1.0 Introduction and Purpose

This document presents the results of the third and fourth quarter 2010 groundwater and surface water monitoring conducted at the former Romic Environmental Technologies Corporation (Romic) facility located at 2081 Bay Road in East Palo Alto, California (Site, Figure 1). This report was prepared by ARCADIS on behalf of Bay Enterprises.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

The purpose of the groundwater-monitoring program is to provide a historical database which can be used to track the boundaries and concentrations of volatile organic compounds (VOCs), and verify that the interim remedial measures (IRMs) are working effectively. The monitoring was conducted in accordance with ARCADIS's updated *Monitoring Plan*, dated April 24, 2003, and approved by the United States Environmental Protection Agency (USEPA) on May 21, 2003. Groundwater monitoring is required at the Romic facility as part of an Administrative Consent Order (RCRA-09880015, December 8, 1988) between the USEPA and Romic. In addition, Romic is performing monitoring of selected wells as part of the rebound assessment following shut down of the groundwater extraction and treatment system (GETS) on February 27, 2004.

1.1 Project Background and Remedial Activities

The Romic facility encompasses approximately 14 acres in East Palo Alto, San Mateo County, approximately 0.5 mile from the San Francisco Bay (Figure 1). The Site has generally been used to recycle or process chemicals since the mid 1950s. In 1956, a chemical processing plant was built and used by Hird Chemical Corporation. The Site was transferred to the Carad Chemical Corporation in 1959. In 1963, the Site was purchased by P. D. Electronics, and Romic began operating at the facility at this time. The Site was purchased by Romic in 1979, and Romic operated the facility until the end of 2007. Activities at the Site included solvent recycling (primarily distillation), fuel blending, wastewater treatment, and hazardous waste storage and transfer (Conor Pacific/EFW/Henshaw 1999). Closure activities were initiated in the winter of 2008-2009.

At the time of the third and fourth quarter 2010 monitoring events, the Site structures have been demolished, including the former central processing area, the northern and western drum and material storage warehouses, truck and facility maintenance buildings, administrative buildings, a wastewater treatment system and storage tank, and an analytical laboratory. Romic also controls adjacent land to the south, formerly used for surplus storage, and adjacent land to the west, which acts as a buffer area.

The Site is surfaced with concrete, except in the equipment storage yard and southern parking lot which are surfaced with compacted gravel, and soil berms that have been constructed around the Site to prevent surface runoff entering from adjacent properties (HLA 1989).

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

Romic implemented groundwater extraction and treatment as an IRM to address VOCs in the A- and B-zones. Beginning in May 1993, groundwater was extracted from six wells in the A-zone, and the extracted groundwater was treated by stream stripping and granular activated carbon. In January 2001, ARCADIS initiated two enhanced reductive dechlorination (ERD) pilot tests to evaluate the effectiveness of the ERD technology to reduce VOC contaminant mass at the Site. In February 2005, upon receipt of USEPA approval, the groundwater extraction and treatment system was shut down due to the success of ERD pilot tests.

Based on the results of the pilot tests, the ERD system was expanded in three phases as IRMs, in July and August 2003, September 2005, and August 2007. The IRMs were implemented in three different areas of the Site: in the A-, B-, and C-zones along the site boundary (for off-site migration control); in the A-zone in the southwestern area; and in the B- and C-zones in the central processing area. The remedial objectives are summarized below:

1. Control and minimize plume migration off-site and vertically.
2. Reduce impact of VOCs to surface water from groundwater migration.
3. Perform source control and mass removal in the most impacted "source" areas.

1.2 Report Organization

Quarterly monitoring activities performed during the third and fourth quarters 2010 are discussed in Section 2. Site hydrogeologic conditions are discussed in Section 3. Groundwater monitoring analytical results and summary of the ERD IRMs trends are discussed in Section 4. Surface water monitoring analytical results are discussed in Section 5. Quality assurance/quality control procedures are discussed in Section 6. Activities planned for the next semiannual monitoring period are presented in Section 7.

2.0 Field Activities and Procedures

Field activities conducted during September 2010 (third quarter) and December 2010 (fourth quarter) included the collection of groundwater samples from 49 monitoring wells during the third quarter (annual event) and 28 monitoring wells during the fourth quarter (quarterly event). In addition, samples were collected from four surface water locations (S-2, S-4, S-7, and S-10) within two unnamed sloughs.

As part of the sampling event, former extraction wells EW-1B and EW-2B were sampled to evaluate water quality in the B-zone near existing wells RW-10A and RW-1A, respectively. In addition, wells RW-8A, RW-10A, and RW-12A were sampled quarterly as part of the rebound assessment. However, the following monitoring wells were not sampled during this semi-annual event: RP-11A (free product), RW-19A (hidden under vegetation in slough area), RW-18B (not located for sampling), and RW-20B (free product).

Well RW-19A was located during the fourth quarter event in December 2010 and will be sampled during the semiannual event in March 2011. This well is typically sampled during the annual event in September. The search for RW-18B is continuing with the next step being another attempt to triangulate the well location once the surveyor completes calculating the coordinates for the nearby wells. Currently, there are two other B-zone wells located with 15 feet of RW-18B that are monitored on a quarterly basis (RW-17B) and semiannual basis (RW-8B).

The sampling frequency for the monitoring wells and surface water stations is shown in Table 1. The monitoring wells, piezometers, and surface water sampling locations are shown in Figure 2. Field Water Sampling Logs are presented in Appendix A.

2.1 Water Level Measurements

Water level measurements were collected on September 13 through 15, 2010 (third quarter) and on December 13, 2010 (fourth quarter) from selected A-, B-, C-, and D-zone monitoring wells and piezometers using a depth-to-water meter. Groundwater elevation data is presented in Appendix B.

2.3 Groundwater Monitoring

Groundwater samples were collected on September 13 through 15, 2010 (third quarter) and on December 14 through 16, 2010 (fourth quarter). After water levels were measured, groundwater was purged with the Waterra™ system consisting of

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

dedicated high-density polyethylene tubing and a hydrolift. The purge rate was between 300 and 1,000 milliliters per minute to maintain *a stable depth to water, with the total drawdown less than 0.3 foot (3.6 inches)*. During purging activities, field parameters were recorded using the multi-parameter field meter to measure pH, temperature, and specific conductivity. The following indicator field parameters were monitored until stabilization was achieved (stabilization criteria are in parentheses): pH (± 0.1 units), temperature ($\pm 3\%$), specific conductance ($\pm 3\%$), dissolved oxygen (DO; $\pm 10\%$), and oxidation-reduction potential (ORP; ± 10 millivolts). Field parameters were recorded on the Water Sampling Logs (Appendix A) and are summarized in Appendix B.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

All samples were collected into 40-milliliter (mL) vials, placed on ice, and transported to Accutest Laboratory, a California-certified analytical laboratory. All samples were analyzed for VOCs using USEPA Method 8260B. In addition, selected samples were analyzed for total organic carbon (TOC) using Method SM5310B, and dissolved gases (ethane, ethene, and methane) using Method AM20GAX.

Water generated during the purging of the wells was temporarily stored on site in 55-gallon drums and disposed of by Bay Enterprises.

2.4 Surface Water Monitoring

Surface water samples were collected from the surface water stations S-2, S-4, S-7, and S-10, located in the unnamed northern and eastern sloughs (Figure 2), during the third and fourth quarter sampling events. Samples were obtained by collecting water from the center of the slough in a glass container attached to an extension pole. The water was then transferred into 40-mL vials, placed on ice, and transported to Accutest for VOC analysis using USEPA Method 8260B.

3.0 Groundwater Hydrology

Groundwater elevation data for the third and fourth quarters 2010 are summarized in Appendix B. Groundwater elevation maps for the A-, B-, and C-zones for each quarterly event are presented in Figures 3 through 8. No figures are presented for the D-zone.

Contours of the groundwater elevations were not prepared. The general groundwater flow directions are indicated and they are consistent with previous monitoring events.

3.1 A-Zone

The A-zone is composed of interbedded clays, sands, and gravels. The sand and gravel interval, and the overlying fill, range in thickness from 7.5 to 21 feet. For conceptual purposes, the A-zone and the fill zone are located approximately from ground surface to 22 feet below ground surface (bgs). The A-zone is underlain by a discontinuous clay horizon (A/B aquitard), approximately 4 to 13 feet thick.

Currently, there are 26 A-zone wells at the Site. Groundwater elevations at each monitoring well in the A-zone during the September and December 2010 monitoring events are presented in Figures 3 and 4, respectively. Groundwater elevations ranged from 2.06 feet mean sea level (msl) to 5.23 feet msl in September 2010 and 2.22 feet msl to 7.68 feet msl in December 2010. Groundwater flow in the A-zone is primarily to the northeast towards the sloughs.

3.2 B-Zone

The B-zone is semi-confined and composed of a sequence of fine sands and silts with minor localized clay lenses. The unit is approximately 5 to 27 feet thick and is underlain by a clay unit (B/C aquitard), which is approximately 3 to 22 feet thick. For conceptual purposes, the B-zone is located approximately 22 to 60 feet bgs.

Currently, there are 17 B-zone wells at the Site. Groundwater elevations at each monitoring well in the B-zone during the September and December 2010 monitoring events are presented in Figures 5 and 6, respectively. Groundwater flow in the B-zone is primarily to the east-northeast towards the sloughs.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

3.3 C-Zone

The C-zone is confined and consists of poorly- to well-sorted sands, silty sands, and clays. The unit is approximately 13 to 25 feet thick and is underlain by a regional aquitard (C/D aquitard), which is more than 80 feet thick. For conceptual purposes, the C-zone is located between 60 and 80 feet bgs.

Currently, there are 14 C-zone wells at the Site. Groundwater elevations at each monitoring well in the C-zone during September and December 2010 monitoring events are presented in Figures 7 and 8, respectively. Groundwater flow in the C-zone is primarily to the east-northeast towards the sloughs.

3.4 D-Zone

The D-zone is separated from the C-zone by approximately 80 feet of dense clays and silts and is first encountered at a depth of approximately 160 feet bgs. This zone is confined and composed of approximately 30 feet of fine to coarse sands, gravels, and minor clay lenses. Monitoring well RW-16D is the only well installed in the D-zone.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

4.0 Groundwater Quality

The VOC analytical results in the A-, B-, and C-zones are shown on Figures 9 through 12. Analytical results for the third and fourth quarter 2010 sampling events are summarized in Appendix C along with historical data. Copies of laboratory analytical reports for the third and fourth quarters are provided in Appendix D.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

Based on the distribution of VOCs in groundwater and historical land uses, the facility can be divided into three general source areas: (1) the former pond area beneath the northern drum storage buildings; (2) the process area in the center of the facility; and (3) the southwestern portion of the facility, which was purchased by Romic in the late 1980s, but has never been used by Romic for the handling and management of chemicals (Figure 2). Discussions of the general distribution of VOCs in groundwater at each of the facility areas are presented in the following sections.

The highest frequency of chemical detections is associated with the processing area. In general, the concentration of VOCs is relatively consistent between monitoring events, though fluctuations have been observed. Most of the reductions in concentrations are at wells affected by the ERD IRMs. Data trends related to the ERD IRMs are summarized in Section 4.4 and the graphs are provided in Appendix E. General discussions of the analytical results for the wells sampled are divided into the three general source areas below.

4.1 Former Pond Area

Groundwater monitoring around the former pond area is conducted by sampling a total of 16 on-site and off-site wells (includes extraction well EW-1B). Specifically, six A-zone wells, five B-zone wells, and four C-zone wells are sampled. The former pond area wells and their hydraulic locations with respect to the former pond area are presented in Table 2. The VOC analytical results in the A-, B-, and C-zones are shown on Figures 9 through 11.

4.2 Process Area

Groundwater monitoring of the process area and vicinity is conducted by sampling a total of 29 on-site and off-site wells (includes extraction well EW-2B). Specifically, 10 A-zone wells, 10 B-zone wells, and nine C-zone wells are sampled. The process area wells and their hydraulic locations with respect to the process area are presented in Table 2. The VOC analytical results in the A-, B-, and C-zones are shown in Figures 9 through 11.

4.3 Southwestern Area

Groundwater monitoring of the southwest area and vicinity is conducted by sampling a total of nine on-site wells. Specifically, five A-zone wells, two B-zone wells, one C-zone well, and one D-zone well are sampled. The southwestern area wells and their locations with respect to the southwestern area are presented in Table 2. The VOC analytical results in the A-, B-, and C-zones are shown in Figures 9 through 11.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

4.4 Summary of the ERD IRM Groundwater Trends

This section discusses the ERD performance of the two 2001 pilot tests and the three phases of ERD IRMs which were initiated in July and August 2003, March 2005, and August 2007. From February 2001 through December 2010, up to 29 ERD injections and 42 ERD performance monitoring events have been performed. Table 3 highlights the ERD primary indicators, major data trends for each of the main VOCs, and changes in data trends for each performance monitoring well. Appendix E provides the trend charts for the ERD primary indicators.

The primary indicator parameters highlighted in Table 3 are as follows:

- **pH measurement** is critical to a proper understanding of the prevailing geochemistry environment. Ideally, pH should be greater than 5.5 for optimal microbial population growth. If pH has decreased to below optimal level due to excessive fermentation of the injected carbohydrate solution, then the carbohydrate solution concentration should be reduced.
- **Injections and associated TOC levels** are critical to evaluating whether sufficient TOC levels (greater than 50 milligrams per liter [mg/L]) are being distributed to the VOC-impacted areas. As with this site and most other sites, there is a direct correlation between sufficient TOC levels and the rate of dechlorination.
- **Methane production** is the consequence of a series of metabolic interactions among various groups of microbes. Methane increase to greater than 1,000 mg/L demonstrates the development of strongly reducing conditions. Review of the data trends shows a clear correlation between increase in methane levels and reductive dechlorination of the VOCs.

- **Chlorinated VOCs and ethene levels** show the concentration trends of the main VOCs and their degradation products. Ethene is one of the main harmless byproducts of the reductive dechlorination process.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

For each of the main VOCs, Table 3 summarizes the baseline concentrations (prior to the first ERD injection event), maximum concentrations observed, and the most recent concentration. This summary highlights the major changes from baseline event to the current conditions. In addition, Table 3 notes new data trends or changes from previous monitoring events.

Summary of well performance are presented below:

- Currently, there are 20 ERD performance wells (5 A-zone wells, 10 B-zone wells, 5 C-zone wells) monitored for VOCs and ERD parameters (total organic carbon [TOC], methane, ethene, and ethane) at all the IRMs (Table 3).
- Of the 20 wells, 6 wells are associated with the pilot tests, 11 wells are associated with the Existing Off-Site Migration Control IRM, and 3 are associated with the Additional Source Area IRM.
- Of the 6 wells at the pilot tests, 3 wells (RW-15A, RW-26A, and RW-18B) show significant reduction and most concentrations are near or below MCLs. In Table 3, the remaining 3 wells (RW-27A, RW-8B, and RW-17B) show fluctuating concentrations and this performance is mainly due to low TOC (below 50 mg/L) at the wells (Table 3).
- Of these 11 wells at Existing Off-Site Migration Control IRM, 8 wells (RW-2A, RW-2B, RW-5B, RW-5C, RW-17C, RW-20C, RW-21C, and RW-29A) show significant reduction and most concentrations are near or below MCLs. In Table 3, 3 of these wells (RW-20C, RW-21C, and RW-29A) do not have recent values for TOC and methane. These wells have concentrations near or below MCLs or detection limits; therefore, analyses for TOC and methane were discontinued. The remaining 3 wells (RW-19B, RW-21B, and RW-22B) show fluctuating concentrations in the Existing Off-Site Migration Control IRM. This performance is mainly due to low TOC (below 50 mg/L) at the wells (Table 3).
- Of the 3 wells at the Additional Source Area IRM, 1 well (RW-10C) shows significant reduction and most concentrations are near or below MCLs. In Table 3,

the remaining 2 wells (EW-1B and EW-2B) show fluctuating concentrations and this performance is mainly due to low TOC (below 50 mg/L) at the wells (Table 3).

To improve the performance of the mainly B-zone wells (RW-27A, RW-8B, RW-17B, RW-19B, RW-21B, RW-22B, EW-1B, and EW-2B), a scope of work was developed to enhance performance of the all the IRMs with regards to the injection program (ARCADIS, 2010). The scope of work is bulleted below

- Increase injection volumes from 250 gallons up to 750 gallons per injection point
- Increase injection solution from 1:20 to 1:10 concentration
- Perform injections on a quarterly basis

For the rest of the A- and C-zone IRMs, the current injection program will remain the same (250 gallons of a 1:20 solution concentration) and will be completed on a semiannual basis.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

5.0 Surface Water Samples

Surface water samples were collected from stations S-2, S-4, S-7, and S-10 during the third and fourth quarter 2010 monitoring events. Station S-2 monitors water quality in the eastern unnamed slough adjacent to the former pond area. Station S-4 monitors the water quality downstream of the Romic facility. Station S-7 monitors the water quality upstream of the facility along the northern unnamed slough. Station S-10 monitors the water quality upstream of the facility along the eastern unnamed slough.

The surface water analytical results from the third and fourth quarters are summarized in Appendix C. Distribution of VOCs in surface water samples is shown in Figure 12.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

6.0 Quality Assurance/Quality Control

Field Quality Control (QC) samples and selected laboratory Quality Assurance/Quality Control (QA/QC) data were evaluated to assess the acceptability of the analytical results. Laboratory QA/QC results are included with the laboratory analytical reports in Appendix D. Holding times and internal laboratory quality control data, including surrogate, laboratory control sample (LCS), and matrix spike recoveries, and laboratory and field duplicate results, are within control limits except as summarized below. During the third quarter, duplicate samples were collected from wells RW-14B, RW-2B, RW-2A, and RW-8B. During the fourth quarter, duplicate samples were collected from wells RW-20C, RW-4A, and RW-19B.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

6.1 Holding Times

The EPA-recommended holding time for preserved ($\text{pH} < 2$) VOC samples is fourteen days and seven days for aromatic hydrocarbons in unpreserved VOC samples ($\text{pH} > 2$). All holding times were met.

6.2 Trip Blank, Field Blank, and Laboratory Method Blank Results

Trip blanks consisted of 40-mL vials filled with laboratory grade deionized water at the laboratory and transported in the same cooler as the groundwater sample bottles. Appendix C summarizes the results of the trip blank analyses.

Summary of findings are listed below:

- Target compounds were not detected in the trip blanks. Iron was detected in the laboratory method blanks; however, data qualification was unnecessary because the associated sample concentrations of iron were greater than five times the blank concentrations.
- Carbon disulfide was detected at 2.5 $\mu\text{g/L}$ in the 9/14/10 field blank in sample delivery group (SDG) C12512. The associated sample detections for carbon disulfide that are less than five times the blank concentration have been qualified as not detected ("UB").

6.3 Field Duplicate Samples

Duplicate samples collected in the field and analyzed at the same laboratory are a means to provide additional QA/QC. Calculation of the relative percent difference

(RPD) between the duplicate samples provides insight into the precision of sample collection technique. Because small differences between values near detection limits can produce large RPDs, and because of questionable reliability of detections at or near reporting limits, RPDs are generally evaluated quantitatively for duplicate sample pairs where analytes are detected at greater than five times the reporting limit in either of the primary and duplicate analyses. In other cases, RPDs are evaluated qualitatively by inspection. Table 4 summarizes the RPDs for the first and second quarter 2010 sampling events. RPDs were less than the 50% QC acceptance limit.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

6.4 Matrix Spike/Matrix Spike Duplicate Samples (MS/MSD)

MS/MSD data are used to assess the precision and accuracy of the analytical method. The analytes used to perform the MS/MSD analysis must exhibit recoveries within the laboratory-established acceptance limits. The relative percent difference (RPD) between the MS/MSD recoveries must be within the laboratory-established acceptance limits. The MS/MSD recovery control limits do not apply for MS/MSDs performed on sample locations where the analyte concentration detected in the parent sample exceeds the MS/MSD spiking concentration by a factor of four or greater. Qualification for MS/MSD exceedances where the parent sample is not site-specific are not warranted.

Sample locations RW-16C, RW-21C, RW-6A, and RW-8C were used in the third quarter VOC MS/MSD analyses. The results met the QC acceptance criteria. Sample locations RW-21C, RW-2C, and RW-5A were used in the fourth quarter VOC MS/MSD analyses. Recoveries for acetone, 1,2-dibromo-3-chloropropane, 2-hexanone, 4-methyl-2-pentanone, methyl ethyl ketone, and 1,1,2,2-tetrachloroethane were above the upper control limit in the RW-5A MS/MSD analysis. Data qualification is unnecessary because the MS/MSD bias is high and these compounds were not detected in RW-5A.

6.5 Laboratory Control Samples (LCS)

The LCS analysis is used to assess the accuracy of the analytical method independent of matrix interferences. The compounds associated with the LCS analysis must exhibit a percent recovery within the laboratory-established acceptance limits. Several LCS analyses exhibited recoveries that were greater than the upper control limit for acetone. No sample results warranted qualification because the LCS bias is high and acetone was not detected above the reporting limits in the associated samples.

6.6 Surrogate Recoveries

All samples to be analyzed for organic compounds are spiked with surrogate compounds prior to sample preparation to evaluate overall laboratory performance and efficiency of the analytical technique. VOC analysis requires that all surrogates associated with the analysis exhibit recoveries within the laboratory-established acceptance limits. All surrogate recoveries were within control limits.

Fomer Romic Environmental
Technologies Corporation
2081 Bay Road
East Palo Alto, California

7.0 Work Planned For Next Reporting Period

Work planned for the next reporting period includes, but is not limited to, the following:

- Implement the field work in accordance with the approved Work Plan for 2011 Expansion of the Groundwater Interim Remedial Measures, dated December 17, 2010 (ARCADIS, 2010)
- Finalize the Site-Wide Sampling and Analysis Plan
- Continue the ERD IRM remediation programs with the modified injection program for the B-zone IRMs and the current injection program for the rest of the A- and C-zone IRMs
- Complete quarterly water level measurements
- Complete groundwater and surface water sampling and analysis in the frequency specified by ARCADIS' Monitoring Plan, dated April 24, 2003.

Notes:

1. Depth-to-water measurements will be collected at all stations on a quarterly basis in March, June, September, and December.
2. Total depth of well will be measured on an annual basis (during the third quarter) in September.
3. Semiannual samples collected first and third quarters in March and September.
4. Annual samples collected third quarter in September.
5. Highlighted wells are compliance point boundary wells.

Analyzed by US EPA Method 8260 unless otherwise noted.

Analysis performed by Sequoia Analytical.

(µg/L) micrograms per liter
 1,1-DCA 1,1-Dichloroethane
 1,2-DCA 1,2-Dichloroethane
 1,1-DCE 1,1-Dichloroethene
 cis-1,2-DCE cis-1,2-Dichloroethene
 trans-1,2-DCE trans-1,2-Dichloroethene
 PCE Tetrachloroethene
 1,1,1-TCA 1,1,1-Trichloroethane
 1,1,2-TCA 1,1,2-Trichloroethane
 TCE Trichloroethene
 < Symbol indicates not detected at or above laboratory detection limit as noted.

Relative percent difference calculated as: (Primary Result-Duplicate Result)/(Mean of both results)
 In cases where one result returns a non-detection, RPD values were not calculated.

SPH or Purge Water Drum Log

Client: Accadis
 Site Address: 2081 Bay Rd. E. Palo Alto Ca.

STATUS OF DRUM(S) UPON ARRIVAL

Date	12/13/10				
Number of drum(s) empty:	2 ^{Rushed} _{out}				
Number of drum(s) 1/4 full:					
Number of drum(s) 1/2 full:	1				
Number of drum(s) 3/4 full:					
Number of drum(s) full:	4				
Total drum(s) on site:	7/1 ^{New} _{BTS}				
Are the drum(s) properly labeled?	Yes				
Drum ID & Contents:	Purge H ₂ O				
If any drum(s) are partially or totally filled, what is the first use date:					

- If you add any SPH to an empty or partially filled drum, drum must have at least 20 gals. of Purgewater or DI Water.
- If drum contains SPH, the drum MUST be steel AND labeled with the appropriate label.
- All BTS drums MUST be labeled appropriately.

STATUS OF DRUM(S) UPON DEPARTURE

Date	12/16/10				
Number of drums empty:	2 ^{Rushed} _{out}				
Number of drum(s) 1/4 full:	1 = 1/2 full				
Number of drum(s) 1/2 full:					
Number of drum(s) 3/4 full:					
Number of drum(s) full:	5				
Total drum(s) on site:	8/1 ^{New} _{BTS}				
Are the drum(s) properly labeled?	Yes				
Drum ID & Contents:	Purge H ₂ O				

LOCATION OF DRUM(S)

Describe location of drum(s): Near the trailers and conex boxes.

FINAL STATUS

Number of new drum(s) left on site this event	1				
Date of inspection:	12/16/10				
Drum(s) labelled properly:	Yes				
Logged by BTS Field Tech:	DR				
Office reviewed by:	ma

Notes appear on the following page.

Notes:

- Not measured
- (µS/cm) Microsiemens per centimeter
- (ft bgs) Feet below ground surface
- (ft msl) Feet above mean sea level
- (mv) Millivolt
- (mg/L) Milligrams per liter
- SC Specific conductivity
- DO Dissolved oxygen
- ORP Oxidation/reduction potential
- FP Free product in well - no sampling
- (ntu) Nephelometric turbidity unit
- MM Meter malfunction for DO measurements
- A Well casing raised. New top of casing elevation not surveyed.
