit."

Add to the end of Part 4.4.v.iii.:

Permittees failing to demonstrate in an Annual Report that the BMPs implemented during the previous year(s), and/or included in the SWMP for implementation in future years, either

- *constitute all practicable measures toward achieving the Waste Load Allocation for direct discharge of stormwater contained in any TMDL, or*
- *will achieve compliance with the prohibition on any net increase in discharges to Category 5 waters in Part 2.1.2.b.,*

shall do the following:.

- *If such ineffective BMP(s) involves post-construction stormwater runoff from new development and redevelopment projects under Part 2.3.6.a.(ii)(a), the permittee shall determine whether any or all of the following revisions to the municipality's*

stormwater ordinance are likely to improve effectiveness and, to the extent that it is found that any of them are, amend their municipal stormwater bylaw within two years thereafter:

- *a requirement that new development and redevelopment projects of ¼ (one quarter) or ½ (one half) acre or more obtain a stormwater permit;*
- *a requirement that all new development and redevelopment projects over a de minimus size involving "Land Uses With Higher Potential Pollutant Loads" (as defined in the MA Wetlands Protection Regulations) obtain a stormwater permit;*
- *a requirement that the stormwater permitting authority review and approve new development and redevelopment projects of 5,000 s.f. or more that are not required to obtain a stormwater permit. Such reviews shall occur outside of the formal permitting process with more limited submission requirements and performance standards. If any such review results in the permitting authority identifying a project that it believes needs to be conditioned through the issuance of a permit, the authority shall be authorized to require the applicant to apply for such a permit; and*
- *a requirement that applicants for stormwater permits submit operations and maintenance plans that meet the requirements of Part 2.3.6.a.iii.*

- *If such ineffective BMP(s) involves the post-construction stormwater runoff program required under Parts 2.3.6.b.-d., the permittee shall require each project above a specific de minimus size occurring on town owned property or financed by the town to:*
  - *demonstrate compliance with the provisions of Part 2.1.2.b. relating to net increases in discharges to Category 5 waters, and/or*
  - *include all practicable BMPs aimed at achieving Waste Load Allocations contained in any TMDL.*

- *If such ineffective BMP(s) involve activities or procedures implemented pursuant to Part 2.3.7. regarding Good House Keeping and Pollution Prevention for Permittee Owned Operations, the permittee shall analyze whether increasing the frequency, nature or stringency of such activities and procedures could potentially increase their effectiveness and, to the extent that any are found to be likely to do so, begin implementing them immediately thereafter.*

D. Miscellaneous Recommendations on improvements to other provisions in the proposed permit.

- SWMPs (1.10) regarding BMPs for Public Education and Public Participation (2.3.2 and 2.3.3). Part 1.10 states: "*The SWMP is the document used by the permittee to describe and detail the activities and measures that will be implemented to meet the terms and conditions of the permit.*" This language, we believe, provides a disincentive for MS4s to do anything more than what is strictly required in the proposed permit, for fear that enforcement action could be taken if they do not in fact implement a measure contained in their SWMP that goes beyond the minimum permit requirements. In most cases the Draft permit is quite detailed in its requirements and no permittee is likely to propose doing more than the minimum permit requirement. The one exception is the requirements

regarding education and public participation, where the requirements remain quite vague and non-specific.

Over the last year, the Association has been working with a group of communities to help them prepare a regional approach to implementing requirements of the proposed MS4 permit, including public education & outreach and public participation. As part of this effort, the project outreach committee and a number of participants have made it clear that they agree with the watershed association that they would benefit from a more comprehensive outreach program than the minimum effort required under the proposed permit in order to build public support for actions and funding needed to implement the permit as a whole.

One task for the Association during the course of the above project has been to develop templates for regional Public Education & Outreach and Public Participation SWMPs. While at least some communities have been enthusiastic about the idea of more extensive outreach and participation programs, the communities were unanimous in requesting that the SWMP templates outline the bare minimum outreach and participation work plan required to comply with the permit. This was because the communities see that by writing more ambitious Outreach and Participation SWMPs, they are raising the bar on themselves, and theoretically opening themselves to enforcement action for failing to implement the more ambitious plan, even if the programs they ultimately do implement still comfortably exceed the actual outreach and public participation requirements of the permit. This unfortunate dynamic has the unintended consequence of greatly reducing the likelihood that communities will implement a robust outreach and participation program.

We therefore recommend that EPA add the following sentence to Part 1.10:

> ***MS4s may also include in the SWMP public education & outreach and public participation measures that go beyond what is strictly required to meet the minimum terms and conditions of the permit" without having implementation of such additional measures become a requirement of this permit.***

- Electronic NOIs (1.7.2 and Appendix E) and Annual Reports (4.4). **We recommend that all MS4s be required to file the electronic NOI** so that EPA and the public can create reports and cross-evaluate various MS4s (in our case, we'd like to compare what each MS4 within the Neponset River watershed is doing for each MEP). While it is practically inconceivable that MS4s would not be able to access a computer somewhere in town (e.g., at the library), perhaps EPA could offer hardship waivers to those that demonstrate they cannot. **We also recommend that the NOI add a section listing BMPs designed to ensure compliance with the ban on increased discharges to waters requiring TMDLs (Category 5 waters).**

  The electronic NOI proposed in Appendix E is extremely disappointing in light of the fact that **EPA Region 1 had already created, but did not propose, an excellent electronic NOI that would have ensured full reporting by listing every MEP requirement one by one with blank fields next to each requirement for the MS4s' planned activities. We recommend that EPA substitute that NOI Form for the one it included in Appendix E.** If that is not possible, it is even more important that EPA create an Annual Report Form that includes such a listing of permit requirements. Based on our reading of Annual Reports of towns in our watershed over the years, virtually none of them addresses all permit requirements. EPA will never be able to evaluate MS4s' self-evaluations if they are not comprehensive.

- Cross Referencing (Parts, 2.2, 2.3, and Appendices E, F, and H). Although from a strictly legal standpoint, MS4s must of course comply with all provisions contained in the MS4 permit, the fact is that the permit is used primarily by DPWs, not lawyers. Therefore, whenever, possible, the permit should contain cross reference to related provisions. For example, in determining which BMPs to implement, most DPWs look solely at Part 2.3. **We recommend that both Part 2.3 and Appendix E (the NOI) have specific references to the requirements of Part 2.1.2.b. forbidding increased discharges to waters requiring TMDLs ; Part 2.2.1. and Appendix F for additional and enhanced BMPs required for discharges to waters subject to TMDLs; and Appendix H for additional and enhanced BMPs required for discharges to water quality limited waters.**

  Similarly, **we recommend that Parts 1.1.0 (on SWMPs), 2.2.1, 2.1.2, 2.3, Appendices F and H should reference the provisions on alternative BMPs that may be required under 4.1 Annual Program Evaluations and 4.4.b. Annual Reports.**

- Discharges to water quality limited waterbodies where chloride is the cause of the impairment (2.2.2.d and Appendix H Section IV.). **We recommend that the chloride provisions in Parts 2.2.2.d. and Appendix H Section IV apply in all waters listed by the state as moderately or severely depleted pursuant to the state Water Management Act Regulations).** Chloride pollution is very serious in our, as in most other eastern Massachusetts watersheds, even though few of them (including ours) are listed as impaired for chloride on the Integrated List of Waters. We believe this is due more to the lack of sampling than to the lack of chloride. This conclusion has strong support from the U.S.G.S. and MassDFG in its recent studies of fluvial fish diversity and populations in our rivers and streams. The fish in most of the Neponset River Watershed were found to be severely depleted, and the greatest correlation to this depletion was found to be the percentage of impervious area in a given sub-watershed. While there is no absolute proof that chloride washed from roads and highways is the major cause of this correlation, it is inconceivable to us that it is not at least a significant cause.

- IDDE (2.3.4.7 and Appendix G*)*

  Wet Weather sampling requirements (described in 2.3.4.7.c.ii.d.iv). **It is recommended that wet weather sampling be allowed beyond the months of March- June**. There will be a considerable number of outfalls that require wet weather sampling due to System Vulnerability Factors and this will increase compliance with wet weather sampling. Given the results of wet weather sampling in Boston under the Boston Water & Sewer Commission Consent Decree it is likely that outfalls will be flowing during wet weather during the rest of the year.

  Approved E. coli/Enterococci tests (described in section 2.3.4.7.c.ii.d.v and in Appendix G). **It is recommended that the approved tests for E. coli and Enterococci for outfall sampling at outfalls discharging to impaired waters be expanded to include Colilert and Enterolert methods**. According to Appendix G of the draft permit the only approved tests for bacteria impaired waters are membrane filtration methods. Colilert and enterolert are both approved for compliance 14onitoring under the EPA Groundwater Rule and Colilert has been used successfully for in stream and outfall water quality monitoring in the past by many groups including the Neponset River Watershed Association. The inclusion of these

methods will increase the ability of many municipalities to perform the laboratory analysis themselves without the use of an outside laboratory. There are also a variety of other less robust bacteria testing methods available in the marketplace, and we do not recommend that EPA authorize the use of these less robust methods.

Quality Assurance Project Plan for outfall sampling procedure (described in section 2.3.4.7.c.ii.d.i). **It is recommended that a requirement be put in place for the development of a simple Quality Assurance Project Plan ("QAPP") for outfall sampling performed to meet the requirements of this permit.** The QAPP should include requirements for quality control samples, including field blanks and field duplicates for each sampling event, as well as sample preservation methods and hold times, and identification of analytical methods. We also strongly recommend that EPA provide a sample QAPP, which would not be required, but which would be a helpful guide for permittees. Lastly while we are recommending a simplified QAPP requirement, we are not recommending that EPA require the QAPP to be formally reviewed and approved by EPA or MassDEP staff in advance.

Thank you very much for the opportunity to comment on this proposed Massachusetts MS4 permit. We dearly hope that EPA will promulgate the permit, without weakening it, as soon as possible, even if you do not see fit to include all the recommendations for improvement we make in this comment letter.

Sincerely yours,

Steve Pearlman
Advocacy Director

stormwater/feb 27 2015 ms4 permit comments final.docx

Bacteria BMPs

Structural BMPs found by the Massachusetts Stormwater Handbook and/or the Boston Water and Sewer Commission Stormwater Guidance to be effective at bacteria removal
(Handbook page references are to Vol. 2, Ch. 2)

Infiltration Practices

- All infiltration practices described in the Mass Stormwater handbook, when designed, and provided with applicable pre-treatment measures as described in the handbook

Filtration Practices

- Filtering bioretention cells (Handbook page 23 and BWSC Guidance Doc page B-7).
- Filtering dry water quality swales (where the WQ volume is retained, filtered and discharged via an underdrain; also sometimes referred to as bioretention swales or biofilter swales; not to be confused with drainage channels or grassed channels; Handbook page 78).
- Sand and organic filters, including tree filter boxes (underdrains should not discharge to a catch basin sump; sometimes also known as tree pits, tree channels, green gutters, or stormwater planters; Handbook page 57 and, for sand filters BWSC Guidance Document page B-17).

- Porous pavements (although normally used as an infiltration practice, porous pavements can also be utilized as a filtration practice when provided with an appropriate reservoir/filter course and underdrain; Handbook page 118).

Constructed Stormwater Wetlands and Wet Basins

- Shallow marsh wetlands (Handbook page 38).
- Pocket wetlands (Handbook page 41).
- Basin/wetland systems (Handbook page 39).
- Extended detention wetlands (Handbook page 40).
- Gravel wetlands (may arguably be considered a filtration practice; Handbook ge 47).
- Wet basins (with appropriate permanent pool volume and length to width ratio; Handbook page 63).
- Wet water quality swales (not to be confused with drainage channels or grassed channels; Handbook page 79).

Structural BMPs found by Handbook and Guidance not to be effective at bacteria removal unless used in combination with other BMPs effective in removing bacteria:

- Catch basins. Treated effluent from a Pathogen-Effective BMPs should never be routed through a catch basin sump.
- Oil and grit separators, and proprietary separators (including particle separators and hydrodynamic separators).
- Sediment forebays.
- Rock lined swales, drainage channels, and grassed swales designed for conveyance rather than water quality. These conveyance practices should not be confused with dry and wet water quality swales, which are designed to retain and treat the water quality volume through media filtration, infiltration or permanent ponding as further described in the MassDEP Stormwater Handbook.
- Dry detention basins, and extended dry detention basins (though in some cases these BMPs may be reconfigured as wetland detention basins which are Pathogen-Effective).

Draft Massachusetts Small MS4 General Permit - Comments

1. Will EPA provide a clear consolidated schedule of requirements for each BMP similar to what was presented when the 2010 Draft Permit was issued?

2. Please describe the methods to delineate catchments. Are they to be based on of topography only? How can a catchment be ranked before mapping is complete? The sequence of system mapping and catchment ranking is not realistic in the time allowed, two (2) years for mapping, needed to delineate piped drainage systems and catchment ranking in year one (1).

3. EPA should define interconnection as related to screening target requirements or catchment delineations.

4. EPA should quantify multiple and widespread failures as related to system vulnerability factors.

5. EPA should define medium and densely populated areas.

6. EPA should explain the purpose of screening and sampling each outfall when the entire catchment is to be investigated regardless? If the MS4 is required to implement Catchment Investigation Procedures in every catchment per pg. 36. Part 2.3.4.8.c. *(The permittee shall implement the Catchment Investigation Procedure in every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges.)*

7. EPA should clearly explain the purpose of the March-June sampling timeline requirement for wet weather sampling. Dry weather sampling has no calendar requirement and wet weather sampling is much more difficult to coordinate due to precipitation, daylight and tidal requirements.

8. If the purpose of wet weather sampling is to locate leaking sanitary sewer lines, will EPA allow municipalities use alternative methods to locate these illicit discharges? Permittee's feel alternate methods can achieve wet weather goals without the influence of surface runoff in the sample. By utilizing sandbagging techniques an investigator could locate this type of illicit discharge. For example, installing sandbags in junction manholes for several dry days any flow captured would be sampled without the contamination surface run off would contribute. This could be restricted to the same high groundwater months (March-June) specified in the Draft Permit but would eliminate surface runoff contamination which occurs during rain events. Investigating high bacteria from surface runoff is not an effective use of IDDE resources.

9. EPA should clarify if all or some criteria of sample result thresholds must be met to trigger further investigation. The Permittee finds it unreasonable for wet weather sampling thresholds to be the same as dry weather levels.

10. When is an outfall/catchment investigation closed if the outfall is dry during dry weather screening but sampling results are high in wet weather but the IDDE was unable to identify a source?

11. Will EPA align timeline for dog owner messages required in MS4's with water quality limited waters? Messages should be allowed to be provided along with the dog license notices as allowed with other additional requirements.

12. In MS4's with carry out/carry policies out in parks will the Permittee be required to provide waste containers for disposal of trash and pet waste?

Dear Mr. Tedder:

Further to my letter of December 23, 2014, our stormwater team has some additional questions:

1. Neither our DPW headquarter nor our transfer station is in, nor do they discharge to an MS4 area. Does this mean that we are not required to do those tasks in Section 2.3.7 of the draft permit which are site-specific to these locations?

2. All of the Parker River system waters are impaired. We can find no evidence that there is a TMDL for any of the included rivers at this time. Are we correct?

3. Do roadside ditches in a residential area, which gradually discharge in a diffused manner to adjacent bordering vegetated wetlands, constitute an outfall?

Thank you for your assistance.

Mr. Newton Tedder
US EPA – (OEP 06-4)
5 Post Office Square
Boston, MA 03109-3912

Dear Mr. Tedder:

This letter is in response to EPA's request for comments on the draft MA MS4 General Permit entitled "General Permits for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts".

Our comments are as follows:

1. MS4 Area Delineations

   It is suggested that communities be allowed to participate in the selection/delineation of MS4 boundaries. The use of census tracts appears to be a somewhat crude way to denote the more vulnerable sections of a small municipality; small, but important dischargers can easily be missed by people who are not familiar with the town. (EPA Urbanized Areas Map, Newbury, MA)

2. Inspections

   We feel that quarterly site inspections of all areas exposed to stormwater, and all stormwater control measures is an excessive and overly burdensome requirement. We would suggest annual inspections would be sufficient (2.3.7.b.iii (a)).

3. Flexibility in Response

   While the activities requirements in the draft permit are excellent for raising public consciousness, locating current points of illicit discharge, and improving the municipality's performance in source control, there are no requirements for BMP retrofits.

   We suggest that the EPA consider giving some credit to the municipalities that actually retrofit their stormwater system with structural BMP's. There are some activities (such as keeping certain records and certain required documentation) that appear to be of limited value for some smaller communities (2.3.7.biv)

4. Measurable Goals for Public Education

   The success of any publication program is not easy to determine. Questionnaires frequently are not returned. The success of a workshop, lecture or seminar is dependent upon weather, conflicting activities that would appeal to the same audience, etc. Hence, success is frequently beyond the municipality's

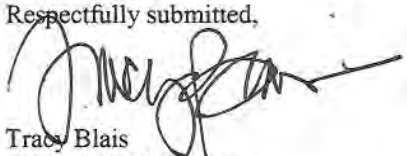
control. While the municipality can sponsor a public education event it cannot force people to attend, nor be assured that the message gets across to attendees.

We suggest that the number of public education activities be increased for communities that do not wish to establish and track "measurable goals", and that the presently required activities be maintained for communities which wish to comply with the draft permit as written. Alternatively, communities that find it difficult to track "measurable goals" might construct some structural BMP's instead. It should be noted that mailed out questionnaires that seek to evaluate the extent that public consciousness has been raised are both expensive and frequently fail to elicit a meaningful response (Fact Sheet page 74-76).

5. Replacing Planned BMP's

The municipality should not be required to justify a change in an ineffective BMP as long as the two BMP's are comparable (4.1 b).

Respectfully submitted,



Tracy Blais

Re: **Public Comment on 2014 Draft NPDES General Permit for MS4 Systems in Massachusetts**

Dear Mr. Tedder:

We thank you for the opportunity to comment on the above referenced draft permit. The City of Newburyport is committed to improving water quality through stormwater management efforts. We have reviewed the subject Draft MS4 Permit and fact sheet and provide the following general comments:

- We consider ourselves an environmentally-friendly community – we worked hard to join the members of the Massachusetts Green Communities – and we are updating our Stormwater Rules and Regulations to implement very strict requirements. These regulations will provide further support to supplement our Stormwater Ordinance. However, The City of Newburyport is operating with limited funding and resources at our disposal. We anticipate that the strict schedule and additional requirements of the Draft MS4 Permit will create a huge financial burden for the City. We do not object to the permitting compliance requirements, per se, but rather how we can fund it.

- The outfall monitoring requirements and schedule, as drafted, are not feasible based on our current and anticipated resources. Wet weather sampling is particularly burdensome, given that it serves little purpose in detecting illicit discharges to the stormwater system. We feel that this requirement should be removed from the permitting requirements so that communities are better able to focus their limited resources on known priority areas.

- The significant amount of recordkeeping, documentation, written procedures and protocols required to be developed under this permit will further exacerbate resource issues. We believe the City's time would be better spent identifying and resolving problems with the sanitary sewer and stormwater infrastructure in order to achieve the maximum benefit to the watershed as a whole.

- If every municipality is required to do all this work at the same time (upon execution of the Permit), we'll all be fighting the same labor pool. The supply of engineering graduates for this demand is simply not going to be there. A similar labor shortage will likely occur for the labor necessary to clean the piping and structures with the equipment needed to perform said functions. While it is not overly complex, the new vacuum trucks do require a particular skillset, otherwise the infrastructure will get destroyed.

- We are considering a separate Stormwater Utility to assist us in funding this work but we are already experiencing strong opposition to yet another fee or tax. Environmental issues are not just local but are also for the welfare of our nation. Therefore, we believe that funding opportunities and programs should be provided at the federal level.

We also provide the following slightly more specific comments:

1. Our 250+ year old city has approximately 38 miles of drainage pipe, 500 manholes, 2,800 basins, 175 outfalls, and 8 culverts. Plus a number of miles of grassed swales. The vast majority of our structures is 100+ years old and need replacement. They do not meet today's standards for treatment (sump depths, hoods, etc.). Simple math will prove that complying with the proposed permit requirements for this many structures and this much pipe will cost in the millions. (2,000 basins @ $4k each = $8 million, etc.)
2. If this Permit is fully executed as currently proposed, we will likely need $485,000 more annually for labor (3 junior engineers, 4 laborers, and summer interns), $70,000 annually in police detail for cleaning and maintenance work, and $45,000 annually for consulting fees. Total additional annual labor costs will be about $600,000.
3. The City currently hires-out services for catch basin cleaning but we will not be able to continue this practice if we are to remain in compliance with the Permit. Therefore, we will need to purchase two vacuum trucks at approximately $400,000 each. Additional equipment will likely be required.
4. The TMDL requirements will be imposed on almost our entire MS4 area because it almost all drains into the Merrimack River. This only adds to the manpower, equipment, and testing costs. We suspect that our runoff will surpass the threshold requirements proposed

in the permit so eliminating positive-tested pollutants from our screening program within 60 days is way too soon. Identifying the problem is one thing; it's another to successfully remove it. Section 2.1.1.d.

5. Demonstrate no net increase in pollutants to an impaired water body is difficult and we need to train people to make this happen. We are not sure if we can get the expertise soon enough and successfully meeting the one-year timeframe as required. Section 2.1.2.b.
6. Mapping our system is time consuming. Our Engineer Department just completed mapping a small, ¼ mile section in our city and it took many days to complete. Our system is very old and has been connected to, rerouted, partially abandoned, collapsed, or otherwise modified. Mapping it properly takes smoke and dye tests and video camera work and this takes time. Two years is too short of a timeframe to map our city. We will need at least five years to perform this work. Section 2.3.4.6.
7. Creating and prioritizing an IDDE program will take additional time. It would be best if we combine an IDDE program with the mapping work so we don't have to look at that section of the system twice. We request longer than 2 years. Section 2.3.4.7.
8. We cannot complete the priority ranking of catchments within one year if our existing information is insufficient to do so. We highly recommend doing the ranking after doing bullets 6 and 7 above. Section 2.3.4.7.c.iii.
9. Implementing a screening program within 15 months is too soon. We first need to locate all the outfalls as well as find the labor. Section 2.3.4.8.b.
10. Some of this work can be done concurrently providing we have the staff but a lot of this work is linear. Implementing and reporting catchment investigation procedures in every catchment (Section 2.3.4.8.c) and the Permit's subsequent req'ts related thereto (Section 2.3.4.8.c.i, ii, and iii) should be pushed back so the mapping can be done first so we know the limits of the catchment areas.

Again, we are committed to improving the water quality from our stormwater runoff but as you can see, it'll take a lot of money and a lot of time. Please take our concerns seriously.

Thank you for the opportunity to comment.

Very truly yours,

Re: Comments on the Draft NPDES MS4 Permit

Dear Mr. Tedder:

The City of Newton is in receipt of the Revised Draft Small Municipal Separate Storm Sewer System (MS4) General Permit for stormwater management, applicable to 260 communities in the Commonwealth. Staff from my office attended an information session last fall on the proposed content and requirements. We appreciate that EPA has listened to our previous comments, made in response to the first draft, and has revised some of the most onerous requirements. The current draft, although better, still has an overwhelming number of requirements - several of which have significant cost implications.

The regulatory agencies and the regulated communities share a common mission: to ensure the health and quality of our cities and towns and their natural resources. In order to accomplish these goals, environmental programs must be balanced with other needs and responsibilities of each community and implemented in a fashion that is both feasible and financially responsible. In this context, we offer the following comments on the Draft Permit.

GENERAL COMMENTS

NOI Form: The amount of detailed information required to complete the new electronic NOI Form is extensive and includes information that, in the previous permit cycle, was provided in the Stormwater Management Plan (SWMP). Having a detailed understanding of all the proposed BMPs that will be used to meet the six minimum control measures, as well as those to be used to meet the water quality based effluent limitations, within 90 days is impractical. The NOI submittal should be scaled back to provide only basic information relative to the storm sewer system and leave the more detailed descriptions of the proposed BMPs to meet the six minimum measures and water quality based requirements for the SWMP, which permittees have up to a year to complete.

Timeline: First Year Requirements: The number of major activities and related plans that need to be completed in the first year of the Permit is impractical. Our review of the permit indicates that there are over ten major plans or action items that need to be completed in the first year after issuance of the final permit, or sooner including:

- NOI preparation
- SWMP preparation
- Inventory of municipally-owned parks, buildings, facilities and equipment
- O&M plans for municipal facilities
- Inventory of the City's infrastructure requiring rehabilitation and/or repair
- Sanitary Sewer Overflow (SSO) inventory
- Outfall/interconnection inventory (including condition assessment)
- Updated Illicit Discharge Detection and Elimination (IDDE) Plan
- Storm Water Pollution Prevention Plans (SWPPPs) for relevant municipal facilities
- Updated written protocols for erosion control inspections and infrastructure maintenance.

Comment: We suggest that the time frame to complete these activities, especially the O&M Plans, outfall/ interconnection inventory and condition assessment and SWPPP preparation be extended to at least two years from the effective date.

Phosphorus Control Plan:

Newton is very concerned about the costs to implement a Phosphorus Control Plan (PCP). Like many New England communities, our underground infrastructure is aging and funds must be allocated to fix and upgrade our storm drainage system. The development and implementation costs associated with the PCP are roughly estimated to be $10 Million for Newton. In order to fund the PCP we will have to make tough choices between critical drainage infrastructure projects, stream channel improvements (restoration) and permit compliance projects; some of which will need to be implemented on private / commercial property, which we have little, if any, authority to do. It would be helpful if the EPA could provide documentation (that we may share with our community) demonstrating the benefits of phosphorus control are a worthy investment of this magnitude.

Pollutant Load Calculations - Appendix F and Appendix H: There is a significant amount of work to complete the calculations, tracking and accounting to address impaired waters. It will be difficult for us to prepare all this information and complete the data management relative to pollutant load reductions and credits without a consultant or full time staff member.

Comment: EPA should provide significant support to municipalities if they are to prepare this information on their own. Training sessions and technical support are recommended.

SECTION SPECIFIC COMMENTS

Section 1.9.2 - Documentation Regarding Historic Properties: It is unclear what documentation will be needed to demonstrate no impact to historic properties. The screening procedure outlined in Appendix D suggests that any subsurface excavation activity related to the stormwater program, which is highly likely as part of any future repair, upgrade or replacement of stormwater infrastructure, will require consultation with State Historic Properties Office (SHPO) to certify that there will be no impact to historic properties and the documentation of this consultation/ certification must be included in the NOI and the SWMP in order to be eligible for permit coverage.

Comment: The SHPO certification requirement regarding subsurface excavation activity imposes two major problems: 1) the extent of possible future repairs and related excavation activity will not be fully understood at the time of NOI submittal, and 2) to obtain SHPO certification for each potential excavation activity will result in extensive added coordination time, costs and project delays if field investigations are required to obtain this certification. Also, is EPA confident that SHPO will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI?

Section 2.2.1 – Discharges to Impaired Water Bodies with an Approved TMDL: Tables F-1 and F-2 of Appendix F indicate that Newton's phosphorus reduction target is 52%.

Comment: Given that the reported phosphorus removal efficiencies are generally in the range of 40 and 65 percent for structural stormwater BMPs and much lower for non-structural measures, this would essentially mean that nearly all, or a large majority of existing impervious areas, would need to be treated with structural BMPs. This is not only impractical given the wide range of site constraints that will be encountered in implementing stormwater retrofit BMPs but would also be quite costly. We suggest that EPA provide guidance for municipalities to realistically meet the targets including increased credits for non-structural measures if they are considered truly worthy actions.

Section 2.3 - Requirements to Reduce Pollutants to the Maximum Extent Practicable (MEP):

Comment: Completing the multitude of requirements included in this section in a 5-year permit cycle is not realistic. We suggest that the number of requirements be reduced substantially and be spread over two permit cycles or allow up to 10 years to complete this section's requirements.

Section 2.3.4.7.d.iv – Written Illicit Discharge Detection and Elimination Program: This section states that "The permit does not require a minimum rainfall event prior to wet weather screening. However, the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather."

Comment: We know first-hand how expensive and time-consuming wet weather sampling can be, especially when limited to 4 months of the year as specified. In Newton, we have been collecting wet weather samples for 9 years. The data collected over these 9 years has led us to find only 1 out of 101 drainage basins with an illicit connection. Unless there is clear evidence that there is a wet weather contamination threat, wet weather sampling should not be mandated. Bacteria levels in stormwater are highly variable and individual samples could easily show a spike which could falsely indicate an illicit connection. This could be extremely costly to try to track down with no

results. It is requested that EPA provide: data on past wet weather sampling results that show the number of outfalls sampled during wet weather for which illicit connections were found that were not also found during the dry weather screening process, cost of the stormwater sampling for all the outfalls sampled, percentage illicit connections that had wet weather contamination, not stormwater contamination found that was not indicated during dry weather sampling, and source of the contaminants found (i.e. one time dumping verses continuous illicit connection).

Section 2.3.4.7.e.ii – Catchment Investigation Procedure: This section describes the manhole inspection methodology.

Comment: We feel that it is an excessive amount of work to investigate every junction manhole if there is no dry weather flow or indication of any illicit discharges. Investigating upstream of outfalls requires work in the middle of roads, sidewalks, private property and will require police details and substantial field work and disruption. Time and money may be better spent on training municipal staff and contractors during their regular field work and maintenance, as well as the focused educational materials regarding what is an illicit connection for the residents/businesses/property owners. We request that EPA provide data showing that investigating upstream drainage systems when there is no evidence of illicit connections at the outfalls results in the identification of illicit connections worthy of the associated cost.

Section 2.3.6(d) – Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management: This section states "All BMPs installed as part of the site's stormwater management system shall be constructed in accordance with the Massachusetts Stormwater Handbook Volume 2, Chapter 2."

Comment: The Massachusetts Stormwater Handbook is outdated for many of the changing BMP design features. Some BMPs such as permeable pavements are not even included in the Handbook. Other states are developing more updated design handbooks in response to TMDLs and stormwater requirements such as Rhode Island and the Chesapeake Bay area states. In addition, limiting designers to meeting the Massachusetts Stormwater Handbook will discourage designers to install BMPs that do not meet the standards but still provide treatment (as indicated by the EAP pollutant treatment curves). The wording should be changed to reference the MA Stormwater Handbook, as well as EPA, and other state manuals with recent updates that provide good BMP design guidelines.

Section 2.3.6.d.: This section requires permittee to track impervious area and disconnected impervious area each year.

Comment: Requiring a municipality to have an accurate database of the impervious cover broken down by what is directly connected or disconnected is an onerous requirement without an explanation of the use or benefit of such detailed data. Statewide and/or regional impervious cover data layers provide a much more cost effective estimate of impervious cover for the purpose planning, understanding trends, and identifying hot spots.

Section 2.3.7.a/b – Operations and Maintenance (O&M) Programs and Stormwater Pollution Prevention Plan (SWPPP): This section requires written O&M procedures for the municipal facilities that have specific activities listed within the first year and SWPPPs within the first two years.

Comment: This requirement includes collecting, organizing and updating information on each facility and will be difficult to effectively complete within one year, in addition to the other first years tasks. We suggest extending the time for completion of these documents to three years.

Appendix H, Attachment 1 – Street Sweeping and Catch Basin Cleaning Credits: The credits included in the permit are based on information from Center for Watershed Protection Street Sweeping program in the Chesapeake Basin, dated 2008.

Comment: The credits provided for street sweeping are extremely low and there it is no mention in the permit about the extensive benefits of street sweeping for removing a considerable volume of debris and sediment in addition to actual pollutant loads. The credits do not provide incentive to utilize this source control method that not only removes contaminants and trash, it also contributes to the long term longevity of the BMPs that are listed as most valuable for phosphorus removal; infiltration BMPS. We recommend that this be researched further including the region specific USGS street sweeping study completed recently in Cambridge Massachusetts to determine the appropriate credits. If, in fact, the water quality benefit is shown to have such an insignificant impact then these costly practices should not be required.

Appendix F Attachment 3 Semi-Structural/Non-structural BMP Performance Credits: The section states that the cumulative runoff reduction is being used to estimate cumulative phosphorus load reduction credit for the semi-structural/non-structural BMPs which have an infiltration benefit by disconnecting IA and providing soil amendments to increase permeability.

Comment: The infiltration BMP curves show that phosphorus reductions are greater than runoff volume reductions. Therefore, it is conservative to use runoff volume as a direct surrogate when in fact phosphorus reductions are likely higher. We suggest an additional phosphorus treatment factor in addition to solely the runoff reduction.

Sincerely,

Keith Nastasia

Mr. Newton Tedder
Environmental Protection Agency – Region 1
5 Post Office Square – Suite 100
Boston, MA 02109-3912

Dear Mr. Tedder:

We have reviewed the Draft NPDES General Permit for Stormwater Discharges for Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts noticed in the federal register on September 30, 2014. With regards to the Draft Permit and the Appendices, we offer the following comments:

1. Annual Reports submitted under the 2003 Small MS4 Permit indicate a large variability in the work being done by MS4 operators to comply with existing permit requirements. Some of these reports document the significant activities undertaken by the MS4 operators while others have minimal documentation. Without a significant commitment from the Environmental Protection Agency (EPA) or the Massachusetts Department of Environmental Protection (MassDEP), compliance with the Draft 2014 Small MS4 Permit will likely continue to be variable. What level of oversight of this program will be provided by EPA or MassDEP?

2. Section 2.3.6 of the Draft 2014 Small MS4 Permit requires permittees to develop or modify an ordinance or regulatory mechanism to regulate stormwater. Under this requirement, permittees must develop a local stormwater ordinance to retain the first inch of stormwater from all new or redeveloped sites, or provide a level of pollutant removal equal to or greater than retaining the first inch of stormwater. We concur that requiring a greater level of infiltration or treatment of stormwater at the source is consistent with environmental goals for improved water quality. However, based on the guidance provided in the Permit, the requirement also allows for wide interpretation at the local level regarding how to meet this requirement. We are concerned that local governments will independently develop stormwater regulations to meet this requirement that may vary widely from municipality to municipality.

   Additionally, stormwater is regulated by MassDEP through the Stormwater Management Standards under the Wetlands Protection Act. After municipalities develop a stormwater ordinance as required by the Permit, the local regulations will not align with the infiltration and water quality treatment requirements in the MassDEP Stormwater Management Standards. How will these conflicting requirements between the regulations/permits be resolved? This requirement may further contribute to inconsistent development regulatory requirements throughout the Commonwealth. What happens if a local municipality chooses an infiltration requirement or process that is not substantiated by standard engineering practice or science?

3. Will there be a review process of a municipality's proposed stormwater regulations to determine compliance with the MS4 permit requirements? What happens if there are conflicting requirements between local regulations and the requirements/intent of the MS4 Permit? Who will resolve conflicting requirements?

4. Section 2.3.5 and 2.3.6 describe reevaluating current land development regulations that impact the inclusion of low impact development (LID) stormwater management techniques in new development projects, the reduction of impervious cover, and erosion control management. Therefore, stormwater management could be regulated by a number of regulatory boards within each municipality including the Planning Board, Zoning Board of Appeals, Conservation Commission, or possibly an additional Board created by a municipality to regulate stormwater management. We assume the intent is to uniformly incorporate stormwater management throughout the land development process and agree

that there are many land development regulations that require study, revisions, and updates. Our concern is that the execution of this requirement at the local level may result in more regulatory hurdles for the development community, rather than aligning all municipal regulations as intended.

5. Further clarification is needed regarding the application of the design requirements in Section 2.3.6 to redevelopment sites. If a portion of a site is redeveloped, will the entire site be subject to the increased standards described in this Section, or will the new requirements apply only to the portion of the site that is being redeveloped? Is it the intent of EPA to allow each municipality to determine the extent to which compliance is required for redevelopment sites?

6. In our conversations with MS4 communities and facilities, we understand the requirements of the permit are perceived as extensive and arduous. Compliance, and more specifically the documentation of compliance, with the minimum control measures will require significant time, energy, and expense by municipalities and non-traditional MS4s. MS4 communities and facilities are concerned with the lack of funding associated with the Draft Permit.

7. The Draft Permit appears to be more specifically weighted towards municipalities. Section 5.0 of the permit acknowledges non-traditional MS4s and how the requirements will differ for the non-traditional MS4s when compared to municipalities. Requirements for the non-traditional MS4s appear less arduous than the requirements for the municipal MS4s. Although there is no criteria listed within the MS4 permit for non-traditional MS4s, the EPA website lists 41 non-traditional MS4s. The final Permit should provide clear criteria for the designation of non-traditional MS4s and a timeline for when these designations will be made.

8. Appendix F of the Draft Permit describes requirements for discharges to impaired waters with an approved Total Maximum Daily Load (TMDL) and provides targets for pollutant reductions. Some MS4s may have already implemented Best Management Practices (BMPs) to accomplish pollutant reductions. Will credit for previously installed BMPs be allowed, possibly reducing the overall pollution reduction target, or are these pollutant reduction targets required at the time the permit goes into effect? The path to achieve compliance with the pollutant reduction targets should be clarified in the Final Permit.

9. Due to site constraints, there may be properties regulated by the Draft Permit that are not able to achieve the pollutant reduction targets described in Appendix F. In the event that the pollution reduction target is not achievable, is it EPA's intent to require retrofits on privately-owned property that are paid for and installed by private property owners?

In general, the structure of the requirements places a lot of burden on the regulated communities and facilities, which could lead to inconsistency in the implementation of the MS4 permit requirements.

Please call if you have any questions or request clarifications on these comments.

Very truly yours,

Nitsch Engineering, Inc.

Scott D. Turner, PE, AICP, LEED AP ND
Director of Planning

RE: U.S. Environmental Protection Agency's (EPA) Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder:

The Northern Middlesex Council of Governments (NMCOG) and the Northern Middlesex Collaborative (NMSC) have reviewed the U.S. Environmental Protection Agency (EPA) Draft Massachusetts Small MS4 General Permit, appendices, and fact sheet, released on September 30, 2014.

Formed by the Northern Middlesex Council of Governments in 2013, the Northern Middlesex Stormwater Collaborative (NMSC) utilizes a regional approach to address the public education, procurement, management, administrative, and mapping tasks necessary to meet EPA requirements and implement municipal stormwater management plans. The NMSC is comprised of thirteen communities in the Northern Middlesex Region including Billerica, Burlington, Carlisle, Chelmsford, Dracut, Dunstable, Littleton, Lowell, Pepperell, Tewksbury, Tyngsborough, Westford and Wilmington. The NMSC is overseen by an Advisory Board with equal representation from each of the 13 participating communities. The goals of the Collaborative are to effectively manage stormwater, improve water quality, share resources, improve services for residents, reduce costs, and promote regional communication. We also strive to serve as a model to municipalities throughout the Commonwealth.

The NMSC recognizes the importance of stormwater management and values the importance of clean rivers, stream, lakes and water bodies. Achieving designated uses, in particular, is important to the health and economic well-being of our communities. However, at the same time, municipalities are balancing environmental concerns with multiple other needs and responsibilities. They are striving to implement stormwater management programs in a responsible manner that balances feasibility, fiscal responsibility, and maintenance of the health and well-being of the residents and

environment in their jurisdictions. As such, we submit the following comments on the Draft Massachusetts Small MS4 General Permit.

NMSC COMMENTS

The draft general permit requires regulated small MS4s to develop, implement and enforce a "Stormwater Management Program" designed to control pollutants to the maximum extent practicable, protect water quality, and satisfy appropriate requirements of the federal Clean Water Act. Municipalities must comply with existing water quality standards including TMDLs, water quality limitations as found on the 303d and 305b lists, and numeric and narrative criteria. It also includes implementation of six minimum control measures: illicit discharge detection and elimination (IDDE), public education and outreach, public participation, management of construction site runoff, management of runoff from new development and redevelopment, and good housekeeping practices.

WATER QUALITY-BASED EFFLUENT LIMITATIONS AND DISCHARGES TO IMPAIRED WATERS

In the Northern Middlesex region, there are two approved TMDLs: the bacteria/pathogen TMDL and the Assabet River Watershed TMDL. In addition, municipalities are subject to limitations related to phosphorus impaired waters without a TMDL.

Bacteria and Pathogen TMDL

Billerica, Burlington, Tewksbury and Wilmington are subject to the bacteria/pathogens TMDL. This is stipulated on page 14 of the Draft permit, which explains that municipalities "*that discharge to a waterbody segment listed on Table F-6 in Appendix F ....shall meet the requirements ... with respect to reduction of bacteria/pathogens discharges from their MS4.*" Our first comments are editorial in nature. Table F-6 in Appendix F refers to the Phosphorus TMDL table, so the text should be amended to reference Table F-8, which is the bacteria TMDL table. In addition, for the larger tables embedded in the text, the Table name and number should be displayed at the top of the table, rather than at the bottom. For the bacteria TMDL table, one must scroll through **nine pages** in order to see the table name at the end of the table. Listing the table names at the top of the table would save time and enhance readability.

Table F-8 indicates that Billerica, Burlington, Tewksbury and Wilmington all discharge to water bodies impaired for fecal coliforms including Spring Brook (MA 83-14) in Billerica; the Shawsheen River (MA 83-17) in Billerica, and Wilmington; Vine Brook (MA83-06),

Long Meadow Brook (MA 83-11) and Sandy Brook (MA-83-13) in Burlington; and Strong Water Brook (MA 83-07) and an Unnamed Tributary (MA 83-15) in Tewksbury.

A review of the source documents indicate that the Lakes and Ponds TMDLs were drafted years ago using older data and outdated testing methods. For example, the Shawsheen River TMDL was finalized in 2002 and used data from 1989 through 1998.[1] This data likely does not reflect the current conditions today. In addition Fecal coliform is no longer the recommended indicator for bacteria sampling; today, EPA recommends E. coli as the best indicator of health risk from water contact in recreational waters.[2] The TMDLs should be revised to use more updated data and testing methodology.

To comply with the TMDL, municipalities must identify and implement Best Management Practices (BMPs) to reduce bacteria or pathogen discharges from its MS4. These include enhanced public education for pet waste, and septic systems and a "high priority" designation for catchments draining to any waterbody impaired for bacteria or pathogens. However, according to the Massachusetts Lakes and Pond Guide, bacteria and pathogens can come from a variety of sources including failing septic systems, waterfowl, farm animal and pet waste, polluted stormwater runoff, wildlife, and wastewater treatment plants.[3] The bacteria and pathogen BMPs only focuses on pet waste, septic systems and illicit connection, and do not account for bacterial contamination that could come from waterfowl or other animals (e.g. farm animals or geese). Municipalities should have freedom to implement enhanced BMPs that make the most sense for their municipality, and that allow that municipality to focus on the main issues in their jurisdiction. Additionally, a permittee should be allowed to submit information to EPA demonstrating that all or a portion of its discharge does not contain bacteria/pathogens, to obtain an exemption from the Bacteria and Pathogen TMDL requirements.

[3] http://www.uwsp.edu/cnr-ap/UWEXLakes/Documents/ecology/shoreland/background/mass_lake_and_pond_guide.pdf

Assabet River TMDL

Carlisle, Littleton and Westford must comply with the Assabet River Watershed TMDL, which was approved by EPA in 2004. The TMDL addresses water quality impairments resulting from the excessive growth of algae caused by an over-abundance of phosphorus in the Assabet River system. The TMDL sets waste load allocations (WLAs) for Publically Owned Treatment Works (POTWs) within the Assabet River watershed, as well as load allocations (LAs) for sediment flux and cultural contribution associated with stormwater runoff and groundwater. It does not require phosphorus load reductions from MS4 permittees, however, it also does not allow additional phosphorus from stormwater sources associated with future growth. Therefore, municipalities are required to take measures to ensure that current phosphorus loads from MS4 stormwater discharges do not increase. Municipalities must implement enhanced BMPs, including enhanced public education and outreach, additional requirements for stormwater management in new development and redevelopment, and additional good housekeeping practices (e.g. twice annual street sweeping.)

As with the bacteria TMDL, the age of the water quality data utilized to form the TMDL is a concern. Much of the data is from 1999, and is thus more than 15 years old.[4] The document should be updated with more recent data to better reflect current conditions. Additionally, municipalities should not be limited to the enhanced BMPs listed in Appendix F, because they may not be the most cost-effective and productive BMP for the community. For example, twice annual street sweeping may not be the most cost-effective way to remove phosphorus from the River. In fact, the requirement that municipalities in a nutrient impaired water body must sweep streets a minimum of two times per year is of particular concern. Municipalities worry that this could have unintended results at the municipal level – it could encourage the elimination of street trees, as well as permit denials for new street trees. Trees are important to the environment, and this requirement should be eliminated or revised so as not to discourage street trees in any way.

As with the bacteria TMDL, municipalities should have the freedom to choose the BMPs that work best for them, and should not be restricted to the three BMPs listed in the

---

[4] http://www.mass.gov/eea/docs/dep/water/resources/a-thru-m/anuttmdl.pdf

permit. Finally, a permittee should be allowed to submit information to EPA demonstrating that all or a portion of its discharges do not contain phosphorus to obtain an exemption from the Phosphorus TMDL requirements.

Phosphorus Impaired Waters

Billerica, Burlington, Carlisle, Chelmsford, Dracut, Dunstable, Littleton, Lowell, Pepperell, Tewksbury, and Tyngsborough are listed as discharging to Phosphorus Impaired Waters. Phosphorus Impaired Waters do not have a defined pollutant reduction target and no approved TMDL has been established. Appendix H outlines an iterative approach for addressing pollutant reductions to these waters: each permittee must comply with enhanced BMPs (public education, phosphorus-optimized BMPs, and increased street sweeping), a Phosphorus Source Identification Report, and additional structural BMPs.

These requirements are significantly stricter than the bacteria and pathogen TMDLs, and the proactive implementation of structural BMPs will be particularly costly for municipalities. Without an approved TMDL, it is difficult to make the most informed, cost-effective decisions regarding phosphorus reductions. Structural BMPs should not be required without a further understanding of the phosphorus loads to each of the designated water bodies, as well as the potential source. Requiring across-the-board implementation of structural BMPs will be extremely expensive, and it is unlikely that municipalities will be able to implement these structures without a designated funding source.

The permit stipulates that each municipality must complete a Phosphorus Source Identification Report within four years of the effective date of the permit. Additionally, all permittee-owned properties must be evaluated for the possibility of structural BMP retrofit opportunities within five years of the effective date of the permit. The permittee must install one structural BMP as a demonstration project within six years of the permit effective date. While six years may seem like a reasonable timeframe, the reality is that securing funding and planning for this project will take time, especially in addition to other permit requirements. The installation of the demonstration project should be changed to ten years to ensure municipalities have proper time for planning and funding the project. Installation of additional structural BMPs should only be required if phosphorus cannot be reduced using non-structural methods.

Six Minimum Control Measures

Public Education and Outreach (2.3.2)

The draft permit requires municipalities to distribute educational materials to four audiences: (1) residents, (2) businesses, institutions and commercial facilities, (3) developers (construction), and (4) industrial facilities. Municipalities must:

- Distribute two educational messages the first year;
- Distribute at least eight educational messages during the permit term; and
- Ensure messages to each audience are spaced at least a year apart.

In each annual report, municipalities must also document the messages for each audience, the method of distribution, the evaluation methodology, and the measures used to assess the overall effectiveness of the education program. It is clear that the EPA wants municipalities to evaluate the effectiveness of their educational messages and presumably modify or change that messaging over time, as necessary to be effective. However, the current draft permit does not provide any guidance on what would be considered effective messaging or how municipalities should be measuring success. It is recommended that EPA either remove this requirement from the permit or provide more clear instruction on how to adequately measure effectiveness of the individual messages as well as the overall educational program.

Education is a crucial component to stormwater management, and educating different audiences at various intervals is an excellent way to ensure that the message gets across to multiple stakeholders. However, this methodology is not appropriate for all communities. In particular, the smaller municipalities in our region, Dunstable, Pepperell and Carlisle, have very few businesses or industrial facilities. The requirement to educate these audiences should be waived if not applicable to the municipality.

Illicit Discharge Detection and Elimination (IDDE) & System Mapping (2.3.4)

The new draft permit requires municipalities to complete a SSO and Outfall inventory, a detailed system map, a detailed written IDDE program and catchment rankings. Dry weather investigation of key junction manholes as well as wet weather investigations for manholes with system vulnerability factors is required. The extent of the IDDE program requirements is particularly burdensome for municipalities. Comments regarding the IDDE program are as follows:

- *Outfall Inventory*: Municipalities are required to complete an outfall inventory and physically visit each outfall within one year of the permit. The range in the number of outfalls per community is highly variable and is dependent on the population and road miles in the affected community. In the NMSC region, some municipalities have over 600 outfalls, and it would likely take two to three years to visit all the outfalls. EPA should revise the permit to allow extended time for the completion of the outfall inventory, such as 3 to 5 years.

  The permit states that the municipality must "*physically label all MS4 outfall pipes (excluding interconnections) with their unique identifier by the end of the permit term.*" This new condition will presumably require a physical sign to be installed at each outfall pipe in the field. For some municipalities this will result in the installation of more than six hundred new signs. This will not only result in a substantial initial cost in both staff time and material costs for installation but will also introduce legacy costs to manage, maintain and eventually replace the signs over time. The location of many of these signs will also be in places where they will not aesthetically fit the character of the surrounding area and could also be vulnerable to potential vandalism. The installation of a physical sign should not be necessary with the increased level of MS4 mapping detail that will be required under the new permit – particularly because this would not be correlated with any improvements to water quality. EPA should eliminate the need to physically label all MS4 outfall pipes with their unique identifier.

- *GIS Map:* The permit indicates a full map of the drainage system is to be completed in two years. However, in order to correctly and thoroughly map the system, municipalities estimate it could take up to five years. EPA should revise the permit to allow for five years for the full map of the drain system to be completed.

- *Catchment Delineations:* The permit requires that catchment delineations are mapped for the use of priority rankings. Mapping catchments for each outfall will be very time consuming, and has the potential to be expensive with a low level of accuracy. EPA should consider that catchment mapping may not be necessary in all circumstances. For example, if outfall inspections yield a clean result, the outfall should be exempt from the catchment mapping requirement. EPA should revise the permit to allow municipalities to map the catchments as they are being inspected, or as needed.

- *System Vulnerability Factors:* The permit requires that municipalities develop a written systematic procedure for catchment investigation that includes detailed methodology and procedures to isolate and confirm sources of IDDE. The permit provides a series of vulnerability factors which are intended to identify catchments with a high potential for illicit connections. Many of the system vulnerability factors are too all-encompassing, and would include all of the catch basins in a municipality. In particular the factors that state *"Areas formerly served by sewers"* and *"Any sanitary sewer and storm drain infrastructure that is greater than 40 years old"* would encompass almost 100% of the sanitary sewers in many municipalities. EPA should eliminate these factors.

- *Reporting*: The permit states that municipalities need to report the volume or mass of material removed from each catch basin draining to water quality limited waters and the total volume or mass of material removed from all catch basins. This task will significantly increase the cost of catch basin cleaning for municipalities and is not necessarily a wise use of the limited resources available to municipalities. The tracking of volume and/or mass should be eliminated.

- *Wet weather monitoring*: Municipalities must conduct wet weather monitoring during the spring at designated outfalls, in order to identify illicit discharges that may activate or become evident during wet weather. This has the potential to be extremely costly for municipalities, with a low potential for benefits. Municipalities should be able to focus on removing dry weather discharges, which would indicate the most severe problems. Wet weather monitoring should not be required under the permit. Rather, it should be considered an optional BMP for compliance with Bacteria and Pathogen TMDLs.

Stormwater Management in New Development and Redevelopment (2.3.6)

This section of the permit requires municipalities to develop, implement, and enforce a program to address post-construction stormwater runoff from all new development and redevelopment projects that disturb one or more acres. There are two particularly problematic components of this requirement.

First, as currently written, roadway reconstruction projects greater than one acre will be required to provide storage and/or treatment for the first inch of stormwater runoff. This type of infiltration and treatment would likely be impossible for a linear project, and would be crippling to local road budgets. EPA should revise the permit to clarify that linear projects are exempt from this requirement.

Second, the permit requires that stormwater management systems on new and re-developed sites be designed to either: retain the first one (1) inch of runoff from all impervious surfaces on site, or provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of biofiltration on the first one (1) inch of runoff from all impervious surfaces on site.

Unfortunately, there is a discrepancy between the Massachusetts Stormwater Handbook and the requirements as outlined in this section: the Massachusetts Stormwater Handbook has variable infiltration requirements depending on soil type and site condition. The 1-inch requirement as outlined in the draft permit is particularly problematic for redevelopment sites. Many redevelopment sites are old, abandoned mill sites, which are constrained by site conditions and/or soil type. Municipalities are concerned that implementation of the 1-inch rule would render many of these properties undevelopable. As a result, developers would seek new land to develop as opposed to redeveloping a parcel. With the 1-inch requirement inadvertently encouraging new development, EPA should work with DEP to eliminate any discrepancy between standards.

PROGRAM EVALUATING RECORD KEEPING AND REPORTING

The demands of the new draft permit will significantly increase the level of reporting and record keeping that will be required, compared to the current 2003 permit. These additional demands will not only place a substantial and unfair financial burden on cities and towns but will also require a significant increase in municipal staff time and resources necessary to manage the new permit conditions.

Under the current permit, a significant amount of time and record keeping is required over the course of a year to make certain that all conditions of the permit are being met. The results of those efforts are documented in the annual report which typically ends up being about twenty pages in length for the average-sized community. The bulk of information included in the annual report is dedicated to a self-assessment and a summary of how the municipality is complying and will continue to comply with the permit's minimum control measures. The new permit will not only continue to require the current 2003 permit reporting and record keeping standards but will also require the preparation of extensive supporting documentation for inclusion in the annual report in order to demonstrate permit compliance. These additional requirements are expected to more than triple staff efforts to manage the permit over the course of each

permit year, and the resulting annual reports are expected to be more than five to ten times the size of current annual reports. In order to ease the proposed reporting and record keeping burden, it is recommended that EPA consider the following recommendations and improvements to the current draft permit:

- Provide a standardized and easy to use template that would be utilized to prepare annual reports. The Fact Sheet indicates that EPA is currently developing a suggested annual report template that will have pre-populated information to help ease the reporting burden. A reporting format similar to the current reporting format would be practical, since municipalities have become very familiar with this format, and introducing the option of having the template pre-populate information would also be helpful and appreciated.

- Reduce or eliminate the need to include extensive supporting documents with annual reports. It should be adequate for municipalities to summarize and confirm compliance within each report without the need to provide extensive back-up materials.

- Cities and towns should be given the option to electronically submit their annual reports rather than mailing or hand delivering a hard copy. The Fact Sheet does indicate that it will be possible to submit annual reports via email, however the draft permit only provides EPA's and MassDEP's physical mailing addresses where reports will need to be submitted. The draft permit should include information on electronic submissions.

- Provide guidance documents, to help municipalities fully understand and meet the increased reporting and record keeping requirements of the new permit, and to allow communities to better understand EPA's permit expectations. The current draft permit is almost three hundred pages long with the nine appendices, and the supporting Fact Sheet with attachments is one hundred and fifty pages long. The combined volume of information between the two is not only overwhelming but also confusing and difficult to fully interpret. Helpful documents that would provide better guidance and direction for municipalities include: a summary table of major changes between the current and draft permits (this was provided for the previous draft permit), a simplified summary of permit requirements (this was also provided for the previous draft permit), permit checklists, standardize reporting and record keeping templates,

examples of completed forms and reports that show level of detail expected, FAQ sheets, etc.

- Each annual report is required to estimate the annual increase or decrease in impervious area and directly connected impervious areas. This task would be much more manageable and cost effective for municipalities if it were required every five years, rather than recalculating these areas on an annual basis. Most cities and towns use aerial imagery and GIS to calculate and track impervious cover, which would be extremely expensive if required every year. The expected level of accuracy for the change in impervious area should also be specified in the draft permit.

Funding & Additional Assistance

As drafted, EPA estimates the cost to meet the requirements associated with implementation of the six minimum control measures to be between $78,000 and $829,000 per year averaged over the permit term. This does not include compliance with any additional parts of the permit, including the water quality requirements.

Municipalities will have a very difficult time funding this work. Funding mechanisms should be suggested and provided by EPA, so that municipalities can meet the terms of the permit effectively and efficiently. EPA should also provide assistance with educating local municipal managers, administrators, and boards regarding the permit terms. This education will be crucial to permit implementation at the local level. It is recommended that EPA hold a series of meetings for municipal administrators and policy boards, so they understand the components and implications of the permit.

Thank you for considering our comments. Should you have any questions or need clarification, please feel free to contact me directly at (978) 454-8021, ext. 120.

Sincerely,

Beverly Woods

RE: Comments on the 2014 Draft Massachusetts MS4 Permit

Dear Mr. Tedder;

The Town of Northborough Engineering Department has reviewed the Environmental Protection Agency (EPA) National Pollutant Discharge Elimination System (NPDES) Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts. We thank you for the opportunity to provide comments.

The Town of Northborough is a rural community, which is located 10 miles northeast of Worcester and 30 miles west of Boston. The Town has a total area of 18.76 square miles, one third of which is protected open space. The Town also contains 79 miles of roadway along with portions of Massachusetts State Routes 9, 20 and Interstate 290, Interstate 290 connects Interstate 495 with Worcester. Northborough, like many of the cities and towns in Massachusetts is struggling with insufficient funds and manpower to accomplish all of the tasks associated with municipal government while providing a desirable place to live for its' 14,000 residents. The Public Works Department is significantly is currently under staffed in comparison to other communities with similar area and population.

Northborough is one of the 28 members of the Central Massachusetts Regional Stormwater Coalition (CMRSWC) and is a regulated community under the United States Environmental Protection Agency's (the Agency's) 2003 NPDES Phase II Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit. We have provided a letter of support for the Coalition's comments submitted by Spencer's Town Administrator, Adam Gaudette but would like to also provide the following comments:

1. We are supportive of proposed Permit provisions that will directly result in improved water quality, but object to those that are administrative or arbitrary, and that will not have a direct bearing on water quality.

2. We encourage the Agency to update its own guidelines about how regulated communities are expected to balance compliance with the Permit (in its final form) with the ability to afford that compliance without experiencing economic hardship.

3. We encourage the Agency to include flexibility in the final Permit with respect to the date on which the Permit in its final form will become effective in each community. Flexibility in setting the effective date will allow each town the opportunity to budget for Year 1 and Year 2 tasks, specifically, within the municipal budget cycle, which will likely be out of sync with the Permit cycle.

4. We believe that many provisions in the proposed Permit do not lend themselves to implementation over a five-year Permit term, at least in a way that is affordable for the regulated communities and that results in meaningful improvements to water quality. Instead, we propose that the Agency extend the schedule for several specific provisions, such as development and implementation of a catchment delineation, over a ten-year period. The Commonwealth of Massachusetts has in place a statutory framework that allows for such an extended timeline as a Compliance Schedule within a NPDES Permit. This compromise will comply with Clean Water Act 402(b)(1)(B) while providing flexibility for the regulated communities.

5. When describing dry weather and wet weather screening and sampling and outfall/interconnection screening, the proposed Permit frequently refers to "detectable levels of chlorine". It should be noted that chlorine is detectable in most if not all outfalls and at the perimeter of many of Massachusetts' surface water bodies using many field kits available today, and this detection limit is likely to become lower (identifying smaller and smaller concentrations of chlorine) as technology improves. Treated drinking water entering a stormwater system is the potential source the chlorine indicator is intended to highlight. However, chlorine in drinking water is highly volatile, and decomposes quickly once discharged to a surface water body and exposed to sunlight and the ambient atmosphere. If all outfall samples would demonstrate "detectable levels of chlorine", but the chlorine will degrade quickly within a water body, this parameter ceases to be useful as a screening tool. We request that the chlorine parameter either be removed from all sections discussing screening methodologies, or that a numeric threshold be established based on peer-reviewed data that can correlate a specific elevated detected chlorine concentration to a potential illicit discharge, such as a grey water connection (or the absence of elevated bacteria) or a cross-connection (in the presence of elevated bacteria).

6. We strongly encourage the Agency to engage in conversations and workshops that lead to development of a Final MS4 Permit that MassDEP is willing to sign onto. The alternative to a joint Permit, outlined by the Agency's Thelma Murphy at a meeting of the Northern Middlesex Stormwater Collaborative in Lowell, MA on December 4, 2014, would be two separate Massachusetts MS4 Permits: the current 2003 Massachusetts MS4 Permit would continue to be enforced by MassDEP, and the new Final Massachusetts MS4 Permit would be enforced by the Agency. Significant confusion would follow due to administration, operations and maintenance, and coordination duplication resulting from each of the Commonwealth's regulated communities being subject to two separate,

parallel MS4 Permits. In practice, progress toward improving water quality would likely stop as legal challenges were filed, which is not in the best interest of any party involved.

Coordination should begin as soon as possible to reach a version of the permit agreeable to both organizations and compliant with the Clean Water Act, Massachusetts' Surface Water Quality Standards, and associated supporting documentation, so that water quality improvement activities across the Commonwealth can be focused and consistent.

Please feel free to contact me at (508) 393-5015 with any questions you may have.

Sincerely,

Fred Litchfield

Boston MA 02109-3912

David Ferris, Director
Division of Watershed Management
DEP
1 Winter St
Boston MA 02108

Dear Mr. Moraff and Mr. Ferris,

The Norton Conservation Commission has reviewed the Draft 2014 General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in MA and offers the following comments.

1. There have been many clarifications in the currently proposed 2014 Draft General Permit for MS4s since the 2011 Draft General Permit for Stormwater Discharges from MS4s in MA Interstate, Merrimack and South Coastal Watersheds. Itemizing each town in Section 2.2.1 very clearly identifies which towns are responsible for certain impairments to Commonwealth waters. This is less ambiguous than the 2011 Draft. Sharing and partnering to meet the requirements in Section 2.3.1 is also helpful to municipalities with limited financial and technical resources. And the use of standardized, commonly-used field kits greatly eases the burden of water quality testing on municipalities. The Conservation Commission applauds these positive changes.

2. Clarifying language should be added to Section 1.1, and any other applicable section, regarding MassDOT. The connection between MassDOT's requirements and a municipalities' is still ambiguous. EPA's mapping for each municipality illustrates the regulated areas but does not clearly identify those State roads for which MassDOT will be responsible. The maps imply a municipality is responsible for areas that MassDOT will cover. EPA and MassDOT should reproduce the 'NPDES Phase II Stormwater Program Automatically Designated MA4 Areas" maps to clearly illustrate MassDOT responsibility. There should be a clearly written division of responsibility for those

Norton Conservation Commission

Norton MA 02766
508-285-0275
508-285-0277 fax
conservation@nortonmaus.com

watersheds contributing to an impaired water containing State roads in both the General permit for MS4s and the MassDOT's individual permit.

3. The MS4 General Permit should, at a minimum, very clearly state that MassDOT is responsible for storm water discharges on State roads throughout the Commonwealth. We understand that MassDOT is required to obtain an individual permit, but inclusion of clarifying statements in the proposed General Permit for MS4s will greatly enhance a municipalities' ability to rank watersheds, address IDDE violations, and prioritize water quality goals by avoiding any overlap with MassDOT requirements, creating a more cost and resource effective process. This will also aid municipalities in projecting costs and locally approving funding for tasks associated with this MS4 General Permit.

4. The MassDOT individual permit draft should be available for public comment and clearly noticed to all municipalities.

5. Section 1.2.1 should include the Non-traditional MS4s and provide a reference to Section 5? Similarly, Transportation Agencies should be mentioned and reference Section 6.

6. Section 1.10.2, 6th bullet, how will a municipality know if DEP authorizes a new or increased discharge? If this is something municipalities need to include in the SWMP, notification procedure to the municipality should be added to Part 2.1.2 referenced on page 8.

Sincerely,

Jennifer Carlino

Comments on EPA's Proposed New Municipal Separate Storm Sewer System (MS4) General Permit

Dear Mr. Tedder,

The Nashua River Watershed Association represents 25 communities in north central Massachusetts. Our mission is to work for clean water and open space that is beneficial to humans and wildlife, where people work together to sustain mutual economic and environmental well-being.

We are writing in support of the draft MS4 permit and the measures it would provide to ameliorate the effects of stormwater runoff to the rivers and streams in our watershed. Data collected by the NRWA's Water Monitoring Program over the past 20 years proves with incontrovertible evidence the detrimental effects of stormwater runoff. Our data routinely show bacteria concentrations exceed standards for swimming and boating after a rainstorm. NRWA advises those who wish to swim in the river to delay for at least three days following a rainstorm to allow concentrations to return to safe levels. And bacteria is only one of the myriad of pollutants making their way into our rivers and streams.

NRWA supports the requirement to address illicit connections to storm drains. The NRWA has worked closely with the cities of Fitchburg and Leominster to determine the sources of bacteria in storm drains. These efforts have led to the removal of a few poor connections, but work needs to continue to ensure improvements in water quality.

592 Main Street, Groton, MA 01450-1230 p 978.448.0299 f 978.448.0941 www.nashuariverwatershed.org

The proposed MS4 general permit would result in reductions in stormwater runoff, and in turn result in marked improvement to water quality. NRWA understands municipalities are concerned about the cost of the permit requirements. Regional stormwater coalitions, such as the Central Massachusetts Regional Stormwater Coalition representing approximately 30 towns, can help to offset costs by sharing resources. Watershed associations, including NRWA, can work with towns to reduce costs. Establishment of a stormwater utility, while not ideal for every town, would help to cover the cost of stormwater management. Finally, private development has never before been required to contribute to the cost of maintaining storm drainage systems. Municipalities will benefit from the requirement that new developments and redeveloped properties over an acre contribute to the cost of stormwater management by infiltrating the first one inch of runoff from their properties.

NRWA urges the EPA to finalize the permit without delay.

Thank you for the opportunity to comment.

Sincerely,

Elizabeth Ainsley Campbell

ORAL TESTIMONY
EPA Draft Massachusetts MS4 General Permit
November 19, 2014

Good afternoon, my name is Alison Field-Juma, Executive Director of OARS, the watershed organization for the Assabet, Sudbury and Concord Rivers (Concord Basin). We have been running an EPA-certified quality assured water quality monitoring program for 22 years. Our organization is dedicated to restoring these three rivers to their Class B water quality—fishable and swimmable. Currently stormwater is a major source of impairment and the proposed MS4 permit will go a long way in enabling us and the communities in this 400-square mile watershed to meet this goal.

Stormwater has an unrelenting impact on our streams, ponds and rivers. Unless we take action now, this impact will only get worse with the increasing intensity of precipitation already being experienced and even more anticipated with climate disruption. Increasing intensity exacerbates runoff pollution and decreases infiltration of stormwater. The resulting loss of baseflow coupled with more frequent droughts and higher temperatures will stress our water bodies further. The draft MS4 permit is a critical tool to decrease stormwater contamination, recharge stormwater, improve infrastructure investment planning, and educate the public so that our surface waters continue to be major public assets. Reducing water pollution will benefit every resident of the state and is well worth the investment.

We are pleased that the EPA has developed a permit that will result in significantly reduce water pollution, while giving municipalities extra time and flexibility to make the needed investments. This is a long-term problem and long-term solutions take time and creativity to develop and put in place. But it is also an urgent problem and we ask EPA to work quickly in response to comments and complete a final permit at the earliest possible date.

Today I will highlight a few key requirements that the draft MS4 permit needs in order to be effective.

1) Illicit connections to storm drains are a serious problem. Requirements to prioritize, investigate and eliminate illicit connections will reduce dangerous pathogen levels and help restore designated uses such as swimming and boating. Right now we are struggling to deal with an illicit discharge into the Wild & Scenic section of the Assabet River.
2) All new development and redevelopment over an acre should infiltrate the first inch of runoff (the most polluted runoff), or provide an equal measure of pollutant reduction. This will ensure that ever more large developments use modern stormwater management techniques, whether new or on previously developed land. It is important that developments not be able to avoid this requirement by having fragmented parcels that fall under the threshold. This requirement will reduce the financial burden on towns by making private parties who use the public storm systems responsible for their discharges;
3) Towns discharging to water bodies with salt problems should minimize road and parking lot salt use to help improve habitat and restore fish diversity. We are glad that this important pollution problem will finally be addressed;
4) Where stormwater runoff causes or contributes to violations of state water quality standards extra measures should be taken to control individual pollutants (e.g., bacteria, nutrients, solids, salt, metals, oil and grease). This is an effective way to target the most serious water pollution problems in individual waterways;
5) Municipal public outreach campaigns should target businesses, institutions and industries—not just residents. These entities have a large role in pollution and need to change their behavior at least as much as residents;
6) Greater public access and opportunities to comment on towns' on-going efforts to comply with the MS4 permit is important to increase public support for increased municipal stormwater management and investment.

Thank you for proposing these significant improvements in the MS4 General Permit and for this opportunity to speak. We will be submitting more extensive written comments.

Re: Comments on Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder,

Thank you for the opportunity to comment on the draft small MS4 General Permit. OARS is the watershed organization for the Assabet, Sudbury and Concord River watersheds, which are part of the Merrimack watershed. The Concord River, of which the Assabet and Sudbury rivers are tributaries, is the public drinking water supply of the town of Billerica. All three rivers have impaired waters, influence by both wastewater and stormwater discharges, and there are many lakes and ponds with water quality problems. Several municipalities have local ponds as part of their public water supply system.

OARS' EPA-approved water quality monitoring program has tracked changes in water quality in the rivers and tributaries since 1992. Our organization is dedicated to restoring these three rivers to their Class B water quality—fishable and swimmable. Currently stormwater is a major source of impairment and the proposed MS4 permit will go a long way in enabling us and the communities in this 400-square mile watershed to meet this goal. As municipalities complete major investments in reducing pollution entering our rivers from wastewater treatment plants, stormwater is increasingly the major source of pollution.

OAR believes that this Draft General Permit, with a few modifications, will serve to protect and restore the health of the water resources of the Merrimack watershed while recognizing the constraints facing municipalities. It is builds upon the 2003 MS4 General Permit, *significantly* strengthening those areas where increased attention and action is needed. We urge EPA to issue it this year without further delay. OARS strongly supports the detailed and important points made by the Mass. Rivers Alliance and Mass. Audubon (particularly regarding the use of low impact development techniques) in their comment letters regarding this permit, and we will not repeat them here.

We would, however, like to emphasize a few key points.

1) Illicit connections to storm drains are a serious problem. Requirements to prioritize, investigate and eliminate illicit connections will reduce dangerous pathogen levels and help restore designated uses such as swimming and boating. OARS strongly supports the revised IDDE methodology in the draft permit. Permits should also include a date for the elimination of the illicit connections that have been identified. Right now we are struggling to deal with an

illicit discharge into the Wild & Scenic section of the Assabet River. Proactive municipal governments are far better at dealing with this problem than under-funded state agencies who can only get involved via enforcement after the problem has been located—which may not be for years. It is not only illicit connections, however, that are a source of pathogen pollution. Sheet flow runoff that enters MS4s is also a source; this is addressed in part by #2, infiltrating the first inch of rainfall for all new and redevelopment. The Neponset River Watershed Association has proposed language to this effect in their comment letter, which we support.

2) All new development *and* redevelopment over *half an acre* should infiltrate at least the first inch of runoff since this is the most polluted runoff, or provide an equal measure of pollutant reduction. This should apply to the entire site so that developers evaluate the infiltration opportunities throughout a site and not just that portion being redeveloped. This will ensure that ever more large developments use modern stormwater management techniques, whether new or on previously developed land. It is important that developments not be able to avoid this requirement by having fragmented parcels that fall under the threshold. We recommend that a half-acre threshold be used due to the cumulative effects of stormwater runoff in urbanized areas, which would otherwise have no attenuation at all unless they were in wetlands resource areas. Because the eastern part of the state is so highly developed already, we strongly support the inclusion of redevelopment in this provision. This requirement will reduce the financial burden on towns by making private parties who use the public storm systems responsible for their discharges.

3) Cost. We understand our communities are concerned about the cost of stormwater management, but there are several ways towns can take the initiative to defray costs. Establishing stormwater utilities, requiring that even small new commercial developments which use public storm drains minimize their own stormwater pollution, and working together with other towns and watershed associations to reduce costs are all useful approaches. For example, in 2005 the town of Westborough put in place a cost-effective stormwater infrastructure maintenance reporting program for over 260 private industrial, commercial and high-density residential sites. These sites are inspected annually to ensure that the structures are being effectively maintained and that owners are reporting accurately. A program like this reduces the financial burden on towns by making private parties who have stormwater infrastructure or use the public storm systems responsible for their discharges. We support the Charles River Watershed Association's suggestion of "trading program" or off-site stormwater management compliance options where on-site opportunities are prohibitively expensive or impossible.

4) Salt. Towns discharging to water bodies should minimize road and parking lot salt use to help improve habitat and restore fish diversity. This could be done through good housekeeping and tracking/reporting use. This should be done whether or not the water body is considered "impaired" for chloride. We are glad that this important pollution problem will finally be addressed.

5) Individual pollutants. Where stormwater runoff causes or contributes to violations of state water quality standards extra measures should be taken to control individual pollutants (e.g., bacteria, nutrients, solids, salt, metals, oil and grease). This is an effective way to target the most serious water pollution problems in individual waterways. We support allowing rebuttal of the presumption that discharges contain specific pollutants by presenting evidence that the target pollutant is not present.

6) Municipal public outreach. Campaigns should target businesses, institutions and industries—not just residents. These entities have a large role in pollution and need to change their behavior at least as much as residents.

7) Greater public access and opportunities to comment on towns' on-going efforts to comply with the MS4 permit is important to increase public support for increased municipal stormwater management and investment. Stormwater Management Plans should be made readily available to the public on-line and in public libraries.

8) Compliance schedules. We support the Charles River Watershed Association's point that the Charles River TMDL compliance should be within ten years, with the milestones that they propose. It is entirely reasonable to expect compliance within a decade if work is started now.

9) Street sweeping one per year is completely inadequate. Municipalities should prioritize parts of their communities for more frequent street sweeping (at least twice per year). High-efficiency vacuum sweeping should be encouraged to remove nutrient-rich particulate pollutants. It is also necessary for permeable asphalt paving. Several communities currently collectively purchase such equipment for cost savings.

We appreciate all the work that EPA staff and others have put in to making this draft permit as effective and responsive to the Commonwealth's needs as possible. We urge all due speed in issuing this permit which has been delayed for far too long so that the effects can begin to be seen. With the increasingly intense precipitation events that we are observing and that are predicted, this becomes more urgent than ever.

Yours sincerely,

Alison Field-Juma,
Executive Director

Re: Comments on Draft MS4 General Permit for Massachusetts

Dear Mr. Tedder:

I would like to submit the following comments on the draft "General Permits For Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts" and Appendices F and H (public comment period September 30- December 29, 2014). The comments will be referenced by permit section where appropriate.

Section 1.7.1.: in what form will USEPA provide written authorization- via certified U.S. Mail or by an email?

Commented [CC1]: Should this be a ?

Section 1.7.3.: the NOI should be required to be submitted to MassDEP only if MassDEP jointly issues the permit; the agency noted at the public meeting that it would decide whether to be a co-issuer of the permit only after reviewing public comments submitted during the comment period.

Section 1.10.: the posting of the Storm Water Management Plan at a website operated by the permittee should be mandatory to encourage public involvement in the process.

Section 1.10.2.: the permit requires that the SWMP (to be submitted in 1 year) shall contain "listing of all interconnected MS4s" but system wide mapping which would include detailed pipe connectivity necessary for interconnection identification is not required until the end of Year 2. We suggest requiring interconnections as a part of Section 2.2.4.6 and not a part of the SWMP submission.

Formatted: Font: Not Italic

Section 1.10.3.: the extended deadlines for some of the permit elements for new permittees (those not part of the 2003 permit) are warranted and USEPA should reach out to those communities to provide assistance in the MS4 permitting process.

Section 2.0.: the permit is based upon meeting "Maximum Extent Practicable" (MEP) goals; we encourage USEPA to provide further definition of MEP as it can be viewed differently by many people and should be defined as clearly as possible.

Section 2.1.2.: the "Increased Discharges" provision appears to require authorization for each regulated community to obtain authorization of increased discharges from MassDEP. It~~I~~ is not clear what this "authorization" will require. Furthermore, as written this provision would essentially end any new construction within impaired watersheds (Category 5 or 4b). It is not possible to develop land from forested or "natural" conditions, which does not result in increased discharge of pollutants from this newly developed land. Please consider modifying this provision to include assumptions that permittee meeting provisions of this permit will be assumed to meet antidegradation provisions through pollutant load reductions across the regulated municipal area.

Formatted: Font: Italic

Formatted: Font: Italic

Section 2.3.2.e.: the permit requires the permittee to show evidence of progress and conduct an evaluation of demonstrating progress; such self-evaluation is difficult and its merits are questionable; we suggest removing this somewhat nebulous requirement.

Section 2.3.4.4.b.: the permittee is required to identify all past SSOs over the previous 5-year period within 120 days; due to the complexity of many stormwater systems, we recommend that the time frame be extended to 180 days.

Section 2.3.4.4.c.: 24-hour oral notice to USEPA of an SSO is required; ~~what is the contact number ?~~We recommend that this provision be rewritten and consistent with current MassDEP requirements for SSO reporting as stated here: http://www.mass.gov/eea/agencies/massdep/service/approvals/sanitary-sewer-overflow-bypass-backup-notification.html. These procedures for reporting are well established and allow both verbal or email notification.

Section 2.3.4.5.b.: the physical labeling of all outfalls within 5 years may be problematic if access to the outfall is difficult; in addition, what is the reason for such labeling? Would labeling through a GIS map on its web site be a better way of informing the public of the outfall designation?

Section 2.3.4.7.c.iii: the assessment and priority ranking of all catchment areas in one year is too brief a time period and as catchment delineation requires mapping, this provision is inconsistent with mapping requirements~~; mapping is the first step and it is~~, which are required within ~~tw oone~~ years; it is recommended that the ranking and prioritization be completed within ~~three2~~ years of the effective permit date.

Commented [ZH2]: Two years right?

Section 2.3.4.7.e.: wet weather sampling is required if only one "vulnerability factor" is triggered; the list of vulnerability factors is extensive and it appears almost any stormwater system would have at least one factor thus requiring all outfalls to be sampled for a wet weather event; past discussions have readily questioned the usefulness of a one-time random wet weather sampling; it is recommended that wet weather sampling be conducted only in truly priority catchment areas.

~~*Section 2.3.5: how do the construction control requirements relate to street construction and re-paving ?; the linear nature of such activities makes controls difficult and makes the requirements in Section 2.3.6 for infiltration impractical.*~~

Commented [ZH3]: I'm less concerned with construction provisions for linear projects. I think we cover this in the next section and could remove this one.

Section 2.3.6.: Please define redevelopment in the permit definitions. ~~t~~The ~~infiltration~~ requirement to retain the first one (1) inch of runoff for new or re-developed areas is a laudable goal but the requirement to have pollutant removal equivalent to that of a bio-filtration system should be removed; a "one size fits all" ~~infiltration~~ removal requirement for pollutant removal is too restrictive; we assume USEPA means that "retain" is equivalent to infiltration of the first one inch of runoff- please clarify; the "MEP" principle should be applied here for removal of individual pollutants; infiltration in re-development areas may be limited by site characteristics and the "MEP principle" should again be applied here; also road reclamation and re-surfacing does not fit in the one inch recharge scenario; for a roadway with greater than one acre of disturbance, meeting the infiltration goals does not seem practical; better definition of the requirements for road work should be included possibly in a new appendix; lateral projects do not fit cleanly into the post-construction arena; we request that USEPA provide a clear definition of redevelopment and disturbance as it relates to road projects.

Commented [ZH4]: I don't see specific infiltration requirements?

Section 2.3.6.d.iii.: inventory all permittee owned properties for possible recharge areas is a very time consuming activity for large municipalities with numerous parcels of municipally owned properties; we

suggest allowing the permittee to select five priority sites to evaluate; this likely will result in a better assessment of viable sites.

Section 2.3.7.b.: we strongly suggest that the one comprehensive SWPPP be allowed for all municipal operations, that requiring an individual SWPPP for each site is repetitive, and not a good use of resources; one comprehensive SWPPP can have numerous elements that would apply to all municipal sites.

Section 5 (and fact sheet): the discussion of what entities are included in the "Non-Traditional" MS4's is very limited and does not provide good direction to various federal and state facilities to determine if they are required to be in the program; reviewing the listing of "Non-Traditional" MS4s on the web site clearly shows many sites are not identified; it would be prudent for USEPA to identify and specify all the "Non-Traditional" MS4s which should be in the program as they did by listing all the municipal MS4s which required coverage or were eligible for a waiver; USEPA should actively notify those entities which they consider to be part of the permit universe; entities such as regional school districts and public colleges and universities are not clearly identified.

Formatted: Font: Italic

~~*Section 5 (and fact sheet)*: the discussion of what entities are included in the "Non-Traditional" MS4's is very limited and does not provide good direction to various federal and state facilities to determine if they are required to be in the program; reviewing the listing of "Non-Traditional" MS4s on the web site clearly shows many sites are not identified; USEPA should actively notify those entities which they consider to be part of the permit universe; entities such as regional school districts and public colleges and universities are not clearly identified.~~

Commented [PH5]: Delete this paragraph

Appendix F: we recognize the need for an enhance effort for stormwater controls in waters which are impaired and subject to an approved TMDL; however, we note that the requirements, particularly related to the Charles River phosphorus TMDL seem extremely complicated, confusing and likely impossible to track; we strongly urge USEPA to review the phosphorus reduction requirements, deadlines and reporting elements; a strong effort should be made to streamline the goals and make the process clearer to those involved; as outlined, it does not seems to be manageable.

Appendix F, page 14: note that the reference to F-6 should be F-8.

Formatted: Font: Not Italic

Appendix H-section I.2: the element to demonstrate that an outfall has no nitrogen would require at least 30 discrete sampling events over a 2-3 year period; such an effort seems beyond practical efforts and should be removed from~~or~~ the appendix.

I welcome the opportunity to discuss these comments with you and would like to take an opportunity to credit USEPA with undertaking a very complicated process in a very open and professional manner.

Sincerely,

WOODARD & CURRAN

Boston, MA 02109-3912

RE: Comments on the 2014 Draft Massachusetts MS4 Permit

Dear Mr. Tedder,

I am writing on behalf of the Town of Paxton to bring attention to the impact the new draft Massachusetts MS4 Permit requirements will have on small communities like Paxton. As a Wachusett Watershed town we are regulated by the Department of Conservation and Recreation (DCR) and as such regulated through the Massachusetts Watershed Protection Act.

Paxton saw the opportunity to strive towards compliance with the MS4 Permit requirements by being part of the original thirteen towns who took the initiative to form the Central Massachusetts Regional Stormwater Coalition (CMRSC). Through this CMRSC we were able to meet many of the requirements of the existing MS4 Permit; example being mapping the town's outfalls and coordinating catch basin inspections.

The CMRSC worked to improve public education and outreach one of the minimum control measures of the MS4 Permit by producing material that would help control illicit discharge and proper disposal of household products and pet waste. The new MS4 Permit requires this to be taken a step further by expecting towns to develop plans to prove the effectiveness of this educational outreach. Towns cannot devote such time and resources to creating platforms to monitor such measures and it is not the best use of our time and money.

The new MS4 Permit also proposes many new instances of data collection such as the volume of street sweeping, wet weather sampling, and catch basin cleaning; requiring manpower that Paxton and many towns do not have. We truly understand the importance of data collection but not to the extent that it becomes burdensome, expensive and serving no purpose other than being collected. We would much prefer to see efforts being put into the improvement of the water quality and not merely becoming a collection agency for EPA.

Paxton has adopted a comprehensive storm water permit that is supported and implemented by our town officials. Paxton Conservation Commission has recently hired a Conservation Agent and is

currently in the process of developing a Wetland Protection Bylaw. We are members of the Wachusett Recycling Center that promotes proper disposal of hazardous waste that could poison our water. So as a town we know the importance of clean and illicit discharge free water.

As a town, Paxton truly supports the intent of the MS4 Permit to protect our waters and prevent illicit discharges that could potentially harm our waterways. However, we do not have the money, manpower and resources to perform all the additional requirements that will be mandated by the new MS4 Permit and we look for the EPA to understand that we want do our best to comply but also ask for the understanding and cooperation of EPA.

Sincerely,

Carol L Riches
Town Administrator

Support for Central Massachusetts Regional Stormwater Coalition
Comments Addressing 2014 Draft Massachusetts MS4 Permit

The Central Massachusetts Regional Stormwater Coalition (the Coalition) represents 28 Towns in Central Massachusetts, most of which are Permittees under the United States Environmental Protection Agency's (USEPA's) Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit, and all of which take their role as stewards of the environment seriously. Coalition participants recognize and share the USEPA's goal of maintaining water quality and recognize that stormwater management is an important component in protecting the water resources of the Commonwealth of Massachusetts (and beyond).

The Coalition, as a group, has prepared comments on the 2014 Draft Massachusetts MS4 Permit published by the USEPA in the Federal Register on September 30, 2014, for submittal to the USEPA. The Town of Paxton (the Town) is a member of the Coalition.

The Town hereby reserves the following rights:

- The right to submit individual comments on the 2014 Draft Massachusetts MS4 Permit (and any and all revisions), in addition to these Coalition comments.
- The right to submit additional comments to any Response to Comments prepared by the USEPA after the close of the public comment period for the 2014 Draft Massachusetts MS4 Permit.
- The right to submit additional comments on the Final Massachusetts MS4 Permit to address any and all changes made by the USEPA subject to comments the agency receives on the 2014 Draft Massachusetts MS4 Permit.
- The right to appeal any provision of the Final Massachusetts MS4 Permit when it is issued, regardless of whether that provision has been specifically noted in these Coalition comments, in subsequent Coalition comments, or in any comments the Town submits to USEPA individually.

The Coalition and the Town hereby adopt and support by reference, in whole or in part, comments submitted by the Northern Middlesex Stormwater Collaborative, the Merrimack Valley Stormwater Collaborative, the Neponset Valley Stormwater Collaborative, the Massachusetts Municipal Association, and the Massachusetts Coalition for Water Resources Stewardship.

The Coalition has also been in communication with the Massachusetts Department of Environmental Protection for on the Department's comments on the 2014 Draft Massachusetts MS4 Permit. While not yet available to the public, we understand that many of the Department's comments will mirror the concerns of Coalition members about the administrative burden many provisions impose on municipalities without direct benefit on water quality. As such, we incorporate comments submitted by the Massachusetts Department of Environmental Protection by reference, in whole or in part.

This signature page documents the support of the Town for the comments submitted by the Coalition, with rights reserved, as noted.

TOWN OF PAXTON

RE: Draft NPDES General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

We are submitting this letter in accordance with the public comment protocol for the proposed NPDES General Permit. Please know that we believe in the intent and ultimate goals of this program and indeed have realized some significant environmental improvements as a result. Our primary challenge, and, we imagine, that of most communities, is the financial obligation required to successfully implement such a program. We do not see how the requirements could be met without adding staff or incurring consulting fees. Increasing our permit fees slightly is a possibility, but will not be enough to fund the program; placing an additional tax or utility fee burden on our aging population is not only unpopular, but also perhaps impossible.

The following concerns constitute "reasonably ascertainable issues" identified on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), and practical experience implementing the program over the preceding eleven (11) years. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit.

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **MCM 3 - IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm drain and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification*: Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on

the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.

b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification*: Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification*: Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

d. **Catchment Investigative Procedure (2):** : EPA states, "This review shall be used to identify areas within the catchment with higher potential for illicit connections and System Vulnerability Factors that indicate a risk of sanitary or septic system inputs to the MS4 under

wet weather conditions." Septic systems are not designed to remove nutrients and may discharge nutrients to an MS4 through groundwater. Septic systems can comply with MA Title 5 (310 CMR 15.00) and still discharge nutrients. Are septic systems considered an illicit connection if they discharge nitrogen and phosphorus to groundwater? Do the Clean Water Act and this MS4 permit override MA Title 5 and therefore limit septic systems from discharging any amount of nitrogen or phosphorus indirectly to an MS4, even though they do not violate the state's Title 5 permitting program? *Proposed Modification*: EPA should set a concentration limit, consistent with other regulations that may trigger mitigation action under this permit's regulations.

2. **MCM 3 - Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties under separate permit programs in the event of an SSO excursion. *Proposed Modification*: Elimination of this requirement.

3. **Affordability; Estimated Program Cost Increases**: EPA directs MS4 owners to the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report for reference regarding anticipated program cost increases (administrative, operating and capital) under a variety of scenarios. This document, and subsequent evaluations conducted for Upper Charles River watershed communities indicates that program administrative/operational costs alone will range from double to quadruple existing expenditures. More recent updates to these figures for the communities that were the subject of EPA's detailed analysis indicate that, if anything, these estimates are under-representing the magnitude of cost increases. Capital costs to comply with the TMDL requirements embedded in the permit are estimated in the tens of millions of dollars. The enormous gains in water quality under the Clean

Water Act in the first two decades after passage were achieved through a locally affordable program aimed at primarily wastewater-related point source discharges, and underwritten by state and federal funding equivalent in many cases to 90% of the program capital cost. Stormwater-related pollutant contributions to receiving water bodies are much more difficult to control and will achieve an incremental water quality improvement compared to the wastewater discharges that were the target of initial infrastructure investments. It is inconceivable that the estimated costs of this MS4 program can be affordably sustained by a limited number of property owners within communities subject to the most stringent pollutant reductions. Water quality improvements have local, state and national benefits. A program that EPA and other environmental organizations (regulatory, advocacy/non-profit or commercial) recognize as this important should have some kind of legislative or Congressional support that provides adequate funding to promote programs that can achieve water quality improvements in a more equitable and financially sustainable manner.

4. **Regional or Alternative Implementation Opportunities**: Many of the sustainable funding alternatives explored in the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report refer to opportunities for working with designated dischargers (DD) in some capacity. The Residual Designation Authority (RDA) Draft Permit has not progressed in some time, and there is little information available as to the likelihood of this permit ever becoming final. In addition, under current conditions, it applies to a very small number of communities (Bellingham, Franklin and Milford). Private properties are a major contributor of pollutants to MS4 discharges; however, this RDA mechanism is an unwieldy approach to incorporating private activity into pollutant control. Without passage, however, private property owners have no incentive to collaborate with local authorities regarding operation of sites that were designed and constructed in accordance with local stormwater regulations in place at the time of development. It is unrealistic to include any of the funding scenarios that include cooperation or collaboration with a group of designated dischargers that do not exist today, are unlikely to be designated in the near future, and are unlikely to

voluntarily engage in a complex and costly program without measurable benefit to them directly.

5. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the City of Pittsfield. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification*: EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.

6. **Definitions – Redevelopment**: The term "redevelopment" is nowhere defined in the permit or appendices. Given that EPA is requiring "redevelopment" projects to meet the new development design guidelines for stormwater management (and particularly in reference to the one-inch retention/treatment provision), it is important to know what constitutes redevelopment versus rehabilitation, restoration, maintenance or repair

projects. This is particularly of concern as it relates to transportation-related projects such as pavement programs (full depth reconstruction, pavement overlays, chipping, etc.), and the possibility that routine maintenance could trigger requirements for significant drainage improvements that would not otherwise be appropriate or necessary for operational purposes. *Proposed Modification*: Define redevelopment to exclude roadway projects that do not add significant new paved acreage.

7. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.

8. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.

9. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MassDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MassDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided

under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.

10. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MassDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.

11. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b), the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental street design" the MS4 owner should be allowed to make local decisions that are in its best interest.

12. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs

associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO Long Term Control Plan programs.

Water Quality Based Effluent Limitations (WQBELs)

13. **Source Reports and controls**: With this MS4 draft some Municipalities are required to submit source reports and control plans with enhanced measures for WQBELs. The cost of producing the reports and the control measures are high when coupled with the other requirements of the draft NPDES permit. Program affordability is again called into question. Furthermore, the program is experimental and the likely effectiveness of it is unknown.

14. **Sampling:** Communities can perform a sampling plan to show that specific outfalls are not contributing nutrients or bacteria, but the sampling protocol outlined in the draft permit is onerous and could be difficult or impossible to complete depending on precipitation events. *Proposed Modification:* Allow grab samples, and reduce the number of samples required.

15. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.

16. **Phosphorus Load Export Rates – Appropriate Use:** Regarding Appendix F and attachments, the Phosphorus Load Export Rates (PLERs) are general and approximate at best. The composite PLERs are good for screening / planning purposes or comparative purposes. They are not accurate for determining hard design of control measures. For example, they can be used to evaluate whether a proposed change in land use is expected to increase or decrease pollutant loads. But to use a PLER to conclude that the loading rate is actually X lbs/yr, or will change from Y lbs/yr to Z lbs/yr with land use or other changes, is not a recommended technical practice. Loading rates are ordinal rather than cardinal, i.e., they can tell you if one is higher than another, but not exactly how much higher one is than another. It appears that EPA assumes that over the entire Commonwealth of Massachusetts, using PLERs will represent the average condition. That may be true, but EPA is requiring that the PLERs be used to make decisions on a much smaller watershed and sub watershed scale, which is inappropriate.

17. **PLERs - Derivation:** It is not clear how the values for PLERs in the EPA documents are derived, however, a literature search shows that there is a large range of values for any given land use. For example, the PLER for medium density residential is given as 0.55 lb/ac/yr in Table 1-1 (App. F Attachment 1), but the range of PLERs for medium density residential in the scientific literature can be an order of magnitude around the value. Please provide further information regarding derivation of the PLERs since these values have significant impact on program implementation for regulated communities.

18. **PLERs – Blanket vs. Site Specific:** PLERs found in older literature generally do not reflect the presence of stormwater BMPs, low impact development (LID) planning, etc., and therefore may overestimate pollutant loads for current land uses. In addition, composite PLERs are a particular concern for communities that have previously instituted stricter local development standards for stormwater management many years ago (in some cases, decades) where assumed PLERs may be much greater than actual conditions. *Proposed Modification:* Rather than limiting appeals of assumed baseline watershed phosphorus loading to updates of land use information, allow permittees the option to develop their own alternative methodology for determining baseline phosphorus loads and reduction requirements based on more detailed data and/or site specific information.

19. **Ambiguity in Determining Contributing Drainage Area:** It is not clear in Appendix F and its pertaining attachments whether the permittee will be using the impervious area or the directly connected impervious area (DCIA) in the PLER calculations, which includes factoring in DCIA in determining PCP area. The phosphorous loads should be determined from the DCIA of a target catchment, but this is not explicitly mentioned in either Appendix F or its attachments. The only explicit mention on DCIA is in Appendix F under sections "Phosphorous Source Identification Report" and "Nitrogen Source Identification Report" which simply state that the source identification report should include the "Impervious area and DCIA for the target catchment." There is no mention of how this DCIA information needs to be used, for example, in determining either the PCP area, total development area,

impervious area (IA) for calculating phosphorous reduction credits for non-structural BMPs, or in distributing the total drainage area into impervious area for BMP load and volume calculations. In all the above instances, DCIA should be considered, rather than total impervious area. This needs to be clarified in the new permit.

20. **Determining Infiltration Rate for Structural BMPs:** Attachment 3 of Appendix F specifies identification of infiltration rate for a particular BMP when determining the design volume of a structural BMP to achieve a known phosphorous load reduction target from a contributing drainage area. However, it is not clear how the infiltration rate needs to be determined. It is stated that the infiltration rates represent the saturated hydraulic conductivity of the soils. Since saturated hydraulic conductivity of soils is a function of its hydrologic soil group, it is important to mention how this rate needs to be determined for a combination of soil types. Please provide further guidance to determine infiltration rates for an infiltration type structural BMP, such as an infiltration trench or infiltration basin.

21. **Choosing BMP Performance Curve for Multiple Combination of BMPs:** Attachment 3 of Appendix F provides several BMP performance curves for different types of structural BMPs. However, the permittee may choose a combination of BMPs to achieve a desired phosphorous load reduction. It has been noted through literature search that a combination of BMPs may be more effective in capturing larger storms, and hence will be more effective in providing desired phosphorous load reductions from these storm events. For example, if a bio-retention system is coupled with a secondary spillway to a porous pavement, it has been found from literature that this combination is effective in capturing the first 1" rain (first flush) and higher flows, respectively. In such a situation, it is not clear what BMP performance curve should be referenced and how the curve(s) need to be used by the permittee. Please provide further documentation regarding the method to determine BMP performance curves for a combination of BMPs.

Other Issues

22. **Non-Stormwater Discharges**: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." Explicit guidance is necessary regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges.

23. **City / Town Administration Outreach**: In most communities responsibility for permit compliance resides with Public Works or similar agency officials. City or Town Mayors, Councilors, Select people and Town Managers are often not involved in program administration outside of procurement or appropriation processes for identified projects. Their lack of understanding and support to local implementing agencies has been a continuing challenge. EPA and/or DEP must increase their involvement in educating Town officials about the extent, costs, operational impacts and policy determinations incumbent on program administrators to ensure continued organizational support, particularly for funding strategies.

Thank you for your consideration of our comments.

Sincerely,

Matt Billetter
City Engineer

Re: PRCWA Public Comments on 2014 Draft NPDES Massachusetts Small MS4 General Permit

25 February 2015

Dear Mr. Tedder:

Please welcome Parker River Clean Water Association (PRCWA) comments on the EPA's 2014 Draft NPDES Massachusetts Small Municipal Separate Stormwater Systems General Permit. PRCWA is a non-profit watershed association whose mission is for the conservation and protection of all ecosystems in the Parker River Watershed. The Parker River Watershed consists of 7 communities, all in the EPA-Region 1, -North Andover, Boxford, Groveland, Georgetown, Newbury, Rowley, and West Newbury with the contribution of Rowley River & Egypt River subwatershed to the town of Ipswich water supply.

We applaud the efforts of the EPA on the improvements on the water quality requirements and regulations, and the requirement for municipals in our watershed to better monitor and manage stormwater in the 2014 Draft MA Small MS4 General Permit. We particularly commend the efforts of the EPA to support and improve implementation, to improve public awareness of stormwater issues, and to improve design of new, and retrofit better, stormwater infrastructure to retain the first 1" inch of run-off from all impervious surfaces on one acre or more sites or provide the level of pollutant removal equal to or greater than the level of pollutant removal provided through the use of bioinfiltration on the first 1" of run-off from all impervious surfaces on one acre or more sites. As noted by the EPA –Region 1, polluted stormwater contributes significantly to the violation of water quality standards in MA state streams, rivers, lakes, and ocean.

PRCWA Water Quality Program has been monitoring the Parker River Watershed for the past 17 years for pathogens and nutrients. Major segments

of the Parker River Watershed rivers and streams, and Plum Island Sound have been designated with impairment for pathogens thus requiring a TMDL. Our communities in our watershed are on private septic systems with a limited amount of our community on sewer treatment systems, one of which is a regional compromised sewer system on Plum Island tied in with the Newburyport Municipal Sewer System. With climate change the watershed is faced with the additional stress of compromised aging stormwater infrastructure in our communities. **The contribution of increased depth of flood waters, the effects of subsequent erosion and pollution, the need for improvements of aging stormwater infrastructure, plus the urgent need to increase recharged to our overly stressed water withdrawal from private wells and from privately held water supply districts in our watershed, PRCWA strongly supports the promotion of the 2014 Draft of NPDES Small MA MS4 General Permit.**

PRCWA suggests the following improvement to this area of the proposed 2014 NPDES MA SMALL MS4 General Permit.

- **The stormwater bylaw requirements should apply to projects as small as a quarter or half an acre.** Urbanized, or village areas, of towns in our community have very few large developments and redevelopment projects, and projects under an acre would not be required to employ any stormwater management measures unless they are located in wetland resource areas. This will make it difficult for our towns to comply with the proposed prohibition against new and increased stormwater discharges from MS4s. (Sec. 2.3.6.a)

We urge the EPA to respond to comments and to issue the completed permit with upmost promptness.

Thank you for your consideration of Parker River Clean Water Association's comments on the 2014 Draft NPDES MA Small MS4 General Permit.

Best regards,
Yvonne Buswell, PRCWA director

Re: 2014 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts

Dear Mr. Tedder:

Below please find the City of Quincy's public comments on the September 30, 2014 draft of the above referenced MS4 permit. Quincy supports the Environmental Protection Agency's (EPA) efforts to protect water quality and we have been working diligently for many years to improve our sewer and stormwater infrastructure and to implement Best Management Practices (see Attachment for fiscal year 2014 investments). Based on a detailed and thoughtful review, however, we have determined that this draft permit contains many unclear, unachievable, and unfunded mandates. We offer the following comments, together with our recommendations as to how the permit could be revised to address each comment:

1. Comment: The cost to comply with many of the permit mandates is tremendous which will necessitate significant increases in staff, equipment and professional services resulting in substantial negative financial impacts on the City, its rate-payers and its tax-payers. The five-year projection of implementation costs (beyond current expenditures) is fourteen (14) million dollars, but could be far greater if significant infrastructure improvements are needed.

In addition to the initial preparatory expenditures in the amount of $250,000 which have recently been approved by the Quincy City Council and Mayor Koch, we have estimated the average annual costs for this EPA mandate at $2.7M. Based on EPA's draft compliance

55 Sea Street, Quincy, MA 02169-2572
Telephone: (617) 376-1959 FAX: (617) 376-1969

schedule, the following table shows the program costs. The timeline assumes that the General Permit will be final in December 2015; Year 1 will fall approximately within Fiscal Year 2016, and so on.

Expected Major Program Requirements (FY16-20)	
Public Education & Outreach	$17,500 per year
Drainage System Map Updating	$15,000 twice in 5 years
Outfall Monitoring, cleaning, and inventory	$20,000 per year
Personnel Costs for Drain Crew & Compliance Officer*	$500,000 per year*
IDDE Program Field Investigations & CCTV Inspection	$60,000 per year
Additional Street Sweeping & Disposal Costs (above existing program)	$50,000 per year
Additional Catch Basin Cleaning & Disposal Costs (above existing program)	$50,000 per year
Impervious Cover Estimates and Tracking	$30,000 per year
Retrofit drain cleaning & CCTV Inspection Equipment	$600,000
Written O&M Procedures for Parks, Buildings, Vehicles/Equip and Infrastructure	$35,000
SWPPPs for City Garages, DPW, Staging Areas, etc.	$10,000 in years 1 & 2
Outfall Sampling (Dry and Wet Weather) & Laboratory Analysis	$300,000 per year
Drainage System Construction Modifications & Improvements	$1,500,000 per year**
Annual Reports and Record Keeping	$10,000 per year
Average NPDES MS4 Program Estimated Cost per year	**$2.7M annual average**

*Personnel Costs assumes a Compliance Officer (Senior Engineer), Drain Foreman, Working Foreman, 2 Special Heavy MEOs and 1 laborer plus benefits.

**Estimate uses City's $1.5M Annual I/I Construction Framework as a proxy. Actual costs for drainage system repairs, corrections of illicit discharges and connections, and construction of storm water management facilities will be based upon urgency and available funds.

Based upon the task-list cost estimates above, we estimate that the annual costs for this program to be an additional $2.7M annual average. Please note that this excludes the existing costs already in the City DPW budgets for street sweeping, catch basin cleaning, drainage system O&M, IDDE efforts, and I/I removal efforts.

Recommendation: Additional funding assistance is necessary and should be made available. Without a funding component, Quincy views this permit as additional "unfunded mandates" from the federal government. In addition, without a federal financial commitment, it will be difficult to convince local voters, rate payers, tax payers and decision makers to fund these

mandated storm water programs. It is critical for the proper implementation of this federal mandate that EPA make available a dedicated funding source for all municipalities covered by storm water permits.

2. Comment: The EPA'S draft MS4 permit contains unclear, unachievable and unfunded additional mandates that present a very significant financial burden to the City in the event that the permit is enforced in a manner consistent with the way EPA currently enforces its NPDES permits for point source discharges. The requirements for discharges to impaired waters are costly, overly burdensome, and have questionable direct impact on the improvement of water quality

The Clean Water Act contains language that allows EPA to require "limit of technology" treatment of any system which discharges into an impaired water. Since all of Quincy's drains discharge into water bodies (Neponset River, Quincy Bay, Town River) which are on the 2014 draft integrated list of impaired waters, there is the very real potential that the MS4 program could evolve to the point that Quincy is mandated to treat its storm water run-off. Since it is extremely unlikely that the receiving waters will come off the impaired waters list, the logical extension of the permit and the Clean Water Act is that storm water treatment will be required, it is just a matter of when.
In the event that "end of pipe" treatment is required, the challenges are:

- There is little to no room for treatment systems in the areas around the City's outfalls;
- There are few cost effective and technically proven storm water treatment technologies for removing the likely target pollutants which impair the receiving waters;
- As treatment units must be sized for peak discharges and storm drains have enormous peak flow rates, the cost of providing any significant treatment will be very high; and
- A fairly conservative estimate of several million dollars per outfall/drainage basin (including permitting, land acquisition, etc) implies that "end of pipe" storm water treatment in Quincy could easily be in the realm of $100 million dollars in capital spending, not including the ongoing operational expenses of the treatment units.

In the event that BMPs (rain gardens, storm water infiltration, etc.) are required throughout the City, there are guidance documents from the Mid-Atlantic region which show most storm water nutrient management tools cost $2,000 - $4,000 per year per acre, assuming no land acquisition expenses. With around 6,500 total acres generating storm water 3,500 estimated to be impervious acres served by the City drainage system, full deployment of these tools could add an additional 7 to14 million in annual storm water spending.

Regardless of the approach EPA may take (end of pipe or BMP), there is no certainty that the required upgrades would improve the receiving water quality to the point that further

unfunded mandates would not be forthcoming. As a whole, the new permit, combined with the manner in which EPA has been enforcing point discharge treatment requirements, represents a potential unlimited spending mandate on the City as long as the receiving waters remain in impaired status even if the City demonstrates that it isn't contributing to the impairment.

Furthermore, other public entities such as Braintree, Milton, Weymouth, MBTA, DCR and MA. DOT are also discharging through City drains into Quincy Bay and the Neponset River. Quincy has no control over these separate governmental bodies; however, we are solely responsible for the water quality of Quincy Bay. We get no credit for the work we do. There is no proportional responsibility. Quincy remains responsible to monitor, sample and report.

In addition, the impact of tidal backflow from impaired waters into Quincy's MS4 will require the City to make additional investments to identify potential pollutant sources that are not actually originating from our MS4. This permit mandates more work than could possibly be funded under any reasonableness standard and offers no evidence that these huge expenditures will eliminate the impairments. Even if Quincy was to implement every aspect of this permit, and future permits, our water bodies would most likely remain impaired.

This permit mandates more work than could possibly be funded under any reasonableness standard and, but offers no evidence that these huge expenditures will eliminate the impairments. There is also limited guidance as to how the City should prioritize these significant investments.

Recommendation: The EPA must provide a more defined and reasonable standard of effort for the City to comply with the requirements associated with discharges to impaired waters. This should include a way for Quincy to demonstrate that its MS4 discharges are within water quality standards. If the City can demonstrate that its MS4 discharges are within water quality standards then it should be excused from further required actions regardless of whether the receiving water remains impaired. In addition, more clarification on how MS4s are expected to prioritize investigation and removal of pollutants of concern is needed.

3. Comment: The requirements for written programs, policies, procedures, and reports do not have direct water quality benefits and should have a lower priority. Significant increases in financial and staff resources will be necessary in order to prepare and submit all of the mandated written documentation. With limited resources, the focus of the permit should be on performance, not documentation. There are over 50 phrases in the main body of the permit and many more in the appendices (and this does not include the

actual annual reporting requirements listed in Section 4.4) that require certain information be included in the Annual Report.

Recommendation: An efficiency and effectiveness review should be performed on the entire permit; preferably by an outside party who can assist the EPA in prioritizing those items where written documentation and annual reporting will provide a measurable benefit. The permit should be revised to reflect these improvements.

4. Comment: Once the permit is finalized, the City will be required to submit a Notice of Intent (NO1) to comply with the permit within 90 days. This requirement is similar to the 2003 permit; however, a significant amount of new information is required to be included in the NOI. Much of that information will not be known until the City revises its stormwater management program, which is not due until the end of the first year of the permit. It will also be difficult for the City to adequately respond in its NOI until it completes its stormwater management program assessment, which will also not be completed until the end of permit year one.

Recommendation: The NOI requirements should be revised to remove elements of the storm water management program that will be addressed during the assessment and updating of the existing program. These requirements can be included in the requirements for the written storm water management plan and/or first Annual Report.

5. Comment: Section 1.7.4. Page 5. The draft permit still does not define the responsibility for addressing comments received in response to EPA's posting of the Notice of Intent for public comment. The permit needs to state whether the City of Quincy or the EPA will be responsible for this task.

Recommendation: Since EPA is publishing the Public Notice for all MS4s and similar comments are likely to be submitted for many NOIs, it is recommended that EPA be responsible for addressing public comments.

6. Comment: Section 1.10.2. Page 8. The discussion about interconnections is not clear about whether Quincy is responsible for discharges "TO" its system or "FROM" its system. Since Quincy is not responsible for drainage mapping in abutting communities, we are unable to list the information regarding the receiving water bodies for our interconnections.

Recommendation: Clarify whether an interconnection is a discharge TO the MS4 or FROM the MS4. In addition, delete the requirement to provide information regarding receiving water bodies for interconnections in its entirety, as MS4s cannot demand the mapping from abutting communities needed to prepare this information.

7. Comment: Section 2.1.2. This requires the City to obtain authorization from MassDEP for increased discharges. It is not clear what this "authorization" will entail. This provision could threaten new construction and redevelopment within Quincy's impaired watersheds (Category 5 or 4b), because of the prohibition against new discharges to these waters unless it can be demonstrated that there is no net increase in pollutants. Without historic data, it is not possible to measure "increased discharges of pollutants" from new or redeveloped land.

Recommendation: This provision should be modified to allow increased discharges that meet water quality standards regardless of impairments. The permit should also allow compliance with anti-degradation provisions via pollutant load reductions in other areas of the same watershed (instead of prohibiting the increased discharge altogether).

8. Comment: Section 2.3.4.4. Page 26. Sanitary sewer overflows are already prohibited and regulated at both the Federal and State level under existing mechanisms governing wastewater facilities. Including SSOs in the MS4 permit results in Quincy being regulated by multiple permits for the same issue. This will cause confusion, unnecessary expenditures and potentially conflicting requirements for compliance.

Recommendation: The MS4 permit should only contain language related to SSOs potentially contributing to illicit discharges and that these potential illicit discharges should be investigated, eliminated, and documented under the IDDE Program.

9. Comment: Section 2.3.4.4b mandates that the City identify SSOs over the previous five-year period within 120 days and Section 2.3.4.4c requires a 24-hour verbal notice and a five (5) day written notice of an SSO to EPA and MassDEP. The City already reports all SSOs to the EPA and MassDEP in accordance with current MassDEP and EPA regulations, which are exactly the same as those stated in these Sections. Adding these requirements to the MS4 permit duplicates an existing effort and, therefore, is unduly and unnecessarily burdensome.

Recommendation: This section should be rewritten to simply reference, not duplicate, current EPA/MassDEP requirements for verbal and written SSO reporting.

10. Comment: 2.3.4.5. Page 26. It is unclear whether outfall/interconnection inventories completed prior to the effective date of the new permit will count toward compliance.

Recommendation: Revise this Section to allow prior inventories to count towards compliance, providing they meet the requirements of Section 2.3.4.5.

11. Comment: Section 2.3.4.7.c.i & 2.3.4.8.c.i. Pages 30 & 37. The definition of and

implementation milestones for "Problem Catchments" significantly disadvantage MS4s that have proactively undertaken outfall sampling in advance of it being required by this permit. Proactive MS4s with sampling data, especially those in urban areas, will have far more outfalls that must be designated as Problem Catchments and given only 5 years to complete IDDE. Conversely, MS4s that have made no effort to sample their outfalls will have no (or very few) Problem Catchments, but are given 5to10 years to complete IDDE. As written, the permit punishes proactive MS4s by imposing far more stringent IDDE milestones than those for MS4s that have not performed sampling.

Recommendation: The definition and implementation milestones for "Problem Catchments" need to be revised to remove this inequity.

12. Comment: Section 2.3.4.7.c.iii. Page 31. The draft permit mandates that the initial illicit discharge potential assessment and priority ranking must be completed within 1 year from the effective date. However, mapping of the MS4 infrastructure and Catchment Delineations will not be completed until 2 years from the effective date. The mapping requirement contained in the 2003 permit was limited to MS4 outfalls only and, therefore, "existing" mapping is insufficient to complete the required 2.3.4.7.c.iii assessment/ranking.

Recommendation: The required catchment assessment and ranking in 2.3.4.7.c.iii needs to align with the mapping and have a completion date of 2 years from the effective date.

13. Comment: Section 2.3.4.7.d.iv. Page 32. The limitation on when wet-weather screening should take place ("March to June") does not make sense for IDDE. Although wet-weather screening is intended to identify illicit discharges that only occur during peak flows, whether it should be performed in conjunction with high or low groundwater is determined by the System Vulnerability Factors (SVFs). For example, if the SVFs indicate structural defects and exfiltration potential, high groundwater would actually inhibit the investigation. In this case, sampling should be performed during a heavy rainfall event at low groundwater. Conversely, if the SVFs indicate capacity restrictions and SSO potential, then sampling during high groundwater would be appropriate.

Recommendation: The permit should be revised to state that wet-weather sampling should be performed during conditions appropriate for the identified SVFs for each catchment area, and provide examples similar to those above to assist MS4s in making an informed decision about when to sample.

14. Comment: Section 2.3.4.7.d.iv. Page 32. The requirements related to wet-weather monitoring are not provided in sufficient detail. Inspection must be performed during wet weather, defined as sufficient intensity to produce a discharge. However, it is not clear

whether a discharge must be observed at every outfall to achieve compliance. Does the City have to return to an outfall repeatedly until a discharge is observed, even if it was monitored during a substantial rainfall event? To require the City to mobilize staff, equipment, and laboratory services an unlimited number of times to observe flow at each outfall places is an unreasonable burden.

Recommendation: The permit should be revised to provide specific minimum storm parameters, for both time and rainfall amount. The minimum storm event should be one sufficient to anticipate discharges at all functional outfalls. The requirement for discharges to be observed at every outfall should be eliminated.

15. Comment: Section 2.3.4.7.d.v. Page 32. Based on the response from you at the MS4 Information Session on October 28, 2014, analysis for conductivity is being required as a measure of salinity. Requiring both salinity and conductivity testing for the same purpose is a waste of MS4 resources.

Recommendation: The permit should be revised to require either salinity or conductivity, but not both. In addition, the permit needs to state the applicable benchmark and required action for the chosen parameter, as is provided for other sampling parameters in Section 2.3.4.7.d.vi.

16. Comment: Section 2.3.4.7.d.v & 2.3.4.7.vi. Pages 32 & 33. The level of accuracy for each required sampling parameter is not provided. For example, at what detection level is chlorine to be considered "detectable" in Section 2.3.4.7.vi.

Recommendation: The permit must be revised to clarify the required level of accuracy for each sampling parameter.

17. Comment: Section 2.3.4.7.e. Page 34. The System Vulnerability Factor (SVF) for "any sanitary sewer and storm drain infrastructure greater than 40 years old in medium and densely developed areas" is too inclusive. In Quincy, where infrastructure is typically in excess of 40 years old, this SVF serves as a "catch all" to require wet-weather sampling in virtually all catchment areas. Infrastructure age, by itself, is not an indicator of illicit potential. For example, some of our oldest sewers are in better condition than those built 40 or more years later. It is typically other factors, such as poor structural condition, that are the source of elevated illicit potential, not solely the age of the infrastructure.

Recommendation: This SVF should be revised to include only those sewers and drains that are known to have specific concerns, not all sewers/drains older than an arbitrarily selected age.

18. Comment: Section 2.3.4.7.e. Page 33. The SVF for "crossing of storm and sanitary sewer alignments" is too inclusive. On streets with both sanitary sewers and storm drains, the likelihood that a catch basin connection crosses a sanitary sewer or a sanitary sewer service connection crosses a storm drain is extremely high. This would mean that nearly all catchments would trigger this vulnerability factor and therefore require wet weather sampling.

Recommendation: This SVF should be revised to include only those catchments that are known to have specific concerns, not all catchments where storm and sanitary sewer alignments cross.

19. Comment: Section 2.3.4.7.e. Page 34. The SVF for "any sanitary sewer infrastructure defects such as leaking service laterals, cracked, broken or offset sanitary infrastructure...or other vulnerability factors identified through Infiltration/Inflow Analyses, Sanitary Sewer Evaluation Surveys, or other infrastructure investigations" is too inclusive. Again, in Quincy, where infrastructure is typically in excess of 40 years old, most sewers have some defects, which again would mean that nearly all catchments would trigger this SVF and therefore require wet weather sampling. In most cases, individual sewer defects do not portend illicit connections.

Recommendation: This SVF should be revised to include only those catchments known to have specific concerns related to the sewer system, and not all catchments with sewers that have minor defects.

20. Comment: Section 2.3.4.7 f & g. Pages 35 & 36. The second paragraph of Section f contains the same requirements as Section g, except for the timeline.

Recommendation: The permit should be revised to either delete one of the paragraphs, or clarify the intended difference between the two requirements.

21. Comment: Section 2.3.4.8.c. Page 36. The draft permit requires that the IDDE Catchment Investigation Procedure be implemented in "every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges." If there is no evidence of any sewer input at an outfall, IDDE field investigation is a waste of resources.

Recommendation: This requirement should be changed to say that outfall screening or sampling, whichever is appropriate, should be repeated some number of times at varying times/conditions to confirm there is no sewer input. If no sewer input is confirmed during dry and wet weather screening or sampling, IDDE field investigation will not be required.

22. Comment: Section 2.3.4.8.c.i-iii. Pages 36 & 37. The milestones stated for the IDDE

effort in 2.3.4.7 are unrealistic for urban MS4s . For some MS4s with ongoing IDDE programs, it has taken many years to locate and remove illicit connections from even one catchment area, let alone 100% of catchment areas. This is especially burdensome in areas where nearly every outfall will exceed the benchmarks for at least one IDDE sampling parameter or System Vulnerability Factor. The draft permit requires IDDE to be completed for the entire MS4 within 10 years. This requirement is both cost-prohibitive and unattainable during that limited period of time.

Recommendation: The permit should be revised to allow for additional time to locate illicit discharges. It is recommended that EPA extend the timeframe for completing the Catchment Investigation Procedure in 100% of the area served by all MS4 catchments from within 10 years of the permit effective date to within 20 years of the permit effective date. The permit should also indicate that, as long as the MS4 is making reasonable efforts to locate the source of the discharge, the MS4 will be in compliance even if the source is not located within the allotted timeframe.

23. Comment: Section 2.3.6.a.ii.a. Page 40. The requirement to retain/treat the first one inch of rainfall applies to "runoff from all impervious surfaces on site." Without a definition for the term "site" (see comment below), this implies runoff from the entire parcel on which the one acre-or-more disturbance occurs. It is not reasonable or cost-feasible to require a large parcel to treat runoff from "all impervious surfaces" on that parcel when they disturb only a small portion of it. Take, for example, a large user that occupies hundreds or even thousands of acres. If it was to disturb one acre, the draft permit would require the user to retrofit its entire drainage system to retain/treat the first inch of runoff. This measure alone will have a chilling effect on economic development and job creation within our City.

Recommendation: Language in this section needs to be revised to limit the regulated area to all impervious areas within the development or redevelopment area, not the entire parcel. Alternatively (or additionally), the definition of "site" needs to defined so that it refers to the area within the limits of work for a development, redevelopment, or other construction project.

24. Comment: Section 2.3.6. The requirements to have pollutant removal equivalent to that of a bio-filtration system must be removed, as a "one size fits all" model for pollutant removal is too restrictive. A "Maximum Extent Practical" principle is more appropriate. For example, the City's annual roadway reclamation or re-surfacing projects do not fit into the "one inch recharge" scenario, even though projects are greater than one acre of disturbance.

Recommendation: EPA should define the words "development" and "redevelopment,"

which would allow exclusion of lateral projects such as roadway improvements.

25. Comment: Section 2.3.6.a.ii. Page 40. This section sets different standards than those existing in the Misstep's Storm water Policy and associated handbooks. Having two different sets of standards will cause conflicts for MS4s and developers and will likely subject communities to litigation. In addition, the ordinances/bylaws of most Massachusetts MS4s reference the MA Storm water Standards.

Recommendation: If EPA wants more stringent standards, it should work with the MassDEP to effect changes to existing State regulations instead of enacting a second, different, and conflicting set of requirements through the MS4 permit.

26. Comment: Section 2.3.6.a.ii. Page 40. The requirement to inventory all City-owned properties for possible recharge areas is not practical.

Recommendation: At most, the City can select five priority sites per year to evaluate, which will result in a better assessment of viable sites.

27. Comment: Section 2.3.6.b&c. Page 41. Both of these sections require review of local bylaws. It is not cost-effective to perform two separate reviews and prepare two separate "assessments" related to the reduction of impervious area.

Recommendation: Sections b and c should be combined into one assessment report, covering both reviews.

28. Comment: Section 2.3.7.b. Requiring an individual Storm water Pollution Prevention Plan (SWPPP) for each municipal site is repetitive, unduly burdensome and unreasonable. The City has one Hazard Mitigation Plan and one Open Space Plan, both of which are renewed every 5 years. It makes sense to have one SWPPP renewed every 5 years. One, single comprehensive SWPPP should be allowed for all municipal operations, with site-specific elements covered as needed.

Recommendation: The permit should be revised to allow a single SWPPP document with site-specific sections as needed to cover all sources of potential pollution.

29. Comment: Section 4.3. Page 51. Now that outfall monitoring has been incorporated into Section 2.3.4.7, there is no need for a separate Section 4.3.

Recommendation: Requirements stated in Section 4.3 should be incorporated into Sections 2.3.4.7 or 4.4, as appropriate.

30. Comment: All Appendices. The appendices do not contain proper page numbering.

Recommendation: Page numbers should include a reference to the Appendix (e.g., "A-21") so as to avoid duplication with the main permit document.

31. Comment: Appendix A. No definition is provided for the following critical terms: Directly Connected Impervious Area, Disturbance, Illicit Discharge, Increased Discharger, Redevelopment, or Site. Interpretation of these terms could be a significant source of controversy, especially for Planning Boards charged with the implementation of the requirements for new development and redevelopment.

Recommendation: Definitions of these terms should be added to Appendix A.

32. Comment: App. H 1.2, 11.2, 111.4, IV.5, V.5. To require the collection of at least 30 flow-weighted samples over a period of 2 to 3 years from each storm water outfall discharging (or tributary) to an impaired water in order to demonstrate that the discharges meet water quality standards is excessive and cost-prohibitive.

Recommendation: All of these sections of the permit should be revised to require sampling of outfalls during not more than 10 rainfall events. EPA should provide a list of rainfall events during which outfall sampling must be performed.

33. Comment: Appendix I. Multiple Sections. Appendix I should not be included in the permit. It should a reference/example document only. The protocol presented in the Appendix is not required by the permit and is only one of many methods that could be used to comply with IDDE requirements. It's inclusion as an Appendix to the permit is inappropriate. In addition, because this protocol is specific to a single method, some of the information that is included is incorrect. For example, holding times presented in Appendix I, Attachment 1, Table 1 are listed incorrectly due to an assumption that analyses are being performed onsite (see Specific Conductance, which actually has a holding time of 28 days, not "Immediate").

Information presented in Appendix A, Table 1 and Step V, are also not appropriate for inclusion in a NPDES permit. The parameters and thresholds presented in Table 1 are already included as Section 2.3.4.7.d.vi. The information regarding instrumentation is reference material and should not be included in a permit. Step V should be removed in its entirety because it does not belong in a permit. It should be in a Fact Sheet or reference/example document.

Recommendation: The permit should be revised to delete Appendix I in its entirety. EPA should provide an online source to the IDDE protocol in Section 2.3.4.7.

The City of Quincy values our water resources and supports the EPA's efforts to reduce pollutants in storm water; however, this draft permit, if implemented in its present form, will have significant negative impacts on our City and its ability to provide basic services. Increases in personnel, capital expenditures, professional services, and expenses are needed to enable us to comply with all these unfunded mandates.

It is the obligation of all of us, to balance the needs and costs of government with the ability of our rate payers and tax payers to pay for the improvements that this permit mandates. The EPA is an unelected federal bureaucracy that has lost sight of the fact that our sewer rate payers and our real estate taxpayers are already burdened with escalating costs of housing, food and health insurance. There is no doubt that this permit will result in higher real estate taxes and higher sewer bills because of the EPA's lack of concern for small businesses, working families, retirees and seniors on fixed incomes.

Additional funding assistance is necessary and should be made available. Without a funding component, Quincy views this permit as additional "unfunded mandates" from the federal government. In addition, without a federal financial commitment, it will be difficult to convince local voters, rate payers and tax payers and decision makers to fund these mandated storm water programs. We urge the EPA to make available a dedicated funding source for all municipalities covered by storm water permits. As responsible caretakers of public resources, we cannot ignore the impact that these expenditure increases will have on our property tax payers and sewer rate payers.

Respectfully Submitted,

City of Quincy, Massachusetts by its Commissioner of Public Works

Daniel G. Raymondi

cc: Mayor Thomas P. Koch,
Thelma Murphy, EPA Region 1 Coordinator
Frederick Civian, MassDEP Storm water Coordinator
Shawn Hardy, PE, Quincy City Engineer

ATTACHMENT

Background

The Water/Sewer/Drain Division of the Department of Public Works is responsible for water distribution, sewer services, and drain/storm water management for the commercial and residential communities of the City of Quincy. The Division conducts operations 24 hours a day, 7 days a week with a workforce that consists of an Operations Manager, Senior Civil Engineer, General Foreman and 59 highly skilled, experienced, trained, certified and licensed personnel.

Water and Sewer operations are funded through an Enterprise Account established pursuant to M.G.L. c. 44 § 53F1/2. All of the costs associated with Water and Sewer operations are paid by water/sewer ratepayers. Drain operations are funded through the property tax. All of the costs associated with Drain operations are paid by the property taxpayers of Quincy.

The Department strives to maximize the benefit and value of our infrastructure funding. Examples of the Department's ongoing accomplishments and successes are as follows:

Drain/Storm Water Management

- Maintained and improved our complex storm water collection system consisting of 150 miles of underground drain pipes, 9,329 catch basins and 5 dewatering pump stations located at Division Street, Alrick Road, Hollis Avenue, Webster Street and the Strand. City drain crews responded to street flooding, broken catch basins, and clogged drain lines on a regular basis.

- As part of Mayor Koch's commitment to improving the city's infrastructure, the Department completed the second year of its proactive Comprehensive Storm Drain/Catch Basin Cleaning and Evaluation Program. Utilizing internal personnel and a private contractor, 1,145 tons of debris was removed from 1,700 catch basins across the city dramatically improving the efficiency of our drainage system.

- Repaired 80 catch basins.

- Revised and implemented the protocol for the operation of the tide gates at Blacks Creek which minimized potential flooding concerns.

- Inspected, maintained and monitored the City's tide gates to prevent rising tides from entering the system and causing flooding.

- Maintained outfalls that allow storm water to drain into brooks, waterways, and marshes and eventually into the ocean. Cleaned debris and branches from Furnace Brook, Town Brook, and Blacks Creek.

- With the assistance of Community Preservation Act Funds and local Friend and Community Groups, the Department managed $90,000 in projects related to the health and preservation of Butler's Pond, Sailor's Home Pond and Manet Lake. This includes efforts to eliminate invasive species from the standing bodies of water.

Street Sweeping

In addition to the daily sweeping of our main thoroughfares, business districts and trash routes and our fall comprehensive sweep, Highway Operations, with the purchase of a new street sweeper, initiated spring and fall street-sweeping blitzes. The City was divided into three zones and the entire City was swept spring and fall in three weeks. This prevented that material from migrating into our drainage system.

Storm Drain Projects

- Removed roots and cleaned the drains along the Furnace Brook drainage area. These remedial activities over the past two years consisted of cleaning approximately 20,300 feet of drainage pipe and disposal of 340 cubic yards of sediment and debris.

- Continued targeted cleaning projects in the Furnace Avenue, Miller Street and Cross Street area of West Quincy.

- Assisted in flood mitigation projects of the Miller Street / Cross Street / Furnace Avenue neighborhood with the installation of back flow prevention devices in the closed conduit portion of Furnace Brook. New drainage pipes were also installed to divert flows from the neighborhood's existing system to reduce the magnitude, frequency, and duration of flooding. This phase of the Furnace Avenue Flood Improvement Project was completed for $215,000 in May of 2014.

- Completed the replacement of storm drainage piping between the Atlantic Middle School on Hollis Avenue to the Massachusetts Bay Transportation Authority (MBTA) Parking lot on Hancock Street (North Quincy drainage area). Grove Construction completed $1.5M of piping and structure replacement including three cross country sections.

- Completed the $1,100,000 Spence Avenue Drainage project that provided flood relief to Circuit Road, Quincy Avenue, Charlesmount Road, Craig Avenue and Martensen Street. The project improved the condition of the storm water infrastructure and increased the hydraulic capacity of the system with the goal of reducing the magnitude, frequency, and duration of localized flooding. This project will mitigate flood conditions in this neighborhood through drainage easements.

- Performed routine cleaning of the Town Brook By-Pass system behind Star Market on School Street. The by-pass system is a component of Town Brook flowing from the Braintree Dam to the Town River at Southern Artery. The By-Pass structure diverts peak (storm) flow into a

Deep Rock Tunnel which flows under the city to Town River, thus mitigating flooding in the Downtown.

Sewer Improvements

- Continued implementation of a new Sewer Ordinance that allows the Department to charge users for unauthorized sewer connections, unauthorized sewer use and prohibited discharges into our sewer system.
- Maintained 204 miles of sewer mains.
- Responded to 1,085 sewer related calls.
- Cleaned 971 sewer mains and performed 118 sewer repairs.
- Responded to 20 odor issue calls, 42 pump station alarms and performed general maintenance on our infrastructure and pump stations to ensure continuous, uninterrupted operation.
- Upgraded sewer and storm drain pipes around the Hancock Street, Chestnut Street and Cottage Avenue triangle. Sewer replacement was completed on Chestnut Street and a portion of Cottage Avenue. The Hancock Street sewer was inspected and determined to be in serviceable condition.
- Continued to operate the closed circuit television (CCTV) truck to proactively investigate the internal condition of sewer and drain piping. This vehicle responded to sewer calls and emergency situations and was routinely scheduled for I&I investigations.
- Maintained and inspected the sewer collection system which included the six wastewater pump stations at Fort Square, Quincy Point, Evelyn Place, Carlisle Street, Squantum Gardens and the Strand.
- Completed engineering designs for upgrades and improvements to the second largest City-owned sewer pump station. The Fort Square pump station services a major portion of south Quincy. In conjunction with the Town Brook relief interceptor sewer, the pump station was also designed to relieve the surcharging of the trunk sewer running parallel to the Town Brook. With a design capacity of over 3,500 gallons per minute, the pump station pumped directly to the MWRA high-level sewer and ensures that wet weather and high flow events do not cause sewer overflows. Constructed in 1985, the aging pump station has a number of deficiencies and improvements are necessary in order to sustain the reliability of the station. Methuen Construction Company, Inc. was awarded a contract for $2.5M. The project is substantially completed.
- Initiated the evaluation of the Quincy Point pump station which is the largest City-owned sewer station in the city. This project is similar to the Fort Square pump station improvement project and a preliminary design is scheduled to be completed in fiscal year 2015.

Construction is scheduled for fiscal year 2016.

- Evaluated need for repair or replacement of the sewer force main from Quincy Center to Quincy Point.

Infiltration and Inflow (I&I) Work

- Invested $550,000 dollars into the City's fourth I&I removal project. This important initiative was started by Mayor Koch in 2009.

- Completed the sewer replacement for Rice Road. This repair became necessary because of settlement and suspected infiltration. The project replaced approximately 1,500 linear feet of sewer and service laterals.

- Completed an emergency open excavation repair of 70 linear feet of sewer on the 24 inch sewer that runs through Mallard Road onto Post Island Road. Also, completed the non-emergency portion of the work in this area. A final Cured In-Place Pipe (CIPP) liner was installed in the two remaining sections of sewer. It is estimated that this work has removed approximately 175,000 gpd of I&I from the sewer.

- Completed emergency sewer repairs to a portion of Dysart Street.

- Two catch basins were found illicitly connected to the City's sewer system. The two catch basins were removed from the sewer and properly reconnected to the local drainage system.

I & I removal projects scheduled for construction in fiscal year 2015 include:

- CIPP lining along East Squantum Street to line the 15- and 24-inch clay sewer that runs through the salt marsh. This sewer has structural defects and infiltration is leaking into the pipe. Portions of this sewer have been previously lined and the manholes were previously sealed.

- Open-cut spot repairs throughout coastal areas of the city to replace defected pipe that is leaking infiltration into the pipe. This work will also involve CIPP lining in select areas and will address structural and capacity concerns.

Community Outreach

The Department continued its commitment to strengthen relations with its constituency and other Departments through improved communication, information, and education through:

- Timely updates on the City web site and Department home page.

- Delivery of 40,000 InfoLetters twice yearly to every household in Quincy, social and community centers, the City's libraries, City Departments, coffee shops and to businesses.

- Appearances on Quincy Access Television.
- Articles and advertisements in the Quincy Sun and Patriot Ledger newspapers.
- Produced and installed "Public Notices" at 11 beaches.
- Informational Water Bill inserts.
- Participation in municipal, community and neighborhood special events.
- QATV public service announcements, crawls and bulletin boards on Quincy Access Television channels 8 and 11.

US EPA – OEP06-4
Mr. Newton Tedder
5 Post Office Square, Suite 100
Boston, MA 02109-3912

Subject: Comments on the Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder:

The Town of Reading is in receipt of the Draft Massachusetts Small MS4 General Permit for stormwater management. This letter provides our comments for consideration when developing the final permit.

We recognize the importance of stormwater management to the environmental health of Massachusetts waterways and the maintenance of designated uses. With the Clean Water Act long focusing on point sources alone, we applaud the efforts of the Environmental Protection Agency (EPA) and the Massachusetts Department of Environmental Protection (MassDEP) over the last decade to incorporate non-point source pollutant reduction into the CWA regulatory program.

The regulatory agencies and the regulated communities share a common mission - to ensure the health and quality of our cities and towns and their natural resources. In order to accomplish these goals, environmental programs must be balanced with other needs and responsibilities of each community and implemented in a fashion that is both feasible and financially responsible. In this context, we offer the following comments on the Draft Permit.

Stormwater Retention/Treatment

The Draft Permit requires that when a project disturbs one or more acres, or is less than one acre but is part of a larger common project that disturbs more than an acre, stormwater management facilities for new development and redevelopment projects shall be designed to either retain the first one inch of runoff from all impervious surfaces or treat that stormwater. This is a sweeping requirement that encompasses many types of projects, including pavement maintenance work that exceeds one acre. Therefore, to fulfill this requirement, a community will need to redesign the existing stormwater management facilities as part of the resurfacing of a road. With the abundance of utilities located within right of ways many communities do not have room within the existing right-of-way to install stormwater management facilities and will need to purchase/take extra land by eminent domain to provide a location for these facilities. This will add a significant expense to the cost of routine maintenance work on roads. Accordingly, many communities will need to scale back on

their pavement maintenance projects because of the limitations in funding, which will cause the Commonwealth's roads to deteriorate faster than they currently do.

The 2010 Draft Permit required new development and redevelopment projects to comply with the Massachusetts Stormwater Standards. Stormwater Management Standard 7 (Redevelopment) allowed certain projects to meet the standards to the maximum extent practicable. In the case of pavement maintenance work, resurfacing a road within the existing footprint would be a redevelopment project and providing stormwater treatment would be required to the maximum extent practicable, not required as it would be under this permit. Therefore, the Draft Permit should be revised to require projects comply with the Massachusetts Stormwater Standards, or revised to provide exemptions for specific types of projects, such as pavement maintenance.

Street and Parking Lot Design Guidelines

The Draft Permit requires that within three years a community prepare a report assessing the current street design and parking lot guidelines and determine if changes need to be made to these guidelines to support low impact design features. It is unclear in the permit if low impact design would need to be applied to pavement maintenance projects that have full-depth reclamation. Incorporation of low impact design features into existing pavement maintenance projects will add significant cost to these projects. As stated in the previous comment, funds for these projects are limited and will likely reduce the number of projects a community can do in a year. The Draft Permit should be clarified on this issue.

Tracking of Impervious Area

The Draft Permit requires that a community estimate the annual increase or decrease in the number of acres of impervious area and directly connected impervious area. Tracking of impervious area in a community is a burdensome requirement on a community's limited financial and personnel resources. A community can track changes in impervious area associated with municipal facilities, large commercial and industrial projects, and roadways. However, tracking changes in impervious area on private property, e.g., driveways, roofs and walkways, is not practical. Communities do not have the staff available to determine the changes in impervious area that have occurred on private property. Doing a flyover of the community on an annual basis would be the most reasonable way to perform this task; however, the cost of doing this annually is prohibitive. The Draft Permit should be revised to require a community to track changes in impervious area at municipal facilities, large commercial and industrial projects, and roadways only.

Wet Weather Sampling

The Draft Permit requires that a community conduct wet weather sampling at outfalls to the extent necessary when there is the presence of one or more System Vulnerability Factors. The permit states that 80 percent of the Problem Catchments must be completed with three years of the permit effective date, with 100 percent completed within five years of the permit effective date. For a community with a many outfalls requiring wet weather sampling, meeting this timeline may be difficult. The wet weather sampling must be done between March and June when the groundwater levels are relatively high. To obtain reliable results, the sampling must be done during the "first flush." Given the need to mobilize rapidly upon commencement of a storm to capture the first flush, sampling will need to be done during working hours. With limited staff, only a few of outfalls will be sampled during a storm. If many outfalls need to be sampled or if dry weather persists during the spring months, it may not be feasible for a community to meet the timeline requirements for wet weather sampling. The Draft Permit should extend the timeline beyond the five year permit term.

Chloride Reduction

The Draft Permit requires a community to implement procedures for winter road maintenance, including minimization of the use of sodium chloride and other salts. Most communities currently try to limit salt use to reduce costs and apply it to the roads in a responsible manner. However, to reduce salt usage below to what is necessary to maintain safe, passable roads, in order to address water quality impairments, endangers human life and opens a community up to potential litigation for having unsafe roads. The Draft Permit should require that communities follow the most current Best Management Practices for salt usage on roads.

In conclusion, while the Town of Reading agrees with the regulation of stormwater inputs to maintain high water quality, the Draft Permit as presented includes several requirements which are not achievable by many communities and do not take into account time and budget constraints that affect cities and towns. The permit should be scaled back to include achievable, cost-effective goals during the course of the five-year permitting period. If communities are presented with a permit they can meet, they are more likely to successfully invest the funds and labor into implementation.

Thank you for your consideration of these comments. Should you have any questions, please contact me at 781-942-9082.

Very truly yours,

RE: Rhode Island Department of Environmental Management (RIDEM) Comments on the 2014 Draft Massachusetts Small MS4 General Permit

As the delegated permitting authority for the administration of the National Pollutant Discharge Elimination System (NPDES) Program in Rhode Island, the Department of Environmental Management (DEM) Rhode Island Pollutant Discharge Elimination System (RIPDES) Program is responsible for the review and coordination of responses to regulatory matters that affect the administration of the Program.

The DEM has received and reviewed the 2014 Draft Massachusetts Small MS4 General Permit. Based on this review the RIPDES Program has the following comments:

1. The Mount Hope/Kickemuit River Estuary TMDL and the Runnins River TMDL approved by USEPA on 1/14/2010 and 12/06/2002 respectively, affect the Massachusetts municipalities of Seekonk, Rehoboth, Swansea and Fall River. Requirements for these TMDLs should also be incorporated into Appendix F, Part B.III. Also the Blackstone River, Mill River and Peters River Bacteria (and Metals) TMDL approved by USEPA on 4/23/2013 identify Massachusetts' sources as contributing to bacteria impairments in the Blackstone River and Peters River. Though urban stormwater discharges are not specifically identified as contributing to the impairments in Rhode Island waters, the TMDL identifies both wet and dry weather sources in Massachusetts as contributing to impairments in RI.

2. In addition to the Additional or Enhanced BMPs specified in the Bacteria TMDL Requirements section, the Rhode Island TMDLs for bacteria require enhancements to the post-construction minimum control measure for MS4 operators to revise their ordinances to ensure that: 1. **new land development** employ stormwater controls to prevent any net increase in bacteria for sites contributing to MS4s which discharge to the impaired water bodies, and 2. **redevelopment projects** employ stormwater controls to reduce bacteria to the *maximum extent feasible*. RI's Bacteria TMDLs also

require construction of structural BMPs at priority outfalls similar to the requirement specified for nutrient TMDLs in Part B.II.1.c of Appendix F., Description of planned structural controls. These requirements should be incorporated into Parts B.III of Appendix F to ensure interstate equity in addressing pollutant loadings contributing to the impairments.

3. The Blackstone River, Mill River and Peters River Bacteria and Metals TMDL approved by USEPA on 4/23/2013 also identified Massachusetts' sources as contributing to metals impairments in the Blackstone River and Peters River. Though urban stormwater discharges are not specifically identified as contributing to the impairments in Rhode Island waters, the TMDL identifies both wet and dry weather sources in Massachusetts as contributing to impairments in RI.

4. In addition to the Additional or Enhanced BMPs specified in the Metals TMDL Requirements section, the Rhode Island TMDLs for bacteria require enhancements to the post-construction minimum control measure for MS4 operators to revise their ordinances to ensure that: 1. **new land development** employ stormwater controls to prevent any net increase in metals of concern for sites contributing to MS4s which discharge to the impaired water bodies, and 2. **redevelopment projects** employ stormwater controls to reduce metals of concern to the *maximum extent feasible*. RI's Metals TMDLs also require construction of structural BMPs at priority outfalls similar to the requirement specified for nutrient TMDLs in Part B.II.1.c of Appendix F., Description of planned structural controls. These requirements should be incorporated into Parts B.IV of Appendix F to ensure interstate equity in addressing pollutant loadings contributing to the impairments.

If you have any questions regarding this correspondence please do not hesitate to call me at 401-222-4700 extension 7202, or Margarita Chatterton at extension 7605.

Sincerely,

Mr. Tedder -

I proof-read my comments four times before sending, but just found an egregious error I must correct:

In my paragraph on chlorine testing, please replace the word hypochlorite with the correct "thiosulfate" as I have done below.

thanks once again.

Subject: Draft MA MS4 permit comments - Roger Frymire 27Feb2015

Mr. Tedder -

First, I'd like to thank you and all the permitting team for your excellent efforts to date. Having commented on earlier drafts for MA and NH MS4 permits as well as on Worcester, Boston Phase I stormwater and CSO permits, etc. - I am impressed with the consideration given to earlier comments and gratified with the evolution seen towards a workable 'final' permit version.

Personally, I could accept the Draft as a final permit, but I fear challenges would further delay the improvements I hope to see from a stringent IDDE requirement being implemented firmly but fairly. From personal experience, the largest problem with stormwater continues to be Sewage therein.

I am a firm believer in the efficacy of bacterial sampling at outfalls to identify sewage problems. I would be thrilled if every outfall could be sampled quarterly in both wet and dry weather. But that would leave no money for fixing any of the problems found.

Ammonia and to a lesser extent surfactant sampling provide a reasonable quick screen for problem catchments. Boston Water & Sewer did a decent job screening their 200 outfalls this way, and might have avoided a lawsuit if they had put out enough effort to solve the problems seen faster than more problems appeared.

I believe Any exceedence seen in ammonia, surfactant, or bacterial levels should raise an alert at an outfall - rather than requiring all three to be high before admitting there might be a problem to investigate.

I would require followup bacterial testing to show problems first found thru ammonia or surfactants have been fully fixed, as well as testing every good outfall at least every five years in wet and dry weather to maintain catchment integrity.

Characterization of Phosphorous loading from an outfall is complicated and requires multiple samples from multiple storms in all four seasons - possibly a hundred samples per outfall. Requiring sporadic outfall sampling for phosphorous seems a complete waste of time, effort, and money better spent reducing sewage and building infiltration BMPs.

The mother of modern sanitary science and first female MIT graduate Ellen Swallow Richards created the famous "Normal Chlorine" map of Massachusetts which shows that prior to road salt proliferation most of Massachusetts fresh water averaged only ~ 2ppm chloride - rising near the coast to ~ 9ppm due to blown salt spray effects. Road salt usage has devastated aquatic and wetland ecosystems and helped the wide spread of invasive plants in areas stressed by this salt. However, requiring permittees to test for chlorides will do nothing to fix the problem, if it is solvable. At most I might like to see annual reporting of salt tonnage applied for every permittee.

As one graph in MyRWA's comments shows - even at the end of a spring, summer, and fall to rinse away a prior winter's salt and before the first snow requires new salt to renew the cycle ... Alewife Brook runs consistently above EPA stress levels for aquatic life in salinity. In winter most Mystic River watershed streams and ponds regularly cycle into EPA listed Toxic salinity levels.

Chloride is one thing, Chlorine testing at outfalls is another. While the EPA standard for bacterial sampling calls for using sodium hypochlorite to neutralize free chlorine which might otherwise kill fecal bacteria prior to culturing - I have seen several recent QAPPs which do not include this requirement. The IDDE requirement for chlorine testing might be obviated if the bacterial sampling standard were adhered to. In personally taking thousands of bacterial samples, the only instance where chlorine was hiding bacterial contamination, chlorine was obvious as an odor. Besides bleach from laundry, which should cause surfactant hits, only drinking water and swimming pools regularly raise chlorine levels. Swimming pools are extremely seasonal and too sporadic to be seen in this testing, while drinking water leaks should be traced and fixed for their own merits - not under this program.

Please consider the City of Cambridge's comment on section 2.1.2 for increased discharges. If storm water from sewer separation is not clearly allowed, all further benefits from cso removal thru sewer separation will be lost. Ten years ago Cambridge had a written goal of eventual city-wide separation. Myself and other residents hope an MS4 permit does not forever derail this goal.

One spot I cannot now find in the draft permit documents calls for what I believe to be an unrealistic precision in recording GPS coordinates of outfalls. The EPA STORET standard here of five decimal places in digital degrees (DD.ddddd) seems to be reasonable. A single digit in the fifth decimal place is about three feet - the size of an average pipe of interest. Similarly an accuracy of +/- five meters would allow the use of very reasonably priced GPS equipment. This again leaves more monies available for fixing IDDE problems.

As always, Thank you for your professional consideration of these comments.

Sincerely,
Roger Frymire

RE: Public Comment on the 2014 revised Draft NPDES General Permit for Small MS4 Systems in Massachusetts

Dear Mr. Tedder:

On behalf of the Town of Rowley, I respectfully offer comments on the revised draft MS4 permit for Massachusetts, notice of which was published by EPA in the Federal Register on September 30, 2014.

The Town of Rowley shares and embraces the goal of protection and enhancement of water quality with the EPA. The Town is blessed with various water resources (fresh and salt) which enrich and sustain our community. As a small rural community we know all too well the detrimental impacts of stormwater and have witnessed storm and flood related impacts to our small and historic infrastructure. We submit these comments and concerns in the hope that a "cooperative engagement" can take place between the EPA (regulator) and our citizens (regulated community).

Rowley is a small rural community settled in 1639 with a long tradition of agriculture and aquaculture that recognizes the importance of clean water. Our municipal structure is also small and departments such as Highway mirror the same in staffing since our built roadway infrastructure is not extensive and not complex. Thus the apparent number of administrative requirements and tasks is initially a deep concern for our town. We are concerned that there doesn't seem to be a proportional application of these administrative requirements that would address a small rural community's lessoned ability at implementation.

Town Department Capacity & Budget Constraints

The Town in general and our Departments specifically, have been operating with very constrained budgets for a decade. The Town has been obligated, when able, to implement stormwater management in the

most cost effective manner, given the extent of competing local demands in education, public safety, facilities and infrastructure upgrades and general welfare. Town officials will have to make very compelling cases for additional resources to Town Meeting attendees and Boards of Selectmen. It doesn't seem to be prudent to expect small Towns to make major expenditures just prior to these requirements effective date without both EPA and the state DEP coordinated in these regulations, and offering committed implementation assistance to small MS4 communities.

The Rowley Highway Department has a small number of permanent full time staff and doesn't current possess the capability to assume the extensive administrative burdens put forth in the draft permit. The magnitude of the draft permit's administrative requirements will apparently require possible engagement of expensive consultants solely to guide implementation and direct future hiring of more full-time staff for those tasks.

For our community, which lacks built infrastructure to begin with, the projected costs of compliance are overwhelming. Given current fiscal circumstances and the capacity of municipal departments, it would seem prudent to adopt a proportional and focused approach to implementing those administrative requirements.

Clarification, State-Federal Regulatory Consistency and Streamlining Needed

In our rural community where not all of the town lies within the designated MS4 area, we have questions about how to cost-effectively implement an illicit discharge detection and elimination program. The draft permit is unclear as to administrative responsibilities where municipal storm drainage systems are lacking. This is but one example where clarification is needed. Our community certainly wishes to be responsive to eliminating instances where pollution is degrading water quality but municipal funds need to be wisely marshalled where most effective. There is also the concern that a coastal community is being forced to respond to degraded water quality in waterways that have already flowed through many miles of inland communities upstream from us. Thus the waterways' impairment may already be a "done deal" and expenditures here may not improve the receiving waters as effectively as they would if implemented upstream.

It appears that some confusion may lie in the apparent contradiction between MassDEP rules and the EPA draft permit about treatment and infiltration threshold definitions and requirements for stormwater management in new developments. These apparent inconsistencies may result in additional administrative and potential legal expenses. The final permit should provide for clarity and consistency in regulatory thresholds and requirements between local, state, and federal regulatory requirements.

Time Line for New Permit

In light of the existing uncertainties and implementation questions and given the level of investment needed for compliance, this draft permit does not allow nearly enough time for small Town with the requisite Town Meeting process to set up an adequate revenue source to fund a fully compliant program. We respectfully urge EPA to extend the timeline for the MS4 permit effective date, NOI filings and compliance. Our town is already preparing the Fiscal Year 2016 budget. The local budgetary cycle requires Town Meeting votes to adopt fiscal year budgets in the Spring for the July 1st, 2015 thru June 30th, 2016 year. Any major new expenses generated by a final permit effective as envisioned in Fall 2015 are likely to provoke financial turmoil in City/Town halls. We note that EPA has phased in many of the proposed

requirements including the additional GIS mapping and IDDE implementation. More time, however, will be needed to allow for planning, staffing, and incorporation into establish programs.

Given the local budget cycle, EPA should establish an effective date of Fiscal Year 2017 for the permit and extend timeframes for municipalities to file the NOI, prepare stormwater management programs and undertake the many administrative mandates. A minimum of two years should be provided from the permit effective date simply to allow small municipalities time to plan, staff and budget accordingly. Communities will need this time to work in determining costs and appropriate funding sources, to obtain the necessary local approvals, to secure funding levels and staffing that can sustain a compliant program, and finally to establish workable intermunicipal Collaborative programs for sharing personnel, equipment and/or testing labs.

Thank you for considering these comments in preparing the final MS4 permit for Massachusetts.

Sincerely,

G. Robert Merry

Date: December 29, 2014

Subject: Comments – Draft NPDES Small MS4 Permit

The following list of comments regarding the Draft NPDES Small MS4 permit is compiled from discussions with the Southeastern Regional Services Group (SERSG) during MS4 training workshops and review of the Draft Permit and attachments. SERSG has established a stormwater collaborative, Southeastern Massachusetts Stormwater Collaborative (SEMSWC) to share knowledge, expertise and costs among its twenty (20) communities. Community members are:

Town of Abington	Town of Foxborough	Town of Plainville
Town of Bridgewater	Town of Lakeville	Town of Raynham
City of Brockton	Town of Mansfield	Town of Sharon
Town of Canton	Town of Middleborough	Town of Stoughton
Town of East Bridgewater	Town of North Attleborough	City of Taunton
Town of Easton	Town of Norton	Town of West Bridgewater
	Town of Norfolk	Town of Wrentham

1. Tables and references are outdated in permit:

    a. The list of TMDLs in the Draft Permit does not include the September 2014 South Coastal bacteria TMDL

    b. The draft 2014 list of 303(d) waters includes other TMDLs and impairments not listed in the draft permit.

    c. Communities listed in Section 2.2.2 are not always listed in Table F-8. Which table determines coverage? The wording in the permit is unclear and inconsistent.

    d. Communities listed in Section 2.2.2 are not always listed in the TMDL as influencing water quality. For example, West Bridgewater is listed in Section 2.2.2 as having a bacteria TMDL because of the Salisbury Plain River (MA62-06) TMDL, but the actual TMDL document excludes West Bridgewater's MS4. West Bridgewater should not be listed in the new MS4 permit for this TMDL.

2. EPA must coordinate its various permitting programs. The definition of "Waters of the United States" recently underwent a public comment period. This is a fundamental

building block of the Clean Water Act and the Small MS4 NPDES permit. Without a clear definition of the "Waters of the United States", the comments made relative to the MS4 permit may be moot or altered.

3. Many of the Draft Permit's prescriptive requirements do not allow the individual permittees to select the most effective BMPs for their community and watershed, nor can they align BMPs with best "measurable goals", especially with the requirements for nutrient impaired waters. For example, requiring public education on specific impairments multiple times per year may not provide a measurable goal for a community or be the most effective use of funds to reach the goals of the permit. Street sweeping two times per year in drainage areas discharging to nitrogen impaired waters may not be cost-effective, or effective, for all communities. Constructing BMPs on municipal land may also conflict with the measurable goal requirement. These are prescriptive requirements that may not have measurable results for some communities and therefore do not meet the requirement that the permittees assign measurable goals to their selected BMPs. Each community should be allowed to decide which BMPs provide the biggest impact and best measurable goals. EPA should instead provide a menu of options and/or suggestions that a permittee can select for effectiveness and measurability.

4. 2.1.1.d: EPA states, "… the permittee shall, as expeditiously as possible, but no later than 60 days of becoming aware of the situation, eliminate the condition causing or contributing to an exceedance of water quality standards." But, under 2.3.4.2. – Elimination of Illicit Discharges, EPA states "Where elimination of an illicit discharge within 60 days of its identification as an illicit discharge is not possible, the permittee shall establish an expeditious schedule for its elimination…". Is the 60 day limit a hard deadline or a guidance threshold?

5. 2.3.4.2: Please define "identification as an illicit discharge" and "upon detection of an illicit discharge". Are these situations defined as samples/testing at an outfall that indicates a probable illicit discharge or when the illicit source is located and identified?

6. 2.2.1.a: EPA states that TMDL waters covered by the permit are as of the EFFECTIVE date of the permit. With the number of waters listed as pending TMDLs in the MA 303(d) impaired waters list, EPA should set the coverage date for the TMDL waters as of the FINAL date of the permit to allow communities to budget and plan properly, much as EPA has done to delay the effective date of the entire permit for budgeting purposes.

7. 2.3.4.6.: The schedule for mapping of the complete MS4 is overly aggressive. Mapping can take more than 2 years with connectivity included and post collection data processing for small and mid-sized communities, especially when adding the other requirements of this MS4 permit due within the first two years. The limited availability of proper equipment and staffing will strain the ability of communities to create an accurate map without data gaps and conflicts within this time frame.

8. 2.3.4.6.a.ii: Does “where available” refer to the existence of sewer systems or maps of sewer systems?

9. 2.3.4.7.diii: Dry weather screening and sampling should not proceed when there is observable snow melt.

10. 2.3.4.7.e.i. – Catchment Investigation Procedures: EPA states, “This review shall be used to identify areas within the catchment with higher potential for illicit connections and System Vulnerability Factors that indicate a risk of sanitary or septic system inputs to the MS4 under wet weather conditions”. Septic systems are not designed to remove nutrients and may discharge nutrients to an MS4 through groundwater. Septic systems can comply with MA Title 5 (310 CMR 15.00) and still discharge nutrients. Are septic systems considered an illicit connection if they discharge nitrogen and phosphorus to groundwater? Do the Clean Water Act and this MS4 permit override MA Title 5 and therefore limit septic systems from discharging any amount of nitrogen or phosphorus indirectly to an MS4, even though they do not violate the state’s Title 5 permitting program? EPA instead should set a concentration limit, consistent with other regulations, that may trigger mitigation action under this permit’s regulations.

11. 2.3.5 Construction Site Stormwater Runoff Control: EPA states, “…so that it is not transported in stormwater and allowed to discharge directly or indirectly to water of the U.S.”. EPA’s requirement for nutrient reduction from private development sites and for ordinance updates exceeds the coverage area of the permit. There is no consistent wording that restricts these ordinances to discharges to the MS4. The wording in the permit should be consistent in every paragraph so that this important point is not lost. Otherwise, this is not applicable to the EPA’s jurisdiction under this permit.

12. 2.3.5. Construction Site Stormwater Runoff Control: The “Objective” should be rephrased to restrict the definition to stormwater discharged to the MS4.

13. 2.3.5.6 – System mapping: a.i. The draft permit states, “Waterbodies identified by name and indication of all use impairments as identified on the most recent EPA approved MA Integrated Report of waters report pursuant to CWA section 303(d) and 305(b).” This means the requirements of the draft permit can change during the permit period whenever a new Integrated Report is approved by EPA. This is a difficult requirement for permittees that rely on town meeting votes once per year for budgets. EPA should set a fixed date of compliance with impaired waters, as EPA does with TMDLs, which set compliance with TMDLs finalized as of the EFFECTIVE date of the permit.

14. 2.3.5.6.ei and eii(b): The application of System Vulnerability Factors for wet weather sampling is a blanket approach to applying generic criteria that do not apply to every community regulated by the permit, and the permit does not allow waivers if the criteria do not apply. For example, two of the SVFs are (1)“Crossing of storm and sanitary sewer alignments”, and (2) “Any sanitary sewer and storm drain infrastructure greater than 40 years old in medium and densely developed areas”, which are criteria presented without

any supporting basis or justification. Many communities are proactive in their infrastructure maintenance and have addressed cross connections (direct or indirect) and increased the expected life span of their sewers and drains through routine maintenance and upgrades. Communities with active asset management and/or CMOM programs should be exempt from wet weather monitoring in these catchment areas.

15. 2.3.6.aii (b) through (d) inclusive: Infiltration systems do not discharge to the MS4 and therefore should not be covered under this permit.

16. 2.3.6.dii: This paragraph refers to "each sub-basin identified pursuant to Part 2.3.4.6.a.". The reference to sub-basins is unclear since the referenced section defines mapping elements, not sub-basins.

17. Coordination with other NPDES Permits:

    a. Appendix H and Fact Sheet page 66: EPA is requiring permittees to monitor nutrients, especially nitrogen in the Taunton River watershed, which is a common practice under the wastewater discharge NPDES program. However, the requirement to construct BMP controls circumvents the TMDL process established by the Clean Water Act Sections 303(d) and 305(b). Under these sections, a TMDL must allocate the acceptable pollutant load among all potential sources. EPA is requiring all permittees to construct BMPs, regardless of pollutant load.

    b. The NPDES permitting fact sheets in the Taunton watershed for wastewater treatment facilities shows an analysis that allots 20% of the nitrogen load (286 lbs/day) to non-point sources (included as LA's under the TMDL). This leaves 0% of the nitrogen load to be mitigated from other WLA's such as storm drain outfalls. By this process, no nitrogen loading is occurring from outfalls.

    c. The NPDES wastewater fact sheets follow a stringent process to assign nitrogen limits to the treatment facilities based on flow, discharge load, attenuation, and the resulting nitrogen load to the estuaries. For communities furthest upstream from the estuary and the wastewater treatment facilities, the stream flows are dominated by the wastewater treatment facilities (Brockton's wastewater facility's discharge flow is 98% of the flow in the Salisbury Plain River at 7Q10). Under the Draft MS4 permit, these communities are required to monitor stormwater flows, educate the public, and construct BMPs for nitrogen mitigation. Dividing the 286 ppd of nitrogen between the 43 communities in the Taunton watershed gives approximately 6.7 ppd of nitrogen for each community. The nitrogen load for NPS sources in these upper watershed communities is therefore not measurable and not significant, especially when EPA considers 50 lb per day of nitrogen from smaller treatment facilities as negligible. Furthermore, EPA does not allow for attenuation of the nps nitrogen load, as it does for the point source loads. Before requiring MS4 permittees to expend limited funds, EPA should

provide better data to establish the impact from each community, much like EPA has done for point load sources.

18. Appendix A:

    a. Water Quality Limited Water definition: This includes the phrase "*including but not limited to* waters listed in categories 5 of 4b…". This is an overextension of the definition of impaired waters in the CWA. This is also not definable or enforceable since permittees are instructed to look to the integrated list for impaired waters. What other document does EPA consider included in a definition for Water Quality Limited Water?

19. Appendix G:

    a. When fecal coliform is the Pollutant Causing Impairment, EPA suggests using fecal coliform as the Monitoring Parameter. Should this be updated to E. coli or entero?

20. Appendix F – Charles River TMDL Phosphorus Control Program

    a. Does allowing a permittee the option of installing BMPs in non-MS4 areas (and non-regulated areas) extend EPA's jurisdiction and the coverage of this permit beyond the regulated area? Can a permittee, on its own, choose to extend permit coverage beyond the MS4 Permit's jurisdiction? Can EPA conduct enforcement beyond the MS4 under this permit once a permittee elects to work outside the MS4 to meet the requirements of this permit? EPA should provide a guide to the legal and regulatory impacts of a permittee extending the EPA's jurisdiction beyond that allowed by law.

    b. Page 7, Phosphorus Control Plans performance evaluation: "The permittee shall evaluate the effectiveness of the PCP by tracking the phosphorus reductions achieved through implementation of structural and non-structural BMPs and tracking increases resulting from development". EPA should be clear that this includes BMPs already implemented prior to the effective date of the permit as described in the previous paragraph on page 6, "Description of Phase 1 planned structural controls".

    c. Does EPA have expectations for the quantity of BMPs to be implemented in each phase of the Phosphorus Control Plans, or can the permittee choose when to implement structural and non-structural controls within the 20 year period without risk of fines or enforcement from EPA?

21. Appendix F – Lake and Pond Phosphorus TMDL Requirements

    a. Are permittees that discharge to a lake or pond listed in Table F-6 the only entities regulated by this permit for lake and pond phosphorus? Footnote 9 provides a list

of lakes and ponds with final TMDLs, but no community is listed in Table F-6 for White Island Pond. Does the TMDL govern, or does the draft MS4 permit? Including tables such as this within the permit may cause conflicting governance and coverage under the various regulatory programs. If White Island Pond is included, what is the required percent reduction?

b. According to EPA's definition of TMDLs, "TMDLs are water quality assessments that determine the source or sources of pollutants of concern for a particular waterbody, consider the maximum amount of pollutants the waterbody can assimilate, and then allocate to each source a set level of pollutants that it is allowed to discharge." Why is EPA delegating the "allocation to each source" to the permittee under the Lake and Pond Phosphorus TMDL requirements? This is not a function to be assigned to local communities but should be conducted by EPA.

22. Appendix F, Attachment 1 and Appendix H, Attachment 1 require the permittee to calculate the phosphorus load from the entire impaired watershed, not just the catchment area connected to the MS4. Many communities have areas not connected to the MS4 but draining to the impaired water, and should not be required to reduce P load from these areas under this permit. If this is a TMDL requirement, it should be included with TMDL regulations and not included with regulations covering the MS4 exclusively.

23. Appendix H I) 1.c.iii

    a. BMPs listed in "Table 4-2 of Attachment 1 to Appendix H" should include existing BMPs.

24. Appendix I:

    a. The Stormwater Monitoring Program QAPP provided in this appendix as Attachment 1 is in direct conflict with the permit. Permit paragraph 2.3.4.5.c states that the location of outfalls must have a minimum accuracy of +/- 30 feet. Paragraph 2.3.4.7.d.i refers to Appendix I. Section 2.0 of the QAPP in Appendix I states, "Sample sites will be located using GPS, with an accuracy goal of +/- 1 meter".

25. Fact Sheet

    a. Fact Sheet pages 65-66: EPA states that all outfalls discharge nitrogen and phosphorus and other pollutants. The only way for permittees to avoid the permit's requirements is to sample outfall flows over many scenarios, prove that zero pollutants exist over all these flow scenarios, and ask permission of EPA - not a fair or likely scenario. Even if an MS4 is discharging nutrients, the outfall may not be contributing to water quality impairments if the nutrient load is comparable to the natural environment. The requirement to have 0 mg/L of nutrients is overly restrictive and should be adjusted to a more natural scenario.

b. EPA's cost ranges presented for the 6 MCM's do not add correctly when applying the percentage guidelines for MCMs 1, 2, 4, and 5. The costs listed in the Fact Sheet total to a range of $67,200 to $534,000. But, for example, the $40,000 listed for MCM 1 is 5% of $800,000. Which is the correct estimate?

c. The previous Draft MS4 Permit (10/26/10) allowed a permittee to omit wet weather sampling at outfalls with less than 10% impervious cover. Page 91 of the 2014 Fact Sheet refers to King, et al. (2011) as evidence that water quality impacts may occur in areas with impervious cover less than 10%. This document is not readily available for review. An abstract found on line states, "Within distinct physiographic classes, higher-gradient, smaller catchments required less impervious cover than lower gradient, larger catchments to elicit community thresholds". This should not be applied broadly by EPA and should not be used to remove the previous exemption for areas and communities with less than 10% impervious cover without corroborating studies. The quantity of research and data that shows minimal impact in areas with less than 10% impervious cover far outweighs one study showing impact at less impervious cover. Furthermore, EPA uses the Boston Water & Sewer (2004) protocol in Appendix I for sampling. The basis of this protocol omits areas with less than 10% impervious cover, a direct conflict with the King, et al. (2011) study.

Re: Comments on the 2014 Draft Massachusetts MS4 General Permit

Dear Mr. Tedder:

Thank you for the opportunity to provide comments on the Draft Massachusetts MS4 General Permit on behalf of the Town of Shrewsbury Engineering Department. The Engineering Department supports the goal of this Draft Permit, which is to improve the quality of our waters of the United States. Our department has been responsible for overseeing the Town's stormwater program since the 2003 Phase II General Permit was issued.

Comments on specific sections:

1.10 - 1.10.2, Stormwater Management Program - The permit requires a written Stormwater Management Program (SWMP) to be completed within one year of the effective date. This requires a collaborative effort among multiple municipal departments, boards, and the general public. It also requires that the BMPs for each control measure be listed. The Town needs ample time to study all of the options for BMPs and seek a sustainable funding source for them in order to commit to them in the SWMP. Determining the BMPs for TMDL requirements and discharges to impaired waters are particularly challenging here, and will take significantly longer than one year.

2.1, Water Quality Based Effluent Limitations - This section states that "this permit includes provisions to ensure that the permittee's small MS4 does not cause or contribute to an excee dance of water quality standards". The referenced section of the Clean Water Act, 402(p)(3)(B)(iii), actually states that municipal discharge permits shall require controls to reduce the discharge of pollutants to the maximum extent practicable, known as MEP. Our concern with the language in this section is that it would overrule the commonly recognized MEP standard, an authority that the EPA does not have over water quality standards in Massachusetts. The language in this section and other parts of the permit where applicable should be revised to reflect the MEP standard.

2.1.1, Requirement to Meet Water Quality Standards - It is our belief that TMDL wasteload allocations are goals and not standards that must be achieved in our MS4 discharges. Any requirement to remove pollutants of concern should be done using the MEP standard.

2.1.2, Increased Discharges - There is no clear definition of increased discharges and increased loading within the permit. The language here appears to read that any increase in flow is an increased discharge of pollutants, and would require the Town to prove that there is no increase in the total load of a pollutants within the MS4 discharges. Many of the Category 5 Waters have a long list of pollutants on the most recent Integrated List of Waters, and it's unlikely that stormwater flows exist without containing at least trace amounts of all or most of the pollutants listed. Increases in flow to an MS4 can come from the smallest of land alterations, many of which don't require local permitting and are nearly impossible for the Town to track. It's not practicable for any MS4 operator to oversee all land alterations within the MS4 and try to prove that there is no net increase in pollutant loading. This section should either be eliminated or revised with clear language that addresses only significant pollutant loads.

2.2.1.b and Appendix F, Part A, Discharges Subject to Requirements Related to an Approved TMDL - The permit is requiring Shrewsbury to meet varying degrees of phosphorous reduction loads based on the requirements for the Northern Blackstone Lakes TMDL, and the Lake Quinsigamond and Flint Pond TMDL. These TMDLs are based largely on outdated studies that used questionable scientific modeling and also lacked significant empirical data for stormwater point source discharges. The TMDLs specifically state:

"Unfortunately, no detailed study of the nutrient sources within the watersheds has been conducted to date." (Total Maximum Daily Loads of Phosphorus for Selected Northern Blackstone Lakes, p. 37).

"Because of the limited data available on discrete sources of nutrients within the watershed, a locally organized watershed survey is recommended to target reductions in nonpoint source nutrients and sediments." (Total Maximum Daily Loads of Phosphorus for Lake Quinsigamond and Flint Pond, p.4). The Lake Quinsagmond and Flint Pond TMDL was largely based on the Watershed Management Plan for Lake Quinsigamond and Flint Pond report (McGinn, 1982 - as referenced in the TMDL document). Within this report it is noted that only a total of six stormwater sample locations were used in the study, two of which are located in Shrewsbury. Both of the locations in Shrewsbury are within streams or culverted streams that also intercept flows from storm drains (McGinn, p. 144). There is nothing within the McGinn report or within the two TMDLs that suggest that removing phosphorus loads from point source discharges in the amounts required in Appendix F will have any direct impact on achieving the wasteload allocation goals of the TMDLs. It is quite possible that the majority of the impairments are caused by other pollution sources, such as nonpoint source stormwater pollution. Within Appendix F, there is also a number of BMPs listed to achieve phosphorus reductions. Most of these are unfeasible due to site constraints within MS4 owned properties. Rather than try to achieve unsubstantiated point source load reductions with BMPs that can't be implemented, the permit should simply allow for the removal of phosphorus using the MEP standard.

2.2.2, Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements - Shrewsbury does not have any Category 5 Waters where nitrogen is listed as a cause of impairment. Nitrogen is not listed as a pollutant source for Category 4a Waters in Shrewsbury as well. We are also unaware of any scientific studies that have been conducted and subjected to peer review that would indicate that nitrogen is a problem in Shrewsbury. We feel that Shrewsbury should be removed from the requirements of this section.

2.3.2, Public Education and Outreach - Most of the general public has no understanding of how stormwater impacts water quality. This problem is not unique to Shrewsbury or any other municipality. We also receive many out-of-town visitors using our open space and recreational facilities. Those people can be difficult for us to reach yet educating them is just as important as our local residents. It's not practical for every community to perform their own educational efforts, and then try to assess the effectiveness of those efforts with some type of marketing research analysis. We're also not experts on industrial activities. EPA and industry operators themselves typically have a better understanding than local officials of how to manage industrial materials and the wastes that they generate. It should not be up to MS4 communities to educate people on the requirements of the EPA Multi-Sector General Permit (MSGP), or even the Construction General Permit (CGP), as EPA suggests. The CGP and MSGP are permits issued and administered by EPA, not MS4 communities. Stormwater public education and outreach is better suited for programs on a national level. In the absence of that, MS4 communities should be given more flexibility in determining their own target audiences and appropriate contents of outreach materials.

2.3.4, Sanitary Sewer Overflows - The Massachusetts Department of Environmental Protection (MassDEP) already requires the reporting of SSOs and appropriate mitigating measures, and the reporting requirement should be removed from this permit.

2.3.4.5.b through c., Outfall/Interconnection Inventory - More than one year is needed to update the outfall inventory, and the full permit term of five years is recommended. It's impractical for survey crews to perform this work without GPS equipment. Many outfalls have significant forest canopy nearby that can interfere with satellite signals used with GPS. Often the only option is to perform this survey work during November-April when a clear signal can be obtained. We currently have over three feet of snow on the ground in Shrewsbury today, making surveying even more challenging during winters such as these. The requirement to physically label outfalls with markers serves no purpose in improving water quality, and this requirement should be removed from the permit. Many outfalls are on private property where the markers would remain largely unseen except by the property owners who may find them aesthetically unpleasing. Those that would be more visible to the public would often become vandalized, as we've experienced with other signage in town. There is no benefit to these markers beyond what's being achieved with outfall mapping.

2.3.4.6, System Mapping - More than two years is needed to map all of the required elements listed, and the full permit term of five years is recommended.

2.3.4.7.d, Outfall and Interconnection Screening and Sampling - The requirement to sample interconnections should be eliminated. Interconnection points are generally located within

primary roadways and major highways, and are often located within structures that are difficult to access. If monitoring at the outfall indicates a problem, the interconnection points can then be evaluated on an as-needed basis. The three year time period given to complete screening tasks, especially with the wet weather sampling constraints, is unrealistic and five years is recommended. During spring seasons with little rainfall, allowing wet weather sampling during March to June only makes compliance even more challenging as there will be little opportunity to complete this task.

2.3.6, Stormwater Management in New Development and Redevelopment - The requirement to retain one inch of runoff from all impervious surfaces on site is beyond what's required under the MassDEP Stormwater Management Policy. A clear definition of redevelopment needs to be within the permit as well. One particular concern we have is that roadway resurfacing could be interpreted as redevelopment. Shrewsbury has installed BMPs in recent years for resurfacing projects, however due to site constraints it is unlikely that we could have either retained the first one inch of runoff or provided pollutant removal through biofiltration as required in this permit. Another concern that we have is the number of commercial facilities in town in dire need of improvement, with owners struggling to sell their property or attract business tenants because of the conditions of these unmaintained properties. Redevelopment under this permit would become cost prohibitive. The MEP standard consistent with MassDEP stormwater management is needed here as well, or the Town will probably see more businesses fleeing the area. Redevelopment under MassDEP standards usually improves discharge quality from existing sites and is a better choice than the "do nothing" option, thereby leaving sites in poor condition; which is what we anticipate will happen often under these permit conditions. It is highly recommended that that standards within this permit be consistent with the MassDEP stormwater management standards for both new and redevelopment. The requirement to estimate the annual increase in impervious area (IA) and directly connected impervious area (DCIA) on an annual basis will require significant costs without providing any stormwater control that improves water quality. Resources are better spent on BMPs. Impervious areas are not point sources, nor are they pollutants. They have hydrologic modeling runoff rates associated with them, as do a variety of other land surface features. Impervious areas and other land surface area calculations are more appropriately conducted to monitor stormwater flows, not pollution levels. This requirement should be removed from the permit. It's an academic study that is more suitable for universities than municipalities. We do however support the idea of reducing impervious areas where it can be achieved in an effort to promote groundwater recharge and improve base flows.

2.3.7, Good House Keeping and Pollution Prevention for Permittee Owned Operations - Measuring the volume or mass of materials removed from catch basin cleanings has no impact on water quality. We feel that cleaning catch basins is important and we wish to continue doing so. Spending resources on measurements would potentially reduce the number of catch basins that we could clean each year with the funding available. These measurement requirements should be removed from the permit.

<u>General Comments:</u>

Administrative Burden - There is somewhere around 15-20 sections and subsections within this permit that require monitoring, measuring, tracking, assessing and educating, amongst

other tasks, that will simply result in mountains of paperwork that pull resources away from other tasks that could provide real-world water quality benefits.

Time Constraints and Funding - Most of the schedules within the permit are too aggressive and likely setting-up most municipalities for failure. EPA has been steering municipalities in the direction of creating stormwater utilities in order to fund stormwater management programs necessary for permit compliance. These utilities when done properly take time to establish. A minimum of two to three years of planning is needed in most cases when everything goes well. There can also be accounting hurdles that last a year or more after utilities are in place. Making sure there is an adequate funding source available takes time, and is one of the reasons we feel that the schedules in the permit are mostly unreasonable.

Program Credits - Many communities, including Shrewsbury, have implemented stormwater controls in the past that are above and beyond what is required under the 2003 permit but may be required under the new permit. These municipalities should be commended for taking proactive measures and allowed to take credit for the controls required within the new permit that they have already implemented. Additionally, any controls implemented that were required under the MassDEP Stormwater Managment Policy should be given credit as well, and the permit language should more clearly define allowed credits and a timeframe for those credits.

Program Costs - Currently Shrewsbury spends approximately $280,000 per year to comply with the 2003 Permit. EPA has estimated that the cost of compliance for the new permit could vary from $78,000 to $829,000 per year depending on the size of the municipality. After reading through the Draft Permit and the Fact Sheet, we're concerned that the EPA may be grossly underestimating the true costs of permit compliance. Shrewsbury is highly affected by the Lake Phosphorus Control Plan (LPCP) requirements due to the Lake Quinsigamond and Flint Pond TMDL, and the Northern Blackstone Lakes TMDL. EPA uses the upper Charles River communities, Milford, Bellingham, and Franklin in the Fact Sheet as examples of communities where cost estimates for a Phosphorous Control Plan (PCP) have been done in the past. The PCP plan costs for those three communities is $200 million to $350 million under worst case assumptions, and $85 million to $195 million if aggressive phosphorous source reductions and non-structural controls are implemented to remove the most challenging 15% of the total load reduction needed (Fact Sheet, Page 33). Viewing the Impervious Cover & Watershed Maps on the EPA's website, Shrewsbury has more impervious cover (IC) than any of these three communities, and is equal to 42% of their combined IC. Approximately one-half of Shrewsbury's IC area is within the two TMDL watersheds, where phosphorus load reductions are required, or 21% of the combined IC within the three communities. Using the lower and higher cost estimates provided within the Fact Sheet ($85 million and $350 million) as guidance, the costs for Shrewsbury's PCP would be 21% of this estimate, or $18 million to $74 million. It should also be noted that the phosphorus load reductions required for those Charles River communities are 37-46%, whereas the majority of the required reductions for Shrewsbury are 46-63%. This could further add to the costs. <u>The LPCP portion of this permit alone could cost Shrewsbury approximately $1.2 to $5 million per year or more over a 15 year compliance period.</u> The entire town is within an MS4 regulated area as well. Most communities are only partially regulated. In addition, all of Shrewsbury falls within an area either discharging to TMDL water bodies or water quality limited water bodies, which simply trigger more and more

permit conditions requiring significant costs for compliance. Our residents have already seen significant increases in their water bills, their sewer bills, and recent property assessments increases from a 2014 Proposition 2 ½ Override. Our concern is that in order to acquire any funding for stormwater beyond current expenditures, the rates need to be equitable and there needs to be a proven costs-benefits analysis to support them.

Thank you once again for this opportunity to provide comments. We hope that they will assist you in developing a more workable permit. Please don't hesitate to contact our office if you'd like to discuss these comments in detail.

Sincerely,

Brad Stone

Re: Draft Massachusetts EPA NPDES MS4 Phase 2 Regulations

The Town of Southwick, no doubt like many other Massachusetts communities, has significant questions/concerns with the latest (9/30/14) draft NPDES MS4 Phase 2 Regulations which, if implemented, will result in undue significant increase in costs to municipalities in the Commonwealth. The following summarizes some of the major issues with this draft.

1. Pavement Maintenance Work Triggers Retaining the First Inch of Stormwater or Adding Treatment. Under the proposed regulations, disturbing more than 1 acre in area through phased construction or reclamation projects totaling one acre or more (which translates to only ¼ mile of 30' wide pavement) will require that the first inch of storm water either be retained or all the stormwater must be treated. This essentially will now require that cities and towns must completely redesign and re-construct their entire stormwater collection and/or treatment system to satisfy this requirement in conjunction with the road paving/reconstruction project. This new requirement will consume the already stretched-thin road maintenance budgets and cities and towns will additionally be forced to acquire extra land through purchase or eminent domain. This huge new expense could dwarf the typical (local level) road overlay or mill/pave costs of $100,000 to $150,000 per mile, especially in older areas with extremely narrow city/town-owned rights-of-way.

   Current federal, state and local funding for pavement maintenance is less than half of what is needed to preserve the condition of roads, let alone be required to include additional drainage work. Accordingly, Massachusetts roads are degrading faster than they can be repaired. The costs associated with this EPA-proposed requirement will

compound the problem, inherently creating more failing roads and more erosion. There must be an exemption to this proposed requirement for pavement maintenance projects, including minor pavement width improvements. If a new road is being constructed or if an existing road is being widened, incorporating these stormwater management requirements should be a goal, subject to existing conditions like available right-of-way width and/or proximity of existing structures to the right-of-way.

2. Requirement for Tracking Impervious Area. The EPA's documents suggest that the simple presence of impervious areas is not a direct correlation to stormwater quality. MassDEP considers roof-water runoff "clean" and can be infiltrated into the ground without pre-treatment. Paved areas can store/detain and/or treat stormwater so that stormwater quality issues are mitigated. Accordingly, tracking the amount of impervious area does not have a direct correlation to water quality and therefore the MS4's should not have to expend resources *tracking minor changes* in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities. Any attempt at limiting /restricting development through controlling impervious area should be outside the purview of the Clean Water Act.

3. Signage at Outfalls. Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources, encourage theft or vandalism and provide little to no use in management of the stormwater system. All regulated organizations are now required to have maps with locations of all outfalls and the availability of GPS devices makes these outfalls easy to locate by Town personnel.

4. Chloride Reduction. Most municipalities already work to limit salt (chloride) usage as the cost of road salt and deicers represent an increasingly larger portion of winter storm budgets. Responsible DPW administrators continually look for ways to reduce costs wherever practical and have no objection to training the operators in Best Management Practices suggested by the EPA. However, reducing salt usage below what is practical with the current technology would be irresponsible when it exposes motorists to hazardous conditions. Road designs and weather conditions vary widely across the Commonwealth, so no one solution fits all. If the EPA will protect an endangered reptile, bird, plant or animal, it should be equally concerned with human life. The chloride reduction regulations should be limited to recommending the use of Best Management Practices.

5. Cost of Implementation. An article published in Construction Outlook, a publication of UCANE, recently published EPA cost estimates between $70,000 and $829,000 per year to comply with the new regulations depending on population and size. At the 9/24/2014 meeting, Newton Tedder from the EPA and other speakers commented that they believe most municipalities will have to pass a stormwater utility to fund the new

NPDES Phase 2 regulations. Accordingly, it appears that the EPA is admitting that the new regulations will be so costly that the municipalities cannot afford them through existing revenues. The EPA was charged with cleaning the water and operating within its budget as set by Congress. States and local cities and towns must do the same. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to capriciously raise the cost of compliance with the new regulations. Municipalities are happy to work with the EPA to achieve progress on stormwater, but the heavy handed, adversarial and punishing regulations as proposed will not encourage cooperation from state and municipal partners.

The Town of Southwick urges the EPA to not impose unnecessary and expensive financial burdens on the cities and towns in the Commonwealth. Taking reasonable actions to improve water quality is one thing, but being mandated to accomplish unreasonable demands is unnecessary. All levels of government must be cognizant of costs of new regulations. The EPA's proposed regulations, reporting requirements and overall costs of implementation must be reduced to a sustainable and rational level. The taxpayers should not be burdened by an attempt to reach unrealistic goals.

Very truly yours,

Russell S. Fox

Attention: Comments on the 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

Dear Mr. Tedder,

The following pages outline some of the Town of Spencer's concerns with the proposed Permit duplicating portions of the CMRSWC letter that we were part of authoring and signed by the Spencer Town Administrator.

General Comments

The Town of Spencer is supportive of proposed Permit provisions that will directly result in improved water quality, but object to those that are administrative or arbitrary, and that will not have a direct bearing on water quality. We have repeated some of our general objections from our CMRSWC letter below.

1. We encourage the Agency to update its own guidelines about how regulated communities are expected to balance compliance with the Permit (in its final form) with the ability to afford that compliance without experiencing economic hardship. Since 1997, the Agency has generally considered a maximum combined annual water and wastewater bill of 4.5% of mean household income (MHI)- 2% for drinking water and 2.5% for wastewater services- to be affordable. In their May 2013 "Affordability Assessment Tool for Federal Water Mandates" report, the United States Conference of Mayors, the American Water Works Association, and the Water Environment Federation argue that MHI is a poor indicator of economic distress, bears little relationship to poverty within the community, does not capture variation across diverse populations, and does not account "for the historical and future trends of a community's economic, demographic, and/or social conditions", especially during recessions and recovery from them, such as Massachusetts is presently

experiencing. Municipal revenues are decreasing, and further restrictions on development or redevelopment are not in the best interest of the community.

2. Even so, if we were to use MHI as the basis for evaluating a community's ability to afford a stormwater management program to comply with the proposed Permit, the 4.5% MHI cap would easily be exceeded if stormwater costs were included, along with drinking water and wastewater, in the calculation. This is true whether a community funds its program traditionally through the tax base or has developed a sustainable funding mechanism such as a stormwater utility or enterprise fund. In some rural Massachusetts towns, the cost of stormwater compliance will exceed the cost of wastewater compliance and the total may well be closer to 10% of MHI. Leaders and administrators in these towns will have a difficult task indeed to convince their residents and business owners that some of the proposed provisions will result in water quality improvements commensurate with the expense.

3. We encourage the Agency to include flexibility in the final Permit with respect to the date that the Permit in its final form becomes effective in each community. Flexibility in setting the effective date will allow each town the opportunity to budget for Year 1 and Year 2 tasks, specifically, within the municipal budget cycle, which will likely be out of sync with the Permit cycle. In the last few years, many communities have been telling their leaders and residents that the new Permit would be out "soon" based on updates from the Agency, with the target issue date moving over the course of several municipal budget cycles. Many of these leaders will face reluctance, skepticism, and frustration when proposing increased stormwater program budgets, and will need to re-educate their decision makers about why these increases are required.

4. We believe that many provisions in the proposed Permit do not lend themselves to implementation over a five-year Permit term, at least in a way that is affordable for the regulated communities and that result in meaningful improvements to water quality. Instead, we propose that the Agency extend the schedule for several specific provisions, such as development and implementation of catchment delineation, over a ten-year term. The Commonwealth of Massachusetts has in place a statutory framework that allows for such an extended timeline as a Compliance Schedule within a NPDES Permit. Indeed, the Agency has taken advantage of this extended schedule in the proposed Permit for the Catchment Investigation Procedure (see Section 2.3.4.8(c)(iii), IDDE Program Implementation Goals and Milestones, Page 37). This compromise will comply with Clean Water Act 402(b)(1)(B) while providing flexibility for the regulated communities.

5. When describing dry weather and wet weather screening and sampling and outfall/interconnection screening, the proposed Permit frequently refers to "detectable levels of chlorine". It should be noted that chlorine is detectable in most if not all outfalls and at perimeter of many of Massachusetts' surface water bodies using many field kits available today, and this detection limit is likely to become lower (identifying smaller and smaller concentrations of chlorine) as technology improves. Treated drinking water entering a stormwater system is the potential source the chlorine indicator is meant to highlight. However, chlorine in drinking water is highly volatile, and decomposes quickly once discharged to a surface water body and exposed to sunlight and the ambient atmosphere. If all outfall samples would demonstrate "detectable levels of chlorine", but the chlorine will degrade quickly within a water body, this parameter ceases to be useful as a screening tool. We request that this either parameter be removed from all sections discussing screening methodologies, or that a numeric threshold be established based on peer-reviewed data

that can correlate a specific elevated detected chlorine concentration to a potential illicit discharge, such as a grey water connection (or the absence of elevated bacteria) or cross-connection (in the presence of elevated bacteria).

6. We strongly encourage the Agency to engage in conversations and workshops that lead to development of a Final MS4 Permit that the Massachusetts Department of Environmental Protection (Mass DEP) is willing to sign onto. The alternative, outlined by the Agency's Thelma Murphy at a meeting of the Northern Middlesex Stormwater Collaborative in Lowell, MA on December 4, 2014, would be two separate Massachusetts MS4 Permits: the current 2003 Massachusetts MS4 Permit would continue to be enforced by the Mass DEP, and the new Final Massachusetts MS4 Permit would be enforced by the Agency. Mayhem would ensue due to administration, operations and maintenance, and coordination duplication resulting from each of the Commonwealth's regulated communities being subject to two separate MS4 Permits. In practice, progress toward improving water quality would likely stop as legal challenges were filed, which is not in the best interest of any party involved.

7. This coordination should begin as soon as possible to reach a version of the permit agreeable to both organizations and compliant with the Clean Water Act, Massachusetts' Surface Water Quality Standards, and associated supporting documentation, so that water quality improvement activities across the Commonwealth can be focused and consistent.

8. Please refer to the CMRSWC letter for additional specific comments.

We appreciate the opportunity to comment on this proposed Permit, and look forward to the additional protections and clarifications afforded by its consistency. Please feel free to contact me directly any time at (508) 885-7525 or styler@spemcerma.gov if you have questions.

Sincerely,
TOWN OF SPENCER

Re: Massachusetts Small MS4 Draft General Permit Comments

Dear Mr. Tedder:

The Springfield Water and Sewer Commission (Commission) appreciates the opportunity to comment on the Small MS4 draft general permit for Massachusetts. The Commission is a regional water and sewer authority providing retail and wholesale water and sewer service to approximately 250,000 people. Each year, the Commission plans a budget that will allow for sustainable reinvestment and operation of our facilities and infrastructure while maintaining compliance with all applicable federal, state, and local regulations. Each year, this task has become more difficult due to increases in the cost of supplying services and the expanding regulatory framework. With the comments that follow, we hope to provide some direction for Region 1 to develop a stormwater permit that addresses water resource issues but remains reasonable, considerate of the realities of municipal operations and finances, and is consistent with statutory limitations on municipal stormwater pollution control stipulated in the Clean Water Act.

General Comments:

While the goal of the Clean Water Act is laudable and supported by the Commission, we consider the requirements in the MA Small MS4 general permit to be overly prescriptive, burdensome, and most likely unachievable for most communities.

Schedule Constraints: The schedules set forth in the draft permit are not reasonable or feasible when considered in the context of municipal realities. Schedules for some aspects of the permit may appear reasonable but become unreasonable when the permit is viewed in its entirety and it becomes clear that schedules for most parts of the permit overlap.

Significant Administrative Burden: The permit, as drafted, would create a significant administrative burden for municipalities that would detract from their ability to provide direct

benefits to water quality through such concrete activities as increased street sweeping, increased catch basin cleaning, and removal of illicit discharges. The permit goes overboard in terms of monitoring, measuring, and quantifying changes in pollutant loads. More environmental progress would be gained if communities could focus resources on actual, physical improvements to stormwater systems and not on pollutant accounting. Per the Clean Water Act municipalities are obligated to remove pollutants from stormwater to the maximum extent practicable and that should be the objective of the permit. The ongoing assessment of receiving waters is a function of MassDEP, not individual communities.

Funding Challenges: Many of the deadlines provided in the draft permit do not allow sufficient time to allocate funding within set municipal budget cycles to complete the tasks required. No item in the permit should be required to be completed during the first permit year except the preparation of the Stormwater Management Plan (SWMP).

Integrated Planning Opportunities: There should be language within the permit that references EPA's Integrated Planning framework and how integrated planning can be utilized to address a community's stormwater/MS4 requirements. That language should be specific about how an integrated planning approach could be applied through the permit and how permit conditions, including implementation schedules, would be modified under an integrated plan.

Section-Specific Comments:

1. Section 2.1 Water Quality Based Effluent Limitations and 2.1.1-Requirement to Meet Water Quality Standards: Section 2.1 (page 9) states that "Pursuant to Clean Water Act Section 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to exceedances of water quality standards...". Similarly, the Fact Sheet, at page 4, states "Section 402(p)(3)(B)(iii) of the CWA also authorizes EPA to include in an MS4 permit 'such other provisions as [EPA] determines appropriate for the control of ... pollutants'" and that "[t]his provision forms a basis for imposing water quality-based effluent limitations (WQBELs)" citing to *Defenders of Wildlife v. Browner*. 191 F.3d 1159 (9th Cir. 1999), and EPA's preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec 8, 1999); and at page 16, that "EPA interprets this latter clause (i.e. "such other provisions as [EPA] determines appropriate for the control of . . . pollutants" at Section 402(p)(3)(B)(iii) of the CWA) to authorize the imposition of water quality based effluent limitations." This interpretation distorts entirely the meaning of CWA Section 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision, and is incorrect. When Section 402(p) of the CWA was added in 1987, it established a comprehensive new scheme for regulation of stormwater. It differentiated the technology-based requirements for MS4s relative to the rest of the NPDES program by creating a new "maximum extent practicable standard," in contrast to the traditional BAT/BCT standard that applied to industrial stormwater and other wastewater discharges. The opening clause of CWA § 402(p)(3)(b)(iii) states that, unlike industrial stormwater permits, MS4 permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable . . . ." A subordinate clause states that such controls shall include "management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Each of those controls is subject to the limitation in the first clause that they shall be required "to the maximum extent practicable." EPA's interprets this provision contrary to its plain meaning and

in a manner which suggests that the final clause referring to "such other provisions as the Administrator or the State determines appropriate" is independent and coequal with the requirement to reduce pollutants to the "maximum extent practicable." Region 1's reading distorts the syntax of § 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision.

The Region also suggests, incorrectly, that the Ninth's Circuit's opinion in *Defenders of Wildlife v. Browner* supports this misreading of the statute. While in dicta at the end of its decision, the court suggested that the "such other provisions" clause allowed EPA the discretion to include "either management practices or numeric limitations" in MS4 permits, the court did not say that the discretion to include numeric limitations or to require compliance with water quality standards could be exercised without regard to the "maximum extent practicable" limitation in the statute. That issue was not presented by the facts of the case before it, and it was not addressed in the court's opinion. Had the court so ruled, it would have been contrary to the plain language of the statute and subject to reversal on appeal.

Federal courts have consistently ruled that the MEP standard is the only standard that MS4 discharges are required to meet. *Natural Resources Defense Council, Inc. v. U.S. EPA*, 966 F.2d 1292, 1308 (9th Cir. 1992) (CWA § 402(p)(3)(B) "retained the existing, stricter controls for industrial stormwater dischargers but prescribed new controls for municipal stormwater discharge); *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1165 (9th Cir. 1999) (CWA § 402(p)(3)(B) "replaces" the requirements of § 301 with the MEP standard for MS4 discharges, and it creates a "lesser standard" than § 301 imposes on other types of discharges); *Environmental Defense Center v. EPA*, 319 F.3d 398 (9th Cir. 2003), vacated, rehearing denied by, and amended opinion issued at 344 F.3d 832 (9th Cir. 2003) (CWA "requires EPA to ensure that operators of small MS4s 'reduce the discharge of pollutants to the maximum extent practicable'"); *Mississippi River Revival, Inc. v. City of St. Paul*, 2002 U.S. Dist. LEXIS 25384 (N.D. Minn. 2002) ("the CWA specifically exempts municipal stormwater permittees" from the requirement to ensure that water quality standards are met).

In addition, EPA's citation to the Preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec. 8, 1999) to support its interpretation of Section 402(p)(3)(B)(iii) of the CWA as authorizing the imposition of water quality based effluent limitations is disingenuous. The Preamble to the Phase II rule at 64 Fed. Reg. 68788, states only that EPA disagrees with commentators who challenged EPA's interpretation of the CWA as requiring water quality based effluent limits for MS4s. The Preamble gives no legal rationale. Like the fact sheet, at page 4, the Preamble to the Phase II rule cites to *Defenders of Wildlife*. As noted above, *Defenders of Wildlife* does not support the proposition that EPA can require MS4 operators to comply with WQBELs regardless of practicability.

EPA has taken the position in the defense of the Phase II rule in *Environmental Defense Center* that:

> MS4 requirements… rest on the "maximum extent practicable" ("MEP") standard which CWA Section 402(p)(3)(B)(iii), 33 U.S.C. § 1342(p)(3)(B)(iii), prescribes for Section 402(p) municipal storm sewer permits. 40 CFR § 122.34(b). Thus, while the regulations suggest numerous ways in which small MS4s ought to control their stormwater discharges, *the MS4s are not, in the end, required to do anything that is not "practicable."* 2000 U.S. 9th Cir. briefs 70014, 70020 (June 26, 2001). (Emphasis supplied)

Given the plain language of Section 402(p)(3)(B)(iii), any application of the Phase II rule to require that MS4 discharges need to meet WQBELs regardless of "practicability" would be *ultra vires.*

The cited section of the Clean Water Act makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable (MEP) as the standard to which pollutants must be removed from municipal MS4s. The language in section 402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. Section 402(p)(3)(B)(iii) of the Act states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA tries to imply. The proper wording throughout the permit that would be consistent with the Act would be for the permittee to meet water quality standards to the maximum extent practicable. For Congress to bother to include such language in the Act is clear and unassailable evidence that lawmakers understood that there are limitations in the ability of municipalities to meet water quality standards in stormwater discharges. These limitations are spelled out in the statutory standard of MEP applied only to municipal stormwater discharges. NPDES stormwater permits for municipalities will continue to be contentious as long as EPA refuses to recognize that the MEP standard applies as the only mandate for pollutant removal from MS4s. Water quality standards and TMDL waste load allocations may be goals but are not the required standards that must be achieved in municipal stormwater.

2. Section 2.1.2 Increased Discharges: New and additional stormwater flow to impaired waters regardless of concentration would be prohibited under this draft permit. This requirement could only be overcome by demonstrating that the pollutant of concern is not present in the new/increased discharge or that the total load of pollutants to the impaired waters will not increase. Even the most innocuous "new discharge," say a new single family home with a driveway and stormwater-minimizing design, will produce some pollution and will add some additional load, be it insignificant, to a receiving water. The language in this section could thus be interpreted to mean no new development in MS4 areas draining to impaired waters. Many urban areas of Massachusetts have nothing but impaired waters. This section could effectively preclude new development in such communities. That is an impact that goes far beyond EPA and federal authority. This language must be modified to stipulate thresholds on new/additional pollutant loads being significant and not merely all new loads.

3. Section 2.2.1.b (pages 11-15) and Appendix F, Part A: The permit requires compliance with TMDL waste load reductions associated with stormwater. It mandates a progressive reduction in pollutant loads with 100% reduction achieved within 15 years. The permit neglects to recognize that most TMDL's developed for Massachusetts waters are lacking in sound science and are instead based on very generic models of watershed loading. In many cases there is a dearth of actual sampling data from the TMDL regulated waters or data may be 25 or more years old. Even in the more rigorous Charles River TMDL for phosphorus, the model used to determine needed phosphorus reduction produced results that are not supported by actual test data. The TMDL's which drive pollutant removal requirements in the draft permit are wholly inadequate for this purpose and cannot legitimately justify specific pollutant load removal for the vast majority of waters. To be consistent with the Clean Water Act and avoid reliance on unsubstantiated pollutant load reductions, municipalities should be required to remove the pollutant of concern to the maximum extent practicable by implementing feasible BMPs, including structural and non-structural measures, that have been demonstrated through generally accepted research to be effective at removing that pollutant. Municipalities cannot do any more than what is feasible and should not be squandering limited resources chasing highly tenuous pollutant "numbers".

4. Section 2.2.1.c (pages 15-17) and Appendix F, Part B: Massachusetts municipalities should not be held to comply with out-of state TMDL requirements. TMDLs are determined by state environmental agencies. While there may be an "open" regulatory process for TMDL development it is highly unlikely that process and its requisite public notification was extended to potentially impacted communities outside of the state. The interests of Massachusetts municipalities were not represented by anyone during TMDL development in Rhode Island, Connecticut, New York, Vermont or New Hampshire. Massachusetts cities and towns are now being subjected through this draft permit to regulatory programs in other states to which they had no opportunity to participate. Even within Massachusetts, the majority of TMDLs were developed in the early 2000's at a time when their link to future stormwater permits was unknown. Massachusetts TMDLs, with few exceptions, were offered as stand-alone documents with little bearing on anything that a municipality would be required to do. Had it been clear that these documents would have substantial and costly implications for cities and towns the TMDL development process would have fallen under much greater scrutiny and the haphazard, unscientific way they were created would likely have been challenged. The TMDL program in Massachusetts is so hopelessly flawed in terms of science and public process that it should not be utilized for NPDES permitting at all, let alone be the primary focus of a MS4 general permit.

5. Section 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements (pages 17-22) and Appendix H: This section assumes that there has been sound and defensible science used to determine the cause of impairments of numerous water bodies. That has rarely been the case. State agencies including Massachusetts DEP have rarely had the resources to perform legitimate water quality investigations of lakes, ponds and rivers. Very often an assessment of a water body is based on the most cursory information (visual observation of weeds or algae) and lacks the detailed sampling and analysis needed to truly determine conditions and causes. Yet this unscientific assessment will now result in communities expending significant resources developing nitrogen source identification reports and phosphorus source identification reports along with the planning, implementation and tracking of structural BMPs for removal of these pollutants. For some communities, the "water quality limited waters" driving these added expenses could be 75 miles downstream. It is

ludicrous to imagine that stormwater generated in a small community of 5,000 people could have a significant impact on a coastal bay nearly 100 miles distant yet that is what is being described in this section. There needs to be both better science and common sense applied before cities and towns are held to "fix" problems that often do not exist.

6. Section 2.3.2 Public Education and Outreach: While EPA provides more time to conduct the public education program in this draft of the permit, it is important to keep in mind that the majority of the public does not understand how stormwater can become polluted and how it can contribute to water quality issues. Most of the public still believes that catchbasins in their roads transport stormwater to a treatment facility prior to discharge. In addition, most people do not understand the concept of a watershed, or the concepts related to the water cycle (rainfall, runoff, infiltration, and evapotranspiration). A significant amount of awareness-raising must be done across the United States prior to an individual community education/outreach campaign in order to truly stimulate behavior changes in the general public. Many municipalities see a large influx of visitors during the tourist season and thus education must extend well beyond the immediate locality to be truly effective. Stormwater education is a national need and should be spearheaded by EPA nationally through a consistent education campaign and not simply left to municipalities.

7. Section 2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program (pages 25-37): Overall the IDDE program as described is highly prescriptive and very burdensome. While IDDE is necessary and valuable for a strong stormwater management program, the extent to which a municipality can comply with the edict mandated in the draft permit is questionable. The schedule mandated by the permit is unreasonable for an initiative that constitutes a major capital project requiring significant expenditures and coordination. The described program needs to be tempered by the Maximum Extent Practicable standard and thus subject to that which is feasible.

8. Section 2.3.4.1 Definitions and Prohibitions (page 25): EPA needs to modify its definitions to differentiate illicit discharges caused by mis-connected sewer laterals or direct introduction of contaminants into the MS4 by illegal dumping from those caused by systemic failures within the sanitary sewer or MS4. It is one thing to track, identify, and remove an illicit connection but altogether different to track, identify, and correct a failed sanitary sewer or similar system defect. The former are generally easy to locate and repairable within a relatively short time while the latter are extremely difficult to locate and repair and may involve wholesale replacement of large parts of the sanitary sewer collection system. The language in section 2.3.4 implies a "one size fits all" approach to IDDE and it clearly is not in terms of locating and removing the illicit discharge.

9. Section 2.3.4.4 a through e: This Sanitary Sewer Overflow reporting requirement is redundant and should be removed from the Small MS4 permit. MassDEP already requires SSO reporting through statewide regulations. For purposes of this MS4 permit, the term SSO needs to be defined. Relative to stormwater management and MS4 permitting the only SSO that should be considered are those that discharge through a stormwater outfall into a receiving water. SSOs that enter basements or are contained on street surfaces or upland areas have no link to an MS4.

10. Sections 2.3.4.5 and 2.3.4.6 (page 26-28): Outfall and interconnection inventory and system mapping are necessary and valuable components of stormwater management. However, the timeframe to complete these more detailed studies is likely inadequate, especially for smaller communities that may lack GIS and GPS capabilities. Communities should identify feasible schedules for completing this work within their SWMP.

11. Section 2.3.4.7.d.i (page 32): The Commission objects to the requirement that the permittee adopt a screening and sampling protocol consistent with a January 2012 draft document (EPA New England Bacterial Source Tracking Protocol). If this protocol is to be used in a regulatory context as proposed for this permit, it should be subject to rule making, peer reviewed, and scrutinized by others outside of the Agency and become a Final, not a draft, before making its use mandatory. Otherwise, the draft document may be useful as a suggested reference only.

12. Section 2.3.5 – Construction Site Stormwater Runoff Control, and 2.3.6 – Stormwater Management and New Development and Redevelopment (Post Construction Stormwater Management). These provisions require permittees to develop, implement, and enforce a program to reduce pollutants and any stormwater runoff discharge to the MS4. EPA has no authority to make local land-use decisions by compelling permittees to make specific choices with regard to ordinances or other regulatory mechanisms. EPA is exercising federal land-use mandates on a local basis in violation of the 10th Amendment of the Constitution.

    These provisions would also apply to public road reclamation and resurfacing projects involving more than ¼ mile of 30 foot wide pavement (approximately 1 acre equivalent). By doing so, this permit would cripple local road maintenance budgets by effectively requiring redesign and construction of entirely new stormwater collection and control systems for all but the smallest road resurfacing project. Maintaining safe, passable roads is among the highest priorities of local government and one that is currently grossly underfunded. Taking limited funds and utilizing them for stormwater improvements for virtually every significant resurfacing project will greatly curtail meaningful improvements to local roads. Resurfacing and pavement maintenance projects should be exempted from this requirement to meet stormwater standards. The standards might be applicable to road reconstruction projects but only to the extent that they are practicable.

13. Section 2.3.6.d (pages 42-43) Directly Connected Impervious Area: The requirement to monitor and track impervious cover is a burdensome and inappropriate requirement for most municipalities. It has the appearance of a research effort and not a tool that will benefit stormwater management by the community. Compiling and tracking impervious area will require manpower and costs that would be better utilized implementing better stormwater control systems. If Region 1 is that interested in tallying impervious cover acreage, the Commission suggests it directly fund and coordinate with colleges and universities to accomplish the task through graduate and undergraduate GIS projects.

    Region 1's effort to regulate impervious surfaces raises the legal issue on whether such surfaces are "point sources" under the NPDES permit program. Impervious surface, on its own, cannot be subject to regulation under the NPDES permit program because impervious surfaces are neither a "point source" nor a "pollutant." Instead, it is a feature of the landscape that

indirectly influences how water is carried on and off land. Congress predicated the stormwater permitting program and Section 402(p) of the CWA on "point source" discharges of "pollutants" from certain categories of dischargers, including MS4s and industrial activities. If Region 1 were to interpret "point source" to include impervious surfaces, it renders that term meaningless and contrary to Congressional intent to define the term and distinguish between "point sources" and "nonpoint sources." In addition, Region 1's authority to control pollutant discharges does not encompass the ability to mandate land-use decision-making. While local authorities can develop a regulation, for example, to limit impervious surfaces or other stormwater flows into the MS4, EPA is limited to regulating the discharge of pollutants from the MS4 and cannot force MS4s to do what EPA is not otherwise authorized to do, including imposing restrictions on local land use decisions. While on November 26, 2014, EPA released a guidance memorandum in which it asserts authority to mandate retention standards based upon the amount of impervious surface at a site, that authority is necessarily limited to discharges from MS4 storm system (i.e., the "point source") into navigable waters. In short, impervious surfaces are not "point sources" under the NPDES permit program. CWA Section 304 prohibits unauthorized point source discharges, but Congress left the regulation of nonpoint source pollution to the states.

The Commission appreciates the opportunity to comment on Massachusetts Draft Small MS4 General Permit. We urge EPA to consider modifications to the permit that will make it more sustainable and reasonable for municipalities and consistent with the Clean Water Act.

Respectfully

Springfield Water and Sewer Commission

Re: Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder:

Thank you for this opportunity to comment on EPA's Draft General Permit for Small MS4s in Massachusetts. I appreciate the decision to extend the comment period.

For Belmont, as for the rest of the state, polluted stormwater is the most serious water pollution problem. We know the town has many illicit discharges – both misconnections of sewerage pipes to the stormwater system and places where sewer pipes are broken and the sewage seeps underground into the stormwater drains.

The Illicit Discharge Detection and Elimination requirements could help if they are seriously enforced – but that's a big "if". Belmont was issued a 308 letter by the EPA in 1998 and a Notice of Noncompliance by the Massachusetts Departments of Environmental Protection in 2000. So far, though the town has invested in upgrading its infrastructure, it has not come close to solving its problems, nor have the regulators put much pressure on it to increase its investments.

I hope that the provisions of this permit will be strengthened and that they will be enforced.

Cordially,

Sue Bass

RE: Draft NPDES General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts – Public Comment Letter

Dear Mr. Tedder:

This letter is submitted to you in accordance with public comment procedures related to the proposed NPDES General Permit referenced above. The concerns enumerated below constitute "reasonably ascertainable issues" developed on the basis of review of the draft General Permit, supporting documentation provided by EPA (including fact sheets, appendices, technical guidance and reports), and practical experience implementing the program over the preceding eleven (11) years of the existing permit term. These are significant issues that warrant response by EPA and consideration for modifications in the final General Permit. The initial comments refer to conditions associated with "Requirements to Reduce Pollutants to the Maximum Extent Practicable" (the six Minimum Control Measures [MCM]); the latter comments refer to conditions related to "Water Quality Based Effluent Limitations (WQBELs)." General comments follow thereafter.

Comments

Minimum Control Measures / Maximum Extent Practicable Requirements

1. **MCM 1 – Public Education and Outreach**: Although not explicitly required under the permit, EPA has repeatedly suggested that introducing stormwater quality-related topics in school curricula would be an appropriate and cost-effective means of achieving MCM-1 objectives. Experience has demonstrated that statutory subject requirements within most school systems makes it very difficult to introduce non-mandatory (or non-MCAS related) material. Cost estimates related to achieving the minimum requirements of this

2. MCM appear to be under-representing the broad audience targets and should not assume school programs as the basis for cost estimates.
3. **MCM 3 - IDDE Investigations**: Level of effort to achieve all of the elements of the Illicit Discharge Detection and Elimination (IDDE) Program is significantly higher than currently experienced and not significantly reduced from previous drafts despite prior concerns expressed in this regard. Several specific issues include:
    a. **Catchment Prioritization:** We recognize the value of categorizing and ranking/prioritizing catchments as a means of identifying more likely pollutant sources early in the program. Protocols for ranking catchments (and continually re-evaluating rankings) require significant knowledge about storm drain and sanitary sewer system condition and characteristics, which are elements drawn from mapping and investigations that are executed after the initial prioritization is completed at the end of year 1. The methods described in the permit provide some latitude based on "existing knowledge," however, it is important that absence of specific information regarding a catchment does not default to "High" categorization or prioritization within a category. We are concerned that "unknown" conditions related to screening factors may result in a disproportionate number of catchments being categorized as Problem or High, which in turn places these catchments on a faster-tracked investigation schedule with implications for labor and costs for communities. *Proposed Modification*: Ranking and prioritization factors are highly specific, and cover a broad spectrum of infrastructure condition, land use, laboratory analytical results and development age/characteristics. We suggest simplifying the procedure and allowing communities to categorize catchments as either "excluded" or "problem" as defined in the permit, with all other catchments falling into "other" to be investigated on a prioritized basis developed through local operator knowledge. Investigations can be performed within the 10-year timeframe currently established in the permit, with documentation on investigation results provided in annual reports. For those communities that have already undertaken a prioritization exercise on the basis of guidance provided in the 2010 Draft Permit, that ranking ought to be allowed as the basis for execution of the plan.
    b. **Wet Weather Monitoring:** The Fact Sheet accompanying the general permit indicates that the revised wet weather monitoring requirements were modified to reduce the number of outfalls that would require labor intensive sampling/monitoring. However, the twelve (12) specified "System Vulnerability Factors" provided as the basis for inclusion in a wet weather monitoring program encompass a broad swath of infrastructure system characteristics and the "one or more" threshold trigger for categorizing a catchment as a wet weather monitoring candidate will capture the vast majority of outfalls in many if not most communities. This fails to provide the relief communities requested during the 2010 Draft General Permit comment period, and which the fact sheet

accompanying the 2014 Draft General Permit implies has been provided. *Proposed Modification*: Wet weather screening of catchments should be conducted on the basis of observed conditions during physical investigation of catchments rather than the system vulnerability factors presented in the permit. Actual conditions as the trigger for further investigation will mitigate the low threshold ("one or more") and the breadth of the factors that, as proposed, will result in a disproportionate number of outfalls requiring wet weather screening.

c. **Catchment Investigation Procedure:** The storm drain network investigation as proposed, including the physical inspection of all key junction manholes irrespective of evidence of dry weather flow or other illicit connections at the point of outfall discharge, is new, excessive, and will fail to provide environmental benefit for the additional labor and expense required. *Proposed Modification*: Allow local MS4 operators to implement a manhole inspection methodology appropriate to the complexity of their system, to be documented in their IDDE plan, with results reported annually as required in the current permit.

4. **MCM 3 - IDDE Mapping:** New mapping requirements relating to sewer infrastructure under the IDDE MCM are a significant concern, as they not only require mapping of all storm drain components, but now must include sanitary sewer infrastructure "where available" and knowledge of asset conditions relative to both storm and sewer systems in order to implement procedures related to prioritization and execution of catchment investigations on the basis of the System Vulnerability Factors. This level of asset inventory, condition assessment, mapping and documentation represents an effort that could take much longer than the two (2) year deadline in the permit. Based on the dynamic and cumulative documentation relative to investigations and program progress, it is also clear that communities are virtually required to develop this mapping and condition assessment as part of a GIS database. For communities that have not begun or are in early stages of GIS development, two years is certainly an inadequate amount of time. The "where available" language relative to sewer mapping (Section 2.3.4.6 (a) (ii)) is itself problematic because it is not clear to what extent the MS4 operator, who may be different than the sanitary sewer system operator, is required to obtain, develop or update sanitary sewer mapping elements that could influence catchment prioritization or wet weather screening obligations through the course of the permit term. *Proposed Modification*: Extend deadlines for storm system mapping requirements to Years 4 or 5 and make all sanitary sewer mapping voluntary or "recommended" rather than required.
5. **MCM 3 - Sanitary Sewer Overflows**: The inclusion of sanitary sewer infrastructure management or monitoring (such as reflected in Section 2.3.4.4 – Sanitary Sewer Overflows) as a component of MS4 permit compliance is a redundant requirement since communities that operate sanitary sewer systems are already regulated in this regard under existing wastewater NPDES permits. The manner in which the condition is incorporated into the MS4 permit potentially subjects communities to multiple penalties

under separate permit programs in the event of an SSO excursion. *Proposed Modification*: Elimination of this requirement.

6. **Affordability; Estimated Program Cost Increases**: EPA directs MS4 owners to the 2011 "*Sustainable Stormwater Funding Evaluation*" Final Report for reference regarding anticipated program cost increases (administrative, operating and capital) under a variety of scenarios. This document, and subsequent evaluations conducted for other Upper Charles River watershed communities (including Medway), indicates that program administrative/operational costs alone will range from double to quadruple existing expenditures. More recent updates to these figures for the communities that were the subject of EPA's detailed analysis indicate that, if anything, these estimates are under-representing the magnitude of cost increases. Capital costs to comply with the TMDL requirements embedded in the permit are estimated in the tens of millions of dollars. The enormous gains in water quality under the Clean Water Act in the first two decades after passage were achieved through a locally affordable program aimed at primarily wastewater-related point source discharges, and underwritten by state and federal funding equivalent in many cases to 90% of the program capital cost. Stormwater-related pollutant contributions to receiving water bodies are much more difficult to control and will achieve an incremental water quality improvement compared to the wastewater discharges that were the target of initial infrastructure investments. It is inconceivable that the estimated costs of this MS4 program can be affordably sustained by a limited number of property owners within communities subject to the most stringent pollutant reductions. Water quality improvements have local, state and national benefits. A program that EPA and other environmental organizations (regulatory, advocacy/non-profit or commercial) recognize as this important should have some kind of legislative or Congressional support that provides adequate funding to promote programs that can achieve water quality improvements in a more equitable and financially sustainable manner.
7. **Regional or Alternative Implementation Opportunities**: Many of the sustainable funding alternatives explored in the 2011 report refer to opportunities for working with designated dischargers (DD) in some capacity. The Residual Designation Authority (RDA) Draft Permit has not progressed in some time, and there is little information available as to the likelihood of this permit ever becoming final. In addition, under current conditions, it applies to a very small number of communities (Bellingham, Franklin and Milford). Private properties are a major contributor of pollutants to MS4 discharges, however, this RDA mechanism is an unwieldy approach to incorporating private activity into pollutant control. If the permit were to be finalized as it currently stands, these three communities are likely to experience detrimental economic development impacts due to the additional cost of operating in their towns compared to immediately abutting communities. Without passage, however, private property owners have no incentive to collaborate with local authorities regarding operation of sites that were designed and constructed in accordance with local stormwater regulations in place

at the time of development. It is unrealistic to include any of the funding scenarios that include cooperation or collaboration with a group of designated dischargers that do not exist today, are unlikely to be designated in the near future, and are unlikely to voluntarily engage in a complex and costly program without measurable benefit to them directly.

8. **Affordability; Integrated Planning (IP):** The water quality protection objectives of the NPDES stormwater and wastewater programs are recognized and supported by the regulated community. However, inclusion of an increasing number of the sanitary sewer management elements into the MS4 permit program suggests that EPA is migrating towards an integrated planning model as presented in your "Integrated Municipal Stormwater and Wastewater Planning Approach Framework." As provided for in the conditions of this draft permit, however, the effect is to import compliance conditions suitable for wastewater management programs while failing to provide permit relief or incentives to the regulated community for employing an integrated management approach to community water resource assets, including stormwater management infrastructure. The result is the equivalent of "double jeopardy" under dual permits without schedule, affordability or reporting relief. *Proposed Modification:* EPA should integrate an affordability assessment component into the Permit that will allow communities to determine the extent to which they and their constituents can afford to implement Clean Water Act requirements associated with both storm and sanitary sewer permit obligations, including operational and capital costs. If EPA is committed to the IP approach, general permits such as this should be explicitly incorporating elements of the framework on an iterative basis (i.e. every term renewal moving closer to the ideal). Ultimately, a model of risk-based decision making relative to infrastructure investments can recognize greater water quality benefit for the dollars spent without the current regulatory liability associated with multiple permits addressing water quality through different program frameworks.
9. **Definitions – Redevelopment**: The term "redevelopment" is nowhere defined in the permit or appendices. Given that EPA is requiring "redevelopment" projects to meet the new development design guidelines for stormwater management (and particularly in reference to the one-inch retention/treatment provision), it is important to know what constitutes redevelopment versus rehabilitation, restoration, maintenance or repair projects. This is particularly of concern as it relates to transportation-related projects such as pavement programs (full depth reconstruction, pavement overlays, chipping, etc.), and the possibility that routine maintenance could trigger requirements for significant drainage improvements that would not otherwise be appropriate or necessary for operational purposes. *Proposed Modification*: Define redevelopment to exclude roadway projects that do not add significant new paved acreage.
10. **MCM 5 – Roadway Projects:** The revised Stormwater Management in New Development and Redevelopment MCM presents several challenges. Primary among these is the requirement to retain the first inch of runoff (or treat the equivalent pollutant

load) from all impervious areas on site. This requirement will pose a significant challenge as it relates to roadway projects (either new or redeveloped) and will contribute to significant escalation of costs associated with drainage and/or treatment from roadways. *Proposed Modification*: Include an exemption or waiver from this permit condition for roadway projects.

11. **MCM 5 - BMP Sizing:** Language in this permit provision states that "all impervious area" is subject to the capture, infiltration or treatment requirements and specifically that flow volumes [for retention or treatment] are calculated based on "multiplying the area of impervious area on site by one inch." We seek clarification that BMPs on site need not be sized to reduce "calculated" pollutant loads that theoretically are contained in flow from disconnected impervious area on-site that is not otherwise directed to the MS4.
12. **MCM 5 – EPA and DEP Consistency:** With the encouragement of the Massachusetts Department of Environmental Protection (MassDEP) and EPA, many communities have adopted the Massachusetts Stormwater Management Standards either directly or by reference into existing municipal design standards and by-laws. This permit represents a divergence from the MassDEP stormwater standards and complicates compliance for regulated entities. We request EPA and MassDEP develop a consistent set of development standards that ensures that exemptions or waivers provided under federal NPDES permits will ensure similar treatment under MassDEP surface water discharge regulations.
13. **MCM 5 - 1-inch Standard:** EPA has stipulated that the one-inch retention/treatment standard applies to both new and re-development projects. As noted above, this is not consistent with the MassDEP stormwater management standards and creates further confusion relative to application of development standards. See our comment above regarding joint approach.
14. **MCM 5 – Street Design Guidelines:** At Section 2.3.6 (b),the MCM requires development of a report assessing current street design and parking lot guidelines that affect creation of impervious cover to be due within three (3) years of the permit effective date. The intent is to identify opportunities to support low impact design options to be incorporated into local regulation and standards. Under "smartgrowth" principles with comparable environmental impact mitigation interests, the federal government, state and local agencies have promoted a "complete streets" approach to invite multi-modal use of roadways that frequently results in greater impervious area. Given the sometimes contradictory nature of these programs, the regulated community would like assurances that the federal and state government are collaborating to provide adequate guidance that achieves prioritized environmental objectives without potential penalty (either in terms of punitive fines or loss of grant/loan funding, etc.) to the regulated community. *Proposed Modification:* We propose modification of the permit term within this section to provide greater latitude to MS4 owners regarding implementation of recommendations resulting from the report. Where there are competing interests relative to "environmental

street design" the MS4 owner should be allowed to make local decisions that are in it's best interest.

15. **MCM 6 – Good Housekeeping Affordability Assumptions:** The Good Housekeeping MCM as proposed will be extremely expensive for most communities to implement. The accompanying permit fact sheet states that while this is the most costly program area for most communities, these are existing functions (e.g. catch basin cleaning and street sweeping) and the costs associated with compliance under the permit will be incremental, or less, such that "these costs are likely not above and beyond what the permittee likely spends on maintenance of permittee owned property currently." The cost estimate provided fails to appreciate that most communities do not currently collect the data, analyze findings, document and report activities in the manner now required under this permit. For communities that contract these services to outside vendors, procurement of new contracts to include documentation required will undoubtedly impact bids by increasing costs significantly. It is expected that data collection from catch basin sump cleaning efforts will almost double the time per catch basin required. It is reasonable to anticipate, therefore that catch basin cleaning costs will double, regardless of whether the activity is out-sourced or done in house. Program affordability, particularly in light of requirements under Water Quality-Based Effluent Limits (WQBEL's), continues to diminish and timeframes within the permit further compromise a community's ability to meet permit requirements under the MCM's as presented in this draft permit. *Proposed Modification:* Again, we request that EPA include an affordability component into the MS4 Permit, comparable to that provided under CSO Long Term Control Plan programs.

Water Quality Based Effluent Limitations (WQBELs)

16. **New Discharger Definition:** Based on the accompanying fact sheet, the definition of "new discharger" within the permit does not include expansion of an MS4's existing system within its jurisdiction. The distinction is important since increased discharges can be covered under the General Permit, but new discharges must be covered under a separate individual permit. Please confirm that the term "adjacent" or "adjacency" within the context of this definition includes any new drainage element, including an outfall, within an MS4's jurisdiction but not otherwise connected to any other component of the MS4. For instance, the town may accept a private road that includes a "self-contained" drainage system (e.g. a series of connected catch basins discharging to a discrete outfall none of which is connected to or "adjacent to" existing drainage infrastructure) without triggering a requirement to cover that segregated outfall through a separate individual permit. Public management of the streets will generally lead to better pollutant management and on that basis the permit should not dis-incentivize acceptance of private roads.

Other Issues

17. **Non-Stormwater Discharges**: At public meetings during which EPA has presented material about the new permit, there has been much discussion about the classification of sump pump discharges as an allowed "non-stormwater discharge." Explicit guidance is necessary regarding local permit programs sufficient to meet documentation of determination standards relative to sump pump discharges as a class of allowed discharges.
18. **Town Administration Outreach**: In most communities responsibility for permit compliance resides with Public Works or similar agency officials. Boards of Selectmen and/or Town Managers are often not involved in program administration outside of procurement or appropriation processes for identified projects. Their lack of understanding and support to local implementing agencies has been a continuing challenge. EPA and/or DEP must increase their involvement in educating Town officials about the extent, costs, operational impacts and policy determinations incumbent on program administrators to ensure continued organizational support, particularly for funding strategies.
19. **Floor Drain Inventory:** It is appropriate and appreciated that this requirement has been removed from the Draft Permit.
20. **Errors:** A number of errors in referencing were noted in the document. The ones we noticed are listed below, there may be more. Please carefully check all cross references in the preparation of the Final Permit and correct the following errors:

- Page 12 – change references from Table F-5 to Table F-6
- Page 14 – change references from Table F-6 to Table F-8
- Page 14 lists reference to Buzzards Bay but there is no Nitrogen TMDL for Buzzards Bay watershed on DEP's website
- Page 14 list does not include Wareham although Wareham is in Buzzards Bay watershed
- Page 15 change reference from Table F-7 to F-9
- Page 17 – reference to Table F-10 is incorrect (that is a table of Assabet towns)
- Appendix F page 5 of 53 – footnote No. 4 incorrectly references Table F-2 for PCP area scope inclusive of MS4 only (should be Table F3) and references Table F-1 for jurisdiction-wide PCP area (should be F-2)

Sincerely,

Gino A. Cresta, Jr., Director
Town of Swampscott
Department of Public Works

Re: **Comments on the Draft NPDES General Permit for Stormwater Discharges from Small MS4s in Massachusetts**

Dear Mr. Tedder:

Tighe & Bond has prepared the following comments and questions, referenced by page (from the copy of the draft permit provided on EPA's website) and by the permit section number. We have focused our comments on sections of the permit where we believe there is a substantial need for improvement to allow feasible, cost effective implementation of the Clean Water Act and NPDES program goals.

Part 1: Introduction

- **(Page 1, Part 1.2.1)**: This part states that an MS4 is eligible for coverage if it is located either fully or partially within an urbanized area as determined by the latest Decennial Census by the Bureau of Census as of the effective date of this permit (the 2010 Census). EPA has *verbally* stated that the area to be covered by the permit is the *combined area* defined by the 2000 Census and the 2010 Census and has also indicated this on the regulated area maps provided on their website. Can EPA please clarify the limits of permit coverage in the permit text?

- **(Page 7, Part 1.10)**: This section requires permittees to modify or update their existing BMPs and measurable goals in their Stormwater Management Programs (SWMP) to meet the terms and conditions of the new permit. Does that mean that permittees cannot delete ineffective or impractical BMPs from the MS4-2003 SWMP while they are updating the SWMP? Part II.D.2 of the MS4-2003 allowed modification of the SWMP under certain conditions and Part 4.1 of the draft General Permit generally continues these requirements. As written, we interpret these sections to prohibit subtraction (deletion) of components or controls of the SWMP. While we agree communities should be encouraged to build on their current program for the new permit, EPA should recognize it has been over a decade since BMPs were first identified and therefore municipalities should be provided an opportunity to meet the new permit conditions using the most cost-effective, appropriate BMPs for the community in 2015 and beyond. We recommend the final permit be revised to explicitly allow flexibility in deleting ineffective BMPs that Towns committed to in 2003 during development of the updated SWMP that meets the new General Permit requirements.

- **(Page 9, Part 1.10.3):** New permittees will struggle to catch up to other communities regulated since 2003 within the deadlines provided. We recommend that the outfall inventory and outfall mapping (second and third bullets, respectively) be conducted at the same time and be completed within four (4) years. We believe it is also reasonable to require the initial dry weather screen to be completed concurrently. We recommend modifying the fourth bullet, "All other timelines for the

IDDE Program… shall be extended by *four (4) years*" to allow communities to spread the cost of drainage system mapping over additional years.

Part 2.1: Water Quality Based Effluent Limitations

- **(Page 10, Part 2.1.1. and Appendices F&H)**: Permittees that are required to address TMDLs have public outreach requirements above and beyond the requirements in Part 2.3.2. EPA should consider explicitly *allowing* permittees to combine public outreach efforts if feasible to meet both TMDL requirements and the public education and outreach requirements under Part 2.3.2. This will allow permittees to focus their messages to address key water quality concerns, without overwhelming the audience with too frequent communication or overcomplicated materials. For example, permittees may send a spring flyer to Businesses within a Nitrogen TMDL area with a targeted message regarding proper use and disposal of grass clippings and proper use of slow release fertilizer that also provides the web address for more general stormwater information related to businesses. This outreach effort would achieve multiple goals and should meet the requirements of Parts 2.1.1 and 2.3.2.

- **(Page 10, Part 2.1.1.b & c)**: Please clarify the statement "or its tributaries in some cases." Does EPA intend to say that if a discharge from a MS4 to a tributary of a waterbody that is subject to an approved TMDL, or to a tributary of a waterbody that is impaired, that the MS4 is subject to the same requirements as if the MS4 were discharging directly to the impaired waterbody, even if the tributary is not listed in the most recent Massachusetts Integrated List of Waters as impaired or subject to a TMDL?

- **(Pages 11-22, Part 2.2):** Upon scenario testing for a number of permittees, we have identified some potential errors and inconsistencies in the applicability of pollutant-specific requirements to municipalities for TMDLs (Part 2.2.1) and impairments (Part 2.2.2) that EPA should correct or clarify. In several cases, it was unclear to us why some municipalities were listed for certain impairments since receiving waters within the Regulated Area were not listed as impaired for the pollutant of concern.

    - It appears that EPA has applied TMDL and impaired waters requirements to receiving waters that are *outside of the Regulated Area* by including those municipalities in the watershed-specific list. We request that prior to issuing the final permit, EPA revise the lists provided in the permit (both this section and Appendices F & H) as appropriate to correct this.

    - What documents govern interpretation of TMDL and impaired waters applicability? Is it individual TMDL reports, the 303 (d) list / most recent Final Massachusetts Integrated List of Waters, or the tables provided in Part 2.2? See previous comment regarding applicability to tributaries that are not listed as impaired in the current Massachusetts Integrated List of Waters. Please state the source in the final permit.

    - **(Pages 18-19, Part 2.2.2.a.i.1)**: There are several communities, such as Boylston and Mendon, listed as having waterbodies that are impaired due to nitrogen that we believe are in error. For these example municipalities, the proposed Massachusetts Year 2014 Integrated List of Waters does not show Category 5 or 4a receiving waters in Boylston or Mendon with nitrogen as the

pollutant of concern. In the response to comments, please clarify EPA's rational and authority to broadly impose nitrogen reduction requirements in the Blackstone River and Ten Mile River watersheds and unimpaired tributaries and please revise the permit to reflect necessary changes.

- **(Page 10, Part 2.1.2)**: Please define "increased discharge" in Appendix A of the permit.

- **(Page 11-18 Part 2.2.1 and Part 2.2.2)**: EPA needs to provide clarification for communities that are subject to overlapping requirements for addressing TMDLs and water quality impairments as currently defined under Parts 2.2.1 and 2.2.2. By way of example, the draft General Permit has identified Mendon as needing to meet requirements to address the Charles River Watershed phosphorus TMDL, an approved TMDL for bacteria/pathogens, and water quality impairments for nitrogen and phosphorus, however, our review of the Final 2012 and Proposed Year 2014 Integrated List of Waters does not identify this extensive list of impairments within the Town's Regulated Area. Based on the permit requirements, the town would be subject to implementing the provisions of Appendix F for the Charles River as well as Appendix H for the impairment status within the same watershed, which is duplicative. It would be more reasonable to require one or the other, but not both. Please revise the final permit to reduce this duplication.

- **(Page 14, Part 2.2.1.b.3)**: Note that Manchester and Manchester-by-the-Sea are listed in the bacteria/pathogen table. We recommend EPA remedy this duplicate listing and verify no other communities are duplicated in the lists provided.

Part 2.3 Requirements to Reduce Pollutants to the Maximum Extent Practicable

Part 2.3.2 Public Education and Outreach

- **(Page 24, Part 2.3.2.e)**: It will be a significant challenge for individual communities to measure effectiveness of stormwater educational messages and the overall education program at the local level, and it will be very difficult to determine if efforts provide meaningful results. It may not be an efficient use of funds for every community to individually pay for independent effectiveness measurement programs that could be equally or more effective if done collaboratively. EPA should be measuring effectiveness of MS4 education program at a state or regional level. We recommend removing this requirement from the permit and suggest that EPA work with state agencies, regional stormwater groups, or watershed groups to evaluate the effectiveness of educational efforts. However, if this requirement must be included in the final general permit, we recommend this section be revised to encourage a collaborative effort between communities, regional stormwater groups, and/or watershed groups and clarify that EPA will consider these efforts as meeting permit conditions as long as they are completed in accordance with Part 2.3.1.b . In addition, if this requirement remains in the final permit, we respectfully request EPA provide additional guidance on measuring and tracking effectiveness of MS4 education programs at a local, regional, and state level.

Part 2.3.4 Illicit Discharge Detection and Elimination

- **(Page 26, Part 2.3.4.4.b)**: Developing the inventory of SSOs would typically be completed as part of developing the written SWMP. We recommended EPA extend

the timeline for completing the inventory of all SSOs to be within one year of the effective date of the permit.

- **(Page 26-27, Part 2.3.4.5.b & c)**: If outfall inventory and dry weather inspections completed under the MS4-2003 need to be repeated, we recommend coordinating the timelines of the inventory required by Section 2.3.4.5 and dry weather screening required in 2.3.4.7.d.iii to both be completed within three years. The most costly part of these requirements is the labor, and therefore we recommend revising requirements to allow performing dry weather screening and the outfall inventory concurrently, which will allow communities to reduce the number of time consuming visits to each outfall to save on labor costs.

- **(Page 27, Part 2.3.4.5 c):** It is unclear if permittees are required to re-do the outfall inventory. Many permittees have recorded dimensions, shape, material, spatial location, and physical condition, as well as sensory observations, under the MS4-2003. We recommend EPA revise this requirement to state that, if the permittee previously recorded spatial location meeting the minimum accuracy listed in the permit, the location does not need to be GPS located again. In addition, if dimension, shape, material were inventoried, they should be compared to observations in the field to verify the outfall was correctly inventoried but are not required to be re-inventoried.

- **(Page 27, Part 2.3.4.5.b)**: EPA requires permittees to physically label all MS4 outfall pipes and interconnections with others MS4s with a unique identifier by the end of the permit term. We have assisted several communities with labeling their outfalls. We purchased approximately 450 62" flexible fiberglass reinforced composite utility markers and customized labels (stickers) at an approximate cost of $13 per marker due to a bulk rate. Outfall markers were placed at outfalls throughout these communities. Finding the correct label and installing the markers in the ground with the specialty driving tool was time consuming. It is expensive to label every outfall with no apparent direct water quality benefit for this effort. Will EPA please clarify the goals of the outfall labeling exercise and revise the permit accordingly?

    - Is the purpose of this exercise to provide a visual clue for citizens and businesses, alerting them to the presence of the otherwise unseen stormwater drainage system? If so, this can be easily achieved without labeling every outfall or interconnection. This goal could be more cost-effectively achieved through labeling a small number of "example" high visibility outfalls. To the average citizen a label that says "outfall number X" is alarming without supporting education. These small number of high visibility outfalls could be labeled not only with a unique identifier, but also with more information about stormwater impacts to surface water quality, recreation, public health, etc. The information could also include a website or contact information.

    - Is the purpose of this exercise to make it easier for EPA enforcement and environmental groups to identify outfalls and collect samples separately from the community's effort? If so, this goal could be more cost-effectively achieved by requiring communities to provide GPS coordinates or GIS data to EPA, as communities update their mapping. Because permittees are required to collect GPS locations of outfalls, submitting ether GIS files or latitude and longitude coordinates for each outfall would be adequate to meet this need.

- Is the purpose of this exercise to make it easier for communities be able to identify their outfalls in the field, as City/Town staff turnover and IDDE efforts progress? If so, we recommend this can be achieved more cost-effectively through other MS4 permit requirements, including developing an accurate drainage system map and developing a complete outfall/interconnection inventory including photographs showing each outfall.

- There are some outfalls that may be impracticable for a municipality to label, as they are not readily accessible due to being located on private property with no easements. Also, due to the location of many outfalls, these markers are easy targets for vandalism or theft, which will add costs for permittees to replace.

- **(Page 28-36, Part 2.3.4.7 and 2.3.4.8)**: The IDDE requirements are lengthy, cumbersome, and costly. We believe that the requirements may be so onerous that communities will not even attempt full compliance.

  - For example, highly urbanized communities that have been doing ongoing IDDE work under the MS4-2003 permit will likely have the majority of their system categorized as Problem Catchments. While they will not be required to complete dry weather sampling, they will be required to complete investigations of 100% of the problem catchments within five years, which is not achievable or feasible. In many of these communities, catchment investigations will include opening manholes in roadways with heavy traffic, thereby necessitating police details and putting the safety of inspectors at jeopardy and causing traffic delays.

  - Conversely, rural areas with limited urbanized area and no sewer (or recently installed low pressure sewer) will still have to complete investigations in 40% of their entire MS4 with little potential for finding illicit discharges. Communities should expend their limited budgets on finding and fixing non-stormwater discharge inputs instead of excessive planning.

- **(Page 29, Part 2.3.4.7.c):** While the IDDE Program has potential for measurable water quality improvements, the elaborate multi-step ranking process will not result in a cost-effective, pragmatic implementation strategy. The prioritizing and ranking process and milestones should be streamlined to reduce the onerous planning effort and result in the same environmental benefit. We recommend EPA generally revise the process as such:

  - Classify each catchment into one of the four categories (excluded, problem, high priority, and low priority).

  - Rank all catchments together (regardless of category) using the criteria presented

  - Determine the total number of dry weather and wet weather inspection points (outfalls, interconnections, and key junction manholes) in each catchment area and schedule catchments for investigation based on category and priority ranking as well as staffing and financial considerations.

Generally speaking, the goal should be to focus on which catchments are likely to have illicit discharges and which ones are unlikely to have illicit discharges. Then the likely catchments should be prioritized by severity.

- **(Page 33 – 35, Part 2.3.4.7.e.ii):** The draft General Permit is requiring communities to implement a manhole inspection methodology that "must, at a minimum, include an investigation of each key junction manhole within the MS4, even where no evidence of an illicit discharge is observed at the outfall." Based on our experience completing field work to identify and track potential illicit discharges, Tighe & Bond thinks that this effort is onerous with little potential benefit to improve water quality for the amount of effort. Inspecting manholes is valuable only when an outfall has dry weather or wet weather indicators (visual, olfactory, screening) of an illicit discharge. This procedure is ideal to find the problem during the time the discharge is occurring. In addition, there are substantial safety risks associated with inspecting key junction manholes. The majority of these manholes will be in roadways with heavy traffic, putting staff and contractors at risk during inspections and necessitating police details. These efforts will also cause traffic nuisance conditions. To improve the benefit of the inspections and reduce the overall risk, we recommend EPA revise this section of the permit to only apply the manhole inspection methodology when evidence of an illicit discharge is observed at the outfall.

- **(Page 32 - 33, Part 2.3.4.7.d iv and vi):** EPA has provided benchmarks that "indicate sewer inputs to the MS4", however, these benchmarks have typically been used for comparing results from dry weather sampling. What benchmarks does EPA want permitees to compare to for wet weather sampling results? Please clarify in the final permit.

- **(Page 33, Part 2.3.4.7.e.i):** EPA has provided "System Vulnerability Factors" for permittees to identify catchments that have a higher potential for illicit connections under wet weather conditions. However, for the majority of permittees with sewer systems, almost every catchment in the MS4 will have the presence of these Factors. In addition, many communities with and without sewer have drainage systems greater than 40 years old. Therefore they will be required to complete wet weather investigations of a high percentage of catchments. We request EPA re-consider the vulnerability factors and revise this list to be simplified and more focused, as there are currently too many factors. For example, remove the factor related to age being 40 years or greater as the other factor related to overall condition is more meaningful. Age is not necessarily an indicator of condition. Crossings of storm and sanitary sewer alignments and possible common trench construction situations can be seen when viewed from a map perspective, but oftentimes when we review as-builts it is clear that sewer lines are many feet below the drainage system, which will not likely result in exfiltrated sewage entering the drain line. The focus should be on situations where the sewer line is at a higher elevation than the drainage system or where it is within a few feet.

- **(Page 35, Part 2.3.4.7.e.ii.b):** Wet weather monitoring in accordance with the wet weather screening and sampling requirements to meet the deadlines specified in the goals and milestones section will be an all-consuming effort for Town staff and/or their consultants each Spring, particularly when nearly all catchment areas have System Vulnerability Factors as described in the previous comment. There are a limited number of storm events that occur between March and June during business days and hours of operation. In our experience with wet weather sampling, we have

found that oftentimes storm events produce runoff but are not long enough to allow an inspector to get to more than a few outfalls. Assuming a community has 600 outfalls, and 550 of them have Vulnerability Factors, and an inspector could get to five to ten outfalls each wet weather event, it would take 55 to 110 events to get to all outfalls. There are only approximately 85 working days from March through June. Assuming it rained once a week, there may be approximately 17 events during the "wet weather season" each year. Field staff would have to monitor weather forecasts daily and attempt to do wet weather outfall monitoring during nearly every spring storm during business hours and beyond. One way to alleviate this burden could be to extend the wet weather monitoring season to include March through November. Recent increases in severity and frequency of storms in New England has been well documented. Extending the monitoring period would enable communities to spread their time over a longer period and also utilize labor from summer interns.

- **(Page 37, Part 2.3.4.8.c):** We suggest that EPA simplify this section and limit the IDDE burden by putting an annual cap on implementation of the Catchment Investigation (Part 2.3.4.7.e) so that communities should perform wet weather investigations on up to 10% of all outfalls with System Vulnerability Factors per permit year and perform the remaining catchment investigation procedure on up to 10% of *inspection points* (outfalls, interconnections, and key junction manholes). All permittees must begin with Problem Catchments followed by High Priority Catchments then Low-Priority Catchment. This would accomplish the goal of investigating the entire MS4 within 10 years of the permit effective date, starting with the highest priority areas. Because the labor and screening cost are driven by the number of "inspection points" not catchments, the cost for each community will be evenly distributed over multiple permit years. As the permit is written now, municipalities with the most work to do (due to large drainage systems, complex and aging storm and sanitary sewer systems, and a high percentage of Problem and High Priority Catchments) will have the least amount of time. Our proposed change provides extra time for these communities to spread out the IDDE Program costs and considerable staff commitment. We believe EPA and the Commonwealth will achieve a better result if the program milestones are manageable.

- **(Page 32, Part 2.3.4.7.d and Appendix I)**: We are very pleased that EPA developed the Bacterial Source Tracking Protocol to create a consistent procedure for determining the presence of illicit discharges. However, we are troubled by the following aspects of the protocol:

    - Testing for chlorine and then noting any sample where chlorine is detected above the instrument Reporting Limit requires additional labor and/or expenditures for field instrumentation or laboratory analysis with little benefit. We understand the concern that chlorine in the sample can further disinfect the sample during the hold time, but what is the expected die off rate during the 6 hour hold time and at what chlorine concentration? We think it is unreasonable to categorize catchments where "ammonia ≥ 0.5 mg/l, surfactants ≥ 0.25 mg/l, and *detectable levels of chlorine*" as High Priority Catchments that are "highly likely to contain illicit discharges." (Page 33, Part 2.3.4.7.d.vi) To more accurately measure bacteria concentrations and properly prioritize catchment areas, EPA should allow the use of pre-sterilized sample bottles with dechlorination chemicals instead of chlorine analysis.
    - On p. 1 of Appendix I, EPA advises "additional concurrent collection of samples for select Pharmaceutical and Personal Care Product analysis." This option is financially out of reach for most communities, unless EPA's lab has

capacity and can perform the analysis for a reduced cost. Currently EPA's preferred PPCP analysis suite can be performed for $450 per sample if shipped across the country. Additionally, there are no corresponding surface water quality standards for these constituents and high concentrations do not constitute a water quality violation. It is not advisable for communities to request that EPA perform this analysis, as there will be cases where PPCPs are detected where traditional outfall screening does not indicate an illicit discharge. This would indicate an indirect source of human wastewater entering the MS4. Should these diffuse, intermittent, and difficult to find discharges to the MS4 be a priority when there is much work to do to find and correct direct illicit discharges and sanitary sewer overflows?

Part 2.3.6 Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management

- **(Page 40, Part 2.3.6.a.ii):** We are incredibly concerned that EPA has revised the post-construction stormwater management performance standards to be inconsistent with the Commonwealth's Stormwater Management Handbook (hereafter referred to as the Handbook). This is problematic for a number of reasons:
    a. The Handbook was developed through an extensive public process, including receiving stakeholder input from engineers, contractors, communities, and the public, and the provisions were carefully vetted to ensure they are feasible and reasonable. While the MS4 permit has a public comment process and response to comments, this is not the same effect as obtaining stakeholder and expert consensus through numerous meetings and public outreach efforts to develop a state-wide stormwater management handbook with design guidelines and maintenance recommendations. Because comments EPA receives will be focused on the MS4 program, they will lack the substantial input on design details associated with a 1" requirement. We are concerned that EPA may issue a final permit that does not include the necessary technical considerations associated with retaining 1" or providing the equivalent level of pollutant removal.
    b. The Handbook provides various considerations for redevelopment projects that recognize stormwater management for redevelopment is much more difficult and costly, and the Handbook allows flexibility for these types of projects. As the draft MS4 general permit is written, these flexibilities are not allowed, and therefore redevelopment projects will be required to expend significant money to comply and, in some cases, this requirement may make redevelopment infeasible and push projects to green field sites. Additionally, this standard is applied to "the first one (1) inch of runoff from *all impervious surfaces on the site*" which unfairly applies this new standard to unimproved portions of the site.
    c. Has EPA considered how this standard will apply to work on municipal roadways? Roadway projects may exceed one acre of land-disturbing activity on individual projects and are often included in Capital Improvement Plans, which could be considered a "common plan of development" and therefore even though individual projects disturb less than one acre, the combined plan results in a disturbance of one or more acres. These roadway projects may merely be mill and overlay efforts that are necessary for public safety and long-term roadway maintenance. Will municipal roadway projects be required to meet this 1" standard? This is infeasible in many cases, due to limited area for structural BMP installation on right of ways and limitations on installation caused by the existing drainage layout and elevations. With the

exception of full-depth reconstruction, the maintenance and rehabilitation of existing roadways and parking areas should be exempt from this requirement. Implementation of stormwater management systems within the right of way for the purpose of water quality and/or flow attenuation should be up to the discretion of the permittee and based on the receiving water-specific retrofit feasibility assessment and implementation requirements in Section 2.2 of the Permit.

d. This proposed new requirement is troubling for permittees that have already adopted their local stormwater ordinances per the requirements of the MS4-2003. In most cases these local Bylaws and Ordinances reference the ten MA Stormwater Management Standards as local "performance standards". In many cases, local code also exempts projects already completely within wetlands jurisdiction to avoid redundant permitting and reduce costs and effort on both the applicant and the community's part. This new MS4 requirement will mean permittees must update their local code, which is an extremely costly and laborious effort. In our experience, updates to bylaws/ordinances and regulations typically necessitates a public participation process, with numerous meetings, obtaining and responding to stakeholder comments, and, if they are written into the local ordinances or bylaws , require review by Town Counsel or City Solicitor and then City Council or Town Meeting approval.

We strongly recommend that if EPA desires this level of post-construction stormwater management, they work with MassDEP to initiate a public process to vet the technical components of the requirement, feasibility, and revise the Massachusetts Stormwater Handbook instead of adding this requirement to the MS4 general permit. If this is not possible, at a minimum, we strongly urge EPA to revise the requirement to match the Massachusetts Stormwater Handbook's considerations for redevelopment and revise the requirement to exempt municipal roadway projects when they are conducted in accordance with a SWPPP per MCM #4.

- **(Page 41, Part 2.3.6 b & c)**: Tighe & Bond recommends EPA revise the compliance timelines for part b and part c to be completed concurrently within four (4) years of the permit effective date. While these are slightly different efforts, review of local code (bylaws, ordinances, regulations, design guidelines, etc.) is time consuming and takes substantial effort, and therefore it is most efficient to review local code only once during the permit term. Tighe & Bond recommends requirements relating to review of local code (regulations) be on the same compliance schedule.

- **(Page 42, Part 2.3.6.d):** We believe the goal of this exercise is to utilize impervious cover percent as a measure of watershed health, as the impervious cover model does. However, tracking annual changes in impervious cover will be significantly difficult, costly, and time consuming with no benefit to water quality. Therefore, we suggest the assessment be done only in the first and last years of the permit term (or every five years) and be supported by statewide GIS mapping initiatives to understand the short-term change and utilize these data to feed into planning impervious cover management under future MS4 permits.

Part 2.3.7 Good House Keeping and Pollution Prevention for Permittee Owned Operations

- **(Page 44, Part 2.3.7.a.iii (b)):** Because most communities have not surveyed or measured the distance to the bottom of each catch basin sump, it will be difficult to know when a sump is "50 percent full" and therefore we recommend a revised approach to this requirement. We recommend EPA allow communities to either annually clean catch basins or, if a community wants to reduce the frequency of cleaning to less than once a year, we recommend EPA require communities to use an easily measurable benchmark, such as ensure that deposits are no less than2 feet below the invert of the outlet pipe, as an alternative for catch basins with a total sump depth of at least four (4) feet (i.e., deep sump catch basins). Another consideration for this requirement is that, if a community is sweeping more than once per year, should all catch basins still be cleaned annually? More frequent sweeping results in decreased sediment and other loadings to catch basins, and therefore we recommend that communities that increase their sweeping to at least two times per year should be allowed to reduce catch basin cleanings to reflect this.

- **(Page 46, Part2.3.7.b)**: In many cases a community may own, but not operate its transfer station. In this case it is impossible for the municipality to develop and enforce a SWPPP where the day-to-day operations are not controlled by the municipality and a new lease agreement is potentially five to 20 years away. We suggest that EPA modify this language to only apply to permittee *operated* facilities.

Part 4: Program Evaluation, Record Keeping, and Reporting

- **(Page 51-52, Parts 4.3 and 4.4):** There are numerous reporting requirements listed throughout the permit and also listed in these parts. To make it easier for permittees to correctly identify all requirements and timeframes for completion (deadlines), we request EPA prepare a table of all reporting requirements and deadlines to include in this section.

Appendices:

- **(Appendix A):** Please include definitions for *Common Plan of Development, Disturb* or *Land-Disturbing Activity,* and *Increased Discharges* and please improve the definition for *Key Junction Manhole*.

- **(Appendix H, Part V)**: The wording of the "solids, oil and grease (hydrocarbons), or metals" water quality limitation is not consistent with MassDEP's impairment causes. Please revise the permit to clarify if "solids" is equivalent to MassDEP's "turbidity" and "total suspended solids" impairment causes.

- **(Appendix I)**: Attachment 1 to the EPA New England Bacterial Source Tracking Protocol references Standard Operating Procedures in Section 5.0, Attachments (Page 7 of 7), however these documents are not included in the draft permit or readily available online. Please make these available upon issuance of the final permit.

Other/Overall:

- **Guidance.** We sincerely appreciate EPA has made the investment to prepare guidance documents for specific parts of the permit, including IDDE, impervious

cover tracking, etc. We request that EPA update and revise guidance documents as appropriate for the final permit, including guidance maps showing impaired waterbodies and potentially additional information on applying for an individual permit (anticipating that many smaller, rural regulated communities may choose to do so).

- **Recordkeeping.** The administrative burden of maintaining detailed written records for all permit activities, such as maintenance, inspection and training records should be minimized wherever possible. We suggest that EPA maintain flexibility on the level of detail required for this tracking effort that will be meaningful and yet not detract from the staff time for operation tasks as opposed to administration tasks. Cost efficient approaches to demonstrating compliance with the Good Housekeeping requirements might involve monthly summaries of highlights from staff time cards, employee diaries, and planning calendars.

We thank you for the opportunity to comment on the draft Massachusetts Small MS4 General Permit. Please contact us with any questions at 508-754-2201 or ejscerbo@tighebond.com or jsmoonan@tighebond.com .

Re: Massachusetts Draft EPA Storm Phase 2 Regulations

Dear Mr. Tedder,

We are writing to provide our association's concerns regarding the proposed new Stormwater Phase Two regulations. The following is a list of the most troubling portions of the proposed new Stormwater Phase Two regulations.

1) Pavement maintenance work triggers retaining first inch of stormwater or stormwater treatment. Under the new regulations, when one disturbs more than one acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) or more which will include road reclamation projects, the new regulations require that the first inch of storm water be retained or all the stormwater must be treated. This essentially means one now not only has to resurface the road one has to completely redesign and re-construct the entire stormwater collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for stormwater storage or pay for the expense of stormwater treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way.

   As everyone is aware, the funds available for pavement maintenance are less than half of what are needed to simply preserve the condition of the current infrastructure. This means that Massachusetts roads are falling apart faster than they can be repaired. The above added costs will compound the problem and create more failing roads and more erosion. Municipalities will be forced to use the wrong pavement rehabilitation technique at the wrong time which will squander the available limited pavement maintenance resources.

   There must be an exemption for pavement maintenance projects. The above regulations should not be applied to maintenance projects. If a new road is being constructed or a lane is being added, these stormwater management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should not trigger rebuilding the world.

2) Chloride Reduction. Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training

TEL. 562-1600

the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to legal action. Yes, usage of chlorides could all stop tomorrow, but at what cost to human life. If the EPA will protect an endangered salamander, it should be equally as concerned with the loss of human life. The chloride reduction regulations should be limited to recommending that municipalities follow the latest accepted Best Management Practices.

3) Requirement for tracking impervious area. The EPA in its permit guidance documents implicitly admits that the simple presence of impervious areas is not a direct correlation to stormwater quality. Sites with paved areas can store/detain or treat stormwater so that the presence of paved areas on stormwater quality is mitigated. Similarly, the MaDEP considers roof water runoff "clean" and can be infiltrated into the ground without pretreatment. Tracking the amount of impervious areas does not have a direct correlation to water quality; therefore the MS4's should not have to expend resources tracking changes in impervious area. As long as new development is in compliance with Best Management Practices, control of development should be under the jurisdiction and control of local planning authorities. Any attempt at limiting /restricting development through the veiled attempt at controlling impervious area is outside the purview of the Clean Water Act.

4) Cost of implementation. An article published in Construction Outlook a publication of UCANE recently published EPA cost estimates of compliance between $70,000 and $829,000 per year depending on population and size. This is very troubling because they have been known to significantly under-estimate the actual cost. At the meeting, Newton Tedder from the EPA commented that he believes most cities and towns will have to pass a stormwater utility in order to pay for the costs to comply with the new Storm Phase Two regulations. Obviously, the EPA is admitting that the new regulations are an undue burden and so costly that the municipalities cannot afford them with existing revenues. It seems unlikely that the intent of Congress in passing the Clean Water Act was to authorize the EPA to mandate additional taxes and create its own hidden tax structure to accomplish its charge of cleaning the water. The EPA was charged with cleaning the water and operating within its budget as set by Congress. The States and local cities and towns must do the same. It is unconscionable at a time when state and local governments are undergoing staff and budget cuts to capriciously raise the cost of compliance with the new regulations. The local governments will be happy to work with the EPA to achieve progress on storm water. However, the heavy handed, adversarial and punishing regulations as proposed will not encourage cooperation from state and municipal partners.

The Congress of the United States should act to restrain the EPA from imposing uncontrolled and expensive tax burdens on the subjects it regulates. Taking reasonable actions to improve water quality is one thing, but being mandated to accomplish everything overnight is unfathomable. All levels of government must be cognizant of costs. The regulations, reporting requirements and the overall implementation costs must be reduced to a sustainable

and rational level. The taxpayers and the country cannot be bankrupted by an attempt to reach unrealistic goals set by a bloated out of touch federal bureaucracy.

5) Signage at outfalls. Installation of signage at outfalls provides no tangible benefit to water quality. Installation of signs and posts will waste resources. The signs will encourage theft or vandalism and will provide little to no use in management of the stormdrain system. All regulated organizations are required to have maps with locations of all outfalls. The availability of low cost GPS devices makes these outfalls easily located by just about anyone.

Thank you for your consideration, if you would like additional information, please contact me at joepip@easthampton.org or (413) 527-1410.

Very Truly Yours,

Re: Comments on EPA Draft General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Mr. Tedder:

The Taunton River Watershed Alliance, Inc. (TRWA) submits the following comments on the Draft National Pollutant Discharge Elimination System (NPDES) General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts (MA MS4 Permit). TRWA is an environmental organization whose mission is the protection and restoration of the water quality and aquatic ecosystems of the Taunton River and its tributaries and other habitats and ecosystems of the watershed. Our members use the Taunton River and its tributaries for recreation and our volunteer water quality monitoring teams have conducted monthly testing at locations on the River and several tributaries since 1991.

As you are aware proper stormwater management which restores and preserves predevelopment hydrology is essential for watershed health. Although it is not possible to eliminate all the imperviousness that generates stormwater much can be done to mitigate the effect of impervious cover. We are concerned that too many of the streams in the Taunton River watershed experience erosion, destruction of stream bed habitat, and wash out of benthic aquatic life for even the frequent small storms Massachusetts receives (per Region 1 website 65% of MA storms are < 0.5 inches). These streams are

also not maintaining base flow conditions to support aquatic life. The habitat and benthic life of the streams most impacted by stormwater are needed for spawning/reproduction and juvenile food supply during critical life stages of virtually all recreational and commercial freshwater and marine fish species (or their primary food sources). The Taunton River supports globally rare freshwater and brackish tidal marshes and was added to the National Wild and Scenic Rivers System in 2009. The negative impacts of poorly managed stormwater have widespread environmental ramifications. As discussed below, TRWA supports the draft as an important next step but believes much more needs to be done to begin reducing the frequency and volume of stormwater discharged from existing impervious cover for progressively larger storms.

This is a good draft permit building on the May 1, 2003 MA MS4 permit which expired in 2008. Learning from experience in stormwater management gained over the last 12 years EPA has improved the new permit. The draft permit provides more explicit requirements for compliance as well as tools to help the regulated community reduce stormwater's contribution to water quality impairment.

Elements of the draft permit TRWA feels are important to retain include both the more specific Maximum Extent Practicable (MEP) requirements and the water quality based requirements for discharges to water quality limited waters and waters with Total Maximum Daily Loads (TMDLs). TRWA opposes significant changes to the three bulleted Sections listed below for the reasons provided:

- **The Illicit Discharge Detection and Elimination (IDDE) Program Section 2.3.4.**

  Illicit discharges are continuous sources of untreated sanitary waste pollution that separate sewer owners need to identify and eliminate once and for all. Storm sewer owners/operators must maintain a vigilant program to prevent new sanitary/stormwater connections. In addition the detailed piping network and catchment area delineations are critical to future stormwater abatement efforts.

- **The Stormwater Management in New Development and Redevelopment Section 2.3.6.**

  Proper control of stormwater from new development is essential to avoid violation of numeric and narrative pollutant and aquatic life water quality criteria, stormwater pollution impacts to wetland resources and for compliance with state and federal antidegradation regulations. Improvement of stormwater systems during redevelopment is necessary to begin the process of reducing stormwater pollution from existing development. The final permit should do more to regulate and reduce stormwater from existing private/commercial development. Currently only in the Charles River watershed (Appendix F.A.1) is EPA requiring measurable action to reduce existing stormwater phosphorous pollution loads. Reducing phosphorus will also address other stormwater pollutants and aquatic life habitat impairment. EPA should include a permit provision so that if the Charles River efforts to address stormwater pollution in an optimized cost effective fashion are successful other areas may be required to do the same in

advance of permit reissuance. A provision such as this is needed due to the Region's poor track record on timely reissuance of this general stormwater and other NPDES water quality based permits.

- **Appendices H and F**

  For the water quality impaired receiving waters of the Taunton River watershed the water quality based elements of the permit in Appendix H (nitrogen and phosphorus) Appendix F (pathogens) are necessary and strongly supported. For nutrients in particular we are concerned about the nutrient load stormwater adds to the portions of the watershed receiving wastewater treatment plant discharges. The draft NPDES permits for wastewater treatment plants use a very optimistic estimate of a 20% reduction in nitrogen load from nonpoint sources including stormwater. This permit does little to ensure a 20% nitrogen reduction from existing stormwater sources. At a minimum it is critical that this permit be issued promptly, municipalities take efforts to reduce stormwater flows and nitrogen loads and that this permit is replaced with a more comprehensive stormwater permit as soon as possible. If there is delay in issuance of this permit, lack of permittee progress in reducing stormwater impacts or delay in reissuance of this permit in 5 years the nitrogen limitations of wastewater treatment plant permits should be reviewed and reduced.

TRWA has **two major requests for changes in the final permit:**

1. In Appendix H under nitrogen (Section I.1.b.i.5) and phosphorus (Section II.1.b.i.5) the N or P Source Identification Report, we believe the last four words **"of permittee owned properties"** should be removed. The detailed mapping required in the IDDE section of the permit (2.3.4.6) provides the permittee with the essential information to readily complete a useful system-wide source identification report on potential upgrade opportunities at the planning level for all impervious area within their jurisdiction. This information is critically needed by the permittee, property owners, environmental groups and others promoting voluntary BMP efforts on non-permittee owned property. This change does not impose a major burden since planning level identification of potential BMP opportunities can readily be done as part of the system mapping already required for the IDDE program. We understand that for the more detailed Potential Structural BMP analysis required in Part c of the Sections noted above EPA may allow the permittee to limit its analysis to "all permittee-owned properties" as provided in the current draft permit.

2. It is critical for the public to have ready access to information regarding what a specific municipality is doing to comply with the permit, and the opportunity for watershed groups to offer assistance or to complain if it appears that a city or town is not complying. This permit is an improvement over the 2003 permit, but robust implementation and dedication of adequate resources by municipalities and regulatory agencies will be needed to achieve significant reductions in water quality and insure that a promising program doesn't fall into a black hole. The

following should be added to the stormwater Record Requirements of Section 4.2.c of the draft:

a.) The permittee should be required to keep a list of interested parties and notify them by mail or e-mail of the stormwater program reports available online, the other information available including where they may be reviewed by the public, and opportunities to participate in Stormwater Management Plan (SWMP) review and implementation;
b.) As new stormwater program implementation products are completed interested party notification should be required including but not limited to the following; annual reports, updated system mapping, construction site ordinances, new development/redevelopment ordinances, source identification reports, potential structural BMP analysis, structural BMP demonstration plans and Stormwater Pollution Prevention Plan (SWPP) updates for permittee owned or operated facilities.

Conclusion

TRWA supports the draft MA MS4 Permit. We urge EPA to not make any changes that would reduce the level of stringency or reduce the effectiveness of the Sections referenced in the bullets above. We would like EPA to eliminate the limiting language "**of permittee owned properties"** in the source identification report Sections of Appendix H. TRWA requests EPA make public access to information more convenient so that the public and watershed groups can support local, state and federal efforts to address stormwater problems. We believe that prompt issuance of this permit as well as timely renewal 5 years from now of a more comprehensive permit addressing existing privately owned stormwater sources connected to a permittee's separate sewer system is necessary to maintain the credibility of the NPDES wastewater permits currently being reissued in the Taunton River watershed and elsewhere in Region 1. Finally, **TRWA encourages expeditious issuance of the permit because reissuance is seven years overdue this May**. Thank you for considering these comments.

Sincerely,

Marta J. Nover

February 17, 2015

Attention: Comments on the 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262
Town of Upton, MA

Dear Mr. Tedder;

The Town of Upton is a community that will be subject to regulation under the United States Environmental Protection Agency's (USEPA's) Massachusetts Municipal Separate Storm Sewer (MS4) Permit, as we are presently a Permittee under the USEPA's 2003 Massachusetts MS4 Permit.

We have been a member of the Central Massachusetts Regional Stormwater Coalition since 2013, and have provided a Letter of Support for the comments submitted by that group.

However, the Draft 2014 Massachusetts MS4 Permit includes some substantial provisions that will apply to Upton for the first time. We felt it worthwhile to provide this separate comment letter to highlight our concerns.

For the first time, water bodies in our community have been identified as contributing to both nitrogen (Part 2.2.2[a]) and phosphorus impairments (Part 2.2.2[b]). For both of these impairments, no Total Maximum Daily Loading (TMDL) has been established, and there no specific pollutant reduction target has been proposed. Instead, the Town of Upton is being asked to implement enhanced public education messages, development and redevelopment controls, and good housekeeping measures in municipal operations. We are optimistic we could implement these enhanced elements successfully, as they build on our existing program.

However, some proposed enhanced requirements are excessively burdensome for a Town of our size and rural nature. These enhanced requirements include:

- Preparation of a Nitrogen Source Identification Report (Final due by Year 4 of the Permit);
- Preparation of a Phosphorus Source Identification Report (Final due by Year 4 of the Permit);

- Completion of an inventory, by Year 5 of the Permit, of Town-owned properties that are candidates for the installation of structural Best Management Practices (BMPs) for nitrogen and phosphorus removal, within watersheds impaired for each, respectively; and
- Installation of selected structural BMPs for nitrogen and phosphorus removal beginning within six years of the Permit effective date and continuing on a schedule to be provided in Year 5.

We are advocates for the use of green infrastructure where it can be maintained in a cost-effective way in order to provide ongoing stormwater treatment, and we utilize low impact development (LID) techniques on Town projects. However, this proposed mandate will exceed our internal capacity as a small community to perform such an inventory, perform a cost/benefit analysis of the BMPs appropriate for each impairment, finance the design and construction of the BMPs, and evaluate the effectiveness of each. Without an approved TMDL outlining a target load for either impairment, our efforts would not substantially contribute to improvements in the watersheds. Costs to use a third-party to perform these assessments will siphon budget from critical infrastructure operations and maintenance activities that have a strong, direct bearing on water quality improvements.

For these reasons, we support maximizing the use of pollution prevention tools, LID, public education, and other non-structural BMPs to the maximum extent practicable before looking to structural BMPs as the solution. We request the ability to continue to evaluate potential sources of nitrogen and phosphorus discharged to Upton's MS4 and report our progress on mitigating identified sources, in lieu of the proposed stringent and inflexible provisions in Section 2.2.2 (and the associated Appendix H) of the proposed Permit.

We also support an extended timeline for the implementation of some proposed Permit provisions, including activities associated with discharges to water quality-limited water bodies.

The Town of Upton reserves the rights: to submit additional comments to any Response to Comments prepared by the USEPA after the close of the public comment period for proposed Permit; to submit additional comments on the Final Massachusetts MS4 Permit to address any and all changes made by the USEPA based on comments it receives; and/or to appeal any provision of the Final Massachusetts MS4 Permit when it is issued, regardless of whether that provision has been specifically noted in these comments.

We look forward to the requested flexibility and modifications being integrated into the Permit in its final form.

Sincerely,

Robert J. Fleming

RE: Comments on the 2014 Draft Massachusetts MS4 Permit

Dear Mr. Tedder:

The Town of Uxbridge Department of Public Works (DPW) has reviewed the United States Environmental Protection Agency (USEPA) National Pollutant Discharge Elimination System (NPDES) Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems (MS4) in Massachusetts. We thank you for the opportunity to provide comments and we note that the Uxbridge Town Manager will be submitting comments separately. On behalf of the Town of Uxbridge, we are submitting these comments in an effort to bring to light the substantial impacts this draft permit will have on our community.

As a Phase II MS4 community, we have a population of nearly 13,000 people (of which over 10,000 within the regulated area), a land area of 30.4 square miles and is situated in southern Worcester County along the border with Rhode Island. A number of water resources traverse the Town, including the Blackstone, Mumford and West River systems. For this reason, the Town is very concerned with the operation and maintenance of the Town's infrastructure, as well as budgetary constraints.

The Town of Uxbridge strongly supports the goal of protecting the Waters of the United States from untreated stormwater runoff. Since the beginning of the Phase II MS4 implementation, the Town has supported the underlying goal of improving the quality of the Waters of the United States. The Town has worked tirelessly to implement the requirements of the original 2003 permit. In this regard, the Town joined the Central Massachusetts Stormwater Coalition (CMRSWC) and continues to partner with other member communities to develop and implement a consistent framework to address the continuously changing stormwater needs.

The following pages outline the concerns that the Town of Uxbridge have with the proposed Permit. Our comments have been organized into two sections: ***General*** (which describes overarching concerns and concepts); and ***Specific*** (which apply to unique sections of the proposed Permit). For the latter, we have provided the section and page number of text for ease of reference. Where appropriate, we have provided suggestions for replacement language (or clarification) that would better align the proposed Permit with other MS4 Permits in New England, or have outlined provisions, concepts, or metrics we believe are more suitable or feasible (for in-the-field implementation).

General Comments

1. The Town of Uxbridge is supportive of proposed Permit provisions that will directly result in improved water quality, but object to those that are administrative or arbitrary, and that will not have a direct bearing on water quality. We have outlined specific objections as much as possible in our Specific Comments, below.

2. We encourage the Agency to update its own guidelines about how regulated communities are expected to balance compliance with the Permit (in its final form) with the ability to afford that compliance without experiencing economic hardship. Since 1997, the Agency has generally considered a maximum combined annual water and wastewater bill of 4.5% of mean household income (MHI)- 2% for drinking water and 2.5% for wastewater services- to be affordable. Municipal revenues are decreasing, and further restrictions on development or redevelopment are not in the best interest of the Town struggling to maintain the level of service expected by residents.

   If we were to use MHI as the basis for evaluating a community's ability to afford a stormwater management program to comply with the proposed Permit, the 4.5% MHI cap would easily be exceeded if stormwater costs were included- along with drinking water and wastewater- in the calculation. This is true whether the Town funds its program traditionally through the tax base or has developed a sustainable funding mechanism such as a stormwater utility or stormwater enterprise fund. The Town will have a difficult task to convince our residents and business owners that some of the provisions in this proposed Permit will result in water quality improvements commensurate with the expense.

   The Town agrees that clean water supports our communities in many, many ways; notwithstanding this, the absence of guidance on how to best afford the increased costs of stormwater management cannot be ignored.

3. We encourage the Agency to include flexibility in the final Permit with respect to the date on which the Permit in its final form will become effective in each community. Flexibility in setting the effective date will allow each town the opportunity to budget for Year 1 and Year 2 tasks, specifically, within the municipal budget cycle, which will likely be out of sync with the Permit cycle. In the last few years, many communities have been telling their leaders and residents that the new Permit would be out "soon" based on updates from the Agency, with the target issue date moving over the course of several municipal budget cycles. Many of these leaders will face reluctance, skepticism, and frustration when proposing increased stormwater program budgets, and will need to re-educate their decision makers about why these increases are required.

4. We believe that many provisions in the proposed Permit do not lend themselves to implementation over a five-year Permit term, at least in a way that is affordable for the regulated communities and that results in meaningful improvements to water quality. Instead, we propose that the Agency extend the schedule for several specific provisions, such as development and implementation of a catchment delineation, over a ten-year period. The Commonwealth of Massachusetts has in place a statutory framework that allows for such an extended timeline as a Compliance Schedule within a NPDES Permit. Indeed, the Agency has taken advantage of this extended schedule in the proposed Permit for the Catchment Investigation Procedure (see Section 2.3.4.8(c)(iii), IDDE Program Implementation Goals and Milestones, Page 37). This compromise will comply with Clean Water Act 402(b)(1)(B) while providing flexibility for the regulated communities. Where

we believe this extended schedule is appropriate, we hereafter refer to it in subsequent comments as a "10-year Compliance Schedule".

5. When describing dry weather and wet weather screening and sampling and outfall/interconnection screening, the proposed Permit frequently refers to "detectable levels of chlorine". It should be noted that chlorine is detectable in most if not all outfalls and at the perimeter of many of Massachusetts' surface water bodies using many field kits available today, and this detection limit is likely to become lower (identifying smaller and smaller concentrations of chlorine) as technology improves. Treated drinking water entering a stormwater system is the potential source the chlorine indicator is intended to highlight. However, chlorine in drinking water is highly volatile, and decomposes quickly once discharged to a surface water body and exposed to sunlight and the ambient atmosphere. If all outfall samples would demonstrate "detectable levels of chlorine", but the chlorine will degrade quickly within a water body, this parameter ceases to be useful as a screening tool.

   We request that the chlorine parameter either be removed from all sections discussing screening methodologies, or that a numeric threshold be established- based on peer-reviewed data- that can correlate a specific elevated detected chlorine concentration to a potential illicit discharge, such as a grey water connection (or the absence of elevated bacteria) or a cross-connection (in the presence of elevated bacteria).

6. We have observed that many provisions in the proposed Permit include the development of a written program, written inventory, written report, written procedures, or other "written" documentation. These proposed provisions counter a shift on the part of many regulated communities to cloud-based infrastructure management systems, such as the online mapping and inspection platform used the Town of Uxbridge. The Town uses these cloud-based tools because they work with mobile devices, reduce paperwork, and allow data to be added to a management system in real-time. These tools reduce the amount of inefficient administrative time to enter information into a form or spreadsheet and typically allow towns to create work orders from the field for follow-up or maintenance activities. The data is every bit as useful and accessible and can be readily queried into reports to provide summaries and snapshots.

   Managing operations and maintenance procedures through cloud-based systems such as the one the Town uses is also more effective- if a change is made to a procedure or form on our platform, that change is available immediately without the need to print new forms. These workflow improvements should be considered to be enhancements, and encouraged as they are consistent with federal efforts to reduce paperwork and not "overburden the public with federally sponsored data collections", mentioned as the goal of the Paperwork Reduction Act.

   We also know that many regulatory agencies like municipalities to maintain hard copies of documents at multiple locations, even though this practice does not lead to improved use of these documents. The *absence* of large volumes of paperwork doesn't mean that a community isn't implementing something any more than the *presence* of many binders means that a community is effectively utilizing the programs in them. Decreasing the use of paper in our work environment is also environmentally preferable.

   It is important for both the Agency and the public to realize that increased use of technology and cloud-based tools allows local governments to work more efficiently and respond to their needs and requests more efficiently.

This modernization should be encouraged, and we request the Agency to incorporate flexibility for many of the "written" submittals requested to be implemented as modules within asset management platforms, and allow the permittee to demonstrate by other methods that these procedures, inventories, etc… exist and are being utilized.

7. We strongly encourage the Agency to engage in conversations and workshops that lead to development of a Final MS4 Permit that MassDEP is willing to sign onto. This coordination should begin as soon as possible to reach a version of the permit agreeable to both organizations and compliant with the Clean Water Act, Massachusetts' Surface Water Quality Standards, and associated supporting documentation, so that water quality improvement activities across the Commonwealth can be focused and consistent.

Specific Comments

1. Part 1.10(a), Stormwater Management Program (SWMP), (Page 7). The SWMP is required to describe the specific activities that will be taken, and the schedule for each activity or Best Management Practice (BMP), for the duration of the permit term. This document cannot be developed without thorough coordination of multiple departments and persons within each regulated community, and without each of these departments and persons committing the resources (both time and financial) needed for those activities and BMPs to be completed on the schedule proposed. The SWMP is arguably the most complicated and detailed submittal in the proposed Permit.

   The Town therefore request that the proposed Permit be revised to require an in-person coordination meeting between the Agency (and MassDEP, ideally) and the regulated community one year after the effective date to review the draft SWMP, with the Final SWMP due one year after that coordination meeting. This gives the regulated community an opportunity to receive intermediate feedback from the Agency and MassDEP, and for corrections to be made, if needed, to ensure that Final SWMP will be acceptable to all parties, reducing revision efforts. This coordination meeting would provide many communities with feedback on their current compliance status (which has not routinely been provided to this point), and allow them to adjust proposed investments in any Minimum Control Measure that they intend to incorporate into the SWMP.

2. Part 2.1, Water Quality Based Effluent Limitations (Page 9). This section references Clean Water Act 402(p)(3)(B)(iii), stating that this section of the Clean Water Act prohibits discharges that "cause or contribute to an exceedance of water quality standards". However, the referenced section of the Clean Water Act actually states that Municipal discharge Permits shall require "controls to reduce the discharge of pollutants to the maximum extent practicable", commonly known as MEP.

   MEP has long been the statutory standard that governs the level to which municipalities are responsible for limiting and reducing pollution in stormwater, and has been interpreted in many decisions as being subject to certain limitations, including the limits of technology and cost/benefit analyses.

   For example, if a community spends $1 billion dollars on a stormwater treatment project for Pollutant X and continues to contribute 0.01% of the loading of Pollutant X to a receiving water that does not meet water quality standards for that pollutant, that community would be considered to have *satisfied the MEP standard* but would *not comply with the narrative limit* ("contribute

to…") proposed in this section. The Agency implies that language in the proposed Permit would ***overrule MEP as the accepted standard***, an authority that the Agency does not have over water quality standards in the Commonwealth of Massachusetts.

To eliminate this inconsistency, we strongly request that language in this and other parts of the proposed Permit be revised to clearly establish that MEP standard shall be applied throughout the proposed Permit.

3. Part 2.3.2, Public Education and Outreach (Pages 22-24). As noted previously, flexibility in the Permit will result in the most substantial improvements to water quality. This also applies to a Permittee's authority to direct education and outreach messages to targets it has determined are the priorities for their specific community, rather than mandated messages to mandated audiences. We request the following modifications:

    a. In (b), replace "shall" with "should", to enable the Permittee to focus messages on the types of properties it has already determined- through its efforts under the 2003 MS4 Permit- to be the highest priority. The Agency should encourage the Permittee to evaluate whether it should target a new audience, but not all audiences exist in regulated communities. Increased flexibility to direct messages to priority targets (rather than to mandated audiences) will result in the most substantial improvements to water quality.

    b. In (c), replace:

        "…shall distribute a minimum of two (2) educational messages over the permit term to each audience identified in Part 2.3.2.b. (The permittee shall distribute at least eight educational messages during the permit term)."

        with

        "…shall distribute a minimum of eight (8) educational messages over the permit term."

    c. In (e), (f), and (g), eliminate the mandate to quantify the effectiveness of each message, each distribution technique, and the overall program. These requirements aim to compel technical and administrative personnel in the Town to function as marketing or public relations specialists, where they have not been trained to do so. If and when the Town tries a new message delivery mechanism, encourage- but do not mandate- that they report on how well it worked. Towns are not in the habit of sending good money after bad, and will not continue to pay for services or products that it knows are ineffective.

        The inclusion of these elements in the final Permit, however well-intentioned, will have the effect of siphoning off a portion of the town's funding to a third party for implementation, losing the connection within the community. Instead, we encourage the Agency to actively share the resources that have been developed (and continue to be developed) within Massachusetts, as ways to reduce the burden on individual communities to developing its outreach and education programs.

4. Part 2.3.4.5(c), Outfall/Interconnection Inventory (Page 27). The proposed Permit asks the Permittee to physically label all MS4 outfall pipes. This proposed provision is related to public

education, not inventory of the system, and should not be included in Part 2.3.4.5. The Agency is already proposing that regulated communities capture information such as pipe and open channel discharge locations under Part 2.3.4.6 (System Mapping, Page 27-28), with the goal of being able to readily locate and mobilize at these locations to perform illicit discharge activities. As such, the Town is already required to maintain outfall location information in the way most useful to it. Placement of physical labels, such as signs, will be costly and provide no additional benefit to Permittee personnel over and above the system mapping. We recommend that placement of such signage be considered a potential delivery mechanism in Part 2.3.2 (Public Education and Outreach, Page 22-24) on a location-by-location basis - that is, if the community determines that the placement of such signage in an area would increase the public's understanding of stormwater services provided or help resolve a chronic illicit discharge issue, such as illegal dumping, in that area.

5. Part 2.3.4.6(a)(i), System Mapping (Page 27-28). The number of required mapping elements (ten) and detail to be provided for each far exceeds the system mapping provisions included (or proposed) in any other New England state. We understand the value in documenting the location of many kinds of points of interest within stormwater system infrastructure, but request that this Part be scaled back to focus mandatory future mapping only on outfalls, pipes, catch basins, and drain manholes, with other information to be collected as the Permittee's discretion.

   Further, the definition of catchment provided in this section ("the area that drains to an individual outfall or interconnection") differs from the Agency's responses to questions on this provision at public meetings. For example, at a meeting in Lowell, an Agency representative stated the opinion that two catch basins connected to a single outfall pipe would not need to be delineated; in fact the proposed Permit does not include an exemptions for a "small" catchment like this one. We encourage the Agency to define, in the final Permit, some types and configurations of catchments that could be exempt from the delineation requirement, such as this example.

6. Part 2.3.4.7(c,), Assessment and Priority Ranking of Catchments (Page 30): We request clarification of the identifying parameters for sewer input based on sampling results. The permit language states that Problem Catchments and High Priority Catchments be categorized by ammonia $\geq$ 0.5 mg/l, surfactants $\geq$ 0.25 mg/l and bacteria levels greater than the water quality criteria applicable to the receiving water; or ammonia $\geq$ 0.5 mg/l, surfactants $\geq$ 0.25 mg/l and detectable limits of chlorine.

   Based on these requirement detection limits, *all three parameters* must be above levels for prioritization into one of these categories. We do not believe this is the intent of the Agency and request clarification on the threshold of these parameters.

7. Part 2.3.4.7(c)(i), Assessment and Priority Ranking of Catchments (Page 30). The definition of Low Priority Catchment should allow for categorization based on either the outfall/interconnection screening (Part 2.3.4.7(d)) or the catchment characteristics assessment (Part 2.3.4.7.(c)(ii)), but not both.

   For example, if a catchment has no history of complaints or reports, has good dry weather water quality (per screening kits), has low development density, contains no industrial or commercial properties, consists of new infrastructure, and is located within a recently-sewered area, then there is hardly justification to require the full scope of screening and sampling outlined in 2.3.4.7(d). The community should be able to consider this example to be a Low Priority Catchment without

going to extraordinary efforts, which is the very purpose of defining this category between the Excluded and High Priority categories.

8. Part 2.3.4.7(c)(iii), Reporting dates for Assessment and Priority Ranking of Catchments (Page 31). The level of effort required for the Assessment and Priority Ranking of Catchments is substantial and will require far more than one year from the effective date to implement. We request that this provision have a submittal milestone closer to 60% of the Permit term (i.e., Year 3 of a five-year permit term or Year 6 of a 10-year Compliance Schedule).

9. Part 2.3.4.7(e)(i), Catchment Investigation Procedure (Pages 33-34). This section outlines the System Vulnerability Factors that indicate "a risk of sanitary or septic system inputs to the MS4" under some conditions. These Factors include information that is either subject to the separate NPDES permit for the permittee's publicly owned treatment work (POTW), or is not applicable (for communities that aren't sewered). In either case, the core concept outlined by the Agency in listing these factors is that there needs to be increased cooperation between the entity primarily responsible for the operation of the regulated community's POTW (e.g., Town wastewater department or local sewer district) or subsurface wastewater discharge program (e.g., Board of Health or Code Enforcement Officer) and the entities primarily responsible for compliance with the MS4 Permit).

   The information outlined in the Factors includes data and occurrences that are already routinely tracked by the POTW/subsurface system operator(s). As such, it is much more efficient to require these Factors to be discussed during the development of the SWMP early in the process and reviewed with the Agency at the one year coordination meeting (see Specific Comment #1) than to mandate that the permittee duplicate that substantial effort with a mid-permit term submittal.

10. Part 2.3.4.8(a), IDDE Program Implementation Goals and Milestones (Page 36). The level of effort required to complete the dry weather screening and sampling is substantial and will require far more than three years from the effective date. We request that this provision have a submittal milestone at Year 6 of a 10-year Compliance Schedule, or, alternately, that the Permittee be required to begin this task by Year 3 (of a 5 or 10-year Compliance Schedule).

11. Part 2.3.4.8(c), IDDE Program Implementation Goals and Milestones (Page 36-37). We request that the first sentence be deleted. As noted in Specific Comment #10, if a catchment characteristics assessment satisfies all criteria in Part 2.3.4.7.(c)(ii)), there is hardly justification to require the full scope of screening and sampling included in the Catchment Investigation Procedure.

    Further, the progress milestones for Problem, High Priority, and "all" catchments outlined in (i) through (iii) of this Part are not realistic, given the effort required in performing the Catchment Investigation Procedure, even if Low Priority catchments are excluded. We request that the Agency revisit these progress milestones based on a ten-year Compliance Schedule.

12. Part 2.3.6(a), Post-Construction Stormwater Runoff from New Development and Redevelopment (Page 39): The Agency has been asked at a number of public meetings to clarify the intent of the requirement to retain (or provide treatment for) the first inch of runoff from new and re-developed sites that disturb one or more acres and discharge to the MS4.

    The Town similarly request that the Agency confirm that projects such as roadway maintenance projects - including surface overlay, milling followed by overlay, and full-depth reclamation that

does not expose the roadway sub-base - are not included in the definition of "disturb". That is, if a community is implementing a maintenance project on an existing roadway, without increasing the area of impervious surface, that no stormwater retention or treatment is required. The potential unintended result of the alternative interpretation is the crippling of existing pavement maintenance projects- already underfunded- as new stormwater conveyance, storage, and treatment infrastructure is designed, for very little water quality benefit. Another potential unintended result of the alternative interpretation is discouraging redevelopment of urban/brownfields parcels with existing infrastructure in favor of focusing on a previously undeveloped parcel, which would ultimately increase, not decrease impervious area.

Finally, the Agency has acknowledged at public meetings that it is not authorized to supersede a state's water quality-based limits and has previously deferred to the antidegradation policy set forth in Massachusetts' Surface Water Quality Standards, 314 CMR 4.00. Nevertheless, tools for calculating removal efficiencies in this Part are inconsistent with the Massachusetts Stormwater Handbook. Please clarify that the Agency does not intend to challenge or rewrite guidance for design of stormwater treatment BMPs included in the Massachusetts Stormwater Handbook.

13. Part 2.3.6(d), Directly Connected Impervious Area (Page 42): The proposed Permit asks each Permittee to report on impervious area (IA) and directly connected impervious area (DCIA) each year of permit coverage, with the goal of reducing both metrics each year of permit coverage. The Agency has indicated that it will provide a benchmark for measurement of these metrics through maps located on its Massachusetts NPDES website and implies that these maps reflect "subbasins" that are hydraulically connected to a point of discharge. A review of these draft maps shows that development data are not only outdated (e.g., GIS layers dated 2000 through 2010) but also that the subbasins delineated by the Agency do not reflect development. The subbasins shown on these maps are inconsistent with the definition of "catchment delineation" in the proposed Permit (see: Section 2.3.4.6(a)(i), Page 28). That is, the subbasins on maps referenced by the Agency are of undeveloped topography, ignoring the engineered infrastructure and roadway elevations that convey stormwater across a reference area to a point of discharge. In fact, a single subbasin as shown on the Agency's map may include multiple hydraulic catchments.

    The value of using IA and DCIA as a surrogate for stormwater pollution is not yet proven, and we believe the Agency, not the regulated communities, should take the lead on gathering data on the correlation between the two. To allow the Agency to develop meaningful IA and DCIA benchmarks, we encourage that the IA and DCIA reporting measure be moved from a Year 2 start date to milestone closer to 80% of the Permit term (i.e., Year 4 of a five-year permit term or Year 8 of a 10-year Compliance Schedule). As a result of this shift, the deadline for submittal of the inventory and priority ranking for installation of BMPs should be shifted appropriately (or deleted entirely, as discussed in other comments we've provided).

14. Part 2.3.7, Good House Keeping and Pollution Prevention for Permittee Owned Operations (Pages 43-49). This Part has expanded substantially from the 2003 version, and with good reason: pollution prevention and good housekeeping are a very effective non-structural BMP for reducing stormwater pollution. Having said that, some sections of this part lack the flexibility inherent in other state MS4 Permits. Some provisions focus too strongly on the specific steps to be taken to reach an objective instead of the objective itself. As an example: Part 2.3.7(a)(ii)(a) includes specific procedures to be implemented for "Parks and open space". One mandated procedure outlined in this section is to establish "pet waste handling collection and disposal location at all parks and open space including the placing of proper signage concerning the proper collection and

disposal of pet waste". This specific procedure is inappropriate for a community that has already banned dogs from public parks and open spaces and has successfully enforced that ban. In this case, the mandated placement of pet waste collection stations would work *against* the implemented dog ban by providing visitors with a disposal location of waste from animals that shouldn't be there, sending mixed signals! This example community is already accomplishing the objective (reducing bacteria and nutrient runoff from a park) through an alternative approach that they decided was most appropriate, and should be permitted the flexibility to stay on the course they have chosen while the goal continues to be achieved. An improvement for our example community could be to encourage (not mandate) them to place signage informing visitors about improvements to water quality in the park (or adjacent water bodies) that have been observed since the pet ban went into effect. We request that this Part of the proposed Permit be revised to focus on the end point or objective rather than the prescriptive steps to reach it.

Further, the progress milestones under all sections of this Part are not realistic, given the effort required in evaluating the range of activities and potential pollution sources across a wide spectrum of permittee-owned facilities and operations. We request that the Agency revisit these progress milestones based on a ten-year Compliance Schedule with the Permit.

15. Part 2.3.7(a)(iii)(b), Infrastructure Operations and Maintenance- Catch Basins (Pages 44-45). A catch basin sump being no more than 50 percent full is described as the threshold for proper function of the basin. This may be accurate, but the inclusion of this metric is arbitrary and not in and of itself protective of water quality. As many commenters will likely note, most Massachusetts regulated communities are already familiar with locations within their MS4 where catch basins receive higher debris and sediment loading and require more frequent cleaning. Most of these communities already inspect and clean these basins more frequently, and include these activities in Annual Reports to the Agency.

    Use of the "no more than 50 percent full" metric is preferred over the "twice a year, minimum" metric that has appeared in previous versions of this and related permits. However, if a permittee is mandated to use the "no more than 50 percent full" metric as the threshold for additional cleaning and/or investigation of areas not previously considered a priority, then it's inevitable that other areas will suffer as a result. The end result is that, given current wording, the permittee can be considered non-compliant if a single basin in the system has a sump more than 50 percent full, regardless of whatever increased investment was made in cleaning and inspection activities or net improvements to water quality.

    The Town requests that the Agency replace "shall" with more permissive language like "should" in this section, maintaining the "no more than 50 percent full" metric as an ideal to strive for but not a provision that can lead to noncompliance.

    Finally, the last bullet in this section asks the permittee to report "the volume or mass of material removed from each catch basin draining to water quality limited waters and the total volume or mass of material removed from all catch basins". The latter part of this provision is feasible, although will require thorough recordkeeping and tedious summaries. The first part, however, is not feasible: regardless of the methodology by which the volume or mass is calculated, the numbers reported would not match reality. No catch basin cleaning technology can remove 100% of the sediment and material in a sump and material density varies, so a calculated volume/mass isn't realistic: at the end of the day, the calculated mass/volume from cleaning X catch basins would not be equal to the mass/volume of material in the truck that cleaned X catch basins. Manifests would

never match estimated, reported removal mass/volume and would be flagged in an audit. The potential for a truck to return to the Public Works yard (or other location) after cleaning a single catch basin to be re-weighed (allowing for documentation of the actual mass removed from that basin) is also not realistic. This provision has good intentions, but is not feasible from a boots-on-the-ground perspective. It may be possible for some communities to plan cleaning routes to be watershed- or catchment-specific (allowing a total volume or mass to be quantified for that water body), although in other communities this may be highly inefficient. The Town requests that this bullet be modified to eliminate the "each catch basin" provision.

16. Part 2.3.7(a)(iii)(b), Infrastructure Operations and Maintenance- Street Sweeping (Page 45). The proposed Permit describes each street (with some limitations) being swept a minimum of once per year as the threshold for reduction of sediment loads to surface waters. This may be accurate, but the inclusion of this metric is arbitrary and not in and of itself protective of water quality. Most Massachusetts regulated communities are already familiar with locations within their MS4 where streets may contribute higher sediment loading and therefore require more frequent sweeping. Most of these communities already sweep these roadways more frequently than once a year, and include these activities in Annual Reports to the Agency.

    We request that the Agency include more permissive language that maintains the annual evaluation metric as an ideal to strive for, but eliminates a single provision that can lead to noncompliance.

We appreciate the opportunity to comment on this proposed Permit, and look forward to working with you to create a more practical general permit. If you have any questions, please don't hesitate to contact me at 508-278-8616 or via email at bsherman@uxbridge-ma.gov.

Sincerely,

Benn S. Sherman, P.E.

RE: Comments on the 2014 Draft Massachusetts MS4 Permit

Dear Mr. Tedder:

The Town of Uxbridge currently operates its storm sewer system under the 2003 NPDES Phase II MS4 general permit. As a Phase II MS4 community, we have a population of nearly 13,000 people (of which over 10,000 reside within the regulated area), a land area of 30.4 square miles and is situated in southern Worcester County along the border with Rhode Island. A number of water resources traverse the Town, including the Blackstone, Mumford and West River systems. For this reason, the Town is very concerned with the operation and maintenance of the Town's infrastructure, as well as budgetary constraints.

We thank you for the opportunity to provide these comments on the 2014 Draft MS4 permit. We also note that the Uxbridge Department of Public Works will be submitting a separate set of comments, and we hereby incorporate those comments into our own. On behalf of the Board of Selectmen, we are submitting these comments in an effort to bring to light the substantial impacts this draft permit will have on our community.

The Town of Uxbridge strongly supports the goal of protecting the Waters of the United States from untreated stormwater runoff. Since the beginning of the Phase II MS4 implementation, the Town has supported the underlying goal of improving the quality of the Waters of the United States. The Town has worked tirelessly to implement the requirements of the original 2003 permit. In this regard, the Town joined the Central Massachusetts Stormwater Coalition (CMRSWC) and continues to partner with other member communities to develop and implement a consistent framework to address the continuously changing stormwater needs.

GENERAL COMMENTS

1) This letter is intended to express our concerns with the extremely large and overreaching burden that the 2014 Draft Permit will impose on the Town of Uxbridge, as well as others in the Commonwealth. The Draft Permit as currently written will result in large increases in compliance costs related to administratively focused tasks, studies, and reports that will

create no quantifiable increase in water quality in the Town's receiving waters. Furthermore, the Draft Permit imposes strict conditions on the development and redevelopment projects that are in conflict with current Massachusetts Stormwater Standards, existing local bylaws and regulations.

2) The Draft Permit requires the Town to develop a number of different stormwater education messages, each of which are targeted to a specific audience. While the Town does in fact agree with the targeted message campaign, the Draft Permit requires the Town to develop and implement ways to measure the effectiveness of those messages on the intended audience. The Draft Permit does not provide any guidance as to how this is to be done. In addition, the Draft Permit language does not consider the current metrics (number of pamphlets distributed, number of web page views, etc.) as adequate for measuring effectiveness. In order to comply, the Town will be required to engage a consultant to design messages, conduct surveys and measure the effectiveness of the campaign. This type of activity is simply not a good way to spend limited money on stormwater cleanup and will not provide an improvement to overall water quality. The USEPA should remove the requirements for determining effectiveness of the public education

3) The Town is also concerned with the impediments to land redevelopment costs that the Draft Permit appears to impose. In the sections of the permit dealing with the new and redevelopment land projects, the Draft Permit appears to require the upgrading of the stormwater management system of an entire site, even if only the portion of the site is actually undergoing redevelopment. Further, the requirement of the Draft Permit to treat the first 1-inch of stormwater runoff is in conflict with the Massachusetts DEP Stormwater Standards, which requires the 1-inch treatment volume only for discharges to critical environmental areas. The imposition of both the 1-inch treatment volume for all new land development projects, as well as the retrofitting of the entire site undergoing land redevelopment activities will greatly increase the cost of construction of both types of projects. This requirement may make future redevelopment projects not cost effective. While the Town does not encourage unchecked land development activities, the added construction costs due to the Draft Permit must be weighed against the general economic harm that may occur from those added costs. We encourage USEPA to reassess this requirement to treat the 1-inch stormwater runoff on the entirety of a redevelopment site. Additional consideration should be taken with respect to the conflicts created between the Draft Permit, existing Massachusetts Stormwater Standards and other local land development bylaws and regulations.

4) The Draft Permit provides a level of detail for activities to be completed to achieve permit compliance that has been previously not seen. There are at least 250 different actionable items that the Town has to demonstrate compliance with over the permit term. The Draft Permit lists criminal penalties for failure to comply with these items. Many of these items are of limited benefit. For example, requiring the Town to sweep streets a second time in the year, primarily in order to collect leaves is unreasonable. We believe the USEPA needs to re-examine this list of activities. We urge the USEPA to develop permit requirements

that are based on quantifiable improvements in stormwater runoff quality, rather than mandating a set of actions that may or may not result in an appreciable improvement to runoff quality.

5) There are a number of areas within the permit where it appears the USEPA is using cities and towns to collect data on behalf of the agency. Collecting data on volume of street sweepings, catch basin cleanings, amount of directly connected impervious areas (DCIA), and wet weather sampling serves little purpose in increasing stormwater runoff quality. Although this data may be interesting to collect for research purposes, there is a cost associated with the collection efforts. The impacts to town's resources (staff and budget) should not be borne by the Town since there is no appreciable benefit to runoff quality.

6) The overall projected cost for compliance is of great concern to the Board of Selectmen. The Town is currently defining the costs associated with the implementation of the 2003 permit and developing estimates for the compliance with the Draft Permit. Based on municipalities similar to Uxbridge that have undertaken this financial analysis, it appears that there will be appreciable budgetary increases in order to comply with the draft permit. Furthermore, these projected costs do not include monies necessary to perform structural retrofits on existing Town owned stormwater management systems.

7) The Town is a supporter of improving stormwater quality and is doing its best to fund the activities necessary to comply with the 2003 permit. The Town did expect the Draft Permit would require an increase in the expenditure of money related to new stormwater compliance costs, however, the projected compliance costs are unreasonable, especially given the unreasonableness of many of the items that are driving the cost increase, and the lack of quantifiable improvements to runoff quality. The USEPA must examine further the cost implications of the Draft Permit, and work to find ways to reduce this additional burden to cities and towns. While the USEPA has indicated that it understands there will be additional permit compliance costs, it has not sought out ways to reduce that burden. The USEPA champions the establishment of stormwater utilities to raise dedicated funding for stormwater management. Establishment of such a utility is one way to raise the funds necessary for stormwater management activities. Unfortunately the utility simply represents a way to levy an additional tax or fee on the residents and business owners of the Town. A stormwater utility may prove to be a viable option to raise program funds, however, it does not do anything to limit the amount of money that is needed by the Town to comply with the Draft Permit. We strongly urge the USEPA to re-examine all the new mandates that it is requiring cities and towns to comply with in the Draft Permit.

The Town of Uxbridge Board of Selectmen is quite concerned with the large expansion of the USEPA's involvement in the Town's stormwater management program. The USEPA is mandating a number of activities that will be expensive to implement, are not within the core function of a municipality in Massachusetts, and will have not resulted in a readily apparent increase in stormwater quality. The Town of Uxbridge is a strong supporter and advocate for clean water, whether it is drinking water, stormwater, or wastewater. Unfortunately, the increased costs

due to permit compliance must be balanced against the financial capability of the Town of Uxbridge and other cities and towns to absorb those additional costs. The scale of the costs increases, as well as the reasons for those increases, is not something that can easily be defended or explained to the general public. Should the USEPA wish to increase stormwater runoff quality, they must adopt a more cooperative approach to the problem, and work with the cities and towns in Massachusetts to create a permit with more realistic requirements that create measurable improvements in stormwater quality. Until the Federal and/or State governments step forward with the additional funding necessary to gain permit compliance, cities and towns will be stuck in an adversarial relations with the USEPA, and will be unable to adequately fund their stormwater management programs.

The Town of Uxbridge thanks you for the opportunity to provide public comment on the 2014 Draft Permit. We look forward to working with the USEPA in the future to create a more practical and cost effective stormwater permit.

Sincerely,

David Genereux
Town Manager

Re: 2014 Draft General Permit for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts

Dear Mr. Tedder,

In our role as consultants, our professionals here at Weston & Sampson are responsible for advising and assisting many municipal clients that own Municipal Separate Storm Sewer Systems (MS4s). Through the services that we have provided, and are continuing to provide, we have a strong understanding of the challenges that these communities face in complying with stormwater permit requirements. Based on that understanding, and in response to EPA's request for public comments, we offer the following comments and suggestions on the above-referenced draft MS4 Permit. We would like to note that a number of the comments below are based on the comments of others on this draft permit, as well as prior MA and NH drafts. We have echoed these comments in our letter to reinforce their importance.

1. Comment: Section 1.7.4. Page 5. This third draft of the Massachusetts permit still does not define responsibility for addressing comments received in response to EPA's Public Noticing of the Notice of Intent. The permit needs to state whether the MS4 or the EPA will address public comments.

   Recommendation: Since EPA is publishing the Public Notice for all MS4s and similar comments are likely to be submitted for many NOIs, it is recommended that the permit be revised to state that the EPA will be responsible for addressing public comments.

2. Comment: Section 2.1, page 9, states (and other sections reference) that the "permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to an exceedance of water quality standards". Discharges from the MS4 should certainly not be the cause of an exceedance, but simply contributing a measurable concentration of a pollutant does not necessarily constitute a violation of water quality standards. EPA is simply presuming that the MS4 contribution is significant, not rendering a demonstration, as required by federal law and applicable NPDES rules, that the MS4 is a significant contributor.

   Recommendation: All references to contributing to an exceedance of water quality standards should be deleted from the permit, or at least qualified to state that the contribution in the discharge has to be in excess of water quality standards.

3. Comment: Section 2.1, page 9, states that "Pursuant to Clean Water Act Section 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to exceedances of water quality standards…". The cited section of the Clean Water Act makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable (MEP) as the standard to which pollutants must be removed from MS4s. The language in section

402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. This section of the Act also states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA seems to imply.

For Congress to include such language in the Act is clear and unassailable evidence that lawmakers understood that there are limitations in the ability of municipalities to meet water quality standards in stormwater discharges. These limitations are spelled out in the statutory standard of MEP applied only to municipal stormwater discharges. Water quality standards and TMDL Waste Load Allocations (WLAs) may be goals, but are not the required standards that must be achieved in municipal stormwater.

The draft permit requires MS4s to implement specific BMPs to meet phosphorous reductions and TMDL WLAs, as well as evaluate/implement additional BMPs as needed. Specific percent reductions in phosphorous loads and WLAs are essentially numeric limitations. If EPA's approach to stormwater permitting is indeed an iterative BMP approach to MEP, and one that has been upheld in the courts, then the permit needs to be consistent in its language so that this intent is clear. At present, the draft permit contains conflicting language that first suggests the BMP approach to MEP is sufficient and then requires compliance with water quality standards, including numeric limitations set by TMDLs.

Furthermore, TMDLs are developed with the sole purpose of addressing discharges to impaired waters; therefore, EPA's inclusion of additional requirements/BMPs to address discharges to impaired waters in the MS4 permit is duplicative and inappropriate.

Recommendation: The permit must be revised to be consistent with the Act, which would be for the permittee to be allowed to use an iterative BMP approach to MEP standards. Requirements related to TMDLs and setting specific numeric limitations should be removed from the permit since these are inconsistent with the Act.

4. Comment: Sections 2.1 and 2.2 of the draft permit set forth requirements that place the responsibility on the permittee to prove that its MS4 is not causing or contributing to a water quality violation. Under 40 CFR Section 122.44(d)(1)(ii), a *permitting authority* determines whether a discharge "causes, has the reasonable potential to cause, or contributes to" an excursion of water quality standards. The "reasonable potential analysis is required to account for dilution, the various sources of the pollutant of concern and current/proposed treatment improvements affecting pollutant levels in rendering a decision on the need to control a particular facility." Once such a determination is made, the *permitting authority* determines whether a pollutant reduction is required. Likewise, under Section 303(c), the state (or EPA) determines which sources require control under the TMDL program. Neither the CWA nor EPA's regulations provide a basis to presume an impairment contribution or to transfer the assessment procedure to the permittee.

   Furthermore, deriving water quality-based limitations for any NPDES permit without an adequate effluent characterization, or an adequate receiving water exposure assessment would result in the imposition of unjustifiable limits on that discharge.

   Recommendation: Any and all provisions in the permit that place the responsibility to conduct "reasonable potential" analyses on the permittee should be deleted.

5. Comment: Section 2.2 of the permit sets forth onerous requirements for MS4 discharges to impaired waters, but in most cases, the impairments and TMDLs are based on extremely limited, and possibly suspect, water quality data. Science tells us that phosphorus can contribute to the growth of aquatic plants and algae thereby making a water body less suitable for recreation and possibly having negative

impacts on fish and aquatic wildlife; therefore, phosphorus reduction is a reasonable goal. However, specific sources of this phosphorus, the ability to cost-effectively reduce phosphorus, and the actual level of reduction needed are not well understood, especially for stormwater. The lack of current and valid data used in TMDLs clearly shows that specific percent reduction requirements for phosphorus called for in these reports are highly suspect. We recognize that comments on a draft permit are not the forum for correcting weak or faulty TMDLs; however, given the questionable nature of these studies, MS4s should not be held to meeting TMDL reduction requirements through this permit.

Recommendation: Prior to including requirements related to impaired waters in the MS4 permit, the EPA should provide sufficient scientific data to confirm that:

- The receiving waters are actually impaired for the pollutant of concern.
- That the MS4's discharges are causing or are a significant contributor of that pollutant.
- That there is scientific evidence that required BMPs will actually result in a reduction of that pollutant.

Since permit-required sampling of MS4 discharges to impaired waters should include analysis for the pollutant of concern during wet weather, this data can be used (in conjunction with catchment delineation) to produce an outfall-specific estimate of each discharge's pollutant loading. Outfalls with an elevated pollutant loading would then be evaluated, prioritized, and mitigated as part of an iterative BMP approach to MEP standards.

6. Comment: Section 2.2 of the permit sets forth numerous requirements for discharges to impaired waters, but also states that tributaries to these impaired waters are also subject to these requirements without any apparent regard to whether those tributaries are impaired. If the tributaries are not listed as impaired for that pollutant on the 303d list, and an approved TMDL has not set forth load allocations and/or percent reductions needed for that tributary, then the EPA may be over-stepping its authority in attempting to force additional requirements for these tributaries.

   Recommendation: Section 2.2 should be revised to be applicable only to discharges to impaired waters, or discharges to those tributaries specifically included by reference in approved TMDLs.

7. Comment: Section 2.2 (and Appendix F). The permit requires MS4s to achieve significant percent reductions in phosphorus loading; however, the various non-structural BMPs have phosphorus reduction rates of not more than 10% so MS4s will need to achieve the remaining percent reduction through structural BMPs. The only structural BMPs capable of achieving the reductions called for in the TMDLs are infiltration trenches/basins. Consequently, in order to comply with the MS4 permit, communities will have to site, design, and construct hundreds of these BMPs at an incredible capital cost. In addition, once constructed, the MS4s will have to maintain these hundreds of BMPs at an equally incredible annual operating cost.

   It is also possible that limitations – such as soils, depth to groundwater, presence of contaminants, etc. – may prevent MS4s from constructing BMPs in locations needed to provide the required reductions. As such, constructing enough BMPs in needed locations may not be even technically feasible.

   Since the permit is based on MEP, and achievement of the required reductions is not "practicable", the proposed permit requirements exceed statutory authority.

   Recommendation: The permit should be revised to provide more "practicable" (or practical) reductions in phosphorus loadings, or at a minimum, substantially more time for MS4s to comply with the reduction requirements.

8. Comment: Section 2.2. The implementation of the draft permit requirements for discharges to impaired waters has questionable direct impact on the improvement of water quality. For MS4s discharging to impaired waters, very large expenditures are mandated, but even if MS4s implement every aspect of this permit, and future permits, the waterbodies could remain impaired. The permit offers no evidence that the large expenditures on mandated BMPs will actually eliminate the impairments.

   Recommendation: The EPA should provide a more defined and reasonable level of effort to comply with requirements associated with discharges to impaired waters. This should include a way for the MS4 to demonstrate that its MS4 discharges are within water quality standards, and be excused from further required actions regardless of whether the receiving water is still impaired.

9. Comment: Section 2.1.2. This requires MS4s to obtain authorization from MassDEP for increased discharges; however, it is not clear what this "authorization" will entail. This provision could also threaten new construction and redevelopment within impaired watersheds (Category 5 or 4b), because of the prohibition against new discharges to these waters unless it can be demonstrated that there is no net increase in pollutants. Without historic data, it is not possible to measure "increased discharges of pollutants" from new or redeveloped land.

   Recommendation: This provision should be modified to allow increased discharges that meet water quality standards regardless of impairments. The permit should also allow compliance with anti-degradation provisions via pollutant load reductions in other areas of the same watershed (instead of prohibiting the increased discharge altogether).

10. Comment: Section 2.3.4.4. Page 26. Sanitary sewer overflows are already prohibited and regulated at both the Federal and State level under existing mechanisms governing wastewater facilities. Including SSOs in the MS4 permit results in the Permittee being regulated by multiple permits for the same issue. This will cause confusion, unnecessary expenditures and potentially conflicting requirements.

    Recommendation: The MS4 permit should only contain language related to SSOs potentially contributing to illicit discharges and that these potential illicit discharges should be investigated, eliminated, and documented under the IDDE Program.

11. Comment: Section 2.3.4.4b mandates that MS4s identify SSOs over the previous five-year period within 120 days and Section 2.3.4.4c requires 24-hour verbal notice and five (5) day written notice of an SSO to EPA and MassDEP. MS4s already report all SSOs to the EPA and MassDEP in accordance with current MassDEP and EPA regulations, which are exactly the same as those stated in these Sections. Adding these requirements to the MS4 permit duplicates an existing effort and, therefore, is unduly burdensome for the permittee.

    Recommendation: This section should be rewritten to simply reference, not duplicate, current EPA/MassDEP requirements for verbal and written SSO reporting.

12. Comment: 2.3.4.5. Page 26. It is unclear whether outfall/interconnection inventories completed prior to the effective date of the new permit will count toward compliance.

    Recommendation: Revise this Section to allow prior inventories to count toward compliance, providing they met the intent of Section 2.3.4.5.

13. Comment: Section 2.3.4.7.c.i & 2.3.4.8.c.i. Pages 30 & 37. The definition of and implementation milestones for "Problem Catchments" significantly disadvantage MS4s that have proactively undertaken outfall sampling in advance of it being required by this permit. Proactive MS4s with sampling data, especially those in urban areas, will have far more outfalls that must be designated as Problem Catchments and given only five years to complete IDDE.

Conversely, MS4s that have made no effort to sample their outfalls will have no (or very few) Problem Catchments, but are given 5-10 years to complete IDDE. As written, the permit punishes proactive MS4s by imposing far more stringent IDDE milestones than those for MS4s that have not performed sampling.

Recommendation: The definition and implementation milestones for “Problem Catchments” need to be revised to remove this inequity.

14. Comment: Section 2.3.4.7.c.iii. Page 31. The draft permit mandates that the initial illicit discharge potential assessment and priority ranking must be completed within one year from the effective date. However, mapping of the MS4 and Catchment Delineations aren’t completed until two years from the effective date. The mapping requirement contained in the 2003 permit was limited to MS4 outfalls only and, thus, "existing" mapping is insufficient to complete the required 2.3.4.7.c.iii assessment/ranking.

    Recommendation: The required catchment assessment and ranking in 2.3.4.7.c.iii needs to be revised so as to align with the mapping (i.e., have a completion date of two years from the effective date).

15. Comment: Section 2.3.4.7.d.iv. Page 32. The limitation on when wet-weather screening should take place ("March to June") does not make sense for IDDE. Although wet-weather screening is intended to identify illicit discharges that only occur during peak flows, whether it should be performed in conjunction with high or low groundwater is determined by the System Vulnerability Factors (SVFs). For example, if the SVFs indicate structural defects and exfiltration potential, high groundwater would actually inhibit the investigation. In this case, sampling should be performed during a heavy rainfall event at low groundwater. Conversely, if the SVFs indicate capacity restrictions and SSO potential, then sampling during high groundwater would be appropriate.

    Recommendation: The permit should be revised to state that wet-weather sampling should be performed during conditions appropriate for the identified SVFs for each catchment area, and provide examples similar to those above to assist MS4s in making an informed decision about when to sample.

16. Comment: Section 2.3.4.7.d.iv. Page 32. The requirements related to wet-weather monitoring are not provided in sufficient detail. Inspection must be performed during wet weather, defined as sufficient intensity to produce a discharge. However, it is not clear whether a discharge must be observed at every outfall to achieve compliance. Does the Permittee have to return to an outfall repeatedly until a discharge is observed, even if it was monitored during a substantial rainfall event? To require the Permittee to mobilize staff, equipment, and laboratory services an unlimited number of times to observe flow at each outfall places an unreasonable burden.

    Recommendation: The permit should be revised to provide specific minimum storm parameters, for both time and rainfall amount. The minimum storm event should be one sufficient to anticipate discharges at all functional outfalls. The requirement for discharges to be observed at every outfall should be eliminated.

17. Comment: Section 2.3.4.7.d.v. Page 32. Based on the response from EPA at the MS4 Information Session on October 28, 2014, analysis for conductivity is being required as a measure of salinity. Requiring both salinity and conductivity testing for the same purpose is a waste of MS4 resources.

    Recommendation: The permit should be revised to require either salinity or conductivity, but not both. In addition, the permit needs to state the applicable benchmark and required action for the chosen parameter, as is provided for other sampling parameters in Section 2.3.4.7.d.vi.

18. Comment: Section 2.3.4.7.d.v & 2.3.4.7.vi. Pages 32 & 33. The level of accuracy for each required sampling parameter is not provided. For example, at what detection level is chlorine to be considered "detectable" in Section 2.3.4.7.vi.

Recommendation: The permit should be revised to clarify the required level of accuracy for each sampling parameter.

19. Comment: Section 2.3.4.7.e. Page 34. The System Vulnerability Factor (SVF) for "any sanitary sewer and storm drain infrastructure greater than 40 years old in medium and densely developed areas" is too inclusive. Throughout Massachusetts, infrastructure is typically in excess of 40 years old; thereore, this SVF serves as a "catch all" to require wet-weather sampling in virtually all catchment areas. Infrastructure age, by itself, is not an indicator of illicit potential. For example, some of our oldest sewers are in better condition than those built 40 or more years later. It is typically other factors, such as poor structural condition, that are the source of elevated illicit potential, not solely the age of the infrastructure.

    Recommendation: This SVF should be revised to include only those sewers and drains that are known to have specific concerns, not all sewers/drains older than an arbitrarily selected age.

20. Comment: Section 2.3.4.7.e. Page 33. The SVF for "crossing of storm and sanitary sewer alignments" is too inclusive. On streets with both sanitary sewers and storm drains, the likelihood that a catch basin connection crosses a sanitary sewer or a sanitary sewer service connection crosses a storm drain is extremely high. This would mean that nearly all catchments would trigger this vulnerability factor and therefore require wet weather sampling.

    Recommendation: This SVF should be revised to include only those catchments that are known to have specific concerns, not all catchments where storm and sanitary sewer alignments cross.

21. Comment: Section 2.3.4.7.e. Page 34. The SVF for "any sanitary sewer infrastructure defects such as leaking service laterals, cracked, broken or offset sanitary infrastructure...or other vulnerability factors identified through Infiltration/Inflow Analyses, Sanitary Sewer Evaluation Surveys, or other infrastructure investigations" is too inclusive. Again, in Massachusetts, where infrastructure is commonly in excess of 40 years old, most sewers have some defects, which again would mean that nearly all catchments would trigger this SVF and therefore require wet weather sampling. In most cases, individual sewer defects do not portend illicit connections.

    Recommendation: This SVF should be revised to include only those catchments known to have specific concerns related to the sewer system, and not all catchments with sewers that have minor defects.

22. Comment: Section 2.3.4.7 f & g. Pages 35 & 36. The second paragraph of Section f contains the same requirements as Section g, except for the timeline.

    Recommendation: The permit should be revised to either delete one of the paragraphs, or clarify the intended difference between the two requirements.

23. Comment: Section 2.3.4.8.c. Page 36. The draft permit requires that the IDDE Catchment Investigation Procedure be implemented in "every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges." If there is no evidence of any sewer input at an outfall, IDDE field investigation is a complete waste of resources.

    Recommendation: This requirement should be changed to say that outfall screening or sampling, whichever is appropriate, should be repeated some number of times at varying times/conditions to confirm there is no sewer input. If no sewer input is confirmed during dry and wet weather screening or sampling, IDDE field investigation will not be required.

24. Comment: Section 2.3.4.8.c.i-iii. Pages 36 & 37. The milestones stated for the IDDE effort in 2.3.4.7 are unrealistic for urban MS4s. For some MS4s with ongoing IDDE programs, it has taken many years to locate and remove illicit connections from even one catchment area, let alone 100% of catchment

areas. This is especially burdensome in areas where nearly every outfall will exceed the benchmarks for at least one IDDE sampling parameter or System Vulnerability Factor. The draft permit requires IDDE to be completed for the entire MS4 within ten years. This requirement is both cost-prohibitive and potentially technically unattainable during that limited period of time.

Recommendation: The permit should be revised to allow for additional time to locate illicit discharges. It is recommended that EPA extend the timeframe for completing the Catchment Investigation Procedure in 100% of the area served by all MS4 catchments from within ten years of the permit effective date to within 20 years of the permit effective date. The permit should also indicate that, as long as the MS4 is making reasonable efforts to locate the source of the discharge, the MS4 will be in compliance even if the source is not located within the allotted timeframe.

25. Comment: Section 2.3.6.a.ii.a. Page 40. The requirement to retain/treat the first one inch of rainfall applies to "runoff from all impervious surfaces on site." Without a definition for the term "site" (see comment below), this implies runoff from the entire parcel on which the one acre-or-more disturbance occurs. It is not reasonable or cost-feasible to require a large parcel to treat runoff from "all impervious surfaces" on that parcel when they disturb only a small portion of it. Take, for example, a large user that occupies hundreds or even thousands of acres. If it was to disturb one acre, the draft permit would require the user to retrofit its entire drainage system to retain/treat the first inch of runoff.

    Recommendation: Language in this section needs to be revised to limit the regulated area to all impervious areas within the development or redevelopment area, not the entire parcel. Alternatively (or additionally), the definition of "site" needs to defined so that it refers to the area within the limits of work for a development, redevelopment, or other construction project.

26. Comment: Section 2.3.6. The requirements to have pollutant removal equivalent to that of a bio-filtration system must be removed, as a "one size fits all" model for pollutant removal is too restrictive. A "Maximum Extent Practical" principle is more appropriate. For example, annual roadway reclamation or re-surfacing projects should not fit into the "one inch recharge" scenario, even though projects are greater than one acre of disturbance.

    Recommendation: EPA should define the words "development" and "redevelopment," which would allow exclusion of lateral projects such as roadway improvements.

27. Comment: Section 2.3.6.a.ii. Page 40. This section sets different standards than those existing in the MassDEP's Stormwater Policy and associated handbooks. Having different sets of standards will cause conflicts for MS4s and developers and will likely subject communities to legal action. In addition, the ordinances/bylaws of most Massachusetts MS4s reference the MA Stormwater Standards.

    Recommendation: If the EPA wants more stringent standards, this should be done through working with the MassDEP to affect changes to existing State regulations instead of enacting a second, different, and conflicting set of requirements through the MS4 permit.

28. Comment: Section 2.3.6.a.ii. Page 40. The requirement to inventory all MS4-owned properties for possible recharge areas is not practical.

    Recommendation: At most, an MS4 should select five priority sites per year to evaluate, which will also result in a better assessment of viable sites.

29. Comment: Section 2.3.6.b&c. Page 41. Both of these sections require review of local bylaws. It is not cost-effective to perform two separate reviews and prepare two separate "assessments" related to the reduction of impervious area.

Recommendation: Sections b and c should be combined into one assessment report, covering both reviews.

30. Comment: Section 2.3.7.b. Requiring individual Stormwater Pollution Prevention Plan (SWPPP) for each municipal site is repetitive and overly burdensome. MS4s typically have one Hazard Mitigation Plan and one Open Space plan, both of which are renewed every five years. It makes sense to also have one SWPPP renewed every five years.

    Recommendation: The permit should be revised to allow a single SWPPP document with site-specific sections as needed to cover all sources of potential pollution.

31. Comment: Section 4.3. Page 51. Now that outfall monitoring has been incorporated into Section 2.3.4.7, there is no need for a separate Section 4.3.
    Recommendation: Requirements stated in Section 4.3 should be incorporated into Sections 2.3.4.7 or 4.4, as appropriate.

32. Comment: All Appendices. The appendices do not contain proper page numbering.

    Recommendation: Page numbers should include a reference to the Appendix (e.g., "A-21") so as to avoid duplication with the main permit document.

33. Comment: Appendix A. No definition is provided for the following critical terms: Directly Connected Impervious Area, Disturbance, Illicit Discharge, Increased Discharger, Redevelopment, or Site. Interpretation of these terms could be a significant source of controversy, especially for Planning Boards charged with the implementation of the requirements for new development and redevelopment.

    Recommendation: Definitions of these terms should be added to Appendix A.

34. Comment: App. H 1.2, 11.2, 111.4, IV.5, V.5. To require the collection of at least 30 flow-weighted samples over a period of two to three years from each stormwater outfall discharging (or tributary) to an impaired water in order to demonstrate that the discharges meet water quality standards is excessive and cost-prohibitive.

    Recommendation: All sections of the permit with this provision should be revised to require sampling of outfalls during not more than ten rainfall events. The EPA should provide a list of rainfall events of varying volume or intensity during which outfall sampling must be performed.

35. Comment: Appendix I. Multiple Sections. Appendix I should not be included in the permit. It should be provided as a reference/example document only. The protocol presented in the Appendix is not required by the permit and is only one of many methods that could be used to comply with IDDE requirements. Its inclusion as an Appendix to the permit is inappropriate. In addition, because this protocol is specific to a single method, some of the information that is included is incorrect. For example, holding times presented in Appendix I, Attachment 1, Table 1 are listed incorrectly due to an assumption that analyses are being performed onsite (see Specific Conductance, which actually has a holding time of 28 days, not "Immediate").

    Information presented in Appendix A, Table 1 and Step V, are also not appropriate for inclusion in a NPDES permit. The parameters and thresholds presented in Table 1 are already included as Section 2.3.4.7.d.vi. The information regarding instrumentation is reference material and should not be included in a permit. Step V should be removed in its entirety because it does not belong in a permit. It should be in a Fact Sheet or reference/example document.

    Recommendation: The permit should be revised to delete Appendix I in its entirety. EPA should provide an online source to the IDDE protocol in Section 2.3.4.7.

36. Comment: General. The requirements for written programs, policies, procedures, and reports do not have direct water quality benefits and should have a lower priority. Significant financial and staff resources will be required to prepare and submit all of the required written documentation. With limited resources, the focus of the permit should be on performance, not documentation. There are over 50 phrases in the main body of the permit and many more in the appendices (not including the actual annual reporting requirements in Section 4.4) that require information be included in the Annual Report.

    Recommendation: An efficiency and effectiveness review should be performed on the entire permit; preferably by an outside party who can assist the EPA in prioritizing those items where written documentation and annual reporting will provide a measurable benefit. The permit should be revised to reflect these improvements.

Weston & Sampson supports the EPA and the MassDEP's effort to protect our water resources. We thank you for this opportunity to comment on the draft permit process, and we hope that you accept these comments in the interest of improving the ability of municipalities to comply with this and future stormwater permits.

Very truly yours,

WESTON & SAMPSON

Re: Draft Regulations for MS4 Permit, public comment

Dear Mr. Tedder,

WalkBoston is Massachusetts' primary pedestrian advocacy organization, and we have worked with more than 100 communities across the state to help them improve walking safety, add new sidewalks and paths, and encourage more people to walk more. Our work sits at the intersection of health, transportation, community vitality and environmental improvement. Massachusetts is experiencing a significant increase in interest in walking and transit use – an increase that we believe supports the EPA's goals of improved environmental quality in very important ways.

I am writing to express WalkBoston's concerns with the newly proposed MS4 NPDES Stormwater Regulations. The regulations could seriously impact the ability of communities to add walking (and bicycling) facilities that would allow our citizens to engage in healthy, active transportation and limit their ability to reduce the use of private vehicles. We believe that this is a potentially serious unintended consequence of the revised regulations and one that deserves re-consideration.

We urge you to consider exempting existing roadways from this requirement when pavement reclamation is being used and when the expansion of impervious area is for GREEN Transportation elements like sidewalks and bike lanes. We would be pleased to meet with you to discuss these concerns and thank you for your consideration.

Sincerely yours,

Wendy Landman

Office Square – Suite 100
OEP06-4
Boston, MA 02109-3912

Dear Mr. Tedder:

The draft 2014 MA MS4 General Permit ("Permit") has many aspects which will achieve positive results for the Town of Walpole by reducing pollutants carried to our waterways by untreated stormwater. The permit requirements, " to reduce the discharge of pollutants to the maximum extent practicable", is a goal that we can all agree upon. The permit requirements to investigate, educate, involve, treat, infiltrate, reduce, and remove will change how the Town approaches the management of stormwater. The results of the control measures will make our streams, rivers, ponds and other water bodies cleaner for recreational uses, wildlife habitats, public and private drinking water and other uses of water . The "reduce pollutions that discharge" is a good thing. The "maximum extent practicable" is the part which needs more flexibility. Is it the "maximum extent practicable" based on science or is it the "maximum extent practicable" given the Towns available resources (staff and funds)? In order for the 2014 permit to be practicable it needs to be realistic for the Town to implement.

The Town of Walpole offers the following comments, suggestions and concerns:

Deadlines and timing

EPA has to be aware of the timing of the permits effective date and yearly deadlines so that these deadlines are achievable given the July to June municipal budgeting cycle. The Town has to have enough time to request and approve funds in order to meet each EPA deadline based on the effective date of the permit. The Town needs at least a year in advance to include permit expenses into the budget for the following Fiscal year. The one year deadline is not enough time to budget funds and draft the revised SWMP as required by 1.10.b.

Recommend: *2 years to submit SWMP based on the effective date of the permit.*

Resources spent on tasks which do not directly clean our water are wasteful.

The permit should not require time and resources to be spent on tasks which do not directly impact the goal of improving the quality of our water. The report writing and record keeping for the Annual

Report are too time consuming and the unfunded requirements for expensive infrastructure will divert valuable Town funds to project's which may only benefit a few and divert funds away from projects which benefit the most needy. The Town of Walpole has struggled to fund much needed project such as a Senior Center, Police Station, and Fire Station. In addition, to the regular budgeted items needed to run the Town these are the type of projects which will be competing for funds with the new MS4 permit requirements. The Town every fiscal year has to carefully budget to fund those required programs and services and weigh the numerous needed program and services. EPA has to recognize the funding issue and pare down the requirement s to those that directly improve our water quality and remove unnecessary reporting and data collection requirements.

The permit requires the Towns to address 6 Control Measures to the maximum extent practicable each one of these will require additional staff hours and resources to complete:

Section 2.3.2 Public Education) and Section 2.3.3 Public involvement are probably the most manageable of the 6 control measures and will hopefully benefit the program as a whole by educating and bring attention to the issues of stormwater management and why reducing pollution to the waterbodies effects individuals.

Recommendation:/Comment:

The requirement to measure the effectiveness of the 6 annual messages to residents, Businesses, Developers, and Industry and document the achievements, re-evaluate if needed, and document within the Annual Report will require the Town to become media specialist and a time consuming task only to prove to EPA that the messages were sent.

Public education of issues which are common across the Commonwealth, such as, pet waste disposal, yard waste disposal, car washing limitations, use of phosphate and nitrogen products, are best taken on by regional planning commissions, watershed groups and regional stormwater groups rather than requiring each town to duplicate information. Regional partnerships and planning agency are better equipped to measure the effectiveness of these programs as well.

Section 2.3.4 -Illicit Discharge Detection Program The illicit discharge detection program is a necessary program required by the permit to find pollution discharges to the municipal waterways and remove them. A program which the Town began under the 2003 permit however the 2014 permit extensively builds upon the 2003 requirements, adding more costs.

Mapping, testing, analyzing: The large amount of information required by the 2014 permit will require the Town to hire private consultants to review every outflow structure in town for the outflow inventory and ranking. This will require time to collect the information, map and input the data, and analyze the data to determine the ranking. The required data at 2.3.6.ai and aii is extensive. The Town is in support of having this detailed information mapped however the diversion of resources to achieve this task within 1 year will be a strain on the Town's budget.

Recommend/comment:

Section 2.3.4.5.c*-It is unclear if the Town is required to re-do the outfall inventory which was completed under the 2003 permit or add new outfalls since 2003.*

Recommend/Comments:

Section 2.3.4.5 b- *The task of physically labelling all MS4 outfalls pipes and interconnections with other MS4s with a unique identifier will be expensive to conduct and maintain. We believe that providing a GPS coordinate or GIS mapping will achieve the result of creating an inventory of out fall pipes necessary to monitor water quality.*

Section 2.3.4.8- *The IDDE requirements are lengthy, cumbersome and costly. The Town is better off to spend funds to fix known problems then excessive funds on investigating potential problems.*

Section 2.3.4.7.c. *- The IDDE Program should focus on which catchments are likely to have illicit discharges and which ones are unlikely to have illicit discharges. Then the likely catchment areas should be prioritized.*

Section 2.3.4.7.e *and* ***Section 2.3.4.8.c.*** *- The "System Vulnerability Factors", wet weather monitoring and deadline for Catchment Investigation: See Tighe and Bond recommendations to simplify and cap annual investigation.*

Section 2.3.5 -Construction Site Stormwater Runoff: The construction management portion of the permit was addressed in the 2003 permit when the Town adopted the *Stormwater and Erosion Control Bylaw*. The Bylaw administered by the Conservation Commission requires any project disturbing 40,000 square feet or more of land to file for a Land Disturbance Permit to implement erosion controls and stormwater management BMP's for their project. The Bylaw has worked well.
Recommend and Comment: *The record requirements and documentation to be included within one year of the effective date and included within the Annual Report is the unnecessary and costly requirements of the 2014 Permit. It also seems somewhat redundant with both state and EPA requirements already in place through construction permits and SWPPP's .*

Section 2.3.6.-Post-construction Stormwater Management: The Town implemented this program under the 2003 Permit by adopting the Stormwater and Erosion Control Bylaw and including review of the MA DEP Stormwater Management Requirements with subdivision and site plan reviews.

Recommend/Comment: *The 2014 permit requirements of retaining the first 1-inch for construction totaling one acre is inconsistent with DEP's Stormwater Management Standards. We recommend that the 2014 Permit be consistent with the DEP Stormwater Handbook.*

Section 2.3.6.a.ii - Retaining first inch of stormwater or stormwater treatment for public road projects will be costly to the Town. Under the new regulations, when one disturbs more than 1 acre in area or phased construction totaling one acre (translates to only ¼ mile of 30' wide pavement) or more which will include road reclamation projects, the new regulations require that the first inch of storm water be retained or all the stormwater must be treated. This essentially means one now not only has to resurface the road one has to completely redesign and re-construct the entire stormwater collection system to satisfy this requirement. This will cripple road maintenance budgets. Accordingly, cities and towns will be forced to purchase/take extra land by eminent domain for stormwater storage or pay for the expense of stormwater treatment systems on simple routine maintenance projects. This is a huge expense in downtown business districts and even in rural areas with old roads and narrow town-owned rights-of-way (provided by others).
The funds available to the Town for pavement maintenance are less than half of what are needed to maintain existing condition of the current infrastructure. Walpole, as do other Towns, strives to repair

as many roads as possible each year as funds are available. The above added costs will mean that there will be less funds available for maintenance of roadways and therefore conditions which cause erosion will continue for longer periods.

Recommend: An exemption for pavement maintenance projects. *The above regulations should not be applied to maintenance projects. If a new road is being constructed or a lane is being added, these stormwater management upgrades may be able to be accommodated, depending on surrounding conditions like available right-of-way width and/or proximity of buildings to the right-of-way. Simple pavement surface maintenance projects or minor improvements should not trigger rebuilding the world.*

Section 2.3.6.b and c. -Requirement to track impervious surfaces, assess parking and road design and review Regulations and Bylaws for feasibility of green infrastructure are all tasks which will help the Town comply with the2014 Permit and useful planning information. The requirement for each Town to take on these tasks without new resources or support is not practical for a town like Walpole with limited staff.

Recommend: *These requirements are much better suited for regional planning groups which can then support the Town's limited planning staff. We recommend a four year timeline to complete this both tasks.*

Section 2.3.7 Good Housekeeping : The implementation of Operation and Maintenance Plans was begun under the 2003 and is a task which should be completed by the Town as it is required.

Section 2.3.7.a.iii (b) -The new requirements for cleaning catch basins will require the Town to take a new approach and length time consuming record keeping and documentation. For a Town which does not have issues with catch basin cleaning the amount of review and record keeping is a financial burden which will increase the funds needed for this task. If there are no issues then the review and record keeping just seems like an un-necessary task.

Section 4.3 and 4.4 -Record keeping and inspection of all storm drain systems in the Town annually will be a large task for the Town. Many of the storm basins and structures in Town are located on single family lots by private ownership. The Town will need to put into effect a program to notify and keep up on these private owners to maintain their structures.

Recommend: *Less record keeping and reporting requirements for the Annual Report. Annual Report should include problems and solutions and not unnecessary reporting requirements.*

Section 2.3.7.d -Chloride Reduction: _Most municipalities already are trying to limit salt/chloride usage. The cost of road salt and deicers is a large portion of the winter storm budgets. Any responsible DPW director or winter road program manager is looking to reduce the costs in all areas that are practical. There is no objection to installing computers on the truck spreaders and training the operators in best management practices nor do we object to the EPA providing Best Management Practices or guidance suggestions; however, reducing salt usage below what is practical with the current technology is irresponsible and to do this exposes the motorists to hazardous conditions and the municipalities to legal action.

Recommend: *Let the Town determine the usage of sands and salts for safe conditions.*

Summary

The Town of Walpole supports the goal of preventing pollutants from discharging to our waterways however EPA's unfunded mandates require an abundance of Town resources for investigations, reporting and policing is unrealistic. . In order for the Permit to be successful in preventing the discharge of pollutants to the maximum extent practicable, the 2014 Permit should be revised to allow the Town additional time to meet requirements once the permit is issued. The Permit should have more flexibility in reporting and reduce the amount of documentation required within the Annual Reports. The Permit needs to be consistent with existing regulations that already work well and allow for more time to plan and implement new protocols.

Regional planning agencies and regional Stormwater partnerships should be funded and encouraged to assist municipalities with the planning, mapping, data collection and information analysis required for this permit which is similar from municipality to municipality. As the permit is written it will be difficult for the Town and other municipalities to meet the deadlines with their limited staff and resources available.

Thank you for the opportunity to comment on the Draft Massachusetts Small MS4 General Permit. If there are any questions regarding our comments please contact, Landis Hershey, Walpole Conservation Agent or Maggie Walker, Walpole, Town Engineer.

Sincerely,

James A. Johnson
Town Administrator

RE: 9/30/14 Draft NPDES MS4 General Stormwater Permit Number MAR041000 – Comments submitted by the City of Waltham, MA

Dear Mr. Moraff and Mr. Ferris:

On behalf of the City of Waltham, the City of Waltham Engineering Department (the "City") has reviewed the above-referenced Draft NPDES MS4 General Permit and associated Fact Sheet (the "Draft Permit") and has concerns regarding some of the provisions of the Draft Permit as currently proposed. These concerns are outlined in the following comments which are generally presented in the order in which the issue appears in the Draft Permit.

1. **Page 2 - Item 1.3 (i) The structural controls for disposal of stormwater into the ground may be subject to Underground Injection Control (UIC) regulation requirements.**

Under the current City requirements for development/redevelopment, the stormwater runoff generated requires ground water infiltration on-site through structural means such as concrete drywells that typically are deeper than they are wider. Also, where necessary, on-site infiltration of sump pump discharges through dry wells is being implemented as part of the City's on-going Sump Pump Amnesty Program.

Submitting individual UIC permits for the structures already installed and to be installed in the future by private residents, developers and the City would be extremely onerous and result merely in a paper exercise. The City recommends that these structures be exempted from the permit requirements.

2. Pages 9 and 10 - Item 2.1 Pursuant to Clean Water Act 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permit tee's small MS4 do not cause or contribute to an accidence of water quality standards, in addition to requirements to reduce the discharge of pollutants to the maximum extent practicable.

The cited section of the Clean Water Act (the "Act") makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable ("MEP") as the standard to which pollutants must be removed from municipal MS4s. The City disagrees with EPA's interpretation of section 402(p)(3)(B)(iii) of the Federal Water Pollution Control Act. EPA interprets this section to mean they can impose water quality based effluent limitations and that this provision overrules the MEP standard for municipal stormwater discharges. A reading of this section of the Act clearly shows that EPA's interpretation is incorrect. The language in section 402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. Section 402(p)(3)(B)(iii) of the Act states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods, and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA tries to imply in the Fact Sheet and permit. The proper wording throughout the permit that would be consistent with the Act would be for the permitee to meet water quality standards to the maximum extent practicable. Furthermore, EPA lacks legal authority to render an interpretation of Massachusetts water quality standards.

3. Pages 11 and 12 - Item 2.2.1 The municipality shall meet the requirements of Appendix F, Part A.I with respect to the reduction of phosphorus discharges from their MS4.

The required Waste Load Allocation (WLA) for Total Phosphorus reductions for the City of Waltham is 51%. Under any circumstances, achieving these reductions will be daunting if not impossible given the amount of already developed area with minor scope for redevelopment that provides limited opportunities for the installation of the permit recommended structural BMPs. Most troubling is that the TMDLs which produced these figures relied on outdated data and studies that are dated and of questionable validity in 2008.

The City has completed a calculation for the baseline Phosphorus quantity estimations and submitted it to the EPA. A copy of this memorandum is attached to this comment letter. This memorandum also calculates the amount of revised phosphorus reduction requirements that are significantly lower than estimated by the EPA.

Consequently, the City requests that the EPA review the attached memorandum and review/revise the EPA TMDL Model for Phosphorus with an updated WLA for Waltham as well as other municipalities within Charles River Basin.

4. Pages 25-37 - Item 2.3.4 Illicit Discharge Detection and Elimination (IDDE Program)

The proposed IDDE Program requirements under the Draft Permit are impractical especially for completing the wet weather monitoring and completing the construction work required to eliminate any illicit discharge connections within the stipulated time frames. Given the requirements of Public Bidding to award construction contracts, the City will require an extension of time to meet the Draft Permit requirements.

5. Page 42 - Item 2.3.6 The permittee shall estimate the annual increase or decrease in the number of imperviousness area (IA) and directly connected impervious area (DCIA) from the initial baseline provided by EPA.

The requirement to calculate then annually update the directly connected impervious area (DCIA) measurement from the initial baseline provided by EPA seems unreasonable and of little value. We understand the link between impervious area and stormwater quality but also realistically recognize that for large urban areas like Waltham the change in IA and DCIA may be insignificant. The DCIA measurement, updated at some regular frequency, may be helpful to developing communities as a way of tracking trends and making the public aware of impervious area impacts, however, for a large urban very-developed area such as Waltham that is and has been substantially impervious, it is an effort that would be very expensive, time and resource consuming while producing minimal benefits. We do not expect that on a year to year basis there will be a measurable decrease in impervious area in the City of Waltham. The City requests that this requirement be removed or , alternatively, be waived for highly developed municipalities such as Waltham.

6. Page 44- Item 2.3.7 The permittee shall establish a schedule that the frequency of routine cleaning will ensure that no catch basin at anytime will be more than 50 percent full.

Under the current Permit Requirements, the City has a very rigorous plan to clean the sediment from the catch basins. The proposed language for cleaning and monitoring sediment depths in catch basins to make sure none of them have sediment depths greater than 50% at any time is going to be impractical given the thousands of catch basins City-Wide. This requirement will put significant financial burden while requiring personnel resources that are already stretched thin. The City will have to hire a Consultant to manage

the catch basin cleaning and monitoring program on an on-going basis and issue bids for the cleaning services. Also, in order to meet the full intent of the proposed language every single catch basin needs to be monitored for depth in almost real-time. The language of this permit requirement will need to be modified.

In conclusion, the City would like to submit that the proposed permit requirements are an unfunded mandate that will put a severe financial burden ultimately on the residents especially given the current state of the economy. The EPA and the DEP do not offer any financial incentives to support the well intentioned requirements of the Draft Permit.

Should you have any further questions, please feel free to contact me at 781-314-3831.

Sincerely,

Stephen A. Casazza, P.E.
City Engineer

MWH

BUILDING A BETTER WORLD

MEMORANDUM

DATE: September 20, 2011

TO: Todd Borci, U.S. EPA

CC: Stephen A. Casazza, City Engineer, City of Waltham

FROM: David Bedoya, MWH
Jeff Schmidt, MWH

SUBJECT: Draft Total Phosphorus Calculations Using 2010 Conditions in Waltham, MA

1 Background

According to the Draft North Coastal General Permit for Stormwater Discharges From Small Municipal Separate Storm Sewer Systems in Massachusetts (draft permit), the City of Waltham is responsible for reducing its EPA-estimated total phosphorus (TP) annual loading to the Charles River by 62.6%. The TP loading baseline provided by EPA was calculated with 1999 land use conditions.

The draft permit requires the City to update, if data is available, its phosphorus contributions using more up to date information. Consequently, the City of Waltham has updated the calculations of the estimated TP loads reported in the *Final TMDL for Nutrients in the Lower Charles River Basin* report of June, 2007 (TMDL Report). Several factors were considered when adjusting the TP loading values and are listed below:

1. Available 2010 land use data.

2. TP sampling data from the United States Geological Survey (USGS) in the Stony Brook Reservoir, which discharges directly into the Charles River.

3. The existence of stormwater collection areas within Waltham which are tributary to treatment systems such as preserved natural wetlands.

4. Private property, on-site stormwater treatment in new development and redevelopment.

The following memorandum provides an overview of the adjustment calculations undertaken by the City and the resulting total phosphorus loads using 2010 conditions.

2 TP Loading Baseline Based on 2010 Conditions

2.1 *TP Loading Modifications Based on Land Use Change*

Land use data from the 2010 Waltham GIS Database was used to update the phosphorus loading calculations originally presented in the TMDL Report, which is based on 1999 land use data. A comparison of the 1999 and 2010 land use and total annual phosphorus load calculations is presented below in Table 1. The TMDL Report presents the total annual phosphorus loading from the City of Waltham to the Charles River watershed as 2,447 kg/yr (1999 land use), while the 2010 land use analysis results in a total annual phosphorus load of 2,412 kg/yr, a reduction of 35 kg/yr.

Table 1 Land Use Phosphorus Loading Comparison Table

Land Use Type as listed in the TMDL Report	MassGIS Land Use Covers for Each Land Use Type	TP Export Rates (KG/Ha-y)	Area-2010 (Ha)	TP Load - 2010 (Kg/y)	Area-1999 (Ha)	TP Load -1999 (Kg/y)

			Total	2411.55		2447.21

2.2 Phosphorus Loading from the Stony Brook Watershed within Waltham

In 2006, the United States Geological Survey (USGS) collected water samples at different points of the Stony Brook Reservoir drainage area, which includes the Hobbs Brook or Cambridge Reservoir. The USGS analyzed the samples for total nitrogen and phosphorus, among other constituents (Smith, 2008). A significant portion of the City of Waltham territory (approximately 6.44 square miles) is tributary to the Stony Brook watershed. The Stony Brook Reservoir's outlet discharges directly into the Charles River and is the lowest point of the watershed. The

USGS sampling data was used to calculate the TP loading from the portion of the Stony Brook watershed within Waltham to the Charles River.

As a first step, the 2010 land use based TP loading from the Waltham area tributary to the Stony Brook Reservoir was calculated. Table 2 below outlines this calculation. The area within Waltham tributary to the Stony Brook Reservoir is approximately 1,447.5 Ha (excluding waterbodies) and the resulting TP loading from this area is 1,183.3 kg/year.

Table 2. TP Loading Calculations in the Stony Brook Area in Waltham Using 2010 Land Use Data

Land Use	*Area (Ha)*	*Export rate (Kg/Ha/Year)*	*TP Load (Kg/y)*
Commercial	228.20	1.70	387.95
Forest	448.58	0.13	58.32
Forested Wetland	27.55	0.13	3.58
High Density Residential	343.63	1.13	388.31
Industrial	95.57	1.47	140.48
Junkyard	2.58	1.13	2.92
Low Density Residential	5.54	0.05	0.28
Medium Density Residential	97.44	0.57	55.54
Mining	3.87	1.47	5.69
Multi-Family Residential	27.85	1.13	31.47
Non-Forested Wetland	14.38	0.13	1.87
Open Land	2.89	0.03	0.09
Participation Recreation	1.92	0.03	0.06
Pasture	1.70	0.03	0.05
Powerline/Utility	11.55	0.03	0.35
Spectator Recreation	0.63	0.03	0.02
Transitional	5.46	0.03	0.16
Transportation	71.03	1.47	104.41
Urban Public/Institutional	55.84	0.03	1.68
Very Low Density Residential	1.33	0.05	0.07
TOTAL	**1,447.55**		**1,183.28**

The second step consisted of subtracting the 2010 land use based TP load calculations from the Stony Brook watershed within Waltham to the 2010 city-wide land use based phosphorus calculations. The following equation shows the results after performing this operation:

City-wide TP load (kg/y)		**2,411.55**
	-	
TP load from the Stony Brook drainage area within Waltham (kg/y)		**1,183.28**
TP load from Waltham areas outside of the Stony Brook watershed (kg/y)		**1,228.27**

The third step consisted of calculating the TP loading from the portion of the Stony Brook watershed within Waltham based on USGS sampling data. The calculated load was then added back to the TP loads generated from Waltham areas outside of the Stony Brook watershed.

Median TP concentrations (in mg/L) and total annual flow (MG) were available for the two Stony Brook Reservoir tributaries (Stony Brook at Rt. 20, Station 1104460 and Unnamed Tributary to the Stony Brook Reservoir, Station 1104475). These values were used to calculate a flow-weighted, average TP concentration for the Stony Brook Reservoir. Subsequently, the annual TP loading to the Charles River was calculated using the annual volume of water discharged from the reservoir dam outlet (Station 1104480) and the calculated flow-weighted, average TP concentration in the reservoir. Table 3 provides the results of this stage of calculations. The location of the referenced TP and flow monitoring stations are presented in Figure 1.

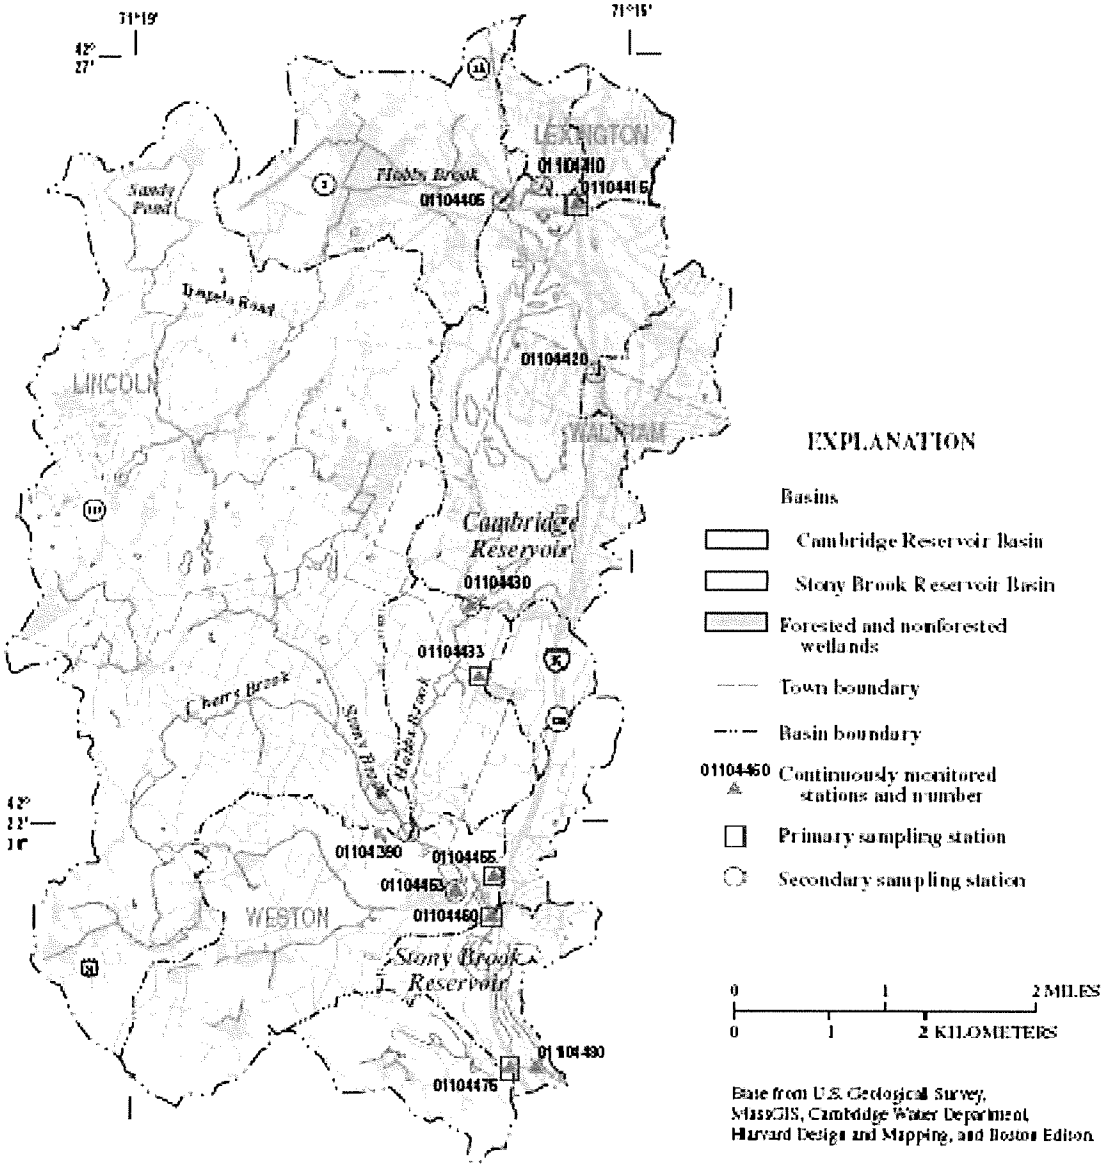

Figure 1. Stony Brook watershed with location of USGS sampling stations (from Smith, 2008)

Table 3. TP Loading Calculations from the Stony Brook Watershed

USGS Sampling Station Name	Station #	Median TP conc. (mg/L)	Recorded annual flow (MG)	Annual TP loading to Charles River (Kg/y)
Stony Brook at Rte 20	1104460	0.01	13,933.00	----
Unnamed tributary to Stony Brook Reservoir	1104475	0.03	427.00	----
Stony Brook Reservoir Dam near Waltham	1104480		6,963.00	276.51
Weighted TP Conc. in Stony Brook Reservoir (mg/L)		0.01		

The TP loading contribution from the portion of watershed within Waltham was calculated by multiplying the calculated watershed TP loading (276.51 Kg/y) by the percentage of the Stony Brook watershed area within Waltham (6.44 over 23.70 square miles or 27%). The TP loading from the Waltham portion of the Stony Brook watershed is 75.14 kg/year (See Table 4 below). This value was then added to the 2010 land use based TP loading from areas outside of the Stony Brook drainage area, which represents the 2010 annual TP loading updated baseline. Results are presented in Table 4.

Table 4. Waltham's 2010 Charles River TP Loading Baseline

	Whole watershed annual TP loading (kg/year)	Total watershed area (sq-mi)	Portion of the watershed within Waltham (sq-mi)	Total TP loading from Waltham (kg/year)
Stony Brook watershed	276.51	23.70	6.44	75.14
Waltham area outside of the Stony Brook watershed	1,228.27	7.16	7.16	1,228.27
2010 BASELINE TOTAL	1,504.78	30.86	13.6	**1,303.39**

3 Total Phosphorus Load Deductions from Wetlands and On-Site Stromwater Treatment

3.1 Wetland Systems

Using the City of Waltham's GIS database, all areas discharging into natural wetland areas were identified and delineated. Phosphorus loading reductions due to wetland treatment systems were calculated using EPA's *Methods to Calculate Load Reductions for Structural Storm Water Best Management Practices at a Designated Discharge (DD) Site.* EPA-provided phosphorus removal performance curves for engineered gravel wetlands were used to calculate phosphorus deductions from existing natural wetlands. For these calculations, an average wetland depth of four feet was assumed.

A total of 27 wetland areas outside of the Stony Brook watershed were identified. These areas collect flows from 674 acres of land, out of which 213 are impervious and 461 pervious. Based on land use type, total phosphorus loading to each wetland was calculated using the export rates listed in the EPA document mentioned in the paragraph above. Results from these calculations are summarized in Table 5.

Table 5. Phosphorus Treatment Performance Calculations in Natural Wetland Areas

Wetland No.	Wetland Area (acres)	Maximum Vol. from Contributing Area (in)	TP Removal Performance	Inflow TP Mass (lb/yr)	Outflow TP Mass (lb/yr)
1	44.71	85.73	66%	21.37	7.27
2	4.26	11.66	66%	15.55	5.29
3	4.79	2.91	66%	51.38	17.47
4	6.33	19.96	66%	16.05	5.46
5	4.61	11.73	66%	17.07	5.80
6	0.83	4.73	66%	12.76	4.34
7	1.30	5.67	66%	13.06	4.44
8	2.17	3.93	66%	23.39	7.95
9	1.70	9.61	66%	11.07	3.76
10	5.49	2.64	66%	95.13	32.34
11	2.68	3.83	66%	19.3	6.56
12	2.04	6.72	66%	11.03	3.75

24	4.92	13.38	66%	8.69	2.95
25	0.28	2.1	66%	8.43	2.87
26	0.08	0.73	55%	7.11	3.20
27	0.27	0.84	58%	20.92	8.79

TOTAL (lb/yr)	*474.33*	*165.29*
TOTAL (Kg/yr)	*215.35*	*75.04*
TP MASS REDUCTION (lb/yr)	*309.30*	
TP MASS REDUCTION (Kg/yr)	*140.42*	

3.2 On-Site Stormwater Treatment

In 2001, as part of the construction permit application process, the City of Waltham established an on-site drainage policy for new development and redevelopment. The policy states that for any work other than interior or utility work covering over 150 square feet, "all drainage must be retained/recharged onsite for a 100 year storm with no connection to the city system". Flow from these residential and commercial lots would not reach the City's drain system and therefore, would not be tributary to the Charles River basin.

The City's records were searched for all residential and commercial properties which applied for and obtained a permit after 2001. Approximately 742 properties were identified and information including property size (square feet) and type of drainage structure installed was noted for each property. The total area of permitted property since 2001 was calculated to be approximately 347 acres (236 acres of residential property and 111 acres of commercial property).

The average residential lot had 38% impervious area while the average commercial lot had 68% impervious area. An assumption was made regarding the percentage of impervious area which drained onsite; 50% and 65% on residential and commercial properties respectively. Average percentages of impervious area for each land use were calculated using GIS parcel information from the City of Waltham database. No deductions were calculated for the pervious areas in these lots.

Annual phosphorus loading rates were obtained from the EPA's documented *Method to Calculate Annual Phosphorus Load for the Designated Discharge (DD) (Attachment 1 to Appendix D)*. For commercial properties, the commercial impervious phosphorus load export rate of 2.23 lb/acre/year was used. In order to determine the residential phosphorus loading rate, an area weighted average of the High, Medium and Low-density impervious residential annual phosphorus load export rates was calculated (2.23, 1.34, and 0.89 lb/acre/year, respectively). The weighted, average residential phosphorus export rate was equal to 2.05 lb/acre/year. Table 6 presents all of the assumptions, the annual treated loading calculations, as well as the calculated reduction in phosphorus loading.

Table 6. On-Site Drainage Calculations

Land Use	Total on-site drainage area (acres)	Average percent impervious	Assumed % of impervious area draining on-site	Impervious area loading rate (lb/acre/Year)	Total treated annual loading (lb/year)
Residential	236.11	38	50	2.05	92.15
Commercial	110.90	68	65	2.23	109.31
				TOTAL (lb/year)	201.46
				TOTAL (Kg/year)	91.46

4 Updated Phosphorus Loading Reduction Requirements

The deductions outlined in this document were subtracted from the 2010 conditions baseline to calculate the current phosphorus contribution from the City of Waltham to the Charles River (1,071.63 kg/year) and the resulting, revised reduction requirements. Results are presented in Table 7.

Table 7. Summary of Updates to the Waltham's TP Contribution to the Charles River and Reduction Requirements

	2010 Phosphorus Loading Baseline				Deductions		Adjusted Values	
Adjustment Source:	City-wide (Land Use 2010)	Stony Brook watershed within Waltham (2010 Land Use)	Stony Brook watershed within Waltham (USGS)	2010 final baseline	On-site drainage	Wetland treatment	Updated TP loading	Updated , necessary TP loading reduction
TP load (Kg/year)	2,411.5	(-) 1,183.3	(+)75.1	**1303.4**	(-) 91.5	(-) 140.4	**1071.6**	**156.0**

Therefore, according to the presented calculations, an additional reduction of 156 Kg/year of TP is required to achieve EPA's TP loading goal of 916 kg/yr. This represents an additional 6% of the original baseline TP loading of 2,447 Kilograms of TP/year or an additional 15% of the updated TP loading baseline of 1,072 kg/y.

RE: Comments on the 2014 Draft Massachusetts MS4 Permit
Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

On behalf of the Town of Watertown, we would like to provide comments on the draft General Permit for Discharges from Small Municipal Separate Storm Sewer Systems (MS4).

In particular, the Town of Watertown has serious concerns with the Charles River Watershed Phosphorus TMDL requirements of the permit. We cannot support the permit as written and respectfully request a number of issues be studied in further detail and modified as needed. Though discussed in greater detail in the comments below, they are summarized here:

- The phosphorus reduction requirements are based on crude computer modeling using many assumptions.
- The EPA has not studied whether the required phosphorus reductions are technically or economically feasible in Watertown.
- The EPA is requiring a phosphorus reduction that may exceed the maximum extent practicable. It is unclear what authority the EPA has to do so.
- The cost to implement the phosphorus control plan, if feasible, is completely unknown. The only cost information provided by EPA is based on estimates from three suburban Upper Charles River communities and is not applicable to a dense urban community like Watertown.
- The EPA has no responsibility to track actual improvements to water quality over time in order to substantiate the permit requirements and evaluate progress.
- The permit disadvantages densely-developed communities such as Watertown due to higher phosphorus reduction requirements, higher implementation costs, and a reduced ability of the community to pay for implementation; it favors new development over redevelopment.

The next section of this letter provides detailed comments on the Charles River Watershed Phosphorus TMDL requirements, as described in Appendix F of the permit, followed by specific comments related to the remainder of the general permit.

Appendix F—Charles River Phosphorus TMDL Requirements

General Discussion

The proposed permit sets specific requirements to reduce phosphorus sources throughout the Charles River Watershed. They are based on the respective Total Maximum Daily Load (TMDL) studies for the Upper and Lower Charles River. The TMDLs set wasteload allocations and specify phosphorus reductions for each community in the Charles River watershed in order to address water quality impairments caused by an overabundance of phosphorus in discharges to the river system.

The phosphorus loads in the TMDL were developed based on estimated land uses and assumed export coefficients (pounds per unit time) associated with those land uses. By knowing the different types of land uses and export coefficients, the phosphorus loading was estimated for each community. However, that does not mean that the EPA knows how much phosphorus comes from the MS4. To our knowledge, no actual assessment of the actual, observed phosphorus loading from the Town of Watertown MS4 has been performed by the EPA. We question the validity of basing such an expensive and administratively complex component of the proposed permit based on the many assumptions used to develop the TMDL.

The EPA assumes that water quality goals will be met when each MS4 achieves the required phosphorus reductions, which are based solely on the need to achieve water quality improvements and do not consider whether the reductions are technically feasible or cost-effective. Section 402(p)(3)(B)(iii) of the Clean Water Act states that municipal discharge permits shall require "controls to reduce the discharge of pollutants to the maximum extent practicable." Typically the term "maximum extent practicable" includes certain limitations, including the limits of technology and cost/benefit analysis. In our opinion, the phosphorus reduction requirement may exceed the maximum extent practicable.

As discussed in the permit, the phosphorus reduction requirements of the permit are to be met by developing a phased phosphorous control plan over a period of 20-years. There are incremental phosphorous reductions required at the end of each phase and the total phosphorus reduction must be met at the end of the 20-year schedule. The phosphorus control plan consists of structural and non-structural controls to reduce phosphorus from stormwater. These controls can be subdivided into three categories: ongoing source reduction measures, such as enhanced street sweeping and yard waste collection, performed by the MS4; control measures, such as infiltration or bioretention systems, installed by private property owners in conjunction with new development or redevelopment; and control measures installed by the MS4 on public property or within the right-of-way. A fourth category, requiring private property owners to retrofit their property is noted in some sections of the permit, but it is unclear if it is specifically required.

Watertown is a densely developed, built-out community and there are many challenges that will make it difficult to meet the phosphorous reduction requirement using the three control measures:

- Enhanced street sweeping, catch basin cleaning, and other non-structural BMPs, even if provided to the maximum extent, would only provide a small fraction of the total required phosphorous reduction required by the EPA, based on the credit calculations specified in the permit.

- The Town already requires aggressive water quality treatment of stormwater when sites are redeveloped, but only a fraction of parcels will be redeveloped in a 20-year time period. About half of the Town's land use is high density single- and two-family residential with very limited redevelopment potential.
- Narrow right-of-ways and dense development limits the ability to provide treatment at the source.
- Almost all of the Town's outfalls are located on parkland not under the care and control of the Town, meaning end of pipe treatment may be limited.
- Most Town controlled open spaces and buildings contain intensive uses and a large fraction are cemeteries where structural stormwater controls would be inappropriate.

In addition to these challenges, the costs of the phosphorus control plan are a complete unknown. The cost information presented by the EPA is based on a 2011 study, *Sustainable Stormwater Funding Evaluation for the Upper Charles River Communities of Bellingham, Franklin, and Milford, MA*. We note that the Upper Charles River communities are very different in land use than Lower Charles communities such as Watertown. As shown in the table below, these communities consist mainly of forested and other open spaces, with development primarily consisting of low and medium density residential uses. Watertown is the one of the most densely developed community in the Commonwealth, and consists of over 50-percent high density residential development and 30-percent commercial and industrial uses.

From Attachment 1—Fact Sheet Massachusetts Small MS4.

Community	Commercial	Industrial	High Density Residential	Medium Density Residential	Low Density Residential	Highway	Open land	Agr.	Forest
Bellingham	4%	5%	6%	6%	7%	3%	5%	2%	62%
Franklin	3%	4%	2%	14%	13%	2%	4%	3%	56%
Milford	5%	5%	9%	18%	6%	3%	6%	0%	49%
Watertown	23%	7%	52%	0%	0%	0%	12%	3%	3%

In fact, many of the approaches discussed by the EPA are simply not achievable in densely developed communities such as Watertown. For example, the permit notes that considerable savings can be made by eliminating unnecessary impervious surfaces. One referenced project includes reducing the road width in a residential subdivision from 32-feet to 28-feet; in Watertown, which has significant on-street parking due to high density residential land use, the current average road width is less than 25-feet. Another type of project referenced is the removal of a paved cul-de-sac and installation of a rain garden in its place; there are fewer than five cul-de-sacs in the Town of Watertown.

The fact that conditions in Watertown are so different from the conditions in the study area raises the question of whether any of the study results apply. This includes both the feasibility of attaining the phosphorus reduction requirement as well as the cost of implementation.

According to the Upper Charles River study, the estimated capital cost to achieve the TMDL phosphorous load reduction in the three study communities was $181 million. EPA used an optimization process that is not included in the documentation to reduce these costs and make them appear more palatable. The optimization reduced the total implementation cost to $84 million among the three communities. According to EPA, the average unit cost for phosphorous removal is $41,000/kg-phosphorus removed.

Watertown is required by the TMDL to remove 613 kg/yr of phosphorous. Using the unit cost noted by EPA, this represents a $25.1 million cost to the Town. We believe the cost to Watertown could be significantly higher, in the range of $35 to $50 million. This does not even include ongoing operational costs for increased street sweeping, catch basin cleaning, etc.

Specific Comments

1. The information provided in the permit documentation leaves far too much unknown for municipalities. The EPA must have an honest conversation with communities about the phosphorus control plan. This includes, first, whether the phosphorus reduction requirements are technically feasible and second, what the anticipated implementation costs are in dense urban communities. One step towards achieving this would be to reproduce the work of the Upper Charles River study in Lower Charles River communities.

2. The EPA needs to set a reasonable requirement for phosphorus reduction in each community based on the actual ability to reduce phosphorus loads at an acceptable cost. As it is not clear what regulatory authority EPA has to require controls that exceed the maximum extent practicable, the required total phosphorus reduction requirement should be based on the maximum extent practicable instead of a prescribed total phosphorous load reduction.

3. As EPA has not determined whether the required total phosphorus reductions are technically and economically feasible in each community, each community should identify what level of phosphorus reduction can be reasonably implemented within the 20-year timeframe based on a cost-benefit analysis with the goal of identifying the maximum extent practicable. This requires that each community develop a long-term phosphorus control plan in the first planning phase instead of a series of 5-year plans. The long-term plan should be evaluated and updated every five years.

4. The land use data used to define baseline phosphorus load and reduction requirements are from 2005. In addition to physical changes in land use that have occurred in the subsequent 10 years, a number of large properties have been redeveloped and provided infiltration BMPs prior to discharge into the MS4. In the phosphorus control plan, the MS4 should be able to take credit for all phosphorus reductions achieved since the TMDL was issued.

   Furthermore, the EPA states that land use information shall be submitted along with the year 4 annual report for consideration for future permit requirements and that the phosphorus reduction requirement in the permit must be used in all planning until changes are later approved by the EPA. This creates a significant amount of uncertainty for permittees as they move forward with a 20-year plan. The MS4 should be able to submit updated land use information as soon as it is available for immediate consideration by EPA.

5. In addition to credits for structural and non-structural BMPs implemented by the MS4, the phosphorus control plan should also look at anticipated changes in land use in the community and how these will impact phosphorus loads. The community should be able to take a credit for anticipated phosphorus reductions due to private redevelopment.

6. Page 32 of the Fact Sheet states that "the achievement of the required phosphorus load reductions will necessitate phosphorus load reductions being accomplished on private properties that drain to the MS4 and the Charles River system. Consequently, implementation in these communities would also involve coordination with private property owner." The EPA should clarify the intent of this statement. Does the EPA intend to require communities to make property owners install BMPs on private property outside of a new development/redevelopment regulatory review and permitting process? It is not clear what authority a municipality would have to do so.

7. EPA has analyzed and reached conclusions about the financial impacts of the phosphorous control plan on community budgets in a vacuum. Regardless of the funding source, MS4s have other operational and capital needs. These often include significant expenditures to repair failing infrastructure and provide additional flood mitigation that cannot be deferred and have economic or public safety consequences. Flexibility is required to consider the priority of the phosphorus control plan in relation to the other needs of the MS4. To the extent that such efforts can be combined, this should be encouraged.

8. How does EPA intend to tie the improvements made by the MS4s to actual improvements in water quality in the Charles River? Does the EPA have measurable goals for actual water quality improvement that it anticipates at the end of the 5, 10, and 15-year permit terms? EPA should commit to reviewing water quality data at the end of each permit term and determining if anticipated improvements to water quality are being made. Both the TMDL and the phosphorus control plan schedule should be reconsidered at the end of each permit term based on the actual water quality improvement achieved as well as the ability of the MS4s to implement their phosphorous control plans.

9. EPA must consider the environmental justice, economic equity, and smart growth issues inherent in the phosphorus reduction requirements of the permit. Lack of consideration of the needs of dense communities in developing the permit is itself an equity issue that EPA has created and needs to address.

    - Communities with higher phosphorus reduction requirements tend to be densely developed, older, "inner core" communities such as Watertown (62.4%), Somerville (62.0%), and Arlington (64.1%). Suburban communities, such have Weston (32.1%), Dover (21.6%), and Walpole (23.6%) have significantly lower requirements.
    - The communities with higher reduction requirements also have far less open space, significantly higher density, and older infrastructure relative to other communities. Implementation of the phosphorus control plans will place a greater burden on the inner core communities relative to others, due to more limited implementation options, inherently higher construction costs, and often limited resources that must compete with the need to maintain and upgrade existing infrastructure.
    - Densely developed communities tend to have a larger number of environmental justice neighborhoods. Many of the more densely developed communities have lower incomes relative to less intensively developed suburban communities. The implementation costs may be higher per household, yet the ability to bear the additional financial burden may be lower.
    - The costs of achieving phosphorus reductions during redevelopment of private property will be higher in denser communities relative to new development. The permit creates an economic disincentive for redevelopment of existing urban centers in favor of new development.
    - As previously discussed, the costs for implementation of the plan have not been studied in the inner core communities, but it can be inferred from EPA's own documentation that they will be substantially higher.

10. *Appendix F, Attachment 2—Phosphorus Reduction Credits for Selected Enhanced Non-Structural BMPS*: The requirements to obtain the fertilizer phosphorus credit are burdensome to the point of being unachievable. In order to earn the credit, the permittee must certify on an annual basis that no fertilizers containing phosphorus have been applied in any area in the watershed. An example is provided where an MS4 has determined that approximately 60% of lawns are fertilized in Town in order to estimate its phosphorus reduction credit. Please provide additional guidance on how a municipality can certify that no fertilizers containing phosphorus are applied in any area of the municipality and also how to perform surveys to identify the percent of lawns fertilized. What actions would the EPA take to corroborate such certifications and surveys?

11. *Appendix F, Attachment 3—Phosphorus Reduction Credits for Selected Structural BMPs*: While it is not possible to document phosphorus reduction credits for all structural BMPs, most of the BMPs discussed are not well-suited to highly constrained locations. We believe that the EPA should identify phosphorus removal credits for BMPs that are used in dense urban environments, for example, particle separators, green roofs, and phosphorus removal cartridges/inserts.

Other Permit Provisions

12. *Section 1.7.4 (a)—Public notice of NOI*: The permit does not specify what party is responsible for addressing and responding to public comments received in response to the Notice of Intent. As EPA is publishing the public notice, it should be responsible to respond to comments. Furthermore, the EPA only provides the option to grant authorization, extend the public comment period, or deny authorization under the general permit and require an individual permit. This doesn't appear to provide the EPA or the MS4 the flexibility to obtain or provide additional information that may be required in order for the EPA to issue coverage to an MS4 under the general permit.

13. *Section 2.3.2(e)—Education program*: We agree with the intent of the EPA public education and outreach requirements of Section 2.3.2 of the proposed permit, particularly the provisions for targeted outreach based on community concerns. However, we are concerned about the assessment requirements in paragraph (e), which will require the Town to provide evidence that the educational goals of the program have been achieved and to evaluate the effectiveness of the educational messages. In our opinion, these requirements are vague and need to be clarified.

    The Town relies on its staff and volunteers to provide education and outreach to the community. We do not have a public relations or market research department. Anything beyond a qualitative assessment of effectiveness is not reasonable, in our opinion. As the permit has recommended topics to be included in the education program and media to distribute them, it should also recommend metrics to evaluate them.

    Although we understand the EPA's desire that each community develop messages tailored to its needs, we believe it is extremely inefficient to require each of the over 260 traditional MS4s subject to the permit to develop tailored educational programs. A more cost-effective approach would have EPA, MA DEP, or other organizations evaluate the effectiveness of different education programs, and for MS4s to be responsible for selecting and implementing the programs that meet the needs of their communities.

14. *Section 2.3.4.4—Sanitary Sewer Overflows*: Reference should be made to the MA DEP Sanitary Sewer Overflow Bypass Notification Form. We also believe the requirement in Paragraph (d) to report all SSOs should be modified so that only SSOs that impact the MS4 are identified.

15. *Section 2.3.4.6—System Mapping*: Mapping of private stormwater treatment structures should be recommended. Private stormwater treatment structures may discharge to the MS4.

16. *Section 2.3.6(a)(ii)(a)—stormwater retention*: This section requires stormwater management systems on new and redeveloped sites to either retain the first inch of runoff from all impervious surfaces on site or provide the level of pollutant removal equivalent to bioretention on the first inch of runoff from all impervious surfaces on site.

    a. It must be acknowledged that this level of treatment may not be achievable on linear projects such as road reconstruction projects. Available space within right-of-ways is limited by adjacent properties, sidewalks, and underground utilities. We note that paragraph (b) of this section requires the permittee to assess current street design to reduce impervious cover and support low impact development designs. We recommend that linear projects be wholly exempted from this requirement.

    b. As written, this requirement appears to include the entire impervious area of a redevelopment project. Meeting this requirement would significantly increase costs to the developer. While we sympathize with the intent of the requirement, it may act as a barrier to redevelopment of brownfield sites. We believe that this requirement should apply only to the impervious areas disturbed during redevelopment, and that any areas of a larger redevelopment project that will not be altered should be exempt from the requirements.

    c. This section sets different standards than those set forth in the existing MADEP Stormwater Management Policy. Having two sets of standards will cause conflict and confusion for MS4s and developers. If the EPA desires more stringent standards than those already promulgated by MADEP, then it should work to affect changes within the existing State regulatory framework instead of attempting to supersede them with different, conflicting requirements.

    d. Although well-intentioned, aspects of this requirement are extremely problematic from an urban planning perspective. The Town desires to preserve and in some instances increase density in certain areas. In Watertown Square, for example, zoning allows for full lot building coverage to create an urban fabric. Requiring redevelopments in urban centers to meet the recharge and treatment requirements standards directly conflicts with core community goals, may actually discourage development in these areas, and will have negative economic impacts on these areas in the form of reduced development potential. It should be noted that one BMP that might be employed on a full lot building is a green roof; it appear that there is no consensus as to whether green roofs provide phosphorus removal.

17. *Section 2.3.6(d)—Directly Connected Impervious Area (DCIA)*: additional clarification should be given as to what constitutes DCIA. Many stormwater management systems provide partial infiltration of stormwater up to a particular design storm, but retain an overflow connection to the MS4.

18. *Section 2.3.7(a)—Operations and Maintenance Programs*: this section requires written operations and maintenance procedures for municipal activities, including parks and open space, buildings and facilities, and vehicle and equipment areas. These plans are required within the first year of the permit term. This is

an aggressive schedule, given the need for site-specific plans. We recommend that four years be provided for full compliance with this requirement.

19. *Section 2.3.7(b)—Catch Basin Cleaning Program*: The data collection requirements for catch basin cleaning are onerous and burdensome and not commensurate with the benefit provided. We recognize that catch basin cleaning is an important part of municipal operations and does provide a water quality benefit to the MS4. The permit requires the MS4 to track the volume or mass of material removed from each catch basin draining to water quality limited waters. For Watertown, this would require us to track the volume or mass removed from each of our approximately 3,200 catch basins. This would result in significant additional costs to the Town and would not necessarily provide any water quality benefit. We request that the requirement to track volume or mass of material removed from each catch basin be eliminated.

20. *Section 2.3.7(f)—Cleaning of Storm Drainage Systems*: Clarification on what constitutes the storm drain system, for purposes of identifying inspection and maintenance procedures, is required. Does this mean pipes? Pipes provide the means of conveyance of flow and it is unusual for an MS4 to actively inspect them. Inspection of drain pipes, beyond what is required through the IDDE requirements, would be costly and not provide any additional water quality benefit.

Thank you for the opportunity to comment on this proposed permit.

Sincerely,

Matthew I. Shuman, P.E.
Town Engineer

RE: Town of Webster Comments on 2014 Draft Massachusetts MS4 Permit

Dear Mr. Tedder:

The Town of Webster has been working diligently with our engineering consultant, Tighe & Bond, and our surrounding communities through the Central Massachusetts Regional Stormwater Coalition to review the Draft Massachusetts MS4 Permit. Through these two entities and our own review, we offer the following comments and concerns:

1. The Town retains the right to appeal any provision of the Final Massachusetts MS4 Permit as allowed by law and regulation.
2. The timelines for compliance will be very challenging and likely unachievable. The detailed cost for compliance must be established so that a funding source may be derived and approved by local governing bodies. This will likely take more than a year, even if funding is approved through the first vote. Please consider extending all compliance timelines for at least 12 months to allow communities time to finalize cost estimates and establish funding prior to performance of compliance efforts.
3. Compliance with the proposed requirements to address the Long Island Sound nitrogen TMDL will be very costly with unknown benefits. Preparing a Nitrogen Source Identification report will be incredibly time consuming and expensive. If EPA is saying communities in the watershed must reduce nitrogen, the planning process should focus on what is feasible and what potential load reductions are possible from various practices. This is a better use of our time and money. Please revise the requirement to reflect this. In addition, please consider allowing the Municipality to determine the best measures to achieve loading reductions overall, whether it be structural or non-structural practices. There will be minimal opportunities to install structural BMPs, if any. Regardless of feasibility, once a location is found, obtaining funds, designing, permitting, and constructing structural BMPs will take much longer than a year to complete. Please consider revising the permit to extend timeframes by at least five years to allow time for these efforts.
4. Do the individual TMDL reports, the 303 (d) list, EPA's tables in the permit, or another document govern interpretation of TMDL and impaired waters applicability? While Webster is included in the draft permit requirements to address the Long Island Sound TMDL for Nitrogen, none of the Town water bodies or waterways are impaired by nitrogen. Please address this issue in the final permit. Also, please clarify EPA's rational and authority to broadly impose nitrogen reduction requirements in unimpaired tributaries in our watershed and please revise the permit to reflect necessary changes.

5. Webster began installing select outfall identifiers and found the work to be difficult, costly, and not beneficial to the program. Each outfall identifier cost approximately $13 in materials, plus the cost of labor to place the markers. Finding the correct label and installing the markers in the ground with the specialty driving tool was time consuming. It is expensive to label every outfall with no apparent

direct water quality benefit for this effort. Identifying outfalls by using our drainage system maps and GIS locations is much more useful for Webster than placement of physical outfall identifiers. Please consider revising the final permit to remove the requirement to physically label outfalls and interconnections and instead allow outfall labels/numbers to be included in the effort to develop an accurate drainage system map and complete outfall/interconnection inventory.

6. IDDE screening and sampling will be costly and time consuming and bear very limited benefits in lower priority catchment areas/outfalls. The IDDE effort should focus on which catchments are likely to have illicit discharges and which ones are unlikely to have illicit discharges. Then the likely catchments should be prioritized by severity. Please consider requiring screening and sampling programs for only high priority locations. Please consider putting an annual cap on catchment investigations based on the number of points inspected (such as outfalls, manholes, interconnections) to level the playing field across communities.
7. We are very concerned about the manhole inspection methodology that requires investigation of each key junction manhole within the MS4, even where no evidence of an illicit discharge is observed at the outfall. This requirement is onerous with little potential benefit to improve water quality for the amount of effort, and will put our staff and contractors at safety risk during the work, require police details, and cause traffic. Please consider revising this section of the permit to only apply the manhole inspection methodology when evidence of an illicit discharge is observed at the outfall.
8. Meeting the wet weather screening and sampling requirements by the deadlines specified in the permit will be an all-consuming effort for Town staff and our consultants each Spring, particularly when nearly all catchment areas have sewer lines and infrastructure greater than 40 years old. Please consider reducing the wet weather screening requirements in conjunction with an annual cap on catchment investigations referenced in our previous comment (6). Please also consider extending the wet weather monitoring period to include summer and fall to give us more time to get to the structures.
9. Stormwater management for new development and redevelopment projects is currently consistent with the Massachusetts Stormwater Handbook, the Wetland Project Act and associated regulations. Please consider removing the requirements related to retaining 1" or providing the equal amount of pollutant removal. EPA should work with MassDEP in a public process to vet the technical components of the proposed requirement, feasibility, and revise the Massachusetts Stormwater Handbook instead of adding this requirement to the MS4 general permit.
10. The requirement that a catch basin sump be not more that 50% full will be very difficult to physically manage in the field. Towns with aging infrastructure have a wide variety of sump depths. At a minimum please consider revising this standard to cite a distance from pipe invert to top of sediment as the controlling factor. Overall, this is an onerous requirement. Please considering revising the permit to require annual catch basin cleaning, or for a reduction in frequency, using a benchmark. Also, please consider how increased sweeping reduces need to clean catch basins and revise the permit accordingly.
11. The draft permit contains numerous reporting milestones and report content requirements. Please consider including, in the final permit, a complete timeline chart and specific reporting checklists.

The Town of Webster is committed to improving stormwater discharge quality and maintaining environmental permit compliance. We ask that you consider these comments and those of our surrounding communities in preparation of the final permit.

Sincerely,

John F. McAuliffe
Town Administrator - Town of Webster

REFERENCE: COMMENTS TO THE DRAFT SMALL MUNICIPAL SEPARATE STORM SEWER SYSTEMS PERMIT

Dear Mr. Tedder:

Please accept these comments on the draft General Permit for Discharges from Small Municipal Separate Storm Sewer Systems (MS4). While Wellesley is a strong supporter of the goals that the existing and proposed NPDES MS4 permit seek to achieve, we are nevertheless concerned about the cost and practicality of the measures proposed. The Town also believes that the proposed permit lacks an adequate scientific basis for establishing the target phosphorous reductions and, as written, will produce mostly an administrative work product, rather than practical solutions or true improvements to actual water quality. This is a major concern for the community. Our comments on specific sections include:

Section 2.1.1 and Appendix F: Phosphorous Control Plan.

According to Appendix F, Wellesley is required to achieve a 49% reduction in phosphorous loading as compared to existing conditions. The land use data selected to define the baseline phosphorous load and reduction requirements are from 2005. We believe that any rational assessment of current phosphorous contributions from Wellesley and surrounding communities needs to be based on more current data, and that it is unreasonable to rely on data that are essentially a decade out of date. At a minimum, however, if EPA insists on requiring the reduction rates proposed, permittees should be given credit for all phosphorus removal efforts completed since 2005.

Additionally, the draft permit does not appear to make any assessment of a community's ability to achieve the proposed reduction rates. In Wellesley, for example, it appears that non-structural solutions will represent less than a third of the Town's target reductions. Thus, achieving a 49% reduction in phosphorous loading will require a significant capital investment in Low Impact Development ("LID") projects. However a mojority of the land owned by the Town where stormwater systems are located are roadways with a defined right of way, where implementation of LID projects will be cumbersome. The near-term future will involve purchasing equipment and services for items such as vacuum-style street sweeping equipment, increased catch basin cleaning and disposal, organic waste and leaf litter collection, and development and implementation of public and private phosphorous control plans coupled with LIDs to revert paved areas to pervious ones, to install green roofs and to narrow roadways. This will add significant costs to the Department of Public Work's operations.

The Town believes that EPA should assess and target practical solutions to high phosphorous levels, rather than imposing a generic set of requirements that may not be suitable for all communities. Specifically, Wellesley has very active organic fertilizer education and pesticide reduction programs that, in combination with the 2010 law reducing phosphates in some detergents and the more recent lawn fertilizer phosphorus reduction law, may already be achieving the proposed goals.

Section 2.1.1 and Appendix F Attachment 2: Collection Systems.

The draft permit fails to define "collection" and "gather and remove" as used in Appendix F Attachment 2. Wellesley is a "drop off" community for all solid waste, household hazardous waste and leaf/lawn waste. Yet it is unclear whether Wellesley's current program would comply with the requirements of Attachment 2 of Appendix F.

Section 2.3.2: Targeted Education.

Wellesley has been consistently active with public education and involvement. Our Natural Resources Commission, Trails Committee, Sustainable Energy Committee, Board of Selectmen and several planning and permitting boards have issued coordinated and frequent notices related to the importance of stormwater management. The DPW staff has made presentations at the public schools and participated in annual stencil programs with the school children. The Town has established a 24-hour stormwater hotline. While the Town believes that the community is benefiting from these efforts, there is no indication that they have resulted in measurable improvements.

Section 2.3.4.5: Field Labels.

The draft permit requires the permittee to affix a physical label on all MS4 outfalls. The Town has made significant effort both in GIS and in field-proofing the data it has accumulated. The Town has also invested in asset management and can respond on demand to situations while in the field. With these tools, the Town believes that the cost to install and maintain field labels is unnecessary.

Section 2.3.4 and Section 2.3.7: Training.

The draft permit expands on training requirements, which will result in significant costs to the Town. We believe that there are opportunities for regional workshops or mass-produced training modules, possibly developed under the guidance of the EPA.

Section 2.3.4.7: Increased Sampling.

The draft permit outlines a regimen of dry- and wet-weather sampling, but EPA has provided no evidence or rationale to justify such a requirement. Our discussions with communities already implementing a wet-weather testing program suggest that the data collected are erratic and not useful for identifying potential areas for improvement.

In addition, the draft permit requires the Town to observe and evaluate key junction manholes "progressively" based upon System Vulnerability Factors, to conduct confirmatory testing, and to monitor interconnection points. Wellesley's entire system contains at least one System Vulnerability Factor and will therefore require both wet- and dry-weather monitoring. In addition, the Town has numerous interconnection points with surrounding communities, the MBTA and MassDOT. The permit requires 80% of this work to be complete within three years and 100% within five years. This schedule is too aggressive. Furthermore, the Town estimates that such sampling will result in costs of $250-300 per test, plus labor, at each location, far more than the benefit to be derived from the effort. EPA should revise the draft permit's sampling methodology to weigh more realistically its financial impact on permittees.

Section 2.3.6: Increased Municipal Responsibility for Private Stormwater Systems.

The draft permit requires that municipalities conduct inspections, create systems to track performance, and perform post-construction monitoring of LID and Best Management Practices ("BMP") systems installed on private property. The Town's current practice (which is based on the State's policy under the Undeground Injection Control program) registers locations and owners, but refrains from explicitly making owners and operators responsible for their systems. If the proposed language stands, some of this responsibility will apparently be shifted to permittees; this may lead to difficult legal contests and expensive engineering analysis. This work will be in addition to the annual inspections of all municipally owned BMP systems, a list that has doubled over the last five years in Wellesley.

Section 2.3.6 and Section 2.3.7: Discontinuity between Wellesley's built environment and some new permit objectives.

The draft permit requires municipalities to conduct analyses associated with reducing impervious areas and other LID projects. Wellesley's network of storm drains is largely built out, and there is little room or opportunity to make significant strides toward the program's goals. The Town has robust regulations governing redevelopment that, in the last ten years, have resulted in the installation of 41,500 sq.ft. of pervious pavement, 41 infiltration systems, five rain gardens and several locations with rain barrels or other rain

water re-use systems, and several grit/oil separators. Ten of the large infiltration systems are on Town-controlled land.

Notably, Wellesley has direct experience with actual phosphorus management at Morses Pond and can attest that the effort requires both professional expertise and significant investment to achieve meaningful results. Additionally, the community is currently undertaking the Fuller Brook Path Preservation project that includes stormwater features such as bio-filtration. Significantly, this project represents over eight years of work collecting public comments, obtaining the required permits, and issuing contracts to complete the work. When completed, the community will have spent approximately $8 million.

While the Town will continue to pursue such installations, the draft permit fails to take into consideration that such improvements are generally achievable only in connection with public and private redevelopment projects. The Town believes that it is unwise to insist on the pursuit of such installations in circumstances where there are no obvious economic incentives and no clear benefit to be derived by the property owner.

These sections also include new standards for stormwater treatment that appear to be inconsistent with the MassDEP Stormwater Management Handbook. In particular, Wellesley would like clarification on the requirement to retain one inch of stormwater since the current practice for all applications has been 0.5 inches unless a higher pollutant load or an environmental sensitive area applies. More importantly, the draft regulations should be clear on what standard is expected for redevelopments, as these are frequent applications in Wellesley. The EPA needs to specify if the retainage requirement is related to the net change in impervious area or if a maximum extent practicable guideline is appropriate. We have three colleges within our borders; a standard that requires one inch of recharge for their impervious area will make any proposed additions cost prohibitive. We also believe that exemptions for road reconstruction and repaving are necessary.

The Town's experience with the BMP selection process is that the pressures of land value and economic redevelopment have resulted mostly in subsurface infiltration and groundwater recharge systems. It is unclear how these systems (which, in some cases, can sever runoff from large parking and roof areas) will be accounted for in future caclulations of impervious areas and directly connected impervious areas. We recommend that the EPA provide more specific information, and consider regional workshops on the topic of directly connected impervious areas.

Section 2.3.7.b: Stormwater Pollution Prevention Plan (SWPPP)

The draft permit will require SWPPP for all publically owned facilities. In Wellesley, this will span several jurisdictional bodies. The Town is concerned that this work cannot be completed within the required two-year time frame due to the need to contract with experts and obtain the requisite funding.

General Comments.

In addition to the section-specific comments above, we offer the following general comments and thoughts on the draft permit:

The Town continues to be concerned that the draft permit is written in a one-size-fits-all form. It does not reflect the diversity among the MS4 communities, the level of progress during the first phase, or (most importantly) any community-specific data. Wellesley is a community of approximately 26,600 people, consisting largely of residential neighborhoods located about 13 miles west of Boston in the lower Charles River basin. The Town has made consistent and significant investments in stormwater infiltration and groundwater recharge over the last decade. The Town's efforts related to public education and participation are strong and storm drain maintenance activities including catch basin cleaning, street sweeping, pipe cleaning and replacement are at all-time highs. The Town continuously strives to position our community as a steward of sound environmental investments. We are the Commonwealth's first municipality to become an EPA Green Power Partner Community. We are currently constructing one of the region's larger brook and park restoration projects. We operate an active phosphorous reduction system at Morses Pond. However, we must also be cognizant of our obligation to deliver quantifiable improvements.

It is worth noting that this draft permit will increase the number of required written programs, polices, procedures, self assessments, and reports. Some components of the permit require reporting on items that are covered by existing regulation, which will require duplicate efforts. These requirements all come with a cost; yet they yield little in genuine water quality benefits. We urge you to streamline reporting where possible and to focus on achievable performance goals.

Academics and scientists at Worcester Polytechnic Institute have reviewed the permit and concluded that implementation costs are a significant concern. Preliminary projections indicate that compliance with this permit's terms and conditions will cost Wellesley between $700,000 and $900,000 per year. The Town has reviewed estimates that indicate it may cost between $550,000 to $650,000 just to comply with the phosphorous-control elements of the permit, which may exceed $2,000 per pound of phosphorous theoretically removed. The Town doubts that this is the most strategic way to restore impaired waterways.

The timelines associated with the permit also seem unrealistic. Many of the requirements are front-loaded, giving communities that require staffing changes and increased funding a sizable problem. Clearly the draft permit does not reflect the likely need to prepare for and obtain approval from Town Meeting. The Town strongly suggests that EPA and MassDEP initiate a public awareness campaign related to the need for the expansion to the program, its expected costs and its environmental benefits. Further, if this a priority area for the EPA, consideration of grant funds must be made. These efforts would go a long way to communities obtaining support for the MS4 program.

The Town of Wellesley is committed to improvement of its waterways. However, the Town urges EPA to take our concerns seriously and to engage in an inclusive and thorough dialog with municipal permittees before finalizing the permit.

Thank you for the opportunity to present our concerns.

Very truly yours,

David J. Hickey, Jr., P.E.
Town Engineer

Attention: Comments on the 2014 Draft Massachusetts MS4 Permit Docket ID No. FRL-9917-31-Region-1; Document No. 2014-23262

Dear Mr. Tedder;

The Central Massachusetts Regional Stormwater Coalition (CMRSWC) is a group of 28 towns including my Town of West Boylston, most of which are regulated under the United States Environmental Protection Agency's (the Agency's) 2003 NPDES Phase II Massachusetts Small Municipal Separate Storm Sewer System (MS4) Permit. The CMRSWC was formed in 2011 as a regional partnership to manage stormwater programs and ensure the long-term protection of water resources. Working as a group has allowed the CMRSWC to develop tools to expand our stormwater management practices, collectively protect shared resources, and meet the requirements of the 2003 Massachusetts MS4 Permit in an efficient and cost-effective manner.

This coalition has also created an effective forum for collaboration, communication, and discussion among the municipal representatives that attend the regular meetings of our Steering Committee and with other stormwater collaboratives in the Commonwealth of Massachusetts and New England. It is at several of these meetings and at related events that the CMRSWC has discussed the proposed Draft 2014 Massachusetts MS4 Permit that was released for public comment by the Agency on September 30, 2014, hereafter referred to as "the proposed Permit".

The following pages outline the concerns that members of the CMRSWC have with the proposed Permit. While I have specifically mentioned our general concerns, other members of the CMRSWC will go even further to address more specific concerns which apply to unique sections of the proposed Permit. Where appropriate, we have provided suggestions for replacement language (or clarification) that would better align the proposed Permit with other MS4 Permits in New England, or have outlined provisions, concepts, or metrics we believe are more suitable or feasible (for in-the-field implementation).

1) The members of the CMRSWC are supportive of proposed Permit provisions that will directly result in improved water quality, but object to those that are administrative or arbitrary, and that will not have a direct bearing on water quality.

2) We encourage the Agency to update its own guidelines about how regulated communities are expected to balance compliance with the Permit (in its final form) with the ability to afford that compliance without experiencing economic hardship. Since 1997, the Agency has generally considered a maximum combined annual water and wastewater bill of 4.5% of mean household income (MHI)- 2% for drinking water and 2.5% for wastewater services- to be affordable. In their May 2013 "Affordability Assessment Tool for Federal Water Mandates" report, the United States Conference of Mayors, the American Water Works Association, and the Water Environment Federation (see *Attachment B*) argue that MHI is a poor indicator of economic distress, bears little relationship to poverty within the community, does not capture variation across diverse populations, and does not account "for the historical and future trends of a community's economic, demographic, and/or social conditions", especially during recessions and recovery from them, such as Massachusetts is presently experiencing. Municipal revenues are decreasing, and further restrictions on development or redevelopment are not in the best interest of communities struggling to maintain the level of service expected by residents.

   Even so, if we were to use MHI as the basis for evaluating a community's ability to afford a stormwater management program to comply with the proposed Permit, the 4.5% MHI cap would easily be exceeded if stormwater costs were included- along with drinking water and wastewater- in the calculation. This is true whether a community funds its program traditionally through the tax base or has developed a sustainable funding mechanism such as a stormwater utility or stormwater enterprise fund. In some rural Massachusetts towns, the cost of stormwater compliance will exceed the cost of wastewater compliance and the total cost for compliance with water regulations may well be closer to 10% of MHI. Leaders and administrators in these towns will have a difficult task, indeed, to convince their residents and business owners that some of the provisions in this proposed Permit will result in water quality improvements commensurate with the expense.

   Finally, several members of our community have calculated (or begun the process of calculating) their increased cost of compliance with the proposed Permit as compared to the 2003 MS4 Permit. In 2014, as part of an ongoing partnership between the CMRSWC, the Massachusetts Department of Environmental Protection (MassDEP), and the Worcester Polytechnic Institute's Integrated Qualifying Project (IQP) program, three of our member communities (Holden, Millbury, and Southbridge) participated in a project to quantify current and projected stormwater program costs (see *Attachment C*). The IQP report team assumed that provisions the proposed Permit would be implemented as drafted, and evaluated the cost of new and expanded provisions as well as maintaining compliance with other Permit provisions. Among the conclusions, the IQP report team calculated the annual costs for implementation of the proposed Permit for the towns of Holden ($258,790), Millbury ($753,173), and Southbridge ($343,008). These projected costs represent increases of 39%, 30%, and 28% over current annual stormwater program budgets, respectively, and do not include other one-time or intermittent costs (such as capital expenditures like equipment), or the costs of design and construction of projects that may be required to eliminate illicit discharges. Even allowing for the imprecision inherent in a project of this scale, the consistency in comparative relative increases calculated for three communities tells a story that will be repeated across the Commonwealth.

   We all agree that clean water supports our communities in many, many ways; notwithstanding this, the absence of guidance on how to best afford the increased costs of stormwater management cannot be ignored.

3) We encourage the Agency to include flexibility in the final Permit with respect to the date on which the Permit in its final form will become effective in each community. Flexibility in setting the effective date will allow each town the opportunity to budget for Year 1 and Year 2 tasks, specifically, within the municipal budget cycle, which will likely be out of sync with the Permit cycle. In the last few years, many communities have been telling their leaders and residents that the new Permit would be out "soon" based on updates from the Agency, with the target issue date moving over the course of several municipal budget cycles. Many of these leaders will face reluctance, skepticism, and frustration when proposing increased stormwater program budgets, and will need to re-educate their decision makers about why these increases are required.

4) We believe that many provisions in the proposed Permit do not lend themselves to implementation over a five-year Permit term, at least in a way that is affordable for the regulated communities and that results in meaningful improvements to water quality. Instead, we propose that the Agency extend the schedule for several specific provisions, such as development and implementation of a catchment delineation, over a ten-year period. The Commonwealth of Massachusetts has in place a statutory framework that allows for such an extended timeline as a Compliance Schedule within a NPDES Permit. Indeed, the Agency has taken advantage of this extended schedule in the proposed Permit for the Catchment Investigation Procedure (see Section 2.3.4.8(c)(iii), IDDE Program Implementation Goals and Milestones, Page 37). This compromise will comply with Clean Water Act 402(b)(1)(B) while providing flexibility for the regulated communities. Where we believe this extended schedule is appropriate, we hereafter refer to it in subsequent comments as a "10-year Compliance Schedule".

5) When describing dry weather and wet weather screening and sampling and outfall/interconnection screening, the proposed Permit frequently refers to "detectable levels of chlorine". It should be noted that chlorine is detectable in most if not all outfalls and at perimeter of many of Massachusetts' surface water bodies using many field kits available today, and this detection limit is likely to become lower (identifying smaller and smaller concentrations of chlorine) as technology improves. Treated drinking water entering a stormwater system is the potential source the chlorine indicator is intended to highlight. However, chlorine in drinking water is highly volatile, and decomposes quickly once discharged to a surface water body and exposed to sunlight and the ambient atmosphere. If all outfall samples would demonstrate "detectable levels of chlorine", but the chlorine will degrade quickly within a water body, this parameter ceases to be useful as a screening tool.

   We request that the chlorine parameter either be removed from all sections discussing screening methodologies, or that a numeric threshold be established- based on peer-reviewed data- that can correlate a specific elevated detected chlorine concentration to a potential illicit discharge, such as a grey water connection (or the absence of elevated bacteria) or a cross-connection (in the presence of elevated bacteria).

6) We have observed that many provisions in the proposed Permit include the development of a written program, written inventory, written report, written procedures, or other "written" documentation. These proposed provisions counter a shift on the part of many regulated communities to cloud-based infrastructure management systems, such as the online mapping and inspection platform used by our 28 members. Many communities use these cloud-based tools because they work with mobile devices, reduce paperwork, and allow data to be added to a management system in real-time. These tools reduce the amount of inefficient administrative time to enter information into a form or spreadsheet and typically allow towns to create work orders from the field for follow-up or maintenance activities. The data is every bit as useful and accessible and can be readily queried into reports to provide summaries and snapshots.

   Managing operations and maintenance procedures through cloud-based systems such as the one the CMRSWC uses is also more effective- if a change is made to a procedure or form on our

platform, that change is available immediately to all users in all 28 communities without the need to print new forms, distribute them to all members, and inform our many, many users that the new form shall be used. These workflow improvements should be considered to be enhancements, and encouraged as they are consistent with federal efforts to reduce paperwork and not "overburden the public with federally sponsored data collections", mentioned as the goal of the Paperwork Reduction Act.

We also know that many regulatory agencies like municipalities to maintain hard copies of documents at multiple locations, even though this practice does not lead to improved use of these documents. The *absence* of large volumes of paperwork doesn't mean that a community isn't implementing something any more than the *presence* of many binders means that a community is effectively utilizing the programs in them. Decreasing the use of paper in our work environment is also environmentally preferable.

It is important for both the Agency and the public to realize that increased use of technology and cloud-based tools allows local governments to work more efficiently and respond to their needs and requests more efficiently.

This modernization should be encouraged, and we request the Agency to incorporate flexibility for many of the "written" submittals requested to be implemented as modules within asset management platforms, and allow the permittee to demonstrate by other methods that these procedures, inventories, etc... exist and are being utilized.

7) We strongly encourage the Agency to engage in conversations and workshops that lead to development of a Final MS4 Permit that MassDEP is willing to sign onto. The alternative to a joint Permit, outlined by the Agency's Thelma Murphy at a meeting of the Northern Middlesex Stormwater Collaborative in Lowell, MA on December 4, 2014, would be two separate Massachusetts MS4 Permits: the current 2003 Massachusetts MS4 Permit would continue to be enforced by MassDEP, and the new Final Massachusetts MS4 Permit would be enforced by the Agency. Mayhem would ensue due to administration, operations and maintenance, and coordination duplication resulting from each of the Commonwealth's regulated communities being subject to two separate, parallel MS4 Permits. In practice, progress toward improving water quality would likely stop as legal challenges were filed, which is not in the best interest of any party involved.

This coordination should begin as soon as possible to reach a version of the permit agreeable to both organizations and compliant with the Clean Water Act, Massachusetts' Surface Water Quality Standards, and associated supporting documentation, so that water quality improvement activities across the Commonwealth can be focused and consistent.

Thank you for the opportunity to present these brief comments to you. Please know that the Town of West Boylston also supports the Specific Comments offered by the larger organization as well.

With regards,

RE: Town of Westborough, MA Comments on Draft Massachusetts Small MS4 Permit

Dear Mr. Tedder,

The Town of Westborough appreciates the opportunity to review and comment on the Draft Massachusetts Small MS4 General Permit made available in September 2014. As you may or may not know, the Town of Westborough commented on the first draft permit via letter to Ms. Kate Renahan dated January 5, 2011. We applaud the fact that this "2nd" draft of the permit recognized some of our earlier comments and the concerns of others by making time frames more manageable, as well as making the permit more directed to communities in various watersheds. However the level of detail required remains substantially higher than anticipated. As a result, the funds required to meet the permit and to continue the maintenance which is mandated greatly exceed what the Town can acquire for funding.

As we did in the review of the first draft, the following numbered comments provide some specific examples of areas within the draft permit which we see as problems. In most cases we have provided a specific recommendation with the numbered comment. We ask that you review these comments and recommendations for consideration when issuing the final permit. You will note that comments 1-3 remain verbatim per our first review. Many of the remaining comments are similiar:

1) The cost of implementation will be a significant burden to the Town. The Town has many high priority needs competing for limited available funding. The new

requirements contained in the Draft General Permit amount to unfunded federal and state mandates with the burden of implementation falling upon local communities.

2) The Town believes that regulatory changes should be promulgated at the state or federal level, not the local level. There are many reasons why this makes more sense than requiring municipalities to promulgate their own regulations.
   a) Watersheds contain more than one municipality, and conversely one municipality may be contained within two or more watersheds. Therefore a regulation promulgated by one community may be contradictory to those promulgated by another community.
   b) Local ordinances are not easily enforceable and do not have the strength of state or federal laws.
3) Section 1.9 contains several sections outlining information required for Special Eligibility Determinations involving endangered species, specific habitats and historical properties within each community. So, in essence, one branch of the Federal government is asking the community to inform the other branch (the EPA) of the requirements of the other Federal branch and asking the community to perform the coordination. The permitting authorities should coordinate the reviews by these agencies within the comment periods and with particular future milestones in mind, and all comments should be funneled through the permitting agencies to the applicants via formal comments.
4) Section 1.10 of the Draft General Permit has been revised so that the written Stormwater Management Program (SWMP) must be completed within one year following the Town's receipt of authorization from EPA to discharge under the Permit. The Town finds this timeline much more reasonable than the original120 days. Nevertheless, in Section 1.10 c, the permittee is "encouraged to maintain an adequate funding source for the implementation of this program." Adequate funding means that a consistent source of revenue exists for the program. Furthermore, a "consistent source of revenue" implies a funding mechanism such as a stormwater utility assessing user fees. This type of program could require years to develop and implement, normally requiring multiple levels of review and approval from town boards and committees, town counsel, town meetings or general elections, and sometimes the state legislature. At a time when communities are not flush with money, and when most communities do not have enterprise funds for addressing stormwater infrastructure needs, the financial obligations of the proposed regulations may be insurmountable.
5) Section 2.3.2 requires that public education and outreach materials be provided, having each community create their own language and graphics for brochures, websites, signs, etc. We maintain that this method is an inefficient use of resources. We continue to maintain that the majority of the information on non-structural controls which may be implemented by the public is generic and can be provided in a series of templates to communities. We do note that the current draft contains a link to for outreach materials and contend that a few versions of this information could be developed depending on the size and demographics of each community or depending on the watershed. Templates could include areas where communities can input information specific to their locations. Proving these templates would greatly reduce duplicate efforts and costs.

6) Section 2.3.4.6 requires a map of the MS4 system to be completed in 2 years. The level of detail and information required (i.e. individual catchment areas for each outfall) is substantially more than what has been obtained or required for the current permit. It is much more reasonable to require this map be completed by the end of the permit term.
7) Section 2.3.6.d outlines requirements to measure and monitor changes in impervious area and is an interesting academic exercise, however provides little benefit to the municipality. The rate of land development in Westborough may be significantly slower compared to other communities as the Town is nearing full-build-out conditions. This results in significantly lower rates of changes in impervious area (IA) and directly connected impervious area (DCIA). This exercise will be burdensome and will take staff away from more valuable functions. As we noted in the 2010 draft permit, if change in impervious surface over time is a metric of interest to Federal and State regulators then perhaps every 10 years the regulators can utilize advances in satellite imagery or other statewide GIS data to track this information. Municipalities should not be charged with gathering data that does not provide them with useful information.
8) Section 2.3.7. outlines a myriad of categories and requirements for Good House Keeping in municipal ways and facilities as well as providing operation and maintenance plans for various facilities. As we noted in our first draft review and we re-emphasize in this comment letter we are not in the business of collecting data for scientific study and the level of sophistication to collect data with truck driver/laborers is somewhat limited. Furthermore, this section requires that within one (1) year from the effective date of the permit, written operations and maintenance procedures for municipal activities be developed. The Town anticipates that significant effort in planning and coordination with various Town departments is needed and requests that full Permit Term (5 years) be granted for this effort.
9) Section 2.3.7.b. requires that SWPPPs be developed and implemented for maintenance garages, public works facilities, transfer stations, and other waste handling facilities. The Town recommends that a comprehensive SWPPP that covers all of the facilities be required rather than developing individual SWPPPs for each of the facilities. Developing and implementing individual SWPPPs will result in significant cost burden to the Town. The term "waste handling facilities" needs clarification.
10) Section 4.3 and the IDDE requires outfall monitoring and reporting each year in both wet and dry weather conditions. As we noted in our 2010 draft review, this requirement will result in significant costs and is not likely to produce data that could be used to significantly improve the water quality. This should be lowered to a more achievable level, such as 10% per year, starting with known problem areas. Because of the unpredictability of stormwater quality, wet weather monitoring is likely to be of little value. Such monitoring should be kept to a minimum. Only dry weather running outfalls should be tested. Our town does not have combined sewer and does not feel that it is warranted to spend time and money on this expensive task including: establishing a plan, testing, analysis, documentation and reporting.

As we noted previously, many of the individual requirements on their own would be achievable. However, requiring so many varied tasks of each community during a five-year permit cycle is unrealistic and is potentially setting communities up for failure to comply. If communities are presented with a permit they can meet, they are more likely to successfully invest the necessary funds and labor into implementation. For this permit cycle, the program should be pared down to a list, approximately one half of what is identified to make them achievable goals that build on but do not exponentially increase the efforts required to comply with the 2003 permit.

Sincerely,

Lisa C. Allain, P.E.

RE: Draft NPDES General Permit Comments

Dear Mr. Tedder:

The Westford Engineering Department has prepared the following comments for your consideration. In addition to these comments, we are also supportive of the letter prepared by the Northern Middlesex Stormwater Collaborative, of which Westford is a founding member, and the comments submitted by our stormwater consultants at Tighe & Bond, especially as those comments relate to linear construction, redevelopment and reporting.

Regarding 2.3.6 Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management) Part 2.3.6.a.ii.(a) 1.-2., Page 40:

Please consider the benefits of resolving conflicts between the MADEP Stormwater Standards and the USEPA MS4 Permit – Pursuant to its authority under the Massachusetts Clean Waters Act, M.G.L.c. 21, §§ 26-53, and the Wetlands Protection Act, M.G.L .c. 131, § 40, the Massachusetts Executive Office of Energy and Environmental Affairs published the Handbook as guidance for the effective treatment of stormwater runoff and has served as the stormwater standard for Commonwealth communities since 1997.

The 2003 MS4 permit required that each jurisdiction enact a local ordinance in order to establish stormwater management practices for both construction and post-construction activities. In order to stay current with engineering standards and practices, many jurisdictions referred directly to the Massachusetts Stormwater Handbook (Handbook) and the Massachusetts Stormwater Standards (MSS) in their respective ordnances and regulations.

This approach was adopted in Westford because of our expectation that the Handbook and MSS would evolve over time and stay current with best management practices as agreed upon by Massachusetts stormwater stakeholders. It has always been understood that any amendments or revisions to the MADEP standards would be the result of an open and robust dialogue between environmental advocates, engineers, developers, contractors, State and local jurisdictions and the Massachusetts public at large. It was also understood that Westford was committing itself to the

consensus of these stormwater stakeholders, and that our local ordinances would automatically evolve with MADEP standards.

The Draft MA MS4 General Permit, as currently written, creates several conflicts with the Massachusetts Stormwater Standards. In 2.3.6.a.ii.(a) 1.-2., there is a 1-inch retention or treatment requirement on new or re-developed sites. This represents a significant departure from the MSS infiltration requirement that is based on hydrological soil type. While treatment of the first inch of runoff is demonstrably beneficial to both water quality and quantity issues, such a radical transition over a single permit period will produce unintended consequences as will be demonstrated below by example.

The implementation of better retention or treatment requirements is more likely to be successful and embraced at the local level if it is transitioned in responsible phases. This could easily be accomplished by referencing the MSS and Handbook, as done in 2.3.6.a.ii.(d), so that the aforementioned public process is driving the transition and not a mandate from the USEPA.

It is disingenuous to believe that the Commonwealth of Massachusetts stormwater community is not going to evolve and make changes to improve its regulations and guidance documents in a way, manner and time that gives each stakeholder some ownership and a personal investment in those changes. In fact, the process of change has already been initiated by the release of the draft permit and it will reach its natural conclusion after a healthy and meaningful exchange of ideas. The end result will be a shared objective of reducing the discharge of stormwater pollutants.

A secondary and more beneficial result of this stakeholder driven process could be a renewed effort for Massachusetts to obtain delegated authority over National Pollutant Discharge Elimination System programs. The release of the draft permit has highlighted the disadvantages of not having delegated authority, and has brought to the attention of smaller jurisdictions like Westford that it is time for a grassroots change in how Massachusetts is reacting to the Federal Clean Water Act.

In the event that the USEPA cannot realize the benefits of resolving conflicts with the MADEP Handbook and MSS, we respectfully request that, at a minimum, the following changes be adopted in the final permit language:

That Part 2.3.6., be revised to include a provision under redevelopment for compliance equal to the maximum extent practicable as defined by MADEP. If redevelopment projects are blindly subjected to the 1-inch retention or treatment standard, than the redevelopment of various sites will be made economically unattainable and the opportunity for making improvements to the maximum extent practicable on such sites will be lost.

For example, the Westford Planning Board recently issued a Notice of Decision (PB 1420 SPR SWM WRPOD) dated October 21, 2014, for a redevelopment project as shown on the attached and annotated plan sheets. The project, locally known as Brookside Village, involved demolishing an existing cold storage building and a paved parking lot situated in a Water

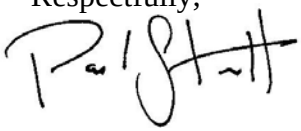
Resource Protection Overlay District. The project site is immediately adjacent to one of Westford's most important water resources, the Stony Brook. The redevelopment portion of the project will include 14 housing units, a private way, and significant improvements to the treatment of stormwater. More notably, this redevelopment project will result in a net decrease of more than one acre of impervious area on a site that directly abuts a sensitive water resource.

Because of the existing and naturally occurring soil conditions on this particular site, infiltration of the first 1-Inch of runoff would not be possible. In order to make this project economically feasible, 14 housing units were required to justify the costs of purchasing the land, demolishing the existing building, design, permitting and construction of the homes. If the developer was required to exchange multiple homes to facilitate stormwater BMPs in order to satisfy the 1-Inch retention or treatment standard, the redevelopment would not have been feasible on this site.

Because we were able to apply the MADEP maximum extent practicable standard, we were able to work with the developer's design team to make substantial improvements to the quality and quantity of stormwater runoff and reduce the impervious area on the site by more than one acre. The Draft MA MS4 General Permit, as currently written, would take away our ability to deliberate, review and approve redeployment projects like Brookside Village.

Thank you for your considerable efforts in making the public hearing and comment period as open, honest, fair and very engaging as it has been under your leadership. We are hopeful that the USEPA will realize the benefits of allowing the MADEP Handbook and MSS to continue being the standard in Massachusetts and letting the those standards evolve through a stakeholder driven process that is equally open, honest, fait and engaging.

Respectfully,



Paul M. Starratt, P.E.
Town Engineer

Re: Town of Westwood comments on the Draft NPDES MS4 permit

Dear Mr. Tedder:

The Town of Westwood, Department of Public Works, has reviewed the EPA's Draft NPDES MS4 permit for stormwater discharges in our Town. The Town overall is supportive of your efforts to improve the quality of stormwater discharge to our wetlands and rivers and has been working to maintain and improve our stormwater infrastructure. However, we have some serious concerns on the implementation of the new permit and submit to you the following comments for your consideration in developing the final permit.

GENERAL COMMENTS

NOI Form: The amount of detailed information required to complete the new electronic NOI Form is extensive and includes information that, in the previous permit cycle, was provided in the Stormwater Management Plan (SWMP). Having a detailed understanding of all the proposed BMPs that will be used to meet the six minimum measures, as well as those to be used to meet the water quality based effluent limitations, within 90 days is impractical. The NOI submittal should be scaled back to provide only basic information relative to storm sewer system and leave the more detailed descriptions of the proposed BMPs to meet the six minimum measures and water quality based requirements for the SWMP, which permittees have up to a year to complete.

Timeline: First Year Requirements: The number of major activities and related Plans that needed to be completed in the first year of the Permit is impractical. Our review of the permit indicates that there are over ten major plans or action items need to be completed in the first year after issuance of the final permit, or sooner:

NOI preparation
SWMP preparation
Inventory of municipally-owned parks, buildings, facilities and equipment
O&M plans for municipal facilities
Inventory of the Town's infrastructure requiring rehab and/or repair
Sanitary Sewer Overflow (SSO) inventory
Outfall/Interconnection Inventory (including condition assessment)
Phosphorus Control Plan (PCP)
Updated IDDE Plan
SWPPP(s) for relevant municipal facilities
Updated written protocols for erosion control inspections and infrastructure maintenance

Comment: We suggest that the time frame to complete these activities, especially the O&M Plans, outfall/interconnection inventory and condition assessment, PCP and SWPPP preparation be extended to at least two years from the effective date.

Pollutant Load Calculations - Appendix F and Appendix H: There is a significant amount of work to complete the calculations, tracking and accounting to address impaired waters. It will be difficult for many municipalities to prepare all this information and complete the data management relative to pollutant load reductions and credits without a consultant or full time staff member. **Comment:** EPA should provide significant support to municipalities if they are to prepare this information on their own. Training sessions and outreach assistance is recommended.

SECTION SPECIFIC COMMENTS

Section 1.9.1 - Documentation Regarding Endangered Species: Before submitting an NOI for coverage, applicants must determine whether they meet the ESA eligibility criteria for following the steps in Appendix C of the permit. **Comment:** Is EPA confident that Fish and Wildlife will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI? Is it reasonable to think that communities can meet this requirement within the 90 day NOI time period?

Section 1.9.2 - Documentation Regarding Historic Properties: It is unclear what documentation will be needed to demonstrate no impact to historic properties. The screening procedure outlined in Appendix

D suggests that any subsurface excavation activity related to the stormwater program, which is highly likely as part of any future repair, upgrade or replacement of stormwater infrastructure, will require consultation with SHPO to certify that there will no impact to historic properties and the documentation of this consultation/certification must be included in the NOI and the SWMP in order to be eligible for permit coverage. **Comment:** The SHPO certification requirement regarding subsurface excavation activity imposes two major problems: 1) the extent of possible future repairs and related excavation activity will not be fully understood at the time of NOI submittal, and; 2) to obtain SHPO certification for each potential excavation activity will result in extensive added coordination time, costs and project delays if field investigations are required to obtain this certification. Also, is EPA confident that SHPO will have the resources to respond in a timely manner to the many communities that will need this review as part of developing their NOI?

Section 2.1.2.b Prohibition for Increased Discharges to Impaired Waters: This section states that there shall be no net increase in discharges from the MS4 to impaired waters listed in Categories 5 or 4B on the most recent Massachusetts Report of Integrated waters unless the permittee demonstrates there is no net increase in loading for the specific impairment and provides documentation in the SWMP. This requirement is also inconsistent with the language in Appendix F Sections IV and V which states that stormwater management for new and redevelopment shall be required to optimize pollutant removal for the pollutant of concern but not necessarily prohibit any additional increase. **Comment:** In the absence of a TMDL, we feel that there is not sufficient basis for requiring no net increases and places an unnecessary burden on the MS4.

Section 2.2.1 – Discharges to Impaired Water Bodies with an Approved TMDL: Tables F-1 and F-2 of Appendix F indicate that various Towns would have phosphorus reductions targets as high as 50% or more. **Comment:** Given that the reported phosphorus removal efficiencies are generally in the range of 40 and 65 percent for structural stormwater BMPs and much lower for non-structural measures, this would essentially mean that nearly all or a large majority of existing IC area would need to be treated with structural BMPs. This is not only impractical given the wide range of site constraints that will be encountered in implementing stormwater retrofit BMPs but would also be quite costly. We suggest that EPA provide guidance for municipalities to realistically meet the targets including increased credits for non-structural measures if they are considered truly worthy actions.

Section 2.3 - Requirements to Reduce Pollutants to the Maximum Extent Practicable (MEP):
Comment: Completing the multitude of requirements included in this section in a 5-year permit cycle is not realistic. We suggest that the number of requirements be reduced substantially and be spread over two permit cycles or allow up to 10 years to complete the requirements of this section.

Section 2.3.4.7.iii – Priority Ranking: This section states that the initial illicit discharge potential assessment and priority ranking based on existing information shall be complete within one year from the effective date of the permit. **Comment:** Since the drainage mapping will not be complete until two years after the permit effective date and since much of the ranking is based on this information, we

suggest that a two and a half or three year time frame be required instead to align with the mapping schedule instead of asking the town to develop the ranking once based on current information and then updating it based on the more detailed information one year later.

Section 2.3.4.7.d.iv – Written illicit Discharge Detection and Elimination Program: This section states that "The permit does not require a minimum rainfall event prior to wet weather screening. However, the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather." **Comment:** Wet weather sampling is extremely costly and difficult to implement, especially when limited to 4 months of the year as specified. Unless there is clear evidence that there is a wet weather contamination threat, wet weather sampling should not be mandated. Bacteria levels in stormwater are highly variable and individual samples could easily show a spike which could falsely indicate an illicit connection. This could be extremely costly to try to track down with no results. It is requested that EPA provide: data on past wet weather sampling results (Phase I permits) that would show the number of outfalls sampled during wet weather for which illicit connections were found that were not also found during the dry weather screening process, cost of the stormwater sampling for all the outfalls sampled, percentage illicit connections that had wet weather contamination, not stormwater contamination found that was not indicated during dry weather sampling, and Source of the contaminants found (i.e. one time dumping verses continuous illicit connection).

Section 2.3.4.7.e.ii – Catchment Investigation Procedure: This section describes the manhole inspection methodology. **Comment:** We feel that it excessive amount of work to investigate every junction manhole if there is no dry weather flow or indication of any illicit discharges. Investigating upstream of outfalls requires work in the middle of roads, sidewalks, private property and will require police details and substantial field work and disruption. Time and money may be better spent on training municipal staff and contractors during their regular field work and maintenance, as well as the focused educational materials regarding what is an illicit connection for the residents/businesses/property owners. We request EPA provide data showing that investigating upstream drainage systems when there is no evidence of illicit connections at the outfalls results in the identification of illicit connections worthy of the associated cost.

Section 2.3.4.7.g– Follow-up Screening: This section requires follow up screening (dry weather with additional wet weather where performed previously) once every five years after the initial review. **Comment:** We request EPA provide evidence that spending this on-going expense will have a significant water quality impact.

Section 2.3.6(d) – Stormwater Management in New Development and Redevelopment (Post Construction Stormwater Management: This section states "All BMPs installed as part of the site's stormwater management system shall be constructed in accordance with the Massachusetts Stormwater Handbook Volume 2, Chapter 2." **Comment:** The Massachusetts Stormwater Handbook is outdated for many of the changing BMP design features. Some BMPs such as permeable pavements are not even included in the Handbook. Other states are developing more updated design handbooks in response to TMDLs and stormwater requirements such as Rhode Island and the Chesapeake Bay area states. In addition, limiting designers to meeting the Stormwater Handbook will discourage designers to

install BMPs that do not meet the standards but still provide treatment (as indicated by the pollutant treatment curves). The wording should be changed to reference the MA Stormwater Handbook as well as EPA and other state manuals with recent updates that provide good BMP design guidelines.

Section 2.3.6.d.: This section requires permittee to track impervious area and disconnected impervious area each year. **Comment:** Requiring a municipality to have an accurate database of the impervious cover broken down by what is directly connected or disconnected is an onerous requirement without an explanation of the use or benefit of such detailed data. Statewide and/or regional impervious cover datalayers provide a much more cost effective estimate of impervious cover for the purpose planning, understanding trends, and identifying hot spots.

Section 2.3.7.a/b – Operations and Maintenance Programs and Stormwater Pollution Prevention Plan (SWPPP): This section requires written O&M procedures for the municipal facilities that have specific activities listed within the first year and SWPPPs within the first two years. **Comment:** This requirement includes collecting, organizing and updating information on each facility and will be difficult to effectively complete within one/two years, in addition to the other first years tasks. We suggest extending the time for completion of these documents to three years.

Appendix H, Attachment 1 – Street Sweeping and Catch Basin Cleaing Credits: The credits included in the permit are based on information from Center for Watershed Protection Street Sweeping program in the Chesapeake Basin, dated 2008. **Comment:** The credits provided for street sweeping are extremely low and there is not mention in the permit of the extensive benefits of street sweeping for removing extensive amounts of debris and sediment in addition to actual pollutant loads. The credits do not provide incentive to utilize this source control method that not only removes contaminants and trash, it also contribute to the long term longevity of the BMPs that are listed as most valuable for phosphorus removal; infiltration BMPS. We recommend that this be researched further including the region specific USGS street sweeping study completed recently in Cambridge Massachusetts to determine the appropriate credits. If, in fact, the water quality benefit is shown to have such an insignificant impact then these costly practices should not be required.

Appendix F Section 2 Reporting: The equation used to calculate yearly phosphorus loads requires the permittee to estimate the amount of development that has occurred since 2005. **Comment:** This is an unreasonable estimate expected for a Town to perform. We suggest that TMDL standards to apply to today's level of development or that EPA update Tables F1 and F2 to reflect conditions at the date of the finalize permit.

Appendix F, Attachment 1 and 2: The loading rate table 2-1 indicates in a footnote to assume Hydrologic Soil Group (HSG) D soils if soils are unknown to estimate pervious loading rates. Attachment 1 text on page 1 says to assume HSG C/D. **Comment:** Please clarify. We suggest to assume C soils or use the surrounding soil types as an indicator. HSG D and C/D are too conservative for our region. Suggest only including this table in one location to avoid confusion.

Appendix F Attachment 3 Semi-Structural/Non-structural BMP Performance Credits: The section states that the cumulative runoff reduction is being used to estimate cumulative phosphorus load

reduction credit for the semi-structural/non-structural BMPs which have an infiltration benefit by disconnecting IA and providing soil amendments to increase permeability. **Comment**: The infiltration BMP curves show that phosphorus reductions are greater than runoff volume reductions. Therefore, it is conservative to use runoff volume as a direct surrogate when in fact phosphorus reductions are likely higher. We suggest an additional phosphorus treatment factor in addition to solely the runoff reduction.

Appendix F Attachment 3 Table 3-18: The porous pavement BMP performance table gives credits based on the depth of filter course. **Comment:** We would expect that the credit would be dependent on the relative watershed size to filter course depth. Please clarify.

Appendix F Attachment 3 Table 3-21: Table 3-21 references a "Grass Swale" when BMP is called a "Water Quality Wet Swale" in the main text. **Comment**: The different naming and design descriptions are confusing. Is the BMP meant to be wet or dry swale? Are there results if the swale is not underdrained? This BMP gets very poor performance. A slightly modified swale designs could get much better results and should be included and encouraged.

We realize a tremendous amount of effort has been put in to drafting this new permit and would appreciate the EPA review of our comments for potential incorporation into the final permit. Thank you for the opportunity to submit comments.

Sincerely,

Todd Korchin

RE: Weymouth, Massachusetts
Comments on the Draft Small MS4 General Permit

Dear Mr. Tedder:

Thank you for providing the Town of Weymouth with the opportunity to comment on the Draft Small MS4 General Permit. The Town shares the EPA's committent to the protection of our natural resources and appreciates the effort that has been expended by the EPA's staff for this purpose.

The Town of Weymouth has reviewed the Draft Permit and offers the following comments.

General Comments

- It is the Town's firm belief that the proposed regulations contained within the draft MS4 permit will be overly burdensome to this community. The costs to administer and implement the minimum controls measures required to comply will far exceed the Town's current budget. The permit, as drafted, would create a significant administrative burden for the Town that would detract from its ability to provide direct benefits to water quality through such activities as increased street sweeping, increased catch basin cleaning, and improvements to our drainage system. Essential programs will need to be reduced or eliminated in order to comply.

- The permit, as drafted, will require MS4 communities to be responsible for controlling, regulating and maintaining discharges from private and state owned properties that are not within its direct control. The Town does not have the authority to enter private property without an obvious violation on a property. The permit should be modified to not hold MS4s liable for third party stormwater contributions.

- The Town of Weymouth is concerned that the draft permit has not taken into account the water quality improvements and effectiveness of the efforts already implemented by municipalities under the 2003 permit.

- Taking into consideration the extensive list of deadlines specified in the permit, a chronological list of all the permit's requirements and associated deadlines would be extremely useful to MS4s when developing implementation schedules.

Part 1.4 Non-Stormwater Discharges

We question why basement sump pump discharges are not included in the list of non-stormwater discharges allowed under the permit. Water from crawl space pumps is included in the list, but is a rare occurrence in most municipalities. We recommend adding basement sump pump discharges to the list under this section of the permit.

Part 1.7.2 Notice of Intent

The Notice of Intent (NOI) will require a significant effort to develop and outline a program in compliance with the permit, as drafted. The development of the Stormwater Management Plan (SWMP) is directly affected by the commitments outlined in the NOI therefore it may be more efficient to develop the NOI at the same time as the SWMP. We recommend the deadline for submitting the NOI be extended to one (1) year from the effective date of the permit to allow the development of the NOI and SWMP to coincide.

Part 1.9.1 Documentation Regarding Endangered Species

The Town of Weymouth objects to Part 1.9.1 and Appendix C that requires permittees to determine eligibility under the Endangered Species Act (ESA). Per 50 C.F.R. § 402.08, "the ultimate responsibility for compliance with Section 7 remains with the Federal agency." It is the EPA's responsibility to ensure that General Permit complies with ESA requirements and the EPA should undertake that responsibility prior to issuing the final permit. Part 1.9.1 should be deleted from the Permit.

Part 2.1.1 Requirement to Meet Water Quality Standards

This section of the permit requires that all discharges from the MS4 causing an exceedance of water quality standards shall be eliminated within 60 days of becoming aware of the condition contributing to the violation. Depending upon the source of the exceedence and time of year when the exceedence is identified, the 60 day timeframe required to identify and eliminate a source of a violation could be unrealistic and unachievable, A source that is identified as being private will only add to the complexities (legal) of the Town's ability to remedy a potential issue. We suggest the permit should not specify a timeframe, but require any violations to be identified in the annual report along with a summary of the steps the municipality has taken or will take to eliminate the violation.

Part 2.1.2.b Increased Discharges

This section of the permit states that "there shall be no increased discharges from the MS4 to impaired waters" unless it can be demonstrated "that there is no net increase in loading." No best management practice (BMP) is 100% efficient, therefore new or additional stormwater flow to impaired waters will be in non-compliance. This section of the draft permit is overly restrictive and would severely limit the Town's ability to approve new development projects. We suggest the EPA require compliance under Part 2.1.2.b to the maximum extent practicable.

Part 2.3.3 Public Education and Outreach

Weymouth questions the need to include developers in education and outreach efforts. Site development plans prepared by professional engineers and filed by developers are reviewed by the Town to ensure compliance with federal, state and local regulations. It is the Town's opinion that it is unnecessary to include developers in an education and outreach program.

Part 2.3.4.2.b Elimination of Illicit Discharges

This section of the permit states "discharges from an MS4 that are mixed with an illicit discharge are not authorized by the permit (Part 1.3.a) and remain unlawful until eliminated." As long as an effective IDDE program is in place and any illicit discharges have been identified, along with reasonable schedules for removal, the presence of such discharges should not constitute an ongoing violation of the permit. We suggest it would be more appropriate to consider illicit discharges unlawful unless the MS4 has demonstrated a reasonable effort to develop a schedule to identify and remove the source.

Part 2.3.4.4 Sanitary Sewer Overflows

Under separate regulations, municipalities are required to notify the MassDEP, EPA and other regulatory agencies of all SSO discharges. Therefore reporting and tracking SSOs under the MS4 Permit is unnecessary and redundant. It is our opinion that SSOs should not be regulated under this permit.

Part 2.3.4.7 Written Illicit Discharge Detection and Elimination Program

The permit states "the written IDDE program shall be completed within one (1) year of the effective date of the permit." The preparation of an effective IDDE program is dependent upon the completion of system mapping, which is two (2) years as specified under Section 2.3.4.6. We recommend the deadline for completing the IDDE program follow the deadline for completing system mapping. A deadline of three (3) years for completion of the IDDE program is suggested.

Part 2.3.4.7.g Follow-up Screening

The Town questions the requirement for a follow-up screening within 5 years. Under 2.3.4.7.g a confirmatory outfall or interconnection screening shall be conducted within one (1) year of removal of all identified illicit discharges, with a follow-up screening within five (5) years as required under Part 2.3.4.7.g. If the results of a confirmatory screening are satisfactory, a follow-up screening within 5 years is unnecessary. We request the permit be modified to include a waiver of Part 2.3.4.7.g when the results of confirmatory screening determines the identified illicit discharge has been successfully removed.

Part 2.3.7.a Operations and Maintenance Program

Please consider revising Part 2.3.7.a to allow municipalities the ability to develop Operations and Maintenance (O&M) Programs with a focus on permittee owned facilities (specified under Part 2.3.7.a.i – 2.3.7.a.iii) located within catchment areas draining to impaired water bodies. Also, taking into consideration the implementation timeframes proposed under the draft permit, we request the timeframe for developing O&M programs be extended to two (2) years for facilities located within catchment areas draining to impaired water bodies and five (5) years for all other permittee owned facilities.

Part 2.3.7.a.iii Infrastructure Operations and Maintenance

The Town of Weymouth DPW is responsible for maintaining approximately 4,500 catch basins. The requirement to describe actions taken for every catch basin found to be more than 50% full during two consecutive cleanings/inspections, in addition to recording/reporting the volume of material removed from each catch basin, is an unnecessary burden on the DPW. The Weymouth DPW already keeps a log of catch basins cleaned, and summarizes the total number of catch basins cleaned and total volume of material removed in the annual reports. The reporting requirements, as written in the draft permit, will impose unnecessary and burdensome tasks on municipalities that will result in slowing down work and increasing costs. We recommend the reporting requirements for catch basins under Part 2.3.7 be limited to the total number of catch basins cleaned and total volume removed.

Additionally, the requirement to sweep uncurbed streets is not practical. Sweeping streets that do not have curbing is inefficient since sand and debris are washed to the shoulder. The requirement to sweep uncurbed streets should be removed from the permit.

Part 4.3.b Outfall Monitoring Reporting

This section states "The permittee shall document all monitoring results each year in the annual report.....The annual report shall include all of this information and data for the current reporting period and for the entire permit period." The meaning of "all monitoring results" needs to be clarified. Does the EPA want copies of the lab reports included in the annual report? We recommend this section be revised to require the annual report include a tabulated summary of the monitoring results.

Summary

The Town of Weymouth wishes to support and enhance clean water and to mitigate wherever possible those areas where stormwater impacts it. However, we are concerned that without acknowledgement of available funding the permit will pose an unreasonable hardship on municipalities. The cost of compliance will likely require municipalities to divert limited resources away from activities that will directly benefit water quality.

The Town of Weymouth appreciates the opportunity to comment on the 2014 Draft Small MS4 General Permit and your consideration of the comments summarized above. We hope that these comments and the comments provided by other municipalities will result in a final permit which supports improvements to water quality while being mindful of scarce funding sources. We urge the EPA to consider modifications to the draft permit that will make it more sustainable and reasonable for municipalities.

If you should have any questions or wish to discuss our comments, please feel free to contact Town Engineer Andrew (Chip) Fontaine, P.E. by phone at 781-337-5100 x43718 or email at cfontaine@weymouth.ma.us.

Respectfully,

Re: Town of Winchester Comments on the Draft Massachusetts NPDES MS4 General Permit

Dear Mr. Tedder,

The Town of Winchester has reviewed the draft "General Permits for Stormwater Discharges from Small Municipal Separate Storm Sewer Systems in Massachusetts", recently issued for public comment by the Environmental Protection Agency (EPA). Based on our detailed review of the draft permit, we are providing comments on various portions of the permit, along with our recommendation as to how those items can be clarified or improved.

As a general comment, the Town would like to express its overriding concern for the scope of the requirements outlined in this draft permit, particularly those associated with the Illicit Discharge Detection and Elimination (IDDE) Program. These proposed requirements represent a substantial change from the first phase of the permit, which expired in 2008. They will have a significant negative impact on the Town's operating budget and will strain the Town's already limited resources. For example, for the upcoming FY16, the Town's Capital Planning Committee received approximately $9 million worth of project requests from various Town departments, including drainage improvements, road and sidewalk repairs, building maintenance, and other infrastructure-related projects. For the same fiscal year, the Town was able to fund only $1.6 million of these project needs. Over the next five years, our Capital Planning Committee estimates that there will be approximately $45 million worth of capital requests made, with only a small portion being able to be funded each year. This does not include other significant infrastructure projects that were already slated for proposed override votes, such as implementation of portions of the Town's Flood Mitigation Program.

While the Town supports EPA's goals of improving the quality of our stormwater and ultimately our receiving waterbodies, we request that the EPA reconsider the scope of these draft permit requirements and provide additional time for municipalities to budget, fund, and complete the proposed tasks.

Detailed comments on the specific permit requirements are provided below:

General Comments:

1. *Comment*: As noted above, the cost to comply with many of the permit requirements (e.g. the requirements for those MS4s that discharge to TMDLs and/or water quality limited waters, and the IDDE requirements) is significant. Additional funding assistance programs should be established and made available to MS4s. Without some financial backing as a sign of commitment, municipal officials may have difficulty convincing local voters and decision makers to fund the needed stormwater programs, which in Winchester will likely come at the cost of other critical infrastructure needs. We urge EPA to request that a dedicated funding source be made available to all municipalities covered by the NPDES MS4 permitting program to help with its implementation.

2. *Comment*: The permit has many requirements for written programs, policies, procedures, and reports that do not always appear to have water quality benefits. Significant financial and staff resources will be required to prepare and submit all of the required written documents. EPA does not have the staff to perform a timely review of the required documentation. With limited resources, the focus of permits should be on performance, not documentation.

   Recommendation: An efficiency and effectiveness review should be performed on the entire permit, preferably by an outside party who can assist the EPA in prioritizing those items where written documentation and annual reporting will provide a measurable benefit. The permit should be revised to reflect these improvements.

3. *Comment:* First Year Requirements & Timeline. The number of major activities and related plans that need to be completed in the first year of the Permit is impractical. Our review of the permit indicates that there are over ten major plans or action items that municipalities need to complete in the first year after issuance of the final permit, or sooner.

   Recommendation: We suggest that the timeframe to complete these activities, especially the O&M Plans, and outfall/ interconnection inventory and condition assessment, be extended to at least two years from the effective date.

4. *Comment:* A substantial number of the permit requirements are complex and difficult to fully digest even from a thorough reading the draft permit and its appendices. In order to minimize the cost of compliance, many municipalities may try to implement as many of the permit tasks as possible without the assistance of consultants or other outside parties.

   Recommendation: We recommend that EPA provide targeted training sessions and outreach assistance to municipalities on each of the respective minimum control measures to ensure a thorough understanding of the permit and reporting requirements. Templates and other standardized forms and/or documents that can be utilized by all municipalities should be provided to minimize costs to Town and ease EPA's review time.

Section Specific Comments:

5. *Comment:* Section 1.7.2 (and Appendix E). Page 4. The amount of detailed information required to complete the NOI Form is extensive and includes information that, in the previous permit cycle, was provided in the Stormwater Management Plan (SWMP). Having a detailed understanding of all the proposed Best Management Practices (BMPs) that will be used to meet the six minimum measures, as well as those to be used to meet the water quality based effluent limitations, within 90 days is impractical.

Recommendation: The NOI submittal should be scaled back to provide only basic information, leaving the more detailed descriptions of the proposed BMPs and water quality based requirements for the SWMP, which permitees have up to a year to complete.

6. *Comment*: Section 1.7.4. Page 5. This latest draft permit still does not define the responsibility for addressing and responding to public comments received in response to the Notice of Intent. The permit needs to state whether the MS4 or the EPA will be responsible for this task.

7. *Comment*: Section 2.3.4.4. Page 26. Sanitary sewer overflows (SSOs) are already prohibited and regulated at both the Federal and State level under existing mechanisms governing wastewater facilities. Including SSOs in the MS4 permit results in the Permitee being regulated by multiple permits for the same issue. This will cause confusion, expenditure of unnecessary resources, and potentially conflicting requirements for compliance.

   Recommendation: The MS4 permit should only contain discussion related to SSOs potentially contributing to illicit discharges and that they should be investigated, eliminated, and documented under the IDDE Program.

8. *Comment*: Section 1.9.2. Page 6& 7. It is unclear what documentation will be needed to demonstrate no impact to historic properties. The screening procedure outlined in Appendix D suggests that any subsurface excavation activity related to the stormwater program, which is highly likely as part of any future repair, upgrade or replacement of stormwater infrastructure, will require consultation with State Historic Properties Office (SHPO) to certify that there will no impact to historic properties and the documentation of this consultation/ certification must be included in the NOI and the SWMP in order to be eligible for permit coverage.

   Recommendation: The SHPO certification requirement regarding subsurface excavation activity imposes two major problems: (1) the extent of possible future repairs and related excavation activity will not be fully understood at the time of NOI submittal, and (2) to obtain SHPO certification for each potential excavation activity will result in extensive added coordination time, costs and project delays if field investigations are required to obtain this certification.

9. *Comment*: Section 2.1.2.b. Page 10 & 11. This section states that there shall be no net increase in discharges from the MS4 to impaired waters listed in Categories 5 or 4B on the most recent Massachusetts Report of Integrated Waters unless the permitee demonstrates there is no net increase in loading for the specific impairment and provides documentation in the SWMP. This requirement is inconsistent with the language in Appendix F Sections IV and V, which states that stormwater management for new and redevelopment shall be required to optimize pollutant removal for the pollutant of concern but not necessarily prohibit any additional increase.

   Recommendation: In the absence of a TMDL, we feel that there is not sufficient basis for requiring no net increases, as this requirement places an unnecessary burden on the MS4.

10. *Comment*: Section 2.3.4.5. Page 26. It is not clear whether outfall/interconnection inventories completed prior to the effective date of the new permit will count toward compliance.

    Recommendation: This section should be revised to indicate that prior inventories are acceptable as long as they meet the requirements of Section 2.3.4.5.

11. *Comment*: Section 2.3.4.7.c.i & 2.3.4.8.c.i. Pages 30 & 37. The definition of, and implementation milestones for 'Problem Catchments' significantly disadvantage MS4s

that have proactively undertaken outfall sampling in advance of it being required by this permit. Proactive MS4s with sampling data, especially those in urban areas, will have far more outfalls that must be designated as Problem Catchments, which are given a maximum of five years to complete IDDE. Conversely, MS4s that have made no effort to sample their outfalls will have no (or very few) Problem Catchments, and are given 5-10 years to complete IDDE. As written, the permit punishes proactive MS4s, particularly those in urban areas, by requiring far more stringent IDDE milestones than those for MS4s that have not performed sampling.

Recommendation: The definition and implementation milestones for 'Problem Catchments' need to be revised to remove this inequity.

12. *Comment*: Section 2.3.4.7.c.iii. Page 31. The initial illicit discharge potential assessment and priority ranking must be completed within one year from the effective date; however, mapping of the MS4 infrastructure and Catchment Delineations will not be completed until two years from the effective date of the permit. The current mapping requirement from the 2003 permit only included MS4 outfalls and, thus, is insufficient "existing" mapping with which to complete the required 2.3.4.7.c.iii assessment/ranking.

   Recommendation: The required catchment assessment and ranking in 2.3.4.7.c.iii needs to align with the mapping, having a completion date of two years from the effective date of the permit.

13. *Comment*: Section 2.3.4.7.d.iv. Page 32. This section states that "The permit does not require a minimum rainfall event prior to wet weather screening. However, the purpose of wet weather screening and sampling under the IDDE program is to identify illicit discharges that may activate or become evident during wet weather." Wet weather sampling is extremely costly and difficult to implement. Unless there is clear evidence that there is a wet weather contamination threat, wet weather sampling should not be mandated. Bacteria levels in stormwater are highly variable and individual samples could easily show a spike, which could falsely indicate an illicit connection. This could be extremely costly to try to track down with no results.

   Recommendation: It is requested that EPA provide: data on past wet weather sampling results that show the number of outfalls sampled during wet weather for which illicit connections were found that were not also found during the dry weather screening process; the cost of the stormwater sampling for all the outfalls sampled; the percentage of illicit connections that had wet weather contamination; non-stormwater contamination found that was not indicated during dry weather sampling; and source of the contaminants found (*i.e.* one time dumping verses continuous illicit connection). This data should be used to determine the cost effectiveness of the proposed wet-weather sampling program.

14. *Comment*: Section 2.3.4.7.d.iv. Page 32. If wet weather sampling is required, the limitation on when wet-weather screening should take place "(March to June)" does not make sense for IDDE. Although wet-weather screening may help identify illicit discharges that only occur during peak flows, whether it should be performed in conjunction with high or low groundwater is determined by the System Vulnerability Factors (SVFs) outlined on page 33 and 34. For example, if the SVFs indicate structural defects and exfiltration potential, high groundwater would actually inhibit the investigation. In this case sampling should be performed during a heavy rainfall event at low groundwater. Conversely, if the SVFs indicate capacity restrictions and SSO potential, then sampling during high groundwater would be appropriate.

   Recommendation: The permit should be revised to state that wet-weather sampling should be performed during conditions appropriate for the identified SVFs for each catchment area, and provide examples similar to those above to assist MS4s in making an informed decision about when to sample.

15. *Comment*: Section 2.3.4.7.d.iv. Page 32. If wet weather sampling is required, the requirements related to the wet-weather monitoring are not provided in sufficient detail. Inspection must be performed during wet weather, defined as sufficient intensity to produce a discharge. However, it is not clear whether a discharge must be observed at every outfall to achieve compliance. Does the Permitee have to return to an outfall repeatedly until a discharge is observed, even if it was monitored during a substantial rainfall event? To require the Permitee to mobilize staff, equipment, and laboratory services an unlimited number of times to observe flow at each outfall places an unreasonable burden on the Permitee.

    Recommendation: The permit should be revised to provide specific minimum storm parameters, for rainfall amount and antecedent conditions. The minimum storm event should be one sufficient to anticipate discharges at all functional outfalls. The requirement for discharges to be observed at every outfall should be eliminated.

16. *Comment*: Section 2.3.4.7.d.v. Page 32. Based on the response from Newton Tedder at the MS4 Information Session on 10/28/14, analysis for conductivity is being required as a measure of salinity. Requiring both salinity and conductivity testing for the same purpose is a waste of MS4 resources.

    Recommendation: The permit should be revised to require either salinity or conductivity, but not both. In addition, the permit needs to state the applicable benchmark and required action for the chosen parameter, as is provided for other sampling parameters in Section 2.3.4.7.d.vi.

17. *Comment*: Section 2.3.4.7.d.v & 2.3.4.7.vi. Pages 32 & 33. The level of accuracy for each required sampling parameter is not provided. For example, at what detection level is chlorine to be considered "detectable" in Section 2.3.4.7.vi.

    Recommendation: The permit must be revised to clarify the required level of accuracy for each sampling parameter.

18. *Comment*: Section 2.3.4.7.e. Page 34. The System Vulnerability Factor for "any sanitary sewer and storm drain infrastructure greater than 40 years old in medium and densely developed areas" is too inclusive. In New England, where most infrastructure is typically in excess of 40 years old, this SVF serves as a "catch all" to require wet-weather sampling in virtually all catchment areas. Infrastructure age, by itself, is not an indicator of illicit potential. For example, some of the oldest brick masonry sewers in New England are in better condition than those built 40 or more years later. It is other factors, such as poor structural condition or prior use as a combined sewer, that are the source of elevated illicit potential, not solely the age of the infrastructure.

    Recommendation: This SVF should be revised to include only those sewers and drains that are known to have specific concerns, not all sewers and drains older than an arbitrarily selected age.

19. *Comment*: Section 2.3.4.7.e. Page 33. The System Vulnerability Factor for "crossing of storm and sanitary sewer alignments" is too inclusive. On streets with both sanitary sewers and storm drains, the likelihood that a catch basin connection crosses a sanitary sewer or a sanitary sewer service connection crosses a storm drain is extremely high. This would mean that nearly all catchments would trigger this vulnerability factor and therefore require wet weather sampling.

    Recommendation: This SVF should be revised to include only those catchments that are known to have specific concerns, and not all catchments where storm and sanitary sewer alignments cross.

20. *Comment*: Section 2.3.4.7.e. Page 34. The System Vulnerability Factor for "any sanitary sewer infrastructure defects such as leaking service laterals, cracked broken or offset sanitary infrastructure...or other vulnerability factors identified through Infiltration/Inflow Analyses, Sanitary Sewer Evaluation Surveys, or other infrastructure investigations." is too inclusive. Again, in New England, where infrastructure is typically in excess of 40 years old, most sewers have some defects, which again would mean that nearly all catchments would trigger this vulnerability factor and therefore require wet weather sampling. In most cases, individual sewer defects do not portend illicit connections.

    Recommendation: This SVF should be revised to include only those catchments that are known to have specific concerns related to the sewer system, and not all catchments with sewers that have minor cracks and offset joints.

21. *Comment*: Section 2.3.4.7.e.ii. Page 34. This section describes the manhole inspection methodology. We feel that it is an excessive amount of work to investigate every junction manhole if there is no dry weather flow or indication of any illicit discharges. Investigating upstream of outfalls requires work in the middle of roads, sidewalks, private property and will require police details and substantial field work and disruption.

    Recommendation: We request that EPA provide data showing that the investigation of upstream drainage systems when there is no evidence of illicit connections at the outfalls results is worthy of the associated cost.

22. *Comment*: Section 2.3.4.7.g. Page 36. This section requires follow up screening (dry weather with additional wet weather where performed previously) once every five years after the initial review.

    Recommendation: We request that EPA provide evidence showing that spending this on-going expense will have a significant water quality impact, particularly in drainage areas that are fully built-out with little to no new construction performed within that five-year period.

23. *Comment*: Section 2.3.4.7 f & g. Pages 35 & 36. The second paragraph of Section f contains the same requirements as Section g, except for the timeline.

    Recommendation: The permit should be revised to either delete one of the paragraphs, or clarify the intended difference between the two requirements.

24. *Comment*: Section 2.3.4.8.c. Page 36. The permit requires that the IDDE Catchment Investigation Procedure be implemented in "every catchment of the MS4, even where dry weather screening does not indicate evidence of illicit discharges." If there is no evidence of any sewer input at an outfall, IDDE field investigation is a waste of resources.

    Recommendation: This requirement should be changed to say that outfall screening or sampling, whichever is appropriate, should be repeated some number of times at varying times/conditions to confirm there is no sewer input. If no sewer input is confirmed during dry and wet weather screening or sampling, IDDE field investigation should not be required.

25. *Comment*: Section 2.3.4.8.c.i-iii. Pages 36 & 37. The milestones stated for the IDDE effort in 2.3.4.7 are unrealistic for urban MS4s. For some MS4s with ongoing IDDE programs, it has taken many years to locate and remove the illicit connections from even one catchment area, let alone 100% of catchment areas. This is especially burdensome in areas where nearly every outfall will exceed the benchmarks for at least one IDDE sampling parameter or System Vulnerability Factor. The current permit requires IDDE to be completed for the entire MS4 within ten years. This requirement is both cost-prohibitive and infeasible based on permit requirements.

Recommendation: The permit should be revised to allow MS4s additional time to locate illicit discharges. It is recommended that EPA extend the timeframe for completing the Catchment Investigation Procedure in 100% of the area served by all MS4 catchments from within ten (10) years of the permit effective date to within twenty (20) years of the permit effective date. The permit should also indicate that as long as the MS4 is making reasonable efforts to locate the source of the discharge the MS4 will be in compliance, even if the source is not located within the allotted timeframe.

26. *Comment*: Section 2.3.6.a.ii.a. Page 40. As written, the requirement to retain/treat the first one inch of rainfall applies to "runoff from all impervious surfaces on site." Without a definition for the term "site" (see comment below), this implies runoff from the entire parcel on which the one-acre-or-more disturbance occurs. It is not reasonable or cost-feasible to require a large parcel to treat runoff from "all impervious surfaces" on that parcel when they disturb only a small portion of it. Take, for example, a large university whose campus occupies hundreds or even thousands of acres. If they were to disturb one acre, the current permit would require them to retrofit the drainage system throughout the entire campus to retain/treat the first inch of runoff.

    Recommendation: Language in this section needs to be revised to limit the regulated area to all impervious areas within the development or redevelopment area, not the entire parcel. Alternatively (or additionally), the definition of "site" needs to define that it refers to the area within the limits of work for a development, redevelopment, or other construction project. Additionally, "redevelopment" needs to be clarified to exclude paving and reconstruction of roadways, as including regular road maintenance would result in an unreasonable burden on municipalities.

27. *Comment*: Section 2.3.6.a.ii. Page 40. This section sets different standards than those existing in the MassDEP's Stormwater Policy and associated handbooks. Having two sets of standards will cause conflict for MS4s and developers, and will likely subject communities to legal action. In addition, it may set up different standards for different permit granting authorities, for example from the Conservation Commission, who enforces the MA Stormwater Policy, and the Zoning Board of Appeal (ZBA) or Planning Board who may enforce these standards under the site plan review process. The current ordinances/bylaws of most MS4s adopted during the original permit round reference the MA Stormwater Standards.

    Recommendation: If the EPA wants more stringent standards, this should be done by working with the MassDEP to affect changes to existing State regulations instead of enacting a second, different, conflicting set of requirements through the MS4 permit. The regulations of MassDEP and EPA must be coincident or it will be an absolute nightmare for municipalities charged with enforcing these regulations.

28. *Comment*: Section 2.3.6.b&c. Page 41. Both of these sections require review of local bylaws. It is not cost-effective to perform two separate reviews and prepare two separate "assessments" related to the reduction of impervious area.

    Recommendation: Sections b and c should be combined into one assessment report, covering both of the desired reviews.

29. *Comment*: Section 2.3.6.d. Page 40. This section states that "All BMPs installed as part of the site's stormwater management system shall be constructed in accordance with the Massachusetts Stormwater Handbook Volume 2, Chapter 2." The Massachusetts Stormwater Handbook does not include many of the emergent and changing BMP design features. Some commonly used BMPs, such as permeable pavements, are not even included in the Handbook. Other states are currently developing updated design handbooks in response to TMDLs and other stormwater requirements, including Rhode Island and the Chesapeake Bay area states.

Recommendation: We recommend that the wording be changed to reference the MA Stormwater Handbook, as well as EPA, and other state manuals with recent updates that provide acceptable BMP design guidelines.

30. *Comment*: Section 4.3. Page 51. Now that outfall monitoring has been incorporated into Section 2.3.4.7, there is no need for a separate Section 4.3.

    Recommendation: Requirements stated in Section 4.3 should be incorporated into Sections 2.3.4.7 or 4.4, as appropriate.

31. *Comment*: All Appendices. The appendices do not contain proper page numbering.

    Recommendation: Page numbers should include a reference to the Appendix (e.g., "A-21") so as to avoid duplication with the main permit document.

32. *Comment*: Appendix A. No definition is provided for the following critical terms: Directly Connected Impervious Area, Disturbance, Illicit Discharge, Increased Discharger, Redevelopment, or Site. Interpretation of these terms could be a significant source of controversy for MS4s, especially for municipal boards and committees charged with implementation of the requirements for new development and redevelopment.

    Recommendation: Definitions of these terms should be added to Appendix A.

33. *Comment*: App. H.II. The Town of Winchester has two (2) impaired water bodies that list phosphorus as the cause of impairment (Aberjona River and Wedge Pond). The Town of Winchester also has two (2) impaired water bodies (Upper Mystic Lake and Winter Pond) where dissolved oxygen saturation/dissolved oxygen and nutrient/eutrophication biological indicators, respectively, are listed as the cause of impairment. In Appendix G, the permit indicates that at least one of the monitoring parameters for each of these pollutants (dissolved oxygen saturation/dissolved oxygen and nutrient/eutrophication biological indicators) is total phosphorus. In the permit, it is unclear as to whether all four of these water bodies are potentially impaired for phosphorus, and therefore subject to the requirements of Appendix H.II, or if only the Aberjona River and Wedge Pond are subject to these requirements.

    Recommendation: The permit should be modified to clarify whether it is exclusively the pollutant causing the impairment that triggers the requirements for water quality limited water bodies outlined in Appendix H or whether the monitoring parameter is also a factor. It is recommended that the permit clearly identify in Appendix H.II, all water quality limited water bodies and their tributaries where phosphorus is the cause of the impairment.

34. *Comment*: App. H.II.1.c. For discharges to water quality limited water bodies where phosphorus is the cause of the impairment, the permit requires that the permitee plan and install a minimum of one structural BMP as a demonstration project within the drainage area of the water quality limited water body within six years of the permit effective date. For MS4s that have multiple water bodies that are impaired for phosphorus located in close proximity to one another, completion of two demonstration projects is an unnecessary duplication of effort.

    Recommendation: It is recommended that the permit be modified to indicate that communities with more than one (1) water body impaired for phosphorus require only one demonstration project within six years of the permit effective date.

35. *Comment*: App. H I.2, II.2, III.4, IV.5, V.5. To require the collection of at least 30 flow-weighted samples over a period of 2-3 years from each stormwater outfall discharging (or tributary to) an impaired water in order to demonstrate that the discharges meet water quality standards is excessive and cost-prohibitive.

Recommendation: All of these sections of the permit should be revised to require sampling of outfalls during not more than ten rainfall events. The EPA should provide a list of rainfall events during which outfall sampling must be performed.

36. *Comment*: Appendix I. Multiple Sections. Appendix I should not be included in the permit document, but should be provided as a reference/example document. The protocol presented is not required by the permit and is only one of *many* methods that could be used by MS4s to comply with IDDE requirements. Because this protocol is specific to a single method, some of the information it includes is incorrect. For example, holding times presented in Appendix I, Attachment 1, Table 1 are listed incorrectly due to an assumption that analyses are being performed onsite (see Specific Conductance, which actually has a holding time of 28 days, not "Immediate").

    Information presented in Appendix A, Table 1 and Step V, are also not appropriate for inclusion in a NPDES permit. The parameters and thresholds presented in Table 1 are already included as Section 2.3.4.7.d.vi. The information regarding instrumentation is reference material and should not be included in a permit. Step V should be removed in its entirety, because it does not belong in a permit. It should be in a Fact Sheet or reference/example document.

    Recommendation: The permit should be revised to delete Appendix I in its entirety. EPA should provide an online source to the IDDE protocol in Section 2.3.4.7.

The Town of Winchester thanks you for the opportunity to comment on the draft permit requirements. It is our hope that at the end of this public comment period EPA will work closely with municipalities and state officials to address these issues and modify the permit in a way that is sensitive to the financial constraints facing Massachusetts communities, while at the same time making progress towards improved water quality.

Very truly yours,

Richard C. Howard

Subject: New permit for stormwater runoff pollution

Dear Mr. Tedder.

I understand that the EPA has recently drafted a new permit that will require cities and town to greatly lessen pollution from stormwater runoff into streams and rivers. I hope you can support strong protections for water quality and this new permit and process.

Thank you.

Re: Massachusetts Small MS4 Draft General Permit Comments

Dear Mr. Tedder:

The City of Worcester Department of Public Works & Parks (DPW&P) appreciates the opportunity to comment on the Small MS4 Draft General Permit for Massachusetts. The City is regulated through an individual NPDES permit for its stormwater discharges and will not be eligible for coverage under this general permit. However, it is expected that the next individual MS4 permit issued to the City will contain many of the same provisions and requirements stipulated in this draft general permit. DPW&P therefore believes it will be impacted by the language contained within this draft general permit and is compelled to offer comments for the record. We also believe our comments will help inform Region 1 of many of the concerns that municipalities have with the prescriptive and unreasonable requirements being considered. We hope Region 1 will pay close attention to these and other comments offered by municipalities and organizations representing municipal interests and revise the final permit to make it reasonable, considerate of the realities of municipal operations and finances, and consistent with statutory limitations on municipal stormwater pollution control stipulated in the Clean Water Act.

General Comments:

DPW&P supports the goal of the Clean Water Act but we find the requirements in the MA Small MS4 General Permit to be overly prescriptive, burdensome and unachievable for most communities.

The schedules set forth in the draft permit are not reasonable or feasible when considered in the context of municipal realities. Schedules for some aspects of the permit may appear reasonable but become unreasonable when the permit is viewed in its entirety and it becomes clear that schedules for most parts of the permit overlap.

The permit, as drafted, would create a significant administrative burden for municipalities that would detract from their ability to provide direct benefits to water quality through such concrete activities as increased street sweeping, increased catch basin cleaning and removal of illicit discharges. The permit goes overboard in terms of monitoring, measuring and quantifying changes in pollutant loads. More environmental progress would be gained if communities could focus resources on actual, physical improvements to stormwater systems and not on pollutant accounting. Per the Clean Water Act municipalities are obligated to remove pollutants from stormwater to the maximum extent practicable and

that should be the objective of the permit. The ongoing assessment of receiving waters is a function of MassDEP, not individual communities.

Many of the deadlines provided in the draft permit do not allow sufficient time to allocate funding within set municipal budget cycles to complete the tasks required. No item in the permit should be required to be completed during the first permit year except the preparation of the Stormwater Management Plan (SWMP).

There should be language within the permit that references EPA's Integrated Planning framework and how integrated planning can be utilized to address a community's stormwater/MS4 requirements. That language should be specific about how an integrated planning approach could be applied through the permit and how permit conditions, including implementation schedules, would be modified under an integrated plan.

Section-Specific Comments:

1. Section 2.1 Water Quality Based Effluent Limitations and 2.1.1-Requirement to Meet Water Quality Standards: Section 2.1 (page 9) states that "Pursuant to Clean Water Act Section 402(p)(3)(B)(iii), this permit includes provisions to ensure that discharges from the permittee's small MS4 do not cause or contribute to exceedances of water quality standards...". Similarly, the Fact Sheet, at page 4, states "Section 402(p)(3)(B)(iii) of the CWA also authorizes EPA to include in an MS4 permit 'such other provisions as [EPA] determines appropriate for the control of ... pollutants'" and that "[t]his provision forms a basis for imposing water quality-based effluent limitations (WQBELs)" citing to *Defenders of Wildlife v. Browner.* 191 F.3d 1159 (9th Cir. 1999), and EPA's preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec 8, 1999); and at page 16, that "EPA interprets this latter clause (i.e. "such other provisions as [EPA] determines appropriate for the control of . . . pollutants" at Section 402(p)(3)(B)(iii) of the CWA) to authorize the imposition of water quality based effluent limitations." This interpretation distorts entirely the meaning of CWA Section 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision, and is incorrect. When Section 402(p) of the CWA was added in 1987, it established a comprehensive new scheme for regulation of stormwater. It differentiated the technology-based requirements for MS4s relative to the rest of the NPDES program by creating a new "maximum extent practicable standard," in contrast to the traditional BAT/BCT standard that applied to industrial stormwater and other wastewater discharges. The opening clause of CWA § 402(p)(3)(b)(iii) states that, unlike industrial stormwater permits, MS4 permits "shall require controls to reduce the discharge of pollutants to the maximum extent practicable . . . ." A subordinate clause states that such controls shall include "management practices, control techniques and system, design and engineering methods, and such other provisions as the Administrator or the State determines appropriate for the control of such pollutants." Each of those controls is subject to the limitation in the first clause that they shall be required "to the maximum extent practicable." EPA's interprets this provision contrary to its plain meaning and in a manner which suggests that the final clause referring to "such other provisions as the Administrator or the State determines appropriate" is independent and coequal with the requirement to reduce pollutants to the "maximum extent practicable." Region 1's reading distorts the syntax of § 402(p)(3)(B)(iii) and the intent of Congress in enacting this provision.

   The Region also suggests, incorrectly, that the Ninth's Circuit's opinion in *Defenders of Wildlife v. Browner* supports this misreading of the statute. While in dicta at the end of its decision, the court suggested that the "such other provisions" clause allowed EPA the discretion to include "either management practices or numeric limitations" in MS4 permits, the court did not say that the

discretion to include numeric limitations or to require compliance with water quality standards could be exercised without regard to the "maximum extent practicable" limitation in the statute. That issue was not presented by the facts of the case before it, and it was not addressed in the court's opinion. Had the court so ruled, it would have been contrary to the plain language of the statute and subject to reversal on appeal.

Federal courts have consistently ruled that the MEP standard is the only standard that MS4 discharges are required to meet. *Natural Resources Defense Council, Inc. v. U.S. EPA*, 966 F.2d 1292, 1308 (9th Cir. 1992) (CWA § 402(p)(3)(B) "retained the existing, stricter controls for industrial stormwater dischargers but prescribed new controls for municipal storm water discharge); *Defenders of Wildlife v. Browner*, 191 F.3d 1159, 1165 (9th Cir. 1999) (CWA § 402(p)(3)(B) "replaces" the requirements of § 301 with the MEP standard for MS4 discharges, and it creates a "lesser standard" than § 301 imposes on other types of discharges); *Environmental Defense Center v. EPA,* 319 F.3d 398 (9th Cir. 2003), vacated, rehearing denied by, and amended opinion issued at 344 F.3d 832 (9th Cir. 2003) (CWA "requires EPA to ensure that operators of small MS4s 'reduce the discharge of pollutants to the maximum extent practicable'"); *Mississippi River Revival, Inc. v. City of St. Paul,* 2002 U.S. Dist. LEXIS 25384 (N.D. Minn. 2002) ("the CWA specifically exempts municipal storm water permittees" from the requirement to ensure that water quality standards are met).

In addition, EPA's citation to the Preamble to the Phase II regulations, 64 Fed. Reg. 68722, 68753, 68788 (Dec. 8, 1999) to support its interpretation of Section 402(p)(3)(B)(iii) of the CWA as authorizing the imposition of water quality based effluent limitations is disingenuous. The Preamble to the Phase II rule at 64 Fed. Reg. 68788, states only that EPA disagrees with commentators who challenged EPA's interpretation of the CWA as requiring water quality based effluent limits for MS4s. The Preamble gives no legal rationale. Like the fact sheet, at page 4, the Preamble to the Phase II rule cites to *Defenders of Wildlife*. As noted above, *Defenders of Wildlife* does not support the proposition that EPA can require MS4 operators to comply with WQBELs regardless of practicability.

EPA has taken the position in the defense of the Phase II rule in *Environmental Defense Center* that:

> MS4 requirements... rest on the "maximum extent practicable" ("MEP") standard which CWA Section 402(p)(3)(B)(iii), 33 U.S.C. § 1342(p)(3)(B)(iii), prescribes for Section 402(p) municipal storm sewer permits. 40 CFR § 122.34(b). Thus, while the regulations suggest numerous ways in which small MS4s ought to control their stormwater discharges, *the MS4s are not, in the end, required to do anything that is not "practicable."* 2000 U.S. 9th Cir. briefs 70014, 70020 (June 26, 2001). (Emphasis supplied)

Given the plain language of Section 402(p)(3)(B)(iii), any application of the Phase II rule to require that MS4 discharges need to meet WQBELs regardless of "practicability" would be *ultra vires.*

The cited section of the Clean Water Act makes no mention of water quality standards. Instead, it establishes Maximum Extent Practicable (MEP) as the standard to which pollutants must be removed from municipal MS4s. The language in section 402(p)(3)(B)(iii) of the Act is clear that MEP governs pollution control requirements for municipal stormwater discharges. Section 402(p)(3)(B)(iii) of the Act states that controls to reduce the discharge of pollutants to the MEP include management practices, control techniques and systems, design and engineering methods,

and such other provisions as the Administrator determines appropriate for the control of pollutants. The "such other provisions" clause is within the broader context of the MEP standard, not separate from it as EPA tries to imply. The proper wording throughout the permit that would be consistent with the Act would be for the permittee to meet water quality standards to the maximum extent practicable. For Congress to include such language in the Act is clear and unassailable evidence that lawmakers understood that there are limitations in the ability of municipalities to meet water quality standards in stormwater discharges. These limitations are spelled out in the statutory standard of MEP applied only to municipal stormwater discharges. NPDES stormwater permits for municipalities will continue to be contentious as long as EPA refuses to recognize that the MEP standard applies as the only mandate for pollutant removal from MS4s. Water quality standards and TMDL waste load allocations may be goals but are not the required standards that must be achieved in municipal stormwater.

2. Section 2.1.2 Increased Discharges: New and additional stormwater flow to impaired waters regardless of concentration would be prohibited under this draft permit. This requirement could only be overcome by demonstrating that the pollutant of concern is not present in the new/increased discharge or that the total load of pollutants to the impaired waters will not increase. Even the most innocuous "new discharge", say a new single family home with a driveway and stormwater-minimizing design, will produce some pollution and will add some additional load, be it insignificant, to a receiving water. The language in this section could thus be interpreted to mean no new development in MS4 areas draining to impaired waters. Many urban areas of Massachusetts have nothing but impaired waters. This section could effectively preclude new development in such communities. That is an impact that goes far beyond EPA and federal authority. This language must be modified to stipulate thresholds on new/additional pollutant loads being significant and not merely all new loads.

3. Section 2.2.1.b (pages 11-15) and Appendix F, Part A: The permit requires compliance with TMDL waste load reductions associated with stormwater. It mandates a progressive reduction in pollutant loads with 100% reduction achieved within 15 years. The permit neglects to recognize that most TMDL's developed for Massachusetts waters are lacking in sound science and are instead based on very generic models of watershed loading. In many cases there is a dearth of actual sampling data from the TMDL regulated waters or data may be 25 or more years old. Even in the more rigorous Charles River TMDL for phosphorus, the model used to determine needed phosphorus reduction produced results that are not supported by actual test data. The TMDL's which drive pollutant removal requirements in the draft permit are wholly inadequate for this purpose and cannot legitimately justify specific pollutant load removal for the vast majority of waters. To be consistent with the Clean Water Act and avoid reliance on unsubstantiated pollutant load reductions, municipalities should be required to remove the pollutant of concern to the maximum extent practicable by implementing feasible BMPs, including structural and non-structural measures, that have been demonstrated through generally accepted research to be effective at removing that pollutant. Municipalities cannot do any more than what is feasible and should not be squandering limited resources chasing highly tenuous pollutant "numbers".

4. Section 2.2.1.c (pages 15-17) and Appendix F, Part B: Massachusetts municipalities should not be held to comply with out-of state TMDL requirements. TMDLs are determined by state environmental agencies. While there may be an "open" regulatory process for TMDL development it is highly unlikely that process and its requisite public notification was extended to potentially impacted communities outside of the state. The interests of Massachusetts municipalities were not represented by anyone during TMDL development in Rhode Island, Connecticut, New York, Vermont or New Hampshire. Massachusetts cities and towns are now

being subjected through this draft permit to regulatory programs in other states to which they had no opportunity to participate. Even within Massachusetts, the majority of TMDLs were developed in the early 2000's at a time when their link to future stormwater permits was unknown. Massachusetts TMDLs, with few exceptions, were offered as stand-alone documents with little bearing on anything that a municipality would be required to do. Had it been clear that these documents would have substantial and costly implications for cities and towns the TMDL development process would have fallen under much greater scrutiny and the haphazard, unscientific way they were created would likely have been challenged. The TMDL program in Massachusetts is so hopelessly flawed in terms of science and public process that it should not be utilized for NPDES permitting at all, let alone be the primary focus of a MS4 general permit.

5. Section 2.2.2 Discharges to Certain Water Quality Limited Waters Subject to Additional Requirements (pages 17-22) and Appendix H: This section assumes that there has been sound and defensible science used to determine the cause of impairments of numerous water bodies. That has rarely been the case. State agencies including Massachusetts DEP have rarely had the resources to perform legitimate water quality investigations of lakes, ponds and rivers. Very often an assessment of a water body is based on the most cursory information (visual observation of weeds or algae) and lacks the detailed sampling and analysis needed to truly determine conditions and causes. Yet this unscientific assessment will now result in communities expending significant resources developing nitrogen source identification reports and phosphorus source identification reports along with the planning, implementation and tracking of structural BMPs for removal of these pollutants. For some communities, the "water quality limited waters" driving these added expenses could be 75 miles downstream. It is ludicrous to imagine that stormwater generated in a small community of 5,000 people could have a significant impact on a coastal bay nearly 100 miles distant yet that is what is being described in this section. There needs to be both better science and common sense applied before cities and towns are held to "fix" problems that often do not exist.

6. Section 2.3.2 Public Education and Outreach: While EPA provides more time to conduct the public education program in this draft of the permit, it is important to keep in mind that the majority of the public does not understand how stormwater can become polluted and how it can contribute to water quality issues. Most of the public still believes that catchbasins in their roads transport stormwater to a treatment facility prior to discharge. In addition, most people do not understand the concept of a watershed, or the concepts related to the water cycle (rainfall, runoff, infiltration, and evapotranspiration). A significant amount of awareness-raising must be done across the United States prior to an individual community education/outreach campaign in order to truly stimulate behavior changes in the general public. Many municipalities see a large influx of visitors during the tourist season and thus education must extend well beyond the immediate locality to be truly effective. Stormwater education is a national need and should be spearheaded by EPA nationally through a consistent education campaign and not simply left to municipalities.

7. Section 2.3.4 Illicit Discharge Detection and Elimination (IDDE) Program (pages 25-37: Overall the IDDE program as described is highly prescriptive and very burdensome. While IDDE is necessary and valuable for a strong stormwater management program the extent to which a municipality can comply with the edict mandated in the draft permit is questionable. The schedule mandated by the permit is unreasonable for an initiative that constitutes a major capital project requiring significant expenditures and coordination. The described program needs to be tempered by the Maximum Extent Practicable standard and thus subject to that which is feasible.

8. Section 2.3.4.1 Definitions and Prohibitions (page 25): EPA needs to modify its definitions to differentiate illicit discharges caused by mis-connected sewer laterals or direct introduction of contaminants into the MS4 by illegal dumping from those caused by systemic failures within the sanitary sewer or MS4. It is one thing to track, identify and remove an illicit connection but altogether different to track, identify and correct a failed sanitary sewer or similar system defect. The former are generally easy to locate and repairable within a relatively short time while the latter are extremely difficult to locate and repair and may involve wholesale replacement of large parts of the sanitary sewer collection system. The language in section 2.3.4 implies a "one size fits all" approach to IDDE and it clearly is not in terms of locating and removing the illicit discharge.

9. Section 2.3.4.4 a through e: This Sanitary Sewer Overflow reporting requirement is redundant and should be removed from the Small MS4 permit. MassDEP already requires SSO reporting through statewide regulations. For purposes of this MS4 permit, the term SSO needs to be defined. Relative to stormwater management and MS4 permitting the only SSO that should be considered are those that discharge through a stormwater outfall into a receiving water. SSOs that enter basements or are contained on street surfaces or upland areas have no link to an MS4.

10. Sections 2.3.4.5 and 2.3.4.6 (page 26-28): Outfall and interconnection inventory and system mapping are necessary and valuable components of stormwater management. However, the timeframe to complete these more detailed studies is likely inadequate, especially for smaller communities that may lack GIS and GPS capabilities. Communities should identify feasible schedules for completing this work within their SWMP.

11. Section 2.3.4.7.d.i (page 32): DPW&P objects to the requirement that the permittee adopt a screening and sampling protocol consistent with a January 2012 draft document (EPA New England Bacterial Source Tracking Protocol). If this protocol is to be used in a regulatory context as proposed for this permit it should be subject to rule making, peer reviewed and scrutinized by others outside of the Agency and become a Final, not a draft, before making its use mandatory. Otherwise, the draft document may be useful as a suggested reference only.

12. Section 2.3.5 – Construction Site Stormwater Runoff Control, and 2.3.6 – Stormwater Management and New Development and Redevelopment (Post Construction Stormwater Management). These provisions require permittees to develop, implement and enforce a program to reduce pollutants and any stormwater runoff discharge to the MS4. EPA has no authority to make local land-use decisions by compelling permittees to make specific choices with regard to ordinances or other regulatory mechanisms. EPA is exercising federal land-use mandates on a local basis in violation of the 10th Amendment of the Constitution.

    These provisions would also apply to public road reclamation and resurfacing projects involving more than ¼ mile of 30 foot wide pavement (approximately 1 acre equivalent). By doing so, this permit would cripple local road maintenance budgets by effectively requiring redesign and construction of entirely new stormwater collection and control systems for all but the smallest road resurfacing project. Maintaining safe, passable roads is among the highest priorities of local government and one that is currently grossly underfunded. Taking limited funds and utilizing them for stormwater improvements for virtually every significant resurfacing project will greatly curtail meaningful improvements to local roads. Resurfacing and pavement maintenance projects should be exempted from this requirement to meet stormwater standards. The standards might be applicable to road reconstruction projects but only to the extent that they are practicable.

13. Section 2.3.6.d (pages 42-43) Directly Connected Impervious Area: The requirement to monitor and track impervious cover is a burdensome and inappropriate requirement for most municipalities. It has the appearance of a research effort and not a tool that will benefit stormwater management by the community. Compiling and tracking impervious area will require manpower and costs that would be better utilized implementing better stormwater control systems. If Region 1 is that interested in tallying impervious cover acreage, it should directly fund and coordinate with colleges and universities to accomplish the task through graduate and undergraduate GIS projects.

    Region 1's effort to regulate impervious surfaces raises the legal issue on whether such surfaces are "point sources" under the NPDES permit program. Impervious surface, on its own, cannot be subject to regulation under the NPDES permit program because impervious surfaces are neither a "point source" nor a "pollutant." Instead, it is a feature of the landscape that indirectly influences how water is carried on and off land. Congress predicated the stormwater permitting program and Section 402(p) of the CWA on "point source" discharges of "pollutants" from certain categories of dischargers, including MS4s and industrial activities. If Region 1 were to interpret "point source" to include impervious surfaces, it renders that term meaningless and contrary to Congressional intent to define the term and distinguish between "point sources" and "nonpoint sources." In addition, Region 1's authority to control pollutant discharges does not encompass the ability to mandate land-use decision-making. While local authorities can develop a regulation, for example, to limit impervious surfaces or other stormwater flows into the MS4, EPA is limited to regulating the discharge of pollutants from the MS4 and cannot force MS4s to do what EPA is not otherwise authorized to do, including imposing restrictions on local land use decisions. While on November 26, 2014, EPA released a guidance memorandum in which it asserts authority to mandate retention standards based upon the amount of impervious surface at a site, that authority is necessarily limited to discharges from MS4 storm system (i.e., the "point source") into navigable waters. In short, impervious surfaces are not "point sources" under the NPDES permit program. CWA Section 304 prohibits unauthorized point source discharges, but Congress left the regulation of nonpoint source pollution to the states.

    The City of Worcester Department of Public Works & Parks appreciates the opportunity to comment on the Massachusetts Small MS4 Draft General Permit. We urge Region 1 to consider modifications to the permit that will make it environmentally and economically sustainable for municipalities and consistent with the limitations set forth in the Clean Water Act.

Sincerely,

Paul Moosey

December 18th, 2014

Worcester Community Project Center

Sponsored By: Massachusetts Department of Environmental Protection

Abstract

Stormwater runoff is one of the leading causes of water pollution in the United States. The MS4 permit reduces pollution by regulating the runoff of pollutants into stormwater drains. With the assistance of the MassDEP and the Worcester Community Project Center, we sought to provide the Massachusetts towns of Southbridge, Holden, and Millbury with a cost analysis for implementation of the 2014 draft MS4 permit. In order to achieve this goal, we learned the details of the 2003 permit and 2014 draft permit, interviewed town officials, and performed water quality sampling. After creating our cost analysis, we provided our subject towns with findings and recommendations assessing the feasibility of implementing the permit, and suggestions for best practices each town uses to manage stormwater.

Acknowledgements

We would like to thank our sponsor, the Massachusetts Department of Environmental Protection, for their support and assistance throughout our project. In particular, we would like to thank Frederick Civian, Andrea Briggs, Stella Tamul, and Cheryl Poirier. We would especially like to thank Frederick Civian for his ongoing commitment to answer any questions we had, for helping us produce our cost sheet, and for appearing in our video.

Next, we would like to thank the representatives from Holden, Millbury, and Southbridge, who were extremely generous in allowing us to interview them and perform outfall tests. From Holden, we would like to thank Isabel McCauley, John Woodsmall, and Pamela Harding. We are especially grateful to John Woodsmall for appearing in our video, and to Isabel McCauley for taking us out to all of the outfalls we tested. From Millbury, we would like to thank Robert McNeil and Cindy Allard for allowing us to interview them, and for showing us a smoke test demonstration. From Southbridge, we would like to thank Heather Blakeley, Ken Pickerin, and Mark DiFronzo for allowing us to conduct our interviews and sampling.

Additionally, we would like to thank Robert Lowell and Larry Pistrang from the Department of Conservation and Recreation (DCR) for allowing us to interview them and gain from their experience. We would also like to thank Kelley Freda from the DCR, for contributing a detailed cost estimation.

We would also like to thank the Central Massachusetts Regional Stormwater Coalition, in particular Aubrey Strause and Matthew St. Pierre for giving us data, answering our questions, and allowing us to attend steering committee meetings.

Finally, we would like to thank our advisors Corey Dehner and Anne Ogilvie for their ongoing support and dedication to the success of our projects. Thank you for pushing us to

perform to the best of our ability no matter what happened during the term. We would also like to thank you for the various donuts, pizzas, and coffee to keep us going along the way.

Executive Summary

Background

Water Pollution affects an enormous number of water bodies in the United States. "In 2006, there were over 15,000 beach closings or swimming advisories issued due to bacterial levels exceeding health and safety standards" (Council, 2008). Much of this pollution is due to stormwater runoff. Stormwater runoff occurs when water becomes displaced by weather and flows over impervious surfaces, such as roads and roofs. When stormwater flows over these surfaces, it often collects pollutants such as oils, nutrients, ammonia, sediments, and heavy metals (EPA, 2012). These pollutants can have environmental, aesthetic, and economic ramifications on surface bodies of water. In order to combat stormwater runoff, the United States Environmental Protection Agency (USEPA) has created a system to move stormwater runoff into nearby bodies of water through what is known as Municipal Separate Storm Sewer Systems (MS4). Unfortunately, while these systems are useful for draining stormwater runoff, they are also very effective at directing pollutants into water bodies.

Before 1972, stormwater runoff and sewage drained through the same pipe, which led to frequent overflows (Robert B. Stegmaier, 1942). These overflows led to the pollution of topsoil, and the need for a better solution became apparent. This situation led to the creation of the Clean Water Act (CWA) in 1972 (Andreen, 2003a). In 1990, the USEPA first released the MS4 permit as part of the CWA. The MS4 permit allows municipalities to regulate the discharge of pollutants into stormwater drains. The MS4 permit defines six minimum control measures to reduce pollution caused by stormwater runoff. These control measures are:

1) Public Education
2) Public Involvement and Participation
3) Illicit Discharge Detection and Elimination (IDDE)
4) Construction Site Runoff Control

5) Post-Construction Runoff Control
6) Pollution Prevention and Good Housekeeping

Municipalities fulfill these control measures with Best Management Practices (BMPs). These BMPs can include street sweeping, waste collection, and outfall sampling. The implementation of these BMPs cost municipalities money. Massachusetts has been regulated under the same MS4 permit since 2003. Even though this permit expired in 2008, the USEPA continued to administer it indefinitely until they were able to release a new permit. On September 30, 2014, the USEPA released the 2014 draft MS4 permit. This new draft permit is much more detailed than the 2003 permit and has much more stringent regulations. Due to this increased level of regulation, the 2014 draft MS4 permit will cost much more to implement than the 2003 MS4 permit.

The Massachusetts Department of Environmental Protection (MassDEP), in collaboration with Worcester Polytechnic Institute (WPI), developed this project in order to assess the cost of implementing the 2014 draft MS4 permit in three Massachusetts towns: Southbridge, Holden, and Millbury. Our subject towns are part of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). As of the 2014 fiscal year, The CMRSWC consists of communities that share resources for stormwater management, such as water sampling kits and GPS mapping equipment. Our goal for this project was to provide a comprehensive analysis of the cost of implementing the 2014 draft MS4 permit in Southbridge, Holden, and Millbury Massachusetts.

Methodology

In order to achieve our goal of providing a comprehensive analysis of the cost of implementing the 2014 draft MS4 permit in Southbridge, Holden, and Millbury Massachusetts, we utilized the following methodology.

1) Became educated on the details of the 2003 MS4 permit and 2014 MS4 permit
2) Assessed what Holden, Millbury, and Southbridge, Massachusetts have done to meet the requirements of the 2003 MS4 permit
3) Identified Holden, Millbury, and Southbridge's total current expenditures for stormwater management
4) Identified what changes each of our subject towns will have to make in order to comply with the requirements of the 2014 MS4 permit
5) Provided a detailed analysis of the complete costs for each town to comply with the requirements of the 2014 MS4 permit
6) Created an informational video to explain the costs of implementing the 2014 MS4 permit

Throughout our project, we used various research methods such as document analysis, field work, and interviews in order to learn about the cost of compliance with the MS4 permit. By analyzing various background documents about stormwater management, including the 2003 MS4 permit and 2014 draft MS4 permit, we were able to learn about the need for stormwater management as well as the BMPs typically used to manage stormwater.

We conducted interviews with various municipal officials, including public works directors, fire chiefs, town engineers, and members of town conservation commissions. These interviews allowed us to learn about our subject towns' stormwater programs and the costs associated with these programs. We also conducted an interview with the Department of Conservation and Recreation (DCR), which allowed us to estimate costs of BMPs, which town officials could not provide to us.

During our project, we also performed field work, which included outfall sampling using the CMRSWC kits, using dry and wet weather screening forms, and using the geographical information system (GIS) maps of our subject towns. This fieldwork allowed us to gain a more accurate understanding of the amount of labor involved with screening outfalls, which ultimately assisted us in completing our cost analysis.

After we completed our goals and objectives, we were able to provide findings and recommendations to our subject towns.

Findings and Recommendations

Finding 1: The 2014 draft MS4 permit may cost too much for the towns to effectively implement

The costs associated with stormwater management are very high, yet many towns have a limited budget for stormwater. The MS4 permit may cost too much for towns to individually implement. For implementation of the 2014 draft MS4 permit, Holden should expect to spend $258,790 annually, Millbury should expect to spend $753,173 annually, and Southbridge should expect to spend $343,008 annually.

Recommendation 1: Effective regionalization will allow towns to better implement their stormwater management programs

Due to the high cost of implementing the 2014 draft MS4 permit, we recommend that the towns regionalize. Regional organization, such as through the CMRSWC, can reduce the cost of many materials related to stormwater management.

Finding 2: Using innovative funding techniques can help the towns spend less from their general funds on stormwater management

The CMRSWC has received funding from the Community Innovation Challenge (CIC) grant. The first year of the Coalition's existence was fully funded by the CIC grant program and the subsequent two years of grant funding supplemented the Coalitions expenditures. In FY2014, member towns paid 4,000 dollars to continue as members of the Coalition. Millbury has begun applying for other grants to support implementation of BMPs, which may save them money over time.

Recommendation 2: The towns should seek alternative sources of funding such as additional grants beyond the CIC

Due to the reduction of CMRSWC funding from the CIC, we recommend that the towns apply for other grants. These grants can include the 604(b) grant from the MassDEP. The Towns should apply to these grants as quickly as possible, and the Coalition should lobby for additional future funding from the USEPA and MassDEP.

Finding 3: Using innovative stormwater management techniques can help the towns save money and thus implement the permit more effectively

Millbury uses innovative stormwater BMPs, such as a school art contest, to fulfill the public participation control measure. These BMPs allow Millbury to implement the MS4 permit effectively and at a low cost.

Recommendation 3: The towns should strive to utilize innovative stormwater management techniques

Millbury's use of creative BMPs has saved them money in implementing the MS4 permit. We encourage other towns to do the same, as they may be able to come up with BMPs, which are more efficient and cost-effective than their current BMPs.

Finding 4: Towns that communicate with other towns, even to a small extent, can more effectively manage and fund their stormwater management programs

A previous IQP group from WPI demonstrated that the CMRSWC towns spend less money on stormwater management than towns that work independently. This type of collaboration can also help generate more innovative BMPs, which will save the towns money.

Recommendation 4: Regionalization can help towns save money by sharing information and resources

We recommend that the towns regionalize and attempt to share information and resources. This practice will help them implement the 2014 draft MS4 permit more effectively.

Finding 5: In each of our subject towns, stormwater management information was divided amongst different departments

In many of our subject towns, there was not one person fully dedicated to stormwater management. Multiple departments in each town were responsible for implementing the stormwater management programs. As a result, we often had to request information from more than one department in each town.

Recommendation 5: Having a central source of stormwater management should allow for easier implementation of future MS4 permits and make continuous compliance easier for the towns

We recommend that the towns research the feasibility of either creating a position dedicated to managing stormwater information, or making this responsibility part of a single position. If smaller towns cannot afford to pay for this position, we recommend that multiple towns share a person dedicated to stormwater information. This practice will make it easier to implement the MS4 permit in the future.

Finding 6: The IDDE control measure will be a significant contributor to the increase in cost between the 2003 and 2014 draft MS4 permits

The 2014 draft MS4 permit has many more requirements than the 2003 MS4 permit, especially in the IDDE control measure. Much of the increase in cost between the two permits will be due to the increased stringency of the IDDE measure. The IDDE measure will also have more detailed requirements for practices such as outfall sampling with water testing kits.

Recommendation 6: The CMRSWC should have one person in charge of keeping track of and maintaining the sampling kits

When we performed sampling in the field, the sampling kits were often disorganized and had expired components, which slowed down our work. Having the kits intact will make it easier to sample, and will thus save money on sampling costs.

Finding 7: The current Asus tablet in use by the CMRSWC is slow and ineffective

When we used the tablet in the field, it was often slow to load. Town employees often complained about the delay. When we used a new smart phone, we did not see this delay. The delay caused by the old technology costs the towns in the CMRSWC money on labor costs.

Recommendation 7: The towns should use software, which can collect data offline and then upload it to an online database later, as well as a tablet, which is more up to date. This would allow the DPW workers to work more efficiently, thus saving the town labor costs

We recommend that the Coalition should purchase a new tablet, such as an Apple iPad. The labor costs that the tablet will save will pay for the cost of the tablet very quickly.

Other Recommendations

The Massachusetts Department of Environmental Protection should research the potential of providing standardized materials available to Massachusetts municipalities

Many of the control measures of the permit, such as public education and public involvement and participation, require municipalities to create similar documents. If the MassDEP could create standardized templates for these requirements, it could reduce the cost to towns, as well as give them more time to focus on eliminating pollutants.

The CMRSWC should streamline and update the digital forms. This practice would reduce the time needed to inspect outfalls, thus saving money

While we performed fieldwork in Holden, we found that the dry and wet weather forms had categories relating to pollutants, which are not regulated by the MS4 Permit. These extra categories made the forms time-consuming to fill out. Collecting this additional information causes the towns to spend increased labor costs. By updating the forms, the CMRSWC can reduce labor costs for the towns.

Recommendations for Future Research

We recommend that future project groups research the cost of implementing Total Maximum Daily Load (TMDL) requirements in towns. These requirements may generate a very large cost, which has not been researched well. We also recommend that future research groups

attempt to eliminate some of the biases, which may have appeared in our research. These biases stemmed from our limited sources of budget data, and as a result, some of our cost figures may be inaccurate. We recommend other project groups eliminate this bias by finding multiple sources for town budget data.

Conclusion

The findings and methods that we present should help the towns understand and prepare for the financial implications of implementing the 2014 draft MS4 permit. The towns will have to work hard to comply with this new permit, but this effort will be worth protecting people and the environment from the negative effects of stormwater runoff. Among our most important recommendations, we emphasize the benefits of regionalization, the use of innovative stormwater management and funding techniques, and the centralization of stormwater management in each town. We also recommend that the towns reach out to the MassDEP for advice on implementing the 2014 draft MS4 permit. Although the task of effective stormwater management is daunting, the towns can plan to effectively manage stormwater, thus protecting human health and the environment.

1.0 Introduction

Pollution affects a staggering number of water bodies in the United States. "In 2006 there were over 15,000 beach closings or swimming advisories issued due to bacterial levels exceeding health and safety standards" (Council, 2008). A 2012 United States Environmental Protection Agency (USEPA) study evaluating 57% of the lakes, reservoirs, and ponds in the United States found that 97.5% of the examined water bodies contained unacceptable levels of pollution (USEPA, 2012).

One illustrative example of the extent of water pollution is in Ohio's Cuyahoga River. The water pollution in the Cuyahoga River was so profound that the river has actually caught on fire multiple occasions, as Figure 1 illustrates. In the 1960s, industries used the river as a dumping ground for contaminants such as oil, industrial waste, sludge, and sewage.

Figure 1. Cuyahoga River on Fire

(Greater Elkhart County Stormwater Partnership)

In 1969, one of these fires captivated national attention, and caused a chain of events, which spawned the creation of the Clean Water Act (EPA, 2013). The Cuyahoga river fires are just one of many cases of such extreme water pollution.

Water displaced by the weather events, also known as stormwater runoff, pollutes the surface waters of the United States. Stormwater runoff occurs when stormwater flows over an impervious surface, an area that water cannot pass through, such as house roofs, streets, and

parking lots. As the stormwater flows over these surfaces, it often collects pollutants such as oils, sediment, and heavy metals (EPA, 2012). These pollutants are detrimental to aquatic life, which in turn, affects the people in the surrounding areas. Pollutants such as nutrients can cause severe harm to aquatic life through the formation of algal blooms. These are alga blooms that become harmful under certain conditions including light availability and an abundance of nutrients. These harmful algal blooms can damage aquatic plants by blocking sunlight and depleting nutrients from the water, which can kill aquatic fauna (Kuentzel, 1969). Beyond the flora and fauna, stormwater runoff pollution also erodes natural structures such as deltas as illustrated in Figure 2.

Figure 2. Example of sediment runoff (Lehman, 2010)

To combat the issue of stormwater runoff, the USEPA created a system to move stormwater runoff into nearby bodies of water this is known as Municipal Separate Storm Sewer Systems (MS4s). In order to minimize stormwater flow over impervious surfaces, the design of the area around MS4s incorporates efficient methods of directing stormwater into the MS4s. The issue with moving the stormwater runoff directly into the bodies of water is that the pollutants that the stormwater runoff carries end up in the body of water.

To mitigate the impact of stormwater runoff, the USEPA has created an MS4 permitting system. The USEPA categorizes these permits are as either MS4 or National Pollutant Discharge Elimination System (NPDES). NPDES permits are a more general category of permits, which apply to facilities that have a wastewater output. The MS4 permits fall under the category of the

NPDES permits, but MS4 permits deal with requirements more specific to stormwater runoff (US EPA, 2014b). Figure 3 shows a simplified example of an MS4. The MS4 permit contains measures, which help mitigate the impacts of stormwater runoff. (USEPA, 2014c)

The MS4 permit contains six minimum control measures that permittees must follow in order to maintain compliance with the permit. These six measures provide general guidelines for stormwater management and public education. On September 30, 2014, the USEPA issued a new draft MS4 permit for permit holders in Massachusetts. In Massachusetts, the USEPA issues the MS4 permit. In the meantime, the Massachusetts Department of Environmental Protection (MassDEP) acts as the cosigner, while the USEPA enforces the permit.

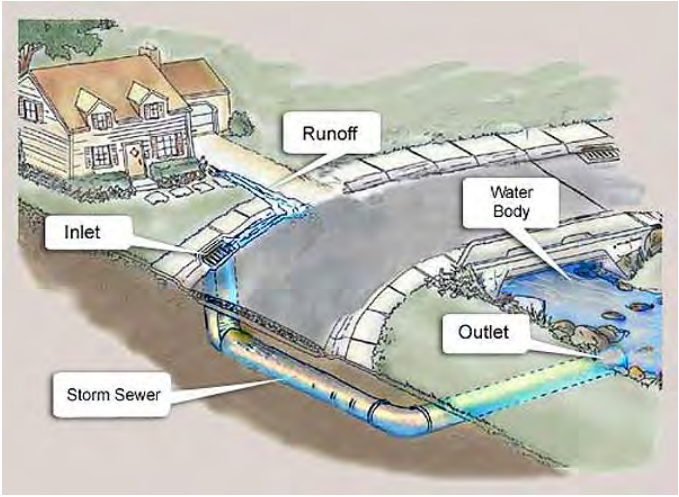

Figure 3. Example of a simple MS4 (Bardstown, 2014)

The MassDEP has developed this project requesting assistance from students with Worcester Polytechnic Institute's (WPI) Worcester Community Project Center. Our project was specifically aimed to assist the Central Massachusetts towns of Holden, Millbury, and Southbridge in understanding the costs of updating to the new 2014 draft MS4 permit. The goal of this project was to assess various municipalities' stormwater management practices for compliance with the MS4 permit, and provide a detailed analysis of the financial cost needed to fulfill the requirements of the 2014 draft MS4 permit. In addition to the cost analyses, we created

an informational video to help selectmen and town meeting members understand the implications of both stormwater runoff and the new MS4 permit requirements.

In chapter 2, we provide a detailed overview of stormwater runoff and its effects, the history and details of the MS4 permit, our sponsor the MassDEP, and the role of the Central Massachusetts Regional Stormwater Coalition (CMRSWC). In chapter 3, we describe the methodology we used to learn the details of the 2014 MS4 Draft permit and assess the total financial expenditures for compliance with its requirements. In our final two chapters, chapter 4 and 5, we outline our findings and provide recommendations for future research to the CMRSWC, the MassDEP, and the towns we worked with, Holden, Millbury, and Southbridge based on our findings.

We hope that this project will have a lasting and meaningful impact on stormwater management in Central Massachusetts. With the assistance of the MassDEP and CMRSWC, we hope our efforts help Central Massachusetts' municipalities prepare for the MS4 permit and protect the waters of the United States (U.S.) from pollution.

2.0 Background

2.1 Introduction

Rainwater runoff poses a serious risk of pollution to the world's surface water bodies. Impervious manmade surfaces such as roads and sidewalks drain pollutants into local water bodies after rain events occur. These pollutants, which can include chemicals, oils, metals, sediment, and bacteria, can directly affect human health by polluting local sources of drinking water (Gaffield, Goo, Richards, & Jackson, 2011). We discuss stormwater runoff and its impacts in more detail in section 2.2 of this chapter. To fully understand the problem of stormwater that the United States (U.S.) faces, we discuss the history of stormwater management in section 2.3

of this chapter. To help mitigate the impacts of stormwater, the United States Environmental Protection Agency (USEPA) released Municipal Separate Storm Sewer System (MS4) permit. This permit helps municipalities reduce pollution in water bodies by using effective stormwater management, which we discuss in more detail in section 2.4 (USEPA, 2014f). The Massachusetts Department of Environmental Protection (MassDEP), a Massachusetts state agency, helps municipalities navigate the intricacies of the MS4 permit. The MassDEP served as our sponsor throughout our project; we introduce them in section 2.5. We discuss the Central Massachusetts Regional Stormwater Coalition (CMRSWC), formed in 2012 to help communities meet the requirements of the MS4 permit (Spain, 2014); in section 2.6.

2.2 Stormwater Runoff

There is a difference between stormwater and stormwater runoff. Stormwater is the water that falls from storms or that which snowmelt produces. Stormwater runoff is the water that travels along impervious surfaces and gathers pollutants. The USEPA defines stormwater runoff as "generated when precipitation from rain and snowmelt events flows over land or impervious surfaces and does not percolate into the ground" (USEPA, 2014g). An impervious surface is a surface which water cannot pass through, such as asphalt and roofs. The stormwater runoff that flows over these impervious surfaces often collects pollutants that contaminate the stormwater and passes those contaminants into local water supplies. Contaminated stormwater runoff may contain oils, nutrients, and sediment. The oils, which usually come from leaking vehicles or car washing, are toxic to aquatic life. The nutrients that come from fertilizer and sewage overflow cause an unnatural increase in the growth of unwanted plant life, which depletes the oxygen in the body of water, causing aquatic life to die (EPA, 2012).

Sediment pollutants are found when land around the water body starts to erode, causing sediment to gather on aquatic life that lives close to the bottom of the water body, which prevents sunlight from getting to the plants (EPA, 2012).

In an effort to mitigate the impacts of stormwater runoff, municipalities may make land use changes, pass by-laws, and/or focus on public education. Municipalities mitigate the impacts of polluted stormwater runoff through Best Management Practices (BMP) and compliance with the MS4 permit, which we explain in section 2.4 below. When land use planners do not consider stormwater runoff, there can be serious environmental, aesthetic, and financial ramifications.

2.2.1 Environmental Impacts of Stormwater Runoff

Stormwater runoff is one of the top causes of water pollution in the U.S. today (Blair et al., 2014). Every two years, the USEPA releases a National Water Quality Inventory Report (NWQIR) on two groups of water bodies: rivers and streams, and lakes, reservoirs, and ponds. The NWQIR is the primary tool that the USEPA uses to keep the public, as well as Congress, informed about the quality of U.S. surface water. The USEPA monitors these bodies of water by regularly testing for various contaminants. These tests primarily look for contaminants such as fecal coliform, Escherichia Coli

Figure 4. Watershed

(S. R. W. Coalition, 2014)

(E. coli), polychlorinated biphenyls (PCB) in fish tissue, total phosphorus, and examine the concentration of dissolved oxygen. Based on these indicators and scientifically determined established safe levels, the USEPA determines if the body of water is impaired (Council, 2008). The USEPA breaks up the different municipalities by watersheds when issuing these reports to the public.

A watershed is the area where all of the connected rivers and ponds merge into one body of water as we illustrate in Figure 4. The Blackstone Watershed encompasses towns around Worcester, Massachusetts and municipalities to the south east of Worcester. In the 2012 NWQIR, the USEPA assessed 28.3% of Rivers and Streams; in the Blackstone watershed, 63.8% were impaired. The majority of the impairment was due to a lack of total maximum daily load (TMDL) management. TMDL is the total maximum amount of pollutants that can be discharged into a body of water while remaining safe for the water's intended use such as swimming or fishing (USEPA, 2013b). Since stormwater has caused so much pollution to bodies of water, the USEPA requires municipalities to use TMDLs, which the state creates, to help restore water bodies from over-pollution (USEPA, 2013b).

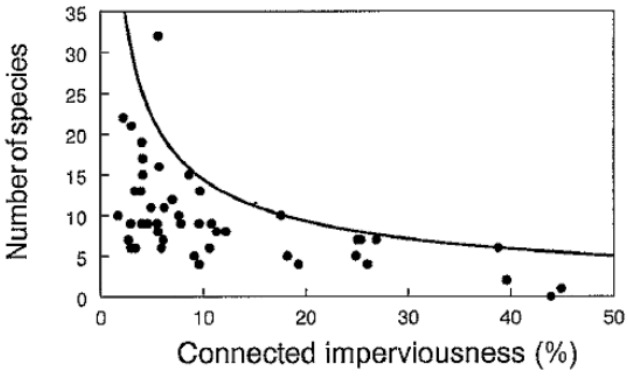

Figure 5: Species vs. EIA

(Council, 2008)

As more areas become urbanized, the amount of impervious area increases. The U.S. is experiencing a urbanization trend of increased urban population; the urban population went from 79.0% in 2000 to 80.7%

in 2010 (Bureau, 2012). This change would increase the Effective Impervious Area (EIA), causing more pollutants to run off into the local bodies of water.

The USEPA performed a study on surface water bodies, assessing, among other things, the amount of different fish species that inhabit that body of water. As Figure 5 illustrates, as the percent of imperviousness increases, the number of fish species in the area exponentially decreases. Figure 5 demonstrates a correlation between the amount of EIA and the presence of bio diverse aquatic system. This correlation is explained by an increase in pollution in the local area, causing the fish to either be poisoned by various pollutants or to suffocate on those same pollutants (Council, 2008).

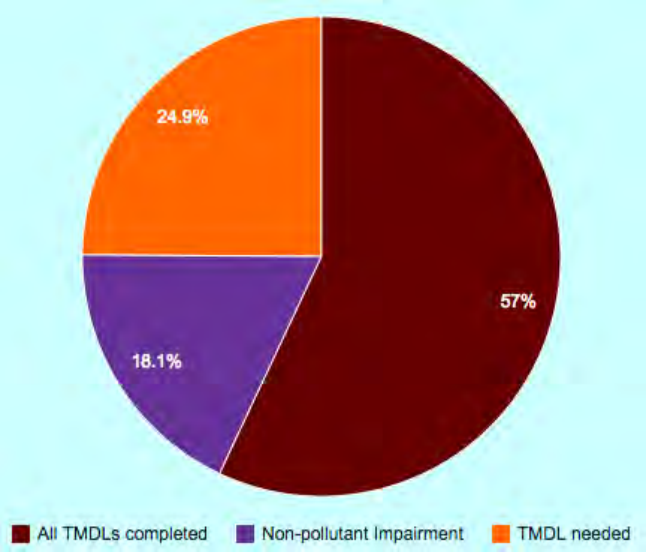

Figure 6. Causes of Lake Impairment (USEPA, 2012)

In addition, in 2012, the USEPA evaluated 57% of lakes, reservoirs, and ponds in the Blackstone watershed area. In this study, the USEPA found that of the 57% evaluated, 97.5% of the lakes, reservoirs, and ponds were impaired. In this case, however, only 24.9% of the lakes, reservoirs, and ponds needed a TMDL to be set in place (Council, 2008). THE USEPA also cited non-pollutant impairment as a problem in the lakes, reservoirs, and ponds in the Blackstone watershed, as seen in Figure 6. Non-stormwater pollutant impairment occurs when unregulated sources of non-stormwater pollution impair a body of water, such as turbidity (US EPA, 2014a).

The pollutants themselves are not the only problem with stormwater flowing into local water bodies untreated. Harmful algal blooms (HABs) are of great concern for aquatic life. HABs not only reduce water clarity, but they also deplete the oxygen in the water, which in turn can kill the natural life in the body of water. Since the HABs create a layer of colored algae on top of the water body, they also have a negative effect on the aesthetics of the water body. In addition, as the water becomes an eyesore, the tourism in the area also is likely to drop (Andersen, 2009).

2.2.2 Low Impact Designs

Low Impact Designs (LIDs) are a way to, "simulate natural hydrologic conditions, by gradually recharging groundwater and slowing runoff that flows to collection systems and receiving water systems" (MassDEP, 2014).

Figure 7. Bioswale

(Service, 2005)

Some of these methods include bioswales, green roofs, and infiltration or retention basins. People who design these areas usually create these designs as LIDs. A LID is a way that the designers try to address stormwater runoff by reducing the amount of impervious surface area and working with the natural landscape. LID includes stormwater BMPs, which we will explain in the next paragraph. LID can also be applied to redesigning areas; in that case, the LID would work more towards rebuilding the landscape rather than working with the existing area (Cahill, 2012).

BMPs are methods and designs that towns use to mitigate the effects of stormwater runoff. Some common BMPs include grassy swales, rain barrels, and vegetated roofs. *Grassy swales* are similar to the bio swales that we will discuss in the next paragraph, except the designers just use grass rather than other plant life. *Rain barrels* collect rainwater from roof runoff. Rather than dumping the runoff into the streets, the rain barrels allow the owner to use the water for watering plants or just dispersing on the ground so that the runoff naturally filters through the ground. *Vegetated roofs* are the same as extensive *green roofs*, which we will discuss later in this section.

Figure 8. Green Roof

(Division, 2014)

Bioswales can be an alternative method to using stormwater drains or simply to augment the drains. Workers place plants and foliage around an area, which is slightly lower than the area around it, as seen in Figure 7. The stormwater then flows into the bioswale, and the plants filter the stormwater for low flow storms. For larger storms, bioswales can direct the flow of stormwater into nearby drainage systems, however average bioswales can handle storms up to 4.3inches per 24hour period (Service, 2005). *Green Roofs* are a layer of dirt and plant life on the roof of a building. This layer above the roof provides shade to the roof, preventing it from reaching extremely hot temperatures; instead, the plant life absorbs most sunlight, which will normally heat the roof (Division, 2014). The layer of dirt also acts as a

Figure 9. Retention Basin

(USGS, 2004)

filtration system for light storms as seen in Figure 8. There are two types of green roofs, intensive and extensive. Intensive is similar to a roof garden, where the plant life is usually flowers, trees, and general garden plants in separate pots. Extensive roofs consist of a layer of dirt and rugged vegetation, which needs little to no maintenance (Division, 2014).

Figure 10. Infiltration Basin (University, 2011)

Infiltration and retention basins filter stormwater in a similar manner. An infiltration basin takes stormwater from the surface, trickles it down slightly below the surface of the ground, and dissipates the stormwater over a larger area, as Figure 9 illustrates. A retention basin is similar to an infiltration system, but instead of keeping the stormwater underground, it turns the stormwater into an artificial lake or pond, which drains slowly, but at a fixed rate, as Figure 10 illustrates (Mays, 2001).

LID	Average Cost
Green Roof (Intensive)	$10/ft^2
Green Roof (Extensive)	$25/ft^2
Rain Barrels	$216
Grassy Swales	$30/ft^2
Bioswales	$16.25/ft^2
Infiltration Basin	$4,500
Retention Basin	$7,500

Table 1. Comparison of LIDs

These methods of handling and filtering stormwater are just some of the ways that engineers and building planners handle the issue of stormwater runoff. Businesses work to mitigate stormwater runoff when it has an economic impact on their business. Below is Table 1[1], which compares the average costs of implementing each of the LIDs mention in this section. In the next section, we discuss the economic impacts of stormwater.

[1] (Brennan, 2014; Center, 2007; Division, 2014; PennsylvaniaDEP, 2006; USEPA, 2013a)

2.2.3 Economic Impacts of Stormwater Management

The goal of improved stormwater management raises questions about cost. Towns use many LID measures to effectively reduce the impact of stormwater runoff. The implementation of these LID measures, i.e. swales, permeable pavement, filter strips, and infiltration trenches, increases the cost of construction projects, as implementation requires careful planning and additional work. However, the economic benefits of these LIDs may in fact defray the cost of their implementation.

The BMPs, which towns use to comply with the requirements of the MS4 permit, can require a large initial financial input. For example, the town of Millbury, Massachusetts estimated that they spent about $75,000 on street sweeping during the 2013 fiscal year (Spain, 2014). The towns must understand the expenditures related to stormwater management in order to effectively fulfill the requirements of the MS4 permit.

Despite the increased cost of construction projects, LIDs can actually save towns money over time. The use of these LIDs minimizes the extent to which stormwater runoff impairs water quality. If there are fewer impaired water bodies, then towns spend less money on treating the water bodies. LIDs may also reduce the effects of flood damage, and eliminate the need for water treatment facilities (Thurston & EnvironetBase, 2012). LID measures can also save money by reducing construction cost. For example, a parking garage can cost approximately $20,000 per space to build. An open parking lot with non-impervious surfaces, however, can cost as little as $2,000 per space to build (Cahill, 2014). In this case, the use of an LID does not just reduce the construction cost; it also reduces the amount of runoff that needs to be treated.

2.3 History of Stormwater Management

October 2012 marked the 40th anniversary of the 1972 Amendments to the Federal Water Pollution Control Act, better known as the Clean Water Act (CWA). Many decades of surface

water pollution preceded the CWA, and some of the causes of pollution are rooted in the industrial surge of the previous two centuries. Unsanitary conditions and polluted drinking water led to health issues, such as yellow fever and cholera (Andreen, 2003b). Even in rural areas, water pollution was a problem. Most towns simply integrated any stormwater management systems into their sewer system. Easy to implement as a combined system, these constructs only involved the conveyance of water away from highly populated areas (Robert B. Stegmaier, 1942). Due to their combined nature, these systems were highly prone to overflow, contaminating topsoil and surrounding water bodies with raw sewage waste (Joseph-Duran, Jung, Ocampo-Martinez, Sager, & Cembrano, 2014). In 1948, the conclusion of World War II allowed the federal congress to bring focus onto more domestic issues. The massive industrial output of the war had taxed rivers, and funding for wastewater treatment had dropped during the years of conflict (Andreen, 2003a).

2.3.1 Evolution of the Clean Water Act

The 1948 Federal Water Pollution Control Act (FWPCA) served as a precursor to the CWA, which would undergo many revisions before the federal government expanded the CWA in 1972. The National Pollution Discharge Elimination System (NPDES) is a permit system added into the FWPCA with the 1972 amendments. Created by the Subcommittee on Air and Water Pollution of the Senate Committee on Public Works, the permit specifies what pollutant discharges the towns must manage. The permitting program specifies that discharges of a pollutant from a point source into a navigable waterway are prohibited unless the discharger has a NPDES. Specifically, the NPDES permit regulates point source discharges of pollutants into surface waters. A point source is defined by the CWA as "any discernible, confined and discrete conveyance, including but not limited to any pipe, ditch, channel, tunnel [etc.] from which

pollutants are or may be discharged" (U.S.C § 1251, (2014)). Originally, the USEPA intended the NPDES to regulate industrial wastewater and municipal sewage as this was the most abundant sources of liquid pollution (Tyer, 1993). Legislative amendments to the FWPCA in 1977, 1983, and 1987 increased the pollutants regulated under the CWA. As these regulations expanded, the EPA decided to implement stormwater management through a separate permit. Under the 1987 amendments, the Municipal Separate Storm Sewer System (MS4) came into being (MINAN, 2005). The CWA has since then expanded to cover many more pollutants than in its original conception.

2.3.2 What is the NPDES Stormwater Program

One of the main reasons that the USEPA put NPDES permits in place was to regulate how many pollutants can be safely discharged into surface waters (USEPA, 2014d). Congress charged the USEPA with administering the NPDES permit program. Congress first established this program with the enactment of the 1972 amendments to the FWPCA. The USEPA can also authorize state and local governments the power to administer the requirements of the CWA by what is called primacy authority (USEPA, 2014h). Massachusetts, however, does not have primacy authority to enforce the CWA so Massachusetts created its own set of laws that mirror the USEPA's laws. Generally, only industrial, municipal, and commercial facilities have to comply with the NPDES permits since they are the primary dischargers of pollutants into surface waters via point sources. Individuals, generally, do not have to get NPDES permits since their wastewater flows through the sewage system or septic tank.

The types of material that NPDES permits regulate are discharged pollutants from point sources. The CWA defines a point source as a pipe, ditch, channel, tunnel, conduit, well, landfill, etc. (U.S.C § 1251, (pg. 214) (2014)). A point source is a source of runoff that only has a single

point of release. A good example of a point source is a chemical treatment plant that uses a chemical to treat their product and then pumps out any of the runoff from their process into a local river. That pipe, which takes the runoff out of the plant, would be a point-based source, as Figure 11 illustrates.

Conversely, the other source of pollution comes from non-point sources. Non-point sources are sources of water pollution, which do not have a point of release such as rainwater and snow melting. Once the stormwater runoff and the melting snow travel into the local MS4s, the runoff becomes a point source, therefore falling under the regulatory authority of the NPDES permit program. A good example of a point source and a non-point source of pollution is Figure 11.

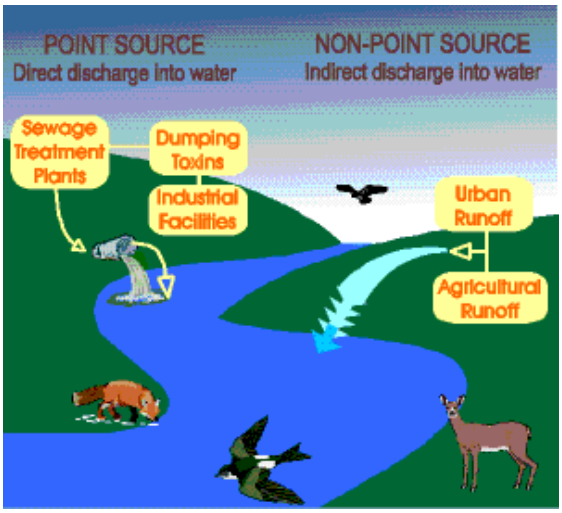

Figure 11. Point and Non Point Sources of Pollution

(College, 2014)

The USEPA and other government bodies, which have primacy authority, require companies and businesses to apply for these NPDES permits when they want to discharge any pollutant into a navigable surface water body through a point source (U.S.C § 1251, (2014))

2.4 The Municipal Separate Storm Sewer System Permit

As part of the CWA, the USEPA issued the MS4 permit in 1990 to reduce the impacts of storm water runoff. The government issues these permits with the sole purpose of addressing the large amounts of stormwater runoff that storms generate. These systems receive stormwater

runoff from the environment, and transport it into nearby bodies of water. These systems do not treat water; they only convey it from impermeable surfaces. With these permits, towns can regulate non-point discharges as point source discharges through the MS4, and create broad stormwater management programs. In 1990, at the inception of the MS4 permitting program, the USEPA issued phase-I MS4 permits on a per-city basis (USEPA, 2014h). These first permits contain measures tailored to individual municipalities, as many large cities had different requirements.

The primary requirement to qualify for a phase-I permit is that the town has a population of at least 100,000. In Massachusetts, there are 2 towns of this size: Boston and Worcester (Massachusetts, 2014b). The phase-II MS4 permit applies to smaller towns with a population of less than 100,000 and contains broad regulations so that it can be applicable to any small municipality. In total, the USEPA has issued approximately 7,450 MS4 permits across the United States from 1990 to 2014 (USEPA, 2014h) (USEPA, 2014b). At their core, these phase-II MS4 permits all integrate practices known as the six minimum control measures. The six minimum control measures are: Public Education, Public Involvement, Illicit Discharge Detection & Elimination, Construction, Post-Construction, and Pollution Prevention/Good Housekeeping.

Although the 2003 MS4 permit has expired, the six minimum control measures remain the primary focus of the 2014 MS4 permit draft. In the following sections, we outline the six minimum control measures and describe some of the BMPs that towns can use to comply with each control measure in the 2014 MS4 permit draft.

2.4.1 Public Education & Outreach

The first minimum control measure addresses the need for public education. Public education plays an important role in reducing pollution levels. Towns can meet the requirements through BMPs such as educational pamphlets, media campaigns, and workshops

The National Environmental Education and Training Foundation (NEETF) found that in 2005, 78% of Americans did not know that runoff from lawns, roads, and agricultural land is the most common source of water pollution. Of further concern, 47% of the public believes that industry accounts for most water pollution (USEPA, 2014b). In order to correct these misconceptions, this control measure requires municipalities to educate the public on the impacts of stormwater runoff and offer residents information on mitigation strategies they can implement at home.

2.4.2 Public Involvement and Participation

The second minimum control measure requires the municipality to form a working partnership with members of the community (USEPA, 2014b). A common way that municipalities fulfill the requirements of this control measure is to create volunteer programs, which engage the public in reducing the pollution caused by stormwater runoff. These programs offer opportunities for volunteers to mark storm drains and participate in cleanup and monitoring programs, as well as to create watershed groups and conservation corps teams (USEPA, 2014b). The officials of each municipality design these opportunities to integrate directly with stormwater programs. When towns implement and utilize this control measure correctly, they can involve the community and create self-monitoring environmental conservation groups.

2.4.3 Illicit Discharge Detection and Elimination

The third minimum control measure deals with the threat of stormwater contamination. Although the MS4 system carries stormwater, it does not treat the stormwater. The MS4 permit defines an illicit discharge as any discharge that is not entirely composed of stormwater. The MS4 stormwater drains are particularly vulnerable to foreign pollutants; the stormwater runoff in these MS4 systems may contain pathogens, nutrients, and various other pollutants. The phase-II MS4 permit requires four primary programs in this control measure, beginning with a full diagram of the MS4 system (USEPA, 2014b). The second program requires the municipality to create a legislative ordinance prohibiting discharges based on pollutant type (USEPA, 2014b). The third is the implementation of reporting techniques such as hotlines, onsite notifications, and outfall water tests (USEPA, 2014b). The fourth is an educational program on the dangers of these illicit discharges (USEPA, 2014b). When used effectively, these programs work to create a system that is both reactive in response to spills and proactive through prevention via education and enforcement.

2.4.4 Construction Site Stormwater Runoff Control

The fourth minimum control measure deals with construction-site stormwater runoff. Of the public works projects that adversely affect the health of a water system, construction site runoff is particularly detrimental. These effects stem from the sediment dissolved in the runoff, including dirt, sand, and other fine particles. When these concentrations of the sediment particles settle in waterways, they block sunlight, and can suffocate many forms of aquatic life (USEPA, 2014a). Phase-II MS4s require the municipalities they regulate to formulate a program to reduce pollutant stormwater runoff for construction exceeding one acre of land. This requirement is

comprised of six components. Collectively, they ensure that construction groups know of their management obligations for proper stormwater pollution management.

2.4.5 Post-Construction Stormwater Management

The fifth minimum control measure refers to post-construction stormwater management. In practice, this control measure is not a continuation of the previous control measure, but a different control measure to monitor BMP effectiveness, as well as the continued prevention of pollution. This control measure is implemented primarily through inspections of on-site facilities, and structures responsible for stormwater management. With these practices in place, areas with new development can continue to manage stormwater runoff pollution after construction has finished.

2.4.6 Pollution Prevention and Good Housekeeping

The final control measure is responsible for the housekeeping of a municipality's stormwater management program. In order for municipalities to maintain good operating conditions within municipal-owned facilities such as the Department of Public Works (DPW) and schools, they must construct a rigorous system of upkeep management. These components can consist of road maintenance and repairs, automobile fleet maintenance, landscape maintenance, as well as building upkeep. Pollution prevention practices can include activities such as street sweeping and storm drain system cleaning (USEPA, 2014e).

2.4.7 General Practices and Municipal Individuality

In order to account for thousands of different municipalities, the MS4 permit authors designed the six minimum control measures to be applicable to any possible situation. Independent of environmental conditions or area development, these measures have to be

comprehensive. Unfortunately, these phase-II MS4 permits rely on a large degree of self-reliance and proactive involvement by the municipalities, but there are resources available to help with this. In order to assist Massachusetts municipalities with MS4 permit compliance, the MassDEP has created a Stormwater Handbook, which contains resources about how a city or town can comply with the minimum control measures (MassDEP, 2014). Additionally, the Massachusetts Watershed Coalition, an organization dedicated to protecting and restoring Massachusetts watersheds, is able to provide many materials to their members, such as brochures and standard operating procedures (Coalition, 2014). However, the officials of each municipality must ultimately take responsibility to implement the practices in the six minimum control measures.

The MassDEP manages a system of computer checks and administering programs for stormwater management in Massachusetts. If the system flags a municipality for irregular readings or reports, inspection by MassDEP officials becomes necessary (Civian, Sept. 26, 2014). Implementation of these control measures requires the municipalities to spend a large amount of money, which raises budget concerns for the 2014 MS4 Draft permit.

2.5 The MassDEP and the Central Massachusetts Regional Stormwater Coalition

The MassDEP is the Massachusetts environmental agency charged with making sure Massachusetts has clean air and water (Massachusetts, 2014a). The central office of the MassDEP serves the entirety of Worcester County (MassDEP, 2013). The MassDEP assists the CMRSWC by providing them with numerous guidance documents, which teach the municipalities how to fulfill the requirements of the MS4 permit (CMRSWC, 2014b). In collaboration with the MassDEP, we sought to provide a cost analysis of implementing the new 2014 MS4 permit in three Massachusetts municipalities. During this project, we worked with

two primary contacts from the MassDEP: Frederick Civian, Statewide Stormwater Coordinator for the MassDEP, and Andrea Briggs, Deputy Regional Director of the Central MassDEP.

2.6 Central Massachusetts Regional Stormwater Coalition

Central Massachusetts is one of many regions in Massachusetts whose municipalities seek to effectively implement the 2014 MS4 permit. The CMRSWC helps its members achieve this goal. The CMRSWC, formed in 2012, initially consisted of 13 municipalities (Spain, 2014). Due to the success and utility of the CMRSWC, it has expanded to 30 municipalities by 2014. All of the municipalities within the CMRSWC are subject to regulations from the USEPA, which require the municipalities to mitigate the impacts of stormwater runoff (CMRSWC, 2014c).

The municipalities within the CMRSWC receive numerous benefits because of their collaboration. The municipalities can share stormwater management tools, such as Leica units and water quality testing kits, thus reducing cost (Coalition, 2014). Their collaboration also reduces redundancies in stormwater management projects, thus allowing the municipalities to use money more efficiently. Although the CMRSWC members try to collaborate as much as possible, the individual towns are ultimately responsible for utilizing the tools developed by the CMRSWC in order to comply with the MS4 permit (Spain, 2014).

2.6.1 Funding of the CMRSWC

The CMRSWC receives funding from the Community Innovation Challenge (CIC) Grant. Massachusetts Governor Deval Patrick started the CIC grant program in 2012 in order to ease the taxpayer burden of community improvements (Massachusetts, 2013a). The CMRSWC received $310,000 in 2012 to help implement the 2003 MS4 permit (Massachusetts, 2013b). The CIC Grant provided the CMRSWC with $105,000 for the 2013 fiscal year. This grant did not cover the total cost of the CMRSWC's efforts, thus each municipality had to provide $2,800 in order to supplement the cost (Spain, 2014). For the 2014 fiscal year, the CIC Grant provided the

CMRSWC with $80,000 (CMRSWC, 2014a). The grants are awarded in December, so at the current time the CMRSWC does not know if they have secured funding for next year.

2.6.2. Organizational Involvement in the CMRSWC

The CMRSWC operates with the help of various agencies and companies. The government agencies, which support the CMRSWC, include the MassDEP, the Massachusetts Department of Conservation and Recreation (DCR) and the USEPA. The CMRSWC also receives support from the private consulting firms of Tata & Howard and Verdant Water. The companies which provide services to the CMRSWC include Maine Technical Source, HACH Company Chemetrics, and People GIS (CMRSWC, 2014d).

2.6.3. Stormwater Consultants

The CMRSWC receives support from the private consulting firms of Tata & Howard and Verdant Water. Tata & Howard is an engineering firm which provides consulting for the management of wastewater, stormwater, and hazardous waste (Tata&Howard, 2014a). Tata & Howard also helped create a system which collects inspection data and maps runoff patterns within the CMRSWC (Tata&Howard, 2014b). Verdant Water operates from Scarborough, Maine, and focuses on industrial and municipal stormwater management. Verdant Water provides Stormwater Pollution Prevention Plans (SWPPPs), Illicit Discharge Detection and Elimination (IDDE) assistance and water quality screening.

The use of these private consulting services to fulfill components of the MS4 permit requires the municipalities to spend a large amount of money. We had to take the cost of these services into account in order to construct our cost analysis. In the next chapter of our report, we describe our methodology for creating our cost analysis.

2.7 Goals and Objectives

In collaboration with the MassDEP and the CMRSWC, we sought to provide the towns of Southbridge, Holden, and Millbury, Massachusetts with a comprehensive analysis of their cost of compliance with the new 2014 MS4 permit.

In order to achieve this goal, we:

1. Became educated on the details of the 2003 MS4 permit and the new 2014 MS4 permit
2. Assessed the degree to which Millbury, Holden, and Southbridge have met the requirements of the 2003 MS4 permit
3. Researched Millbury, Holden, and Southbridge's total current expenditures for stormwater management
4. Identified what changes each of the aforementioned towns will have to make to comply with the requirements of the new 2014 MS4 permit
5. Provided a detailed analysis of the complete costs each town will need to defray in order to comply with the requirements of the new permit.
6. Created an educational video to explain the costs of implementing the 2014 MS4 permit

We discuss our methodological approach to accomplishing these objectives in detail in chapter 3.

3.0 Methodology

3.1. Introduction

In collaboration with the Massachusetts Department of Environmental Protection (MassDEP) and the Central Massachusetts Regional Storm Water Coalition (CMRSWC), we provided the towns of Millbury, Holden, and Southbridge, Massachusetts with a comprehensive analysis of the cost of compliance with the new 2014 Municipal Separate Storm Sewer System (MS4) permit. We focused our project objectives on determining the current and future cost of stormwater management in the subject towns. The MassDEP and CMRSWC proposed this project to increase municipal and agency understanding of the cost of compliance with the MS4 permit; The MassDEP will not use this information for enforcement of the MS4 permit. The MassDEP recruited us to address this problem as independent consultants. The United States Environmental Protection Agency (USEPA) released the new 2014 draft MS4 permit on September 30, 2014. In order to accomplish our goal and objectives, we created the following methodology.

The main goal of our project was to gather information from the towns of Holden, Millbury, and Southbridge Massachusetts in order to help them identify the financial costs of implementing the 2014 MS4 permit draft when it eventually comes into effect. Below we discuss each of the objectives we achieved in order to accomplish our project goal.

3.2. Objective 1: Became educated on the details of the 2003 MS4 permit and the 2014 MS4 permit

In order to create a complete cost analysis of compliance with the 2014 Massachusetts draft MS4 permit, we first sought to understand the requirements of 2014 MS4 permit draft. Understanding the permit also involved an in-depth analysis of the expired 2003 MS4 permit that

the towns have to maintain compliance until the new permit goes into effect. The USEPA issued each of the towns a Phase II permit, as their populations do not exceed 100,000 people (US EPA, 2014).

We analyzed the content of the 2003 MS4 permit minimum control measures so that we would each become more familiar with the minimum control measures. We then contrasted the requirements of the 2003 MS4 permit with those of the 2014 MS4 Draft Permit. As we researched the requirements that are a part of the 2003 MS4 permit, we determined how the permit changed from the 2003 version to the 2014 version with the help of Fred Civian. In addition, we analyzed previous reports written by groups that have worked with the MS4 permit. We interviewed Worcester Polytechnic Institute (WPI) students Xinping Deng, Nicholas Houghton, Haoran Li, and Joseph Weiler, who completed the previous MS4 related project, to gain a better understanding of how to create a cost analysis and work with the towns. We also interviewed them to better understand the efforts that have gone into implementing the permit. After analyzing both permits and interviewing the past IQP group, we were better able to approach the task of creating a cost analysis for our subject towns, see Appendix A for a list of interview questions.

3.3. Objective 2: Assessed what Millbury, Holden, and Southbridge have done to meet the requirements of the 2003 MS4 permit

In order to achieve this objective, we reviewed annual stormwater reports, conducted interviews, and conducted fieldwork. Even though the 2003 MS4 permit expired, understanding what the towns have done to comply with the permit requirements helped us increase our understanding of the additional measures and costs the towns will need to take to maintain compliance once the USEPA implements the 2014 MS4 Draft permit.

In our subject towns, we interviewed Department of Public works (DPW) directors such as Heather Blakeley, John Woodsmall, and Rob McNeil. We also interviewed other municipal officials such as Mark DiFronzo Southbridge's fire chief, Isabel McCauley Holden's Town Engineer, a Conservation Commission member from Southbridge Ken Pickerin, and Pamela Harding Holden's Town Planner. We conducted these interviews to determine what each town currently does to comply with the 2003 MS4 permit. Through our sponsors at the MassDEP, we contacted these towns in order to set up interviews with the municipal officials that oversee compliance with MS4 permit requirements. We focused these interviews on each municipality's efforts to comply with the six minimum control measures. In addition, we asked the interviewees to provide us with any documentation of expenditures, which we used to determine their town's costs. See Appendix A for examples of the interview questions that we asked each of the towns.

The expense reports from the consultants, DPW, and highway department, which the officials provided to us, did not encompass all of the town's expenditures, so we also used these interviews and fieldwork to obtain a more complete understanding of the expenditures. We conducted this fieldwork in order to determine the man-hours needed to conduct sampling tests on site. We used this data for information regarding procedures, costs, and methods used to fulfill the 2003 MS4 permit.

3.4. Objective 3: Identified Millbury, Holden, and Southbridge's total current expenditures for stormwater management

Once we collected data detailing the practices that our subject towns use to manage their stormwater runoff, we aggregated our data to create a cost analysis. Millbury, Holden, and Southbridge are members of the CMRSWC, which utilizes the expertise of the environmental consulting firms Verdant Water and Tata & Howard. We analyzed cost data from any

expenditure that occurred before release of the 2014 draft MS4 permit, but after 2012 to get a general idea of expenses. We analyzed all expenditures from the experience reports mentioned in the previous objective because towns often do more than they report to manage stormwater but are not necessarily aware of the task coming under the rubric of one of the 2003 MS4 permit minimum control measures (Deng, Houghton, Li, & Weiler, 2014). These tasks could include street sweeping, public education, volunteer organizations, and hazardous waste cleanup.

Many municipalities hire construction contractors to make changes to existing Best Management Practices (BMP), if required, or to keep up with maintenance on the town's BMPs. These construction companies may not be a frequent cost, but towns may still face these costs, or similar as-needed costs, while they manage their stormwater. We spoke with stormwater consultants Matthew St. Pierre of Tata & Howard and Aubrey Strause of Verdant Water in order to get a better understanding of how much these municipalities have spent on stormwater management. We also interviewed the municipal officials that oversee the stormwater management programs such as the Directors of the DPW as mentioned in the previous objective. Andrea Briggs put us in contact with them during the course of the project. By interviewing both of these groups of people, we were able to assess stormwater management spending using multiple sources. Drawing on the research that we conducted in the previous objective, we analyzed the methods, which the towns used, and the cost of each method, in order to calculate a total amount that the towns spend on stormwater management.

To compile the data that we gathered from our subject towns, Ms. Strause and Mr. St. Pierre provided us with a chart that the previous IQP group had put together and that Ms. Strause and Mr. St. Pierre had updated, the chart can be seen in Appendix B. This chart had many common costs of towns and ways that towns pay for stormwater management. Once Ms. Strause

provided us with the chart, she was able to take the areas that we were looking at and add them to the chart. By using this chart, towns will be able to directly compare the data that we gathered with the data that the towns would gather from their own cost analyses.

Using the information that we gained from identifying Southbridge, Holden, and Millbury's current expenditures and the previous objective, we were able to compile data from all three municipalities and create a cost analysis.

3.5. Objective 4: Identified what changes each of the subject towns will have to make to comply with the requirements of the 2014 draft MS4 permit

In order to accomplish this objective, we used the knowledge gained in accomplishing objectives one, two, and three to begin calculating the cost of compliance with the 2014 MS4 permit. We performed research to determine the BMPs that the municipalities already have in place to comply with the 2003 MS4 permit. This research included a detailed analysis of the town's annual stormwater reports. In addition, we conducted interviews with town officials and stormwater consultants who have worked with the towns. Examples of the interview questions we used can be found in Appendix A. By identifying what Best Management Practices (BMPs) the towns already use, we were able to determine whether, and in what manner, our subject towns will need to expand their stormwater management efforts to meet the requirements of the 2014 MS4 permit.

In order to identify the necessary changes, we conducted interviews with municipal officials in each town. We also spoke with Frederick Civian; Regional Stormwater Coordinator of the MassDEP. These interviews provided us with insight into each town's level of preparedness toward meeting the requirements of the 2014 MS4 permit.

Ultimately, this objective helped us gain a comprehensive understanding of the financial cost of implementing the 2014 MS4 permit in each municipality. By understanding the BMPs each town uses, we were able to assess what changes they need to make, and by extension, the financial cost of implementing each change. We created a checklist of the common practices such as street sweeping, distribution of pamphlets, and outfall mapping that municipalities use to comply with stormwater permits, and combined this with a similar chart given to us by Mr. St. Pierre and Ms. Strause. We discuss our cost analysis in further detail in objective 5.

3.6. Objective 5: Provided a detailed analysis of the complete costs for each subject town to comply with the requirements of the 2014 draft MS4 permit

In order to complete this objective, we first determined the changes each town will need to make in order to comply with the 2014 draft MS4 permit, as we described in objective four. We then computed the financial cost of the implementation of these changes. In order to perform our cost analysis, we spoke with Mr. St. Pierre, Ms. Strause, and Mr. Civian. These people were able to provide us insight into the typical cost of implementing BMPs, which fulfill the MS4 permit. We were able to determine what equipment each town has, such as street sweepers, outfall mapping equipment, and signage, through interviews that we conducted with municipal officials. The CMRSWC possesses some of this equipment, which the municipalities can use, therefore eliminating the need for the towns to buy and maintain their own equipment. We also determined the human resources each municipality can provide to manage stormwater. This knowledge allowed us to determine the labor costs. This knowledge also allowed us to determine if the towns will need to hire contractors or additional personnel in order to supplement their workforce. Once we had a list of all of the costs of stormwater management from the subject

towns, we were able to estimate the total cost of meeting the requirements of the 2014 draft MS4 permit.

In order to assist us with our cost analysis, Mr. Civian provided us with a chart, which listed every regulation of the 2014 draft MS4 permit. This chart is utilized in Appendices D, E, and F where we used it for each of our three subject towns. We divided this chart into eight separate sheets. Seven of the sheets individually detail the requirements of the six minimum control measures, as well as miscellaneous requirements such as submitting a Notice of Intent (NOI). Within each of these sheets, we divided the costs into annual costs, one-time costs, and intermittent costs, and calculated a total for each. We then took the totals from each of the seven sheets and compiled them into an eighth master sheet. This chart allowed us to create a comprehensive analysis of implementing the 2014 draft MS4 permit in each of our subject towns.

3.7. Objective 6: Created an informational video to explain the costs of implementing the 2014 MS4 Draft permit

Over the course of the project term, we gathered photos, videos, and interviews from Fred Civian, Andrea Briggs, and John Woodsmall and compiled them into an informational video. By gathering this material, we were able to highlight the challenges and importance of stormwater management. These challenges include raising funds and garnering public support for stormwater management.

In order to create this video, we first created an outline. During the outlining process, we reached out to Frederick Civian, Andrea Briggs, Matthew St. Pierre, and Aubrey Strause in order to generate ideas for the content of our video. We then borrowed video recording equipment from WPI's Academic Technology Center (ATC). This equipment included a digital camera, monopod, tripod, GoPro, and a shotgun microphone. We used the GoPro to gather underwater

footage of the outfalls. The shotgun microphone allowed us to eliminate ambient noise from cars during our filming in the field. We also borrowed wireless clip-on interview microphones to get clear audio during our interviews. Once we acquired the equipment, we then began to create our video. We filmed our fieldwork, which included our use of the water sampling kits. We then conducted interviews with stormwater experts that we had contacted previously.

4.0 Cost Analysis

4.1 Introduction

One of our major findings details the benefits of regionalization to effectively implement the 2014 draft Municipal Separate Storm Sewer System (MS4) permit. Due to the high costs that we describe in this chapter, towns should consider joining an established coalition, such as the Central Massachusetts Regional Stormwater Coalition (CMRSWC), or starting a new coalition to serve their specific region.

After completing objectives one through four of our methodology, we were able to construct our cost analysis. In this cost analysis we detail both current stormwater expenditures for the towns of Southbridge, Holden, and Millbury, and potential costs of compliance with the new requirements of the 2014 MS4 Draft permit requirements.

After calculating the current expenditures of our towns, we sought to predict the cost of implementing the 2014 draft MS4 permit in our subject towns. In order to assist us with this portion of our cost analysis, Frederick Civian provided us with a spreadsheet, which lists each of

the requirements of the 2014 draft MS4 permit. We divided this table by the six minimum control measures of the MS4 permit, and then used the resulting spreadsheet to predict the cost of implementing each requirement in our subject towns. See the spreadsheets we used in Appendices D, E, and F.

In this chapter, we first provide some background information on the towns of Holden, Millbury, and Southbridge, Massachusetts. Then we discuss the results of our 2003 MS4 permit and 2014 draft MS4 permits cost analyses. We then explain the results of our comparative analysis of the three subject towns' current costs of implementing the 2003 permit requirements. Next, we describe the results of our comparative analysis of Holden, Millbury and Southbridge's estimated cost of compliance with the 2014 draft MS4 permit requirements.

4.2 Background Information on Millbury, Holden and Southbridge, Massachusetts

The three subject towns for the cost analysis are all located within Central Massachusetts. Despite their similar geographic location as seen in Figure 12, the subject towns vary in size, budget, and population. Southbridge, Massachusetts has a population of approximately 16,800, while Holden has a population of about 17,600, and Millbury has a population of about 13,300.

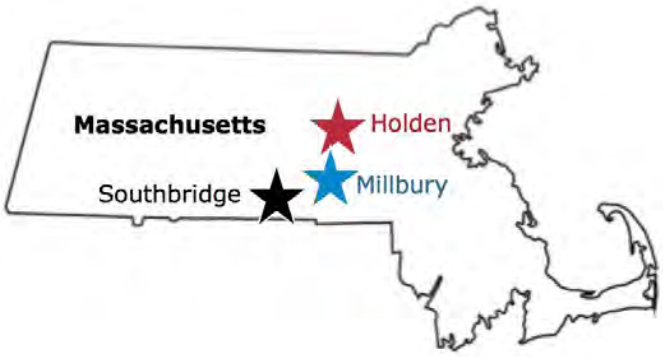

Figure 12: Town Locations in Massachusetts

The towns' geographic area and percentage of impervious surface area also varied. With a higher impervious surface area comes a more expensive stormwater management program since there is more area for the stormwater runoff to run along. As the runoff runs along

impervious area it collects pollutants and the more polluted the runoff becomes. This requires the towns to take more of an effort to reduce the pollution, which leads to a high cost for stormwater management. As our subject towns cover more geographic area, their budget increases except in Southbridge, which has a larger budget than Holden even though Southbridge is significantly smaller. Millbury has the highest percentage of impervious surface area even though they have the smallest total area, which significantly increases their stormwater management costs.

The form of town government can have a large effect on how long towns take to implement the new draft requirements for stormwater management. Both Millbury and Holden have open town meetings as their primary form of government, whereas Southbridge has a Council and an Alderman as their government structure. When we spoke with Robert McNeil, he told us that having open town meetings could cause regulations to take longer to pass since the meetings are open to the public. This, however, does allow for much more public involvement and participation.

Town	Form of Government	Population	Town Budget	Area	Percent Impervious
Southbridge	Council and Alderman	16,799	56,739,257	20.9mi^2	8.69%
Holden	Open Town Meeting	17,636	52,774,844	36.2mi^2	7.04%
Millbury	Open Town Meeting	13,305	39,018,827	16.3mi^2	13.09%

Table 2: Town Information

4.2.1 Current Cost of Public Education and Outreach

The Public Education control measure requires towns to educate their population about the issues the town faces with regard to stormwater and to offer opportunities for the residents to participate in stormwater-related activities. In Table 3, we show how much Southbridge, Holden, and Millbury currently spend on the Public Education control measure.

Town	Population	Cost
Southbridge	16,799	$10,952
Holden	17,636	$1,000
Millbury	13,305	$566

Table 3: Public Education Costs by Town

A first glance at Table 3 may indicate that Southbridge does much more for this control measure than the other towns, but that is not entirely the case. Much of Southbridge's cost comes from the pamphlets and brochures that they create and distribute to their residents. Both Holden and Millbury have savings of about $6,000 annually since they utilize the resources provided to them by the Central Massachusetts Regional Stormwater Coalition (CMRSWC). Holden also uses pamphlets and brochures comply with this control measure, but since they use materials from the CMRSWC, they only have to pay for distribution. Millbury distributes its public education material digitally through their Department of Public Works (DPW) website, saving on distribution and printing costs. Any town that is trying to maintain compliance with this control measure should utilize any already existing education materials, thereby saving money on design, especially if the town is part of the CMRSWC.

Southbridge also holds hazardous waste removal days in order to gather hazardous waste from households. This practice increases the amount Southbridge spends on this public education, but this helps prevent this waste from appearing in runoff, which in the end saves Southbridge money. This practice of preventative action is an example of what other towns can try as a cost-reduction effort.

4.2.2 Current Cost of Public Involvement and Participation

The next minimum control measure is Public Participation. Public Participation requires that towns comply with their own town meeting requirements. The United States Environmental Protection Agency (USEPA) designed this minimum control measure to allow the public to have a voice in the creation of town specific stormwater ordinances and regulations as required by the MS4 permit. In Table 4, we show the costs associated with maintaining compliance with the 2003 MS4 permit for each town.

Town	Cost
Southbridge	$0
Holden	$0
Millbury	$0

Table 4: Public Participation Costs by Town

The table has zero costs for each town, since this control measure only requires that the towns offer a place and time for people to comment and look at the regulations and ordinances before the town puts them into effect. Towns comply with most of this control measure by following basic town meeting requirements laid out outside of the MS4 permit.

4.2.3 Current Cost of Illicit Discharge Detection and Elimination (IDDE)

As illustrated by Table 5, the subject towns have a wide range of costs associated with implementing the 2003 MS4 permit IDDE control measure. Some of the requirements of the IDDE control measure include developing a storm sewer system map and creating a plan to detect and eliminate illicit discharges.

Town	Cost
Southbridge	$2,452
Holden	$3,520
Millbury	$4,678

Table 5: IDDE Costs by Town

Southbridge, Holden, and Millbury have all completed the mapping requirements of the 2003 MS4 permit. Therefore, the towns have not had to map their town in a couple years. The current costs associated with the IDDE control measure in Southbridge reflects outfall sampling since outfall sampling accounts for 97% of the money the town spends on this control measure. Millbury complies with this requirement by using a Best Management Practice (BMP) that includes use of a closed circuit television (CCTV) system and vacuum truck to remove blockages from their storm drain system. This takes up about 86% of the combined cost for this control measure.

Holden also spends much of their money on use of the vacuum truck totaling about 64% of their total costs for this control measure. Isabel McCauley the senior civil engineer for Holden, and John Woodsmall, the director of the department of public works (DPW) for Holden,

estimate that Holden typically spends $3,000-$4,000 per occurrence on the removal of illicit discharges and had to remove one illicit discharge this past year.

We must note, however, that our costs for Holden were based only on data which Ms. McCauley and Mr. Woodsmall were able to provide to us. Environmental Partners Group (EPG) performs many of Holden's costs associated with the IDDE control measure, including outfall mapping and water quality screening. Financial invoices from Holden detailed the town's annual expenditures on EPG services since 2007 at $119,000. However, the invoice descriptions do not specify exactly what service is associated with each line item. Therefore, it was difficult for us to discern between annual costs and one-time costs. We were unable to connect with EPG to obtain a more detailed cost breakdown.

4.2.4 Current Cost of Construction Site Runoff

As illustrated in Table 6, the costs associated with implementing the construction site runoff control measure of the 2003 MS4 permit in Southbridge, Holden, and Millbury is low. The 2003 MS4 permit requirements for this control measure include developing a plan to reduce the discharge of pollutants from construction sites.

Town	Cost
Southbridge	$0
Holden	$0
Millbury	$350

Table 6: Construction Site Runoff Control Cost by Town

Our three subject towns implement this control measure using volunteers from their conservation commissions. The volunteers conduct most of the site inspections for the towns. The use of these volunteers is an excellent way to enforce this control measure without costing the towns any additional money. Another reason the cost of implementing this control measure is so low is that contractors must eliminate any violations at their own expense, as Pamela Harding

of Holden (Holden Senior Planner) and Ken Pickerin (Conservation Commission member) of Southbridge described to us in our interviews.

Our subject towns also already have sediment control ordinances in place. These ordinances do not cost any money to the towns as they are laws, which are already in place, and they do not need to be developed by town lawmakers. Although we did not learn of the particular details of these ordinances, they are similar in the fact that they require sediment and erosion control measures at construction sites.

4.2.5 Current Cost of Post-Construction

Differently from the previous control measure, the USEPA designed the Post Construction Site Stormwater Runoff control measure to ensure continuing pollution prevention, as well as BMP functionality, after construction has been completed. In the 2003 MS4 permit, this control measure states that the permittee must develop, implement, and enforce a program to address stormwater runoff from new development and redevelopment projects that disturb land greater than one acre and discharge into the municipal system (US EPA, 2013). Beyond this function, the control measure requires towns to have an ordinance addressing post-construction stormwater runoff, plans for BMP longevity, and that any control measure the towns put in place will prevent or minimize impacts to water quality (US EPA, 2013).

Town	Cost
Southbridge	$0
Holden	$1,760
Millbury	$0

Table 7: Post Construction Costs by Town

In calculating the costs for each town, we sought to determine what funds the towns spent for stormwater management after they completed development projects. Based on the cost estimation sheets developed in *Cost Analysis For The MS4 Permits* (used in Appendices A, B,

and C) we have found that the annual cost for this control measure is $0 for Southbridge, $1,760 for Holden, and $0 for Millbury as illustrated in Table 7.

These costs can be explained by the ways in which each town implements the post construction site regulations. A representative from Southbridge, Ken Pickerin, is part of the local conservation commission. The Southbridge Conservation Commission (ConCom) is a group of volunteers who inspect construction sites, as well review construction site plans for construction projects. In Southbridge, the ConCom volunteers complete all of the Post-Construction Stormwater Management control measure requirements. Consequently, Southbridge's cost of compliance with the Post-Construction Stormwater Management control measure is zero (Ken Pickerin, 2014).

The town of Holden handles this differently, because they are within the Wachusett watershed and the Department of Conservation and Recreation (DCR) performs a number of the required elements of this control measure without any cost to the town (Robert Lowell, 2014). The $1,760 annual cost is from collaborative efforts between the Department of Conservation and Recreation (DCR) (paid by their agency), and Holden DPW workers paid under Holden. Because of this, Holden does have a notable cost of $1,760 to pay its workforce.

In Millbury, developers of a construction project handle the cost of the post construction control measure for that project. As part of the requirements for development within Millbury, a developer must pay for all required inspection programs themselves (Robert McNeil, 2014). This method is aligned with some of the innovative funding techniques Millbury utilizes, which we discuss in Section 5. Developers who secure the appropriate grants to fund the projects perform many of the projects in the town. As part of the grant, the developers pay for the costs of the post-construction control measures as well.

4.2.6 Current Cost of Good Housekeeping

The final requirement in the 2003 MS4 permit is Good Housekeeping. The USEPA designed this control measure to minimize or prevent the effects of stormwater runoff from municipal operations (US EPA, 2013). Generally, this means the towns must implement maintenance activities, inspection procedures for structural controls, employee training, and the upkeep of BMPs. In the implementation of this control measure, the towns have varying costs.

The annual cost for complying with this control measure for Southbridge is $255,200, while the annual cost for Holden is $180,246, and the annual cost for Millbury is $555,123, as illustrated in Table 8. There is a large degree of variation between the towns on cost of current good housekeeping practices. However, this large variation in expenditures is not unique to these three towns.

Town	Cost
Southbridge	$255,200
Holden	$180,246
Millbury	$555,123

Table 8: Good Housekeeping Costs by Town

In 2011, the USEPA conducted an analysis of the cost of complying with the good housekeeping control measure and found similar results. In this analysis the USEPA found that the Massachusetts towns of Bellingham, Franklin, and Milford, good housekeeping expenditures had a difference of $791,000 between the highest and lowest costs for existing programs (Committee, 2011).

In the town of Southbridge, good housekeeping costs are primarily due to catch basin cleanings, salt and sand road management, a leaf collection program, and an employee training program. Of Southbridge's $255,200, 85% is due to the salt and sand road management, BMP maintenance schedule, street sweepings, and the cleaning of catch basins and outfalls every two years.

In Millbury, the town maintains a schedule of yearly catch basin and outfall cleanings, as well as street sweeping, and the use of salt in their roadway management. Their roadway

management constitutes 83% of the cost for complying with this control measure in Millbury, and represents the largest cost in Millbury's entire stormwater management program. While these costs are part of stormwater management, the actions are not for the stormwater management alone. A few of these procedures are part of other departments, such as the Highway Department (Robert McNeil, 2014), and so the costs do not accurately represent the total budget for a municipality.

4.2.7 Total Current Cost Comparison

When we combined the current costs of the control measure, we were able to obtain an estimation of the total costs of compliance for each town. In implementing their stormwater program, the town of Southbridge spends an estimated $268,604 annually, as illustrated in Table 9. The town of Holden spends an annual $186,526 to fund their stormwater management program, as we illustrate in Table 9. Our third town of Millbury annually spends $584,960 on 2003 MS4 compliance as we illustrate in Table 9. We compiled these total costs from available information provided by the towns.

Town	Cost
Southbridge	$268,604
Holden	$186,526
Millbury	$584,960

Table 9: Total Annual Costs by Town

Based on our research, each town appears to go above what is required for the 2003 MS4 permit, but the magnitude of this differs by town.

For example, Millbury cleans its catch basins and outfalls annually, while Holden cleans them every two years. Despite these differences, both towns maintain compliance with the permit, and do so through different methods. Between each municipality, there are differing divisions of stormwater management responsibility. In our experience interacting with each town, they divide their stormwater management programs amongst multiple departments. Because of this, there is a degree of reporting bias in our cost estimation for each town. These

biases are because different town representatives in different towns are all looking for or maintaining and providing different records. This means that towns may have over or underreported what their actual costs were, even with this, we hope that they can be used by towns in comparing the costs for different categories, if not the total costs.

4.3 Comparative Cost Analysis of 2014 MS4 Draft Permit

In this section, we analyze the cost of compliance with the 2014 draft MS4 permit. We discuss each of the minimum control measures and the costs associated with them on a town-by-town basis in the sections below. To complete the analysis we created a system of charts and created estimations with the assistance of Frederick Civian. The charts detail the costs of each of the requirements of the 2014 draft MS4 permit. There are columns in the charts for information about the control measure, the estimated cost of the specific requirement, the reference number to the MS4 Draft permit, and a justification for our estimation. Within the charts, and this section, we use three different frequencies of costs to describe when costs are applicable: annual, one-time, and intermittent.

Annual costs are costs that the towns will have to spend every year to maintain compliance, such as submitting an annual report, and yearly street sweeping. One-time costs include costs that towns have to pay for only once either in the beginning of the permit term or at some point during the permit term. One-time costs include mapping outfalls, submitting a notice of intent, and labeling outfalls. Finally, intermittent costs are costs that occur inconsistently, such as removing an illicit discharge. Appendices A, B, and C contain the completed cost sheets for Southbridge, Holden, and Millbury.

4.3.1 Future Public Education and Outreach Cost

In the 2014 MS4 Draft permit, requirements for the Public Education minimum control measure have increased. Specifically, in addition to the 2003 MS4 permit Public Education

requirements, the 2014 MS4 Draft permit requires towns to measure the effectiveness of their messages, such as educational materials released to the municipality public. Lawrence Pistrang, Environmental Analyst with the Wachusett Watershed DCR, explained that it will cost towns approximately $8,820 to comply with the measuring effectiveness requirement under this control measure. In both Holden and Millbury, the additional cost of assessing the effectiveness of Public Education control measure would increase their cost by over eight times what they spend currently in this control measure. The increase in cost for would amount to double the town's present expenditures on Public Education. The Public Education minimum control measure has small low-cost administrative tasks, but the bulk of the cost comes from continuing the education efforts and adding an evaluative component to the program.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$19,242	$0	$0
Holden	$9,908	$0	$0
Millbury	$12,106	$0	$0

Table 10: Estimated Public Education Costs

Table 10 shows the cost of compliance of each of the towns, and as we can infer from the values present in the table, the annual costs have increased by 75.2% for Southbridge, 890% for Holden, and 2003% for Millbury. To save money on this control measure, the towns can reuse education materials that already exist within the town or the CMRSWC. The towns can also reduce costs by sharing the metrics and tools used to analyze the effectiveness of their education.

By regionalizing, and working with other towns, every town can save money since towns do not have to work complete these minimum control measures on their own.

4.3.2 Future Public Participation Cost

The Public Participation control measure changed little between the 2003 MS4 permit and the 2014 draft MS4 permit. Consequently, the towns will not have to expend any additional costs to maintain compliance with this control measure. Table 11 shows the expected costs of this minimum control measure based on our estimated costs to update and maintain compliance. The costs do not change for any of the towns since the requirements changed only slightly, the changes that did occur were minor administrative tasks such as adding a section in the annual report, which describes this control measure, and requiring that towns comply with public notice requirements outside of the MS4 permit.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$0	$0	$0
Holden	$0	$0	$0
Millbury	$0	$0	$0

Table 11: Estimated Public Participation Costs

4.3.3 Future IDDE Cost

The IDDE control measure of the 2014 MS4 Draft permit represents a large portion of the cost associated with the permit. Much of this cost is due to more stringent requirements, including mapping, outfall sampling, and priority ranking outfalls. These requirements will

generate many material and labor costs, as the towns will have to sample all of their outfalls, while they currently only sample a small fraction of them.

As we show in Table 12, Millbury and Southbridge share similar annual costs on implementing the IDDE control measure of the 2014 draft MS4 permit. However, Holden's cost is much lower. The main reason for this difference is the variation in number of outfalls between

Town	Annual Cost	One-Time Cost	Intermittent Costs	Number of Outfalls
Southbridge	$19,242	$304,006	$50,440	206
Holden	$7,872	$314,494	$50,440	144
Millbury	$11,523	$306,833	$76,730	267

Table 12: Estimated IDDE Costs

the towns. Much of the annual cost for the IDDE control measure is due to the need for the towns to sample all of their outfalls. Southbridge and Millbury have 206 and 267 outfalls respectively, while Holden only has 144 outfalls.

The one-time cost of implementing the IDDE control measure is similar between our three subject towns. This similarity is because most of the one-time requirements are applicable to all of the towns. For example, all of the towns will be required to update their mapping system, which will cost approximately the same amount for all three towns, as they have a similar number of outfalls to map. The towns will also be required to develop an IDDE ordinance, as well as priority ranking catch basins based on conditions and other factors(US

EPA, 2014a). These requirements are of similar cost as the towns all have a similar number of catch basins, and similar resources from which to develop the ordinance.

The intermittent costs listed are very similar between the towns because many of these intermittent costs are indeterminable at this point. Consequently, for comparison purposes, we operated under the assumption that each town will have to treat one illicit discharge per year. We explain our assumptions in more detail in Appendices D, E, and F.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$0	$770	$0
Holden	$0	$770	$0
Millbury	$350	$858	$0

Table 13: Estimated Construction Site Costs

4.3.4 Future Construction Site Runoff Cost

As we demonstrate in Table 13, the towns are almost identical in the cost that will be required for them to implement the construction site runoff control measure of the 2014 draft MS4 permit. There is only one annual cost associated with this control measure, which is to continue implementing the construction ordinance from the 2003 MS4 permit. Because of this, the town's only have to spend a minimal amount of funds in maintaining this already-establish construction ordinance. Since Millbury is the only town that actually has to spend money to implement this requirement, they are the only town with a future cost associated with it.

The one-time costs of the construction site runoff control measure are all administrative tasks, which should take a similar amount of labor from each town to implement. There is no intermittent cost associated with implementing this measure in any of the towns, as there is only

one intermittent requirement of this control measure, which is to develop and implement a construction site runoff program. In all of the subject towns, the responsibility of this cost primarily falls on independent contractors working on town projects. We found that every town official we spoke informed us that when stormwater runoff issues are found on-site, the responsibility for correcting these issues falls to the developer.

4.3.5 Future Post-Construction Costs

The 2014 MS4 Draft permit, contains numerous additional requirements for the post-construction site runoff minimum control measure. Some of these new requirements include the development, implementation, and enforcement of a post-construction stormwater program for new developments and redevelopments (US EPA, 2014a). Frederick Civian assisted us in analyzing this control measure, and making estimations for the completion of individual items as we demonstrate in Appendices D, E, and F. For the town of Southbridge, we estimated that to implement the requirements of the Post Construction control measure would require an annual cost of $5,280, as we show in Table 14. This cost is joined by a $1,496 cost to update from 2003 MS4 requirements, and an

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$5,280	$1,496	$7,436
Holden	$5,280	$1,496	$7,436
Millbury	$5,280	$1,496	$7,480

Table 14: Estimated Post Construction Costs

estimated $7,436 in intermittent costs as we show in Table 14. We have estimated that Holden will need to pay $5,280 annually, $1,496 in one-time costs, and $7,436 in intermittent costs as we illustrate in Table 14. We estimate our third town, Millbury, will need to pay $5,280 annually, $1496 in one-time costs, and $7,436 in intermittent costs as we show in Table 14. These are all estimated costs that each town should expect to pay, but they may be different depending on how the town plans to implement it. For example, Millbury could expect to reduce its costs by following its current grant funding system. If Millbury imparts these costs onto developers funded by grants, they will be significantly lower (Rob McNeil, 2014). Similarly, if Holden utilizes DCR services; they may be able to forgo some of these costs as well (Robert Lowell, 2014). This section needs some additional detail so we understand where each of the separate costs is coming from.

4.3.6 Future Good Housekeeping Costs

In the new 2014 draft MS4 permit, the Pollution Prevention and Good Housekeeping control measures represent an on average 20% increase in annual costs in comparison to the 2003 MS4 permit cost of compliance. This is because there are many new and specific requirements for this draft permit, where municipalities have to be far more specific in their practices to comply with the permit. We based these cost on our estimates provided in part by Mr. Civian.

We have estimated that the town of Southbridge will have an annual Good Housekeeping cost of $283,458, a onetime cost of $6,292, and an intermittent cost of $0 as illustrated in Table 15. The town of Holden will need to expend an estimated $220,562 annually, as well as $6,292 in one-time costs, but similarly to Southbridge, Holden will have $0 in intermittent costs as

illustrated in Table 15. We have estimated that the town of Millbury will need to pay an annual cost of $693,578, a one-time cost of $6, 292, and no intermittent cost we illustrate in Table 15.

We deduce these costs based on what the towns currently expend in good housekeeping compliance for the 2003 MS4 permit. The 2003 MS4 permit costs, shown in Table 7, represent the current costs for compliance for the subject towns. In the case of annual costs, the largest contributors for this value in each town were their current snow and ice road management. This is a requirement that the USEPA did not update from the 2003 MS4 permit to the 2014 MS4 permit draft.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$283,458	$6,292	$0
Holden	$220,562	$6,292	$0
Millbury	$693,578	$6,292	$0

Table 15: Estimated Good Housekeeping Costs

The annual cost for Millbury is an estimated 275% increase from the average cost of Holden and Southbridge As mentioned earlier in Section 2.4.7, such a large deviation should not come as a surprise. After being interviewed, DPW Director for Millbury Rob McNeil provided us with the costs of salt, the largest contributor to this control measure cost as seen in Appendix F, in the 2014 Fiscal Year.

4.3.7 Total Future Cost Comparison

Beyond the cost of compliance with each of the control measures, there are many miscellaneous requirements that are located elsewhere in the permit. These requirements include: the submission of a notice of intent, total maximum daily load requirements, and the development of a stormwater management program. These costs are difficult to estimate, as some of them have not been performed before (such as meeting Total Maximum Daily Load requirements), and are not implemented as numbers in our cost sheets located in Appendices A (Southbridge 2003 Cost Analysis), B (Holden 2003 Cost Analysis), and C (Millbury 2003 Cost Analysis). The annual miscellaneous costs in each individual town are $15,168, $2,376 in one-time costs and $0 in intermittent costs we illustrate in Table 16 and Appendices A, B, and C. When all of the values in Tables 10 through 15 of this chapter have been summed up in Table 17, we estimate Southbridge's annual cost of compliance with the 2014 Draft MS4 permit to be $343,008 per year. We have also estimated their one-time cost for the 2014 MS4 permit to be $314,940, which we included in Table 17. In terms of intermittent costs, we expect the towns of Southbridge and Holden to have to pay $57,876 per year as we illustrate in Table 17. We estimate the town of Millbury to need to pay $84,210, as indicated in Table 17. In the Town of Holden, their annual costs are $258,790, their one-time costs are $325,428, and their

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$15,168	$2,376	$0
Holden	$15,168	$2,376	$0
Millbury	$15,168	$2,376	$0

Table 16: Estimated Miscellaneous Costs

intermittent costs are $57,876 as we include in Table 17. In the Town of Millbury, we expect the annual costs to total $753,173, their one-time costs to total $320,231, and their intermittent costs to total $84,210 per year, as illustrated in Table 17. These costs reflect the current stormwater management programs in each town that will continue, as well as a multitude of new requirements. We calculated these cost estimates in direct collaboration with Frederick Civian.

Town	Annual Cost	One-Time Cost	Intermittent Costs
Southbridge	$343,008	$314,940	$57,876
Holden	$258,790	$325,428	$57,876
Millbury	$753,173	$320,231	$84,210

Table 17: Estimated Total Costs

5.0 Findings and Recommendations

5.1 Introduction

Having completed our goals, objectives, and cost analysis, we were able to develop many findings and recommendations for the towns of Southbridge, Holden, and Millbury, Massachusetts, the Central Massachusetts Regional Stormwater Coalition (CMRSWC), and other Massachusetts towns. In this chapter, we discuss the results of our research and recommendations for the CMRSWC and the towns so they can be adequately prepared for the 2014 Municipal Separate Storm Sewer System (MS4) draft permit. Our findings detail the cost of implementing the 2014 draft MS4 permit, as well as the difficulties associated with implementing the draft permit in our subject towns. Despite our rigorous methods, our research may not have revealed all potential costs of compliance with the new draft permit. Therefore, the towns should read our cost analysis as an estimate guideline or starting point. We believe, however, that our findings will be accurate and can help our towns effectively implement the 2014 draft MS4 permit.

5.2 Finding 1: The 2014 MS4 permit may cost too much for the towns to effectively implement

Southbridge, Holden, and Millbury, Massachusetts all struggle to finance elements of their stormwater management programs. Currently, Southbridge spends an estimated $ 326,118 annually on their stormwater programs. Comparatively, the towns of Holden and Millbury spend approximately $150,232 and approximately $647,475 respectively on their annual stormwater budgets. We have compiled these reports from information that individual town representatives have provided us as well as our own observations. We also obtained financial information from town archives, such as 2014 annual stormwater reports from each town. In order to ensure the validity of each wage, capital cost, and reoccurring cost, we obtained each value from

representatives of their respective towns. In cases where we could not find specific details, we translated financial estimates for certain services and programs from one town to another and checked the numbers with Frederick Civian, Stormwater Coordinator for the Commonwealth of Massachusetts.

Based on the reports that each town has provided us, each of our subject towns are experiencing difficulties in meeting these requirements, both financially, and with enough workers. Heather Blakeley, the Director of the Southbridge Department of Public Works (DPW), has expressed concern for the town's ability to fund its stormwater management program. Southbridge is running into difficulty with Proposition 2.5, which prevents towns from increasing taxes by more than 2.5% per year, and citizens can vote to reject an increase in taxes. This issue makes compliance with new MS4 requirements more difficult (Heather Blakely, 2014). Based on our interview, Southbridge is especially concerned with the lack of available labor. There are a large number of new requirements in the current MS4 Draft permit, and Southbridge does not have the dedicated labor force to tackle so many new programs (Heather Blakely, 2014).

John Woodsmall, the Director of the DPW in Holden, has expressed similar concerns. He has stated, "A lot of it depends on what the final format of the permit will be, and what the magnitude is in the increase in costs. We're able to absorb some but not too much generally. If it's substantial then that's going to be a real concern." (John Woodsmall, 2014).
Millbury's DPW director Robert McNeil has also indicated a similar situation. He said, "Particularly since it's still in draft form, we have not made any effort to determine the cost of the changes. So I think part of this whole effort, the hope is to work through that. Either [our IQP team] Figure out where the gap is, or what's changing, or work through the [CMRSWC] to

determine what those costs are" (Robert McNeil, 2014). Mr. McNeil also stated in our interview that of all the preparations, funding lacks the most assistance, even though funding is the backbone for the whole system.

After collecting financial data from each town, we were able to create a cost estimate for each town's stormwater management costs as we show in the Finding 1. These cost estimates represent their total costs of compliance with the 2003 MS4 based on currently available information. We were able to contact representatives in the Massachusetts Department of Conservation and Recreation (DCR) during our project. We interviewed Robert Lowell, Stormwater Manager for the DCR, and Lawrence Pistrang, Environmental Analyst for the DCR. They were able to provide us with cost estimates for educational programs, as well as guidelines for estimating the costs of certain requirements. With these resources, we were able to construct a separate cost estimation of complying with the 2014 MS4 Draft permit for Southbridge, Holden, and Millbury. Appendix H contains the blank cost sheets, Appendix D for contains the completed sheets for Southbridge, Appendix E contains the completed sheets for Holden, and Appendix F for Millbury. In total, we expect an annual cost increase of 28% for Southbridge, 39% for Holden, and 30% for Millbury. These costs do not take into account the one-time costs for each town to update mapping systems, ordinances, and other one-time programs. Based on these increases in cost and the current state of the stormwater management programs in each town, we believe that the requirements in the 2014 MS4 Draft permit may cost too much for towns to effectively implement.

5.3 Recommendation 1: Effective regionalization will allow towns to better implement their stormwater management programs

If towns can regionalize their stormwater management programs, they will be able to implement the 2014 MS4 permit more effectively and at a lower cost. In our findings, we have

determined that towns can more effectively manage and fund their stormwater programs if they are part of a regional organization. In our study, the CMRSWC unified 30 towns by providing them an effective and centralized stormwater management resource. With the CMRSWC, the members do not have to produce many of the materials required under the 2014 MS4 Draft permit. Our project did not involve municipalities that were not part of a Coalition. Based on our interviews with DCR representatives and Massachusetts Stormwater Coordinator Frederick Civian, a municipality not part of a regional organization would need to expend an excess of $9,433 to develop these materials in house or hire a contractor. We discuss the benefits of regionalization further in finding 4 and recommendation 4.

5.4 Finding 2: Using innovative funding techniques can help the towns spend less from their general fund on stormwater management

With the new draft permit having so many new requirements, towns will have to use innovative funding techniques such as grants, stormwater taxes, or stormwater utilities to fund all of the necessary changes. When funding large construction projects, towns look outside of the town for assistance. Many towns, however, do not look for additional funding outside of their town for stormwater management. When we interviewed the directors of the DPW in Southbridge and Holden, Heather Blakely and John Woodsmall respectively, both said that they have a line item in the town's general fund that funds the stormwater management program. In addition, when we asked how they planned to fund the required changes, both said they would just seek additional funding from the town. However, our other subject town Millbury did not use the same funding strategy as Southbridge and Holden. Millbury uses a unique method of partially funding their stormwater management, which we learned about when we spoke with the Millbury's DPW director Robert McNeil.

As all towns do, Millbury has contractors bid for projects within the town, such as replacing pipes, building new municipal buildings, and repairing municipal buildings. As a part of this system, Millbury asks some of the contractors to write grant requests for the town. If the town gets the grant, then the town gives the project to the contractor. This is an innovative way for both the town and the contractor to benefit; the town has the project completed with all of, or some of the grant money, and the contractor gets the contract. Innovative ways of funding stormwater management are becoming increasingly necessary, as the Community Innovation Challenge (CIC) grant continues to decrease the amount of funds that the CMRSWC receives.

The CIC grant is an innovative way to get community projects off the ground, but the state government established the grant program to start the projects, not sustain the projects, so every year the funding decreases. The CMRSWC is in its 3rd year of CIC funding, and the funding decreased by 62.9% in the first year and 30.4% in the second year. Therefore, the Coalition should explore other ways to fund their efforts. The CMRSWC member towns help the CMRSWC continue to operate by contributing annual dues. Some towns in the CMRSWC are considering implementing a stormwater tax or a stormwater utility, and in some cases that will be necessary. However, by using innovative funding methods, towns can minimize the amount that their residents have to pay for these measures.

5.5 Recommendation 2: The towns should seek alternative sources of funding such as additional grants beyond the CIC

As we mentioned in Finding 2, towns should start to seek new ways of funding stormwater management. When the United States Environmental Protection Agency (USEPA) releases a new MS4 permit, towns are going to have to find ways to fund the permit, and their current method of funding stormwater management through the general fund can only work for a limited amount of time. Some towns in the CMRSWC have talked about implementing a

stormwater tax, but according to Southbridge's DPW director Heather Blakeley, town residents will be hesitant to vote for this tax. This reservation may be due to the citizens' lack of information of the need for and importance of stormwater management. Another method for funding the necessary changes to stormwater management is to create a stormwater utility. This is most likely the best option for many towns, since it is a small increase in cost to the property owners: $11 per single-family household or some similar number. Gathering this money from all of the properties in the town would significantly help towns pay for stormwater management (USEPA, 2009). The stormwater utility allows the town to gather funding based on a factor such as impervious surface or total area, or just a flat rate. A utility would also not have to through the town approval process, so it may be easier for towns to implement.

As we mentioned in Finding 2, Millbury has contractors look for grants that the town could apply for and has the contractors do the application for the town as part of bidding for a project. This way, the towns can source funding for stormwater management outside of their town with little effort, according to Robert McNeil. When we interviewed Mr. McNeil, he told us that the contractor does almost all of the work in this process, which means that even if the town does not get the grant they did not spend much time and money applying for it. The contractor does most of the actual work and it pays off for them if they can manage to get the grant for the town, since the town is much more willing to fund the project with grant money.

A few examples of grants the towns could apply for is the 604(b) grant from the Massachusetts Department of Environmental Protection (MassDEP), Wastewater grants from the Massachusetts Environmental and Energy Agency (MassEEA), and River Revitalization Grants from the Massachusetts Department of Fish and Game (MassDFG). The 604(b) grant program through the MassDEP serves to help towns determine issues in their current stormwater

management systems. The River Revitalization grant from the MassDFG directs the grant at towns for revitalizing rivers in the towns. The towns should apply for funding as quickly as possible before these funds go away. The Coalition should also lobby for additional future funding from the USEPA and the MassDEP

5.6 Finding 3: Using innovative stormwater management techniques can help towns save money and thus implement the MS4 permit more effectively

Millbury utilizes many innovative methods of stormwater management, which helps them save money in implementing the MS4 permit. During our interview with Millbury's DPW director Robert McNeil, we learned about many of these innovative techniques. Millbury has begun the process of removing sump pump lines from their sewer system and directing them into the stormwater system. The town initiated this process in order to prevent combined sewer overflows (CSOs). In anticipation of the increased flow volume from this project, Millbury has begun installing larger drainpipes. These pipes are much larger than they need to be to handle the flow volume from the current project. The town has installed these larger pipes in case they ever decide to tie more discharges into the stormwater system. If Millbury had installed pipes that were only of adequate size to handle the flow volume from the current project, then they would need to perform additional construction if they ever decided to tie more discharges into the stormwater system. Since Millbury has installed these larger pipes, they have eliminated the need to perform additional construction in the event that they decide to increase the flow volume through the stormwater system. Therefore, by anticipating the need for future construction, Millbury will save money over time, thus reducing their costs for stormwater management.

Millbury also saves money by performing innovative public participation programs. The town promoted an art contest to raise awareness of stormwater management in both their middle school and high school. The middle school art contest involved the entire 5^{th} and 6^{th} grade classes

in Millbury's public schools. The high school art contest targeted about 25 students (Rob McNeil, 2014). However, Mr. McNeil expressed interest in targeting the entire high school, which holds students from 7th through 12th grades, in the future. The town rewarded some of the students by allowing them to paint their artwork on the town's snowplows. The art contest was an effective way to target a large number of people. In addition, the contest only involved about four hours of labor from the town DPW. By keeping the cost of fulfilling the public participation control measure low, the town can focus more of their monetary resources on implementing the Illicit Discharge Detection and Elimination (IDDE) control measure, anticipated to be the most costly requirement of the 2014 draft permit.

5.7 Recommendation 3: The towns should strive to utilize innovative stormwater management techniques

As we have discussed in finding 3, the towns can save money by using innovative stormwater management techniques. The 2014 draft MS4 permit allows for a degree of creativity when designing BMPs. The permit allows the permittee to add a Best Management Practice (BMP) to their Stormwater Management Program (SWMP) at any time. If the towns strive to generate creative ideas, they may end up creating a new BMP, which is far more effective than any BMP, which is currently in use. Therefore, generating innovative ideas can be a tremendously helpful way to reduce the cost of implementing the 2014 draft MS4 permit.

5.8 Finding 4: Towns that communicate with other towns, even to a small extent, can more effectively manage and fund their stormwater management programs

In gathering data for our financial report, we have found that there is a lack of communication and sharing of information between towns to improve their stormwater management programs. Within the municipalities of the CMRSWC, there is a group called the Steering Committee, which meets on a monthly basis to discuss stormwater management within their municipalities. During our IQP term, we were able to attend two of these meetings, and in

both of these meetings, we noted the attendance of DPW Director for Millbury, Robert McNeil, DPW Director for Holden, John Woodsmall, and Town Engineer from Holden, Isabel McCauley. In addition, we noted the attendance of ten other members. These members represented other towns within the Coalition, and from the roster of attendees, we noted representatives from Auburn, Leicester, Millbury, Northborough, Shrewsbury, and Spencer. Of the thirty towns in the CMRSWC, only about 25% of towns were represented. Although there are many new members to the CMRSWC, this still represents a low level of communication between towns on this topic, even among towns that are members of a dedicated stormwater coalition. Despite this, the collaboration within the CMRSWC has benefitted all members. Based on our cost analysis efforts seen in Appendices D, E, and F, towns can save approximately $9,433, not including the thousands in a Global Positioning System (GPS) mapping tools such as a Leica, in the implementation of the new permit as members of the CMRSWC.

In our meetings with representatives within the towns of Millbury and Southbridge, we have found that some cost-saving practices of one town may not appear in another. For example, Southbridge prints and mails all of their public education materials, but Millbury uses digital materials from the CMRSWC. Using the materials from the CMRSWC and digitally distributing them, Millbury saves the $6,500 that Southbridge spends on postage. Millbury also has undertaken a way to gather grant funding that was unique among our subject towns the municipalities. Even though both of these towns are part of the CMRSWC, they were unaware of these cost saving techniques that they could apply to their own stormwater management programs.

In working with these towns in the CMRSWC, we have found that even though they do not always communicate their own techniques, they are able to save money through CMRSWC

membership. There are some requirements within the 2014 MS4 draft that require significant investment within a town, but other requirements that will have little or no financial cost. We found this particularly evident in the Public Education minimum control measure. This control measure requires information materials, such as pamphlets, brochures, or information on a website. Additionally, there are requirements such as a sump pump discharge policy, a municipal Stormwater Pollution Prevention Plan (SWPPP), and various ordinances that do not necessarily need to be uniquely tailored to every municipality. The CMRWSC has templates for these materials, and municipalities can save money by using these materials provided as opposed to developing their own.

5.9 Recommendation 4: Regionalization can help towns save money by sharing information and resources.

The CMRSWC is a great example of towns working together to help each other with stormwater management. Not every town needs to join the same coalition, but towns should form coalitions with neighboring towns to share knowledge and tools. The small $4,000 cost of membership to the CMRSWC more than covers the amount that the towns would normally spend on consultants, testing kits, mapping tools, and educational messages. All towns have to map their MS4 system and test their outfalls. This mapping does not have to happen every year, so a single town buying this equipment would be highly inefficient. Additionally, having to purchase water quality testing kits individually would also be a financial burden, based on the seven different factors to test for in the 2014 MS4 permit draft (US EPA, 2014a).

In the CMRSWC, there are monthly steering committee meetings where members talk about current issue in stormwater management as well as issues that they are facing in their town. This is a great place for the person who is in charge of stormwater to learn more from their peers and discuss the current methods of stormwater management. Towns looking to form their

own coalition should look to the CMRSWC as a model or if they are in the region, they should look into joining the CMRSWC.

5.10 Finding 5: In each of our subject towns, stormwater management information was divided amongst different departments

Since the USEPA released the 2014 draft MS4 permit, the towns recognized the increased importance of updating their stormwater management programs. However, some towns struggle to find all of their stormwater management data. Neither Millbury, Southbridge, nor Holden had a centralized source of stormwater management information. In Southbridge, Heather Blakeley knew some of the general costs of stormwater management, but had to send us to Ken Pickerin for information on the conservation commission and to the fire chief Mark DiFronzo for information on hazardous waste removal. Mr. Pickerin and Mr. DiFronzo both dealt with stormwater management indirectly, which led to some confusion as to what information we needed from them. In Holden, we spoke with Isabel McCauley and John Woodsmall, both of whom were knowledgeable on the stormwater management relating to their jobs, but had to send us to town planner Pamela Harding for information on the conservation commission. In our towns, we eventually received the data that we needed, but always after talking with many different people and looking at many different cost sheets. The people we interviewed were often located between different departments in the town.

In Millbury when we interviewed the director of the DPW, Robert McNeil, he had to check for some of the stormwater data, given that he is in charge of the whole department and there is not a single place for that information. However, the numbers he provided to us were from all from different parts of the town's records, which was the case for all three of our subject towns. Many requirements of the 2003 MS4 permit are likely to be performed by multiple departments, such as ordinance creation and street sweeping being two completely different

programs requiring completely different personnel. For all three of our subject towns, these records were not located in a single place, because the required tasks of stormwater management were handled by multiple departments.

5.11 Recommendation 5: Having a central source of stormwater management would allow for easier implementation of future MS4 permits and make continuous compliance easier for the towns.

Based on our previous finding, having a single person in charge of stormwater management, for example, a stormwater coordinator, would make compliance much easier for towns. According to the Department of Conservation and Recreation's (DCR) Stormwater Coordinator Robert Lowell, the USEPA classifies the Wachusett Watershed as a non-traditional MS4 system. Therefore, looking at the Wachusett Watershed DCR for stormwater management is not too different from looking at a town; there are just some different requirements. When interviewing Mr. Lowell, he was able to access information easily because of his position. Since Mr. Lowell is in charge of stormwater management for the Wachusett Watershed DCR, he had intimate knowledge of how many of the requirements the DCR are meeting and what their plans were for the future with the new 2014 draft MS4 permit. If towns were able to replicate what the Wachusett Watershed DCR does with a stormwater manager, then they would be in a much better position for the any future MS4 permits. We recommend that towns research the feasibility of either creating a full-time position to manage stormwater, or make it part of an already-existing position within the municipality. We realize that small towns may not be able to afford this option, and we suggest some towns research the potential of Regional Stormwater Coordinators. These could be Stormwater Managers for multiple municipalities, whose wages are paid in part by each municipality the manage stormwater for. This option may allow smaller

municipalities to be able to consolidate their stormwater management information within their municipal budget.

5.12 Finding 6: The IDDE control measure will be a significant contributor to the increase in cost between the 2003 and 2014 draft MS4 permits

The IDDE control measure of the 2014 draft MS4 permit will cause a significant increase in the cost of implementation in onetime costs. When researching the permits, we found that the IDDE control measure is much longer and has many more requirements in the 2014 draft MS4 permit than in the 2003 MS4 permit. These more stringent requirements will cause a significant increase in the cost of compliance with the MS4 permit, as we illustrate in Table 18. For example, the town of Southbridge should anticipate a large increase in the cost of testing their outfalls. Southbridge has 206 outfalls. In the 2014 fiscal year, they sampled 25 outfalls. Under the 2003 permit, this effort is enough to fulfill the permit requirements. However, the 2014 draft MS4 permit requires each town to sample all of their outfalls, which will result in an eightfold increase in cost for the town. Many of the other permittees will likely face the same challenge as Southbridge and have to increase their sampling work. Massachusetts's towns should anticipate much higher costs in order to fulfill the new requirements of the IDDE measure.

Town	2003	2014 Draft
Southbridge	$3,520	$7,872
Holden	$4,678	$11,523
Millbury	$2,452	$19,242

Table 18: Annual Cost Comparison of IDDE

5.13 Recommendation 6: The CMRSWC should have one person in charge of keeping track of and maintaining the field sampling kits.

One issue that we often faced during our project was with the field sampling kits. The kits often had disorganized and expired components. For example, there was one day we could not run the ammonia test in the field because of expired components. If town workers discover expired components while they sample in the field, this would delay their opportunity to run the test. The workers would have to take the time to find new components and return to their sampling locations. This delay would raise the labor costs for the towns. It was also difficult to find some of the kits. There was one day we had to travel to Oxford in order to find the Total Dissolved Solids (TDS) meter and the Turbidity test. As we discuss in finding 6, the condition of the sampling kits often made it difficult to perform the tests in the field. The kits often had expired components or were in many different locations. If one person was in charge of tracking and maintaining the kits, the CMRSWC would save time trying to find kits and would not have to perform repeat sampling days at outfalls. Therefore, having one person in charge of the kits will save the CMRSWC money.

5.14 Finding 7: The current Asus tablet in use by the CMRSWC is slow and ineffective

When we were in Holden doing outfall testing, we used the tablet from the CMRSWC, which towns use for mapping and data collection. The tablet was not able to connect to the Internet without Wi-Fi, which made it difficult to use in the field. The current solution to that issue is to have an AT&T wireless hotspot to create a mobile hotspot for the tablet. This was not always reliable since the mobile hot spot could be lost or be out of range of the tablet.

The next issue that we learned about with the tablet system was the software. According to Isabel McCauley, Holden's Town Engineer, the software was slow on the tablet and was hard

for the DPW workers to use. When we used the CMRSWC tools on the tablet in the field, we saw this delay. However, when we tried the same tools on one of our smart phones, an iPhone 5, the tools worked smoothly. The screen of the iPhone was smaller than that of the tablet, but the CMRSWC's software was clearly not the issue, the issue was with the tablet.

5.15 Recommendation 7: The towns should use software, which can collect data offline and then upload it to an online database later, as well as a tablet, which is more up to date. This would allow the DPW workers to work more efficiently, thus saving the town labor costs

There are many issues with using the current CMRSWC tablet. Sometimes there just is no cellular signal, which a new tablet could help with, but not be able to completely fix. For this issue, we recommend that the CMRSWC develop an offline mode for the tablet so that anyone using the tablet can collect data and save it so that when the tablet can connect to the network, either via Wi-Fi or via a cellular network, the tablet can upload any data it saved while in offline mode.

Since the tablet is almost three years old, and there are new tablets that would work better, we recommend that the CMRSWC buy a new tablet on which to use their software. Buying a tablet would decrease the amount of time that anyone using the tablet has to wait for loading and reloading when the tools crash. There are tablets that have built-in cell signal receptors, which may be better so the hot spot is not lost and there is a better signal. The combination of the mobile hotspot and the older tablet causes unnecessary frustration and loss of time. When buying the new tablet, the CMRSWC should invest in model that will be durable and will function well over time and with many different users.

For this purpose, we recommend that the CMRSWC purchase a low-end Apple iPad, since they run much better and have a much better life span compared to an Asus tablet. A low-end iPad would cost about $530 for the lowest end full iPad with a diagonal screen size of 9.7in.

A cheaper option is an iPad Mini, which costs $380 with a diagonal screen size of 7.87in. Either of those options would easily out-perform the current Asus tablet. The Asus tablet costs about $250 with a screen size of about 7in and lasted probably two good years. With either iPad they would continue to function well into four years after they are purchased. While working on the current Asus tablet, we lost about four minutes per outfall having to wait for pages to load and reloading pages. If a town is paying a DPW employee $22/hour to use this tablet and they lose four minutes per outfall, they are losing about $2 per outfall. Since the town has to go to each outfall for some of the new requirements approximating 145 outfalls a town, the town is losing $290 due to the cost of the inadequate technology. Just in that savings from one town, the CMRSCW is making the money back in timesaving, especially since the CMRSWC distributes the tablet to many different towns.

5.16 Other Recommendations

5.16.1 The Massachusetts Department of Environmental Protection should research the potential of providing standardized materials available to Massachusetts municipalities

Based on our findings, we believe the MassDEP should consider making available a collection of materials that municipalities could use for their permit compliance when administering the new 2014 MS4 permit. Within the requirements of the 2014 draft MS4 permit, there are many line items that municipalities must develop and implement. These materials primarily consist of those in the Public Education and Public Involvement control measures, such as pamphlets, brochures, and public notices. Beyond these two control measures there are still a number of material requirements, including Stormwater Pollution Prevention Plans (SWPPPs), outfall-screening procedures, and construction site stormwater plans. These materials will require a significant investment from municipalities to implement (See Appendices D, E, and F for cost estimations in our subject towns). In one case, Mr. Lowell provided our team with a high-end

cost estimate for complying with the Public Education requirement. Based on the requirements of the current MS4 Draft permit, a high-end public education program for a town of approximately 17,000 individuals costs an estimated $19,787 annually (Robert Lowell, 2014). This cost can be different, depending on how the municipality chooses to implement certain requirements. Some towns like Millbury are working to abolish paper materials completely (Robert McNeil, 2014). In regards to the Central Massachusetts Regional Stormwater Coalition (CMRSWC), these materials are made by the CMRSWC for its member municipalities, and are available as part of the paid membership to the CMRSWC. Beyond this Coalition, there is also the Massachusetts Watershed Coalition. Formed in 1991, this Coalition works with community partners across Massachusetts in order to protect and restore watershed ecosystems across the state (Coalition, 2014). As part of its goal, the Mass Watershed Coalition also provides information and other services relating to stormwater to many communities in the state (Coalition, 2014). In the 2014 MS4 Draft permit, Most of the requirements are not specific to individual municipalities. The USEPA made the MS4 permit to be applicable to many different municipalities, and the materials that are required are similarly nonspecific to any municipality. With special attention paid to the success of Coalitions distributing materials, it may be highly beneficial for the MassDEP to develop certain materials in-house, as opposed to municipalities developing them themselves. These would be materials like standard operating procedures, ordinances, and other administrative tools that are required under the 2014 draft permit. The MassDEP should certainly not force municipalities to use these materials, but the materials should be available in electronic and physical forms. Even if only a few towns make use of these materials, they could potentially save tens of thousands of dollars.

5.16.2 The CMRSWC should streamline and update the digital forms. This practice would reduce the time needed to inspect outfalls, thus saving money

While we performed outfall sampling in Holden, we completed wet and dry weather sampling forms. We spent roughly ten minutes per outfall in order to complete these forms. As noted by Matthew St. Pierre of Tata & Howard, these forms have many additional categories. These categories include test results for pollutants that are not regulated by the MS4 permit. It is worth noting that, by having categories that go beyond the regulations of the MS4 permit, the CMRSWC can create a cleaner and less polluted environment. The detail of these forms illustrates the CMRSWC's admirable commitment to protecting the environment. However, the cost of implementing the 2014 draft MS4 permit is significant, and will likely strain many towns' budgets. If the CMRSWC updates these forms and removes the categories unrelated to the draft MS4 permit, it will save the town workers time, and thus streamline the process of outfall sampling. These times savings will also save the towns labor costs.

The CMRSWC should also utilize these updated forms on their digital system. Digital sampling forms are easy to upload to a database or the CMRSWC's website. When we were performing field work in Holden, Ms. McCauley demonstrated how to complete the dry and wet weather sampling forms on the CMRSWC tablet and then upload them to the CMRSWC website. Having a database of these forms makes it easy to see trends in pollution, both within a single town, and between towns, which have shared watersheds. Therefore, the database makes it much easier to perform outfall sampling and inspections, thus saving money. A previous IQP group detailed the efficiency of uploading digital forms to the People GIS database using the Leica tablet. This process circumvented the need to submit the forms outside of the field, and also prevented municipal employees from making repeated trips to outfalls in order to inspect

them (Barat, Chin, & Feraco, 2012). Therefore, the use of a digital database makes sampling and inspection easier and more efficient.

5.16.3 Recommendations for Future Research

In the future, we recommend project groups perform an assessment of the cost of implementing Total Maximum Daily Load (TMDL) measures. According to Frederick Civian, the cost of implementing TMDL measures could be overwhelmingly significant for the towns. Although not much research has been done on TMDL, the USEPA has shown the extent of these costs. The USEPA estimated the cost of implementing TMDL requirements in Bellingham, Franklin, and Milford Massachusetts at $23,595,000, $62,810,000, and $67,363,000, respectively (Group, 2011). A proper assessment of these costs could prove to be valuable to the USEPA, as well as the towns, in the future.

We also recommend future project groups attempt to fill the gaps in our research. We received most of our data from the town officials, with few outside sources except for the DCR. We attempted to contact Environmental Partners Group for information about Holden, but we were unable to reach them. In addition, we had to estimate many of our costs. These factors made our cost numbers difficult to verify as being accurate. Because of this lack of verification, some of our data could have resulted in bias. We recommend that future research groups find a method to eliminate some of the biases in our data, such as by finding budget data from multiple sources.

6.0 Conclusion

Stormwater runoff is one of the leading contributors to water pollution in the United States. In order to combat this pollution, the United States Environmental Protection Agency

(USEPA) created the Municipal Separate Storm Sewer System (MS4) permit. On September 30, 2014, the USEPA released the 2014 draft MS4 permit. Once the USEPA releases the permit in full, towns throughout Massachusetts will have to comply with it, which will lead to substantial spending increases.

In our cost analysis chapter, we discuss the predicted annual costs of complying with the 2014 draft MS4 permit in our subject towns of Holden, Millbury, and Southbridge. From our cost analysis, we predict an annual cost of implementing the 2014 draft MS4 permit of $258,790 for Holden, $735,629 for Millbury, and $343,008 for Southbridge. These costs represent an increase in the annual cost of implementation from the 2003 MS4 permit of 39% for Holden, 26% for Millbury, and 28% for Southbridge.

These cost increases are significant, and we propose several potential methods for defraying the cost increases of effectively implementing the 2014 Draft MS4 to individual towns. In addition, we recommend that towns reach out to the Massachusetts Department of Environmental Protection (MassDEP) for advice on implementing the permit. In our findings and recommendations chapter, we provide recommendations to towns, and the Central Massachusetts Regional Stormwater Coalition (CMRSWC) for effective implementation of the 2014 draft MS4 permit. Among our most important recommendations, we emphasize the benefits of regionalization, the use of innovative stormwater management and funding techniques, and centralization of stormwater management in each town.

The task of effective stormwater management is daunting. However, by implementing the proper procedures, the towns can plan effectively manage stormwater management, thus protecting human health and the environment.

KEY:

Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$10,952	Pamphlets (6500), Hazardous Waste Collection (3360), Newspaper Article (500), Media Campaign (500), Develop a curriculum for school system (92)	Yes
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2hrs @ $22/hr	No
3	Admin	*Identify parties responsible for each message	2.3.2 a	$22	1hr @ $22/hr, once a year for 8 years	No
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1hr @ $22/hr	No
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	No
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	Included in No. 5	No
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$19,860
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	Minimal cost, can post on website	No
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	In compliance with public meeting requirement	Yes
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	Yes

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	Varies depending on severity of infraction average cost, actual cost may vary	Yes
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	Included in No. 1	Yes
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hr @ $22/hr for scheduling	Yes
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	Yes
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	Varies depending on severity of infraction around 25000-50000	No
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr if records are available	No
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr to determine the information	No
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included in No. 7	No
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included in No. 7	No
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	No
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr for informing EPA/MassDEP orally/written	Yes
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$1,133	15min/outfall (includes travel), 206 outfalls, @ $22/hr	No
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	No
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$1,183	10min/outfall (includes travel), 206 outfalls, @ $22/hr, + materials ($2 stick per outfall + spraypaint + sharpie)	No
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included in No. 14	No
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included in No. 14	Yes
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Enough new requirements to have to add new data elements, cost assuming outside contracting and implementation into GIS map	No
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included in No. 17	No
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included in No. 17	No
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included in No. 17	No
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included in No. 17	No
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included in No. 17	No
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr for continuous additions to stormwater systems	No
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	Yes
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	Complete redevelopment of the program, review and upgrades	No
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	Change ordinance, 13 weeks @ 5hrs/week @ $22/hr, has to go to different committees	Yes
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included in No. 25	No
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories (soupped up from previous "priority" mark in 2003)	2.3.4.7 c i	$13,200	Approx. 1200 catch basins, approx. 30 min/basin @ $22/hr	No
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors (soupped up from previous "priority" mark in 2003)	2.3.4.7 c ii	$26,400	Approx. 1200 catch basins, approx. 1hr/basin @ $22/hr	No
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included in No. 29	No
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	$0 with CMRSWC Membership	Yes
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	Included in No. 34	Yes
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	Possible time extensions, no cost	Yes
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$2,266	206 outfalls, approximately 30min/outfall @ $22/hr	Yes
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$0	Included in No. 39	Yes
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$15,656	206 outfalls, done by contractor, $30/outfall, $23/hr, 2hrs/outfall Testing Kits (0) b/c CMRSWC membership	Yes
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if records are available	No
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr	No
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included in No. 41	No
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$88	Assuming 4 catchments, 1 hr/catchment @ $22/hr	No
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included in No.43	No
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included in No.43	No
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	Assuming using WPI spreadsheet, otherwise about 10min per catchment	No
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	$0 since CMRSWC Membership	No
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included in No. 47	No
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included in No. 47	No
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$176	8hrs @ $22/hr, for scheduling	Yes
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$0	See Miscellaneous No. 50	No
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included in No. 51	No
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included in No. 51	No
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	Yes
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	No
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	$0 since CMRSWC Membership	No
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included in No. 37 and No. 38	No
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	No
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Deadlines, See No. 38 and 37	No
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Deadlines, See No. 28	No
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Deadlines, See No. 28	No
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Deadlines, See No. 28	No
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Deadlines, See No. 28	No
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	No
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$176	8hrs @ $22/hr	No
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	No
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	$0 since CMRSWC Membership	Yes
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$19,242
Estimated One-time Costs	$304,006
Estimated Intermittent Costs	$50,440

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$0	Volunteer based program	Yes
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	See No. 3-12	Yes
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1hrs @ $22/hr, for review of current document	No
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of current document	No
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$88	4hrs @ $22/hr	No
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr	No
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr	No
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr	No
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr	No
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr	No
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr	No
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr	No
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$0
Estimated One-time Costs	$770
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Yes
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, but 8hrs @ $22/hr if not	Yes
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, assumes no controversy and 4 people working	No
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	Included in No. 3	No
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	No
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	No
7	Admin	*all BMPs must be constructed in accordance with the MA Stormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	Yes
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	No
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	Yes
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,100	Submitted by construction company, 50hrs @ $22/hr, if it's new	No
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	5hrs w/ an attorney, 208hrs @ 22/hr, legal authority adds complexity and cost	No
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included in No. 11	No
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	Yes
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @ $22/hr	No
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included in No. 14	No
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included in No. 14	No
17	BMP	*permittee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included in No. 14	No
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	No
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40hrs @ $22/hr	No
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included in No. 19	No
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included in No. 19	No
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included in No. 19	No
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included in No. 19	No
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	Yes
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80hr @ $22/hr, a lot of data required	No
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	See No. 17 in IDDE	No
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	See No. 17 in IDDE	No
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	No
29	Admin	*break out those figures by development, redevelopment or retrofit by permittee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	No
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	No
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hrs, many properties to assess	No
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included in No. 32	No
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii	$0	Included in No. 32	No
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included in No. 32	No
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included in No. 32	No
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included in No. 32	No
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,436

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hrs @ $22/hrs	No
2	Admin	*w/in 1 year inventory all permittee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	Included in No. 1	No
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	No
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	Included in No. 3	No
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	Included in No. 3	No
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	Included in No. 3	No
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	Included in No. 3	No
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	Included in No. 3	No
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc	2.3.7 a ii b	$1,760	80hrs @ $22/hr	No
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	Included in No. 9	No
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	Included in No. 9	No
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	Included in No. 9	No
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	4hrs @ $22/hr	No
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included in No. 13	No
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included in No. 13	No
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22	No
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0	Included in No. 16	No
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/basin @ $22/hr, assuming 10 basins/year	No
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17 & Annual Report	No
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	Included in No. 17	No
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	Included in No. 23	No
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	Included in No. 23	No
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$40,624	Materials + Labor given by town	Yes
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$0	Included in No. 26	Yes
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Development Cost	No
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Development Cost	No
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$0	$0 Since Southbridge owns their own landfill	Yes
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$0	Properly house materials in municipally owned properties	Yes
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	Yes
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0		Yes
36	Admin	*establish procedures for O&M or all permittee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr	No
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Inspect each BMP, assuming 2000/year 15min/BMP @ 22/hr	No
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	No
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr, based on templates from the CMRSWC	No
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	4hrs to update existing SWPPPs, 10hrs for new SWPPPS, @ $22/hr, assume 5 new facilities + 5 old facilities	No
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included in No. 40	No
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included in No. 40	No
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included in No. 40	No
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$10,000	Depends on variations of the extent of impaired waters varies about 10000-25000	No
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	Included in No. 44	No
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included in No. 44	No
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included in No. 44	No
48	BMP	*Good Housekeeping	2.3.7 d 2	$189,540	Snow removal (3300), leaf collection (34020), salt/sand distribution (152220)	Yes
49	BMP	*Preventative Maintenance	2.3.7 d 3	$23,056	Catchment cleaning (23056)	Yes
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included in No. 44	Yes
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included in No. 44	Yes
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included in No. 44	Yes
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included in No. 44	Yes
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$1,980	Given by town	Yes
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included in No. 44	Yes
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,000	30min/inspection, assume 10 facilities with 4 areas each @ $100/area	No
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$2,266	206 outfalls, approx. 30min/outfall @ $22/hr	No
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc	2.3.7 b iii a	$0	Included in No. 44	No
59	BMP	*permittee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	Included in No. 44	No
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	No
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$283,458
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs @ $22/hour, historical properties or endangered species will increase this cost	No
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	No
3	BMP	*Implement measures to protect endangered species	1.9.1	$0	Included under No. 1	No
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	See Miscellaneous No. 50	No
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	Varies	Included under No. 1	No
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	No
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	No
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	No
9	BMP	Develop a SWMP	1.10	$1,760	80hrs @ $22/hr	Yes
10	BMP	Implement a SWMP	1.10	$0	Included under No. 10	Yes
11	Admin	*Update/modify SWMP	1.10	$440	20hrs @ $22/hr	No
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	No
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	No
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	No
15	Admin	***Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Yes
16	Admin	*List all receiving water bodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	No
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	No
18	Admin	*List all outfalls that discharge to each water body	1.10.2	$0	Included under No. 9	No
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	No
20	Admin	*List all interconnected MS4s and receiving water body	1.10.2	$0	Included under No. 9	No
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	No
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	No
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	No
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	No
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	No
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	No
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	No
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	No
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	No
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	No
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	Yes
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	No
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	No
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	No
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	No
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	No
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	No
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included in No. 9	No
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hrs, of paperwork for new BMP	Yes
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	No
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	See Miscellaneous No. 50	No
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	No
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	40hrs at $22/hr, week of work annually	No
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	No
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	No
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"	4.3 b	$0	See Miscellaneous No. 50	No
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Part of annual report, see No. 46	No
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Part of annual report, see No. 46	No
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Part of annual report, see No. 46	No
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$14,200	The Consultant fee for creating the annual report increased based off of the increase in requirements	Yes
51	Admin	*The status of any required plans	4.4 b iii	$0	Part of annual report, see No. 50	No
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Part of annual report, see No. 50	No
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Part of annual report, see No. 50	No
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Part of annual report, see No. 50	No
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Part of annual report, see No. 50	No
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Part of annual report, see No. 50	No
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Part of annual report, see No. 50	Yes
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Part of annual report, see No. 50	Yes
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Part of annual report, see No. 50	No

Estimated Annual Costs	$15,168
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Illicit Discharge Detection and Elimination Program	$7,872	$314,494	$50,440
Construction Site Stormwater Runoff Control	$0	$770	$0
Post Construction Stormwater Management	$5,280	$1,496	$7,436
Good Housekeeping	$220,562	$6,292	$0
Non-Control Measure			
Miscellaneous	$15,168	$2,376	$0
Totals	**$258,790**	**$325,428**	**$57,876**

KEY:	
Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$1,000	Pamphlets to homes, $500 and businesses,$500	Yes
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2 hrs @ $22/hr	No
3	Admin	*Identify parties responsible for each message	2.3.2 a	$22	1 hr @ $22/hr	No
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1 hr @ $22/hr, once a year for 8 years	No
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	No
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	Included in No. 5	No
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$9,908
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	Minimal cost, can post on website	Yes
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	In compliance with public meeting requirement	No
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	Yes

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	Varies depending on severity of infraction average cost, actual cost may vary	Yes
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	Included in No. 1	Yes
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hrs @ $22/hr, for scheduling	Yes
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	Yes
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	Varies depending on severity of infraction, around $25,000-$50,000	No
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr, if records are available	No
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr, to determine the information	No
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included in No. 7	No
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included in No. 7	No
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	No
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr, for informing EPA/MassDEP orally/written	No
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$792	15min/outfall (includes travel), 144 outfalls, @ $22/hr	No
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	No
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$528	10min/outfall (includes travel), 144 outfalls, @ $22/hr, + materials ($2 stick per outfall + spraypaint+sharpie)	No
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included in No. 14	No
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included in No. 14	Yes
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Enough new requirements to have to add new data elements, cost assuming outside contracting and implementation into GIS map	No
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included in No. 17	No
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included in No. 17	No
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included in No. 17	No
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included in No. 17	No
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included in No. 17	No
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr, for continuous additions to stormwater systems	No
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	Yes
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	Complete redevelopment of the program, review and upgrades	No
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	Change ordinance, 13 weeks @ 5 hrs/week @$22/hr, has to go to different committees	Yes
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included in No. 25	No
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories	2.3.4.7 c i	$17,028	Approx. 1548 catch basins, approx. 30 min/basin @ $22/hr	No
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors	2.3.4.7 c ii	$34,056	Approx. 1548 catch basins, approx. 60min/basin @ $22/hr	No
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included in No. 29	No
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	No
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	8hr @ $22/hr, work day to complete process, ($0 W/CMRSWC Membership)	Yes
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	See No. 34	Yes
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	possible time extensions	Yes
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$1,584	144 outfalls, approx. 30min/outfall @ $22/hr	Yes
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$0	Included in No. 39	Yes
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$4,968	144 outfalls, approx. 1.5hr/outfall @ $23/hr, Paperwork for wet weather sampling (2,266), Testing Kits (0) b/c CMRSWC membership	No
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if records are available	No
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr	No
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included in No. 41	No
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$88	Assuming 4 catchments, 1 hr/catchment @ $22/hr	No
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included in No.43	No
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included in No.43	No
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	Assuming using WPI spreadsheet, otherwise about 10min per catchment	No
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	$0 since CMRSWC Membership	No
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included in No. 47	No
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included in No. 47	No
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$176	8hrs @ $22/hr, for scheduling	Yes
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$0	See Miscellaneous No. 50	No
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included in No. 51	No
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included in No. 51	No
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, 1.5hr/illicit, 3 illicit	No
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, 1.5hr/illicit, 3 illicit	No
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	$0 since CMRSWC Membership	No
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included in No. 37 and No. 38	No
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	No
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Deadlines, See No. 38 and 37	No
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Deadlines, See No. 28	No
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Deadlines, See No. 28	No
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Deadlines, See No. 28	No
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Deadlines, See No. 28	No
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	No
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$176	8hrs @ $22/hr	No
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	No
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	$0 since CMRSWC Membership	Yes
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$7,872
Estimated One-time Costs	$314,494
Estimated Intermittent Costs	$50,440

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$0	Volunteer based program	Yes
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	See No. 3-12	Yes
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1 hr @ $22/hr, for review of current document	Yes
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of current document	No
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$88	4hrs @ $22/hr	No
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr	No
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr	No
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr	Yes
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr	No
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr	No
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr	No
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr	No
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$0
Estimated One-time Costs	$770
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Yes
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, but 8hrs @ $22/hr minimum	Yes
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, assumes no controversy and 4 people working	No
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	See No. 3	No
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	No
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	No
7	Admin	*all BMPs must be constructed in accordance with the MA stormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	Yes
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	No
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	Yes
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,100	Submitted by construction company, 52hrs @ $22/hr, if it's new	No
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	legal authority adds complexity and cost, 5hr w/ an attorney, 208hrs of labor @ $22/hr	No
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included in No. 11	No
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	Yes
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @ $22/hr	No
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included in No. 14	No
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included in No. 14	No
17	BMP	*permitee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included in No. 14	No
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	No
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40 hrs @ $22/hr	No
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included in No. 19	No
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included in No. 19	No
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included in No. 19	No
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included in No. 19	No
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	Yes
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80 hrs @ $22/hr, a lot of data required	No
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	See No. 17 in IDDE	No
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	See No. 17 in IDDE	No
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	No
29	Admin	*break out those figures by development, redevelopment or retrofit by permitee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	No
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	No
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hr, many properties to assess	No
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included in No. 32	No
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc)	2.3.6 d iii	$0	Included in No. 32	No
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included in No. 32	No
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included in No. 32	No
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included in No. 32	No
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	No

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,436

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hr @ $22/hr	No
2	Admin	*w/in 1 year inventory all permitee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	Included in No. 1	No
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc.	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	No
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	Included in No. 3	No
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	Included in No. 3	No
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	Included in No. 3	No
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	Included in No. 3	No
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	Included in No. 3	No
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc.	2.3.7 a ii b	$1,760	80hrs @ $22/hr	No
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	Included in No. 9	No
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	Included in No. 9	No
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	Included in No. 9	No
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	8hrs @ $22/hr	No
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included in No. 13	No
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included in No. 13	No
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22	No
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0		No
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/basin @ $22/hr, assuming 10 basins /year	No
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17/Annual Report	No
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	Included in No. 17	No
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See Miscellaneous No. 50	No
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	included in No. 23	No
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	included in No. 23	No
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$10,560	Materials + Labor	Yes
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$0	See No. 26	Yes
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Development Cost	No
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Development Cost	No
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	See Miscellaneous No. 50	No
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$0	$0 Since Southbridge owns their own landfill	Yes
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$0	Properly house materials in municipally owned properties	Yes
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	Yes
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0		Yes
36	Admin	*establish procedures for O&M or all permitee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr	No
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Inspect each BMP, assuming 2000/year 15min/BMP @ $22/hr	No
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	No
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr, based on templates from the CMRSWC	No
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	4hrs to update existing SWPPPs, 10hrs for new SWPPPS, @ 22/hr, assume 5 new facilities and 5 old facilities	No
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included in No. 40	No
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included in No. 40	No
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included in No. 40	No
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$10,000	depends on variations of the extent of impaired waters	No
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	Included in No. 44	No
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included in No. 44	No
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included in No. 44	No
48	BMP	*Good Housekeeping	2.3.7 d 2	$180,246	$7,040 catch basin cleaning, $10,560 street sweeping, $152,200 salt/sand, $5,956 maintenance, $4,470 audits	Yes
49	BMP	*Preventative Maintenance	2.3.7 d 3	$0		Yes
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included in No. 44	Yes
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included in No. 44	Yes
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included in No. 44	Yes
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included in No. 44	Yes
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$1,980		Yes
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included in No. 44	Yes
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,200	30 minutes per inspection , assume 10 facilities with four areas each @ $100/hr	No
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$1,584	144 outfalls, approx. 30min/outfall @ $22/hr	No
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc.	2.3.7 b iii a	$0	Included in No. 44	No
59	BMP	*permitee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	Included in No. 44	No
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	No
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0		No

Estimated Annual Costs	$220,562
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs at $22/hr, historical properties or endangered species will increase this	No
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	No
3	BMP	*Implement measures to protect endangered species	1.9.1	Varies	Included under No. 1	No
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	See Miscellaneous No. 50	No
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	Varies	Included under No. 1	No
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	No
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	No
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	No
9	BMP	Develop a SWMP	1.10	$1,760	80hrs at $22/hr	Yes
10	BMP	Implement a SWMP	1.10	$0		Yes
11	Admin	*Update/modify SWMP	1.10	$440	20hrs at $22/hr	No
12	Admin	Provide SWMP "immediately" to various agencies and public	1.10.1	$0	Included under No. 9	No
13	Admin	*Post SWMP online	1.10.1	$0	Included under No. 9	No
14	Admin	Identify Names and titles of people implementing the SWMP	1.10.2	$0	Included under No. 9	No
15	Admin	***Include status of 2003 permit requirements**	1.10.2	$0	Included under No. 9	Yes
16	Admin	*List all receiving waterbodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	No
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	No
18	Admin	*List all outfalls that discharge to each waterbody	1.10.2	$0	Included under No. 9	No
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	No
20	Admin	*List all interconnected MS4s and receiving waterbody	1.10.2	$0	Included under No. 9	No
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	No
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	No
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	No
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	No
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	No
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	No
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	No
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	No
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	No
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	No
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	Yes
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	No
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	No
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	No
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	No
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	No
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	No
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included under No. 9	No
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hr, paperwork for new BMP	Yes
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	No
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	See No. 50	No
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	No
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	Week of work annually, 40hrs at $22/hr	No
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	No
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	No
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"	4.3 b	$0	See No. 50	No
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Part of annual report, see No. 46	No
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Part of annual report, see No. 46	No
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Part of annual report, see No. 46	No
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$14,200	Consulting fee for annual report	No
51	Admin	*The status of any required plans	4.4 b iii	$0	Part of annual report, see No. 50	No
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Part of annual report, see No. 50	No
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Part of annual report, see No. 50	No
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Part of annual report, see No. 50	No
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Part of annual report, see No. 50	No
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Part of annual report, see No. 50	No
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Part of annual report, see No. 50	Yes
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Part of annual report, see No. 50	Yes
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Part of annual report, see No. 50	No

Estimated Annual Costs	$15,168
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Appendix F

Control Measure	Estimated Annual Costs	Estimated One-time Costs	Estimated Intermittent Costs
Public Education and Outreach	$12,106	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$11,347	$306,481	$76,972
Construction Site Stormwater Runoff Control	$350	$858	$0
Post Construction Stormwater Management	$5,280	$1,496	$7,480
Good Housekeeping	$693,578	$6,292	$0
Non-Control Measure

KEY:			
Yearly	No. = Reference Number		
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work		
As Needed	X Requirement = The short name for a requirement		
	Requirement = Section in the 2014 MS4 permit draft		
	Cost = Cost of completing the requirement		
	Justification = List of methods used to complete the requirement, as well supporting data from sources		
	In Place (Y/N) = Is the requirement listed currently in place		

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a	$3,176	Art Contest (3000) for materials, 8 hr(s) @ $22/hr	Y
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a	$44	2hrs @ $22/hr, a minor administrative cost	N
3	Admin	*Identify parties responsible for each message	2.3.2 a	$44	2hrs @ $22/hr, a minor administrative cost	N
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c	$22	1hr @ $22/hr, a minor administrative cost, once a year for 8 years	N
5	Admin	*Show evidence that messages are achieving results	2.3.2 e	$8,820	DCR explanation for assessing effectiveness	N
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e	$0	No significant cost	N
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$12,106
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a	$0	No significant cost, website hosting	Y
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b	$0	No significant cost	Y
3	Admin	*Put in annual report these public participation activities	2.3.3 c	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2	$25,000	[Varies depending on infraction, ranges from ($0-50,000) provided by DCR Director Larry Pistrang]	Y
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2	$0	See No. 1, part of identification process	Y
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2	$44	2hrs @ $22/hr, for scheduling	N
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2	$0	See Miscellaneous No. 50	N
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3	$25,000	[Varies depending on infraction, ranges from ($0-50,000) provided by DCR Director Larry Pistrang]	Y
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b	$44	2hrs @ $22/hr, assuming records are easily available	N
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b	$44	2hrs @ $22/hr, to determine the information	N
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b	$0	Included under No. 7	N
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b	$0	Included under No. 7	N
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b	$0	See Miscellaneous No. 50	N
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c	$44	2hrs @ $22/hr, informing EPA/MassDEP orally/written	N
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5	$1,469	2hrs @ $22/hr, about 15min/outfall, 267 outfalls	N
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b	$0	See Miscellaneous No. 50	N
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b	$2,003	2hrs @ $22/hr, about 10min/outfall, 267 outfalls, materials included ($2 stick per outfall + spraypaint+sharpie)	N
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c	$0	Included under No. 14, materials are available from the Coalition	N
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c	$0	Included under No. 14, materials are available from the Coalition	N
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6	$250,000	Will likely require complete redevelopment of the map system, this numbers based on Millbury estimations for People GIS	N
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i	$0	Included under No. 17	N
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i	$0	Included under No. 17	N
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i	$0	Included under No. 17	N
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii	$0	Included under No. 17	N
22	BMP	*Include various recommended elements	2.3.4.6 a iii	$0	Included under No. 17	N
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b	$1,144	1hr/week @ $22/hr, for continuous developments and additions to stormwater systems	N
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c	$0	See Miscellaneous No. 50	N
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7	$10,000	A complete redevelopment of the program, smaller towns can expect a cost of 10,000	N
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a	$1,430	65hrs @ $22/hr, will have to change ordinance and allow a representative to go to different committees	Y
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b	$0	Included under No. 25	N
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories	2.3.4.7 c i	$13,310	1210 catch basins, about 30min/basin @ $22/hr	N
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors	2.3.4.7 c ii	$26,620	1210 catch basins, about 1hr/basin @ $22/hr	N
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii	$0	Included under No. 29	N
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii	$0	See Miscellaneous No. 50	N
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d	$0	No cost with Coalition Membership	N
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i	$0	Included under No. 34	N
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii	$0	Minimal cost, possible time extensions to test applicable outfalls	N
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii	$979	267 outfalls, about 10min/outfall @ $22/hr	N
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv	$1,469	267 outfalls, about 15min/outfall @ $22/hr	N
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v	$8,811	267 outfalls, about 1.5hr/outfall @ $22/hr, along with applicable water quality testing kit costs (none with Coalition)	N
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi	$44	2hrs @ $22/hr, if files readily available	N
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e	$352	16hrs @ $22/hr, for development of procedure	N
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e	$0	Included under No. 41	N
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i	$26,620	1210 catchments, 1 hr/catchment @ $22/hr	N
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i	$0	Included under No. 43	N
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i	$0	Included under No. 43	N
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i	$0	See Miscellaneous No. 50	N
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii	$0	No cost with Coalition Membership	N
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a	$0	Included under No. 47	N
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b	$0	Included under No. 47	N
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii	$22	1hr @ $22/hr, for scheduling	Y
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f	$88	4hrs @ $22/hr, for scheduling	N
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f	$0	Included under No. 51	N
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f	$0	Included under No. 51	N
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	N
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g	$132	$22/hr 30min/screening, approximately 1.5hr/illicit, assuming 3 illicit	N
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h	$0	8hrs @ $22/hr, one work day to complete process, no cost with Coalition membership	N
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a	$0	Included under No. 37 and No. 38	N
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a	$0	See Miscellaneous No. 50	N
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b	$0	Included under No. 37 and No. 38, deadlines	N
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c	$0	Included under No. 28, deadlines	N
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i	$0	Included under No. 28, deadlines	N
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii	$0	Included under No. 28, deadlines	N
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii	$0	Included under No. 28, deadlines	N
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e	$0	See Miscellaneous No. 50	N
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9	$0	8hrs @ $22/hr, administrative work	N
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9	$0	See Miscellaneous No. 50	N
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10	$0	No cost with Coalition membership	Y
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$11,347
Estimated One-time Costs	$306,481
Estimated Intermittent Costs	$76,972

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a	$350	Compare to previous cost, Millbury cost provided by Laurie Connors	Y
2	BMP	Develop and implement a construction site runoff program	2.3.5 c	$0	as provided by Laurie Connors, Town planner	Y
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i	$22	1hr @ $22/hr, included under No. 2	Y
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii	$44	2hrs @ $22/hr, for review of the established document included under No. 2	Y
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii	$176	4hrs @ $22/hr, included under No. 2	N
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii	$88	4hrs @ $22/hr, included under No. 2	N
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv	$88	4hrs @ $22/hr, included under No. 2	N
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v	$88	4hrs @ $22/hr, included under No. 2	N
13	Admin	*All to be included in the annual report	2.3.5 c v	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$350
Estimated One-time Costs	$858
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a	$0	depends on previous program, should already be in place	Y
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii	$176	Already in place, amendment would be 8 hr(s) @ 22/hr minimum	N
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a	$1,760	80hrs @ $22/hr, difficult to assess cost, assumes no controversies or unresolved issues and four people working	N
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a	$0	Included under No. 3	N
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b	$0	Rule, does not require anything to be implemented, Possibly need Attorney	N
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c	$0	Rule, does not require anything to be implemented	N
7	Admin	*all BMPs must be constructed in accordance with the MA Sstormwater Handbook	2.3.6 a ii d	$0	Rule, does not require anything to be implemented	N
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e	$0	Rule, does not require anything to be implemented	N
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f	$0	Rule, does not require anything to be implemented	N
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii	$1,144	52hrs @ $22/hr and submitted by construction company if it is new	N
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii	$4,576	208hrs @ $22/hr, Submitted by construction company, legal authority and complexity add costs, including maybe 5 people inc/attorney	N
12	Admin	*may include annual self-certification program	2.3.6 a iii	$0	Included under No. 11	N
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii	$0	See Miscellaneous No. 50	N
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b	$1,320	60hrs @$22/hr, including fire chief	N
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b	$0	Included under No. 14	N
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b	$0	Included under No. 14	N
17	BMP	*permitee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b	$0	Included under No. 14	N
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b	$0	See Miscellaneous No. 50	N
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c	$880	40hrs @ $22/hr	N
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c	$0	Included under No. 19	N
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c	$0	Included under No. 19	N
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c	$0	Included under No. 19	N
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c	$0	Included under No. 19	N
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c	$0	See Miscellaneous No. 50	N
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d	$1,760	80hrs @ $22/hr, data intensive, devising system and updating yearly, assumes 4 people working	N
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i	$0	Included in IDDE No. 17	N
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i	$0	Included in IDDE No. 17	N
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii	$0	See Miscellaneous No. 50	N
29	Admin	*break out those figures by development, redevelopment or retrofit by permitee, by others voluntarily	2.3.6 d ii	$0	See Miscellaneous No. 50	N
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii	$0	See Miscellaneous No. 50	N
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii	$2,640	120hrs @ $22/hr, involving schools, DPW, fire, police etc. assume 13 weeks work time	N
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii	$0	Included under No. 31	N
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii	$0	Included under No. 31	N
34	Admin	*also include existing rights-of-way,	2.3.6 d iii	$0	Included under No. 31	N
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii	$0	Included under No. 31	N
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii	$0	Included under No. 31	N
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii	$0	See Miscellaneous No. 50	N

Estimated Annual Costs	$5,280
Estimated One-time Costs	$1,496
Estimated Intermittent Costs	$7,480

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i	$176	8hrs @ $22/hr,	N
2	Admin	*w/in 1 year inventory all permitee owned facilities in these "good housekeeping" categories	2.3.7 a ii	$0	included under No. 1	N
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc.	2.3.7 a ii a	$2,640	120hrs @ $22/hr, Large amount of spaces to review plans for	N
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a	$0	included under No. 3	N
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a	$0	included under No. 3	N
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a	$0	included under No. 3	N
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a	$0	included under No. 3	N
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a	$0	included under No. 3	N
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc.	2.3.7 a ii b	$1,760	80hrs @ $22/hr, to write procedures	N
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b	$0	included under No. 1	N
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b	$0	included under No. 1	N
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b	$0	included under No. 1	N
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c	$176	8hrs @ $22/hr,	N
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c	$0	Included under No. 13	N
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c	$0	Included under No. 13	N
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a	$0	See Below through No. 22, will likely require significant investment	N
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b	$0	See below	N
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b	$440	2hrs/catch basin, for example put 10 catch basins assume only 10 more than 50% each year	N
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b	$0	See No. 17/Annual Report	N
20	Admin	*describe these actions in the annual report	2.3.7 a iii b	$0	See No. 17/Annual Report	N
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b	$0	See No. 17/Annual Report	N
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b	$0	See No. 17/Annual Report	N
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b	$0	See No. 17/Annual Report	N
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b	$0	See No. 17/Annual Report	N
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b	$0	See No. 17/Annual Report	N
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c	$0	Included under No. 27, already in place, Based on Estimations for one annual sweep	Y
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c	$165,000	Already implemented, Based on Estimations provided by Rob McNeil	Y
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c	$0	Minimal Developmental cost	N
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c	$0	Minimal Developmental cost	N
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c	$0	See Miscellaneous No. 50	N
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c	$0	Included under No. 28	N
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d	$33,200	400tons @ $83/ton, based on numbers provided by Rob McNeil	Y
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e	$476,449	Properly house materials in municipally owned properties, performed yearly	Y
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e	$176	8hrs @ $22/hr	N
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e	$0	Announcement to DPW workers involved with snow procedures	N
36	Admin	*establish procedures for O&M or all permitee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f	$176	8hrs @ $22/hr,	N
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f	$11,000	Assuming 2000 per year, 15 minutes per structure	N
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv	$0	See Miscellaneous No. 50	N
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v	$2,200	100hrs @ $22/hr,	N
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b	$1,540	Assume 4 hrs to update existing SWPPPs, 10hrs for new SWPPPS, 70 hr(s) @ 22/hr, assume 5 new facilities a	N
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b	$0	Included under No. 40	N
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a	$0	Included under No. 40	N
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b	$0	Included under No. 40	N
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c	$0	Implementation of a number of control measures, cost will depend upon type of enforcement	N
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c	$0	extra work, depends on variations of the extent of impaired waters	N
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c	$0	Included under No. 44	N
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1	$0	Included under No. 44	N
48	BMP	*Good Housekeeping	2.3.7 d 2	$0	Included under No. 44	N
49	BMP	*Preventative Maintenance	2.3.7 d 3	$0	Included under No. 44	N
50	BMP	*Spill Prevention and Response	2.3.7 d 4	$0	Included under No. 44	N
51	BMP	*Erosion and Sediment Control	2.3.7 d 5	$0	Included under No. 44	N
52	BMP	*Management of Runoff	2.3.7 d 6	$0	Included under No. 44	N
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7	$0	Included under No. 44	N
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8	$0	Included under No. 44	N
55	BMP	*Maintenance of Control Measures	2.3.7 d 8	$0	Included under No. 44	N
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a	$2,000	20hrs @ $100/hr, assume 30min/inspection and 10 facilities with four areas each	N
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a	$2,937	267 outfalls, about 30min/area @ $22/hr	N
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc.	2.3.7 b iii a	$0	Already included as operating costs, should be green	N
59	BMP	*permitee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a	$0	costs for maintenance procedures	N
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a	$0	See Miscellaneous No. 50	N
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv	$0	Minimal investment for records keeping	N

Estimated Annual Costs	$693,578
Estimated One-time Costs	$6,292
Estimated Intermittent Costs	$0

No.	BMP/Admin	Miscellaneous Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI	1.7.1	$176	8hrs @ $22/hr, historical properties or endangered species will increase this cost	Y
2	Admin	*Document endangered species status (part of NOI)	1.9.1	$0	Included under No. 1	N
3	BMP	*Implement measures to protect endangered species	1.9.1	$0	cost varies. included under No. 1	N
4	Admin	Document Historic Properties Observation (part of NOI)	1.9.2	$0	minimal cost, Included under No. 50	N
5	BMP	*Describe effect of discharges on Historic properties	1.9.2	$0	Varies, Included under No. 1	N
6	Admin	*Report documents received re: such discharges	1.9.2	$0	Included under No. 1	N
7	Admin	*Provide results of Appendix D historic property screening	1.9.2	$0	Included under No. 1	N
8	BMP	Describe efforts to avoid or minimize impacts on such properties	1.9.2	Varies	Included under No. 1	Y

16	Admin	*List all receiving water bodies, classifications, pollutants of concern	1.10.2	$0	Included under No. 9	N
17	Admin	*list all applicable TMDLs, WLAs	1.10.2	$0	Included under No. 9	N
18	Admin	*List all outfalls that discharge to each water body	1.10.2	$0	Included under No. 9	N
19	Admin	*list all public water sources that may be affected by SW discharges	1.10.2	$0	Included under No. 9	N
20	Admin	*List all interconnected MS4s and receiving water body	1.10.2	$0	Included under No. 9	N
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern	1.10.2	$0	Included under No. 9	N
22	Admin	*Document all new or increased discharges	1.10.2	$0	Included under No. 9	N
23	Admin	*Include map of separate storm sewer system (Map must be improved)	1.10.2	$0	Included under No. 9	N
24	Admin	List all discharges to impaired water and the response	1.10.2	$0	Included under No. 9	Y
25	Admin	*Describe BMPs proposed to meet TMDL requirements	1.10.2	$0	Included under No. 9	N
26	Admin	For each BMP, list the milestone, timeframe and assessment measure	1.10.2	$0	Included under No. 9	Y
27	Admin	*For each BMP, list person or department responsible for implementation	1.10.2	$0	Included under No. 9	N
28	Admin	*Describe BMPs proposed to meet impaired waters requirements	1.10.2	$0	Included under No. 9	N
29	Admin	Describe BMPs used to meet the 6 minimum control measures	1.10.2	$0	Included under No. 9	Y
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters	1.10.2	$0	Included under No. 9	N
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards	2.1	$0	Included under No. 9	N
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)	2.1.1 b	Varies	May range into millions of dollars, no one has estimated this yet	N
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)	2.1.1 c	Varies	May range into millions of dollars, no one has estimated this yet	N
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days	2.1.1 d	Varies	May range into millions of dollars, no one has estimated this yet	N
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04	2.1.2 a	Varies	Cost will vary	N
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)	2.1.2 b	Varies	Cost will vary	N
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)	2.2	$0	Varies depending on EPA interpretations	N
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP	4.1 a	$0	Included under No. 9	N
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time	4.1 b	$88	4hrs @ $22/hr, paperwork for new BMP	N
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective	4.1 b	Varies	Cost of replacement will depend on the BMP being used	Y
41	Admin	*Each Annual shall include a brief explanation of any BMP modification	4.1 b	$0	Included under Public Education No. 7	N
42	Admin	EPA or MassDEP may require the permitte to add, modify, etc., any BMP to satisfy conditions of the permit	4.1.c	$0	Minimal cost	Y
43	Admin	*The permittee shall keep all record required by this permit for at least five years	4.2 a	$880	40hrs at $22/hr	N
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."	4.2 a	$0	Record keeping, doesn't cost anything to implement	N
45	Admin	these records all be made available to the public	4.2 c	$0	Record keeping, doesn't cost anything to implement	Y
46	Admin	*the permitee "shall document all monitoring results each year in the annual report"	4.3 b	$0	Included under Public Education No. 7	N
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results	4.3 b	$0	Included under No. 46	N
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term	4.3 b	$0	Included under No. 46	N
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."	4.3 c	$0	Included under No. 46	N
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs	4.4 b i	$12,000	Consulting fee for annual report, increased from $3000 based on Matt's estimated	Y
51	Admin	*The status of any required plans	4.4 b iii	$0	Included under No. 50	N
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards	4.4 b iii	$0	Included under No. 50	N
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements	4.4 b iii	$0	Included under No. 50	N
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables	4.4 b iii	$0	Included under No. 50	N
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)	4.4 b iv	$0	Included under No. 50	N
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term	4.4 b v	$0	Included under No. 50	N
57	Admin	Description of activities for the next reporting cycle	4.4 b vi	$0	Included under No. 50	Y
58	Admin	Description of any changes in identified BMPs or measurable goals	4.4 b vii	$0	Included under No. 50	Y
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit	4.4 b viii	$0	Included under No. 50	N

Estimated Annual Costs	$12,968
Estimated One-time Costs	$2,376
Estimated Intermittent Costs	$0

Sample Interview Material

Preamble

We are a group of students from Worcester Polytechnic Institute (WPI). We are conducting this interview in order to learn more about the cost of implementing the new 2014 MS4 permit. By participating in this interview, you will help us assess the total cost of compliance for _____(Town Name). If you want, we are able to keep your responses anonymous so you cannot be identified in this report. Your participation in this interview is completely voluntary and you can abstain from answering any question or stop the interview at any point. If you would like, we can provide you with a copy of the results at the end of our project. This project is a collaboration between the Massachusetts Department of Environmental Protection (MassDEP) and WPI, and all of us appreciate your participation.

Sample Interview Questions

1. Does your municipality use a contractor for stormwater management?
    a. If so, may we have their contact information?
2. How much does your municipality spend on public education?
    a. Does your municipality provide pamphlets?
    b. Does your municipality have public access television programs about stormwater management?
    c. How much do you spend on posting signage?

    d. Do you use social media to provide information? If so, how much does it cost?

3. How much does your municipality spend on public participation?
    a. Do you hold town meetings about stormwater management?
4. How much does your municipality spend on illicit discharge and elimination?
    a. Does your municipality use the database?
    b. How much does it cost you to map your catchment basins?
    c. Does your municipality have retention ponds for stormwater? If so, do you maintain them?
    d. How often does your municipality street sweep?
    e. How much does it cost you to remove illicit discharges?
    f. How much does it cost you to train municipal employees to use the detection equipment?
5. How much does your municipality spend on construction site runoff control?
    a. How much does it cost to notify municipal residents about impending construction projects?
    b. How much does it cost you to inspect construction sites?
6. How much does your municipality spend on post-construction site runoff control?
    a. How much does it cost for you to inspect the construction sites after completion of the construction?
7. How much does your municipality spend on good housekeeping?
    a. How much does it cost your municipality to maintain stormwater management BMPs every year?
    b. How much does it cost to train your employees to maintain BMPs?

c. How much does it cost you to inspect your best management practices?

d. How much does it cost you per year to street sweep?

8. Could you provide us with a cost report for your municipality?

    a. Itemized report stormwater spending?

9. Do you believe that your town effectively implemented the requirements of the 2003 MS4 permit?

10. To what extent do you believe your town is prepared to implement the requirements of the new MS4 permit?

    a. What challenges do you foresee in implementing the new MS4 permit?

    b. How do you plan to provide additional funding for implementing the new permit?

Appendix H

Control Measure	Estimated Annual Costs	Estimated One-time Costs	Estimated Intermittent Costs
Public Education and Outreach	$0	$0	$0
Public Involvement and Participation	$0	$0	$0
Illicit Discharge Detection and Elimination Program	$0	$0	$0
Construction Site Stormwater Runoff Control	$0	$0	$0
Post Construction Stormwater Management	$0	$0	$0
Good Housekeeping	$0	$0	$0
Non-Control Measure			
Miscellaneous	$0	$0	$0
Totals	**$0**	**$0**	**$0**

KEY:

Yearly	No. = Reference Number
Once	BMP/Admin = Is the requirement completed with either a BMP or Administrative work
As Needed	X Requirement = The short name for a requirement
	Requirement = Section in the 2014 MS4 permit draft
	Cost = Cost of completing the requirement
	Justification = List of methods used to complete the requirement, as well supporting data from sources
	In Place (Y/N) = Is the requirement listed currently in place

No.	BMP/Admin	Public Education and Outreach Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	Continue public education program required by 2003 permit	2.3.2 a			
2	Admin	*Define goals, express specific messages define audience for each message	2.3.2 a			
3	Admin	*Identify parties responsible for each message	2.3.2 a			
4	Admin	*Develop and send out two separate messages for each of 4 different audiences	2.3.2 c			
5	Admin	*Show evidence that messages are achieving results	2.3.2 e			
6	Admin	*Identify method used to evaluate effectiveness of messages	2.3.2 e			
7	Admin	*Put in annual report the methods of distribution and methods to assess effectiveness	2.3.2 g			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Public Involvement and Participation Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*Comply with state public Notice requirements	2.3.3 a			
2	Admin	Provide annual opportunity for public to participate in review and implementation of SWMP	2.3.3 b			
3	Admin	*Put in annual report these public participation activities	2.3.3 c			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Illicit Discharge Detection and Elimination Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Eliminate any illicit discharge to the stormwater system as expeditiously as possible	2.3.4.2			
2	BMP	*Identify who is responsible for any such discharges	2.3.4.2			
3	Admin	*If elimination takes more than 60 days, establish an expeditious schedule for elimination	2.3.4.2			
4	Admin	*If more than 60 days, report dates of identification and schedules in annual report	2.3.4.2			
5	BMP	Implement measures to control non-stormwater discharges if they add significant pollution	2.3.4.3			
6	Admin	*Identify all known locations where SSOs have discharged to the MS4 in last 5 years	2.3.4.4 b			
7	Admin	*For each such SSO discharge, include date and time, location, volume, suspected cause	2.3.4.4 b			
8	Admin	*Also include whether each entered any surface water and what corrective actions were taken	2.3.4.4 b			
9	Admin	*Also include corrective measures planned and implementation schedule	2.3.4.4 b			
10	Admin	*Maintain the SSO inventory as part of the SWMP and the Annual Reports	2.3.4.4 b			
11	Admin	*Provide oral and written notice to EPA and MassDEP for any SSO occurrence	2.3.4.4 c			
12	BMP	*Develop an inventory of each MS4 outfall, including location, interconnections, and condition (different only in that it requires the condition of the outfall)	2.3.4.5			
13	Admin	*Update inventory annually to include monitoring program	2.3.4.5 b			
14	BMP	*Physically label all MS4 outfall pipes	2.3.4.5 b			
15	Admin	*For each outfall list unique identifier, receiving water, date of most recent inspection	2.3.4.5 c			
16	Admin	*Also include dimensions, shape, material, physical condition and indicators of non-SW discharges	2.3.4.5 c			
17	BMP	*Revise existing map of stormwater system within 2 years of effective date of the permit	2.3.4.6			
18	BMP	*Map shall include all outfalls, pipes, manholes, catch basins, interconnections, open channels	2.3.4.6 a i			
19	BMP	*Also include all municipally-owned BMPs (e.g., retention basins, oil/water separators, etc.)	2.3.4.6 a i			
20	BMP	*Also include catchment delineation and all waters listed on the 303(d) or 305 (b) list	2.3.4.6 a i			
21	BMP	*Also include municipal sanitary sewers or combined sewer systems	2.3.4.6 a ii			
22	BMP	*Include various recommended elements	2.3.4.6 a iii			
23	BMP	*Update the map to reflect newly discovered information and corrections or modifications	2.3.4.6 b			
24	Admin	*Report on the progress toward completion of the map in each annual report	2.3.4.6 c			
25	BMP	*Write an Illicit Discharge Detection and Elimination (IDDE) program document (Discrete, specifically mentions the document must be written out)	2.3.4.7			
26	Admin	Adopt an IDDE ordinance	2.3.4.7 a			
27	Admin	*Program shall clearly identify IDDE responsibilities and provide description of areas of responsibility	2.3.4.7 b			
28	BMP	*Assess and priority rank each catchment into one of 4 possible categories (soupped up from previous "priority" mark in 2003)	2.3.4.7 c i			
29	Admin	*Priority rank each catchment within each category (except those "excluded") using 8 factors (soupped up from previous "priority" mark in 2003)	2.3.4.7 c ii			
30	Admin	*Gather all information needed for the 8 screening factors (e.g., industrial areas > 40 years old)	2.3.4.7 c ii			
31	Admin	*Complete ranking using existing information within 1 year; update in annual report	2.3.4.7 c iii			
32	Admin	*In annual report include summary of evidence of known/suspected illicit discharges by catchment	2.3.4.7 c iii			
33	Admin	*Also include corrective measures and schedule for correcting each illicit discharge	2.3.4.7 c iii			
34	Admin	*Develop written procedure for screening and sampling of outfalls	2.3.4.7 d			
35	Admin	*Include procedures for sample collection, use of field kits and storage and conveyance of samples	2.3.4.7 d i			
36	BMP	*If outfall is inaccessible, report the first accessible upstream structure	2.3.4.7 d ii			
37	BMP	*Perform dry weather screening when and how prescribed; identify in annual report any follow-up needed	2.3.4.7 d iii			
38	BMP	*Perform wet weather screening when and how prescribed	2.3.4.7 d iv			
39	BMP	*Sample at minimum for 7 listed factors	2.3.4.7 d v			
40	Admin	*Catchments with specified septic or other results shall be listed as "High Priority" catchments	2.3.4.7 d vi			
41	BMP	*Develop written Catchment Investigation Procedure including review of maps and historic records	2.3.4.7 e			
42	BMP	*Also include manhole investigation methodology and procedures to confirm sources of illicit discharges	2.3.4.7 e			
43	BMP	*For each catchment review sanitary sewer and storm sewer construction plans; prior work on either	2.3.4.7 e i			
44	BMP	*Also review Health department records for septic system or sanitary sewer system failures or complaints	2.3.4.7 e i			
45	Admin	*Identify and record any of the 12 System Vulnerability Factors (e.g., infrastructure > 40 years old)	2.3.4.7 e i			
46	Admin	*Document and annually report presence or absence of the 12 System Vulnerability Factors for each catchment	2.3.4.7 e i			
47	Admin	*Include these required elements of written manhole investigation and catchment investigation procedures	2.3.4.7 e ii			
48	Admin	*Include these required elements in written dry weather investigation procedure	2.3.4.7 e ii a			
49	Admin	*Include these required elements in written wet weather investigation procedure	2.3.4.7 e ii b			
50	Admin	*Develop procedures to isolate and confirm illicit sources (e.g., dye testing, smoke testing, caulk dams, etc.)	2.3.4.7 e iii			
51	Admin	*In annual report, for each illicit source list the location, its source, description of the discharge	2.3.4.7 f			
52	Admin	*Also list date and method of discovery, date of elimination, mitigation or enforcement action	2.3.4.7 f			
53	Admin	*And estimate volume of flow reduced	2.3.4.7 f			
54	BMP	*One year after illicit discharge removal, perform confirmatory screening; wet, dry or both	2.3.4.7 f			
55	BMP	*Schedule follow up screening within 5 years after confirmatory screening	2.3.4.7 g			
56	BMP	*Develop and implement procedures to prevent illicit discharges and SSOs	2.3.4.7 h			
57	Admin	*Complete and report dry weather screening and sampling of High and Low Priority outfalls within 3 years	2.3.4.8 a			
58	Admin	*"All data shall be reported in each annual report . . ."	2.3.4.8 a			
59	Admin	*Begin implementation of 2.3.4.7 d work no later than 15 months	2.3.4.8 b			
60	Admin	*Implement and report Catchment Investigation Procedure in every catchment . . .	2.3.4.8 c			
61	Admin	*In a minimum of 80% of the MS4 area serviced by Problem Catchments within 3 years and 100% within 5 years	2.3.4.8 c i			
62	Admin	*For all catchments where sampling indicates sewer input within 5 years	2.3.4.8 c ii			
63	Admin	*In 40% of all area served by all MS4 catchments within 5 years and in 100% of 4 area in 10 years	2.3.4.8 c iii			
64	Admin	*Track progress toward these milestones in each annual report	2.3.4.8 e			
65	Admin	*Define or describe indicators for tracking program success; demonstrate efforts to locate illicit discharges	2.3.4.9			
66	Admin	*Also include percent and area in acres evaluated; volume of sewage removed; place in annual report (more detailed, 2003 only asks to measure progress)	2.3.4.9			
67	Admin	provide annual training to employees involved in IDDE program	2.3.4.10			
68	Admin	*Include type and frequency of training in the annual report (2003 -> The program must include an employee training component)	2.3.4.10			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*Continue to implement construction ordinance work from 2003 permit; expand to include 1 acre or more	2.3.5 a			
2	BMP	Develop and implement a construction site runoff program	2.3.5 c			
3	Admin	An ordinance that requires sediment and erosions controls and for other wastes at construction sites	2.3.5 c i			
4	Admin	Adopt written procedures for inspections and enforcement of the ordinance within 1 year (2003 -> (g.) Procedures for inspections and enforcement of control measures at construction sites.)	2.3.5 c ii			
5	Admin	*Document the procedures and responsibilities to implement in the SWMP	2.3.5 c ii			
6	Admin	*Include requirements for site operators to implement BMPs (e.g., reduce disturbed area, protect slopes, etc.)	2.3.5 c iii			
7	Admin	*Include requirements for site operators to control other wastes	2.3.5 c iv			
8	Admin	*Develop written procedures for site plan review and inspection and enforcement within 1 year (003 -> nearly same, now has time requirement)	2.3.5 c v			
9	Admin	*Include pre-construction review, consideration for protection of water quality impacts, LID components	2.3.5 c v			
10	Admin	*And receipt of information from the public, inspections during and after BMP installation (now covers post construction)	2.3.5 c v			
11	Admin	*And "qualifications necessary to perform the inspections"	2.3.5 c v			
12	Admin	*And procedure for tracking the number of site reviews, inspections and enforcement actions	2.3.5 c v			
13	Admin	*All to be included in the annual report	2.3.5 c v			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Post Construction Site Runoff Control Requirement	Reference	Cost	Justification	In Place (Y/N)
1	BMP	*develop implement and enforce a post-construction SW program for new developments and redevelopments	2.3.6 a			
2	Admin	*adopt or amend a local ordinance to control projects that disturb an acre or more	2.3.6 a ii			
3	BMP	*retain and/or treat first inch of runoff; where technically feasible do retention first	2.3.6 a ii a			
4	BMP	*"from all impervious surfaces on site"	2.3.6 a ii a			
5	Admin	*sites with soil contamination problems or at industrial sites shall not include any infiltration BMPs	2.3.6 a ii b			
6	Admin	*infiltration systems near environmentally sensitive areas must include shutdown and containment systems	2.3.6 a ii c			
7	Admin	*all BMPs must be constructed in accordance with the MA Stormwater Handbook	2.3.6 a ii d			
8	Admin	*this system shall include development of a long term O&M plan to inspect and repair BMPs	2.3.6 a ii e			
9	Admin	*systems shall be designed "to avoid disturbance of areas susceptible to erosion and sediment loss"	2.3.6 a ii f			
10	BMP	*systems shall require submittal of as-built drawings that depict all on site controls	2.3.6 a iii			
11	Admin	*shall have procedures to ensure O&M, such as dedicated funds, escrow accounts or management contracts	2.3.6 a iii			
12	Admin	*may include annual self-certification program	2.3.6 a iii			
13	Admin	*annual report shall include measures that the permittee has done to meet these requirements	2.3.6 a iii			
14	BMP	*w/in 3 years document current street design and parking rules that affect creation of impervious cover	2.3.6 b			
15	BMP	*shall be used by permittee to determine if changes "can be made to support low impact design options"	2.3.6 b			
16	BMP	*if changes can be made, assessment shall include recommendations and proposed schedules to adopt changes	2.3.6 b			
17	BMP	*permittee "shall implement all recommendations . . ."; assessment must be placed in the SWMP	2.3.6 b			
18	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 b			
19	BMP	*w/in 4 years assess local rules to determine feasibility of allowing green roofs, water harvesting and LID BMPs	2.3.6 c			
20	Admin	*assessment shall indicate if and under what circumstances these practices are allowed	2.3.6 c			
21	BMP	*if practices not allowed, determine what hinders use of these practices and what changes can be made	2.3.6 c			
22	BMP	*provide a schedule of implementation of recommendations	2.3.6 c			
23	BMP	*"permittee shall implement all recommendations, in accordance with the schedules . . ."	2.3.6 c			
24	Admin	*annual report shall contain an update on this requirement, including any planned or completed changes	2.3.6 c			
25	Admin	*estimate the annual increase or decrease in Impervious Area and Directly Connected Impervious Area	2.3.6 d			
26	Admin	*tabulate results by sub-basins delineated per 2.3.4.6 a I	2.3.6 d i			
27	Admin	*must include conventional pavements, driveways, parking lots and rooftops	2.3.6 d i			
28	Admin	*starting with second annual report, estimate each sub-basin added or removed each year	2.3.6 d ii			
29	Admin	*break out those figures by development, redevelopment or retrofit by permittee, by others voluntarily	2.3.6 d ii			
30	Admin	*. . . or in compliance with the permittee's ordinances or bylaws	2.3.6 d ii			
31	Admin	*within 4 years complete inventory and ranking of Municipal property suitable for modification or retrofit to . . .	2.3.6 d iii			
32	Admin	*. . .reduce frequency, volume and pollutant loads of stormwater discharges by reduction of impervious area	2.3.6 d iii			
33	Admin	*shall include both on site and off site reduction of IA and DCIA (e.g., parking lots, buildings, etc.)	2.3.6 d iii			
34	Admin	*also include existing rights-of-way,	2.3.6 d iii			
35	Admin	*for suitability the evaluation shall consider factors such as depth to water table; subsurface geology; access	2.3.6 d iii			
36	Admin	*priority ranking shall consider factors such as CIP schedules; current storm sewer level of service, etc.	2.3.6 d iii			
37	Admin	*starting with fifth year annual report, report on status of all such inventoried properties	2.3.6 d iii			

Estimated Annual Costs	$0
Estimated One-time Costs	$0
Estimated Intermittent Costs	$0

No.	BMP/Admin	Pollution Prevention and Good Housekeeping Requirement	Reference	Cost	Justification	In Place (Y/N)
1	Admin	*W/in 1 year develop or update written O&M procedures for listed municipal facilities	2.3.7 a i			
2	Admin	*w/in 1 year inventory all permittee owned facilities in these "good housekeeping" categories	2.3.7 a ii			
3	Admin	*For Parks and Open Space: procedures to address the use, storage and minimization of pesticides, fertilizers, etc	2.3.7 a ii a			
4	Admin	*to be reviewed annually and updated as necessary	2.3.7 a ii a			
5	Admin	*evaluate lawn maintenance and landscaping activities to be protective of water quality	2.3.7 a ii a			
6	Admin	*including reduced mowing, proper disposal of lawn clippings, use of drought resistant plantings	2.3.7 a ii a			
7	Admin	*establish pet waste handling collection, disposal and signage at all parks and open spaces	2.3.7 a ii a			
8	Admin	*establish procedures for scheduled cleaning and sufficient number of trash containers	2.3.7 a ii a			
9	Admin	*For Buildings and Facilities, such as town offices, police and fire stations, municipal pools, etc	2.3.7 a ii b			
10	Admin	*evaluate the use. Storage and disposal of petroleum products and train employees on proper procedures	2.3.7 a ii b			
11	Admin	*ensure that spill prevention is in place and coordinate with fire department	2.3.7 a ii b			
12	Admin	*develop management procedures for dumpsters and other waste management equipment	2.3.7 a ii b			
13	Admin	*For Vehicles and Equipment: establish procedures for storage of permittee vehicles, including inside storage	2.3.7 a ii c			
14	Admin	*establish procedures to ensure that vehicle wash water does not enter the SW system	2.3.7 a ii c			
15	Admin	*evaluate fueling areas to minimize exposure	2.3.7 a ii c			
16	Admin	*Infrastructure O&M: w/in 1 year develop and implement procedures to take care for the MS4 system	2.3.7 a iii a			
17	Admin	*optimize routine inspections (e.g., prioritize catch basins located near construction sites)	2.3.7 a iii b			
18	BMP	*ensure that "no catch basin at anytime will be more than 50 percent full"	2.3.7 a iii b			
19	BMP	*if more than 50% full during two routine cleanings, investigate the cause for excessive sediment loading	2.3.7 a iii b			
20	Admin	*describe these actions in the annual report	2.3.7 a iii b			
21	Admin	*document in annual report the plan for optimizing catch basin cleaning, inspections or scheduling	2.3.7 a iii b			
22	Admin	*include metrics used to determine that the plan is optimal for the MS4	2.3.7 a iii b			
23	Admin	*in each annual report list the total number of catch basins, number inspected and/or cleaned	2.3.7 a iii b			
24	Admin	*and "volume or mass of material removed from each catch basin draining to water quality limited waters"	2.3.7 a iii b			
25	Admin	*and "total volume or mass of material removed from all catch basins"	2.3.7 a iii b			
26	BMP	*Sweeping: develop and implement procedures for sweeping streets and municipal-owned lots	2.3.7 a iii c			
27	BMP	*sweep all streets (rural exceptions apply) a minimum of once a year in the spring	2.3.7 a iii c			
28	BMP	*procedures shall include more frequent sweeping of targeted area based on various listed criteria	2.3.7 a iii c			
29	BMP	*criteria include inspections, pollutant loads, catch basin cleanings, land use, TMDL or impaired waters	2.3.7 a iii c			
30	Admin	*Each annual report shall include number of miles cleaned and volume or mass of material removed	2.3.7 a iii c			
31	Admin	*for rural exception areas, either sweep per usual or develop specific procedures and place in first annual report	2.3.7 a iii c			
32	BMP	*properly store catch basin cleanings so they do not discharge to receiving waters	2.3.7 a iii d			
33	BMP	*establish and implement procedures for winter road maintenance including storage of salt and sand	2.3.7 a iii e			
34	BMP	*minimize use of sodium chloride and other salts; evaluate opportunities for alternative materials	2.3.7 a iii e			
35	Admin	*ensure that snow is not disposed into surface waters	2.3.7 a iii e			
36	Admin	*establish procedures for O&M or all permittee-owned stormwater BMPs (e.g., swales, retention basins etc.)	2.3.7 a iii f			
37	BMP	*inspect all such structures at least once annually	2.3.7 a iii f			
38	Admin	*in annual report include status of work required in this part	2.3.7 a iv			
39	Admin	*permittees shall keep a written record of all required activities	2.3.7 a v			
40	BMP	*develop and fully implement a SWPPP for each of the listed facilities no later than 2 years after effective date	2.3.7 b			
41	BMP	*includes maintenance garages, public works yards, transfer stations, other waste handling facilities	2.3.7 b			
42	BMP	*Identify name and title of staff of the Pollution Prevention Team for each facility	2.3.7 b ii a			
43	BMP	*for each facility: include map, description of activities, outfall locations, receiving waters and structural controls	2.3.7 b ii b			
44	BMP	*select , sign, install and implement the following 9 control measures to prevent or reduce discharge of pollutants	2.3.7 b ii c			
45	BMP	*take all reasonable measure to address quality of discharges that may not originate at the facility	2.3.7 b ii c			
46	Admin	*for areas that discharge to impaired waters, identify the control measures to address that issue	2.3.7 b ii c			
47	BMP	*SWPP Required Elements: Minimize or Prevent Exposure (e.g., move activities or materials under cover)	2.3.7 d 1			
48	BMP	*Good Housekeeping	2.3.7 d 2			
49	BMP	*Preventative Maintenance	2.3.7 d 3			
50	BMP	*Spill Prevention and Response	2.3.7 d 4			
51	BMP	*Erosion and Sediment Control	2.3.7 d 5			
52	BMP	*Management of Runoff	2.3.7 d 6			
53	BMP	*Salt Storage or Piles Containing Salt	2.3.7 d 7			
54	BMP	*Employee Training; document training date, title and duration; attendees; subjects covered during training	2.3.7 d 8			
55	BMP	*Maintenance of Control Measures	2.3.7 d 8			
56	BMP	*Inspect all areas exposed to stormwater and all stormwater control measures at least every calendar quarter	2.3.7 b iii a			
57	BMP	*at least one inspection shall occur when a stormwater discharge is occurring	2.3.7 b iii a			
58	Admin	*document the date, time, name of inspector, weather, any control measures needing maintenance or repair, etc	2.3.7 b iii a			
59	BMP	*permittee shall repair or replace any control measures needing repair before the next anticipated storm event	2.3.7 b iii a			
60	Admin	*shall report the findings from the Site inspections in the annual report	2.3.7 b iii a			
61	Admin	*keep a written record of all required activities required in this section	2.3.7 b iv

No.	BMP/Admin	Miscellaneous Requirement		Reference	Cost	Justification	In Place (Y/N)
1	BMP	Submit an NOI		1.7.1			
2	Admin	*Document endangered species status (part of NOI)		1.9.1			
3	BMP	*Implement measures to protect endangered species		1.9.1			
4	Admin	Document Historic Properties Observation (part of NOI)		1.9.2			
5	BMP	*Describe effect of discharges on Historic properties		1.9.2			
6	Admin	*Report documents received re: such discharges		1.9.2			
7	Admin	*Provide results of Appendix D historic property screening		1.9.2			
8	BMP	Describe efforts to avoid or minimize impacts on such properties		1.9.2			
9	BMP	Develop a SWMP		1.10			
10	BMP	Implement a SWMP		1.10			
11	Admin	*Update/modify SWMP		1.10			
12	Admin	Provide SWMP "immediately" to various agencies and public		1.10.1			
13	Admin	*Post SWMP online		1.10.1			
14	Admin	Identify Names and titles of people implementing the SWMP		1.10.2			
15	Admin	***Include status of 2003 permit requirements**		1.10.2			
16	Admin	*List all receiving water bodies, classifications, pollutants of concern		1.10.2			
17	Admin	*list all applicable TMDLs, WLAs		1.10.2			
18	Admin	*List all outfalls that discharge to each water body		1.10.2			
19	Admin	*list all public water sources that may be affected by SW discharges		1.10.2			
20	Admin	*List all interconnected MS4s and receiving water body		1.10.2			
21	Admin	*Include applicable TMDLs, WLAs and pollutants of concern		1.10.2			
22	Admin	*Document all new or increased discharges		1.10.2			
23	Admin	*Include map of separate storm sewer system (Map must be improved)		1.10.2			
24	Admin	List all discharges to impaired water and the response		1.10.2			
25	Admin	*Describe BMPs proposed to meet TMDL requirements		1.10.2			
26	Admin	For each BMP, list the milestone, timeframe and assessment measure		1.10.2			
27	Admin	*For each BMP, list person or department responsible for implementation		1.10.2			
28	Admin	*Describe BMPs proposed to meet impaired waters requirements		1.10.2			
29	Admin	Describe BMPs used to meet the 6 minimum control measures		1.10.2			
30	Admin	*List measures to avoid/minimize impacts to surface drinking waters		1.10.2			
31	BMP	*Ensure that discharges "do not cause or contribute" to an exceedance of WQ standards		2.1			
32	BMP	*For TMDL waters, meet requirements of Appendix F (NB: contains multiple add'l req'ts)		2.1.1 b			
33	BMP	*For impaired waters meet requirements of Appendix H (NB: contains multiple add'l req'ts)		2.1.1 c			
34	BMP	*For any exceedances of WQ standards to TMDL or impaired waters, eliminate it within 60 days		2.1.1 d			
35	BMP	*For any increased discharge, comply with MassDEP's regulations at 314 CMR 4.04		2.1.2 a			
36	BMP	*Demonstrate no net increase in pollutants for discharges to any 303 (d) or 305(b) water (previously only had to identify if 303 d)		2.1.2 b			
37	Admin	*Identify all discharges to waters that are impaired or which have TMDLs (Both in SWMP and Annual report)		2.2			
38	Admin	*Permittee shall annually self-evaluate and maintain the evaluation in its SWMP		4.1 a			
39	Admin	*In evaluating the appropriateness of BMPs, permittees may add BMPs at any time		4.1 b			
40	Admin	Subtracting or replacing BMPs may only be done in limited circumstances, after showing the BMP is ineffective		4.1 b			
41	Admin	*Each Annual shall include a brief explanation of any BMP modification		4.1 b			
42	Admin	EPA or MassDEP may require the permittee to add, modify, etc., any BMP to satisfy conditions of the permit		4.1.c			
43	Admin	*The permittee shall keep all record required by this permit for at least five years		4.2 a			
44	Admin	*"Records" includes "information used in the development of any written program . . . monitoring results, etc."		4.2 a			
45	Admin	these records all be made available to the public		4.2 c			
46	Admin	*the permittee "shall document all monitoring results each year in the annual report"		4.3 b			
47	Admin	*that shall include the date, outfall identifier, location, weather, precipitation and screening or analysis results		4.3 b			
48	Admin	*include all monitoring results for the current reporting period and for the entire permit term		4.3 b			
49	Admin	*permittee shall include "results from any other stormwater or receiving water quality monitoring or studies . . ."		4.3 c			
50	Admin	The annual report shall include a self-assessment of compliance; an assessment of the appropriateness of BMPs		4.4 b i			
51	Admin	*The status of any required plans		4.4 b iii			
52	Admin	*"Identification of all discharges determined to be causing or contributing to an exceedance" of WQ standards		4.4 b iii			
53	Admin	*For discharges to TMDLs, identify specific BMPs used to address those requirements		4.4 b iii			
54	Admin	*For discharges to impaired waters, "a description of each BMP required by Appendix H" and all deliverables		4.4 b iii			
55	Admin	*Assessment of the progress toward meeting the requirements for the 6 minimum control measures (see details)		4.4 b iv			
56	Admin	*"All outfall screening and monitoring data" for the reporting term and cumulative for the permit term		4.4 b v			
57	Admin	Description of activities for the next reporting cycle		4.4 b vi			
58	Admin	Description of any changes in identified BMPs or measurable goals		4.4 b vii			
59	Admin	*Description of activities undertaken by any entity contracted for achieving any requirement of the permit		4.4 b viii

RE: Submittal of Public Comment, Town of Yarmouth
2014 Draft Massachusetts Small MS4 General Permit

Dear Mr. Tedder,

The Town of Yarmouth staff has attended three public meetings that presented an overview of the draft Small MS4 General Permit Requirements. We appreciate the time and effort from staff members of the EPA and MASS DEP during all public meetings. At this time we would like to offer the following comments into the record for the public comment period.

Comments:

1. Page 43, Section 2.3.7 Good House Keeping and Pollution Prevention for Permittee Owned Operations: a.ii.(a). Can you please define the definition of "parks" and "open space"? In some cases, open spaces are put aside for land protection and are left unmaintained and undisturbed. The use of pesticides, herbicides, fertilizers and other lawn maintenance and landscape activities are not applicable in such areas. We would like to see flexibility in the language of what is defined as a park and open space. Furthermore, the establishment of pet waste sites should be dedicated to locations that are frequently used and maintained, and provide recreation opportunities. It is our suggestion that open space areas, which contain unmaintained and undisturbed land, should not have the same requirements as other frequented areas.

2. We would like to suggest EPA to work in collaboration with DEP and consider late fall sweeping of leaves and pine needles to be classified as compost and allow this material to be disposed of in any suitable facility that accepts yard waste debris. A suggested regulation that the roads must have been swept of other debris prior to the sweeping may help DEP agree to this idea. The purpose would be to remove as much of this material as possible prior to it entering into the MS4 system, thus reducing the phosphorus and nitrogen loads. This could be limited only to MS4 discharge area or for all areas meeting any guidelines that DEP may impose.

Sincerely,

Rick Kelley
Highway Superintendent

Kerry Muldoon
Conservation Administrator
